postBodyLimitAction. PostBodyLimit honors error settings when you specify the maximum size of HTTP body to be allowed. To honor error settings you must configure one or more Post Body Limit actions. The configuration is also applicable for requests where the transfer encoding header is chunked.

```
set appfw profile <profile_name> -PostBodyLimitAction block log stats
```

Where, Block - This action blocks connection that violates the security check and it is based on the maximum size of the configured HTTP body (post body limit). You must always enable the option.

Log - Log violations of this security check.

Stats - Generate statistics for this security check.

NOTE:

The log format for post body limit action is now changed to follow the standard audit logging format, for example: `ns.log.4.gz:Jun 25 1.1.1.1. <local0.info> 10.101.10.100 06/25/2020:10:10:28 GMT 0-PPE-0 : default APPFW APPFW_POSTBODYLIMIT 1506 0 : <Netscaler IP> 4234-PPE0 - testprof ><URL> Request post body length(<Post Body Length>) exceeds post body limit.`

inspectQueryContentTypes Inspect request query and web forms for injected SQL and cross-site scripts for the following content types.

```
set appfw profile p1 -inspectQueryContentTypes HTML XML JSON OTHER
```

Possible values: HTML, XML, JSON, OTHER

By default, this parameter is set as "InspectQueryContentTypes: HTML JSON OTHER" for both basic and advanced appfw profiles.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Example for inspect query content type as XML:

```
> set appfw profile p1 -type XML

Warning: HTML, JSON checks except “InspectQueryContentTypes” & “Infer
Content-Type XML Payload Action” will not be applicable when profile type
is not HTML or JSON respectively.
```

Example for inspect query content type as HTML:

```
> set appfw profile p1 -type HTML

Warning: XML, JSON checks except “InspectQueryContentTypes” & “Infer
Content-Type XML Payload Action” will not be applicable when profile type
is not XML or JSON respectively

Done
```

Example for inspect query content type as JSON:

```
> set appfw profile p1 -type JSON

Warning: HTML, XML checks except “InspectQueryContentTypes” & “Infer
Content-Type XML Payload Action will not be applicable when profile type
is not HTML or XML respectively

Done
```

errorURL expression. The URL that the NetScaler Web App Firewall uses as an error URL. Maximum Length: 2047.

NOTE:

For blocking violations in a requested URL, if the error URL is similar to the signature URL the appliance resets the connection.

logEveryPolicyHit - Log every profile match, regardless of security checks results. Possible values: ON, OFF. Default value: OFF.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

stripXmlComments - Strip XML comments before forwarding a webpage sent by a protected website in response to a user request. Possible values: none, all, exclude_script_tag. Default value: none

postBodyLimitSignature - Maximum allowed HTTP post body size for signature inspection for location HTTP_POST_BODY in the signatures, in bytes. The changes in value can impact CPU and latency profile. Default value: 2048. Minimum value: 0 Maximum Value: 4294967295

fileUploadMaxNum - Maximum allowed number of file uploads per form-submission request. The maximum setting (65535) allows an unlimited number of uploads. Default value: 65535 Minimum value: 0 Maximum value: 65535

canonicalizeHTMLResponse - Perform HTML entity encoding for any special characters in responses sent by your protected websites. Possible values: ON, OFF Default value: ON

percentDecodeRecursively - Configure whether the application firewall should use percentage recursive decoding. Possible values: ON, OFF Default value: ON

multipleHeaderAction - One or more multiple header actions. Available settings function as follows:

- Block. Block connections that have multiple headers.
- Log. Log connections that have multiple headers.
- KeepLast. Keep only the last header when multiple headers are present.

inspectContentTypes – One or more InspectContentType lists.

- application/x-www-form-urlencoded
- multipart/form-data
- text/x-gwt-rpc

Possible values: none, application/x-www-form-urlencoded, multipart/form-data, text/x-gwt-rpc

semicolonFieldSeparator - Allow ';' as a form field separator in URL queries and POST form bodies. Possible values: ON, OFF Default value: OFF

Changing an Web App Firewall profile type

If you chose the wrong profile type for an Web App Firewall profile, or the type of content on the protected website has changed, you can change the profile type.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE

When you change the profile type, you lose all configuration settings and learned relaxations or rules for the features that the new profile type does not support. For example, if you change the profile type from Web 2.0 to XML, you lose any configuration options for Start URL, Form Field Consistency Check, and the other HTML-specific security checks. The configuration for any options that is supported by both the old and the new profile types remains unchanged.

To change an Web App Firewall profile type by using the command line interface

At the command prompt, type the following commands:

- `set appfw profile <name> -type ( **HTML** | **XML** | **HTML XML** )`
- `save ns config`

Example

The following example changes the type of a profile named pr-basic, from HTML to HTML XML, which is equivalent to the Web 2.0 type in the GUI.

```
set appfw profile pr-basic -type HTML XML

save ns config
```

To change an Web App Firewall profile type by using the GUI

1. Navigate to **Security > NetScaler Web App Firewall > Policies**.
2. In the details pane, click **Action**, and then **Change Profile Type**.
3. In the **Change Web App Firewall Profile Type** dialog box, **Profile Type** drop-down list, select a new profile type.
4. Click **OK** to save your changes and return to the **Profiles** pane.

Exporting and importing an Web App Firewall profile

You can replicate the entire configuration of an Web App Firewall profile (including all bound objects, such as HTML error object, XML error object, WSDL or XML schema, signatures, and so on) across multiple appliances. You can select a target profile and export the configuration to save it in your computer’s local file system, or you can transfer the archived configuration to store it on a server. Similarly, you can browse your computer’s local file system or import the archive from the server to select a previously exported profile and import it into your NetScaler® appliance.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The option to export the entire profile configuration and then import it into another appliance can be useful in various use cases. For example, you might want to configure an Web App Firewall profile in a test bed set-up to test and validate that it is working as expected. Once you are satisfied, you can export the profile and import the profile configuration to your production NetScaler appliances. This functionality is also useful for backing up your configuration. You can export the profile before making changes, so that you can easily roll back the configuration to a known state if necessary.

NOTE

Web App Firewall profiles that are exported and archived from one build cannot be restored to a system running a different build, because changes introduced in the newer releases can lead to compatibility issues. If you attempt to restore an archived profile to a different build than the one from which it was exported, an error message is logged in ns.log.

The export and import profile functionality is available in both the GUI (GUI) and the command line interface (CLI). The GUI is recommended, because it offers easy to use **Action** options. With a click of a button you can **Export** or **Import** the entire configuration of a profile.

Exporting Web App Firewall profiles with the CLI

If you use CLI to **export** a profile, you must **archive** the configuration and then **export** it. To **import** a profile, you must **import** the archive into the NetScaler appliance and then run the **restore** command to extract the configuration. The following set of CLI commands can be used for exporting, importing and managing the profile configurations.

CLI commands to export archives:

- `archive appfw profile <name> <archivename> [-comment <string>]`
- `export appfw archive <name> <target>`

CLI commands to import archives:

- `import appfw archive <src> <name> [-comment <string>]`
- `restore appfw profile <archivename>`

CLI commands to manage archives:

- `show appfw archive`
- `rm appfw archive <name>`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Exporting a profile from one appliance and importing it to another requires five steps in CLI. The first 3 steps are performed on the source appliance on which profile configuration is originally created, and the next 2 steps are performed on the target appliance on which the profile configuration is to be replicated.

Export profile from the source NetScaler appliance:

Step 1: Create an archive of the configured profile.

Step 2: Export the archive to the NetScaler file system.

Step 3: Use a file transfer utility such as scp to transfer the exported archive file from NetScaler appliance A to the target NetScaler appliance.

Import profile to the target NetScaler appliance:

Step 4: Run the import command to import the archived file. You can import the archive from your NetScaler's local file system, or you can use HTTP or HTTPS protocol to import the archive from a server by using the URL.

Step 5: Run the restore command to restore the profile configuration from the imported archive

To export an Web App Firewall profile by using the command line interface:

First, **archive** the profile's configuration, and then **export** the archive to a target location. At the command prompt, type the following commands:

```
archive appfw profile <profileName> <archiveName>
```

where:

- `<profileName>` is the name of the profile to archive.
- `<archiveName>` is the name of the archive file to create.

Execution of the preceding command creates 2 instances of the archive file. One in the /var/nslog folder and another in the /var/archive/appfw folder.

```
export appfw archive <archiveName> <target>
```

where:

- `<archiveName>` is the name of the archive to export. (The same name as in the previous command).
- `<target>` is a file path starting with local: as the prefix, followed by `<archiveName>`.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Execution of the export command saves the exported archive file on the file system of your NetScaler appliance in the /var/nslog folder.

Examples:

```
> archive appfw profile test_pr archived_test_pr
```

```
> export appfw archive archived_test_pr local:dutA_test_pr
```

After the above two commands are run, the /var/nslog folder contains the archived_test_pr file and the exported copy, dutA_test_pr, which are identical in size. From the CLI, you can drop into the shell to navigate to the folder to verify that these files are there.

After exporting the archive file, you can use **scp** or some other such file transfer utility to transfer a copy of the archive file from the NetScaler appliance on which they were created to your target NetScaler appliance.

Importing Web App Firewall Profiles with the CLI

After you have successfully scp'd the archived file from the source appliance to the target appliance, you are ready to **import** the profile's archive, and then run the **restore** command to replicate the profile's configuration on the target appliance.

Log onto the target appliance. Drop into the shell and cd to the /var/nslog folder to verify that the size of the scp'd file on this appliance matches the size of the original archived file on the source appliance. Exit the shell to return to the command line.

To import a profile by using the CLI:

At the command prompt, type the following commands:

```
import appfw archive <src> <name> [-comment <string>]
```

where

- `<src>` is the location of the archive file after it has been transferred from the source appliance on which it was created. You can use a local file system and file name. If you have placed the archive on a server, you can use a URL to import the archived file. If the path or file name contains spaces, enclose the URL in straight double quotation marks.
- `<name>` is the name of the archive file to be imported.
- `<string>` is an optional description of the purpose of the Archive.

```
restore appfw profile <archiveName>
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Examples:

A. Import from local file followed by restore:

```
> import appfw archive local:dutA_test_pr dut2_test_pr
```

```
> restore appfw profile dut2_test_pr
```

B. Import from URL followed by restore:

```
import appfw archive http://10.217.30.16/FFC/Profile_ImportExport/
dutA_test_pr.tgz my_archive restore appfw profile my_archive
```

This example restores the test_pr profile along with all bound objects (such as signatures, html error page, relaxation rules and so on) on the target NetScaler appliance.

You can use the following CLI commands to access man pages for additional details.

- man archive appfw profile
- man export appfw archive
- man import appfw archive
- man restore appfw profile
- man show appfw archive
- man rm appfw archive

Exporting and Importing Web App Firewall Profiles with the GUI

The GUI is easier to use than the CLI. The utility performs both archive and export operations when you click **Export**. Similarly it runs both import and restore when you click **Import**. The GUI can access the local file system of the computer from which you access the utility. You can export a copy of the archive and save it on your local computer. You can then import this copy directly in the target appliance without having to manually transfer the archive file from one appliance to the other(s).

To export an Web App Firewall profile by using the GUI:

1. Navigate to **Configuration** > **Security** > **Web App Firewall** > **Profiles**.
2. In the details pane, select a profile to export. Click **Actions** and select **Export** to download and save a copy in your computer’s local file system.

To import an Web App Firewall profile by using the GUI:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. Navigate to **Configuration** > **Security** > **Web App Firewall** > **Profiles**.
2. In the details pane, click **Actions** and select **Import**. In the Import Web App Firewall Profile pane, the Import From* selection box gives you 2 options:

URL: You can choose to import an archive by specifying a **URL**. When this option is selected, you must provide an absolute path for the archived file in the **URL** input box.

File: You can choose to import an archive from the local **File**. When this option is selected, a **Local File** selection field is displayed. You can browse your computer's local files to select the target archive file.

Click **Create** to import the specified archive. Successful completion of the import operation creates the profile configuration on the target appliance.

Highlights

- You can replicate the entire configuration (including all import objects as well as configured relaxation rules for the profile) on multiple appliances, without needing to repeat configuration steps, by using export and import profile functionality.
- The imported objects, such as signatures, WSDL, Schema, error page and so on, are included in the archived tar file and replicated on the target appliance.
- Customized field types are included in the archived tar file and replicated on the target appliance.
- The policy bindings of the archived profile are not replicated when the configuration is restored. You must configure the policy and bind it to the profile after importing the profile to the appliance.
- The name of the archive file can be up to 31 character long. As with profile names, an archive name must begin with an alphanumeric character or underscore and contain only alphanumeric and underscore (_), number (#), period (.), space ( ), colon (:), at (@), equals (=) or hyphen (-) characters.
- Comments associated with the archive must be descriptive enough to convey the purpose of the archived configuration. The maximum allowed length for a comment is 255 characters.
- The `clear config –force basic` command does not remove the archived profiles.
- The import and export profile functionality is supported in high availability (HA) deployments.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Debugging Tips

- Monitor the /var/log/ns.log during command executions to see if there are any ERROR messages.
- Additional logs (_restore.log, remove.log, import.log) are generated in the /var/nslog folder. They can help debug issues during the corresponding operations. When these logs reach one MB in size, the log messages are purged to shrink the log file to one fourth of the original size.
- If the import command fails when you are using the URL option instead of the local file system, verify that DNS name server and route settings are accurately configured.
- If you are using the HTTPS protocol to import the archive, the command might fail if the HTTPS server requires client certificate authentication.

Ease of troubleshooting with Web Application Firewall logs

When there is a security attack, it is important to capture detailed WAF logging on the appliance. For this, you can configure the "VerboseLogLevel" parameter on an Application Firewall profile.

Consider a web traffic having a security attack. When the appliance receives the traffic, violation details such as HTTP header details, log pattern, and pattern payload information are logged and sent to the ADM server. The ADM server monitors the detailed logs and displays it on the Security Insight page for monitoring and tracking purpose.

NOTE:

To maximize the benefits of the verbose logging functionality, enable the `Enable Extend Logging` option from NetScaler console. For more informaton on enabling the option, see View application security violation details.

Configuring verbose log level by using the command interface

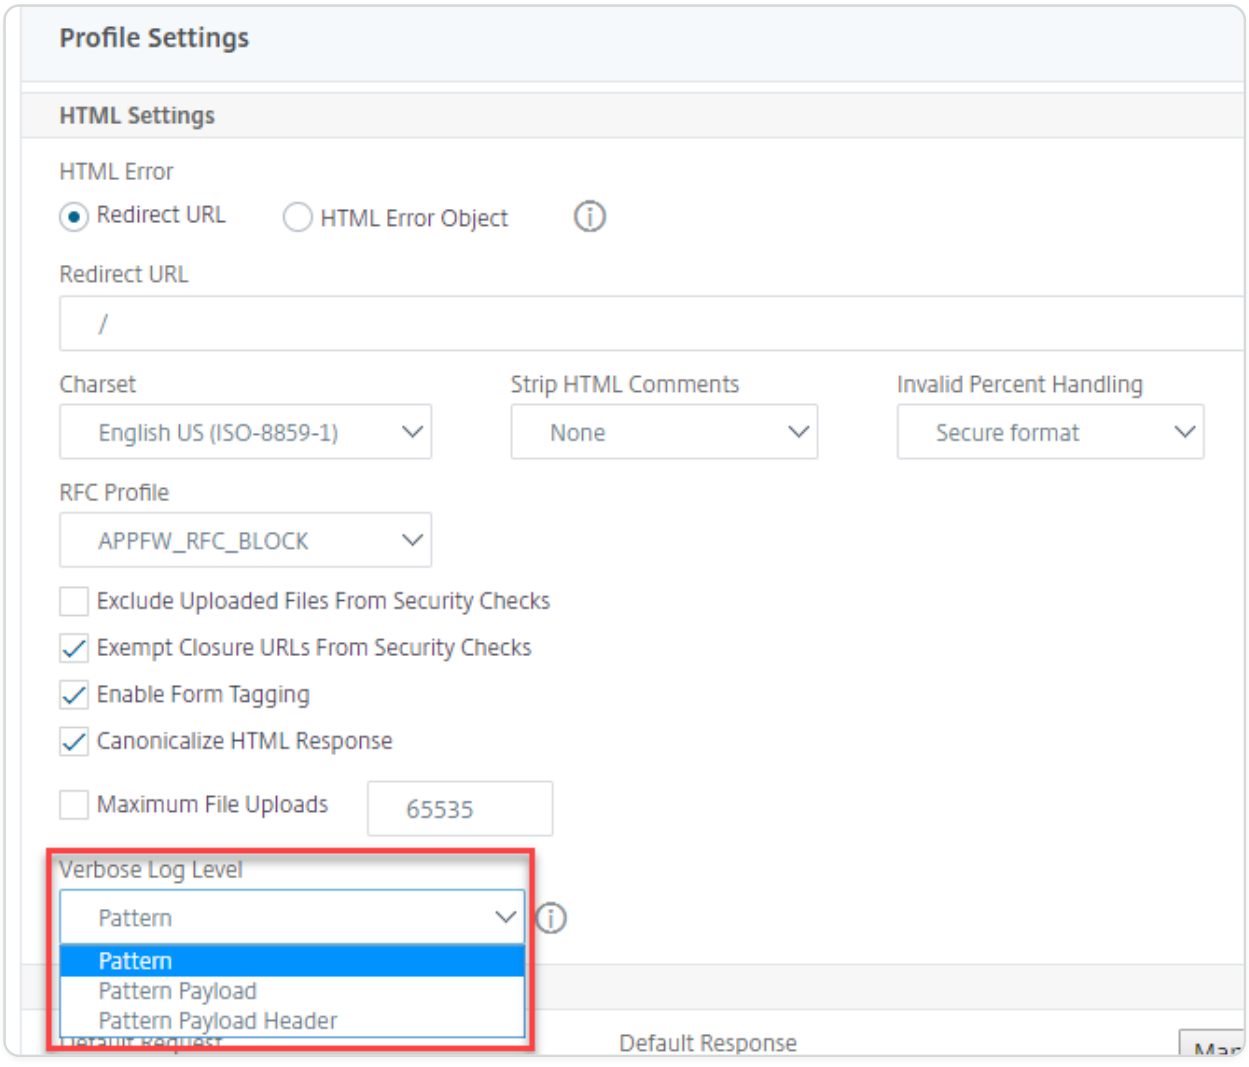
To capture detailed WAF logs, configure the following command. At the command interface, type:

```
set appfw profile <profile_name> -VerboseLogLevel (pattern|patternPayload|patternPayloadHeader)
```

Example

```
set appfw profile profile1 –VerboseLogLevel patternPayloadHeader
```

The available log levels are:



© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. Pattern. Logs only violation pattern.
2. Pattern payload. Logs violation pattern and 150 bytes of extra field element payload.
3. Pattern payload header. Logs violation patter, 150 bytes of extra field element payload and HTTP header information.

Configuring verbose log level by using the NetScaler GUI

Complete the following procedure to configure the verbose log level in the WAF profile.

1. On the navigation pane, navigate to **Security** > **Profiles**.
2. In the **Profiles** page, click **Add**.
3. In the **NetScaler Web App Firewall Profile** page, click **Profile Settings** under **Advanced Settings**.
4. In the **Profile Settings** section, select the detailed WAF log level in the Verbose Log Level field.
5. Click **OK** and **Done**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Verbose logging for JSON security checks (SQL, CMD, and cross-site scripting)

When an incoming request type is of JSON, you can configure the verbose log level parameter to capture detailed violation logs such as pattern, pattern payload, and HTTP header information. The log details are then sent to the NetScaler Console server for monitoring and troubleshooting JSON violations. The verbose log message is not stored in the ns.log file. Verbose logging for JSON content type security protection can be configured for the following violation types:

- SQL Injection
- Cross-site scripting
- Command Injection

Configure verbose logging for JSON security protection by using the CLI

To capture detailed HTTP header information as logs, you can configure the verbose logging parameter in the Web App Firewall profile. At the command prompt, type:

```
set appfw profile <profile_name> -VerboseLogLevel ( pattern |
patternPayload | patternPayloadHeader )
```

Example:

```
set appfw profile profile1 -VerboseLogLevel patternPayloadHeader
```

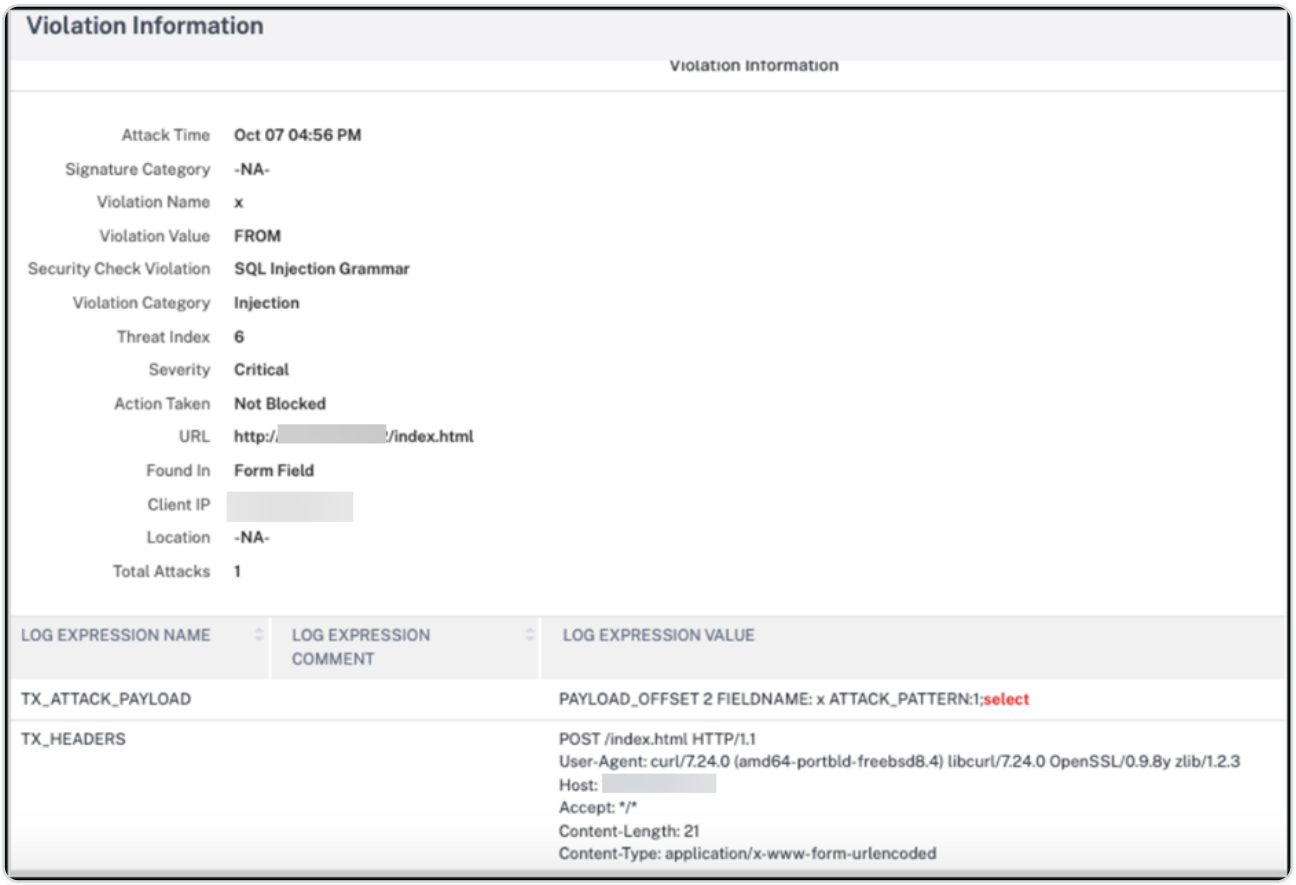
The available log levels are:

Pattern. Logs only violation pattern.

Pattern payload. Logs violation pattern and 150 bytes of extra JSON payload.

Pattern payload header. Logs violation patter, 150 bytes of extra JSON payload and HTTP header information.

Configuring verbose log level by using the NetScaler GUI



Follow the procedure below to configure the verbose log level for JSON security protection.

1. On the navigation pane, navigate to **Security > Profiles**.
2. In the **Profiles** page, click **Add**.
3. In the **NetScaler Web App Firewall Profile** page, click **Security Checks** under **Advanced Settings**.
4. In the **Security Checks** section, select **JSON** and click **Action Settings**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

5. In the **JSON Security Settings** page, set the **Verbose log level** parameter.
6. Click **OK** and **Done**.

Based on the details captured by NetScaler WAF JSON verbose logging, the following violation details can be inspected on the NetScaler Console server.

Manage global lists to bypass WAF or deny requests

An application can receive requests from trusted and untrusted sources. You might want to bypass the NetScaler Web App Firewall for the requests from a trusted source. And, when the requests come from certain untrusted sources, you want to strictly block those requests.

In a NetScaler Web App Firewall profile, you can configure global lists to bypass Web App Firewall or deny requests. If the incoming requests match the global bypass list, they skip the Web App Firewall in NetScaler. If the incoming requests match the global deny list, NetScaler Web App Firewall blocks those requests and applies the defined action.

The bypass and deny lists support URL, IPv4, and IPv6 addresses. You can specify them using literals, PCRE, and expressions.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure the global bypass and deny list using the CLI

Before you begin, create a Web App Firewall profile and enable bypass and deny lists in the profile settings.

1. Create a Web App Firewall profile.

   ```
   add appfw profile <profile-name>
   ```

   Example

   ```
   add appfw profile example-profile
   ```

   NOTE

   By default, bypass list and deny list are disabled. To view profile settings, run the following command:

   `sh appfw profile <profile-name>`

2. Run the following command to enable bypass list and deny list.

   ```
   set appfw profile <profile-name> -bypasslist on -denylist on
   ```

Bind the Web App Firewall profile with a global bypass list

Run the following command to bind the rules to a global bypass list:

```
bind appfw profile <profile-name> -bypasslist <String|PCRE|Expression|IP-address> -valuetype <literal|PCRE|expression> -ruleaction log -location <url|ipv4|ipv6>
```

- **Example-1**:

  ```
  bind appfw profile example-profile -bypasslist http://www.example.com -valuetype literal -ruleaction log -location url
  ```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

This example uses a literal value. When the incoming request URL contains `http://www.example.com`, the request bypasses the WAF checks and logs an event in the NetScaler appliance.

- **Example-2**:

```
bind appfw profile example-profile -bypasslist http://www.example[n]
-valuetype PCRE -ruleaction log -location url
```

This example uses a PCRE value. When the incoming request URL contains `http://www.example` and followed by the letter `n`, the request bypasses the WAF checks and logs an event in the NetScaler appliance.

- **Example-3**:

```
bind appfw profile example-profile -bypasslist
http.req.url.contains("example") -valuetype expression -ruleaction log
```

This example uses an expression. When the incoming request URL contains `example` anywhere in the URL, the request bypasses the WAF checks and logs an event in the NetScaler appliance.

IMPORTANT

Do not enter the location value when you specify the expression value type.

- **Example-4**:

```
bind appfw profile example-profile -bypasslist 10.10.10.10 -valuetype
expression -ruleaction log -location ipv4
```

This example uses an IPv4 address. When the incoming request URL contains an IP address `10.10.10.10`, the request bypasses the WAF checks and logs an event in the NetScaler appliance.

Similarly, you can specify the IPv6 address. To do so, set the location value to `ipv6` in this command.

Bind the Web App Firewall profile with a global deny list

Run the following command to bind the rules to a global deny list:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
bind appfw profile <profile-name> -bypasslist <String|PCRE|Expression|IP-address> -valuetype <literal|PCRE|expression> -ruleaction <log|none|REDIRECT|RESET> -location <url|ipv4|ipv6>
```

- **Example-1**:

  ```
  bind appfw profile example-profile -denylist http://www.example.com -valuetype literal -ruleaction log -location url
  ```

  This example uses a literal value. When the incoming request URL contains `http://www.example.com`, the NetScaler Web App Firewall blocks the request and logs an event in the NetScaler appliance.

- **Example-2**:

  ```
  bind appfw profile example-profile -denylist http://www.example[n] -valuetype PCRE -ruleaction none -location url
  ```

  This example uses a PCRE value. When the incoming request URL contains `http://www.example` and followed by the letter `n`, the NetScaler Web App Firewall blocks the request.

  NOTE:

  When you specify the `-ruleaction` as `none`, NetScaler Web App Firewall performs the default action. The default action for bypass and deny list is allow.

  For more information on rule action, see Overview of security checks.

- **Example-3**:

  ```
  bind appfw profile example-profile -denylist http.req.url.contains("example") -valuetype expression -ruleaction REDIRECT
  ```

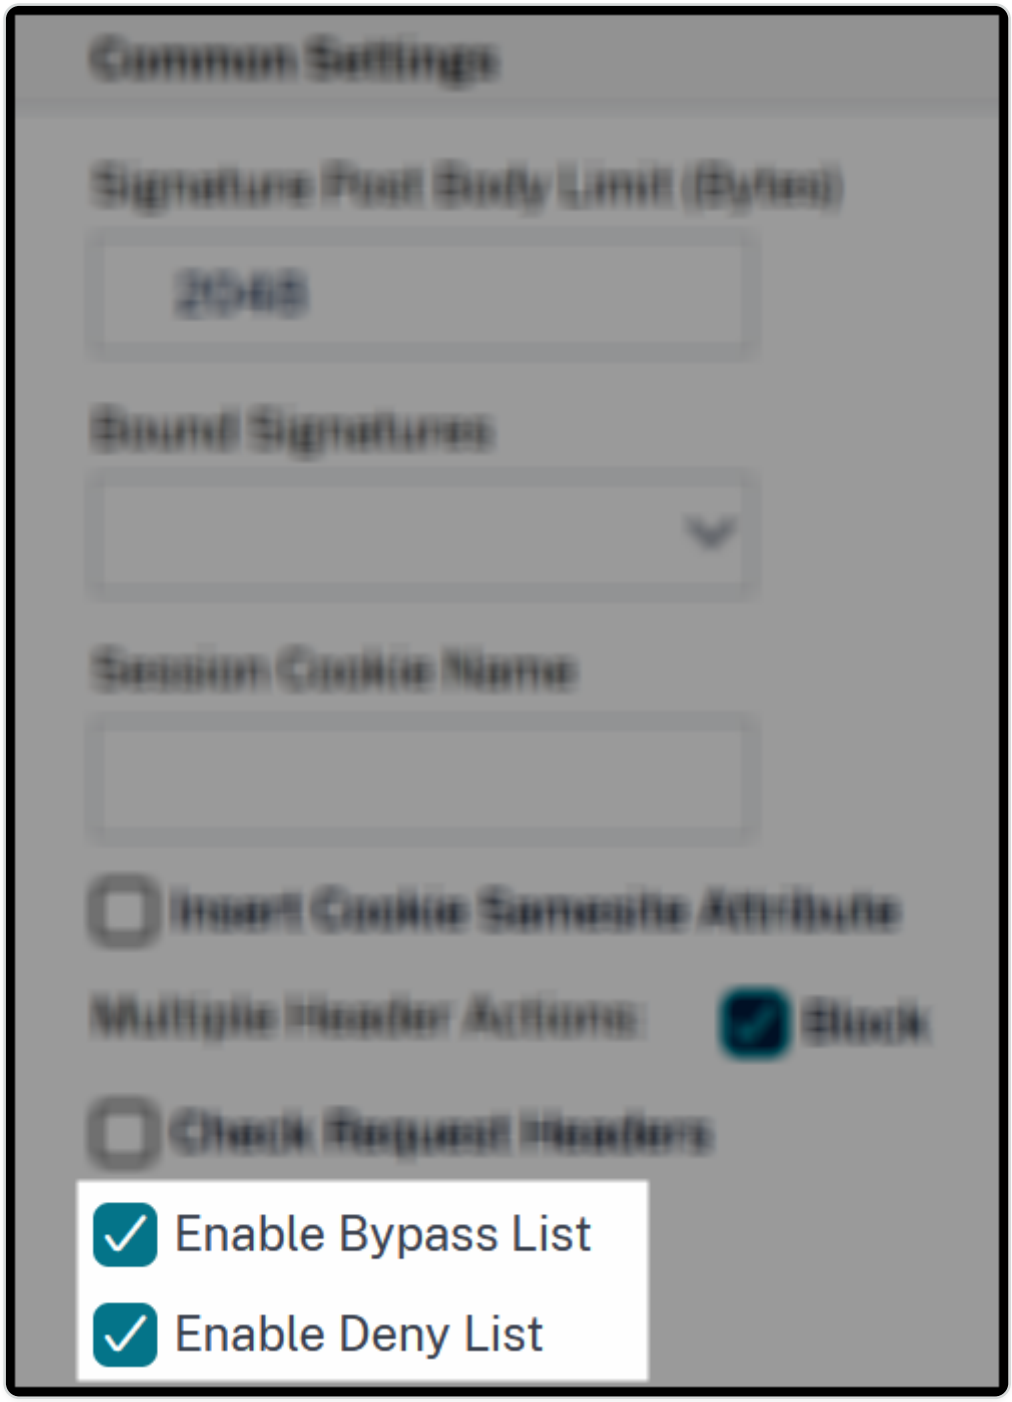
  This example uses an expression. When the incoming request URL contains `example` anywhere in the URL, the NetScaler Web App Firewall blocks and redirects the request.

- **Example-4**:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
bind appfw profile example-profile -denylist 10.10.10.10 -valuetype
expression -ruleaction RESET -location ipv4
```

This example uses an IPv4 address. When the incoming request URL contains an IP address `10.10.10.10`, the NetScaler Web App Firewall blocks the request and resets the connection.



Similarly, you can specify the IPv6 address. To do so, set the location value to `ipv6` in this command.

Configure the global bypass and deny list using the GUI

Before you begin, create a Web App Firewall profile and enable bypass and deny lists in the profile settings.

1. Navigate to **Security > NetScaler Web App Firewall > Profiles**.
2. Select the profile for which you want to add the global bypass and deny lists.
3. In the **NetScaler Web App Firewall Profile** page, click **Profile Settings** under **Advanced Settings**.
4. In **Common Settings**, select the following options:
   - Enable Bypass List
   - Enable Deny List

© 1997–2026 Citrix Systems, Inc. All rights reserved.

5. Click **OK** and **Done**.

Add a global bypass list

Complete the following steps to add a global bypass list:

1. Navigate to **Security > NetScaler Web App Firewall > Profiles**.
2. Select the profile for which you want to add a global bypass list.
3. In the **NetScaler Web App Firewall Profile** page, click **Global Bypass/Deny list** under **Advanced Settings**.
4. In **Global Bypass List**, click **Add**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

5. Specify the following in the **Create AppFirewall Bypass List Binding** page:
    - **Bypass List Value Type**: It supports literals, PCREs, and expressions.
    - **Bypass List Value**: Specify a value depending on the value type.
    - **Bypass List Action**: After the request bypasses the WAF checks, the defined action applies for the request. If the action is set to **Log**, it logs an event in the NetScaler appliance.
    - **Bypass List Location**: Set the location value. If you specify IPv4, the profile looks for the IPv4 address in the incoming request.
6. Click **Create**.

Add a global deny list

Complete the following steps to add a global deny list:

1. Navigate to **Security > NetScaler Web App Firewall > Profiles**.
2. Select the profile for which you want to add a global deny list.
3. In the **NetScaler Web App Firewall Profile** page, click **Global Bypass/Deny list** under **Advanced Settings**.
4. In **Global Deny List**, click **Add**.
5. Specify the following in the **Create AppFirewall Deny List Binding** page:
    - **Deny List Value Type**: It supports literals, PCREs, and expressions.
    - **Deny List Value**: Specify a value depending on the value type.
    - **Deny List Action**: After the NetScaler Web App Firewall blocks the request, the defined action applies for the request. If the action is set to **Reset**, the Web App Firewall resets the connection.
    - **Log**: It logs an event in the NetScaler appliance whenever the NetScaler Web App Firewall blocks the request.
    - **Deny List Location**: Set the location value. If you specify IPv4, the profile looks for the IPv4 address in the incoming request.
6. Click **Create**.

File upload protection

Many attackers try to upload malicious code, virus, or malware as file attachments during multi-form submission. It is important to protect our network and overcome such threats. To prevent such

© 1997–2026 Citrix Systems, Inc. All rights reserved.

malicious file uploads, a NetScaler admin configures a set of allowable file upload formats in the WAF profile. By doing this, you restrict file uploads to specific formats and protect the appliance against malicious file uploads. The protection works only when you disable the `ExcludeFileUploadFormChecks` option in the WAF profile.

How file upload works

When you configure allowable file upload formats, the component interaction is as follows:

- Client request has a form submission with a file upload type, for example PDF.
- As part of the security check, WAF inspects the request payload and validates the file type (based on magic signature numbers).
- If the file type is not in a supported format, the corresponding action based on file type binding is applied.
- To validate the file type the appliance inspects the payload and checks for the known magic numbers at known offsets. Each file type has a sequence of magic numbers that validates the file type.

Configure file type upload by using NetScaler CLI

To configure allowable file formats, the appliance uses a WAF profile that is bound to file upload parameters.

1. Configure Web Application Firewall profile

At the command prompt, type:

```
set appfw profile <profile_name> [-fileUploadTypesAction
<fileUploadTypesAction>]<fileUploadTypesAction> = ( none | block | log | stats )
```

Example

```
set appfw profile profile1 –fileUploadTypesAction block
```

1. Bind Web Application Firewall profile with file upload parameters. The command binds the specified exemption (relaxation) or rule to the specified application firewall profile.

At the command prompt, type:

```
bind appfw profile <profile_name> - fileUploadType <form_field >
<form_action_url> [-isNameRegex ( REGEX | NOTREGEX )] -fileType <fileType> ( pdf
| msdoc | text | image | any)
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE:

The form field name is a regular expression type. The default value is `NOTREGEX`.

Example

```
> bind appfw profile test -fileuploadType thefile "http://10.10.10.10/fileupload_sample/upload.php" -isNameRegex NOTREGEX -filetype image
```

-->

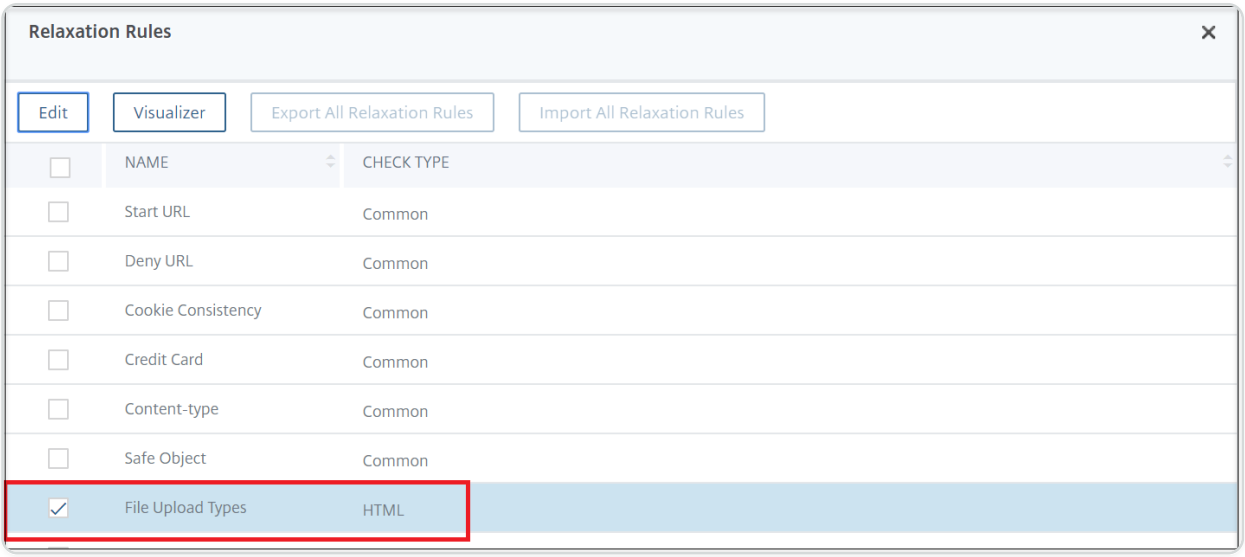
Configure file upload security protection by using NetScaler GUI

1. In the navigation pane, navigate to **Security** > **Profiles**.
2. In the Profiles page, click **Add**.
3. In the **NetScaler Web App Firewall Profile** page, click **Security Checks** under **Advanced Settings**.
4. In the **Security Checks** section, select **File Upload Types** and click **Action Settings**.
5. In the **File Upload Types Settings** page, set the file upload action.
6. Click **OK**.
7. In the **NetScaler Web App Firewall Profile** page, click **OK** and **Done**.

Configure file upload relaxation rule by using NetScaler GUI

You can relax a file upload security protection to avoid false positives. For example, the appliance might block file uploads but you can add a relaxation rule to allow file uploads from specific websites. By doing this, the appliance bypasses security inspection for the specified form field and allow users to upload files from the website mentioned in the action URL.

NOTE:



The file upload validation fails if the **File Upload Types Rexalation Rule** is not enabled.

Perform the following steps to create a relaxation rule.

1. In the navigation pane, navigate to **Security** > **NetScaler Web App Firewall** > **Profiles**.
2. In the Profiles page, click **Add**.
3. In the **NetScaler Web App Firewall Profile** page, click **Relaxation Rules** under **Advanced Settings**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. In the **Relaxation Rules** section, select **File Upload Types** and click **Edit**.

5. In the **File Upload Types Rexalation Rules** page, click **Add**.
6. In the **File Upload Types Relaxation Rule** page, set the following parameters:

   a. Enabled - Select to enable the relaxation rule.

   b. Is Form Field Name Regex - Select to update a regex pattern for the form field name.

   c. Form Field Name - Enter the file name that does not require a security check.

   d. Action URL - The form submission URL that must be exempted from security checks.

   e. File Type - Supported file format that can be uploaded.

   f. Comments - A brief description about the file upload.

7. Click **Create**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

8. In the **NetScaler Web App Firewall Profile** page, click **OK** and **Done**.

Configuring and using the Learning feature

The learning feature is a repetitive pattern filter that observes activity on a website or application protected by the Web App Firewall, to determine what constitutes normal activity on that website or application. It then generates a list of up to 2,000 suggested rules or exceptions (relaxations) for each security checks that include support for the learning feature. Users normally find it easier to

© 1997–2026 Citrix Systems, Inc. All rights reserved.

configure relaxations by using the learning feature than by entering the necessary relaxations manually.

The security checks that support the learning feature are:

- Start URL check
- Cookie Consistency check
- Form Field Consistency check
- Field Formats check
- CSRF Form Tagging check
- HTML SQL Injection check
- HTML Cross-Site Scripting check
- XML Denial-of-Service check
- XML Attachment check
- Web Services Interoperability check

You perform two different types of activities when using the learning feature. First, you enable and configure the feature to use it. You can learn all traffic to your protected web applications, or you can configure a list of IP addresses (called the *Add Trusted Learning Clients* list) from which the learning feature can generate recommendations. Second, after the feature has been enabled and has processed a certain amount of traffic to your protected websites, you review the list of suggested rules and relaxations (learned rules) and mark each with one of the following designations:

- **Edit & Deploy.** The rule is pulled into the Edit dialog box so that you can modify it, and the modified form is deployed.
- **Deploy.** The unmodified learned rule is placed on the list of rules or relaxations for this security check.
- **Skip.** The learned rule is placed on a list of rules or relaxations that are not deployed. The learned rule is removed when skipped. However, as they are not added to relaxations, they might get learned again.

Learning is not performed only when relaxations are in place, except for field format rules. When rules are skipped, they are only removed from the learned database. As relaxations are not added, they might get learned again. When the rules are deployed, they are removed from learned

© 1997–2026 Citrix Systems, Inc. All rights reserved.

database and also relaxations are added for the rules. As relaxations are added, they would not be learned again. For field format protection, learning is performed irrespective of relaxations.

Although you can use the command line interface for basic configuration of the learning feature, the feature is designed primarily for configuration through the Web App Firewall wizard or the GUI. You can perform only limited configuration of the learning feature by using the command line.

The wizard integrates configuration of learning features with configuration of the Web App Firewall as a whole, and is therefore the easiest method for configuring this feature on a new NetScaler appliance or when managing a simple Web App Firewall configuration. The GUI visualizer and manual interface both provide direct access to all learned rules for all security checks, and are therefore often preferable when you must review learned rules for many security checks.

The learning database is limited to 20 MB in size, which is reached after approximately 2,000 learned rules or relaxations are generated per security check for which learning is enabled. If you do not regularly review and either approve or ignore learned rules and this limit is reached, an error is logged to the NetScaler® log and no more learned rules are generated until you review the existing learned rules and relaxations.

If learning stops because the database has reached its size limit, you can restart learning either by reviewing the existing learned rules and relaxations or by resetting the learning data. After learned rules or relaxations are approved or ignored, they are removed from the database. After you reset the learning data, all existing learning data is removed from the database and it is reset to its minimum size. When the database falls below 20 MB in size, learning restarts automatically.

NOTE:

Enable the `-centralizedLearning` parameter in NetScaler using the `set appfw settings` command to use the Web Application Firewall learning feature in NetScaler Console. Once you enable this parameter, it disables the Web Application Firewall learning feature on Netscaler.

To configure the learning settings by using the command line interface

Specify the Web App Firewall profile to be configured and, for each security check that you want to include in that profile, specify the minimum threshold or the percent threshold. The minimum threshold is an integer representing the minimum number of user sessions that the Web App Firewall must process before it learns a rule or relaxation (default: 1). The percent threshold is an integer representing the percentage of user sessions in which the Web App Firewall must observe

© 1997–2026 Citrix Systems, Inc. All rights reserved.

a particular pattern (URL, cookie, field, attachment, or rule violation) before it learns a rule or relaxation (default: 0). Use the following commands:

- `set appfw learningsettings <profileName> [-startURLMinThreshold <positive_integer>] [-startURLPercentThreshold <positive_integer>] [-cookieConsistencyMinThreshold <positive_integer>] [-cookieConsistencyPercentThreshold <positive_integer>] [-CSRFtagMinThreshold <positive_integer>] [-CSRFtagPercentThreshold <positive_integer>] [-fieldConsistencyMinThreshold <positive_integer>] [-fieldConsistencyPercentThreshold <positive_integer>] [-crossSiteScriptingMinThreshold <positive_integer>] [-crossSiteScriptingPercentThreshold <positive_integer>] [-SQLInjectionMinThreshold <positive_integer>] [-SQLInjectionPercentThreshold <positive_integer>] [-fieldFormatMinThreshold <positive_integer>] [-fieldFormatPercentThreshold <positive_integer>] [-XMLWSIMinThreshold <positive_integer>] [-XMLWSIPercentThreshold <positive_integer>] [-XMLAttachmentMinThreshold <positive_integer>] [-XMLAttachmentPercentThreshold <positive_integer>]`
- `save ns config`

Example

The following example enables and configures the learning settings in the profile for the HTML SQL Injection security check. This is an appropriate initial test bed learning configuration, where you have complete control over the traffic that is sent to the Web App Firewall.

```
set appfw learningsettings pr-basic -SQLInjectionMinThreshold 10

set appfw learningsettings pr-basic -SQLInjectionPercentThreshold 70

save ns config
```

To reset learning settings to their defaults by using the command line interface

To remove any custom configuration of the learning settings for the specified profile and security check, and return the learning settings to their defaults, at the command prompt type the following commands:

- `unset appfw learningsettings <profileName> [-startURLMinThreshold ] [-startURLPercentThreshold] [-cookieConsistencyMinThreshold] [-`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

`cookieConsistencyPercentThreshold] [-CSRFtagMinThreshold] [-CSRFtagPercentThreshold] [-fieldConsistencyMinThreshold] [-fieldConsistencyPercentThreshold] [-crossSiteScriptingMinThreshold] [-crossSiteScriptingPercentThreshold] [-SQLInjectionMinThreshold] [-SQLInjectionPercentThreshold] [-fieldFormatMinThreshold] [-fieldFormatPercentThreshold] [-XMLWSIMinThreshold] [-XMLWSIPercentThreshold] [-XMLAttachmentMinThreshold] [-XMLAttachmentPercentThreshold]`

- `save ns config`

To display the learning settings for a profile by using the command line interface

At the command prompt, type the following command:

```
show appfw learningsettings <profileName>
```

To display unreviewed learned rules or relaxations for a profile by using the command line interface

At the command prompt, type the following command:

```
show appfw learningdata <profileName> <securityCheck>
```

To remove specific unreviewed learned rules or relaxations from the learning database by using the command line interface

At the command prompt, type the following command:

```
rm appfw learningdata <profileName> (-startURL <expression> | -cookieConsistency <string> | (-fieldConsistency <string> <formActionURL>) | (-crossSiteScripting <string> <formActionURL>) | (-SQLInjection <string> <formActionURL>) | (-fieldFormat <string><formActionURL>) | (-CSRFTag <expression> <CSRFFormOriginURL>) | -XMLDoSCheck <expression> | -XMLWSICheck <expression> | -XMLAttachmentCheck <expression>) [-TotalXMLRequests]
```

Example

The following example removes all unreviewed learned relaxations for the profile, HTML SQL Injection security check, that apply to the **LastName form** field.

```
rm appfw learningdata pr-basic -SQLInjection LastName
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To remove all unreviewed learned data by using the command line interface

At the command prompt, type the following command:

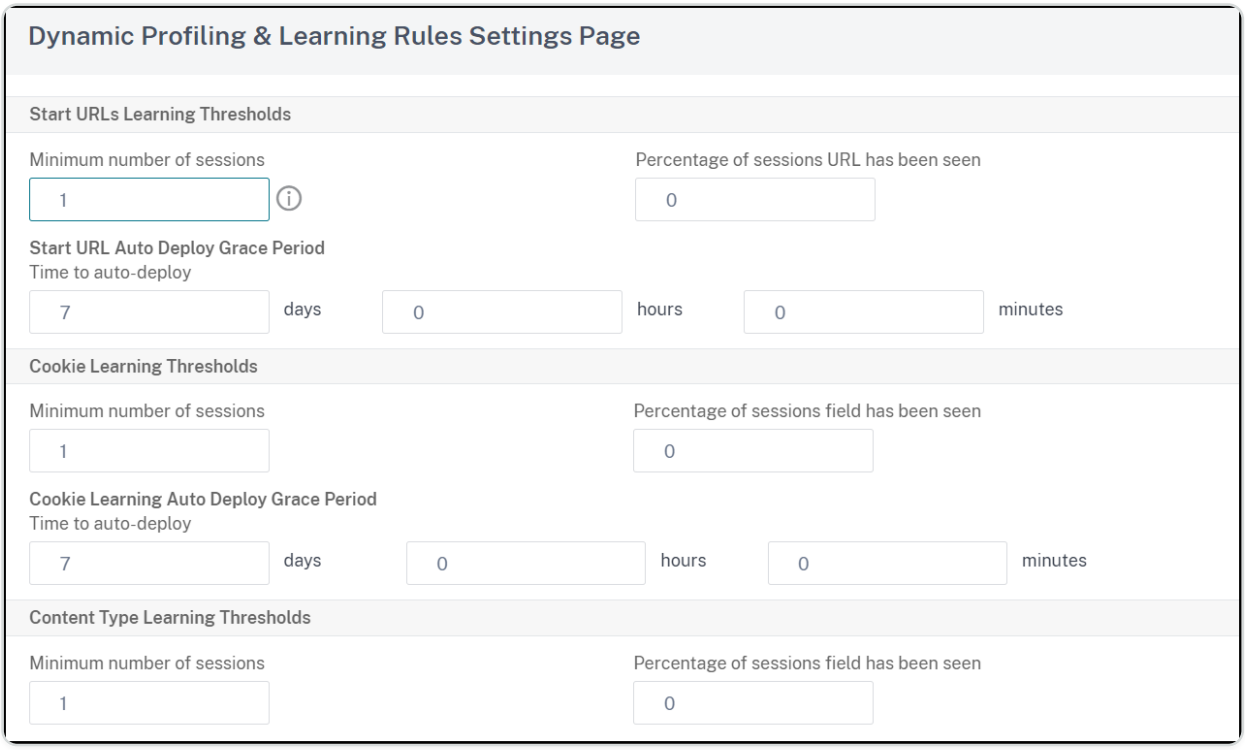
```
reset appfw learningdata
```

To export learning data by using the command line interface

At the command prompt, type the following command:

```
export appfw learningdata <profileName> <securitycheck>[-target <string>]
```

Example



The following example exports learned relaxations for the profile and the HTML SQL Injection security check to a comma-separated values (CSV) format file in the /var/learnt_data/ directory under the file name specified in the -target parameter.

```
export appfw learningdata pr-basic SQLInjection -target sqli_ld
```

To configure the Learning feature by using the GUI

1. Navigate to **Security** > **Web App Firewall** > **Profiles**.
2. In the **Profiles** pane, select the profile, and then click **Edit**.
3. Click **Learnt Rules** under **Advanced Settings** section.
4. In the **Learnt Rules** section, select a security check and click **Settings**.
5. In the **Security Check Settings** page, set the following parameters:
    a. **Minimum number threshold.** Depending on which security check's learning settings you are configuring, the minimum number threshold might refer to the minimum number of total user sessions that must be observed, the minimum number of requests that must be observed, or the minimum number of times a specific form field must be observed, before a learned relaxation is generated. Default: 1
    b. **Percentage of times threshold.** Depending on which security check’s learning settings you are configuring, the percentage of times threshold might refer to the percentage of total observed user sessions that violated the security check, the percentage of requests, or the percentage of times a form field matched a particular field type, before a learned relaxation is generated. Default: 0
6. Click **OK** and **Close**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

7. Click **Remove All Learned Data** to remove all learned data and reset the learning feature, so that it must start its observations again from the beginning.

> **NOTE:**
>
> This button removes only learned recommendations that have not been reviewed and either approved or skipped. It does not remove learned relaxations that have been accepted and deployed.

8. To restrict the learning engine to traffic from a specific set of IPs, click **Trusted Learning Clients**, and add the IP addresses that you want to use to the list.

   a. To add an IP address or IP address range to the Trusted Learning Clients list, click **Add**.

   b. In the **Add Trusted Learning Clients** dialog box, Trusted Clients IP list box, type the IP address or an IP address range in CIDR format.

   c. In the Comments text area, type a comment that describes this IP address or range.

   d. Click **Create** to add your new IP address or range to the list.

   e. To modify an existing IP address or range, click the IP address or range, and then click **Open**. Except for the name, the dialog box that appears is identical to the **Add Trusted Learning Clients** dialog box.

   f. To disable or enable an IP address or range, but leave it on the list, click the IP address or range, and then click **Disable or Enable**, as appropriate.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

g. To remove an IP address or range completely, click the IP address or range, and then click **Remove**.

9. Click **Close** to return to the Configure Web App Firewall Profile page.
10. Click **Done**.

To review learned rules or relaxations by using the GUI

1. Navigate to **Security** > **Web App Firewall** > **Profiles**.
2. In the **Profiles** pane, select the profile, and then click **Edit**.
3. Click **Learnt Rules** under **Advanced Settings** section.
4. In the **Learnt Rules** section, select a security check and click **Settings**.
5. To review the learned data hierarchically as a branching tree, enabling you to choose general patterns that match many of the learned patterns, click **Visualizer**.
6. If you have chosen to review actual learned patterns, perform the following steps.
7. Select the first learned relaxation and choose how to handle it.

   a. To modify and then accept the relaxation, click **Edit & Deploy**, edit the relaxation regular expression, and then click **OK**.

   b. To accept the relaxation without modifications, click **Deploy**.

   c. To remove the relaxation from the list without deploying it, click **Skip**.

   d. Repeat the previous step to review each additional learned relaxation.

8. Click **Close** to return to the **Manage Learned Rules** dialog box.
9. Click **Done**.

Dynamic profiling

The learning feature is a pattern filter that observes and learns activities on the back-end server. Based on the observation, the learning engine generates up to 2000 rules or exceptions (relaxations) for each security check. To automate the process and auto deploy the relaxation rules, NetScaler appliance uses dynamic profiling.

With dynamic profiling, the appliance records the learnt data for a pre-defined threshold and sends an SNMP alert to the user. If the user does not skip the data within a grace period, the appliance auto deploys it as a relaxation rule. Earlier, the user had to manually deploy the relaxation rules. Currently, dynamic profiling is available only for the follow security checks:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. HTML SQL injection
2. HTML Cross Site scripting
3. Field format
4. Start URL
5. Content-type
6. Field formats
7. CSRF form tagging
8. Cookie consistency
9. Deny URL
10. Buffer Overflow
11. Credit Card
12. Content-type protection
13. JSON Cmd Injection protection

For example, consider the HTML SQL Injection security check enabled with dynamic profiling. You can use learning for a list of IPs (called the Trusted Learning Clients list) from which the learning feature must generate recommendations. To configure a list of trusted clients, see Learning Trusted Clients topic. If the incoming traffic has violations, it is recorded as a learnt data. If the learned data is recorded in the learning engine, the appliance sends an SNMP alert to the user. If the user does not recognize a false positive and does not skip the learnt data within a grace period, the appliance auto deploys it as a relaxation rule.

NOTE:

After you configure the dynamic profile, you must periodically review the appliance configuration for the auto-deployment of the relaxation rules and save it on the appliance.

Configure dynamic profiling by using the NetScaler command interface

Dynamic profiling is available for Start URL, HTML Cross-Site Scripting, Field Format, or HTML SQL Injection security checks. To configure dynamic profiling, you must complete the following steps.

1. Configure dynamic learning
2. Configure auto deployment grace period

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure dynamic learning

As a first step, you must configure dynamic learning on your appliance. At the command prompt, type:

```
set appfw profile <profile_name> dynamicLearning <security_checks>
```

EXAMPLE

```
set appfw profile test1 dynamicLearning SQLInjection CrossSiteScripting fieldFormat startURL
```

Configure auto deployment grace period

Once you enable the feature on specific security checks, you must configure the grace period for the auto deployment.

```
set appfw learningsettings <profile name> -crossSiteScriptingAutoDeployGracePeriod <seconds>
```

```
set appfw learningsettings <profile name> fieldFormatAutoDeploymentGracePeriod <seconds>
```

```
set appfw learningsettings <profile name> SQLInjectionAutoDeploymentGracePeriod <seconds>
```

```
set appfw learningsettings <profile name> –startURLAutoDeployGracePeriod <seconds>
```

EXAMPLE

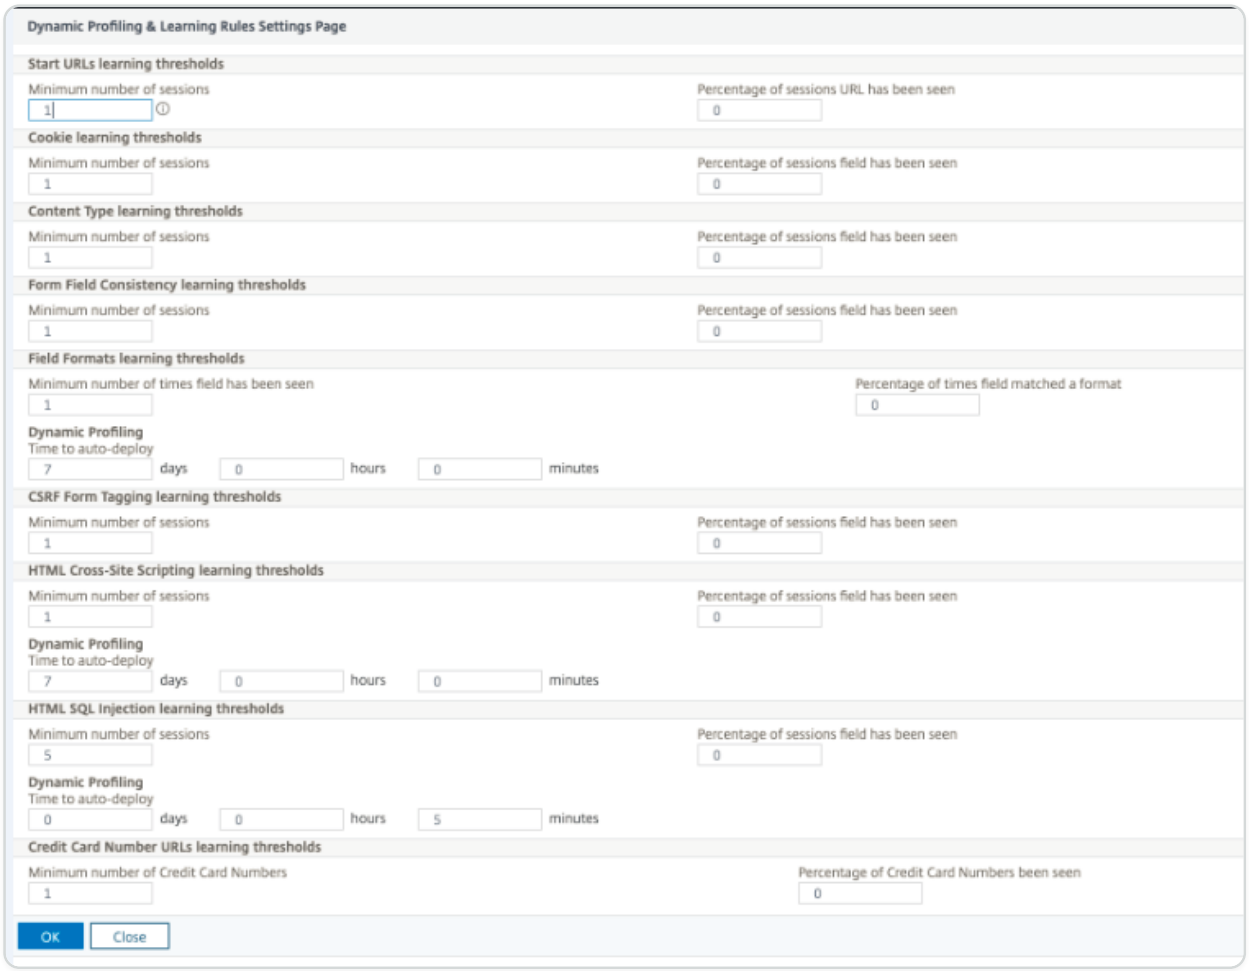
```
set appfw learningsettings test1 –crossSiteScriptingAutoDeployGracePeriod 30
```

```
set appfw learningsettings test1 –startURLAutoDeployGracePeriod 7
```

```
set appfw learningsettings test1 –fieldFormatAutoDeploymentGracePeriod 10
```

```
set appfw learning settings test1 –SQLInjectionAutoDeploymentGracePeriod 12
```

NOTE:



Here, the auto deployment grace period is in minutes.

Configuring dynamic profiling by using the NetScaler GUI

1. Navigate to **Security > NetScaler Web App Firewall > Profile**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. In the details pane, select a profile and click **Edit**.
3. In the **NetScaler Web App Firewall** page, click **Dynamic Profiling** under **Advanced Settings**.
4. In the **Dynamic Profiling** section, select a security check and click **Edit**.
5. In the **Dynamic Profiling and Learning Settings** page, set the grace period the security check.

6. Click **OK** and **Done**.

Export and import of relaxation rules

When you enable dynamic profiling, the learnt data is auto deployed as relaxation rules. Along with this, the appliance also enables you to export the dynamic profiling based relaxation rules and regular relaxation rules. You can export the rules from staging environment and import it to the production environment.

NOTE:

When you import rules to the production environment, you must ensure the process is additive and does not override the existing configuration.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

How to export and import relaxation rules

To export and import the relaxation rules, you must complete the following steps:

1. You must first export the dynamic profiling-based data. For this, the export option is available for the relaxation rules in the WAF profile. When you select this option, you export the dynamic profiling relaxation rules and regular relaxation rules. You can use the export option to download the configuration as a compressed bundle on the appliance.
2. Once you have exported the data from the staging environment, you must import it to another NetScaler appliance. For this, you must use the import option available in the relaxation rules of the WAF profile. When you select this option, the appliance imports the specified relaxation rules bundled and restores it to the WAF profile of the selected appliance.

NOTE:

If you are going to import relaxation rules in a WAF profile, there are two types of action: Augment – This action ensures import is additive, thus not overriding any existing configuration. Overwrite – This action overwrites the existing configuration with configuration present in the compressed export bundle.”

Import archived relaxation rules file by using CLI

To import the relaxation rules, you must import the archive into the NetScaler appliance and then run the restore command to extract the configuration. The following set of CLI commands can be used for exporting, importing, and managing the configurations.

To import the archived file from the specific location and restore, at the command prompt, type:

```
import appfw archive <src> <name> [-comment <string>]
```

Where, “src”: Indicates the source of the tar archive file in the form, `<protocol>://<host>[:<port>][/<path>]` “name”: Indicates name of archive. “comment”: Comments associated with this archive.

```
restore appfw profile <archivename> [-relaxationRules] [-importProfileName <string>] [-matchUrlString <string>] [-replaceUrlString <string>] [-overwrite] [-augment]
```

Where, `archivename`: Indicates source for tar archive. This is a mandatory argument. “relaxationRules”: Option to import all appfw relaxation rules.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

`importProfileName`: Indicates profile name created or updated to associate the relaxation rules during restore operation. “matchUrlString”: Indicates action URL string to match in archived relaxation rules.

`replaceUrlString`: Indicates string to replace in action URL while restoring relaxation rules.

`overwrite`: Existing rules action to purge existing relaxation rules and replace during import.

`augment`: Existing rules action to augment relaxation rules during import.

Example: `import appfw archive local: dutA_test_pr.tgz demo` `restore appfw profile dutA_test_pr`

Export the archived file to the selected appliance by using the CLI

If you use CLI to export the appfw relaxation rules, you must archive the configuration and then export it. To archive and export the archived file, at the command prompt, type:

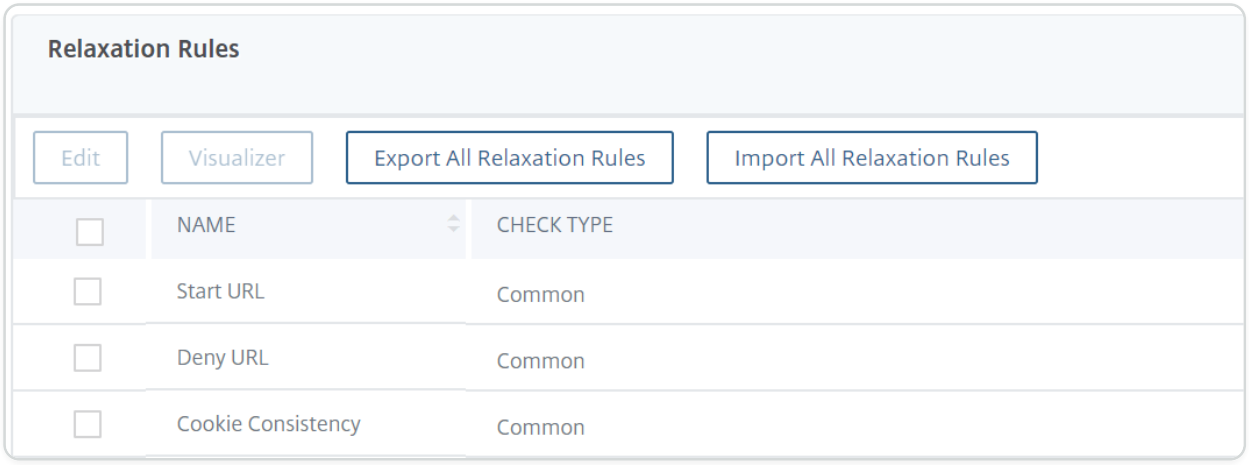
```
archive appfw profile <name> <archivename> [-comment <string>]
```

Where, `archive name`: Indicates source for tar archive. This is a mandatory argument. `name`: Indicates the appfw profile name containing the relaxation rules to export

```
export appfw archive <name> <target>
```

Where, Name. Name of tar archive. This is a mandatory argument. Maximum Length: 31 Target. Path to the file to be exported. This is a mandatory argument. Maximum Length: 2047

Example: `> archive appfw profile test_pr archived_test_pr`



```
> export appfw archive archived_test_pr local:dutA_test_pr
```

To export relaxation rules by using NetScaler GUI

Follow the steps given below to export relaxation rules:

1. Navigate to **Security** > **NetScaler Web App Firewall**.
2. In the details page, click **NetScaler Web App Firewall Profiles** link under **Configuration Summary** section.
3. In the **NetScaler Web App Firewall Profile** page, click the **Relaxation Rules** link under **Advanced Settings** section.
4. In the **Relaxation Rules** section, click **Export All Relaxation Rules**. The action applies to all security checks and on the ones which dynamic learning is enabled on that profile.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To import relaxation rules by using NetScaler GUI

Complete the steps to import relaxation rules:

1. Navigate to **Security** > **NetScaler Web App Firewall**.
2. In the details page, click the **NetScaler Web App Firewall Profiles** link under **Configuration Summary** section.
3. In the **NetScaler Web App Firewall Profile** page, click the **Relaxation Rules** link under **Advanced Settings** section.
4. In the **Relaxation Rules** section, click **Import All Relaxation Rules**.
5. In the **Configure NetScaler Web App Firewall Profile** page, set the following parameters:
    a. Local file. Name of the compressed archived file containing the relaxation rules.
    b. Profile Name. Name of the profile to which the relaxation rules are bound.
    c. Matching URL String. Portion of the URL that matches.
    d. Replace URL String. Portion of the URL that replaces the URL string.
    e. Existing Rule Action. Select if the rule must overwrite existing rules or augment the existing rules.
6. Click **OK**.

Supplemental Information about profiles

Following is supplemental information about particular aspects of Web App Firewall profiles. This information explains how to include special characters in a security check rule or relaxation, and how to use variables when configuring profiles.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configuration variable support

Instead of using static values, to configure the Web App Firewall's security checks and settings, you can now use standard NetScaler named variables. By creating variables, you can more easily export and then import configurations to new NetScaler appliances, or update existing NetScaler appliances from a single set of configuration files. This simplifies updates when you use a test bed setup to develop a complex Web App Firewall configuration that is tuned for your local network and servers and then transfer that configuration to your production NetScaler appliances.

You create Web App Firewall configuration variables in the same manner as you do any other NetScaler named variables, following standard NetScaler conventions. You can create a named expression variable using the NetScaler command line or GUI.

The following URLs and expressions can be configured with variables instead of static values:

- **Start URL** (-starturl)
- **Deny URL** (-denyurl)
- **Form Action URL** for *Form Field Consistency Check* (-fieldconsistency)
- **Action URL** for *XML SQL Injection Check* (-xmlSQLInjection)
- **Action URL** for *XML Cross-Site Scripting Check* (-xmlcross-site scripting)
- **Form Action URL** for *HTML SQL Injection Check* (-sqlInjection)
- **Form Action URL** for *Field Format Check* (-fieldFormat)
- **Form Origin URL** and **Form Action URL** for *Cross-Site Request Forgery (CSRF) Check* (-csrfTag)
- **Form Action URL** for *HTML Cross-Site Scripting Check* (-crossSiteScripting)
- **Safe Object** (-safeObject)
- **Action URL** for *XML Denial-of-Service (XDoS) check* (-XMLDoS)
- **URL** for *Web Services Interoperability check* (-XMLWSIURL)
- <**URL** for *XML Validation check* (-XMLValidationURL)
- **URL** for *XML Attachment check* (-XMLAttachmentURL)

For more information, see Policies and Expressions.

To use a variable in the configuration, you enclose the variable name between two at (@) symbols and then use it exactly as you would the static value that it replaces. For example, if you are configuring the Deny URL check by using the GUI and want to add the named expression variable myDenyURL to the configuration, you would type @myDenyURL@ into the Add Deny URL dialog

© 1997–2026 Citrix Systems, Inc. All rights reserved.

box, Deny URL text area. To do the same task by using the NetScaler command line, you would type add appfw profile `<name>` -denyURLAction @myDenyURL@.

PCRE character encoding format

The NetScaler operating system supports direct entry of characters in the printable ASCII character set only—characters with hexadecimal codes between HEX 20 (ASCII 32) and HEX 7E (ASCII 127). To include a character with a code outside that range in your Web App Firewall configuration, you must enter its UTF-8 hexadecimal code as a PCRE regular expression.

A number of character types require encoding using a PCRE regular expression if you include them in your Web App Firewall configuration as a URL, form field name, or Safe Object expression. They include:

- **Upper-ASCII characters.** Characters with encodings from HEX 7F (ASCII 128) to HEX FF (ASCII 255). Depending on the character map used, these encodings can refer to control codes, ASCII characters with accents or other modifications, non-Latin alphabet characters, and symbols not included in the basic ASCII set. These characters can appear in URLs, form field names, and safe object expressions.
- **Double-Byte characters.** Characters with encodings that use two 8-byte words. Double-byte characters are used primarily for representing Chinese, Japanese, and Korean text in electronic format. These characters can appear in URLs, form field names, and safe object expressions.
- **ASCII control characters.** Non-printable characters used to send commands to a printer. All ASCII characters with hexadecimal codes less than HEX 20 (ASCII 32) fall into this category. These characters must never appear in a URL or form field name, however, and would rarely if ever appear in a safe object expression.

The NetScaler appliance does not support the entire UTF-8 character set, but only the characters found in the following eight charsets:

- **English US (ISO-8859-1).** Although the label reads, “English US,” the Web App Firewall supports all characters in the ISO-8859-1 character set, also called the Latin-1 character set. This character set fully represents most modern western European languages and represents all but a few uncommon characters in the rest.
- **Chinese Traditional (Big5).** The Web App Firewall supports all characters in the BIG5 character set, which includes all of the Traditional Chinese characters (ideographs) commonly used in modern Chinese as spoken and written in Hong Kong, Macau, Taiwan, and by many people of Chinese ethnic heritage who live outside of mainland China.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Chinese Simplified (GB2312).** The Web App Firewall supports all characters in the GB2312 character set, which includes all of the Simplified Chinese characters (ideographs) commonly used in modern Chinese as spoken and written in mainland China.
- **Japanese (SJIS).** The Web App Firewall supports all characters in the Shift-JIS (SJIS) character set, which includes most characters (ideographs) commonly used in modern Japanese.
- **Japanese (EUC-JP).** The Web App Firewall supports all characters in the EUC-JP character set, which includes all characters (ideographs) commonly used in modern Japanese.
- **Korean (EUC-KR).** The Web App Firewall supports all characters in the EUC-KR character set, which includes all characters (ideographs) commonly used in modern Korean.
- **Turkish (ISO-8859-9).** The Web App Firewall supports all characters in the ISO-8859-9 character set, which includes all letters used in modern Turkish.
- **Unicode (UTF-8).** The Web App Firewall supports certain additional characters in the UTF-8 character set, including those used in modern Russian.

When configuring the Web App Firewall, you enter all non-ASCII characters as PCRE-format regular expressions using the hexadecimal code assigned to that character in the UTF-8 specification. Symbols and characters within the normal ASCII character set, which are assigned single, two-digit codes in that character set, are assigned the same codes in the UTF-8 character set. For example, the exclamation point (!), which is assigned hex code 21 in the ASCII character set, is also hex 21 in the UTF-8 character set. Symbols and characters from another supported character set have a paired set of hexadecimal codes assigned to them in the UTF-8 character set. For example, the letter a with an acute accent (á) is assigned UTF-8 code C3 A1.

The syntax you use to represent these UTF-8 codes in the Web App Firewall configuration is “xNN” for ASCII characters; “\xNN\xNN” for non-ASCII characters used in English, Russian, and Turkish; and “\xNN\xNN\xNN” for characters used in Chinese, Japanese, and Korean. For example, if you want to represent a ! in an Web App Firewall regular expression as a UTF-8 character, you would type \x21. If you want to include an á, you would type \xC3\xA1.

NOTE:

Normally you do not need to represent ASCII characters in UTF-8 format, but when those characters might confuse a web browser or an underlying operating system, you can use the character’s UTF-8 representation to avoid this confusion. For example, if a URL contains a space, you might want to encode the space as x20 to avoid confusing certain browsers and web server software.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Below are examples of URLs, form field names, and safe object expressions that contain non-ASCII characters that must be entered as PCRE-format regular expressions to be included in the Web App Firewall configuration. Each example shows the actual URL, field name, or expression string first, followed by a PCRE-format regular expression for it.

- A URL containing extended ASCII characters.

  Actual URL: `http://www.josénuñez.com`

  Encoded URL: `\^http://www[.]jos\xC3\xA9nu\xC3\xB1ez[.]com$`

- Another URL containing extended ASCII characters.

  Actual URL: `http://www.example.de/trömso.html`

  Encoded URL: `\^http://www[.]example[.]de/tr\xC3\xB6mso[.]html$`

- A form field name containing extended ASCII characters.

  `Actual Name: nome_do_usuário`

  Encoded Name: `\^nome_do_usu\xC3\xA1rio$`

- A safe object expression containing extended ASCII characters.

  Unencoded Expression `[A-Z]{3,6}¥[1-9][0-9]{6,6}`

  Encoded Expression: `[A-Z]{3,6}\xC2\xA5[1-9][0-9]{6,6}`

You can find a number of tables that include the entire Unicode character set and matching UTF-8 encodings on the Internet. A useful website that contains this information is located at the following URL:

`http://www.utf8-chartable.de/unicode-utf8-table.pl`

For the characters in the table on this website to display correctly, you must have an appropriate Unicode font installed on your computer. If you do not, the visual display of the character may be in error. Even if you do not have an appropriate font installed to display a character, however, the description and the UTF-8 and UTF-16 codes on this set of web pages will be correct.

Inverted PCRE Expressions

In addition to matching content that contains a pattern, you can match content that does not contain a pattern by using an inverted PCRE expression. To invert an expression, you simply include an exclamation point (\!) followed by white space as the first character in the expression.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE:

If an expression consists only of an exclamation point with nothing following, the exclamation point is treated as a literal character, not syntax indicating an inverted expression.

The following Web App Firewall commands support inverted PCRE expressions:

- Start URL (URL)
- Deny URL (URL)
- Form Field Consistency (form action URL)
- Cookie Consistency (form action URL)
- Cross Site Request Forgery (CSRF) (form action URL)
- HTML Cross-site Scripting (form action URL)
- Field Format (form action URL)
- Field Type (type)
- Confidential Field (URL)

Note: If the security check contains an isRegex flag or check box, it must be set to YES or checked to enable regular expressions in the field. Otherwise the contents of that field are treated as literal and no regular expressions (inverted or not) are parsed.

Disallowed Names for Web App Firewall Profiles

The following names are assigned to built-in actions and profiles on the NetScaler appliance, and cannot be used as names for a user-created Web App Firewall profile.

- AGRESSIVE
- ALLOW
- BASIC
- CLIENTAUTH
- COMPRESS
- CSSMINIFY
- DEFLATE
- DENY
- DNS-NOP
- DROP

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Custom error status and message for HTML, XML, and JSON error object

When the NetScaler Web App Firewall detects a violation, the appliance handles the error scenario using either a redirect URL or the error object (imported into the profile and enabled). If the scenario is handled using an error object configuration, the WAF profile provides a custom response status code and message. You can customize the response error details for an HTML, XML, or JSON error object in the WAF profile.

NOTE:

By default, the error code and error message are set as “200” and “OK” if error object settings are configured.

When handling error scenarios, it is important for the appliance to respond with appropriate HTTP response status code and message for resolving issues. By providing a custom error status message and custom error status code, the appliance can provide better user intervention to resolve a problem when a violation occurs. For example, if you set the response error code to “404” and the status message to “Not Found”, the user can inspect the response status code and message to check if a violation has occurred. This can help the user to filter responses that contain the error object

Configure custom status code and message for HTML error object in a WAF profile by using the CLI

At the command prompt, type:

```
set appfw profile <profile-name> -HTMLErrorStatusCode <value>
-HTMLErrorStatusMessage <value> -useHTMLErrorObject ON
```

Example:

```
set appfw profile profile_1 -HTMLErrorStatusCode 404 -HTMLErrorStatusMessage
“Not Found” -useHTMLErrorObject ON
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure custom status code and message for XML error object in a WAF profile by using the CLI

At the command prompt, type:

```
set appfw profile <profile-name> -XMLErrorStatusCode <value>
-XMLErrorStatusMessage <value>
```

Example:

```
set appfw profile profile_1 -XMLErrorStatusCode 406 - XMLErrorStatusMessage “Not Acceptable”
```

Configure custom status code and message for JSON error object in a WAF profile by using the CLI

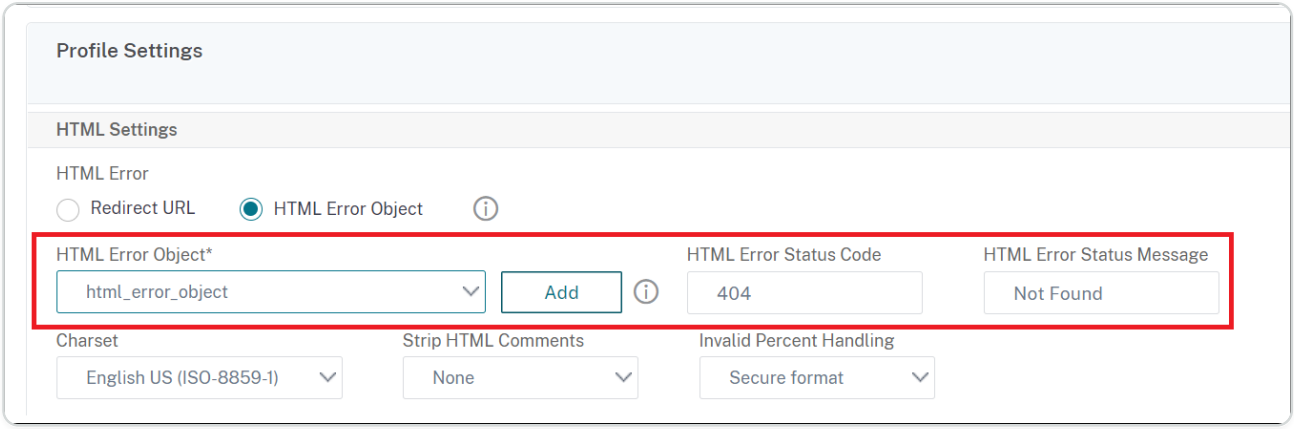
At the command prompt, type:

```
set appfw profile <profile-name> -JSONErrorStatusCode <value>
-JSONErrorStatusMessage <value>
```

Example:

```
set appfw profile profile_1 -JSONErrorStatusCode 500 - JSONErrorStatusMessage “Internal Server Error”
```

Configure custom status code and message for HTML, JSON, or XML error object in a WAF profile by using the GUI



1. Navigate to **Security > NetScaler Web App Firewall > Profiles**.
2. In the details pane, click **Edit**.
3. In the **Create Web App Firewall Profile** page, click **Profile Settings** from the **Advanced Settings** section.
4. In the **Profile settings** section, set the following parameters.

   a. HTML Error Object. Select the option for handing error scenarios using an HTML error object. Import the error object from a URL, file, or text. b. HTML Error Status Code. Provide a custom error status code. c. HTML Error Status Message. Provide a customer error message.
5. Click **OK** and **Done**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE:

The same procedure is applicable for JSON and XML custom error object settings.

Policy labels

A policy label consists of a set of policies, other policy labels, and virtual server-specific policy banks. The Web App Firewall evaluates each policy bound to the policy label in order of priority. If the policy matches, it filters the connection as specified in the associated profile. Then it does whatever the Goto parameter specifies, which can be to terminate policy evaluation, go to the next policy, or go to the policy with the specified priority. If the Invoke parameter is set, it terminates processing of the current policy label and begins to process the specified policy label or virtual server.

To create an Web App Firewall policy label by using the command line

At the command prompt, type the following commands:

- `add appfw policylabel <labelName> http_req`
- `save ns config`

Example

The following example creates a policy label named policylbl1.

```
add appfw policylabel policylbl1 http_req

save ns config
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To bind a policy to a policy label by using the command line

At the command prompt, type the following commands:

- `bind appfw policylabel <labelName> <policyName> <priority> [<gotoPriorityExpression>] [-invoke (<labelType> <labelName>) ]`
- `save ns config`

Example

The following example binds the policy1 to the policy label policylbl1 with a priority of 1.

```
bind appfw policylabel policylbl1 policy1 1

save ns config
```

To configure an Web App Firewall policy label by using the GUI

1. Navigate to **Security > NetScaler Web App Firewall > Policy Labels**.
2. In the details pane, do one of the following:
   - To add a new policy label, click **Add**.
   - To configure an existing policy label, select the policy label and the click **Open**.

   The **Create Web App Firewall Policy Label** or the **Configure Web App Firewall Policy Label** dialog box opens. The dialog boxes are nearly identical.
3. If you are creating a new policy label, in the Create Web App Firewall Policy Label dialog box, type a name for your new policy label.

   The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 127 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore (_) symbols.
4. Select **Insert Policy** to insert a new row and display a drop-down list with all existing Web App Firewall policies.
5. Select the policy you want to bind to the policy label, or select New Policy to create a new policy and follow the instructions in To create and configure a policy by using the GUI. The policy that you selected or created is inserted into the list of globally bound Web App Firewall policies.
6. Make any additional adjustments.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- To modify the policy priority, click the field to enable it, and then type a new priority. You can also select Regenerate Priorities to renumber the priorities evenly.
- To modify the policy expression, double click that field to open the Configure Web App Firewall Policy dialog box, where you can edit the policy expression.
- To set the Goto Expression, double click field in the Goto Expression column heading to display the drop-down list, where you can choose an expression.
- To set the Invoke option, double click field in the Invoke column heading to display the drop-down list, where you can choose an expression

7. Repeat steps 5 through 7 to bind any additional Web App Firewall policies you want to the policy label.
8. Click **Create** or **OK**, and then click **Close**. A message appears in the status bar, stating that you have successfully created or modified the policy label.

Policies

The Web App Firewall uses two types of policies: firewall policies and auditing policies. Firewall policies control which traffic is sent to the Web App Firewall. Auditing policies control the log server to which Web App Firewall logs are sent.

Firewall policies can be complex because the policy rule can consist of multiple expressions in the NetScaler expressions language, which is a full-fledged object oriented programming language capable of defining with extreme precision exactly which connections to filter. Because firewall policies operate within the context of the Web App Firewall, they must meet certain criteria that are connected to how the Web App Firewall functions and what traffic is appropriately filtered by it. As long as you keep these criteria in mind, however, firewall policies are similar to policies for other NetScaler features. The instructions here do not attempt to cover all aspects of writing firewall policies, but only provide an introduction to policies and cover those criteria that are unique to the Web App Firewall.

Auditing policies are simple because the policy rule is always ns_true. You need only specify the log server that you want to send logs to, the logging levels that you want to use, and a few other criteria that are explained in detail.

Web App Firewall Policies

A firewall policy is a rule associated with a profile. The rule is an expression or group of expressions that define the types of request/response pairs that the Web App Firewall is to filter by applying the profile. Firewall policy expressions are written in the NetScaler expressions language,

© 1997–2026 Citrix Systems, Inc. All rights reserved.

an object-oriented programming language with special features to support specific NetScaler functions. The profile is the set of actions that the Web App Firewall is to use to filter request/response pairs that match the rule.

Firewall policies enable you to assign different filtering rules to different types of web content. Not all web content is alike. A simple website that uses no complex scripting and accesses and handles no private data might require only the level of protection provided by a profile created with basic defaults. Web content that contains JavaScript-enhanced web forms or accesses an SQL database probably requires more tailored protection. You can create a different profile to filter that content and create a separate firewall policy that can determine which requests are attempting to access that content. You then associate the policy expression with a profile you created and globally bind the policy to put it into effect.

The Web App Firewall processes only HTTP connections, and therefore uses a subset of the overall NetScaler expressions language. The information here is limited to topics and examples that are likely to be useful when configuring the Web App Firewall. Following are links to additional information and procedures for firewall policies:

- For procedures that explain how to create and configure a policy, see Creating and Configuring Web App Firewall Policies.
- For a procedure that explains in detail how to create a policy rule (expression), see To create or configure an Web App Firewall rule (expression).
- For a procedure that explains how to use the Add Expression dialog box to create a policy rule, see To add a firewall rule (expression) by using the Add Expression dialog box.
- For a procedure that explains how to view the current bindings for a policy, see Viewing a Firewall Policy's Bindings.
- For procedures that explain how to bind an Web App Firewall policy, see Binding Web App Firewall Policies.
- For detailed information about the NetScaler expressions language, see Policies and Expressions.

NOTE

Web App Firewall evaluates the policies based on the configured priority and goto expressions. At the end of the policy evaluation, the last policy that evaluates to true is used and the security configuration of the corresponding profile is invoked for processing the request.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

For example, Consider a scenario where there are 2 policies.

- Policy_1 is a generic policy with Expression=true and has a corresponding profile_1 which is a basic profile. The priority is set to 100.
- Policy_2 is more specific with Expression=HTTP.REQ.URL.CONTAINS(“XYZ”) and has a corresponding profile_2 which is an advance profile. The GoTo Expression is set to NEXT and the priority is set to 95 which is a higher priority compared to Policy_1.

In this scenario, if the target string "XYZ" is detected in the URL of the processed request, Policy_2 match is triggered as it has a higher priority even though Policy_1 is also a match. However, as per the GoTo expression configuration of Policy_2, the policy evaluation continues and the next policy_1 is also processed. At the end of the policy evaluation, Policy_1 evaluates as true and the basic security checks configured in Profile_1 are invoked.

> If the Policy_2 is modified and the GoTo Expression is changed from **NEXT** to **END**, the processed request that has the target string "XYZ", triggers the Policy_2 match due to priority consideration and as per the GoTo expression configuration, the policy evaluation ends at this point. Policy_2 evaluates as true and the advanced security checks configured in Profile_2 are invoked.

NEXT END

Policy evaluation is completed in one pass. Once the policy evaluation is completed for the request and the corresponding profile actions are invoked, the request does not go through another round of policy evaluation.

Creating and configuring Web App Firewall policies

A firewall policy consists of two elements: a *rule*, and an associated *profile*. The rule selects the HTTP traffic that matches the criteria that you set, and sends that traffic to the Web App Firewall for filtering. The profile contains the filtering criteria that the Web App Firewall uses.

The policy rule consists of one or more expressions in the NetScaler expressions language. The NetScaler expressions syntax is a powerful, object-oriented programming language that enables you to precisely designate the traffic that you want to process with a specific profile. For users who are not familiar with the NetScaler expressions language syntax, or who prefer to configure their NetScaler appliance by using a web-based interface, the GUI provides two tools: the **Prefix** menu and the **Add Expression** dialog box. Both help you to write expressions that select exactly the traffic that you want to process. Experienced users who are thoroughly familiar with the syntax may prefer to use the NetScaler command line to configure their NetScaler appliances.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE:

In addition to the default expressions syntax, for backward compatibility the NetScaler operating system supports the NetScaler classic expressions syntax on NetScaler Classic and nCore appliances and virtual appliances. Classic expressions are not supported on NetScaler Cluster appliances and virtual appliances. Current NetScaler users who want to migrate existing configurations to the NetScaler Cluster must migrate any policies that contain classic expressions to the default expressions syntax.

For detailed information about the NetScaler expressions languages, see Policies and Expressions.

You can create a firewall policy by using the GUI or the NetScaler command line.

To create and configure a policy by using the command line interface

At the command prompt, type the following commands:

- `add appfw policy <name><rule> <profileName>`
- `save ns config`

EXAMPLE

The following example adds a policy named pl-blog, with a rule that intercepts all traffic to or from the host blog.example.com, and associates that policy with the profile pr-blog. This is an appropriate policy to protect a blog hosted on a specific host name.

```
add appfw policy pl-blog "HTTP.REQ.HOSTNAME.DOMAIN.EQ("blog.example.com")"
pr-blog
```

To create and configure a policy by using the GUI

1. Navigate to **Security** > **Web App Firewall** > **Policies**.
2. In the details pane, do one of the following:
   - To create a firewall policy, click **Add**. The **Create Web App Firewall Policy** is displayed.
   - To edit an existing firewall policy, select the policy, and then click **Edit**.

   The **Create Web App Firewall Policy** or **Configure Web App Firewall Policy** is displayed.
3. If you are creating a firewall policy, in the **Create Web App Firewall Policy** dialog box, Policy Name text box, type a name for your new policy.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 128 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore (_) symbols.

If you are configuring an existing firewall policy, this field is read-only. You cannot modify it.

4. Select the profile that you want to associate with this policy from the Profile drop-down list. You can create a profile to associate with your policy by clicking New, and you can modify an existing profile by clicking Modify.
5. In the Expression text area, create a rule for your policy.
   - You can type a rule directly into the text area.
   - You can click Prefix to select the first term for your rule, and follow the prompts.
   - You can click Add to open the Add Expression dialog box, and use it to construct the rule.
6. Click **Create** or **OK**, and then click **Close**.

To create or configure a Web App Firewall rule (expression)

The policy rule, also called the *expression*, defines the web traffic that the Web App Firewall filters by using the profile associated with the policy. Like other NetScaler policy rules (or *expressions*), the Web App Firewall rules use NetScaler expressions syntax. This syntax is powerful, flexible, and extensible. It is too complex to describe completely in this set of instructions. You can use the following procedure to create a simple firewall policy rule, or you can read it as an overview of the policy creation process.

1. If you have not already done so, navigate to the appropriate location in the **Web App Firewall** wizard or the NetScaler GUI to create your policy rule:
   - If you are configuring a policy in the **Web App Firewall** wizard, in the navigation pane, click **Web App Firewall**, then in the details pane click **Web App Firewall Wizard**, and then navigate to the **Specify Rule** screen.
   - If you are configuring a policy manually, in the navigation pane, expand **Web App Firewall**, then **Policies**, and then **Firewall**. In the details pane, to create a policy, click **Add**. To modify an existing policy, select the policy, and then click **Open**.
2. On the **Specify Rule** screen, the **Create Web App Firewall Profile** dialog box, or the **Configure Web App Firewall Profile** dialog box, click **Prefix**, and then choose the prefix for your expression from the drop-down list. Your choices are:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **HTTP.** Choose an HTTP protocol if you want to examine some aspect of the request that pertains to the protocol.
- **SYS.** Choose protected websites if you want to examine some aspect of the request that pertains to the recipient of the request.
- **CLIENT.** Choose a client that sent the request. Choose this if you want to examine some aspect of the sender of the request.
- **SERVER.** Choose a client to which the request was sent and if you want to examine some aspect of the recipient of the request.

After you choose a prefix, the Web App Firewall displays a two-part prompt window that displays the possible next choices at the top, and a brief explanation of what the selected choice means at the bottom.

3. Choose your next term.

   If you chose the HTTP protocol as your prefix, your only choice is REQ, which specifies the Request/Response pair. (The Web App Firewall operates on the request and response as a unit instead of on each separately.) If you chose another prefix, your choices are more varied. For help on a specific choice, click that choice once to display information about it in the lower prompt window.

   When you have decided which term you want, double-click it to insert it into the **Expression** window.

4. Type a period after the term you just chose. You are then prompted to choose your next term, as described in the previous step. When a term requires that you type a value, fill in the appropriate value. For example, if you choose HTTP.REQ.HEADER(""), type the header name between the quotation marks.
5. Continue choosing terms from the prompts and filling in any values that are needed, until your expression is finished.

   Following are some examples of expressions for specific purposes.

   - **Specific web host.** To match traffic from a particular web host:

     ```
     HTTP.REQ.HEADER("Host").EQ("shopping.example.com")
     ```

     For `shopping.example.com`, substitute the name of the web host that you want to match.

   - **Specific web folder or directory.** To match traffic from a particular folder or directory on a Web host:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
HTTP.REQ.URL.STARTSWITH("https//www.example.com/folder")
```

For www.example.com, substitute the name of the web host. For the folder, substitute the folder or path to the content that you want to match. For example, if your shopping cart is in a folder called /solutions/orders, you substitute that string for folder.

- **Specific type of content: GIF images.** To match GIF format images:

```
HTTP.REQ.URL.ENDSWITH(".gif")
```

To match other format images, substitute another string in place of .gif.

- **Specific type of content: scripts.** To match all CGI scripts located in the CGI-BIN directory:

```
HTTP.REQ.URL.STARTSWITH("https//www.example.com/CGI-BIN")
```

To match all JavaScript with .js extensions:

```
HTTP.REQ.URL.ENDSWITH(".js")
```

For more information about creating policy expressions, see Policies and Expressions.

NOTE:

If you use the command line to configure a policy, remember to escape any double quotation marks within NetScaler expressions. For example, the following expression is correct if entered in the GUI:

```
HTTP.REQ.HEADER("Host").EQ("shopping.example.com")
```

If entered at the command line, however, you must type the following command instead:

```
HTTP.REQ.HEADER("Host").EQ("shopping.example.com")
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To add a firewall rule (expression) by using the Add Expression dialog box

The **Add Expression** dialog box (also referred to as the Expression Editor) helps users who are not familiar with the NetScaler expressions language to construct a policy that matches the traffic that they want to filter.

1. If you have not already done so, navigate to the appropriate location in the **Web App Firewall** wizard or the NetScaler GUI:
    - If you are configuring a policy in the **Web App Firewall** wizard, in the navigation pane, click **Web App Firewall**, then in the details pane click **Web App Firewall Wizard**, and then navigate to the **Specify Rule** screen.
    - If you are configuring a policy manually, in the navigation pane, expand **Web App Firewall**, then **Policies**, and then **Firewall**. In the details pane, to create a policy, click **Add**. To modify an existing policy, select the policy, and then click **Open**.
2. On the **Specify Rule** screen, in the **Create Web App Firewall Profile** dialog box, or in the **Configure Web App Firewall Profile** dialog box, click **Add**.
3. In the **Add Expression dialog** box, in the Construct Expression area, in the first list box, choose one of the following prefixes:
    - **HTTP.** Choose HTTP protocol if you want to examine some aspect of the request that pertains to the HTTP protocol. The default choice.
    - **SYS.** Choose protected websites if you want to examine some aspect of the request that pertains to the recipient of the request.
    - **CLIENT.** Choose the computer that sent the request if you want to examine some aspect of the sender of the request.
    - **SERVER.** Choose the computer to which the request was sent and to examine some aspect of the recipient of the request.
4. In the second list box, choose your next term. The available terms differ depending on the choice you made in the previous step, because the dialog box automatically adjusts the list to contain only those terms that are valid for the context. For example, if you selected HTTP in the previous list box, the only choice is REQ, for requests. Because the Web App Firewall treats requests and associated responses as a single unit and filters both, you do not need to specific responses separately. After you choose your second term, a third list box appears to the right of the second. The Help window displays a description of the second term, and the **Preview Expression** window displays your expression.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

5. In the third list box, choose the next term. A new list box appears to the right, and the Help window changes to display a description of the new term. The **Preview Expression** window updates to display the expression as you have specified it to that point.
6. Continue choosing terms, and when prompted filling in arguments, until your expression is complete. If you make a mistake or want to change your expression after you have already selected a term, you can simply choose another term. The expression is modified, and any arguments or more terms that you added after the term that you modified are cleared.
7. When you have finished constructing your expression, click **OK** to close the **Add Expression** dialog box. Your expression is inserted into the **Expression** text area.

Binding Web App Firewall policies

After you have configured your Web App Firewall policies, you bind them to Global or a bind point to put them into effect. After binding, any request or response that matches an Web App Firewall policy is transformed by the profile associated with that policy.

When you bind a policy, you assign a priority to it. The priority determines the order in which the policies you define are evaluated. You can set the priority to any positive integer. In the NetScaler OS, policy priorities work in reverse order - the higher the number, the lower the priority.

Because the Web App Firewall feature implements only the first policy that a request matches, not any additional policies that it might also match, policy priority is important for achieving the results that you intend. If you give your first policy a low priority (such as 1000), you configure the Web App Firewall to perform it only if other policies with a higher priority do not match a request. If you give your first policy a high priority (such as 1), you configure the Web App Firewall to perform it first, and skip any other policies that might also match. You can leave yourself plenty of room to add other policies in any order, without having to reassign priorities, by setting priorities with intervals of 50 or 100 between each policy when you bind your policies.

For more information about binding policies on the NetScaler appliance, see "Policies and Expressions."

To bind an Web App Firewall policy by using the command line interface

At the command prompt, type the following commands:

- `bind appfw global <policyName>`
- `bind appfw profile <profile_name> -crossSiteScripting data`

EXAMPLE

The following example binds the policy named pl-blog and assigns it a priority of 10.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
bind appfw global pl-blog 10

save ns config
```

Configure log expressions

The log expression support for binding Web App Firewall is added to log HTTP header information when a violations occurs.

Log expression is binded at the Application profile, and binding contains the expression that needs to be evaluated and sent to logging frameworks when violation occurs.

The Web App Firewall violation log record with http header information is recorded. You can specify a custom log expression and it helps in analysis and diagnosis when violations are generated for the current flow (request/response).

EXAMPLE CONFIGURATION

```
bind appfw profile <profile> -logexpression <string> <expression>

add policy expression headers "\" HEADERS(100):\"+HTTP.REQ.FULL_HEADER"

add policy expression body_100 "\"BODY:\"+HTTP.REQ.BODY(100)"

bind appfw profile test -logExpression log_body body_100

bind appfw profile test -logExpression log_headers  headers

bind appfw profile test -logExpression "\"URL:\"+HTTP.REQ.URL+\" IP:
\"+CLIENT.IP.SRC"
```

NOTE

1. Only auditlog support is available. Support for logstream and visibility in security insight would be added in future release versions.
2. If auditlogs are generated, then only 1024 bytes of data can be generated per log message.
3. If log streaming is used, then the limits are based on maximum supported size of log stream/ipfix protocol size limitations. Maximum support size for log stream is larger than 1024 bytes.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To bind an Web App Firewall policy by using the GUI

1. Do one of the following:
   - Navigate to **Security** > **Web App Firewall**, and in the details pane, click Web App Firewall policy manager.
   - Navigate to **Security** > **Web App Firewall** > **Policies** > **Firewall Policies**, and in the details pane, click **Policy Manager**.
2. In the **Web App Firewall Policy Manager** dialog, choose the bind point to which you want to bind the policy from the drop-down list. The choices are:
   - **Override Global.** Policies that are bound to this bind point process all traffic from all interfaces on the NetScaler appliance, and are applied before any other policies.
   - **LB Virtual Server.** Policies that are bound to a load balancing virtual server are applied only to traffic that is processed by that load balancing virtual server, and are applied before any Default Global policies. After selecting LB Virtual Server, you must also select the specific load balancing virtual server to which you want to bind this policy.
   - **CS Virtual Server.** Policies that are bound to a content switching virtual server are applied only to traffic that is processed by that content switching virtual server, and are applied before any Default Global policies. After selecting CS Virtual Server, you must also select the specific content switching virtual server to which you want to bind this policy.
   - **Default Global.** Policies that are bound to this bind point process all traffic from all interfaces on the NetScaler appliance.
   - **Policy Label.** Policies that are bound to a policy label process traffic that the policy label routes to them. The policy label controls the order in which policies are applied to this traffic.
   - **None.** Do not bind the policy to any bind point.
3. Click **Continue**. A list of existing Web App Firewall policies appears.
4. Select the policy you want to bind by clicking it.
5. Make any additional adjustments to the binding.
   - To modify the policy priority, click the field to enable it, and then type a new priority. You can also select Regenerate Priorities to renumber the priorities evenly.
   - To modify the policy expression, double click that field to open the **Configure Web App Firewall Policy** dialog box, where you can edit the policy expression.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- To set the Goto Expression, double click **field** in the Goto Expression column heading to display the drop-down list, where you can choose an expression.
- To set the Invoke option, double click field in the Invoke column heading to display the drop-down list, where you can choose an expression

6. Repeat steps 3 through 6 to add any additional Web App Firewall policies you want to globally bind.
7. Click **OK**. A message appears in the status bar, stating that the policy has been successfully bound.

Viewing a policy bindings

You can quickly check to determine what bindings are in place for any firewall policy by viewing the bindings in the GUI.

To view bindings for an Web App Firewall policy

1. Navigate to **Security > NetScaler Web App Firewall > Policies > Firewall Policies**
2. In the details pane, select the policy that you want to check, and then click Show Bindings. The Binding Details for Policy: Policy message box is displayed, with a list of bindings for the selected policy.
3. Click **Close**.

Supplemental information about Web App Firewall policies

Following is supplemental information about particular aspects of Web App Firewall policies that system administrators who manage the Web App Firewall might need to know.

Correct but unexpected behavior

Web application security and modern websites are complex. In a number of scenarios, a NetScaler policy might cause the Web App Firewall to behave differently in certain situations than a user who is familiar with policies would normally expect. Following are a number of cases where the Web App Firewall may behave in an unexpected fashion.

- **Request with a missing HTTP Host header and an absolute URL.** When a user sends a request, in the majority of cases the request URL is relative. That is, it takes as its starting point the Referer URL, the URL where the user's browser is located when it sends the request. If a request is sent without a Host header, and with a relative URL, the request is normally blocked both because it violates the HTTP specification and because a request that fails to specify the host can under some circumstances constitute an attack. If a request is sent with an absolute

© 1997–2026 Citrix Systems, Inc. All rights reserved.

URL, however, even if the host header is present, the Web App Firewall picks up the domain from the absolute URL and does an inspection.

Auditing policies

Auditing policies determine the messages generated and logged during a Web App Firewall session. The messages are logged in SYSLOG format to the local NSLOG server or to an external logging server. Different types of messages are logged based on the level of logging selected.

To create an auditing policy, you must first create either an NSLOG server or a SYSLOG server. And then you create the policy and specify log type and the server to which logs are sent.

To create an auditing server by using the command line interface

You can create two different types of auditing server: an NSLOG server or a SYSLOG server. The command names are different, but the parameters for the commands are the same.

To create an auditing server, at the command prompt, type the following commands:

- `add audit syslogAction <name> <serverIP> [-serverPort <port>] -logLevel <logLevel> ... [-dateFormat (MMDDYYYY | DDMMYYYY)] [-logFacility <logFacility>] [-tcp (NONE | ALL)] [-acl (ENABLED | DISABLED)] [-timeZone (GMT_TIME | LOCAL_TIME)] [-userDefinedAuditlog (YES | NO)] [-appflowExport (ENABLED | DISABLED)]`
- `save ns config`

Example

The following example creates a syslog server named syslog1 at IP 10.124.67.91, with log levels of emergency, critical, and warning, log facility set to LOCAL1, that logs all TCP connections:

```
add audit syslogAction syslog1 10.124.67.91 -logLevel emergency critical
warning -logFacility

LOCAL1 -tcp ALL

save ns config
```

To modify or remove an auditing server by using the command line interface

- To modify an auditing server, type the set audit `<type>` command, the name of the auditing server, and the parameters to be changed, with their new values.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- To remove an auditing server, type the rm audit `<type>` command and the name of the auditing server.

Example

The following example modifies the syslog server named syslog1 to add errors and alerts to the log level:

```
set audit syslogAction syslog1 10.124.67.91 -logLevel emergency critical
warning alert error

-logFacility LOCAL1 -tcp ALL

save ns config
```

To create or configure an auditing server by using the GUI

1. Navigate to **Security** > **NetScaler Web App Firewall** > **Policies** > **Auditing** > **Nslog**.
2. In the Nslog Auditing page, click **Servers** tab.
3. Do one of the following:
   - To add a new auditing server, click **Add**.
   - To modify an existing auditing server, select the server, and then click **Edit**.
4. In the **Create Auditing Server** page, set the following parameters:
   - Name
   - Server Type
   - IP Address
   - Port
   - Log Levels
   - Log Facility
   - Date Format
   - Time Zone
   - TCP Logging
   - ACL Logging
   - User Configurable Log Messages

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- AppFlow® Logging
- Large Scale NAT Logging
- ALG messages logging
- Subscriber logging
- SSL Interception
- URL Filtering
- Content Inspection Logging

5. Click **Create** and **Close**.

To create an auditing policy by using the command line interface

You can create an NSLOG policy or a SYSLOG policy. The type of policy must match the type of server. The command names for the two types of policy are different, but the parameters for the commands are the same.

At the command prompt, type the following commands:

- `add audit syslogPolicy <name> <-rule > <action>`
- `save ns config`

Example

The following example creates a policy named syslogP1 that logs Web App Firewall traffic to a syslog server named syslog1.

```
add audit syslogPolicy syslogP1 rule "ns_true" action syslog1
save ns config
```

To configure an auditing policy by using the command line interface

At the command prompt, type the following commands:

- `set audit syslogPolicy <name> [-rule <expression>] [-action <string>]`
- `save ns config`

Example

The following example modifies the policy named syslogP1 to log Web App Firewall traffic to a syslog server named syslog2.

```
set audit syslogPolicy syslogP1 rule "ns_true" action syslog2
save ns config
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To configure an auditing policy by using the GUI

1. Navigate to **Security** > **NetScaler Web App Firewall** > **Policies**.
2. In the details pane, click **Audit Nslog Policy**.
3. In the Nslog Auditing page, click **Policies** tab and do one of the following:
   - To add a new policy, click **Add**.
   - To modify an existing policy, select the policy, and then click **Edit**.
4. In the **Create Auditing Nslog Policy** page, set the following parameters:
   - Name
   - Auditing Type
   - Expression Type
   - Server
5. Click **Create**.

Imports

Several Web App Firewall features make use of external files that you upload to the Web App Firewall when configuring it. Using the GUI, you manage those files in the Imports pane, which has four tabs corresponding to the four types of files you can import: HTML error objects, XML error objects, XML schemas, and Web Services Description Language (WSDL) files. Using the NetScaler command line, you can import these types of files, but you cannot export them.

HTML error object

When a user's connection to an HTML or Web 2.0 page is blocked, or a user asks for a non-existent HTML or Web 2.0 page, the Web App Firewall sends an HTML-based error response to the user's browser. When configuring which error response the Web App Firewall must use, you have two choices:

- You can configure a redirect URL, which can be hosted on any Web server to which users also have access. For example, if you have a custom error page on your Web server, 404.html, you can configure the Web App Firewall to redirect users to that page when a connection is blocked.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- You can configure an HTML error object, which is an HTML-based Web page that is hosted on the Web App Firewall itself. If you choose this option, you must upload the HTML error object to the Web App Firewall. You do that in the Imports pane, on the HTML Error Object tab.

The error object must be a standard HTML file that contains no non-HTML syntax except for Web App Firewall error object customization variables. It cannot contain any CGI scripts, server-parsed code, or PHP code. The customization variables enable you to embed troubleshooting information in the error object that the user receives when a request is blocked. While most requests that the Web App Firewall blocks are illegitimate, even a properly configured Web App Firewall can occasionally block legitimate requests, especially when you first deploy it or after you make significant changes to your protected websites. By embedding information in the error page, you provide the user with the information that he or she needs to give to the technical support person so that any issues can be fixed.

The Web App Firewall error page customization variables are:

- ${NS_TRANSACTION_ID}. The transaction ID that the Web App Firewall assigned to this transaction.
- ${NS_APPFW_SESSION_ID}. The Web App Firewall session ID.
- ${NS_APPFW_VIOLATION_CATEGORY}. The specific Web App Firewall security check or rule that was violated.
- ${NS_APPFW_VIOLATION_LOG}. The detailed error message associated with the violation.
- ${COOKIE The contents of the specified cookie. For `<CookieName>`, substitute the name of the specific cookie that you want to display on the error page. If you have multiple cookies whose contents you want to display for troubleshooting, you can use multiple instances of this customization variable, each with the appropriate cookie name. **Note**: If you have blocking enabled for the Cookie Consistency Check, any blocked cookies are not displayed on the error page because the Web App Firewall blocks them.

To use these variables, you embed them in the HTML or XML of the error page object as if they were an ordinary text string. When the error object is displayed to the user, for each customization variable the Web App Firewall substitutes the information to which the variable refers. An example HTML error page that uses custom variables is shown below.

```
<!doctype html public "-//w3c//dtd html 4.0//en">  <html>  <head>
 <title>Page Not Accessible</title>  </head>  <body>  <h1>Page Not
Accessible</h1>  <p>The page that you accessed is not available. You
can:</p>  <ul>  <li>return to the <b><a href="[homePage]">home page</a></
b>, re-establish your session, and try again, or,</li>  <li>report this
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
incident to the help desk via <b><a href="mailto:
[helpDeskEmailAddress]">email</a></b> or by calling
[helpDeskPhoneNumber].</li>  </ul>  <p>If you contact the help desk,
please provide the following information:</p>  <table cellpadding=8
width=80%>  <tr><th align="right" width=30%>Transaction ID:</th><td
align="left" valign="top" width=70%>${NS_TRANSACTION_ID}</td></tr>
 <tr><th align="right" width=30%>Session ID:</th><td align="left"
valign="top" width=70%>${NS_APPFW_SESSION_ID}</td></tr>  <tr><th
align="right" width=30%>Violation Category:</th><td align="left"
valign="top" width=70%>${NS_APPFW_VIOLATION_CATEGORY}</td></tr>  <tr><th
align="right" width=30%>Violation Log:</th><td align="left" valign="top"
width=70%>${NS_APPFW_VIOLATION_LOG}</td></tr>  <tr><th align="right"
width=30%>Cookie Name:</th><td align="left" valign="top" width=70%>$
{COOKIE("[cookieName]")}</td></tr>  </table>  <body>  <html>
```

To use this error page, copy it into a text or HTML editor. Substitute the appropriate local information for the following variables, which are enclosed in square brackets to distinguish them from the NetScaler variables. (Leave those unchanged.):

- `[homePage]`. The URL for your website's home page.
- `[helpDeskEmailAddress]`. The email address that you want users to use to report blocking incidents.
- `[helpDeskPhoneNumber]`. The phone number that you want users to call to report blocking incidents.
- `[cookieName]`. The name of the cookie whose contents you want to display on the error page.

XML error object

When a user's connection to an XML page is blocked, or a user asks for a nonexistent XML application, the Web App Firewall sends an XML-based error response to the user's browser. You configure the error response by uploading an XML-based error page to the Web App Firewall in the Imports Pane, on the XML Error Object tab. All XML error responses are hosted on the Web App Firewall. You cannot configure a redirect URL for XML applications.

NOTE

. You can use the same customization variables in an XML error object as in an HTML error object.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

XML Schema

When the Web App Firewall performs a validation check on a user's request for an XML or Web 2.0 application, it can validate the request against the XML schema or design type document (DTD) for that application and reject any request that does not follow the schema or DTD. Both an XML schema and a DTD are standard XML configuration files that describe the structure of a specific type of XML document.

WSDL

When the Web App Firewall performs a validation check on a user's request for an XML SOAP-based web service, it can validate the request against the web services type definition (WSDL) file for that web service. A WSDL file is a standard XML SOAP configuration file that defines the elements of a specific XML SOAP web service.

Importing and exporting files

You can import HTML or XML error objects, XML schemas, DTDs, and WSDLs to the Web App Firewall by using the GUI or the command line. You can edit any of these files in a web-based text area after importing them, to make small changes directly on the NetScaler instead of having to make them on your computer and then reimport them. Finally, you can export any of these files to your computer, or delete any of these files, by using the GUI.

NOTE:

You cannot delete or export an imported file by using the command line.

To import a file by using the command line interface

At the command prompt, type the following commands:

- `import appfw htmlerrorpage <src> <name>`
- `<save> ns config`

Example

The following example imports an HTML error object from a file named error.html and assigns it the name HTMLError.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
import htmlerrorpage error.html HTMLError

save ns config
```

To import a file by using the GUI

Before you attempt to import an XML schema, DTD, or WSDL file, or an HTML or XML error object from a network location, verify that the NetScaler can connect to the Internet or LAN computer where the file is located. Otherwise, you cannot import the file or object.

1. Navigate to **Security > NetScaler Web App Firewall > Imports**.
2. Navigate to **Application Firewall** > **Imports**.
3. In the **Application Firewall Imports** pane, select the tab for the type of file you want to import, and then click **Add**.

   The tabs are HTML Error Page, XML Error Page, XML Schema or WSDL. The upload process is identical on all four tabs from the user point of view.
4. Fill in the dialog fields.

   - **Name**—A name for the imported object.
   - **Import From**—Choose the location of the HTML file, XML file, XML schema or WSDL that you want to import in the drop-down list:
     - **URL:** A web URL on a website accessible to the appliance.
     - **File:** A file on a local or networked hard disk or other storage device.
     - **Text:** Type or paste the text of the custom response directly into a text field in the GUI.

   The third text box changes to the appropriate value. The three possible values are provided below.

   - **URL**—Type the URL into the text box.
   - **File**—Type the path and filename to the HTML file directly, or click Browse and browse to the HTML file.
   - **Text**—The third field is removed, leaving a blank space.
5. Click **Continue**. The File Contents dialog is displayed. If you chose URL or File, the File Contents text box contains the HTML file that you specified. If you chose Text, the File Contents text box is empty.
6. If you chose Text, type or copy and paste the custom response HTML that you want to import.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

7. Click **Done**.
8. To delete an object, select the object, and then click **Delete**.

To export a file by using the GUI

Before you attempt to export an XML schema, DTD, or WSDL file, or an HTML or XML error object, verify that the Web App Firewall appliance can access the computer where the file is to be saved. Otherwise, you cannot export the file.

1. Navigate to **Security** > **Web App Firewall** > **Imports**.
2. In the **Web App Firewall Imports** pane, select the tab for the type of file you want to export.

   The export process is identical on all four tabs from the user point of view.
3. Select the file that you want to export.
4. Expand the Action drop-down list, and select **Export**.
5. In the dialog box, choose **Save File** and click **OK**.
6. In the **Browse** dialog box, navigate to the local file system and directory where you want to save the exported file, and click **Save**.

To edit an HTML or XML Error Object in the GUI

You edit the text of HTML and XML error objects in the GUI without exporting and then reimporting them.

1. Navigate to **Security > NetScaler Web App Firewall > Imports**, and then select the tab for the type of file that you want to modify.
2. Navigate to **Application Firewall** > **Imports**, and then select the tab for the type of file that you want to modify.
3. Select the file that you want to modify, and then click **Edit**.

   The text of the HTML or XML error object is displayed in a browser text area. You can modify the text by using the standard browser-based editing tools and methods for your browser.

   Note: The edit window is designed to allow you to make minor changes to your HTML or XML error object. To make extensive changes, you may prefer to export the error object to your local computer and use standard HTML or XML web page editing tools.
4. Click **OK**, and then click **Close**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Global configuration

The Web App Firewall global configuration affects all profiles and policies. The Global Configuration items are:

- **Engine Settings.** A collection of global settings—session cookie name, session time-out, maximum session lifetime, logging header name, undefined profile, default profile, and import size limit—that pertain to all connections that the Web App Firewall processes, rather than to a specific subset of connections.
- **Confidential Fields.** A set of form fields in web forms that contain sensitive information that must not be logged to the Web App Firewall logs. Form fields such as password fields on a logon page or credit card information on a shopping cart checkout form are normally designated as confidential fields.
- **Field Types.** The list of web form field types used by the Field Formats security check. Each of these field types is defined by a PCRE-compliant regular expression that defines the type of data and the minimum/maximum length of data that must be allowed in that type of form field.
- **XML Content Types.** The list of content types recognized as XML and subjected to XML-specific security checks. Each of these content types is defined by a PCRE-compliant regular expression that defines the exact MIME type assigned to that content.
- **JSON Content Types.** The list of content types recognized as JSON and subjected to JSON-specific security checks. Each of these content types is defined by a PCRE-compliant regular expression that defines the exact MIME type assigned to that content.

Engine settings

The engine settings affect all requests and responses that the NetScaler Web App Firewall processes. Following are the settings:

- **Cookie name**—The name of the cookie that stores the NetScaler session ID.
- **Session timeout**—The maximum inactive period allowed. If a user session shows no activity for this length of time, the session is terminated and the user is required to reestablish it by visiting a designated start page.
- **Cookie post-encrypts prefix**—The string that precedes the encrypted portion of any encrypted cookies.
- **Maximum session lifetime**—The maximum amount of time, in seconds, that a session is allowed to remain live. After this period is reached, the session is terminated and the user is required to reestablish it by visiting a designated start page. This setting cannot be less than

© 1997–2026 Citrix Systems, Inc. All rights reserved.

the session timeout. To disable this setting, so that there is no maximum session lifetime, set the value to zero (0).

- **Logging header name**—The name of the HTTP header that holds the Client IP, for logging.
- **Undefined profile**—The profile applied when the corresponding policy action evaluates as undefined.
- **Default profile**—The profile applied to connections that do not match a policy.
- **Import size limit**—The maximum byte count of all files imported to the appliance, including signatures, WSDLs, schemas, HTML, and XML error pages. During an import, if the size of the imported object causes the cumulative count of all imported files to exceed the configured limit, the import operation fails. And the appliance displays the following error message: "*ERROR: Import failed - exceeding the configured total size limit on the imported objects*".
- **Learn message rate limit**—The maximum number of requests and responses per second that the learning engine is to process. Any additional requests or responses over this limit are not sent to the learning engine.
- **Proxy Server** - A proxy server is an intermediate server that retrieves data from the internet on behalf of the user. It provides as an additional layer of security for your appliance. The NetScaler appliance that has proxy authentication enabled authenticates itself with the proxy server before downloading the updates from the internet. This way, it protects the appliances from malicious downloads. Configure the following parameters:
  - **Proxy Server** – The IP address of the proxy server from which the latest AWS signatures are downloaded.
  - **Proxy Port** - The port number of the proxy server from which the latest AWS signatures are downloaded.
  - **Proxy Username** - The port number of the proxy server from which the latest AWS signatures are downloaded.
  - **Proxy Password** - Password to authenticate to the proxy server for downloading signature updates.
- **Entity decoding**—Decode HTML entities when running Web App Firewall checks.
- **Log malformed request**—Enable logging of malformed HTTP requests.
- **Use configurable secret key**—Use a configurable secret key for Web App Firewall operations. This secret key is used for signing and verifying data. When "useConfigurableSecretKey" is turned ON, you must use the key enabled in the "set ns encryptionParams" parameter.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Reset learned data**—Remove all learned data from the Web App Firewall. Restarts the learning process by collecting fresh data.

Two settings, *Reset Learned Data* and *Signatures Auto-Update*, are found in different places depending on whether you use the command interface or the NetScaler GUI to configure your NetScaler Web App Firewall. When using the command interface, you configure Reset Learned Data by using the reset appfw learning data command. This takes no parameters and has no other functions. You can configure the signature auto-Update in the set appfw settings command. The -signatureAutoUpdate parameter enables or disables auto-updating of the signatures, and -signatureUrl configures the URL which hosts the updated signatures file.

When using the NetScaler GUI, you configure Reset Learned Data in **Security >NetScaler Web App Firewall>Engine Settings**. The **Reset Learned Data** option is at the bottom of the dialog box. You configure Signatures Auto-Update for each set of signatures in **Security** > **NetScaler Web App Firewall** > **Signatures**, by selecting the signatures file, clicking the right mouse button and selecting **Auto Update Settings**.

Normally, the default values for the **Web App Firewall** settings are correct. If the default settings cause a conflict with other servers or cause premature disconnection of your users, however, you have to modify them.

The **Web App Firewall** session limit is configurable using the following command:

```
> set appfw settings -sessionLimit 500000

Done

Default value:100000   Max value:500000 per PE
```

To configure engine settings by using the command line interface

At the command prompt, type the following commands:

- `set appfw settings [-sessionCookieName <name>] [-sessionTimeout <positiveInteger> ] [-sessionLifetime <positiveInteger>][-clientIPLoggingHeader <headerName> ] [-undefaction <profileName>] [-defaultProfile <profileName>] [-importSizeLimit <positiveInteger>] [-`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

`logMalformedReq (ON | OFF)] [-signatureAutoUpdate (ON | OFF)] [-signatureUrl <expression>] [-cookiePostEncryptPrefix <string>] [-entityDecoding (ON | OFF)] [-useConfigurableSecretKey (ON | OFF)][-learnRateLimit <positiveInteger>] [–proxyServer <proxy server ip>] [-proxyPort <proxy server port>] [-proxyUsername <username>] [-proxyPassword <password>]`

- `save ns config`

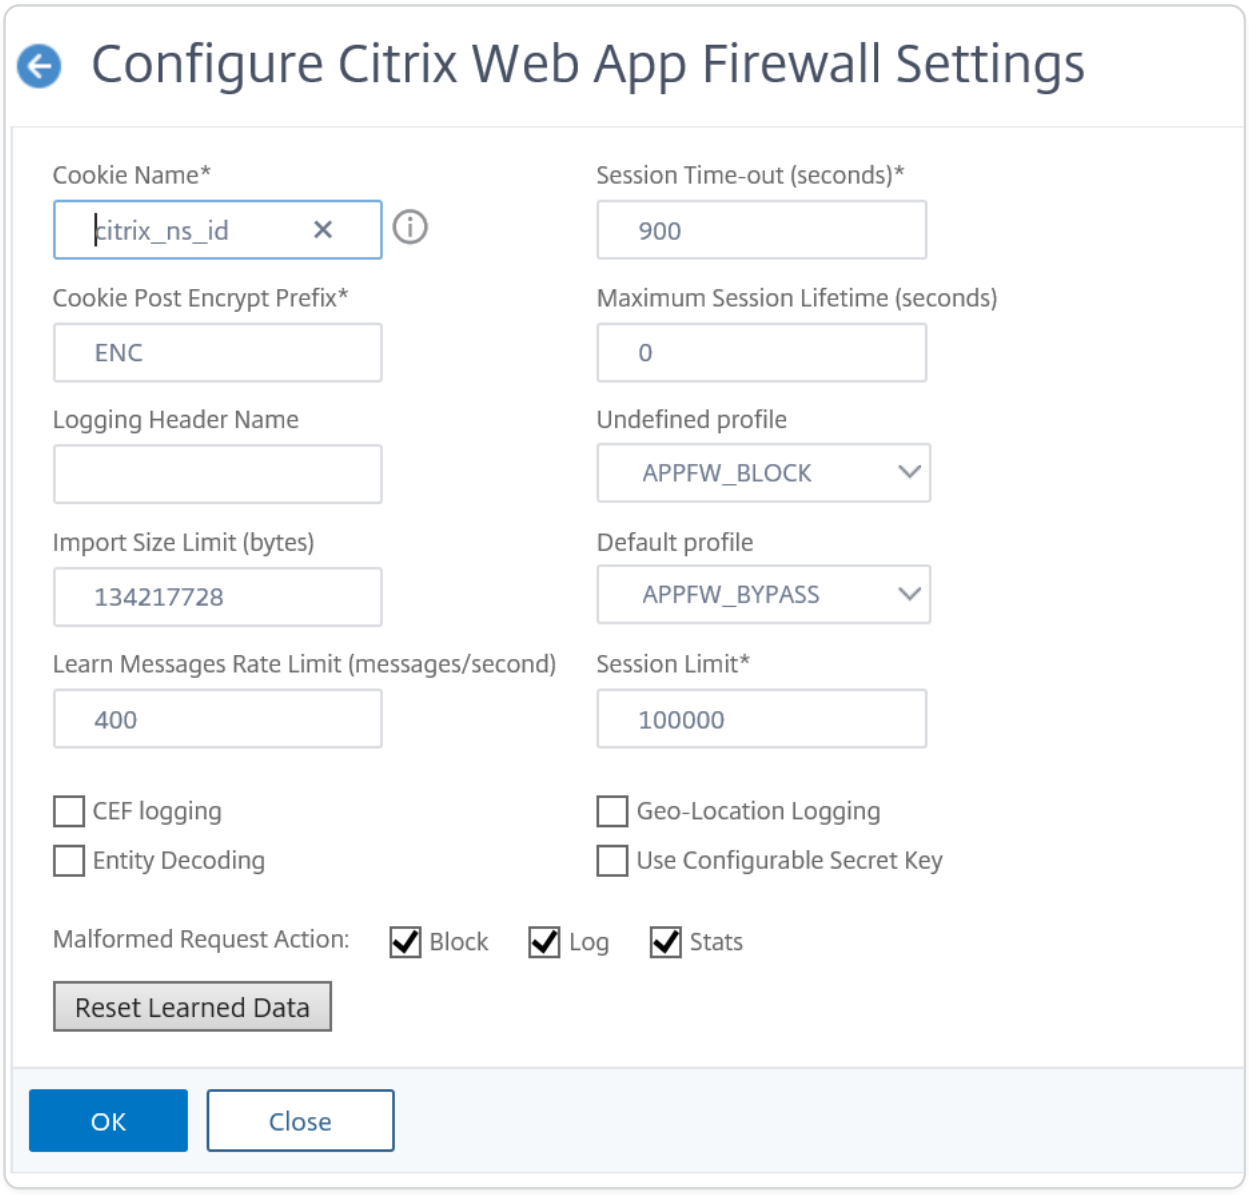
Example

```
set appfw settings -sessionCookieName citrix-appfw-id -sessionTimeout 3600

-sessionLifetime 14400 -clientIPLoggingHeader NS-AppFW-Client-IP
-undefaction APPFW_RESET

-defaultProfile APPFW_RESET -importSizeLimit 4096 -proxyServer
10.102.30.112 -proxyPort 3128 -proxyUsername defaultusername
-proxyPassword defaultpassword

save ns config
```



To configure engine settings by using the NetScaler GUI

1. Navigate to **Security** > **NetScaler Web App Firewall**
2. In the details pane, click **Change Engine Settings** under **Settings**.
3. In the **Web App Firewall Engine Settings** dialog box, set the following parameters:
   - Cookie Name
   - Session Timeout
   - Cookie Post Encrypt Prefix
   - Maximum Session Lifetime
   - Logging Header Name
   - Undefined Profile
   - Default Profile
   - Import Size Limit
   - Learn Messages Rate Limit
   - Proxy Server
   - Proxy Port

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Proxy Username
- Proxy Password
- Entity Decoding
- Log Malformed Request
- Use Secret Key
- Learn Message Rate Limit
- Signatures Auto Update

4. Click **OK**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Confidential fields

You can designate web-form fields as confidential to protect the information users type into them. Normally, any information a user types into a web form on one of your protected web servers is logged in the NetScaler logs. The information typed into a web-form field designated as confidential, however, is not logged. That information is saved only where the website is configured to save such data, normally in a secure database.

Common types of information that you may want to protect with a confidential field designation include:

- Passwords
- Credit card numbers, validation codes, and expiration dates
- Social security numbers
- Tax ID numbers
- Home addresses
- Private telephone numbers

In addition to being good practice, proper use of confidential field designations may be necessary for PCI-DSS compliance on ecommerce servers, HIPAA compliance on servers that manage medical information in the United States, and compliance with other data protection standards.

IMPORTANT

In the following two cases, the Confidential Field designation does not function as expected:

- If a Web form has either a confidential field or an action URL longer than 256 characters, the field or action URL is truncated in the NetScaler logs.
- With certain SSL transactions, the logs are truncated if either the confidential field or the action URL is longer than 127 characters.

In either of these cases, the Web App Firewall masks a fifteen-character string with the letter "x," instead of the normal eight character string. To ensure that any confidential information is removed, the user must use form field name and action URL expressions that match the first 256, or (in cases where SSL is used) the first 127 characters.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To configure your Web App Firewall to treat a web-form field on a protected website as confidential, you add that field to the Confidential Fields list. You can enter the field name as a string, or you can enter a PCRE-compatible regular expression specifying one or more fields. You can enable the confidential-field designation when you add the field, or you can modify the designation later.

NOTE

From release 13.1 build 27.x, confidential fields are also supported in WAF profiles. For more information, see Confidential fields in WAF profile.

To add a confidential field by using the command line interface

At the command prompt, type the following commands:

- `add appfw confidField <fieldName> <url> [-isRegex ( REGEX | NOTREGEX )] [-comment "<string>"] [-state ( ENABLED | DISABLED )]`
- `save ns config`

Example

The following example adds all web form fields whose names begin withPassword to the confidential fields list.

```
add appfw confidField Password "https?://www[.]example[.]com/[^<>]*[^a-z]password[0-9a-z._-]*." -isRegex REGEX -state ENABLED

save ns config
```

To modify a confidential field by using the command line interface

At the command prompt, type the following commands:

- `set appfw confidField <fieldName> <url> [-isRegex ( REGEX | NOTREGEX )][-comment "<string>"] [-state ( ENABLED | DISABLED )]`
- `save ns config`

Example

The following example modifies the confidential field designation to add a comment.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
set appfw confidField Password "https?://www[.]example[.]com/[^<>]*[^a-z]password[0-9a-z._-]*." -comment "Protect password fields." -isRegex REGEX -state ENABLED

save ns config
```

To remove a confidential field by using the command line interface

At the command prompt, type the following commands:

- `rm appfw confidField <fieldName> <url>`
- `save ns config`

To configure a confidential field by using the GUI

1. Navigate to **Security** > **Application Firewall**.
2. In the details pane, under **Settings**, click **Manage Confidential Fields**.
3. In the Manage Confidential Fields dialog box, do one of the following:
   - To add a new form field to the list, click Add.
   - To change an existing confidential field designation, select the field, and then click **Edit**. The **Web App Firewall Confidential Fields** dialog box appears.

   NOTE

   If you select an existing confidential field designation and then click **Add**, the **Create Confidential Form Field** dialog box displays the information for that confidential field. You can modify that information to create your new confidential field.

4. In the dialog box, fill out the elements. They are:
   - **Enabled check box.** Select or clear to enable/disable this confidential field designation.
   - **Is form field name a regular expression check box.** Select or clear to enable PCRE-format regular expressions in the form field name.
   - **Field Name.** Enter a literal string or PCRE-format regular expression that either represents a specific field name or that matches multiple fields with names that follow a pattern.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Action URL.** Enter a literal URL or a regular expression that defines one or more URLs of the web page(s) on which the web form(s) that contains the confidential field are located.
- **Comments.** Enter a comment. Optional.

5. Click **Create** or **OK**.
6. To remove a confidential field designation from the confidential fields list, select the confidential field listing you want to remove, then click Remove to remove it, and then click **OK** to confirm your choice.
7. When you have finished adding, modifying, and removing confidential field designations, click **Close**.

Examples

Following are some regular expressions that define form field names that you might find useful:

- `\^passwd_ (Applies confidential-field status to all field names that begin with the “passwd_” string.)`
- `\^((\[0-9a-zA-Z._-]*||\\x\[0-9A-Fa-f][0-9A-Fa-f])+-)?passwd_ (Applies confidential-field status to all field names that begin with the string passwd_, or that contain the string -passwd_ after another string that might contain non-ASCII special characters.)`

Following are some regular expressions that define specific URL types that you might find useful. Substitute your own web host(s) and domain(s) for those in the examples.

- If the web form appears on multiple web pages on the web host www.example.com, but all of those web pages are named logon.pl?, you can use the following regular expression:

```
https?://www[.]example[.]com/([0-9A-Za-z][0-9A-Za-z_.-]*/)*logon[.]pl\?
```

- If the web form appears on multiple web pages on the web host www.example-español.com, which contains the n-tilde (ñ) special character, you can use the following regular expression, which represents the n-tilde special character as an encoded UTF-8 string containing C3 B1, the hexadecimal code assigned to that character in the UTF-8 charset:

```
https?://www[.]example-espa\xC3\xB1ol[.]com/([0-9A-Za-z][0-9A-Za-z_.-]*/)* logon[.]pl\?
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- If the web form containing query.pl appears on multiple web pages on different hosts within the example.com domain, you can use the following regular expression:

```
https?://([0-9A-Za-z][0-9A-Za-z_-.]*[.])*example[.]com/([0-9A-Za-z]
[0-9A-Za-z_-.]*/)*logon[.]pl\?
```

- If the web form containing query.pl appears on multiple web pages on different hosts in different domains, you can use the following regular expression:

```
https?://([0-9A-Za-z][0-9A-Za-z_-.]*[.])*[0-9A-Za-z][0-9A-Za-z_-.]+[.]
[a-z]{2,6}/([0-9A-Za-z][0-9A-Za-z_-.]*/)*logon[.]pl\?
```

- If the web form appears on multiple web pages on the web host www.example.com, but all of those web pages are named logon.pl?, you can use the following regular expression:

```
https?://www[.]example[.]com/([0-9A-Za-z][0-9A-Za-z_-.]*/)*logon[.]pl\?
```

Field types

A field type is a PCRE-format regular expression that defines a particular data format and minimum/maximum data lengths for a form field in a web form. Field types are used in the Field Formats check.

The Web App Firewall comes with several default field types, which are:

- integer. A string of any length consisting of numbers only, without a decimal point, and with an optional preceding minus sign (-).
- alpha. A string of any length consisting of letters only.
- alphanum. A string of any length consisting of letters and/or numbers.
- nohtml. A string of any length consisting of characters, including punctuation and spaces, that does not contain HTML symbols or queries.
- any. Anything at all.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

IMPORTANT:

Assigning the any field type as the default field type, or to a field, allows active scripts, SQL commands, and other possibly dangerous content to be sent to your protected websites and applications in that form field. You must use the any type sparingly, if you use it at all.

You can also add your own field types to the Field Types list. For example, you might want to add a field type for a social security number, postal code, or phone number in your country. You might also want to add a field type for a customer identification number or store credit card number.

To add a field type to the Field Types list, you enter the field name as a literal string or PCRE-format regular expression.

To add a field type by using the command line interface

At the command prompt, type the following commands:

- `add appfw fieldType <name> <regex> <priority> [-comment "<string>"]`
- `save ns config`

Example

The following example adds a field type named SSN that matches US Social Security numbers to the Field Types list, and sets its priority to 1.

```
add appfw fieldType SSN "^[1-9][0-9]{2,2}-[0-9}{2,2}-[0-9]{4,4}$" 1

save ns config
```

To modify a field type by using the command line interface

At the command prompt, type the following commands:

- `set appfw fieldType <name> <regex> <priority> [-comment "<string>"]`
- `save ns config`

Example

The following example modifies the field type to add a comment.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
set appfw fieldType SSN "^[1-9][0-9]{2,2}-[0-9}{2,2}-[0-9]{4,4}$" 1
-comment "US Social Security Number"

save ns config
```

To remove a field type by using the command line interface

At the command prompt, type the following commands:

- `>rm appfw fieldType <name>`
- `save ns config`

To configure a field type by using the GUI

1. Navigate to Security > Application Firewall.
2. In the details pane, under **Settings**, click **Manage Field Types**.
3. In the **Manage Field Types** dialog box, do one of the following:
   - To add a new field type to the list, click **Add**.
   - To change an existing field type, select the field type, and then click **Edit**. The **Configure Field Type** dialog box appears.

   NOTE:

   If you select an existing field type designation and then click **Add**, the dialog box displays the information for that field type. You can modify that information to create your new field type.
4. In the dialog box, fill out the elements. They are:
   - Name
   - Regular Expression
   - Priority
   - Comment
5. Click Create or OK.
6. To remove a field type from the Field Types list, select the field type listing you want to remove, then click **Remove** to remove it, and then click **OK** to confirm your choice.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

7. When you have finished adding, modifying, and removing field types, click **Close**.

Examples

Following are some regular expressions for field types that you might find useful:

`\^[1-9][0-9]{2,2}-[0-9}{2,2}-[0-9]{4,4}$` U.S. Social Security numbers

`\^\[A-C\]\[0-9\]{7,7}$` California driver's license numbers

`\^+[0-9]{1,3} [0-9() -]{1,40}$` International phone numbers with country codes

`\^[0-9]{5,5}-[0-9]{4,4}$` U.S. ZIP code numbers

`\^[0-9A-Za-z][0-9A-Za-z.+_-]{0,25}@([0-9A-Za-z][0-9A-Za-z_-]*[.]){1,4}[A-Za-z]{2,6}$` Email addresses

XML content types

By default, the Web App Firewall treats files that follow certain naming conventions as XML. You can configure the Web App Firewall to examine web content for additional strings or patterns that indicate that those files are XML files. This can ensure that the Web App Firewall recognizes all XML content on your site, even if certain XML content does not follow normal XML naming conventions, ensuring that XML content is subjected to XML security checks.

To configure the XML content types, you add the appropriate patterns to the XML Content Types list. You can enter a content type as a string, or you can enter a PCRE-compatible regular expression specifying one or more strings. You can also modify the existing XML content types patterns.

To add an XML content type pattern by using the command line interface

At the command prompt, type the following commands:

- `add appfw XMLContentType <XMLContenttypevalue> [-isRegex ( REGEX | NOTREGEX )]`
- `save ns config`

Example

The following example adds the pattern .*/xml to the XML Content Types list and designates it as a regular expression.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add appfw XMLContentType ".*/xml" -isRegex REGEX
```

To remove an XML content type pattern by using the command line interface

At the command prompt, type the following commands:

- `rm appfw XMLContentType <XMLContenttypevalue>`
- `save ns config`

To configure the XML content type list by using the GUI

1. Navigate to **Security** > **Web App Firewall**.
2. In the details pane, under **Settings**, click **Manage XML Content Types**.
3. In the **Manage XML Content Types** dialog box, do one of the following:
   - To add a new XML content type, click Add.
   - To modify an existing XML content type, select that type and then click Edit. The Configure Web App Firewall XML Content Type dialog appears. Note: If you select an existing XML content type pattern and then click Add, the dialog box displays the information for that XML content type pattern. You can modify that information to create your new XML content type pattern.
4. In the dialog box, fill out the elements. They are:
   - **IsRegex.** Select or clear to enable PCRE-format regular expressions in the form field name.
   - **XML Content Type** Enter a literal string or PCRE-format regular expression that matches the XML content type pattern that you want to add.
5. Click **Create**.
6. To remove an XML content type pattern from the list, select it, then click **Remove** to remove it, and then click **OK** to confirm your choice.
7. When you have finished adding and removing XML content type patterns, click **Close**.

JSON content types

By default, the Web App Firewall treats files with the content type "application/json" as JSON files.The default setting enables the Web App Firewall to recognize JSON content in requests and responses, and to handle that content appropriately.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

You can configure the Web App Firewall to examine web content for additional strings or patterns that indicate that those files are JSON files. This can ensure that the Web App Firewall recognizes all JSON content on your site, even if certain JSON content does not follow normal JSON naming conventions, ensuring that JSON content is subjected to JSON security checks.

To configure the JSON content types, you add the appropriate patterns to the JSON Content Types list. You can enter a content type as a string, or you can enter a PCRE-compatible regular expression specifying one or more strings. You can also modify the existing JSON content types patterns.

To add a JSON content type pattern by using the command line interface

At the command prompt, type the following commands:

- `add appfw JSONContentType <JSONContenttypevalue> [-isRegex ( REGEX | NOTREGEX )]`
- `save ns config`

Example

The following example adds the pattern .*/json to the JSON Content Types list and designates it as a regular expression.

```
add appfw JSONContentType ".*/json" -isRegex REGEX
```

To configure the JSON content type list by using the GUI

1. Navigate to **Security** > **Application Firewall**.
2. In the details pane, under **Settings**, click **Manage JSON Content Types**.
3. In the Manage JSON Content Types dialog box, do one of the following:
   - To add a new JSON content type, click Add.
   - To modify an existing JSON content type, select that type and then click Edit. The Configure Web App Firewall JSON Content Type dialog appears. Note: If you select an existing JSON content type pattern and then click Add, the dialog box displays the information for that JSON content type pattern. You can modify that information to create your new JSON content type pattern.
4. In the dialog box, fill out the elements. They are:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **IsRegex.** Select or clear to enable PCRE-format regular expressions in the form field name.
- **JSON Content Type** Enter a literal string or PCRE-format regular expression that matches the JSON content type pattern that you want to add.

5. Click **Create** or **OK**.
6. To remove a JSON content type pattern from the list, select it, then click **Remove** to remove it, and then click **OK** to confirm your choice.
7. When you have finished adding and removing XML content type patterns, click **Close**.

Statistics and reports

The information maintained in the logs and statistics, and displayed in the reports, provides important guidance for configuring and maintaining the Web App Firewall.

The Web App Firewall statistics

When you enable the statistics action for Web App Firewall signatures or security checks, the Web App Firewall maintains information about connections that match that signature or security check. You can view the accumulated statistics information on the **Monitoring** tab by selecting one of the following choices in the Select Group list box:

- **Web App Firewall.** A summary of all statistics information gathered by your Web App Firewall appliance for all profiles.
- **Web App Firewall (per profile).** The same information, but displayed per-profile rather than summarized.

You can use this information to monitor how your Web App Firewall is operating and determine whether there is any abnormal activity or abnormal amounts of hits on a signature or security check. If you see such a pattern of abnormal activity, you can check the logs for that signature or security check to diagnose and take corrective action.

Relaxation hit statistical counter

Based on the relaxation that is applied on the violated traffic, you can also display statistical details such as the number of times a violation is occurring on the appliance, number of relaxation rules applied at the time of violation, and its last applied timestamp. By performing this, the centralized learning engine can automatically deletes unused or redundant relaxation bindings. For more information, see WAF Learn Engine topic.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The relaxation hit statistical counter is available only for the following security checks.

- Cross-site scripting
- SQL Injection
- Cookie consistency
- JSON SQL
- JSON Cross-site scripting
- JSON DoS
- JSON CMD injection
- Cross-Site request forgery
- Field format
- Starturl
- Denyurl
- Content-Type protection

To display statistics for relaxation rule hit counters by using the CLI

At the command prompt, type:

```
stat appfw profile p1
```

Example:

```
stat appfw profile p1 –fullvalues
```

Starturl Rules Statistics

RULE	HITS	RATE	LAST HIT TIME
87a4...51177	0	0	Thu ... 1970
5b83...dc12a	0	0	Thu ... 1970
12345	0	0	Thu ... 1970

To display statistics for relaxation rule hit counters by using the GUI

Complete the following steps to view the relaxation rule hit counter statistics:

1. Navigate to **Security > NetScaler Web App Firewall > Profiles**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. In the details pane, select a **Web App Firewall profile** and click **Statistics**.
3. The **NetScaler Web App Firewall Statistics** page displays the statistics details.
4. You can select Tabular View or switch to Graphical View to display the data in a tabular or graphical format.

The Web App Firewall Reports

The Web App Firewall reports provide information about your Web App Firewall configuration and how it is handling traffic for your protected websites.

The PCI DSS report

The Payment Card Industry (PCI) Data Security Standard (DSS), version 3.2, consists of 12 security criteria that most credit card companies require businesses that accept online payments through credit and debit cards to meet. The criteria are designed to prevent identity theft, hacking, and other types of fraud. If an ISP does not meet the PCI DSS criteria, the ISP or merchant might lose authorization to accept credit card payments through the website.

ISPs and online merchants prove that they are in compliance with PCI DSS by having an audit conducted by a PCI DSS Qualified Security Assessor (QSA) Company. The PCI DSS report is designed to assist them both before and during the audit. Before the audit, it shows which Web App Firewall settings are relevant to PCI DSS, how they must be configured, and (most important) whether your current Web App Firewall configuration meets the standard. During the audit, the report can be used to demonstrate compliance with a relevant PCI DSS criteria.

The PCI DSS report consists of a list of those criteria that are relevant to your Web App Firewall configuration. Under each criterion, it lists your current configuration options, indicates whether your current configuration complies with the PCI DSS criterion, and explains how to configure the Web App Firewall so that your protected websites are in compliance with the criterion.

The PCI DSS report is located under **System > Reports**. To generate the report as an Adobe PDF file, click **Generate PCI DSS Report**. Depending on your browser settings, the report is displayed in the pop-up window or you are prompted to save it to your hard disk.

NOTE:

To view this and other reports, you must have the Adobe Reader program installed on your computer.

The PCI DSS report consists of the following sections:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Description.** A description of the PCI DSS Compliance Summary report.
- **Firewall License and Feature Status.** Tells you whether the Web App Firewall is licensed and enabled on your NetScaler appliance.
- **Executive Summary.** A table that lists the PCI DSS criteria and tells you which of those criteria are relevant to the Web App Firewall.
- **Detailed PCI DSS Criteria Information.** For each PCI DSS criterion that is relevant to your Web App Firewall configuration, the PCI DSS report provides a section that contains information about whether your configuration is in compliance and, if it is not, how to bring it into compliance.
- **Configuration.** Data for individual profiles, which you access either by clicking Web App Firewall Configuration at the top of the report, or directly from the Reports pane. The Web App Firewall Configuration report is the same as the PCI DSS report, with the PCI DSS-specific summary omitted.

The Web App Firewall configuration report

The Web App Firewall Configuration report is located under **System > Reports**. To display it, click **Generate Web App Firewall Configuration Report**. Depending on your browser settings, the report is displayed in the pop-up window or you are prompted to save it to your hard disk.

The Web App Firewall Configuration report starts with a Summary page, which consists of the following sections:

- **Web App Firewall Policies.** A table that lists your current Web App Firewall policies, showing the policy name, the content of the policy, the action (or profile) it is associated with, and global binding information.
- **Web App Firewall Profiles.** A table that lists your current Web App Firewall profiles and indicates which policy each profile is associated with. If a profile is not associated with a policy, the table displays INACTIVE in that location.

To download all report pages for all policies, at the top of the Profiles Summary page click **Download All Profiles**. You display the report page for each individual profile by selecting that profile in the table at the bottom of the screen. The Profile page for an individual profile shows whether each check action is enabled or disabled for each check, and the other configuration settings for the check.

To download a PDF file containing the PCI DSS report page for the current profile, click **Download Current Profile** at the top of the page. To return to the Profiles Summary page, click **Web App**

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Firewall Profiles. To go back to the main page, click **Home**. You can refresh the PCI DSS report at any time by clicking **Refresh** in the upper right corner of the browser.

Web App Firewall logs

The Web App Firewall generates log messages for tracking configuration, policy invocation, and security check violation details.

When you enable the log action for security checks or signatures, the resulting log messages provide information about the requests and responses that the Web App Firewall has observed when protecting your websites and applications. The most important information is the action taken by the Web App Firewall when a signature or a security check violation was observed. For some security checks, the log message can provide useful information, such as, user location or detected pattern that triggered a violation. An excessive increase in the number of violation messages in the logs can indicate a surge in malicious requests. The message alerts you that your application might be under attack to exploit a specific vulnerability that is detected and thwarted by Web App Firewall protections.

NOTE:

If you want to segregate NetScaler Web App Firewall logs from the System Logs, you must use an external SYSLOG server.

NetScaler (Native) format logs

The Web App Firewall uses the NetScaler format logs (also called native format logs) by default. These logs have the same format as those generated by other NetScaler features. Each log contains the following fields:

- Timestamp. Date and time when the connection occurred.
- Severity. Severity level of the log.
- Module. NetScaler module that generated the log entry.
- Event Type. Type of event, such as signature violation or security check violation.
- Event ID. ID assigned to the event.
- Client IP. IP address of the user whose connection was logged.
- Transaction ID. ID assigned to the transaction that caused the log.
- Session ID. ID assigned to the user session that caused the log.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Message. The log message. Contains information identifying the signature or security check that triggered the log entry.

You can search for any of these fields, or any combination of information from different fields. Your selection is limited only by the capabilities of the tools you use to view the logs. You can observe the Web App Firewall log messages in the GUI by accessing the NetScaler syslog viewer, or you can manually connect to the NetScaler appliance and access logs from the command line interface, or you can drop into the shell and tail the logs directly from the `/var/log/folder`.

Example of a native format log message

```

```

Common Event Format (CEF) logs

The Web App Firewall also supports CEF logs. CEF is an open log management standard that improves the interoperability of security-related information from different security and network devices and applications. CEF enables customers to use a common event log format so that data can is easily collected and aggregated for analysis by an enterprise management system. The log message is broken into different fields so that you can easily parse the message and write scripts to identify important information.

Analyzing the CEF Log Message

© 1997–2026 Citrix Systems, Inc. All rights reserved.

In addition to date, timestamp, client IP, log format, appliance, company, build version, module, and security check information, Web App Firewall CEF log messages include the following details:

- src – source IP address
- spt – source port number
- request – request URL
- act – action (for example blocked, transformed)
- msg – message (Message regarding the observed security check violation)
- Offset - represents the bytes from the beginning of the file.
- cn1 – event ID
- cn2 – HTTP Transaction ID
- cs1 – profile name
- cs2 – PPE ID (for example PPE1)
- cs3 - Session ID
- cs4 – Severity (for example INFO, ALERT)
- cs5 – event year
- cs6 - Signature Violation Category
- method – Method (for example GET/POST)

For example, consider the following CEF format log message, which was generated when a Start URL violation was triggered:

```
Jun 12 23:37:17 <local0.info> 10.217.31.98 CEF:0|Citrix|NetScaler|NS11.0

|APPFW|APPFW_STARTURL|6|src=10.217.253.62 spt=47606 method=GET

request=http://aaron.stratum8.net/FFC/login.html msg=Disallow Illegal URL.
cn1=1340

cn2=653 cs1=pr_ffc cs2=PPE1 cs3=EsdGd3VD0OaaURLcZnj05Y6DOmE0002 cs4=ALERT
cs5=2015

act=blocked
```

The above message can be broken down into different components. Refer to the CEP log components table.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Example of a request check violation in CEF log format: request is not blocked

Example of a response check violation in CEF format for an Offset:

```
Jan 24 10:00:00 <local0.warn> 10.175.4.47 CEF:0|Citrix|NetScaler|NS13.0|
APPFW|APPFW_XML_ERR_NOT_WELLFORMED|4|src=5.31.100.129 spt=20644 method=GET
request=https://wifiuae.duwifi.ae/publishApplications/en/
5dafe3e74fa8015599009bc1/images/fallback_photo.svg msg=XML Format check
failed: Message is not a well-formed XML.Error string is 'unclosed token'.
Offset:-517597 cn1=547290214 cn2=974226675 cs1=WIFI_UAE_AppFw cs2=PPE0
cs4=ERROR cs5=2023 act=blocked
```

In this example, the XML_ERR_NOT_WELLFORMED violation occurred because of `unclosed token`. This violation is at 517597 location from the beginning of the file.

Log geolocation in the Web App Firewall violation messages

The log details identify the location from which requests originate, and help you configure the Web App Firewall for the optimal level of security. To bypass security implementations such as rate limiting, which rely on the IP addresses of the clients, malware or rogue computers can keep changing the source IP address in requests. Identifying the specific region from where requests are coming can help determine whether the requests are from a valid user or a device attempting to launch cyberattacks. For example, if an excessively large number of requests are received from a specific area, it is easy to determine whether they are being sent by users or a rogue machine. Geolocation analysis of the received traffic can be useful in deflecting attacks such as denial of service (DoS) attacks.

The Web App Firewall offers you the convenience of using the built-in NetScaler database for identifying the locations corresponding to the IP addresses from which malicious requests are

© 1997–2026 Citrix Systems, Inc. All rights reserved.

originating. You can then enforce a higher level of security for requests from those locations. NetScaler default syntax (PI) expressions give you the flexibility to configure location based policies that can be used with the built-in location database to customize firewall protection, bolstering your defense against coordinated attacks launched from rogue clients in a specific region.

You can use the NetScaler built-in database, or you can use any other database. If the database does not have any location information for the particular client IP address, the CEF log shows the geolocation as an Unknown geolocation.

NOTE:

Geolocation logging uses the Common Event Format (CEF). By default, `CEF logging` and `GeoLocationLogging` are OFF. You must explicitly enable both parameters.

Example of a CEF log message showing geolocation information

```
June 8 00:21:09 <local0.info> 10.217.31.98 CEF:0|Citrix|NetScaler|NS11.0|

Configure log action and other log parameters using command interface

To configure the log action for a security check of a profile by using the command line

At the command prompt, type one of the following commands:

- `set appfw profile <name> SecurityCheckAction ([log] | [none])`
- `unset appfw profile <name> SecurityCheckAction`

Examples

`set appfw profile pr_ffc StartURLAction log`

`unset appfw profile pr_ffc StartURLAction`

To configure CEF logging by using the command line

The CEF logging is disabled by default. At the command prompt, type one of the following commands to change or display the current setting:

- `set appfw settings CEFLogging on`
- `unset appfw settings CEFLogging`
- `sh appfw settings | grep CEFLogging`

To configure the logging of the credit card numbers by using the command line

At the command prompt, type one of the following commands:

- `set appfw profile <name> -doSecureCreditCardLogging ([ON] | [OFF])`
- `unset appfw profile <name> -doSecureCreditCardLogging`

To configure Geolocation logging by using the command line

1. Use the set command to enable GeoLocationLogging. You can enable the CEF logging at the same time. Use the unset command to disable geolocation logging. The show command shows the current settings of all the Web App Firewall parameters, unless you include the grep command to show the setting for a specific parameter.
    - `set appfw settings GeoLocationLogging ON [CEFLogging ON]`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- `unset appfw settings GeoLocationLogging`
- `sh appfw settings | grep GeoLocationLogging`

2. Specify the database

   `add locationfile /var/netscaler/inbuilt_db/Citrix_netscaler_InBuilt_GeoIP_DB.csv`

   or

   `add locationfile <path to database file>`

Customize Web App Firewall logs

Default format (PI) expressions give you the flexibility to customize the information included in the logs. You have the option to include the specific data that you want to capture in the Web App Firewall generated log messages. For example, if you are using AAA-TM authentication along with the Web App Firewall security checks, and would like to know the accessed URL that triggered the security check violation, the name of the user who requested the URL, the source IP address, and the source port from which the user sent the request, you can use the following commands to specify customized log messages that include all the data:

```
> sh version

NetScaler NS12.1: Build 50.0013.nc, Date: Aug 28 2018, 10:51:08   (64-bit)

 Done
```

```
> add audit messageaction custom1 ALERT 'HTTP.REQ.URL + " " +
HTTP.REQ.USER.NAME + " " + CLIENT.IP.SRC + ":" + CLIENT.TCP.SRCPORT'

Warning: HTTP.REQ.USER has been deprecated. Use AAA.USER instead.

 Done
```

```
> add appfw profile test_profile

 Done
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
> add appfw policy appfw_pol true test_profile -logAction custom1

 Done
```

Configure Syslog policy to segregate Web App Firewall logs

The Web App Firewall offers you an option to isolate and redirect the Web App Firewall security log messages to a different log file. This might be desirable if the Web App Firewall is generating many logs, making it difficult to view other NetScaler log messages. You can also use this option when you are interested only in viewing the Web App Firewall log messages and do not want to see the other log messages.

To redirect the Web App Firewall logs to a different log file, configure a syslog action to send the Web App Firewall logs to a different log facility. You can use this action when configuring the syslog policy, and bind it globally for use by Web App Firewall.

NOTE:

To globally bind Web App Firewall policies, you can configure the global binding parameter, "APPFW_GLOBAL" in the "bind audit syslogGlobal" and "bind audit nslogGlobal" commands. The global bound audit log policies can evaluate log messages in the Web App Firewall logging context.

Example:

1. Switch to the shell and use an editor such as vi to edit the /etc/syslog.conf file. Add a new entry to use local2.* to send logs to a separate file as shown in the following example:

   `local2.* /var/log/ns.log.appfw`

2. Restart the syslog process. You can use the grep command to identify the syslog process ID (PID), as shown in the following example:

   `root@ns# **ps -A | grep syslog**`

   `1063 ?? Ss 0:03.00 /usr/sbin/syslogd -b 127.0.0.1 -n -v -v -8 -C`

   `root@ns# **kill -HUP** 1063`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. From the command line interface, configure either advanced or classic SYSLOG policy with action and bind it as a global Web App Firewall policy. Citrix® recommends you to configure the advanced SYSLOG policy.

   Advanced SYSLOG policy configuration

   ```
   add audit syslogAction sysact1 1.1.1.1 -logLevel ALL -logFacility LOCAL2
   ```

   ```
   add audit syslogPolicy syspol1 true sysact1
   ```

   ```
   bind audit syslogGlobal -policyName syspol1 -priority 100 -globalBindType APPFW_GLOBAL
   ```

   Classic SYSLOG policy configuration

   ```
   add audit syslogAction sysact1 1.1.1.1 -logLevel ALL -logFacility LOCAL2
   ```

   ```
   add audit syslogPolicy syspol1 ns_true sysact1
   ```

   ```
   bind appfw global syspol1 100
   ```

4. All Web App Firewall security check violations will now be redirected to the `/var/log/ns.log.appfw` file. You can tail this file to view the Web App Firewall violations that are getting triggered during the processing of the ongoing traffic.

   ```
   root@ns# tail -f ns.log.appfw
   ```

Warning: If you have configured the syslog policy to redirect the logs to a different log facility, the Web App Firewall log messages no longer appear in the `/var/log/ns.log` file.

NOTE:

If you want to send logs to a different log file on the local NetScaler appliance, you can create a syslog server on that local NetScaler appliance. Add `syslogaction` to its own IP, and configure the ADC as you would configure an external server. The ADC acts as the server to store your logs. Two actions cannot be added with the same IP and port. In the `syslogaction`, by default, the value of IP is set to `127.0.0.1` and the value of port is set to `514`.

Send the Application Firewall messages to an external syslog server

Prerequisite:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

A utility to open an SSH connection to the appliance, such as PuTTY.

Perform the following steps:

1. Log on to the external Syslog server.
2. Open the syslog.conf file and add the following line in the file.

   ```
   local5.* /var/log/appfw.log
   ```
3. Restart the server.
4. Run the following command from the NetScaler® CLI to add a syslog action with the external syslog server IP address.

   ```
   add audit syslogAction sysact1 127.0.0.1 -logLevel ALL -logFacility LOCAL5
   ```
5. Add an advanced policy (syslog1) to the syslog action (Sysact1).

   ```
   add audit syslogPolicy syspol1 true sysact1
   ```
6. Bind the advanced Syslog policy as a global Web App Firewall policy:

   ```
   bind audit syslogGlobal -policyName syspol1 -priority 100 -globalBindType APPFW_GLOBAL
   ```

All the Application Firewall security check violations are redirected to the `/var/log/appfw.log` file and will no longer appear in the `ns.log` file. You can now run the tail command and view the latest entries in the `/var/log/appfw.log` file.

View Web App Firewall logs

You can view the logs by using the syslog viewer, or by logging on to the NetScaler appliance, opening a UNIX shell, and using the UNIX text editor of your choice.

To access the log messages by using the command line

Switch to the shell and tail the ns.logs in the **/var/log/** folder to access the log messages pertaining to the **Web App Firewall security** check violations:

- `Shell`
- `tail -f /var/log/ns.log`

You can use the vi editor, or any Unix text editor or text search tool, to view and filter the logs for specific entries. For example, you can use the `grep` command to access the log messages pertaining to the Credit Card violations:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- `tail -f /var/log/ns.log | grep SAFECOMMERCE`

To access the log messages by using the GUI

The GUI includes a useful tool (Syslog Viewer) for analyzing the log messages. You have multiple options for accessing the Syslog Viewer:

- To view log messages for a specific security check of a profile, navigate to **Web App Firewall** > **Profiles**, select the target profile, and click Security Checks. Highlight the row for the target security check and click Logs. When you access the logs directly from the selected security check of the profile, it filters out the log messages and displays only the logs pertaining to the violations for the selected security check. Syslog viewer can display Web App Firewall logs in the Native format and the CEF format. However, for the syslog viewer to filter out the target profile specific log messages, the logs must be in the CEF log format when accessed from the profile.
- You can also access the Syslog Viewer by navigating to **NetScaler** > **System** > **Auditing**. In the Audit Messages section, click the Syslog messages link to display the Syslog Viewer, which displays all log messages, including all Web App Firewall security check violation logs for all profiles. The log messages are useful for debugging when multiple security check violations might be triggered during request processing.
- Navigate to **Web App Firewall** > **policies** > **Auditing**. In the Audit Messages section, click the Syslog messages link to display the Syslog Viewer, which displays all log messages, including all security check violation logs for all profiles.

The HTML based Syslog Viewer provides the following filter options for selecting only the log messages that are of interest to you:

- **File**—The current `/var/log/ns.log` file is selected by default, and the corresponding messages appear in the Syslog Viewer. A list of other log files in the /var/log directory 's available in a compressed .gz format. To download and uncompress an archived log file, select the log file from the drop-down list option. The log messages pertaining to the selected file are then displayed in the syslog viewer. To refresh the display, click the Refresh icon (a circle of two arrows).
- **Module list box**—You can select the NetScaler module whose logs you want to view. You can set it to APPFW for Web App Firewall logs.
- **Event Type list box**—This box contains a set of check boxes for selecting the type of event you are interested in. For example, to view the log messages pertaining to the signature violations, you can select the **APPFW_SIGNATURE_MATCH** check box. Similarly, you can

© 1997–2026 Citrix Systems, Inc. All rights reserved.

select a check box to enable the specific security check that is of interest to you. You can select multiple options.

- **Severity**—You can select a specific severity level to show just the logs for that severity level. Leave all the check boxes blank if you want to see all the logs.

  To access the Web App Firewall security check violation log messages for a specific security check, filter by selecting **APPFW** in the drop-down list options for Module. The Event Type displays a rich set of options to further refine your selection. For example, if you select the **APPFW_FIELDFORMAT** check box and click the Apply button, only log messages pertaining to the Field Formats security check violations appear in the Syslog Viewer. Similarly, if you select the **APPFW_SQL** and **APPFW_STARTURL** check boxes and click the **Apply** button, only log messages pertaining to these two security check violations appear in the syslog viewer.

If you place the cursor in the row for a specific log message, multiple options, such as **Module**, **EventType**, **EventID**, or **Message** are displayed below the log message. You can select any of these options to highlight the corresponding information in the logs.

Highlights

- **CEF Log Format support**—The CEF log format option provides a convenient option to monitor, parse, and analyze the Web App Firewall log messages to identify attacks, fine-tune configured settings to decrease false positives, and gather statistics.
- **Option to customize log message**—You can use advanced PI expressions to customize log messages and include the data you want to see in the logs.
- **Segregate Web App Firewall specific logs**—You have an option to filter and redirect application-firewall specific logs to a separate log file.
- **Remote Logging**—You can redirect the log messages to a remote syslog server.
- **Geolocation Logging**—You can configure the Web App Firewall to include the geolocation of the area from where the request is received. A built-in geolocation database is available, but you have the option to use an external geolocation database. The NetScaler appliance supports both IPv4 and IPv6 static geolocation databases.
- **Information rich log message**—Following are some examples of the type of information that can be included in the logs, depending on the configuration:
  - A Web App Firewall policy was triggered.
  - A security check violation was triggered.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- A request was considered to be malformed.
- A request or the response was blocked or not blocked.
- Request data (such as SQL or cross-site scripting special characters) or response data (such as Credit card numbers or safe object strings) was transformed.
- The number of credit cards in the response exceeded the configured limit.
- The credit card number and type.
- The log strings configured in the signature rules, and the signature ID.
- Geolocation information about the source of the request.
- Masked (X'd out) user input for protected confidential fields.

Mask sensitive data using regex pattern

The `REGEX_REPLACE` advanced policy (PI) function in a log expression (bound to a Web Application Firewall (WAF) profile) enables you to mask sensitive data in WAF logs. You can use the option to mask data using a regex pattern and provide a character or a string pattern to mask the data. Also, you can configure the PI function to replace the first occurrence or all occurrences of the regex pattern.

By default the GUI interface provides the following mask:

- SSN
- Credit Card
- Password
- User name

Mask sensitive data in Web Application Firewall logs

You can mask sensitive data in WAF logs by configuring the `REGEX_REPLACE` advanced policy expression in the log expression bound to a WAF profile. To mask sensitive data, you must complete the following steps:

1. Add a Web Application Firewall profile
2. Bind a log expression to the WAF profile

Add a Web Application Firewall profile

At the command prompt, type:

```
add appfw profile <name>
```

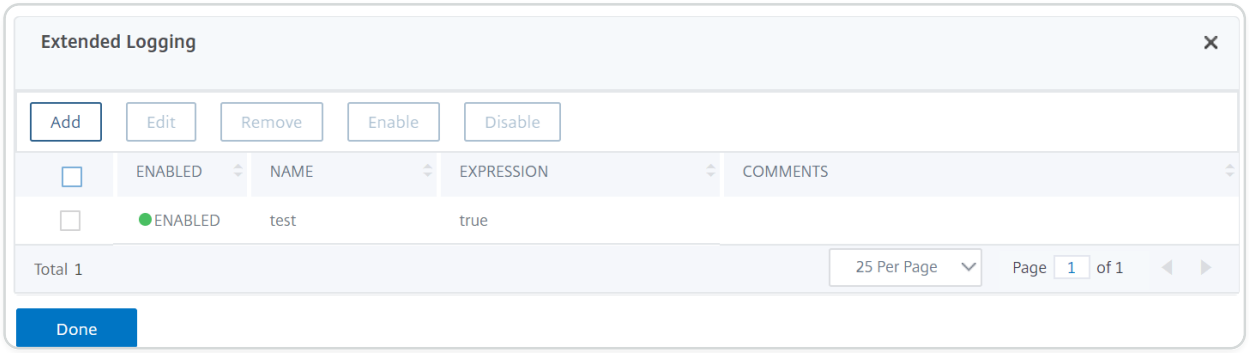
© 1997–2026 Citrix Systems, Inc. All rights reserved.

Example:

```
Add appfw profile testprofile1
```

Bind a log expression with the Web Application Firewall profile

At the command prompt, type:



```
bind appfw profile <name> -logExpression <string> <expression> –comment
<string>
```

Example:

```
bind appfw profile testProfile -logExpression "MaskSSN"
"HTTP.REQ.BODY(10000).REGEX_REPLACE(re!\b\d{3}-\d{2}-\d{4}\b!, “xxx”, ALL)"
-comment "SSN Masked"
```

Mask sensitive data in Web Application Firewall logs by using NetScaler GUI

1. On the navigation pane, expand **Security** > **NetScaler Web App Firewall** > **Profiles**.
2. On the **Profiles** page, click **Edit**.
3. On the **NetScaler Web App Firewall Profile** page, navigate to **Advanced Settings** section and click **Extended Logging**.
4. In the **Extended Logging** section, click **Add**.

5. On the **Create NetScaler Web App Firewall Extended Log Binding** page, set the following parameters:

   a. Name. Name of the log expression.

   b. Enabled. Select this option to mask sensitive data.

   c. Log mask. Select the data to be masked.

   d. Expression. Enter the advanced policy expression that enables you to mask sensitive data in WAF logs

© 1997–2026 Citrix Systems, Inc. All rights reserved.

e. Comments. Brief description about the masking sensitive data.

6. Click **Create** and **Close**.

Appendices

The following supplemental material provides additional detail about complex or peripheral Web App Firewall tasks.

PCRE character encoding format

The **NetScaler operating system supports direct** entry of characters in the printable ASCII character set only—characters with hexadecimal codes between HEX 20 (ASCII 32) and HEX 7E (ASCII 127). To include a character with a code outside that range in your Web App Firewall configuration, you must enter its UTF-8 hexadecimal code as a PCRE regular expression.

Many character types require encoding using a PCRE regular expression if you include them in your Web App Firewall configuration as a URL, form field name, or Safe Object expression. They include:

- **Upper-ASCII characters.** Characters with encodings from HEX 7F (ASCII 128) to HEX FF (ASCII 255). Depending on the character map used, these encodings can refer to control codes, ASCII characters with accents or other modifications, non-Latin alphabet characters, and symbols not included in the basic ASCII set. These characters can appear in URLs, form field names, and safe object expressions.
- **Double-Byte characters.** Characters with encodings that use two 8-byte words. Double-byte characters are used primarily for representing Chinese, Japanese, and Korean text in electronic format. These characters can appear in URLs, form field names, and safe object expressions.

  ASCII control characters. Non-printable characters used to send commands to a printer. All ASCII characters with hexadecimal codes less than HEX 20 (ASCII 32) fall into this category. These characters must never appear in a URL or form field name, however, and would rarely if ever appear in a safe object expression.

The NetScaler appliance does not support the entire UTF-8 character set, but only the characters found in the following eight charsets:

- **English US (ISO-8859-1).** Although the label reads, "English US," the Web App Firewall supports all characters in the ISO-8859-1 character set, also called the Latin-1 character set.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

This character set fully represents most modern western European languages and represents all but a few uncommon characters in the rest.

- **Chinese Traditional (Big5).** The Web App Firewall supports all characters in the BIG5 character set, which includes all of the Traditional Chinese characters (ideographs) commonly used in modern Chinese as spoken and written in Hong Kong, Macau, Taiwan, and by many people of Chinese ethnic heritage who live outside of mainland China.
- **Chinese Simplified (GB2312).** The Web App Firewall supports all characters in the GB2312 character set, which includes all of the Simplified Chinese characters (ideographs) commonly used in modern Chinese as spoken and written in mainland China.
- **Japanese (SJIS).** The Web App Firewall supports all characters in the Shift-JIS (SJIS) character set, which includes most characters (ideographs) commonly used in modern Japanese.
- **Japanese (EUC-JP).** The Web App Firewall supports all characters in the EUC-JP character set, which includes all characters (ideographs) commonly used in modern Japanese.
- **Korean (EUC-KR).** The Web App Firewall supports all characters in the EUC-KR character set, which includes all characters (ideographs) commonly used in modern Korean.
- **Turkish (ISO-8859-9).** The Web App Firewall supports all characters in the ISO-8859-9 character set, which includes all letters used in modern Turkish.
- **Unicode (UTF-8).** The Web App Firewall supports certain more characters in the UTF-8 character set, including those used in modern Russian.

When configuring the Web App Firewall, you enter all non-ASCII characters as PCRE-format regular expressions using the hexadecimal code assigned to that character in the UTF-8 specification. Symbols and characters within the normal ASCII character set, which is assigned single, two-digit codes in that character set, are assigned the same codes in the UTF-8 character set. For example, the exclamation point (\!), which is assigned hex code 21 in the ASCII character set, is also hex 21 in the UTF-8 character set. Symbols and characters from another supported character set have a paired set of hexadecimal codes assigned to them in the UTF-8 character set. For example, the letter a with an acute accent (á) is assigned UTF-8 code C3 A1.

The syntax you use to represent these UTF-8 codes in the Web App Firewall configuration is “\xNN” for ASCII characters; “\xNN\xNN” for non-ASCII characters used in English, Russian, and Turkish; and “\xNN\xNN\xNN” for characters used in Chinese, Japanese, and Korean. For example, if you want to represent a ! in a Web App Firewall regular expression as a UTF-8 character, you would type \x21. If you want to include an á, you would type \xC3\xA1.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE:

Normally you do not need to represent ASCII characters in UTF-8 format, but when those characters might confuse a web browser or an underlying operating system, you can use the character's UTF-8 representation to avoid this confusion. For example, if a URL contains a space, you might want to encode the space as \x20 to avoid confusing certain browsers and web server software.

Below are examples of URLs, form field names, and safe object expressions that contain non-ASCII characters that must be entered as PCRE-format regular expressions to be included in the Web App Firewall configuration. Each example shows the actual URL, field name, or expression string first, followed by a PCRE-format regular expression for it.

- A URL containing extended ASCII characters.

  Actual URL: `http://www.josénuñez.com` Encoded URL: `\^http://www[.]jos\xC3\xA9nu\xC3\xB1ez[.]com$`

- Another URL containing extended ASCII characters.

  Actual URL: `http://www.example.de/trömso.html` Encoded URL: `\^http://www[.]example[.]de/tr\xC3\xB6mso[.]html$`

  A form field name containing extended ASCII characters.

  Actual Name: nome_do_usuário Encoded Name: \^nome_do_usu\xC3\xA1rio$

- A safe object expression containing extended ASCII characters.

  Unencoded Expression {3,6}¥1-9\][0-9]{6,6} Encoded Expression: [A-Z]{3,6}\xC2\xA5\[1-9{6,6}

You can find several tables that include the entire Unicode character set and matching UTF-8 encodings on the Internet. A useful website that contains this information is available in the following table.

`http://www.utf8-chartable.de/unicode-utf8-table.pl`

For the characters in the table on this website to display correctly, you must have an appropriate Unicode font installed on your computer. If you do not, the visual display of the character may be in error. Even if you do not have an appropriate font installed to display a character, however, the description and the UTF-8 and UTF-16 codes on this set of webpages are correct.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Whitehat WASC signature types for WAF use

The NetScaler Web App Firewall accepts and generates blocking rules for all vulnerability types that the Whitehat scanners generate. However, certain vulnerabilities are most applicable to a web App Firewall. Following are lists of those vulnerabilities, categorized by whether they are addressed by WASC 1.0, WASC 2.0, or best practices signature types.

WASC 1.0 signature types

- HTTP Request Smuggling
- HTTP Response Splitting
- HTTP Response Smuggling
- Null Byte Injection
- Remote File Inclusion
- URL Redirector Abuse

WASC 2.0 signature types

- Abuse of Functionality
- Brute Force
- Content Spoofing
- Denial of Service
- Directory Indexing
- Information Leakage
- Insufficient Anti-automation
- Insufficient Authentication
- Insufficient Authorizatio
- Insufficient Session Expiration
- LDAP Injection
- Session Fixation

Best Practices

- Autocomplete Attribute
- Insufficient Cookie Access Control
- Insufficient Password Strength

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Invalid HTTP Method Usage
- Non-HttpOnly Session Cookie
- Persistent Session Cookie
- Personally Identifiable Information
- Secured Cachable HTTP Messages
- Unsecured Session Cookie

Streaming support for request processing

NetScaler Web App Firewall supports request side streaming to provide a significant performance boost. Instead of buffering a request, the appliance examines the incoming traffic for security violation such as SQL, cross-site scripting, field consistency, field formats. When the appliance completes processing data for a field, the request is forwarded to the back-end server while the appliance continues to evaluate other fields. This data processing significantly improves the processing time in handling forms have many fields.

Citrix® recommends you to enable streaming for payload content greater than 20MB. Also, the back-end server must accept the chunked requests if streaming is enabled.

NOTE:

Post Body Limit action is always set to block and is applicable for both streaming and non-streaming modes. If the incoming traffic is greater than 20MB, Citrix recommends you configure the `PostBodyLimit` to the expected value.

Although the streaming process is transparent to the users, minor configuration adjustments are required due to the following changes:

RegEx Pattern Match: RegEx pattern match is now restricted to 4K for contiguous character string match.

Field Name Match: The Web App Firewall learning engine can only distinguish the first 128 bytes of the name. If a form has multiple fields with names that have an identical string match for the first 128 bytes, the learning engine does not distinguish them. Similarly, the deployed relaxation rule might inadvertently relax all such fields.

Removal of white spaces, percent decoding, Unicode decoding, and charset conversion are done during canonicalization to provide security check inspection. The 128 byte limit is applicable for the canonicalized representation of the field name in UTF-8 character format. The ASCII characters

© 1997–2026 Citrix Systems, Inc. All rights reserved.

are 1 byte in length but the UTF-8 representation of the characters in some international languages might range from 1 byte to 4 bytes. If each character in a name takes 4 bytes for converting to UTF-8 format, only the first 32 characters in the name might be distinguished by the learned rule.

Field Consistency Check: When you enable Field Consistency, all the forms in the session are stored based on the "as_fid" tag inserted by the Web App Firewall without considering the "action_url."

- **Mandatory Form tagging for Form Field consistency:** When the field consistency check is enabled, the form tag must be enabled also. The Field Consistency protection might not work if form tagging is turned off.
- **Sessionless Form Field Consistency:** The Web App Firewall no longer carries out the "GET" to "POST" conversion of forms when the sessionless field consistency parameter is enabled. The form tag is required for sessionless field consistency also.
- **Tampering of as_fid:** If a form is submitted after tampering as_fid, it triggers field consistency violation even if no field was tampered. In non-streaming requests, this was allowed because the forms can be validated using the "action_url" stored in the session.

Signatures: The signatures now have the following specifications:

- **Location:** It is now a mandatory requirement that location must be specified for each pattern. All patterns in the rule **MUST** have a `<Location>` tag.
- **Fast Match:** All signature rules must have a fast match pattern. If there is no fast match pattern, an attempt is made to select one if possible. Fast match is a literal string but `PCRE` can be used for fast match if they contain a usable literal string.
- **Deprecated Locations:** Following locations are no longer supported in signature rules.
  - HTTP_ANY
  - HTTP_RAW_COOKIE
  - HTTP_RAW_HEADER
  - HTTP_RAW_RESP_HEADER
  - HTTP_RAW_SET_COOKIE

cross-site scripting/SQL Transform: Raw data is used for transformation because the SQL special characters such as single quote('), backslash (\), and semicolon (;)), and cross-site scripting tags are the same and do not require canonicalization of data. Representation of special

© 1997–2026 Citrix Systems, Inc. All rights reserved.

characters such as HTML entity encoding, percent encoding, or ASCII are evaluated for transform operation.

The Web App Firewall no longer inspects both the attribute name and value for the cross-site scripting transform operation. Now only cross-site scripting attribute names are transformed when streaming is engaged.

Processing cross-site scripting Tags: As part of the streaming changes in NetScaler 10.5.e build and later, the processing of the cross-site scripting tags has changed. In earlier releases, the presence of either open bracket (<), or close bracket (>), or both open and close brackets (<>) was flagged as cross-site scripting Violation. The behavior has changed in 10.5.e build onwards. Presence of only the open bracket character (<), or only the close bracket character (>) is no longer considered as an attack. This is when an open bracket character (<) is followed by a close bracket character (>), the Cross-site scripting attack gets flagged. Both characters must be present in the right order (< followed by >) to trigger the Cross-site scripting violation.

NOTE:

Change in SQL violation log Message: As part of the streaming changes in the NetScaler release 10.5.e onwards, we now process the input data in blocks. RegEx pattern matching is now restricted to 4K for contiguous character string matching. With this change, the SQL violation log messages might include different information compared to the earlier builds. The keyword and special character in the input are separated by many bytes. The appliance has a track of the SQL keywords and special strings when processing the data, instead of buffering the entire input value. In addition to the field name, the log message includes the SQL keyword, SQL special character, or both the SQL keyword and the SQL special character. The rest of the input is no longer included in the log message, as shown in the following example:

Example:

In 10.5, when the Web App Firewall detects the SQL violation, the entire input string might be included in the following log message:

SQL Keyword check failed for field **text=\"select a name from testbed1\;\\(\;\\)\".*\<blocked\>**

In 11.0, we log only the field name, keyword, and special character (if applicable) in the following log message.

SQL Keyword check failed for field `text="select(;)" <blocked>`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

This change is applicable to requests that contain **application/x-www-form-urlencoded**, or **multipart/form-data**, or **text/x-gwt-rpc** content-types. Log messages generated during processing of **JSON** or **XML** payloads are not affected in this change.
RAW POST Body: The security check inspections are always done on the RAW POST body.

Form ID: The Web App Firewall inserted "as_fid" tag, which is a computed hash of the form is longer unique for the user session. It is an identical value for a specific form irrespective of the user or the session.

Charset: If a request does not have a charset, the default charset specified in the application profile is used when processing the request.

Counters:

Counters with a prefix "se" and "appfwreq" are added to track the streaming engine and streaming engine request counters.

```
nsconsmg -d statswt0 -g se_err_
```

```
nsconsmg -d statswt0 -g se_tot_
```

```
nsconsmg -d statswt0 -g se_cur_
```

```
nsconsmg -d statswt0 -g appfwreq_err_
```

```
nsconsmg -d statswt0 -g appfwreq_tot_
```

```
nsconsmg -d statswt0 -g appfwreq_cur_
```

`_err counters`: indicate the rare event which must have succeeded but failed due to either memory allocation problem or some other resource crunch.

`_tot counters`: ever increasing counters.

`_cur counters`: counters indicating current values that keep changing based on usage from current transactions.

Tips:

- The Web App Firewall security checks must work the same as before.
- There is no set ordering for the processing of the security checks.
- The response side processing is not affected and remains unchanged.
- Streaming is not engaged if clientless VPN is used.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

IMPORTANT:

Calculating the Cookie length: In release 10.5.e in addition to NetScaler release 11.0 (in builds before 65.x), Web App Firewall way of processing the cookie header was changed. The appliance evaluated the cookie individually, and if the length of a cookie in the cookie header exceeded the configured length, the Buffer Overflow violation was triggered. As a result, requests blocked in the NetScaler 10.5 version or earlier releases might be allowed. The length of the entire cookie header is not calculated for determining the cookie length. In some situations, the total cookie size might be larger than the accepted value, and the server might respond with "400 Bad Request".

Note: The change has been reverted. The behavior in NetScaler version 10.5.e to version 59.13xx.e and its subsequent builds is similar to the non-enhancement builds of release 10.5. The entire raw Cookie header is now considered when calculating the length of the cookie. Surrounding spaces and the semicolon (;) characters separating the name-value pairs are also included in determining the cookie length.

Trace HTML requests with security logs

NOTE:

This feature is available in NetScaler release 10.5.e.

Troubleshooting requires analysis of data received in the client request and can be challenging. Especially if there is heavy traffic flowing through the appliance. Diagnosing issues might affect the functionality or application security might require a quick response.

The NetScaler isolates traffic for a Web App Firewall profile and collects `nstrace` for the HTML requests. The `nstrace` collected in appfw mode includes request details with log messages. You can use “Follow TCP stream” in the trace to view the details of the individual transaction including headers, payload, and the corresponding log message in the same screen.

This gives you a comprehensive overview regarding your traffic. Having a detailed view of the request, payload, and associated log records can be useful to analyze security check violation. You can easily identify the pattern that is triggering the violation. If the pattern must be allowed, you can take a decision to modify the configuration or add a relaxation rule.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Benefits

1. **Isolate traffic for specific profile**: This enhancement is useful when you isolate traffic for only one profile or specific transactions of a profile for troubleshooting. You no longer have to skim through the entire data collected in the trace or need special filters to isolate requests interest you which can be tedious with heavy traffic. You can view the data that you prefer.
2. **Collect data for specific requests**: The trace can be collected for a specified duration. You can collect trace for only a couple of requests to isolate, analyze, and debug specific transactions if needed.
3. **Identify resets or aborts**: Unexpected closing of connections is not easily visible. The trace collected in –appfw mode captures a reset or an abort, triggered by the Web App Firewall. This allows a quicker isolation of an issue when you do not see a security check violation message. Malformed requests or other non-RFC compliant requests terminated by Web App Firewall will now be easier to identify.
4. **View decrypted SSL traffic**: HTTPS traffic is captured in plain text to allow for easier troubleshooting.
5. **Provides comprehensive view**: Allows you to look at the entire request at the packet level, check the payload, look at the logs to check what security check violation is being triggered and identify the match pattern in the payload. If the payload consists of any unexpected data, junk strings, or non-printable characters (null character, \r or \n and so forth), they are easy to discover in the trace.
6. **Modify configuration**: The debugging can provide useful information to decide if the observed behavior is the correct behavior or the configuration must be modified.
7. **Expedite response time**: Faster debugging on target traffic can improve the response time to provide explanations or root cause analysis by the NetScaler® engineering and support team.

For more information, see Manual Configuration by using the command line interface topic.

To configure debug tracing for a profile by using the command line interface

Step 1. Enable ns trace.

You can use the show command to verify the configured setting.

- `set appfw profile <profile> -trace ON`

Step 2. Collect trace. You can continue to use all the options which are applicable for the `nstrace` command.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- `start nstrace -mode APPFW`

Step 3. Stop trace.

- `stop nstrace`

Location of the trace: The `nstrace` is stored in a time-stamped folder which is created in the /var/nstrace directory and can be viewed using `wireshark`. You can tail the `/var/log/ns.log` to see the log messages providing details regarding the location of the new trace.

Tips:

- When the appfw mode option is used, the `nstrace` will only collect the data for one or more profiles for which the “nstrace” was enabled.
- Enabling the trace on the profile will not automatically start collecting the traces until you explicitly run the “start ns trace” command to collect the trace.
- Although enabling trace on a profile may not have any adverse effect on the performance of the Web App Firewall but you may want to enable this feature only for the duration for which you want to collect the data. It is recommended that you turn the –trace flag off after you have collected the trace. The option prevents the risk of inadvertently getting data from profiles for which you had enabled this flag in the past.
- The block or log action must be enabled for the security check for the transaction record to be included in the `nstrace`.
- Resets and aborts are logged independently of security checks actions when trace is “On” for the profiles.
- The feature is only applicable for troubleshooting the requests received from the client. The traces in –appfw mode do not include the responses received from the server.
- You can continue to use all the options which are applicable for the `nstrace` command. For example,

  `start nstrace -tcpdump enabled -size 0 -mode appFW`
- If a request triggers multiple violations, the `nstrace` for that record includes all the corresponding log messages.
- CEF log message format is supported for this functionality.
- Signature violations triggering block or log action for request side checks will also be included in the trace.
- Only HTML (non-XML) requests are collected in the trace.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Web App Firewall support for cluster configurations

NOTE:

NetScaler Web App Firewall for striped and partially striped configurations was introduced in NetScaler 11.0 version.

A cluster is a group of NetScaler appliances configured and managed as a single system. Each appliance in the cluster is called a node. Depending on the number of nodes the configurations are active on, cluster configurations are referred to as striped, partially striped, or spotted configurations. The Web App Firewall is fully supported in all configurations.

The two main advantages of striped and partially striped virtual server support in cluster configurations are the following:

1. Session failover support—striped and partially striped virtual server configurations support session failover. The advanced Web App Firewall security features, such as Start URL closure and the Form Field Consistency check, maintain, and use sessions during transaction processing. In a high availability configuration, or in a spotted cluster configuration, when the node that is processing the Web App Firewall traffic fails, all the session information is lost and the user has to re-establish the session. In striped virtual server configurations, user sessions are replicated across multiple nodes. If a node goes down, a node running the replica becomes the owner. Session information is maintained without any visible impact to the user.
2. Scalability—Any node in the cluster can process the traffic. Multiple nodes of the cluster can process the incoming requests served by the striped virtual server. This improves the Web App Firewall's ability to handle multiple simultaneous requests, thereby improving the overall performance.

Security checks and signature protections can be deployed without the need for any additional cluster-specific Web App Firewall configuration. You can do the usual Web App Firewall configuration on the configuration coordinator (CCO) node for propagation to all the nodes.

NOTE:

The session information is replicated across multiple nodes, but not across all the nodes in the striped configuration. Therefore, failover support accommodates a limited number of simultaneous failures. If multiple nodes fail simultaneously, the Web App Firewall might lose the session information if a failure occurs before the session is replicated on another node.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Highlights

- Web App Firewall offers scalability, high throughput, and session failover support in cluster deployments.
- All Web App Firewall security checks and signature protections are supported in all cluster configurations.
- Character-maps are not yet supported for a cluster. The learning engine recommends Field-Types in learned rules for the Field Format security check.
- Stats and learned rules are aggregated from all the nodes in a cluster.
- Distributed Hash Table (DHT) provides the caching of the session and offers the ability to replicate session information across multiple nodes. When a request comes to the virtual server, the NetScaler appliance creates Web App Firewall sessions in the DHT, and can also retrieve the session information from the DHT.
- Clustering is licensed with the Advanced and Premium licenses. This feature is not available with the Standard license.

Debugging and troubleshooting

Refer to the following troubleshooting and debugging information related to each of the Web App Firewall functionality:

- Application Firewall - High CPU
- Memory
- Large File Upload Failure
- Learning
- Signatures
- Trace log
- Miscellaneous

High CPU

Following are some of the functionality and high CPU related debugging issues encoutered and the best practices to follow when working with Web App Firewall:

Check Policy hits, Bindings, Network configuration, Web App Firewall configuration:

- Identify misconfiguration

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Identify *vserver* that is serving the affected traffic

Inspect logs in the following log files for security violations and recent configuration changes:

- `/var/log/ns.log`
- `/var/nslog/import.log`
- `/var/nslog/aslearn.log`
- `tail -f /var/log/ns.log | grep APPFW_SIGNATURE_MATCH`

Example:

```
Jun 13 01:11:09 <local0.info> 10.217.31.98 CEF:0|Citrix|NetScaler|NS11.0|
APPFW| APPFW_SIGNATURE_MATCH|6|src=10.217.253.62 spt=61141 method=GET
request= http://aaron.stratum8.net/FFC/wwwboard/passwd.txt msg=Signature
violation rule ID 807: web-cgi /wwwboard/passwd.txt access cn1=140 cn2=841
cs1=pr_ffc cs2=PPE0 cs3=OyTgjbXBqcpBFeENKDlde3OkMQ00001 cs4=ALERT cs5=2015
cs6=web-cgi act=not blocked
```

Isolate the traffic that is effected:

- Isolate the profile
- Isolate the security check
- Isolate the URL, virtual server and traffic parameters

Conditional profile level trace helps identify the traffic and violation records:

- `set appfw profile <profile> -trace ON`
- `start nstrace -mode APPFW -size 0`
- `stop nstrace`

Note: Ensure that the trace is collected with -size 0 option.

Check appfw, dht, IP reputation activity counters:

- `nsconmsg -g as_ -g appfwreq_ -g iprep -d current`

Monitor window size for resets in connection:

Appfw sets the window size to 9845 when NetScaler resets the connection due to an invalid http message.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Examples:

- Malformed request received - connection reset
- High CPU related issues
- Check data sheets for system limits
- Inspect for cpu usage, appfw, DHT and memory related activity. Monitor appfw sessions
- nsconmsg -g cc_cpu_use -g appfwreq -g as -g dht -g mem_AS_OBJ -g mem_AS_COMPONENT -d current

Monitor memory allocated and freed from Web App Firewall components and objects during the target time period. It helps in isolating the protection leading to high CPU usage.

- Profiler output
- Observe logs

Isolate appfw check leading to high CPU:

- startURLClosure
- Formfiledconsistency
- CSRF
- Cookie protections
- Referer header check

Ascertain that autoupdate of signatures is not leading to high CPU (Disable to confirm).

Memory

Following are some of the best practices to follow when encountered with Web App Firewall usage memory related issues:

nsconmsg command usage:

- Look for global memory statistics to ascertain that there is enough memory in the system and there are no memory allocation failures by executing the following command:

  ```
  * *- nsconmsg -d memstats
  ```

- Observe current allocated and maximum memory limits for appsecure, IP reputation, cache and compression by executing the following command:

  ```
  nsconmsg -d memstats | egrep -i APPSECURE|IPREP|CACHE|CMP
  ```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Check appfw, DHT, IP reputation activity counters by executing the following command:

  ```
  nsconmsg -g as -g appfwreq_ -g iprep -d current
  ```

- Check all Web App Firewall error counters by executing the following command:

  ```
  nsconmsg -g as_ -g appfwreq_ -g iprep_ -d stats | grep err
  ```

- Check all system error counters by executing the following command:

  ```
  nsconmsg -g err -d current
  ```

- Inspect for CPU, APPFWREQ, AS and DHT counters by executing the following command:

  ```
  nsconmsg -g cc_cpu_use -g appfwreq -g as -g dht -d current
  ```

- Check the configured Cache memory by executing the following command:
- `show cacheparameter`
- Check the configured memory by executing the following command:

  ```
  nsconmsg -d memstats | egrep -i CACHE
  ```

- Identify distribution of memory in Web App Firewall components and objects:

Display AS_OBJ_ memory:

```
nsconmsg -K newnslog -d stats | grep AS_OBJ | egrep -v AppFW_cpu0|total | sort -k3
```

Display AS_COMPONENT_ memory:

```
nsconmsg -K newnslog -d stats | grep AS_COMPONENT | egrep -v AppFW_cpu0|total | sort –k3
```

Check for number of alive sessions by executing the following command:

Monitor/plot active session counts:

```
nsconmsg -g as_alive_sessions -d current
```

Monitor/plot total allocated, free, updated sessions:

- `nsconmsg -g as_tot_alloc_sessions -g as_tot_free_sessions -d current`
- `nsconmsg -g as_tot_update_sessions -d current`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

If required, reduce session timeout to ensure that session limits are not used by executing the following command:

```
set appfwsettings -sessionTimeout <300>
```

If required, set maximum lifetime of session by executing the following command:

```
set appfwsettings -sessionLifetime <7200>
```

Checking allocated and used memory

To check the total allocated memory and used memory:

- Use the **nsconmsg –d memstats** command. Observe the **MEM_APPSECURE** field.
- Use the **stat appfw** command to obtain meory consumption information.

Web App Firewall does not automatically delete the logs after certain period of time or size.

- `All AppFw logs are archived in the */var/log/ns.log*` file. The *ns.log* file performs the rollover task.

For more information, refer to the following link: `<http://support.citrix.com/article/CTX121898>`

Increasing Web App Firewall memory:

- There is no CLI option to increase Web App Firewall memory. Web App Firewall memory is platform-specific.
- You may use the *nsapimgr* option to increase memory but it is not recommended.

The max allowed memory for Web App Firewall is determined by the platform and disabling IC does not impact memory allocation.

Large file upload failures

When you encounter large file upload failures, ensure that you check the following:

- Misconfigured application firewall postbody limit.
- Enabled file upload scanning leading to increased processing time.
- Hitting system limits.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

For payloads greater than 19 MB, we recommend you to enable streaming on the application firewall profile. Ensure that the back-end server supports chunked requests before enabling streaming.

Learning

Following are some of the best practices recommended when encountered with Learning functionality issues:

Aslearn process:

- Verify that the process *aslearn* is running.
- Check top command output
- Check output of ps command by executing the following command:

  `ps -ax | grep aslearn | grep -v "grep"`

  Example:

  ```
  root@ns\# ps -ax | grep aslearn | grep -v "grep"

  1439  ??  Ss     0:03.86 /netscaler/aslearn -start -f /netscaler/
  aslearn.conf
  ```

- Identify recent configuration commands ran prior to the observed problem by verifying the *ns.log* file:

  `/var/log/ns.log`

- Inspect aslearn logs to check for aslearn messages:

  `/var/nslog/aslearn.log`

- Isolate the profile and security check that is effected
- Identify the GUI and CLI command which is failing by executing the following command:

  `show appfw learningdata <profileName> <securityCheck>`

  Examples:

  - `show learningdata test_profile starturl`
  - `show learningdata test_profile crosssiteScripting`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- `show learningdata test_profile sqLInjection`
- `show learningdata test_profile csRFtag`
- `show learningdata test_profile fieldformat`
- `show learningdata test_profile fieldconsistency`

- Perform integrity check of sqlite from bsd shell prompt:

```
nsshell # sqlite3 /var/nslog/asl/<profile_name_in_lowercase>.db 'pragma integrity_check;`
```

Examples:

```
root@ns# sqlite3 /var/nslog/asl/tsk0247284.db 'pragma integrity_check;'

ok
```

- Deploy or remove rules to start learning again:
  - If 2000 learn items (per protection) are reached, you cannot start learning any more for that protection
  - If 20 MB size is reached for the database, stop learning for all protections
  - Restart aslearn process

`/netscaler/aslearn -start -f /netscaler/aslearn.conf`

- Check the space in the /var folder by executing the following:

`df -h`

- Check the learning threshold limits by executing the following command:

`show appfwlearningsettings <profile_name> <securityCheck>`

- Collect learned data by executing the following command:

`export appfwlearningdata <profile_name> <securityCheck>`

- Ascertain that learned data is uploaded in the collector.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Signatures

Getting started with signatures

To add signature:

1. Select the **Default**-signature and click **add** to make a copy.
2. Give a meaningful name. The new sig object is added as a User-Defined object.
3. Enable the target rules that are pertinent to your specific need.
    - The rules are disabled by default.
    - more rules require more processing
4. Configure the actions:

    Block and Log actions are enabled by default. Stats is another option
5. Set the signature to be used by your profile.

Tips for Using Signatures

- Optimize the processing overhead by enabling only those signatures that are applicable for protecting your application.
- Every pattern in the rule must match to trigger a signature match.
- You can add your own customized rules to inspect incoming requests to detect various types of attacks, such as SQL injection or cross-site scripting attacks.
- You can also add rules to inspect the responses to detect and block leakage of sensitive information such as credit card numbers.
- Add multiple security check conditions to create your own customized check.

Best Practices for Using Signatures

Following are some of the best practices you can follow when encountered with issues related to Signatures:

- Verify that the import command has succeeded on primary as well as secondary.
- Verify that CLI and GUI outputs are consistent.
- Check ns.log to identify any errors during signature import and auto update.
- Check if the DNS name server is configured properly.
- Check schema version incompatibility.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Check if the device is unable to access the Signature Update URL hosted on AWS for auto-update.
- Check for the version mismatch between Default signature and user-added ones.
- Check for version mismatch between signature objects on the primary and secondary nodes.
- Monitor for High CPU Utilization (disable auto-update to rule out issue with signature update).

Trace Log

To record trace logs:

1. Enable tracing for the profile. You can use the show command to verify the configured setting.

```
set appfw profile <profile> -trace ON
```

1. Start collecting trace. You can continue to use all the options which are applicable for the nstrace command.

```
start nstrace -mode APPFW
```

1. Stop collecting the trace

```
stop nstrace
```

Location of the trace: The nstrace is stored in a time-stamped folder which is created in the */var/nstrace* directory and can be viewed using wireshark. You can tail the */var/log/ns.log* file to see the log messages providing details regarding the location of the new trace.

Advantages of trace logs:

- Isolate traffic for specific profile
- Collect data for specific requests
- Identify resets or aborts
- View decrypted SSL traffic: HTTPS traffic is captured in plain text to allow for easier troubleshooting.
- Provides comprehensive view: Allows you to look at the entire request at the packet level, check the payload, view logs to check what security check violation is being triggered and identify the match pattern in the payload. If the payload consists of any unexpected data, junk strings, or non-printable characters (null character, \r or \n etc), they are easy to discover in the trace.
- Expedite response time: Faster debugging on target traffic to do root cause analysis.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Miscellaneous

Following are the resolutions for some of the issues that you might encounter when using Web App Firewall.

- Web App Firewall sets window size to 9845 when resetting connection for invalid http messages.

  – Malformed request received - connection reset – Unknown content-type in request headers

- System Limit: the application appears frozen

  – Occurs when maximum session limit is reached. (100K) – Less system memory for operation.

    - IP Reputation feature not working – The iprep process takes about five minutes to start after you enable the reputation feature. The IP reputation feature might not work for that duration.

- Unexpected Web App Firewall violations being triggered

  – Session timeout has a default value of 900 seconds. If session timeout is set to a low value, browser may trigger false positives for checks which rely on sessionization (e.g CSRF, FFC). Check for session timeout and look at the session ID (cs3 in CEF logs). If the sessionID is different, the session timeout might be the reason. – If form is dynamically generated by javascript, it may trigger false FFC violations.

- Empty field name in FFC violation logs (prior to 11.0 release)

  This may be seen in scenarios where we come across a form field which is not in the forms in our session.

  Scenarios where this may occur:

  – The session has timed out from when the form was sent to the client and when it was received. – The form was generated on the client side using a java script.

Signature alert Articles

NetScaler Web App Firewall (WAF) announces signature updates that you can download and apply on your appliance. When you detect a security attack, you will receive an email notification about the new signature update. You can download the signature and apply it on your appliance.

How to receive signature alert notification

This article explains how to subscribe to RSS feeds to receive notifications for new signature updates. Once subscribed, you receive regular RSS feeds whenever new signatures are available for download.

NOTE:

- To get updates about Web App Firewall signatures, you must configure the signature auto-update feature. For more information, see Signature Auto Update topic.
- To get updates about new bot signatures, you must configure the bot signature auto-update feature. For more information, see Bot Signature Auto Update topic.

To subscribe to RSS feeds for new signature updates, follow the steps given below:

1. Open the Signature alert article document history topic on a web browser.
2. On the top right of the page, click the RSS button and copy the RSS feed URL.
3. Add the copied RSS feed URL to a desired RSS feed reader.

Signature update version 183

New signatures rules are generated for the vulnerabilities identified in the week 2026-09-15. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 183 applicable for Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998078	CVE-2026-48282	WEB-MISC Adobe ColdFusion - Arbitrary File Upload Vulnerability (CVE-2026-48282)
998079	CVE-2026-9586	WEB-MISC Sangoma Switchvox Prior to 8.4.0.2 - Unauthenticated SQL Injection Vulnerability (CVE-2026-9586)
998080	CVE-2026-71362	WEB-MISC Adobe Magento - Incorrect Authorization Vulnerability via createpost (CVE-2026-71362)
998081	CVE-2026-71362	WEB-MISC Adobe Magento - Incorrect Authorization Vulnerability via editpost (CVE-2026-71362)
998082	CVE-2026-32475	WEB-WORDPRESS Elementor Pro Prior to 4.2.2 - Arbitrary File Upload Vulnerability (CVE-2026-32475)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Signature update version 182

New signatures rules are generated for the vulnerabilities identified in the week 2026-09-01. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 182 applicable for Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998083	CVE-2026-63077	WEB-MISC JetBrains TeamCity Prior to 2025.11.7 or 2026.1.3 - Deserialization of Untrusted Data Vulnerability (CVE-2026-63077)
998084	CVE-2026-72898	WEB-MISC Metabase Multiple Versions - SQL Injection Vulnerability (CVE-2026-72898)
998085	CVE-2026-48907	WEB-MISC Joomla JCE Editor Prior to 2.9.99.5 - Authentication RCE Vulnerability via component (CVE-2026-48907)
998086	CVE-2026-48908	WEB-MISC Joomla SP Page Builder Prior to 6.6.2 - Arbitrary File Upload

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
		Vulnerability via component (CVE-2026-48908)
998087	CVE-2026-56290	WEB-MISC Joomla Page Builder CK Prior to 3.6.0 - Arbitrary File Upload Vulnerability via component (CVE-2026-56290)
998088	CVE-2026-64638	WEB-WORDPRESS CORE Prior to 7.0.3 - XSS Vulnerability (CVE-2026-64638)
998089	CVE-2026-65640	WEB-WORDPRESS WordPress Core Prior to 7.0.4 - Arbitrary Code Execution Vulnerability Via media-new (CVE-2026-65640)
998090	CVE-2026-65640	WEB-WORDPRESS WordPress Core Prior to 7.0.4 - Arbitrary Code Execution Vulnerability Via async-upload (CVE-2026-65640)

Signature update version 181

New signatures rules are generated for the vulnerabilities identified in the week 2026-08-18. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 181 applicable for Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998091	CVE-2026-48939	WEB-MISC Joomla iCagenda Prior to 3.9.15 or 4.0.8 - Arbitrary File Upload Vulnerability via component (CVE-2026-48939)
998092	CVE-2026-48939	WEB-MISC Joomla iCagenda Prior to 3.9.15 or 4.0.8 - Arbitrary File Upload Vulnerability (CVE-2026-48939)
998093	CVE-2026-60137	WEB-WORDPRESS CORE Prior to 6.8.6, 6.9.5 and 7.0.2 - SQL Injection Vulnerability Via rest_route (CVE-2026-60137)
998094	CVE-2026-60137	WEB-WORDPRESS CORE Prior to 6.8.6, 6.9.5 and 7.0.2 - SQL Injection Vulnerability (CVE-2026-60137)
998095	CVE-2026-56291	WEB-MISC Joomla Balbooa Forms Prior to 2.4.1 - Arbitrary File Upload Vulnerability via component (CVE-2026-56291)
998096	CVE-2026-56291	WEB-MISC Joomla Balbooa Forms Prior to 2.4.1 - Arbitrary File Upload

SIGNATURE RULE	CVE ID	DESCRIPTION
		Vulnerability (CVE-2026-56291)
998097	CVE-2026-50522	WEB-MISC Microsoft Sharepoint Server - Unauthenticated Deserialization of Untrusted Data Vulnerability (CVE-2026-50522)
998098	CVE-2026-9103, CVE-2026-9198	LLM Langflow Prior to 1.10.1 - Information Disclosure Vulnerability (CVE-2026-9103, CVE-2026-9198)

Signature update version 180

New signatures rules are generated for the vulnerabilities identified in the week 2026-08-04. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 180 applicable for Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
998099	CVE-2026-16723	WEB-MISC FastJson Prior to 1.2.84 - RCE Vulnerability (CVE-2026-16723)
998100	CVE-2026-61511	WEB-MISC vBulletin Up to 5.7.5 or 6.2.1 - Remote Code Execution Vulnerability via routestring (CVE-2026-61511)
998101	CVE-2026-61511	WEB-MISC vBulletin Up to 5.7.5 or 6.2.1 - Remote Code Execution Vulnerability (CVE-2026-61511)
998102	CVE-2026-56290	WEB-MISC Joomla Page Builder CK Prior to 3.6.0 - Arbitrary File Upload Vulnerability (CVE-2026-56290)
998103	CVE-2026-39987	WEB-MISC Marimo Prior to 0.23.0 - Pre-Auth Remote Code Execution Vulnerability (CVE-2026-39987)

Signature update version 179

New signatures rules are generated for the vulnerabilities identified in the week 2026-07-21. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 179 applicable for Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

SIGNATURE RULE	CVE ID	DESCRIPTION
		Description Field and SOAP (CVE-2026-47634)
998113	CVE-2026-47634	WEB-MISC Microsoft SharePoint Server - Stored XSS Vulnerability Via Description Field and REST (CVE-2026-47634)
998114	CVE-2026-47634	WEB-MISC Microsoft SharePoint Server - Stored XSS Vulnerability Via Description Field and CSOM SetProperty (CVE-2026-47634)
998115	CVE-2026-47634	WEB-MISC Microsoft SharePoint Server - Stored XSS Vulnerability Via Description Field and CSOM Property (CVE-2026-47634)
998116	CVE-2026-44127	WEB-MISC SeppMail Prior to 15.0.4 - Unauthenticated Path Traversal Vulnerability (CVE-2026-44127)
998117	CVE-2026-7864	WEB-MISC SeppMail Prior to 15.0.4 - Unauthenticated Information Disclosure Vulnerability (CVE-2026-7864)
998118	CVE-2026-48907	WEB-MISC Joomla JCE Editor Prior to 2.9.99.5 - Unauthenticated RCE Vulnerability (CVE-2026-48907)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Signature update version 177

New signatures rules are generated for the vulnerabilities identified in the week 2026-06-23. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 177 applicable for Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998119	CVE-2026-34653	WEB-MISC Adobe Magento - Path Traversal Vulnerability (CVE-2026-34653)
998120	CVE-2025-59360	WEB-MISC Chaos Controller Manager - OS Command Injection Vulnerability via killProcesses (CVE-2025-59360)
998121	CVE-2026-34647	WEB-MISC Adobe Magento multiple versions - SSRF Vulnerability (CVE-2026-34647)
998122	CVE-2026-42271	LLM BerriAI LiteLLM Prior to 1.83.7 - Command Injection Vulnerability via /tools/list (CVE-2026-42271)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
998123	CVE-2026-42271	LLM BerriAI LiteLLM Prior to 1.83.7 - Command Injection Vulnerability via /connection (CVE-2026-42271)
998124	CVE-2026-2743	WEB-MISC SeppMail Prior to 15.0.3 - Arbitrary File Write Via Path Traversal Vulnerability (CVE-2026-2743)
998125	CVE-2025-59361	WEB-MISC Chaos Controller Manager - OS Command Injection Vulnerability via cleanIptables (CVE-2025-59361)
998126	CVE-2025-59359	WEB-MISC Chaos Controller Manager - OS Command Injection Vulnerability via cleanTcs (CVE-2025-59359)

Signature update version 176

New signatures rules are generated for the vulnerabilities identified in the week 2026-06-10. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 176 applicable for Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler CPU.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998127	CVE-2026-26980	WEB-MISC Ghost CMS - SQL Injection Vulnerability (CVE-2026-26980)
998128	CVE-2026-9082	WEB-MISC Drupal Core Multiple Versions - Unauthenticated SQL Injection Vulnerability Via JSON:API (CVE-2026-9082)
998129	CVE-2026-9082	WEB-MISC Drupal Core Multiple Versions - Unauthenticated SQL Injection Vulnerability Via login (CVE-2026-9082)

Signature update version 175

New signatures rules are generated for the vulnerabilities identified in the week 2026-06-05. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 175 applicable for Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

NOTE:

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998173	CVE-2026-24423	WEB-MISC SmarterTools SmarterMail Prior to Build 9511 - Unauthenticated Remote Code Execution Vulnerability (CVE-2026-24423)
998174	CVE-2025-52691	WEB-MISC SmarterTools SmarterMail Prior to Build 9413 - Unauthenticated Arbitrary File Upload Vulnerability (CVE-2025-52691)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
998175	CVE-2025-61678	WEB-MISC FreePBX Filestore Module Prior to 17.0.3 - OS Command Injection Vulnerability Via path (CVE-2025-64328)
998176	CVE-2025-61678	WEB-MISC FreePBX Filestore Module Prior to 17.0.3 - OS Command Injection Vulnerability Via key (CVE-2025-64328)
998177	CVE-2026-1357	WEB-WORDPRESS WPvivid Backup Prior To 0.9.124 - Unauthenticated Arbitrary File Upload Vulnerability (CVE-2026-1357)
998178	CVE-2025-35028	WEB-MISC HexStrike AI - Unauthenticated OS Command Injection Vulnerability (CVE-2025-35028)
998179	CVE-2025-2905	WEB-MISC WSO2 Multiple Products and Versions - XML External Entity Vulnerability (CVE-2025-2905)

Signature update version 169

New signatures rules are generated for the vulnerabilities identified in the week 2026-02-02. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 169 applicable for Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998180	CVE-2025-53967, CVE-2025-15061	LLM Figma-Context-MCP Prior to 0.6.3 - OS Command Injection Vulnerability Via nodeId (CVE-2025-53967, CVE-2025-15061)
998181	CVE-2025-53967, CVE-2025-15061	LLM Figma-Context-MCP Prior to 0.6.3 - OS Command Injection Vulnerability Via fileKey (CVE-2025-53967, CVE-2025-15061)
998182	CVE-2025-68613	WEB-MISC n8n Prior To 1.120.4, 1.121.1 and 1.122.0 - Remote Code Execution Vulnerability (CVE-2025-68613)
998183	CVE-2025-59155	LLM HackMD MCP Server Prior To 1.5.0 - Server-Side Request Forgery Vulnerability via form (CVE-2025-59155)
998184	CVE-2025-59155	LLM HackMD MCP Server Prior To 1.5.0 - Server-Side Request Forgery Vulnerability via header (CVE-2025-59155)
998185	CVE-2026-23760	WEB-MISC SmarterTools SmarterMail Prior to Build 9511 - Authentication Bypass

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
		Vulnerability (CVE-2026-23760)
998186	CVE-2025-59377	LLM Feiskyer Mcp-kubernetes-server Prior to 0.1.12 - OS Command Injection Vulnerability (CVE-2025-59377)
998187	CVE-2026-21858	WEB-MISC n8n Prior To 1.121.0 - Arbitrary File Read Vulnerability (CVE-2026-21858)

Signature update version 168

New signatures rules are generated for the vulnerabilities identified in the week 2026-01-08. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 168 applicable for Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998188	CVE-2024-8248, CVE-2024-10513	WEB-MISC anything-llm Prior To 1.2.2 - Path Traversal Vulnerability

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
		(CVE-2024-8248,CVE-2024-10513)
998189	CVE-2024-5211	WEB-MISC anything-llm Prior To 1.0.0 - Path Traversal Vulnerability (CVE-2024-5211)
998190	CVE-2024-13059	WEB-MISC anything-llm Prior To 1.3.1 - Path Traversal Vulnerability (CVE-2024-13059)
998191	CVE-2024-6825	WEB-MISC BerriAI LiteLLM - Remote Code Execution Vulnerability (CVE-2024-6825)
998192	CVE-2025-45809	WEB-MISC BerriAI LiteLLM - SQL Injection Vulnerability Via /key/unblock (CVE-2025-45809)
998193	CVE-2025-45809	WEB-MISC BerriAI LiteLLM - SQL Injection Vulnerability Via /key/block (CVE-2025-45809)
998194	CVE-2024-0759	WEB-MISC anything-llm Prior To 1.0.0 - SSRF Vulnerability (CVE-2024-0759)
998195	CVE-2024-6842	WEB-MISC anything-llm 1.5.5 - Information Disclosure Vulnerability (CVE-2024-6842)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Signature update version 167

New signatures rules are generated for the vulnerabilities identified in the week 2025-12-10. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 167 applicable for Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998196	CVE-2025-9501	WEB-WORDPRESS W3 Total Cache Plugin - Unauthenticated Remote Code Execution Vulnerability (CVE-2025-9501)
998197	CVE-2025-61757	WEB-MISC Oracle Identity Manager - Authentication Bypass Vulnerability (CVE-2025-61757)
998198	CVE-2025-10611	WEB-MISC WSO2 Multiple Products and Versions - Access Control Bypass Vulnerability (CVE-2025-10611)
998199	CVE-2025-11705	WEB-WORDPRESS Anti-Malware Security Prior To 4.23.81 - Arbitrary File Read

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
		Vulnerability (CVE-2025-11705)
998200	CVE-2025-61678	WEB-MISC FreePBX Multiple Versions - Arbitrary File Upload Via fwbrand (CVE-2025-61678)

Signature update version 166

New signatures rules are generated for the vulnerabilities identified in the week 2025-12-01. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 166 applicable for Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998201	CVE-2025-55182	WEB-MISC React Server Prior to 19.0.1, 19.1.1 and 19.2.1 - Remote Code Execution Vulnerability (CVE-2025-55182)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Signature update version 165

New signatures rules are generated for the vulnerabilities identified in the week 2025-11-26. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 165 applicable for Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998202	CVE-2025-56380	WEB-MISC ERPNext and Frappe Framework - SQL Injection Vulnerability Via JSON Payload (CVE-2025-56380)
998203	CVE-2025-56380	WEB-MISC ERPNext and Frappe Framework - SQL Injection Vulnerability Via fieldname (CVE-2025-56380)
998204	CVE-2025-56381	WEB-MISC ERPNext and Frappe Framework - SQL Injection Vulnerability Via JSON Payload (CVE-2025-56381)
998205	CVE-2025-56381	WEB-MISC ERPNext and Frappe Framework - SQL Injection Vulnerability Via group_by (CVE-2025-56381)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
998206	CVE-2025-56381	WEB-MISC ERPNext and Frappe Framework - SQL Injection Vulnerability Via order_by (CVE-2025-56381)
998207	CVE-2025-41243, CVE-2022-22947	WEB-MISC Spring Cloud Gateway Server Multiple Versions - Environment Property Modification Vulnerability (CVE-2025-41243)
998208	CVE-2025-9152	WEB-MISC WSO2 Multiple Products and Versions - Authentication Bypass Vulnerability (CVE-2025-9152)
998209	CVE-2025-53772	WEB-MISC Microsoft Web Deploy - Unsafe Deserialization Vulnerability (CVE-2025-53772)
998210	CVE-2025-11833	WEB-WORDPRESS POST SMTP Prior To 3.6.1 - Missing Authorization Vulnerability (CVE-2025-11833)

Signature update version 164

New signatures rules are generated for the vulnerabilities identified in the week 2025-11-05. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 164 applicable for Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998211	CVE-2025-61882	WEB-MISC Oracle E-Business Suite - Authentication Bypass Vulnerability Via SyncServlet (CVE-2025-61882)
998212	CVE-2025-59287	WEB-MISC Microsoft Windows Server Update Service - Remote Code Execution Vulnerability (CVE-2025-59287)
998213	CVE-2025-61884	WEB-MISC Oracle E-Business Suite - Unauthenticated RCE Vulnerability Via ieshostedsurvey.jsp (CVE-2025-61884)
998214	CVE-2025-61884	WEB-MISC Oracle E-Business Suite - Unauthenticated SSRF Vulnerability Via UiServlet (CVE-2025-61884)
998215	CVE-2025-3600	WEB-MISC Telerik UI for ASP.NET AJAX before 2025 Q1 SP2 - Unsafe Reflection Vulnerability (CVE-2025-3600)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
998216	CVE-2025-54236	WEB-MISC Adobe Magento - Improper Input Validation Vulnerability (CVE-2025-54236)

Signature update version 163

New signatures rules are generated for the vulnerabilities identified in the week 2025-10-16. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 163 applicable for Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998217	CVE-2025-10948	WEB-MISC MikroTik RouterOS 7 - Memory Corruption Vulnerability (CVE-2025-10948)
998218	CVE-2025-3515	WEB-WORDPRESS Drag and Drop Multiple File Upload Prior To 1.3.9.0 - Arbitrary File Uploads Vulnerability (CVE-2025-3515)
998219	CVE-2025-10035	WEB-MISC Fortra GoAnywhere MFT Prior to

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
		7.6.3 and 7.8.4 - License Servlet Deserialization Vulnerability (CVE-2025-10035)
998220	CVE-2025-53691	WEB-MISC SiteCore Up to 10.4 - Deserialization of Untrusted Data Vulnerability (CVE-2025-53691)
998221	CVE-2025-35939	WEB-MISC Craft CMS Prior to 5.7.5 and 4.15.3 - Unauthenticated Session Injection Vulnerability (CVE-2025-35939)

Signature update version 162

New signatures rules are generated for the vulnerabilities identified in the week 2025-10-01. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 162 applicable for Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998222	CVE-2025-32429	WEB-MISC XWiki Multiple Versions - SQL Injection

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
		Vulnerability (CVE-2025-32429)
998223	CVE-2025-53693	WEB-MISC SiteCore Up to 10.4 - Unauthenticated Unsafe Reflection Vulnerability (CVE-2025-53693)
998224	CVE-2025-34509	WEB-MISC SiteCore Up to 10.4 - Hardcoded ServicesAPI Credential via ItemService (CVE-2025-34509)
998225	CVE-2024-55661	WEB-MISC Laravel Pulse Prior to 1.3.1 - Code Injection Vulnerability (CVE-2024-55661)
998226	CVE-2025-57788	WEB-MISC Commvault Multiple Versions - Unauthorized API Access Vulnerability via *EventOrganizerPublicUser* (CVE-2025-57788)
998227	CVE-2025-57788	WEB-MISC Commvault Multiple Versions - Unauthorized API Access Vulnerability via *PublicSharingUser* (CVE-2025-57788)
998228	CVE-2025-24000	WEB-WORDPRESS Post SMTP Prior To 3.3.0 - Authentication Bypass Vulnerability via rest_route (CVE-2025-24000)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
998229	CVE-2025-24000	WEB-WORDPRESS Post SMTP Prior To 3.3.0 - Authentication Bypass Vulnerability via URL (CVE-2025-24000)

Signature update version 161

New signatures rules are generated for the vulnerabilities identified in the week 2025-09-17. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 161 applicable for Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler® CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998230	CVE-2024-54188	WEB-MISC Infoblox NETMRI Multiple Versions - Arbitrary File Disclosure Vulnerability (CVE-2024-54188)
998231	CVE-2025-57790	WEB-MISC Commvault Prior to 11.32.102 or 11.36.60 - Path Traversal Vulnerability via ExecuteQCommand (CVE-2025-57790)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
998232	CVE-2025-57790	WEB-MISC Commvault Prior to 11.32.102 or 11.36.60 - Path Traversal Vulnerability via QCommand in URL (CVE-2025-57790)
998233	CVE-2025-57790	WEB-MISC Commvault Prior to 11.32.102 or 11.36.60 - Path Traversal Vulnerability via QCommand in Body (CVE-2025-57790)
998234	CVE-2025-57819	WEB-MISC FreePBX Multiple Versions - Authentication Bypass Vulnerability (CVE-2025-57819)
998235	CVE-2025-57819	WEB-MISC FreePBX Multiple Versions - SQL Injection Vulnerability via Endpoint Module (CVE-2025-57819)
998236	CVE-2025-55209	WEB-MISC FreePBX Multiple Versions - Stored XSS Vulnerability (CVE-2025-55209)
998237	CVE-2024-52874	WEB-MISC Infoblox NETMRI Multiple Versions - SQL injection Vulnerability (CVE-2024-52874)
998238	CVE-2025-7847	WEB-WORDPRESS AI Engine Plugin Prior To 2.9.5 - Authenticated Arbitrary File Upload Vulnerability Via rest_route (CVE-2025-7847)
998239	CVE-2025-7847	WEB-WORDPRESS AI Engine Plugin Prior To 2.9.5 - Authenticated Arbitrary File

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
		Upload Vulnerability (CVE-2025-7847)

Signature update version 160

New signatures rules are generated for the vulnerabilities identified in the week 2025-09-03. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 160 applicable for Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler® CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998240	CVE-2025-27892	WEB-MIS Shopware PriorTo 6.5.8.13 - SQL Injection Vulnerability (CVE-2025-27832)
998241	CVE-2025-32814	WEB-MISC Infoblox NETMRI Multiple Versions - Unauthenticated SQL injection Vulnerability (CVE-2025-32814)
998242	CVE-2025-54788	WEB-MISC SuiteCRM Prior to 7.14.7 - SQL Injection Vulnerability (CVE-2025-54788)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
998243	CVE-2025-57791	WEB-MISC Commvault Prior to 11.32.102 or 11.36.60 - Argument Injection Vulnerability (CVE-2025-57791)
998244	CVE-2024-29198	WEB-MISC GeoServer Prior to 2.24.4 and 2.25.2 - Unauthenticated SSRF Vulnerability (CVE-2024-29198)

Signature update version 159

New signatures rules are generated for the vulnerabilities identified in the week 2025-08-20. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 159 applicable for Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler® CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998245	CVE-2025-2749	WEB-MISC Kentico CMS Up to 13.0.178 - Arbitrary File Upload Vulnerability (CVE-2025-2749)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
998246	CVE-2025-20283	WEB-MISC Cisco ISE - Deserialization of Untrusted Data RCE Vulnerability (CVE-2025-20283)
998247	CVE-2025-47812	Wing FTP Server Prior To 7.4.4 - RCE Vulnerability Via Body (CVE-2025-47812)
998248	CVE-2025-47812	Wing FTP Server Prior To 7.4.4 - RCE Vulnerability Via URL (CVE-2025-47812)
998249	CVE-2025-20284	WEB-MISC Cisco ISE - Deserialization of Untrusted Data RCE Vulnerability (CVE-2025-20284)

Signature update version 158

New signatures rules are generated for the vulnerabilities identified in the week 2025-08-06. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 158 applicable for Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler® CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
998250	CVE-2024-38018	WEB-MISC Microsoft SharePoint Server - Remote Code Execution Vulnerability (CVE-2024-38018)
998251	CVE-2025-20281	WEB-MISC Cisco ISE - Unauthenticated Command Injection Vulnerability (CVE-2025-20281)
998252	CVE-2025-20337	WEB-MISC Cisco ISE - Unauthenticated Deserialization of Untrusted Data RCE Vulnerability (CVE-2025-20337)
998253	CVE-2025-54309	WEB-MISC CrushFTP Prior to 10.8.5 and 11.3.4_23 - Authentication Bypass Vulnerability Via AS2-From (CVE-2025-54309)
998254	CVE-2025-54309	WEB-MISC CrushFTP Prior to 10.8.5 and 11.3.4_23 - Authentication Bypass Vulnerability Via AS2-To (CVE-2025-54309)

Signature update version 157

New signatures rules are generated for the vulnerabilities identified in the week 2025-07-25. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 157 applicable for Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler® CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998255	CVE-2025-49706, CVE-2025-53771	WEB-MISC Microsoft SharePoint Server - Authentication Bypass Vulnerability (CVE-2025-49706, CVE-2025-53771)
998256	CVE-2025-52488	WEB-MISC DNN DotNetNuke Prior to 10.0.1 - NTLM Hashes Disclosure Vulnerability via Browser (CVE-2025-52488)
998257	CVE-2025-52488	WEB-MISC DNN DotNetNuke Prior to 10.0.1 - NTLM Hashes Disclosure Vulnerability via FileUploader (CVE-2025-52488)
998258	CVE-2025-49704, CVE-2025-53770	WEB-MISC Microsoft SharePoint Server - Deserialization of Untrusted Data Vulnerability (CVE-2025-49704, CVE-2025-53770)

Signature update version 156

New signatures rules are generated for the vulnerabilities identified in the week 2025-07-16. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature update version 155

New signatures rules are generated for the vulnerabilities identified in the week 2025-07-02. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 155 applicable for Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler® CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998271	CVE-2025-5071	WEB-WORDPRESS AI Engine Prior to 2.8.4 - Privilege Escalation Vulnerability via rest_route (CVE-2025-5071)
998272	CVE-2025-5071	WEB-WORDPRESS AI Engine Prior to 2.8.4 - Privilege Escalation Vulnerability (CVE-2025-5071)
998273	CVE-2025-3248	WEB-MISC Langflow Prior to 1.3.0 - Unauthenticated Remote Code Execution Vulnerability (CVE-2025-3248)
998274	CVE-2025-34509	WEB-MISC SiteCore Up To 10.4 - Hardcoded

Signature update version 154

New signatures rules are generated for the vulnerabilities identified in the week 2025-06-18. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 154 applicable for Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler® CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998281	CVE-2025-32813	WEB-MISC Infoblox NETMRI Multiple Versions - Unauthenticated OS Command Injection Vulnerability (CVE-2025-32813)
998282	CVE-2024-8190	WEB-MISC Ivanti Cloud Services Application Prior to 4.6 Patch 519 - OS Command Injection Vulnerability (CVE-2024-8190)
998283	CVE-2025-49113	WEB-MISC Roundcube Webmail - Remote Code Execution Vulnerability (CVE-2025-49113)
998284	CVE-2024-9047	WEB-WORDPRESS WordPress Plugin File Upload Prior To 4.24.14 -

Signature update version 153

New signatures rules are generated for the vulnerabilities identified in the week 2025-06-02. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 153 applicable for Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler® CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998291	CVE-2025-24801	WEB-MISC GLPI Prior to 10.0.18 - Unrestricted Upload of File Vulnerability (CVE-2025-24801)
998292	CVE-2025-2774	WEB-MISC Webmin Prior to 2.301 - Privilege Escalation Vulnerability (CVE-2025-2774)
998293	CVE-2025-24893	WEB-MISC xWiki Platform Multiple Versions - Remote Code Execution Vulnerability via /get (CVE-2025-24893)
998294	CVE-2025-24893	WEB-MISC xWiki Platform Multiple Versions - Remote Code Execution Vulnerability via /view (CVE-2025-24893)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
998295	CVE-2024-9380	WEB-MISC Ivanti Cloud Services Application Prior to 5.0.2 - Remote Code Execution Vulnerability (CVE-2024-9380)
998296	CVE-2025-27007	WEB-WORDPRESS WordPress Plugin OttoKit Prior To 1.0.83 - Privilege Escalation Vulnerability Via rest (CVE-2025-27007)
998297	CVE-2025-27007	WEB-WORDPRESS WordPress Plugin OttoKit Prior To 1.0.83 - Privilege Escalation Vulnerability (CVE-2025-27007)
998298	CVE-2025-24799	WEB-MISC GLPI Prior to 10.0.18 - Unauthenticated SQL Injection Vulnerability via contact (CVE-2025-24799)
998299	CVE-2025-24799	WEB-MISC GLPI Prior to 10.0.18 - Unauthenticated SQL Injection Vulnerability via get_params (CVE-2025-24799)

Signature update version 152

New signatures rules are generated for the vulnerabilities identified in the week 2025-05-07. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 152 applicable for Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler® CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998300	CVE-2025-32103	WEB-MISC CrushFTP Prior to 10.8.4 and 11.3.1 - getAdminXMLListing SMB Attacks Vulnerability (CVE-2025-32103)
998301	CVE-2025-22457	WEB-MISC Ivanti Connect Secure Prior to 22.7R2.6 - Remote Code Execution Vulnerability (CVE-2025-22457)
998302	CVE-2024-8517	WEB-MISC SPIP Multiple Versions - Unauthenticated RCE Vulnerability (CVE-2024-8517)
998303	CVE-2025-32102	WEB-MISC CrushFTP Prior to 10.8.4 and 11.3.1 - Server Side Request Forgery Vulnerability (CVE-2025-32102)
998304	CVE-2025-32432	WEB-MISC Craft CMS Multiple Versions - Remote Code Execution Vulnerability via URL (CVE-2025-32432)
998305	CVE-2025-32432	WEB-MISC Craft CMS Multiple Versions - Remote Code Execution Vulnerability via FORM (CVE-2025-32432)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
998306	CVE-2024-36409	WEB-MISC SuiteCRM Prior To 7.14.4 and 8.6.1 - SQLi Vulnerability Via Tree Data entry point (CVE-2024-36409)

Signature update version 151

New signatures rules are generated for the vulnerabilities identified in the week 2025-04-23. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 151 applicable for Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler® CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998307	CVE-2024-36410	WEB-MISC SuiteCRM Prior To 7.14.4 and 8.6.1 - SQLi Vulnerability Via EmailUIAjax getMessageCount controller (CVE-2024-36410)
998308	CVE-2025-31161	WEB-MISC CrushFTP Prior to 10.8.4 and 11.3.1 - Authentication Bypass Vulnerability (CVE-2025-31161)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
998309	CVE-2024-48590	WEB-MISC Inflectra SpiraTeam Up To 7.2.00 - SSRF Vulnerability (CVE-2024-48590)
998310	CVE-2025-2746	WEB-MISC Kentico CMS Up to 13.0.172 - Authentication Bypass Vulnerability (CVE-2025-2746)
998311	CVE-2025-2748	WEB-MISC Kentico CMS Up to 13.0.178 - Stored XSS Vulnerability (CVE-2025-2748)
998312	CVE-2025-1098	WEB-MISC Kubernetes Ingress-Nginx Multiple Versions - RCE Vulnerability Via mirror-target or mirror-host (CVE-2025-1098)
998313	CVE-2024-36411	WEB-MISC SuiteCRM Prior To 7.14.4 and 8.6.1 - SQLi Vulnerability Via EmailUIAjax displayView controller (CVE-2024-36411)
998314	CVE-2025-2294	WEB-WORDPRESS Kubio AI Page Builder Plugin Prior to 2.5.1 - Unauthenticated LFI Vulnerability (CVE-2025-2294)
998315	CVE-2025-1097	WEB-MISC Kubernetes Ingress-Nginx Multiple Versions - Unauthenticated RCE Vulnerability Via auth-tls-match-cn (CVE-2025-1097)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
998316	CVE-2024-36412	WEB-MISC Prior SuiteCRM To 7.14.4 and 8.6.1 - SQLi Vulnerability Via responseEntryPoint (CVE-2024-36412)
998317	CVE-2025-2747	WEB-MISC Kentico CMS Up to 13.0.178 - Authentication Bypass Vulnerability (CVE-2025-2747)

Signature update version 150

New signatures rules are generated for the vulnerabilities identified in the week 2025-03-28. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 150 applicable for Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler® CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998318	CVE-2025-29927	WEB-MISC Next.js Prior to 14.2.25 and 15.2.3 - Middleware Authorization Bypass Vulnerability (CVE-2025-29927)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
998319	CVE-2025-1974	WEB-MISC Kubernetes Ingress-Nginx Multiple Versions - Unauthenticated Remote Code Execution Vulnerability (CVE-2025-1974)

Signature update version 149

New signatures rules are generated for the vulnerabilities identified in the week 2025-03-25. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 149 applicable for Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler® CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998320	CVE-2025-27636	WEB-MISC Apache Camel - Bypass/Injection Vulnerability (CVE-2025-27636)
998321	CVE-2025-25064	WEB-MISC Zimbra Collaboration - SQL Injection Vulnerability via JSON (CVE-2025-25064)
998322	CVE-2025-25064	WEB-MISC Zimbra Collaboration - SQL Injection

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
		Vulnerability via XML (CVE-2025-25064)
998323	CVE-2024-48248	WEB-MISC NAKIVO Backup and Replication- Unauthenticated File Read Vulnerability (CVE-2024-48248)
998324	CVE-2025-29891	WEB-MISC Apache Camel - Bypass/Injection Vulnerability (CVE-2025-29891)
998325	CVE-2025-24813	WEB-MISC Apache Tomcat Multiple Versions - Remote Code Execution Vulnerability (CVE-2025-24813)
998326	CVE-2025-1661	WEB-WORDPRESS HUSKY (WOOF) Products Filter for WooCommerce Up to 1.3.6.6 - Unauthenticated LFI Vulnerability (CVE-2025-1661)

Signature update version 148

New signatures rules are generated for the vulnerabilities identified in the week 2025-03-20. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 148 applicable for Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler® CPU.

SIGNATURE RULE	CVE ID	DESCRIPTION
		Vulnerability Via rest (CVE-2024-2667)
998363	CVE-2024-2667	WEB-WORDPRESS WordPress Plugin InstaWP Connect Prior To 0.1.0.22 - Arbitrary File Upload Vulnerability (CVE-2024-2667)
998364	CVE-2024-11986	WEB-MISC CrushFTP Prior to 10.8.3 and 11.2.3 - Unauthenticated Stored Cross-Site Vulnerability Via % (CVE-2024-11986)
998365	CVE-2024-11986	WEB-MISC CrushFTP Prior to 10.8.3 and 11.2.3 - Unauthenticated Stored Cross-Site Vulnerability Via < (CVE-2024-11986)

Signature update version 143

New signatures rules are generated for the vulnerabilities identified in the week 2025-01-07. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 143 applicable for NetScaler 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler® CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
998366	CVE-2024-8529	WEB-WORDPRESS WordPress Plugin LMS Plugin Prior To 4.2.7.1 - SQL Injection Vulnerability (CVE-2024-8529)
998367	CVE-2024-8522	WEB-WORDPRESS WordPress Plugin LMS Plugin Prior To 4.2.7.1 - SQL Injection Vulnerability via rest_route (CVE-2024-8522)
998368	CVE-2024-8522	WEB-WORDPRESS WordPress Plugin LMS Plugin Prior To 4.2.7.1 - SQL Injection Vulnerability (CVE-2024-8522)
998369	CVE-2024-53961	WEB-MISC Adobe ColdFusion Multiple Versions - Path Traversal Vulnerability (CVE-2024-53961)
998370	CVE-2024-51568	WEB-MISC CyberPanel Prior to 2.3.5 - Unauthenticated OS Command Injection Vulnerability (CVE-2024-51568)
998371	CVE-2024-51567	WEB-MISC CyberPanel Prior to 2.3.8 - Unauthenticated OS Command Injection Vulnerability (CVE-2024-51567)
998372	CVE-2024-51378	WEB-MISC CyberPanel Prior to 2.3.8 - Unauthenticated OS Command Injection Vulnerability (CVE-2024-51378)

SIGNATURE RULE	CVE ID	DESCRIPTION
998373	CVE-2024-46938	WEB-MISC SiteCore Up To 10.4 - Arbitrary File Read Vulnerability via sitecore_speak (CVE-2024-46938)
998374	CVE-2024-46938	WEB-MISC SiteCore Up To 10.4 - Arbitrary File Read Vulnerability via speak (CVE-2024-46938)
998375	CVE-2024-43436	WEB-MISC Moodle Multiple Versions - SQL Injection Vulnerability (CVE-2024-43436)
998376	CVE-2024-42327	WEB-MISC Zabbix - API SQL Injection Vulnerability (CVE-2024-42327)
998377	CVE-2024-37397	WEB-MISC Ivanti Endpoint Manager Multiple Versions - XXE Injection Vulnerability (CVE-2024-37397)

Signature update version 142

New signatures rules are generated for the vulnerabilities identified in the week 2024-12-09. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 142 applicable for NetScaler 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler® CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998378	CVE-2024-52301	WEB-MISC Laravel PHP Framework - Security Bypass Vulnerability (CVE-2024-52301)
998379	CVE-2024-50340	WEB-MISC Symphony PHP Framework - Security Bypass Vulnerability (CVE-2024-50340)
998380	CVE-2024-45767	WEB-MISC Dell OpenManage Enterprise Prior to 4.2 - SQL Injection Vulnerability Via ReportDefs (CVE-2024-45767)
998381	CVE-2024-45767	WEB-MISC Dell OpenManage Enterprise Prior to 4.2 - SQL Injection Vulnerability Via Reports (CVE-2024-45767)
998382	CVE-2024-45216	WEB-MISC Apache Solr Prior to 9.7.0 or 8.11.4 - Authentication Bypass Vulnerability (CVE-2024-45216)
998383	CVE-2024-43425	WEB-MISC Moodle Multiple Versions - Remote Code Execution Vulnerability (CVE-2024-43425)
998384	CVE-2024-10924	WEB-WORDPRESS Really Simple Security Plugin Prior to 9.2 - Authentication Bypass

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
		Vulnerability Via rest_route (CVE-2024-10924)
998385	CVE-2024-10924	WEB-WORDPRESS Really Simple Security Plugin Prior to 9.2 - Authentication Bypass Vulnerability (CVE-2024-10924)
998386	CVE-2024-10781	WEB-WORDPRESS WordPress Plugin Anti-Spam by CleanTalk Prior To 6.45 - Authorization Bypass Vulnerability (CVE-2024-10781)
998387	CVE-2024-10542	WEB-WORDPRESS WordPress Plugin Anti-Spam by CleanTalk Prior To 6.44 - Authorization Bypass Vulnerability (CVE-2024-10542)

Signature update version 141

New signatures rules are generated for the vulnerabilities identified in the week 2024-11-19. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 141 applicable for NetScaler 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler® CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998388	CVE-2024-9634	WEB-WORDPRESS WordPress Plugin GiveWP Prior To 3.16.4 - Deserialization of Untrusted Data Vulnerability (CVE-2024-9634)
998389	CVE-2024-9634	WEB-WORDPRESS WordPress Plugin GiveWP Prior To 3.16.4 - Deserialization of Untrusted Data Vulnerability Via Ajax (CVE-2024-9634)
998390	CVE-2024-9264	WEB-MISC Apache Grafana 11.x - Command Injection And Local File Inclusion Vulnerability via SQL Expressions (CVE-2024-9264)
998391	CVE-2024-5488	WEB-WORDPRESS WordPress Plugin SEOPress Prior To 7.9 - Authorization Bypass Vulnerability Via rest_route (CVE-2024-5488)
998392	CVE-2024-5488	WEB-WORDPRESS WordPress Plugin SEOPress Prior To 7.9 - Authorization Bypass Vulnerability (CVE-2024-5488)
998393	CVE-2024-47949	WEB-MISC JetBrains TeamCity Prior to 2024.07.3 - Path Traversal Vulnerability (CVE-2024-47949)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
998394	CVE-2024-47011	WEB-MISC Ivanti Avalanche Prior to 6.4.5 - Path Traversal Vulnerability (CVE-2024-47011)
998395	CVE-2024-47010	WEB-MISC Ivanti Avalanche Prior to 6.4.5 - Authentication Bypass Vulnerability (CVE-2024-47010)
998396	CVE-2024-47009	WEB-MISC Ivanti Avalanche Prior to 6.4.5 - Authentication Bypass Vulnerability (CVE-2024-47009)
998397	CVE-2024-43363	WEB-MISC Cacti Prior to 1.2.28 - Code Injection Vulnerability Via path_stderrlog (CVE-2024-43363)
998398	CVE-2024-43363	WEB-MISC Cacti Prior to 1.2.28 - Code Injection Vulnerability Via path_cactilog (CVE-2024-43363)
998399	CVE-2024-41874	WEB-MISC Adobe ColdFusion Multiple Versions - Remote Code Execution Vulnerability (CVE-2024-41874)
998400	CVE-2024-27956	WEB-WORDPRESS ValvePress Automatic Plugin Prior to 3.92.1 - Unauthenticated SQL Injection Vulnerability (CVE-2024-27956)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
998401	CVE-2024-27954	WEB-WORDPRESS ValvePress Automatic Plugin Prior to 3.92.1 - Unauth Path Traversal and SSRF Vulnerabilities (CVE-2024-27954)

Signature update version 140

New signatures rules are generated for the vulnerabilities identified in the week 2024-10-24. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 140 applicable for NetScaler 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler® CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998402	CVE-2024-9465	WEB-MISC Palo Alto Expedition Prior to 1.2.96 - Unauthenticated SQL Injection Vulnerability (CVE-2024-9465)
998403	CVE-2024-9464	WEB-MISC Palo Alto Expedition Prior to 1.2.96 - OS Command Injection Vulnerability Via start_date (CVE-2024-9464)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
998404	CVE-2024-9464	WEB-MISC Palo Alto Expedition Prior to 1.2.96 - OS Command Injection Vulnerability Via start_time (CVE-2024-9464)
998405	CVE-2024-8353	WEB-MISC WordPress Plugin GiveWP Prior To 3.16.2 - Deserialization of Untrusted Data Vulnerability (CVE-2024-8353)
998406	CVE-2024-8353	WEB-MISC WordPress Plugin GiveWP Prior To 3.16.2 - Deserialization of Untrusted Data Vulnerability Via Ajax (CVE-2024-8353)
998407	CVE-2024-7781	WEB-WORDPRESS Artbees Jupiter X Core Plugin Prior to 4.7.8 - Authentication Bypass Vulnerability Via Facebook (CVE-2024-7781)
998408	CVE-2024-7781	WEB-WORDPRESS Artbees Jupiter X Core Plugin Prior to 4.7.8 - Authentication Bypass Vulnerability Via Google (CVE-2024-7781)
998409	CVE-2024-7772	WEB-WORDPRESS Artbees Jupiter X Core Plugin Prior to 4.6.6 - Arbitrary File Upload Vulnerability (CVE-2024-7772)
998410	CVE-2024-5932	WEB-MISC WordPress Plugin GiveWP Prior To 3.14.2 - Deserialization of Untrusted Data Vulnerability (CVE-2024-5932)

Signature update version 139

New signatures rules are generated for the vulnerabilities identified in the week 2024-10-02. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 139 applicable for NetScaler 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler® CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998418	CVE-2024-7591	WEB-MISC Progress LoadMaster Prior To 7.2.60.1 - Authenticated OS Command Injection Vulnerability (CVE-2024-7591)
998419	CVE-2024-6658	WEB-MISC Progress LoadMaster Prior To 7.2.60.1 - OS Command Injection Vulnerability (CVE-2024-6658)
998420	CVE-2024-5015	WEB-MISC WhatsUp Gold Prior To 2023.1.3 - SSRF Vulnerability (CVE-2024-5015)
998421	CVE-2024-45507	WEB-MISC Apache Ofbiz Prior to 18.12.16 - SSRF

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
		Vulnerability (CVE-2024-45507)
998422	CVE-2024-45195	WEB-MISC Apache Ofbiz Prior to 18.12.16 - Direct Request ('Forced Browsing') vulnerability (CVE-2024-45195)
998423	CVE-2024-29824	WEB-MISC Ivanti Endpoint Manager Prior To v2022 SU5 - SQL Injection RCE Vulnerability (CVE-2024-29824)
998424	CVE-2024-2448	WEB-MISC Progress LoadMaster - OS Command Injection Vulnerability (CVE-2024-2448)
998425	CVE-2024-1212	WEB-MISC Progress LoadMaster - Unauthenticated OS Command Injection Vulnerability via accessv2 (CVE-2024-1212)
998426	CVE-2024-1212	WEB-MISC Progress LoadMaster - Unauthenticated OS Command Injection Vulnerability via access (CVE-2024-1212)

Signature update version 138

New signatures rules are generated for the vulnerabilities identified in the week 2024-09-18. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Signature version

Signature version 138 applicable for NetScaler 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler® CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998427	CVE-2024-7591	WEB-MISC Progress LoadMaster Prior To 7.2.60.1 - Unauthenticated OS Command Injection Vulnerability Via token (CVE-2024-7591)
998428	CVE-2024-7591	WEB-MISC Progress LoadMaster Prior To 7.2.60.1 - Unauthenticated OS Command Injection Vulnerability Via pass (CVE-2024-7591)
998429	CVE-2024-7591	WEB-MISC Progress LoadMaster Prior To 7.2.60.1 - Unauthenticated OS Command Injection Vulnerability Via user (CVE-2024-7591)
998430	CVE-2024-6670	WEB-MISC WhatsUp Gold Prior To 2023.1.3 - Unauthenticated SQL Injection (CVE-2024-6670)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
998431	CVE-2024-4884	WEB-MISC WhatsUp Gold Prior To 2023.1.3 - Command Execution Vulnerability (CVE-2024-4884)
998432	CVE-2024-44000	WEB-MISC WordPress Plugin LiteSpeed Cache Prior To 6.5.0.1 - Account Takeover Vulnerability (CVE-2024-44000)
998433	CVE-2024-42362	WEB-MISC Apache HertzBeat Prior to 1.6.0 - Remote Code Execution Vulnerability (CVE-2024-42362)
998434	CVE-2024-42361	WEB-MISC Apache HertzBeat 1.6.0 - SQL Injection Vulnerability Via label(CVE-2024-42361)
998435	CVE-2024-42361	WEB-MISC Apache HertzBeat 1.6.0 - SQL Injection Vulnerability Via history(CVE-2024-42361)
998436	CVE-2023-51389	WEB-MISC Apache HertzBeat Prior to 1.5.0 - Remote Code Execution Vulnerability (CVE-2023-51389)

Signature update version 137

New signatures rules are generated for the vulnerabilities identified in the week 2024-09-06. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Signature version

Signature version 137 applicable for NetScaler 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler® CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998437	CVE-2024-7297	WEB-MISC Langflow Prior to 1.0.13 - Privilege Escalation Vulnerability (CVE-2024-7297)
998438	CVE-2024-6172	WEB-WORDPRESS Email Subscribers by Icegram Express Plugin Before 5.7.26 - SQLi Vulnerability unsubscribe_lists (CVE-2024-6172)
998439	CVE-2024-6172	WEB-WORDPRESS Email Subscribers by Icegram Express Plugin Before 5.7.26 - SQLi Vulnerability Via db (CVE-2024-6172)
998440	CVE-2024-5932	WEB-MISC WordPress Plugin GiveWP Prior To 3.14.2 - Deserialization of Untrusted Data Vulnerability (CVE-2024-5932)
998441	CVE-2024-5932	WEB-MISC WordPress Plugin GiveWP Prior To 3.14.2 - Deserialization of

998454	CVE-2024-28147	WEB-MISC Edu-Sharing - Arbitrary File Upload Vulnerability via collection (CVE-2024-28147)

Signature update version 135

New signatures rules are generated for the vulnerabilities identified in the week 2024-07-31. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 135 applicable for NetScaler 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler® CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998455	CVE-2024-38094, CVE-2024-38024, CVE-2024-38023	WEB-MISC Microsoft SharePoint Server 2016 and 2019 - Remote Code Execution Vulnerability

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
		(CVE-2024-38094, 38024 and 38023)
998456	CVE-2024-36401	WEB-MISC GeoServer Multiple Versions - Unauthenticated Remote Code Execution Vulnerability Via TestWfsPost (CVE-2024-36401)
998457	CVE-2024-36401	WEB-MISC GeoServer Multiple Versions - Unauthenticated Remote Code Execution Vulnerability Via HTTP Params (CVE-2024-36401)
998458	CVE-2024-36401	WEB-MISC GeoServer Multiple Versions - Unauthenticated Remote Code Execution Vulnerability (CVE-2024-36401)
998459	CVE-2024-3246	WEB-MISC WordPress Plugin LiteSpeed Cache Prior To 6.3.0 - Cross-Site Request Forgery Vulnerability (CVE-2024-3246)
998460	CVE-2024-30043	WEB-MISC Microsoft SharePoint Server 2016 and 2019 - XXE Injection Vulnerability Via upload.aspx (CVE-2024-30043)
998461	CVE-2024-30043	WEB-MISC Microsoft SharePoint Server 2016 and 2019 - XXE Injection Vulnerability (CVE-2024-30043)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
998462	CVE-2023-46816	WEB-MISC SugarCRM Prior to 12.0.4 and 13.0.2 - Server Side Template Injection Vulnerability (CVE-2023-46816)
998463	CVE-2023-3162	WEB-WORDPRESS Stripe Payment Plugin for WooCommerce Prior to 3.7.8 - Authentication Bypass Vulnerability (CVE-2023-3162)

Signature update version 134

New signatures rules are generated for the vulnerabilities identified in the week 2024-07-19. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 134 applicable for NetScaler 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler® CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998464	CVE-2024-34102	WEB-MISC Adobe Magento - XML External Entity Vulnerability (CVE-2024-34102)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
998465	CVE-2024-2782	WEB-WORDPRESS Contact Form by Fluent Forms before 5.1.17 - Missing Authentication Vulnerability Via POST (CVE-2024-2782)
998466	CVE-2024-2782	WEB-WORDPRESS Contact Form by Fluent Forms before 5.1.17 - Missing Authentication Vulnerability global-settings (CVE-2024-2782)
998467	CVE-2024-2771	WEB-WORDPRESS Contact Form by Fluent Forms before 5.1.17 - Missing Authentication Vulnerability Via DELETE (CVE-2024-2771)
998468	CVE-2024-2771	WEB-WORDPRESS Contact Form by Fluent Forms before 5.1.17 - Missing Authentication Vulnerability Via POST (CVE-2024-2771)
998469	CVE-2024-2771	WEB-WORDPRESS Contact Form by Fluent Forms before 5.1.17 - Missing Authentication Vulnerability Via managers (CVE-2024-2771)
998470	CVE-2024-20759	WEB-MISC Adobe Magento - Stored XSS Vulnerability (CVE-2024-20759)
998471	CVE-2024-20179	WEB-MISC Adobe Magento - Stored XSS Vulnerability (CVE-2024-20179)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Signature update version 133

New signatures rules are generated for the vulnerabilities identified in the week 2024-07-02. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 133 applicable for NetScaler 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler® CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998472	CVE-2024-5806	WEB-MISC Progress MOVEit Transfer - Authentication Bypass Vulnerability Via Log Poisoning (CVE-2024-5806)
998473	CVE-2024-5276	WEB-MISC Fortra FileCatalyst Workflow Prior to 5.1.6.139 - SQL Injection Vulnerability (CVE-2024-5276)
998474	CVE-2024-31982	WEB-MISC XWiki Multiple Versions - Unauthenticated Remote Code Execution Vulnerability (CVE-2024-31982)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Signature update version 132

New signatures rules are generated for the vulnerabilities identified in the week 2024-06-27. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 132 applicable for NetScaler 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler® CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998475	CVE-2024-4295	WEB-WORDPRESS Icegram Express Email Subscribers Prior to 5.7.21 - SQL Injection Vulnerability (CVE-2024-4295)
998476	CVE-2024-37393	WEB-MISC SecurEnvoy MFA Prior to 9.4.514 - Unauthenticated LDAP Injection Vulnerability Via USERID or MEMBEROF (CVE-2024-37393)
998477	CVE-2024-36680	WEB-MISC Prestashop Promokit Facebook Module Up to 1.0.1 - SQL Injection Vulnerability (CVE-2024-36680)
998478	CVE-2024-28995	WEB-MISC SolarWinds Serv-U Prior to 15.4.2 HF 2 - Directory Traversal

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
		Vulnerability (CVE-2024-28995)
998479	CVE-2024-27349	WEB-MISC Apache HugeGraph-Server Prior to 1.3.0 - Authentication Bypass Vulnerability (CVE-2024-27349)
998480	CVE-2024-27348	WEB-MISC Apache HugeGraph-Server Prior to 1.3.0 - Remote code Execution Vulnerability (CVE-2024-27348)

Signature update version 131

New signatures rules are generated for the vulnerabilities identified in the week 2024-06-14. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 131 applicable for NetScaler 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler® CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998481	CVE-2024-4956	WEB-MISC Sonatype Nexus Repository Prior to 3.68.1 - Unauthenticated Path

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
		Traversal Vulnerability (CVE-2024-4956)
998482	CVE-2024-4577	WEB-MISC PHP Prior to 8.1.29, 8.2.20 and 8.3.8 - Command Injection Vulnerability (CVE-2024-4577)
998483	CVE-2024-4358	WEB-MISC Progress Telerik Report Server - Authentication Bypass Vulnerability (CVE-2024-4358)
998484	CVE-2024-2879	WEB-WORDPRESS Wordpress plugin LayerSlider Versions 7.9.11 and 7.10.0 - SQL Injection Vulnerability (CVE-2024-2879)
998485	CVE-2024-23917	WEB-MISC JetBrains TeamCity Prior to 2023.11.3 - Authentication Bypass Vulnerability (CVE-2024-23917)
998486	CVE-2024-21683	WEB-MISC Atlassian Confluence Prior to 8.9.1 - Remote Code Execution Vulnerability (CVE-2024-21683)
998487	CVE-2024-0507	WEB-MISC GitHub Enterprise Server - Command Injection Vulnerability (CVE-2024-0507)
998488	CVE-2023-46729	WEB-MISC Sentry Next.JS Prior to 7.77.0 - SSRF Via

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
		SDK Tunnel Vulnerability (CVE-2023-46729)

Signature update version 130

New signatures rules are generated for the vulnerabilities identified in the week 2024-05-30. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 130 applicable for NetScaler 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler® CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998489	CVE-2024-4434	WEB-WORDPRESS LearnPress Prior To 4.2.6.6 - Unauthenticated SQL Injection Vulnerability (CVE-2024-4434)
998490	CVE-2024-4397	WEB-WORDPRESS LearnPress Prior To 4.2.6.6 - Arbitrary File Upload Vulnerability (CVE-2024-4397)
998491	CVE-2024-30163	WEB-MISC Invision Community Prior to 4.7.16 -

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
		SQL Injection Vulnerability (CVE-2024-30163)

Signature update version 129

New signatures rules are generated for the vulnerabilities identified in the week 2024-05-14. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 129 applicable for NetScaler 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler® CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998492	CVE-2024-31136	WEB-MISC JetBrains TeamCity Prior to 2024.03 - Two-Factor Authentication Bypass Vulnerability (CVE-2024-31136)
998493	CVE-2024-25600	WEB-WORDPRESS Bricks Builder Prior to 1.9.6.1 - RCE Vulnerability Via AJAX content parameter (CVE-2024-25600)
998494	CVE-2024-25600	WEB-WORDPRESS Bricks Builder Prior to 1.9.6.1 - RCE Vulnerability Via AJAX element and elements

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
		parameters (CVE-2024-25600)
998495	CVE-2024-25600	WEB-WORDPRESS Bricks Builder Prior to 1.9.6.1 - RCE Vulnerability Via REST API render_element Via rest_route (CVE-2024-25600)
998496	CVE-2024-25600	WEB-WORDPRESS Bricks Builder Prior to 1.9.6.1 - RCE Vulnerability Via REST API render_element (CVE-2024-25600)
998497	CVE-2023-46302	WEB-MISC Apache Submarine Prior To 0.8.0 - Deserialization of Untrusted Data Vulnerability (CVE-2023-46302)

Signature update version 128

New signatures rules are generated for the vulnerabilities identified in the week 2024-04-26. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 128 applicable for NetScaler 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler® CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
998498	CVE-2024-4040	WEB-MISC CrushFTP Prior to 10.7.1 and 11.1.0 - Server Side Template Injection Vulnerability (CVE-2024-4040)
998499	CVE-2024-30162	WEB-MISC Invision Community - Arbitrary File Upload Vulnerability (CVE-2024-30162)
998500	CVE-2024-23538, CVE-2024-23539	WEB-MISC Apache Fineract Prior to 1.9 - SQL Injection Vulnerabilities (CVE-2024-23538,CVE-2024-23539)
998501	CVE-2024-23538, CVE-2024-23539	WEB-MISC Apache Fineract Prior to 1.9 - SQL Injection Vulnerabilities (CVE-2024-23538,CVE-2024-23539)
998502	CVE-2024-20767	WEB-MISC Adobe ColdFusion Multiple Versions - Improper Access Control Vulnerability (CVE-2024-20767)
998503	CVE-2024-1981	WEB-WORDPRESS WordPress Plugin WPVivid Backup & Migration - SQLi Vulnerability (CVE-2024-1981)
998504	CVE-2023-6019	WEB-MISC Anyscale Ray - OS Command Injection Vulnerability (CVE-2023-6019)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
998505	CVE-2023-44092	WEB-MISC Pandora FMS Prior to 776 - Remote Code Execution Vulnerability (CVE-2023-44092)
998506	CVE-2023-40000	WEB-WORDPRESS LiteSpeed Cache Prior To 5.7.0.1 - Stored Cross Site Scripting Vulnerability (CVE-2023-40000)

Signature update version 127

New signatures rules are generated for the vulnerabilities identified in the week 2024-04-04. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 127 applicable for NetScaler 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler® CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998512	CVE-2024-25153	WEB-MISC Fortra FileCatalyst Worflow Prior to 5.1.6 - Arbitrary File Upload Vulnerability (CVE-2024-25153)
998513	CVE-2024-24401	WEB-MISC NagiosXI Up To 2024R1.01 - SQL Injection Vulnerability (CVE-2024-24401)
998514	CVE-2024-21726	WEB-MISC Joomla! Prior to 5.0.3 and 4.4.3 - XSS Vulnerability via forceLanguage parameter (CVE-2024-21726)
998515	CVE-2024-21726	WEB-MISC Joomla! Prior to 5.0.3 and 4.4.3 - XSS Vulnerability via

		forcedItemType parameter (CVE-2024-21726)
998516	CVE-2024-2055	WEB-MISC Artica Proxy Prior to 4.50 - Authentication Bypass Vulnerability (CVE-2024-2055)
998517	CVE-2024-2054	WEB-MISC Artica Proxy Prior to 4.50 - Unauthenticated PHP Object Deserialization Vulnerability (CVE-2024-2054)
998518	CVE-2024-2053	WEB-MISC Artica Proxy Prior to 4.50 - Unauthenticated Arbitrary File Inclusion Vulnerability (CVE-2024-2053)
998519	CVE-2023-6063	WEB-WORDPRESS WP Fastest Cache Plugin Prior to 1.2.2 - Unauthenticated SQL Injection Vulnerability (CVE-2023-6063)
998520	CVE-2023-3550	WEB-MISC MediaWiki Prior to 1.41 - Stored XSS Vulnerability (CVE-2023-3550)

Signature update version 126

New signatures rules are generated for the vulnerabilities identified in the week 2024-03-15. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 126 applicable for NetScaler 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler® CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998521	CVE-2024-27198	WEB-MISC JetBrains TeamCity Prior to 2023.11.4 - Authentication Bypass Vulnerability (CVE-2024-27198)
998522	CVE-2024-25065	WEB-MISC Apache Ofbiz Prior 18.12.12 - Authentication Bypass Vulnerability (CVE-2024-25065)
998523	CVE-2024-20738	WEB-MISC Adobe Framemaker Publishing Server Prior to 2022 Update 2 - Authentication Bypass Via /doxserver/ (CVE-2024-20738)
998524	CVE-2024-20738	WEB-MISC Adobe Framemaker Publishing Server Prior to 2022 Update 2 - Authentication Bypass Via /server/ (CVE-2024-20738)
998525	CVE-2024-1708	WEB-MISC ConnectWise ScreenConnect Prior to 23.9.8 - Path Traversal Vulnerability via ZipSlip Attack (CVE-2024-1708)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
998526	CVE-2024-1071	WEB-WORDPRESS Ultimate Member From 2.1.3 To 2.8.2 - SQL Injection Vulnerability (CVE-2024-1071)
998527	CVE-2023-5204	WEB-WORDPRESS AI ChatBot Up To 4.8.9 - SQL Injection Vulnerability (CVE-2023-5204)
998528	CVE-2023-44313	WEB-MISC Apache ServiceComb Service-Center Prior to 2.2.0 - Server-Side Request Forgery Vulnerability (CVE-2023-44313)
998529	CVE-2023-41474	WEB-MISC Ivanti Avalanche Up to 6.3.4.153 - Path Traversal Vulnerability (CVE-2023-41474)
998530	CVE-2023-41474	WEB-MISC Ivanti Avalanche Up to 6.3.4.153 - Path Traversal Vulnerability (CVE-2023-41474)
998531	CVE-2023-40597	WEB-MISC Splunk Enterprise Prior to 8.2.12 9.0.6 and 9.1.1 - Absolute Path Traversal Vulnerability (CVE-2023-40597)

Signature update version 125

New signatures rules are generated for the vulnerabilities identified in the week 2024-02-26. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Signature version

Signature version 125 applicable for NetScaler 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler® CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998532	CVE-2024-24830	WEB-MISC OpenObserve Prior to 0.8.0 - Privilege Escalation (CVE-2024-24830)
998533	CVE-2024-25106	WEB-MISC OpenObserve Prior to 0.8.0 - Unauthorized Access Vulnerability (CVE-2024-25106)
998534	CVE-2024-24747	WEB-MISC MinIO Prior to RELEASE.2024-01-31T20-20-33Z - Improper Privilege Management Vulnerability (CVE-2024-24747)
998535	CVE-2024-1709	WEB-MISC ConnectWise ScreenConnect Prior to 23.9.8 - Authentication Bypass Vulnerability (CVE-2024-1709)
998536	CVE-2024-1207	WEB-WORDPRESS WP Booking Calendar Plugin Prior to 9.9.1 - Unauthenticated SQL

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
		Injection Vulnerability (CVE-2024-1207)
998537	CVE-2024-0221	WEB-WORDPRESS Photo Gallery Up To 1.8.19 - Directory Traversal Vulnerability (CVE-2024-0221)
998538	CVE-2024-0221	WEB-WORDPRESS Photo Gallery Up To 1.8.19 - Directory Traversal Vulnerability (CVE-2024-0221)
998539	CVE-2023-46266	WEB-MISC Ivanti Avalanche Prior to 6.4.2 - Authentication Bypass Vulnerability (CVE-2023-46266)
998540	CVE-2023-46264	WEB-MISC Ivanti Avalanche Prior to 6.4.2 - Arbitrary File Upload Vulnerability (CVE-2023-46264)

Signature update version 124

New signatures rules are generated for the vulnerabilities identified in the week 2024-02-14. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 124 applicable for NetScaler 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler® CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998544	CVE-2024-21893	WEB-MISC Ivanti Connect Secure Multiple Versions - Server Side Request Forgery vulnerability (CVE-2024-21893)
998545	CVE-2024-21893	WEB-MISC Ivanti Connect Secure Multiple Versions - Server Side Request Forgery vulnerability (CVE-2024-21893)
998546	CVE-2023-7028	WEB-MISC GitLab CE/EE Multiple Versions - Improper Access Control Vulnerability (CVE-2023-7028)
998547	CVE-2023-50721	WEB-MISC xWiki Platform Multiple Versions - Code Injection Vulnerability (CVE-2023-50721)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Signature update version 123

New signatures rules are generated for the vulnerabilities identified in the week 2024-01-25. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 123 applicable for NetScaler 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler® CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998548	CVE-2024-21650	WEB-MISC xWiki Platform Prior Multiple Versions - Remote Code Execution Vulnerability (CVE-2024-21650)
998549	CVE-2023-6875, CVE-2023-7027	WEB-WORDPRESS POST SMTP Plugin Prior to 2.8.8 - Missing Authorization/XSS Vulnerability (CVE-2023-6875,CVE-2023-7027)
998550	CVE-2023-51409	WEB-WORDPRESS AI Engine Plugin Prior To 1.9.99 - Unauthenticated Arbitrary File Upload (CVE-2023-51409)
998551	CVE-2023-46805, CVE-2024-21887	WEB-MISC Ivanti Connect Secure Multiple Versions - Remote Code Execution

998555	CVE-2023-50968	WEB-MISC Apache Ofbiz Multiple Versions - Server-Side Request Forgery Vulnerability (CVE-2023-50968)

Signature update version 121

New signatures rules are generated for the vulnerabilities identified in the week 2024-01-09. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 121 applicable for NetScaler 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler® CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998556	CVE-2023-6553	WEB-WORDPRESS Backup Migration Plugin Up to 1.3.7 - Remote Code Execution Vulnerability (CVE-2023-6553)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
998557	CVE-2023-48777	WEB-WORDPRESS Elementor Plugin Prior to 3.18.1 - File Upload/Remote Code Execution Vulnerability Via ID (CVE-2023-48777)
998558	CVE-2023-44350	WEB-MISC Adobe ColdFusion Multiple Versions - Remote Code Execution Vulnerability (CVE-2023-44350)

Signature update version 120

New signatures rules are generated for the vulnerabilities identified in the week 2023-12-19. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 120 applicable for NetScaler 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler® CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998559	CVE-2023-50164	WEB-STRUTS Apache Struts Prior to 6.3.0.2 - Path Traversal Vulnerability (CVE-2023-50164)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
998560	CVE-2023-49105	WEB-MISC ownCloud Prior to 10.13.1 - Access Control Bypass Vulnerability (CVE-2023-4105)
998561	CVE-2023-49103	WEB-MISC ownCloud Multiple Versions - Information Disclosure Vulnerability (CVE-2023-49103)
998562	CVE-2023-47246	WEB-MISC SysAid Server On-Premise Prior to 23.3.36 - Path Traversal Vulnerability (CVE-2023-47246)
998563	CVE-2023-46509	WEB-MISC Contec SolarView Compact 6.0 and Prior - OS Command Injection Vulnerability (CVE-2023-46509)
998564	CVE-2023-44450	WEB-MISC NETGEAR ProSAFE Network Management System Prior to 1.7.0.31 - SQL Injection Vulnerability (CVE-2023-44450)
998565	CVE-2023-44449	WEB-MISC NETGEAR ProSAFE Network Management System Prior to 1.7.0.31 - SQL Injection Vulnerability (CVE-2023-44449)
998566	CVE-2023-44351, CVE-2023-44353	WEB-MISC Adobe ColdFusion - Deserialization of Untrusted Data Vulnerability

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
		(CVE-2023-44351, CVE-2023-44353)
998567	CVE-2023-43177	WEB-MISC CrushFTP Prior to 10.5.1 - Improper Control of Dynamically-Managed Code Resources Vulnerability (CVE-2023-43177)
998568	CVE-2023-40062	WEB-MISC SolarWinds Orion Prior to 2023.4.0 - Improper Input Validation Vulnerability Via TestAction (CVE-2023-40062)
998569	CVE-2023-40062	WEB-MISC SolarWinds Orion Prior to 2023.4.0 - Improper Input Validation Vulnerability Via /api/WriteToFile/ (CVE-2023-40062)
998570	CVE-2023-40055	WEB-MISC SolarWinds NCM Prior to 2023.4.1 - Directory Traversal Vulnerability Via SaveResultsToFile (CVE-2023-40055)
998571	CVE-2023-40054	WEB-MISC SolarWinds NCM Prior to 2023.4.1 - Directory Traversal Vulnerability Via txtConfigTemplate (CVE-2023-40054)
998572	CVE-2023-40054	WEB-MISC SolarWinds NCM Prior to 2023.4.1 - Directory Traversal Vulnerability Via txtPath (CVE-2023-40054)
998573	CVE-2023-39912	Zoho ADManager Plus Prior to 7203 - Directory traversal

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
		Vulnerability (CVE-2023-39912)
998574	CVE-2023-35150	WEB-MISC XWiki Multiple Versions - Arbitrary Code Injection Vulnerability (CVE-2023-35150)
998575	CVE-2023-32707	WEB-MISC Splunk Enterprise - Escalation of Privileges Vulnerability (CVE-2023-32707)
998576	CVE-2023-30943	WEB-MISC Moodle Prior to 4.1.3 - TinyMCE Loaders Stored Cross-Site Scripting Vulnerability Via loader (CVE-2023-30943)
998577	CVE-2023-30943	WEB-MISC Moodle Prior to 4.1.3 - TinyMCE Loaders Stored Cross-Site Scripting Vulnerability Via lang (CVE-2023-30943)
998578	CVE-2023-2943	WEB-MISC OpenEMR Prior to 7.0.1 - HTML Code Injection Vulnerability (CVE-2023-2943)

Signature update version 119

New signatures rules are generated for the vulnerabilities identified in the week 2023-11-23. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 119 applicable for NetScaler 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler® CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998579	CVE-2023-40934	WEB-MISC NagiosXI Prior to 5.11.2 - SQL Injection Vulnerability (CVE-2023-40934)
998580	CVE-2023-40932	WEB-MISC NagiosXI Prior to 5.11.2 - XSS Vulnerability (CVE-2023-40932)
998581	CVE-2023-40045	WEB-MISC Progress WS_FTP Server Prior to 8.7.4 and 8.8.2 - Ad Hoc Cross-Site Scripting Vulnerability
998582	CVE-2023-37265	WEB-MISC CasaOS Prior To 0.4.4 - Remote Code Execution Vulnerability via apps_restart (CVE-2023-37265)
998583	CVE-2023-37265	WEB-MISC CasaOS Prior To 0.4.4 - Remote Code Execution Vulnerability via / app_management/compose (CVE-2023-37265)
998584	CVE-2023-3256	WEB-MISC Advantech R-SeeNet Prior to 2.4.23 - Use of Hard-Coded Credentials Vulnerability (CVE-2023-3256)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
998585	CVE-2023-28323	WEB-MISC Ivanti Endpoint Manager Up to 2022 Su3 - Deserialization of Untrusted Data Vulnerability (CVE-2023-28323)
998586	CVE-2023-1669	WEB-WORDPRESS WP SEOPress Plugin Prior To 6.5.0.3 - PHP Object Injection Vulnerability (CVE-2023-1669)
998587	CVE-2022-3214	WEB-MISC Delta Electronics DIAEnergie - Unauthenticated Arbitrary File Upload Via HandlerUploadCalendar (CVE-2022-3214)
998588	CVE-2022-3214	WEB-MISC Delta Electronics DIAEnergie - Unauthenticated Arbitrary File Upload Via HandlerUploadTag (CVE-2022-3214)
998589	CVE-2022-3214	WEB-MISC Delta Electronics DIAEnergie - Unauthenticated Arbitrary File Upload Via HandlerUploadCarbon (CVE-2022-3214)
998590	CVE-2022-27665	WEB-MISC Progress WS_FTP Server 8.6.0 - Cross-Site Scripting Vulnerability (CVE-2022-27665)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Signature update version 118

New signatures rules are generated for the vulnerabilities identified in the week 2023-11-10. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 118 applicable for NetScaler 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler® CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998591	CVE-2023-39968	WEB-MISC Jupyter Server Prior to 2.7.2 - Open Redirect Vulnerability (CVE-2023-39968)
998592	CVE-2023-38743	WEB-MISC Zoho ManageEngine ADManager Plus Prior to 7200 - Remote Code Execution Vulnerability (CVE-2023-38743)
998593	CVE-2023-22518	WEB-MISC Confluence Data Center and Server Multiple Versions - Improper Authorization Vulnerability (CVE-2023-22518)
998594	CVE-2023-20890	WEB-MISC VMware Aria Operations for Networks - Arbitrary File Write

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
		Vulnerability (CVE-2023-20890)
998595	CVE-2023-20889	WEB-MISC VMware Aria Operations for Networks - Command Injection Vulnerability (CVE-2023-20889)
998596	CVE-2023-20273	WEB-MISC Cisco IOS XE Software - Command Injection Vulnerability (CVE-2023-20273)

Signature update version 117

New signatures rules are generated for the vulnerabilities identified in the week 2023-11-01. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 117 applicable for NetScaler 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler® CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998597	CVE-2023-20198	WEB-MISC Cisco IOS XE Software - Authentication Bypass Vulnerability (CVE-2023-20198)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Signature update version 116

Updated signatures rule is generated for the vulnerabilities identified in the week 2023-10-16. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 116 applicable for NetScaler 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler® CPU.

Common Vulnerability Entry (CVE) insight

Following is the updated signature rule, CVE ID, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998599	CVE-2023-22515	WEB-MISC Atlassian Confluence Server - Broken Access Control Vulnerability via /setup/*.action (CVE-2023-22515)

Signature update version 115

New signatures rules are generated for the vulnerabilities identified in the week 2023-10-14. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 115 applicable for NetScaler 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler® CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998598	CVE-2023-24955	WEB-MISC Microsoft SharePoint Server - Remote Code Execution Vulnerability (CVE-2023-24955)
998599	CVE-2023-22515	WEB-MISC Atlassian Confluence Server - Broken Access Control Vulnerability via /setup/*.action (CVE-2023-22515)
998600	CVE-2023-22515	WEB-MISC Atlassian Confluence Server - Broken Access Control Vulnerability via /server-info.action (CVE-2023-22515)

Signature update version 114

New signatures rules are generated for the vulnerabilities identified in the week 2023-10-05. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 114 applicable for NetScaler 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE

Enabling Post body and Response body signature rules might affect Citrix® ADC CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998601	CVE-2023-42793	WEB-MISC JetBrains TeamCity Prior to 2023.05.4 - Authentication Bypass Vulnerability (CVE-2023-42793)
998602	CVE-2023-40931	WEB-MISC NagiosXI Prior to 5.11.2 - SQL Injection Vulnerability (CVE-2023-40931)
998603	CVE-2023-40044	WEB-MISC Progress WS_FTP Server - Deserialization of Untrusted Data Vulnerability (CVE-2023-40044)
998604	CVE-2023-39362	WEB-MISC Cacti Prior To 1.2.25 - OS Command Injection Vulnerability (CVE-2023-39362)
998605	CVE-2023-39361	WEB-MISC Cacti Prior to 1.2.25 - SQL Injection Vulnerability (CVE-2023-39361)
998606	CVE-2023-39359	WEB-MISC Cacti Prior to 1.2.25 - SQL Injection Vulnerability (CVE-2023-39359)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
998607	CVE-2023-39358	WEB-MISC Cacti Prior to 1.2.25 - SQL Injection Vulnerability via reports_admin (CVE-2023-39358)
998608	CVE-2023-39358	WEB-MISC Cacti Prior to 1.2.25 - SQL Injection Vulnerability via reports_user (CVE-2023-39358)
998609	CVE-2023-35813	WEB-MISC Sitecore Through 10.3 - Remote Code Execution Vulnerability (CVE-2023-35813)
998610	CVE-2023-20890	WEB-MISC VMware Aria Operations for Networks - Path Traversal Vulnerability Via infra API (CVE-2023-20890)
998611	CVE-2023-20890	WEB-MISC VMware Aria Operations for Networks - Path Traversal Vulnerability Via data-sources API (CVE-2023-20890)
998612	CVE-2022-43719	WEB-MISC Apache Superset Multiple Versions - CSRF Vulnerability (CVE-2022-43719)
998613	CVE-2022-40881	WEB-MISC Contec SolarView Compact Prior to 7.21 - OS Command Injection Vulnerability (CVE-2022-40881)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Signature update version 113

New signatures rules are generated for the vulnerabilities identified in the week 2023-09-22. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 113 applicable for NetScaler 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect Citrix® ADC CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998614	CVE-2023-38035	WEB-MISC Ivanti Sentry Up To 9.18.0 - Incorrect Authorization Vulnerability via /asproxy/services/ (CVE-2023-38035)
998615	CVE-2023-38035	WEB-MISC Ivanti Sentry Up To 9.18.0 - Incorrect Authorization Vulnerability via /mics/services/ (CVE-2023-38035)
998616	CVE-2023-36846	WEB-MISC Juniper JunOS SRX - Missing Authentication for Critical Function Vulnerability Via webauth_operation (CVE-2023-36846)
998617	CVE-2023-3486	WEB-MISC PaperCut NG Prior to 22.1.3 - Unrestricted

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
		File Upload Vulnerability (CVE-2023-3486)
998618	CVE-2023-34468, CVE-2023-40037	WEB-MISC Apache NiFi Multiple Versions - Command Injection Vulnerability (CVE-2023-34468, CVE-2023-40037)
998619	CVE-2023-33653	WEB-MISC Sitecore - Remote Code Execution Vulnerability (CVE-2023-33653)
998620	CVE-2023-33224, CVE-2023-23843	WEB-MISC SolarWinds Orion Platform Prior to 2023.3 - Remote Code Execution Vulnerability (CVE-2023-33224, CVE-2023-23843)
998621	CVE-2023-32566	WEB-MISC Ivanti Avalanche - SecureFilter Authentication Bypass Vulnerability (CVE-2023-32566)
998622	CVE-2023-32562	WEB-MISC Ivanti Avalanche Prior to 6.4.1 - Unrestricted File Upload Vulnerability (CVE-2023-32562)
998623	CVE-2023-32315	WEB-MISC Ignite Realtime Openfire - Path Traversal Vulnerability (CVE-2023-32315)
998624	CVE-2023-28128	WEB-MISC Ivanti Avalanche Prior to 6.4.0 - Unrestricted Upload Vulnerability (CVE-2023-28128)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
998625	CVE-2023-27066	WEB-MISC Sitecore Up To 10.2 - Path Traversal Vulnerability (CVE-2023-27066)
998626	CVE-2022-23333	WEB-MISC Contec SolarView Compact Prior to 7.21 - OS Command Injection Vulnerability (CVE-2022-23333)
998627	CVE-2022-37044	WEB-MISC Zimbra Collaboration Suite Prior to 8.8.15 P33 - XSS Vulnerability via onload (CVE-2022-37044)
998628	CVE-2022-37044	WEB-MISC Zimbra Collaboration Suite Prior to 8.8.15 P33 - XSS Vulnerability via extra (CVE-2022-37044)
998629	CVE-2022-37044	WEB-MISC Zimbra Collaboration Suite Prior to 8.8.15 P33 - XSS Vulnerability via title (CVE-2022-37044)
998630	CVE-2022-24086	WEB-MISC Adobe Magento - Arbitrary Code Execution Vulnerability Via wishlist (CVE-2022-24086)
998631	CVE-2022-24086	WEB-MISC Adobe Magento - Arbitrary Code Execution Vulnerability via checkout (CVE-2022-24086)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Signature update version 112

New signatures rules are generated for the vulnerabilities identified in the week 2023-08-30. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 112 applicable for NetScaler 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect Citrix® ADC CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998632	CVE-2023-39526	WEB-MISC PrestaShop Prior to 8.0.5, 8.1.1 and 1.7.8.10 - Arbitrary File Write Vulnerability via OUTFILE (CVE-2023-39526)
998633	CVE-2023-39526	WEB-MISC PrestaShop Prior to 8.0.5, 8.1.1 and 1.7.8.10 - Arbitrary File Write Vulnerability via DUMPFILE (CVE-2023-39526)
998634	CVE-2023-39143	WEB-MISC PaperCut NG/MF Prior to 22.1.3 - Path Traversal Vulnerability in CustomReportExampleServlet (CVE-2023-39143)
998635	CVE-2023-37979	WEB-WORDPRESS Ninja Forms Contact Form Plugin Up to 3.6.25 - Cross-Site

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
		Scripting Vulnerability (CVE-2023-37979)
998636	CVE-2023-33652	WEB-MISC Sitecore - Remote Code Execution Vulnerability (CVE-2023-33652)
998637	CVE-2023-32563	WEB-MISC Ivanti Avalanche Prior to 6.4.1 - Arbitrary File Upload Vulnerability (CVE-2023-32563)
998638	CVE-2023-29357	WEB-MISC Microsoft SharePoint Server - Elevation of Privilege Vulnerability via access_token/prooftoken (CVE-2023-29357)
998639	CVE-2023-29357	WEB-MISC Microsoft SharePoint Server - Elevation of Privilege Vulnerability via Authorization Header (CVE-2023-29357)
998640	CVE-2023-22480	WEB-MISC KubeOperator Prior to 3.16.4 - Improper Authorization Vulnerability (CVE-2023-22480)

Signature update version 111

New signatures rules are generated for the vulnerabilities identified in the week 2023-08-04. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 111 applicable for NetScaler 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1 platforms.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE

Enabling Post body and Response body signature rules might affect Citrix® ADC CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998641	CVE-2023-37580	WEB-MISC Zimbra Collaboration Suite Multiple Versions - XSS Vulnerability (CVE-2023-37580)
998642	CVE-2023-35082	WEB-MISC MobileIron Core (Ivanti EPMM) prior to 11.2 - Authentication Bypass (CVE-2023-35082)
998643	CVE-2023-35078	WEB-MISC Ivanti EndPoint Manager Mobile - Authentication Bypass (CVE-2023-35078)
998644	CVE-2023-34192	WEB-MISC Zimbra Collaboration Suite Multiple Versions - XSS Vulnerability (CVE-2023-34192)
998645	CVE-2023-29382	WEB-MISC Zimbra Collaboration Suite Multiple Versions - RCE Via sfdc_preauth.jsp (CVE-2023-29382)

Signature update version 110

New signatures rules are generated for the vulnerabilities identified in the week 2023-07-25. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Signature version

Signature version 110 applicable for NetScaler 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect Citrix® ADC CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998646	CVE-2023-35036	WEB-MISC Progress MOVEit Transfer - Authenticated SQL Injection Vulnerability Via X-siLock-FolderID Smuggling (CVE-2023-35036)
998647	CVE-2023-35036	WEB-MISC Progress MOVEit Transfer - Authenticated SQL Injection Vulnerability Via X-siLock-FolderID (CVE-2023-35036)
998648	CVE-2023-3460	WEB-WORDPRESS Ultimate Member Wordpress plugin before 2.6.7 Improper Privilege Management (CVE-2023-3460)
998649	CVE-2023-33651	WEB-MISC Sitecore - Authorization Rules Bypass Vulnerability Via MVC Device Simulator (CVE-2023-33651)
998650	CVE-2023-33157	WEB-MISC Microsoft SharePoint - Remote Code Execution Vulnerability (CVE-2023-33157)

Signature update version 109

New signatures rules are generated for the vulnerabilities identified in the week 2023-07-14. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 109 applicable for NetScaler 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect Citrix® ADC CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998685	CVE-2023-36933	WEB-MISC Progress MOVEit Transfer Multiple Versions - Denial Of Service Vulnerability (CVE-2023-36933)

Signature update version 108

New signatures rules are generated for the vulnerabilities identified in the week 2023-07-12. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 108 applicable for NetScaler 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE

Enabling Post body and Response body signature rules might affect Citrix® ADC CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998686	CVE-2023-36934	WEB-MISC Progress MOVEit Transfer Multiple Versions - SQL Injection Vulnerability (CVE-2023-36934)
998687	CVE-2023-36932	WEB-MISC Progress MOVEit Transfer Multiple Versions - SQL Injection Vulnerability Via folderlistrecursive (CVE-2023-36932)

Signature update version 107

New signatures rules are generated for the vulnerabilities identified in the week 2023-06-16. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 107 applicable for NetScaler 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect Citrix® ADC CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
998688	CVE-2023-35708	WEB-MISC Progress MOVEit Transfer Multiple Versions - Unauthenticated SQL Injection Vulnerability (CVE-2023-35708)
998689	CVE-2023-35036	WEB-MISC Progress MOVEit Transfer Multiple Versions - Unauthenticated SQL Injection Vulnerability (CVE-2023-35036)

Signature update version 106

New signatures rules are generated for the vulnerabilities identified in the week 2023-06-16. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 106 applicable for NetScaler 11.1, NetScaler 12.0, Citrix 12.1, Citrix 13.0, NetScaler 13.1, NetScaler 14.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect Citrix® ADC CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

New signatures rules are generated for the vulnerabilities identified in the week 2023-03-01. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 103 applicable for NetScaler 11.1, NetScaler 12.0, NetScaler 12.1, NetScaler 13.0, NetScaler 13.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998761	CVE-2022-45094	WEB-MISC Siemens SINEC INS Prior to V1.0 SP2 Update 1 - Remote Code Execution Vulnerability via bootFileLoc (CVE-2022-45094)
998762	CVE-2022-40044, CVE-2022-40043	WEB-MISC Centreon Prior to 22.04.1 - XSS Vulnerability Via esc_name and esc_alias(CVE-2022-40044)
998763	CVE-2022-3361	WEB-MISC WordPress Plugin Ultimate Member before 2.5.1 - Command Injection Vulnerability (CVE-2022-3361)
998764	CVE-2022-32573	WEB-MISC Lansweeper Prior to 10.3.1.0 - Path Traversal Vulnerability Via txtdocname (CVE-2022-32573)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
998765	CVE-2022-29517	WEB-MISC Lansweeper Prior to 10.3.1.0 - Path Traversal Vulnerability Via inlineattachmentname (CVE-2022-29517)
998766	CVE-2022-29511	WEB-MISC Lansweeper Prior to 10.3.1.0 - Information Disclosure Vulnerability (CVE-2022-29511)
998767	CVE-2022-29081	WEB-MISC Zoho ManageEngine Multiple Products - REST API Access Control Bypass Vulnerability (CVE-2022-29081)
998768	CVE-2022-25487	WEB-MISC AtomCMS Prior to 2.1 - Unrestricted File Upload Vulnerability (CVE-2022-25487)
998769	CVE-2021-26086	WEB-MISC Atlassian Jira Server and Data Center - Information Disclosure Vulnerability Via WEB-INF (CVE-2021-26086)
998770	CVE-2021-26086	WEB-MISC Atlassian Jira Server and Data Center - Information Disclosure Vulnerability Via META-INF (CVE-2021-26086)
998771	CVE-2021-26085, CVE-2021-26086	WEB-MISC Atlassian Confluence Server - Information Disclosure Vulnerability Via WEB-INF (CVE-2021-26085, CVE-2021-26086)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
998772	CVE-2021-26085, CVE-2021-26086	WEB-MISC Atlassian Confluence Server - Information Disclosure Vulnerability Via META-INF (CVE-2021-26085, CVE-2021-26086)
998773	CVE-2020-13818	WEB-MISC Zoho ManageEngine OpManager Prior to 125144 - Directory Traversal Vulnerability (CVE-2020-13818)

Signature update version 102

New signatures rules are generated for the vulnerabilities identified in the week 2023-02-03. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 102 applicable for NetScaler 11.1, NetScaler 12.0, NetScaler 12.1, NetScaler 13.0, NetScaler 13.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998774	CVE-2022-47966	WEB-MISC Zoho ManageEngine Products - RCE Vulnerability Via XSL Transformations in

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
		SamlResponseServlet Endpoint (CVE-2022-47966)
998775	CVE-2022-47966	WEB-MISC Zoho ManageEngine Products - RCE Vulnerability Via XSL Transformations in samlLogin Endpoint (CVE-2022-47966)
998776	CVE-2022-47615	WEB-WORDPRESS LearnPress Plugin Up to 4.1.7.3.2 - REST_ROUTE Local File Inclusion Vulnerability (CVE-2022-47615)
998777	CVE-2022-47615	WEB-WORDPRESS LearnPress Plugin Up to 4.1.7.3.2 - REST API Local File Inclusion Vulnerability (CVE-2022-47615)
998778	CVE-2022-46169	WEB-MISC Cacti Server Prior to 1.2.23 - Command Injection (CVE-2022-46169)
998779	CVE-2022-45808	WEB-WORDPRESS LearnPress Plugin Prior to 4.2 - REST_ROUTE SQL Injection Vulnerability via order_by (CVE-2022-45808)
998780	CVE-2022-45808	WEB-WORDPRESS LearnPress Plugin Prior to 4.2 - REST API SQL Injection Vulnerability via order_by (CVE-2022-45808)
998781	CVE-2022-45808	WEB-WORDPRESS LearnPress Plugin Prior to 4.2 - REST_ROUTE SQL

SIGNATURE RULE	CVE ID	DESCRIPTION
		Injection Vulnerability via order (CVE-2022-45808)
998782	CVE-2022-45808	WEB-WORDPRESS LearnPress Plugin Prior to 4.2 - REST API SQL Injection Vulnerability via order (CVE-2022-45808)
998783	CVE-2022-44877	WEB-MISC Control Web Panel (CWP) 7 Prior to 0.9.8.1147 - OS Command Injection Vulnerability (CVE-2022-44877)
998784	CVE-2022-43473	WEB-MISC Zoho ManageEngine OpManager Prior to 126141 - XML External Entity Injection Vulnerability (CVE-2022-43473)
998785	CVE-2022-43447	WEB-MISC Delta Electronics DIAEnergie - SQL Injection Vulnerability in AM_EBillAnalysis Via txtPf (CVE-2022-43447)
998786	CVE-2022-43447	WEB-MISC Delta Electronics DIAEnergie - SQL Injection Vulnerability in AM_EBillAnalysis Via txtFav (CVE-2022-43447)
998787	CVE-2022-4323	WEB-WORDPRESS Google Analyticator Plugin Prior to 6.5.6 - PHP Object Injection Vulnerability (CVE-2022-4323)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
998788	CVE-2022-42904	WEB-MISC Zoho ManageEngine ADManager Plus Prior to 7160 - OS Command Injection Vulnerability (CVE-2022-42904)
998789	CVE-2022-34271	WEB-MISC Apache Atlas Prior to 2.3.0 - Arbitrary File Upload Vulnerability (CVE-2022-34271)

Signature update version 101

New signatures rules are generated for the vulnerabilities identified in the week 2023-01-24. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 101 applicable for NetScaler 11.1, NetScaler 12.0, NetScaler 12.1, NetScaler 13.0, NetScaler 13.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998790	CVE-2022-43452	WEB-MISC Delta Electronics DIAEnergie - SQL Injection Vulnerability Via Data Item Row Deletion (CVE-2022-43452)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
998791	CVE-2022-43452	WEB-MISC Delta Electronics DIAEnergie - SQL Injection Vulnerability Via Data Type Row Deletion (CVE-2022-43452)
998792	CVE-2022-41080	WEB-MISC Microsoft Exchange Server - OWA Server Side Request Forgery Vulnerability (CVE-2022-41080)
998793	CVE-2022-40309	WEB-MISC Apache Archiva Prior to 2.2.9 - Arbitrary Directory Removal Vulnerability (CVE-2022-40309)
998794	CVE-2022-40308	WEB-MISC Apache Archiva Prior to 2.2.9 - Arbitrary File Read Vulnerability (CVE-2022-40308)
998795	CVE-2022-36962	WEB-MISC SolarWinds Platform Prior to 2022.4 - RCE Vulnerability Via SaveToDisk Create or Update (CVE-2022-36962)
998796	CVE-2022-36962	WEB-MISC SolarWinds Platform Prior to 2022.4 - RCE Vulnerability Via EmailUrl Create or Update (CVE-2022-36962)
998797	CVE-2022-3361	WEB-WORDPRESS WordPress Plugin Ultimate Member Prior to 2.5.1 - Directory Traversal (CVE-2022-3361)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
998798	CVE-2022-24254	WEB-MISC Extensis Portfolio Prior to 4.0.1 - Arbitrary File Upload Vulnerability Via Backup Restore (CVE-2022-24254)
998799	CVE-2022-24253	WEB-MISC Extensis Portfolio Prior to 4.0.1 - Path Traversal Vulnerability Via brandingUpload (CVE-2022-24253)
998800	CVE-2022-0224	WEB-MISC Dolibarr Prior to 14.0.6 - SQL Injection Vulnerability (CVE-2022-0224)
998801	CVE-2021-35232	WEB-MISC SolarWinds Web Help Desk Prior to 12.7.7 Hotfix 1 - Use of Hard-Coded Credentials Vulnerability (CVE-2021-35232)

Signature update version 100

New signatures rules are generated for the vulnerabilities identified in the week 2023-01-05. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 100 applicable for NetScaler 11.1, NetScaler 12.0, NetScaler 12.1, NetScaler 13.0, NetScaler 13.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler CPU.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998802	CVE-2022-47945	WEB-MISC ThinkPHP - Language File Inclusion RCE Vulnerability Via Header (CVE-2022-47945)
998803	CVE-2022-47945	WEB-MISC ThinkPHP - Language File Inclusion RCE Vulnerability via Cookie (CVE-2022-47945)
998804	CVE-2022-47945	WEB-MISC ThinkPHP - Language File Inclusion RCE Vulnerability via Form (CVE-2022-47945)
998805	CVE-2022-45462	WEB-MISC Apache DolphinScheduler Prior to 2.0.6 - OS Command Injection Vulnerability (CVE-2022-45462)
998806	CVE-2022-44635	WEB-MISC Apache Fineract Prior to 1.8.1 - File Upload Path Traversal Vulnerability (CVE-2022-44635)
998807	CVE-2022-43672	WEB-MISC Zoho ManageEngine Multiple Products - SQL Injection Vulnerability (CVE-2022-43672)
998808	CVE-2022-43671	WEB-MISC Zoho ManageEngine Multiple Products - SQL Injection Vulnerability (CVE-2022-43671)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
998809	CVE-2022-41773	WEB-MISC Delta DIAEnergie - SQL Injection Vulnerability Via CheckDIACloud (CVE-2022-41773)
998810	CVE-2022-41351	WEB-MISC Zimbra Collaboration Suite 8.8.15 - XSS vulnerability (CVE-2022-41351)
998811	CVE-2022-41350	WEB-MISC Zimbra Collaboration Suite 8.8.15 - XSS vulnerability (CVE-2022-41350)
998812	CVE-2022-41133	WEB-MISC Delta Electronics DIAEnergie - SQLi Vulnerability Via GetDIAE_line_message_settingsListParameters (CVE-2022-41133)
998813	CVE-2022-40967	WEB-MISC Delta Electronics DIAEnergie - SQL Injection Vulnerability Via CheckIoTHubNameExisted (CVE-2022-40967)
998814	CVE-2022-34662	WEB-MISC Apache DolphinScheduler Prior to 2.0.6 - Path Traversal Vulnerability (CVE-2022-34662)
998815	CVE-2022-3383, CVE-2022-3384	WEB-WORDPRESS WordPress Plugin Ultimate Member Prior to 2.5.2 - Command Injection Vulnerability (CVE-2022-3383, CVE-2022-3384)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
998816	CVE-2022-31698	WEB-MISC VMWare vCenter Server Prior to 6.5U3u, 6.7.0U3s and 7.0U3i - Denial of Service Vulnerability (CVE-2022-31698)
998817	CVE-2022-20867	WEB-MISC Cisco Email Security Appliance - SQL Injection Vulnerability (CVE-2022-20867)

Signature update version 99

New signatures rules are generated for the vulnerabilities identified in the week 2022-12-20. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 99 applicable for NetScaler 11.1, NetScaler 12.0, NetScaler 12.1, NetScaler 13.0, NetScaler 13.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998818	CVE-2022-1361	WEB-MISC On-Premise Cambium Networks cnMaestro - SQL Injection Vulnerability Via MAC (CVE-2022-1361)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
998819	CVE-2022-1361	WEB-MISC On-Premise Cambium Networks cnMaestro - SQL Injection Vulnerability Via Serial Number (CVE-2022-1361)

Signature update version 98

New signatures rules are generated for the vulnerabilities identified in the week 2022-12-06. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 98 applicable for NetScaler 11.1, NetScaler 12.0, NetScaler 12.1, NetScaler 13.0, NetScaler 13.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998820	CVE-2022-43781	WEB-MISC Atlassian Bitbucket Server Multiple Versions - OS Command Injection Vulnerability (CVE-2022-43781)
998821	CVE-2022-43775	WEB-MISC Delta DIAEnergie - SQL Injection Vulnerability Via HandlerTag_KID (CVE-2022-43775)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
998822	CVE-2022-43774	WEB-MISC Delta DIAEnergie - SQL Injection Vulnerability Via HandlerPageP_KID and KID (CVE-2022-43774)
998823	CVE-2022-43774	WEB-MISC Delta DIAEnergie - SQL Injection Vulnerability Via HandlerPageP_KID and HtmlId (CVE-2022-43774)
998824	CVE-2022-42977, CVE-2022-42978	WEB-MISC Netic Confluence User Export App Prior to 1.3.5 - Information Disclosure Vulnerability (CVE-2022-42977, CVE-2022-42978)
998825	CVE-2022-40127	WEB-MISC Apache Airflow Prior To 2.4.0 - Example Dags Command Injection Vulnerability via Api (CVE-2022-40127)
998826	CVE-2022-40127	WEB-MISC Apache Airflow Prior To 2.4.0 - Example Dags Command Injection Vulnerability via Trigger (CVE-2022-40127)
998827	CVE-2022-39298	WEB-MISC Melis Platform Prior to 5.0.1 - MelisFront Arbitrary Deserialization Vulnerability (CVE-2022-39298)
998828	CVE-2022-39297	WEB-MISC Melis Platform Prior to 5.0.1 - MelisCms Arbitrary Deserialization Vulnerability (CVE-2022-39297)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
998829	CVE-2022-39296	WEB-MISC Melis Platform Prior to 5.0.1 - MelisAssetManager Arbitrary File Read Vulnerability (CVE-2022-39296)
998830	CVE-2022-38772	WEB-MISC Zoho ManageEngine Multiple Products - OS Command Injection Vulnerability Via configureNmapScanOptions (CVE-2022-38772)
998831	CVE-2022-35933	WEB-MISC Prestashop Productcomments Prior to 5.0.2 - Cross-Site Scripting Vulnerability (CVE-2022-35933)
998832	CVE-2022-3214	WEB-MISC Delta DIAEnergie - Use of Hard-Coded Credentials Vulnerability (CVE-2022-3214)
998833	CVE-2022-24716	WEB-MISC Icinga Web 2 - Arbitrary File Read Vulnerability via icinga-php-library (CVE-2022-24716)
998834	CVE-2022-24716	WEB-MISC Icinga Web 2 - Arbitrary File Read Vulnerability via icinga-php-thirdparty (CVE-2022-24716)
998835	CVE-2022-24715	WEB-MISC Icinga Web 2 - Path Traversal Vulnerability (CVE-2022-24715)
998836	CVE-2022-2139	WEB-MISC Advantech iView Prior to 5.7.04.6469 - Path Traversal Vulnerability Via

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
		NetworkServlet URI and filename (CVE-2022-2139)
998837	CVE-2022-2139	WEB-MISC Advantech iView Prior to 5.7.04.6469 - Path Traversal Vulnerability Via CommandServlet URI and filename (CVE-2022-2139)
998838	CVE-2021-39144	WEB-MISC VMware Cloud Foundation 3.x - Remote Code Execution Vulnerability via XStream (CVE-2021-39144)
998839	CVE-2021-35220	WEB-MISC SolarWinds Orion Prior to 2020.2.6 HF1 - RCE Vulnerability Via EmailWebPage and TestAction (CVE-2021-35220)
998840	CVE-2021-35220	WEB-MISC SolarWinds Orion Prior to 2020.2.6 HF1 - RCE Vulnerability Via EmailWebPage Create or Update (CVE-2021-35220)

Signature update version 97

New signatures rules are generated for the vulnerabilities identified in the week 2022-11-15. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 97 applicable for NetScaler 11.1, NetScaler 12.0, NetScaler 12.1, NetScaler 13.0, NetScaler 13.1 platforms.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998841	CVE-2022-40043	WEB-MISC Centreon Prior to 22.04.1 - SQL Injection Vulnerability Via esc_name (CVE-2022-40043)
998842	CVE-2022-35153	WEB-MISC FusionPBX 5.0.1 and Prior - OS Command Injection Vulnerability (CVE-2022-35153)
998843	CVE-2022-3387	WEB-MISC Advantech R-SeeNet Prior to 2.4.21 - Path Traversal Vulnerability (CVE-2022-3387)
998844	CVE-2022-3385	WEB-MISC Advantech R-SeeNet Prior to 2.4.21 - Buffer Overflow Vulnerability Via filename (CVE-2022-3385)
998845	CVE-2022-31680	WEB-MISC VMWare vCenter Server Prior to 6.5 U3u - Unsafe Deserialization Vulnerability Via PSC (CVE-2022-31680)
998846	CVE-2022-28732	WEB-MISC Apache JSPWiki Prior to 2.11.3 - WeblogPlugin XSS vulnerability Via weblog.startDate (CVE-2022-28732)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
998847	CVE-2022-28732	WEB-MISC Apache JSPWiki Prior to 2.11.3 - WeblogPlugin XSS vulnerability Via startDate (CVE-2022-28732)
998848	CVE-2022-28730	WEB-MISC Apache JSPWiki Prior to 2.11.3 - AJAXPreview XSS vulnerability Via Denounce Plugin (CVE-2022-28730)
998849	CVE-2022-23463	WEB-MISC Nepxion Discovery - SpEL Injection Vulnerability (CVE-2022-23463)

Signature update version 96

New signatures rules are generated for the vulnerabilities identified in the week 2022-10-23. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 96 applicable for NetScaler 11.1, NetScaler 12.0, NetScaler 12.1, NetScaler 13.0, NetScaler 13.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION

Signature update version 95

Modified signatures rules are generated for the vulnerabilities identified in the week 2022-10-07. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 95 applicable for NetScaler 11.1, NetScaler 12.0, NetScaler 12.1, NetScaler 13.0, NetScaler 13.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
811	CVE-2000-0066	WEB-CGI websitepro path access
1029	NESSUS-11032	WEB-IIS scripts-browse access
1047	CVE-2001-0251	WEB-MISC Netscape Enterprise DOS
1048	CVE-2001-0250	WEB-MISC Netscape Enterprise directory listing attempt
1663	NESSUS-11007	WEB-MISC *%20.pl access
1725	CVE-2000-0630, CVE-2001-0004	WEB-IIS +.htr code fragment attempt
16521	CVE-2009-0478	WEB-CLIENT Squid Proxy http version number overflow attempt

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Signature update version 94

New signatures rules are generated for the vulnerabilities identified in the week 2022-10-06. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 94 applicable for NetScaler 11.1, NetScaler 12.0, NetScaler 12.1, NetScaler 13.0, NetScaler 13.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998871	CVE-2022-41082, CVE-2022-41040	WEB-MISC Microsoft Exchange Server - RCE Vulnerability (CVE-2022-41082, CVE-2022-41040)

Signature update version 93

New signatures rules are generated for the vulnerabilities identified in the week 2022-10-02. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 93 applicable for NetScaler 11.1, NetScaler 12.0, NetScaler 12.1, NetScaler 13.0, NetScaler 13.1 platforms.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998871	CVE-2022-41082, CVE-2022-41040	WEB-MISC Microsoft Exchange Server - RCE Vulnerability (CVE-2022-41082, CVE-2022-41040)
998872	CVE-2022-37299	WEB-MISC Shirne CMS 1.2.0 - Path Traversal Vulnerability Via /static/ueditor/php/controller.php (CVE-2022-37299)
998873	CVE-2022-36923	WEB-MISC Zoho ManageEngine Multiple Products Multiple Versions - Authentication Bypass Vulnerability (CVE-2022-36923)
998874	CVE-2022-33891	WEB-MISC Apache Spark UI Multiple Versions - Remote Code Execution Vulnerability Via doAs Parameter (CVE-2022-33891)
998875	CVE-2022-3184, CVE-2022-3183	WEB-MISC DataProbe iBoot-PDU Prior to 1.42.06162022 - Remote Code Execution Vulnerability (CVE-2022-3184, CVE-2022-3183)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
998876	CVE-2022-31814	WEB-MISC pfSense pfBlockerNG Prior to 2.1.4_26 - Remote Code Execution Vulnerability (CVE-2022-31814)
998877	CVE-2022-31097	WEB-MISC Apache Grafana - Unified Alerting Stored XSS Vulnerability (CVE-2022-31097)
998878	CVE-2022-2903	WEB-WORDPRESS NinjaForms Plugin Prior to 3.6.13 - PHP Object Injection Vulnerability (CVE-2022-2903)
998879	CVE-2022-2552	WEB-WORDPRESS Duplicator Plugin Prior to 1.4.7.1 - Unauthenticated Information Disclosure Vulnerability (CVE-2022-2552)
998880	CVE-2022-23854	WEB-MISC AVEVA InTouch Access Anywhere Secure Gateway - Path Traversal Vulnerability Via SG URI (CVE-2022-23854)
998881	CVE-2022-23854	WEB-MISC AVEVA InTouch Access Anywhere Secure Gateway - Path Traversal Vulnerability Via Blaze URI (CVE-2022-23854)
998882	CVE-2022-23854	WEB-MISC AVEVA InTouch Access Anywhere Secure Gateway - Path Traversal Vulnerability Via

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
		AccessAnywhere URI (CVE-2022-23854)
998883	CVE-2017-9841	WEB-MISC PHPUnit Before 4.8.28 and 5.x Before 5.6.3 - Remote Code Execution Vulnerability Via eval-stdin.php (CVE-2017-9841)

Consolidated and updated signature rules

A few redundant signature rules are deleted and the CVE IDs of these rules are consolidated in the updated rules. Make sure to enable the corresponding signature rules for each deleted rule.

The following table lists the consolidated and updated signature rule IDs:

DELETED SIGNATURE RULES	UPDATED SIGNATURE RULES	CVE ID
1242	1243	CVE-2000-0071
1245	1244	CVE-2000-0071
1589	1221	CVE-2001-0224, NESSUS-10609
1648	832	CVE-1999-0509, NESSUS-10173, `www.cert.org/advisories/CA-1996-11.html`
1700	821	CVE-1999-0951, NESSUS-10122
2598	2597	CVE-2004-0600
999779	999721	CVE-2019-14994
999861	999859	CVE-2019-12099

© 1997–2026 Citrix Systems, Inc. All rights reserved.

DELETED SIGNATURE RULES	UPDATED SIGNATURE RULES	CVE ID
999862	999857	`https://www.wordfence.com/blog/2019/05s-command-injection-vulnerability-patched-in-wp-database-backup-plugin/`
999863	999858	`https://www.wordfence.com/blog/2019/05/privilege-escalation-flaw-present-in-slick-popup-plugin/`

Signature update version 92

New signatures rules are generated for the vulnerabilities identified in the week 2022-09-22. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 92 applicable for NetScaler 11.1, NetScaler 12.0, NetScaler 12.1, NetScaler 13.0, NetScaler 13.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998884	CVE-2022-38130	WEB-MISC Keysight SMS Prior to 2.4.1 - Arbitrary File Upload Vulnerability Allows

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
		SQL Injection (CVE-2022-38130)
998885	CVE-2022-35741	WEB-MISC Apache Cloudstack Prior to 4.16.1.1 - XML External Entity Injection Vulnerability Via SAMLResponse (CVE-2022-35741)
998886	CVE-2022-35650	WEB-MISC Moodle Multiple Versions - Path Traversal Vulnerability Via Blackboard Questions (CVE-2022-35650)
998887	CVE-2022-32551	WEB-MISC Zoho ManageEngine ServiceDesk MSP Prior to 10604 - Unauthenticated Information Disclosure Via /WEB-INF (CVE-2022-32551)
998888	CVE-2022-31675	WEB-MISC VMware vRealize Operations Manager - Authentication Bypass Vulnerability (CVE-2022-31675)
998889	CVE-2022-31674	WEB-MISC VMware vRealize Operations Manager - Information Disclosure Vulnerability (CVE-2022-31674)
998890	CVE-2022-31656	WEB-MISC VMware Workspace ONE Access - Authentication Bypass Vulnerability (CVE-2022-31656)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
998891	CVE-2022-31474	WEB-WORDPRESS BackupBuddy Plugin Prior to 8.7.5 - Information Disclosure Via backupbuddy_local_download (CVE-2022-31474)
998892	CVE-2022-31137, CVE-2022-31126	WEB-MISC Roxy-wi Prior To 6.1.1.0 - Multiple Command Injection Vulnerabilities (CVE-2022-31137, CVE-2022-31126)
998893	CVE-2022-28731	WEB-MISC Apache JSPWiki Prior to 2.11.3 - Server Side Request Forgery Vulnerability (CVE-2022-28731)
998894	CVE-2022-2551	WEB-WORDPRESS Duplicator Plugin Prior to 1.4.7.1 - Unauthenticated Backup Download Vulnerability (CVE-2022-2551)
998895	CVE-2022-2546	WEB-WORDPRESS All-in-One WP Migration Plugin Prior to 7.63 - Reflected XSS Vulnerability Via ai1wm_export (CVE-2022-2546)
998896	CVE-2022-2546	WEB-WORDPRESS All-in-One WP Migration Plugin Prior to 7.63 - Reflected XSS Vulnerability Via ai1wm_import (CVE-2022-2546)
998897	CVE-2022-24948	WEB-MISC Apache JSPWiki Prior to 2.11.2 - XSS

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
		Vulnerability (CVE-2022-24948)
998898	CVE-2022-2139	WEB-MISC Advantech iView Prior to 5.7.04.6469 - Path Traversal Vulnerability Via MenuServlet URI and page (CVE-2022-2139)
998899	CVE-2022-2139	WEB-MISC Advantech iView Prior to 5.7.04.6469 - Path Traversal Vulnerability Via CommandServlet URI and page (CVE-2022-2139)
998900	CVE-2022-2139	WEB-MISC Advantech iView Prior to 5.7.04.6469 - Path Traversal Vulnerability Via CommandServlet URI and filename (CVE-2022-2139)
998901	CVE-2022-2139	WEB-MISC Advantech iView Prior to 5.7.04.6469 - Path Traversal Vulnerability Via NetworkServlet URI and filename (CVE-2022-2139)
998902	CVE-2022-0817	WEB-WORDPRESS BadgeOS Plugin Prior to 3.7.1 - SQLi Vulnerability Via get-earned-achievements and exclude (CVE-2022-0817)
998903	CVE-2022-0817	WEB-WORDPRESS BadgeOS Plugin Prior to 3.7.1 - SQLi Vulnerability Via get-earned-achievements and include (CVE-2022-0817)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
998904	CVE-2022-0817	WEB-WORDPRESS BadgeOS Plugin Prior to 3.7.1 - SQLi Vulnerability Via get-earned-achievements and order (CVE-2022-0817)
998905	CVE-2022-0817	WEB-WORDPRESS BadgeOS Plugin Prior to 3.7.1 - SQLi Vulnerability Via get-earned-achievements and orderby (CVE-2022-0817)
998906	CVE-2022-0817	WEB-WORDPRESS BadgeOS Plugin Prior to 3.7.1 - SQLi Vulnerability Via get-earned-achievements and offset (CVE-2022-0817)
998907	CVE-2022-0817	WEB-WORDPRESS BadgeOS Plugin Prior to 3.7.1 - SQLi Vulnerability Via get-earned-achievements and limit (CVE-2022-0817)
998908	CVE-2018-20062, CVE-2019-9082	WEB-MISC ThinkPHP 5.x Prior to 5.1.32 - Unauthenticated Remote Code Execution Vulnerability (CVE-2018-20062, CVE-2019-9082)

Signature update version 91

New signatures rules are generated for the vulnerabilities identified in the week 2022-08-23. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Signature version

Signature version 91 applicable for NetScaler 11.1, NetScaler 12.0, NetScaler 12.1, NetScaler 13.0, NetScaler 13.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998909	CVE-2022-38129	WEB-MISC Keysight SMS Prior to 2.4.1 - Path Traversal Vulnerability Allows RCE (CVE-2022-38129)
998910	CVE-2022-37042, CVE-2022-27925	WEB-MISC Zimbra Collaboration Suite - MailboxImportServlet Multiple Vulnerabilities (CVE-2022-37042, CVE-2022-27925)
998911	CVE-2022-36446	WEB-MISC Webmin Multiple Versions - HTML Injection and Remote Code Execution Vulnerabilities (CVE-2022-36446)
998912	CVE-2022-35405	WEB-MISC Zoho ManageEngine Password Manager Pro Prior to 12101 - Java Deserialization Vulnerability (CVE-2022-35405)
998913	CVE-2022-34872	WEB-MISC Centreon Prior to 21.10.7 - SQL Injection

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
		Vulnerability Via vhidden (CVE-2022-34872)
998914	CVE-2022-34872	WEB-MISC Centreon Prior to 21.10.7 - SQL Injection Vulnerability Via rpn_function (CVE-2022-34872)
998915	CVE-2022-34872	WEB-MISC Centreon Prior to 21.10.7 - SQL Injection Vulnerability Via unit_name (CVE-2022-34872)
998916	CVE-2022-34872	WEB-MISC Centreon Prior to 21.10.7 - SQL Injection Vulnerability Via warn (CVE-2022-34872)
998917	CVE-2022-34872	WEB-MISC Centreon Prior to 21.10.7 - SQL Injection Vulnerability Via crit (CVE-2022-34872)
998918	CVE-2022-34872	WEB-MISC Centreon Prior to 21.10.7 - SQL Injection Vulnerability Via def_type (CVE-2022-34872)
998919	CVE-2022-31813	WEB-MISC Apache HTTP Server Up to 2.4.53 - mod_proxy X-Forwarded-* Headers Removal Vulnerability (CVE-2022-31813)
998920	CVE-2022-31125	WEB-MISC Roxy-wi Prior To 6.1.1.0 - Authentication Bypass Vulnerability Via alert_consumer (CVE-2022-31125)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
998921	CVE-2022-31101	WEB-MISC Prestashop Blockwishlist Prior to 2.1.1 - SQL Injection Vulnerability (CVE-2022-31101)
998922	CVE-2022-26137	WEB-MISC Atlassian Products Multiple Versions - Cross-Origin Resource Sharing Bypass Vulnerability (CVE-2022-26137)
998923	CVE-2022-24299	WEB-MISC pfSense CE Prior to 2.6.0 - Remote Code Execution Vulnerability Via vpn_openvpn_client.php (CVE-2022-24299)
998924	CVE-2022-24299	WEB-MISC pfSense CE Prior to 2.6.0 - Remote Code Execution Vulnerability Via vpn_openvpn_server.php (CVE-2022-24299)
998925	CVE-2022-0817	WEB-WORDPRESS BadgeOS Plugin Prior to 3.7.1 - SQL Injection Vulnerability Via get-achievements and user_id (CVE-2022-0817)
998926	CVE-2021-36749	WEB-MISC Apache Druid - Arbitrary Local File Disclosure Vulnerability (CVE-2021-36749)
998927	CVE-2021-26919	WEB-MISC Apache Druid Prior to 0.20.2 - Untrusted Deserialization Vulnerability via autoDeserialize=true (CVE-2021-26919)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
998928	CVE-2021-26919	WEB-MISC Apache Druid Prior to 0.20.2 - Untrusted Deserialization Vulnerability via detectCustomCollations=true (CVE-2021-26919)

Signature update version 90

New signatures rules are generated for the vulnerabilities identified in the week 2022-07-30. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 90 applicable for NetScaler 11.1, NetScaler 12.0, NetScaler 12.1, NetScaler 13.0, NetScaler 13.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998929	CVE-2022-34871	WEB-MISC Centreon Prior to 21.10.6 - SQL Injection Vulnerability (CVE-2022-34871)
998930	CVE-2022-29846	WEB-MISC In Progress Ipswitch WhatsUp Gold - Information Disclosure Vulnerability (CVE-2022-29846)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
998931	CVE-2022-29845	WEB-MISC In Progress Ipswitch WhatsUp Gold - Path Traversal Vulnerability (CVE-2022-29845)
998932	CVE-2022-28055	WEB-MISC FusionPBX Prior to 5.0.1 - Remote Code Execution Vulnerability (CVE-2022-28055)
998933	CVE-2022-26138	WEB-MISC Atlassian Questions For Confluence App - Hardcoded Credentials Vulnerability Via REST API (CVE-2022-26138)
998934	CVE-2022-26138	WEB-MISC Atlassian Questions For Confluence App - Hardcoded Credentials Vulnerability Via Login Form (CVE-2022-26138)
998935	CVE-2022-26135	WEB-MISC Jira Server and Data Center - Mobile Plugin Server-Side Request Forgery Vulnerability (CVE-2022-26135)
998936	CVE-2022-21445	WEB-MISC Oracle OBIEE ADF Faces - Deserialization of Untrusted Data Vulnerability (CVE-2022-21445)
998937	CVE-2022-2143	WEB-MISC Advantech iView Prior to 5.7.04.6469 - RCE Vulnerability Via NetworkServlet URI and fwfilename (CVE-2022-2143)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
998938	CVE-2022-2143	WEB-MISC Advantech iView Prior to 5.7.04.6469 - RCE Vulnerability Via CommandServlet URI and fwfilename (CVE-2022-2143)
998939	CVE-2022-2143	WEB-MISC Advantech iView Prior to 5.7.04.6469 - RCE Vulnerability Via NetworkServlet URI and backup_filename (CVE-2022-2143)
998940	CVE-2022-2143	WEB-MISC Advantech iView Prior to 5.7.04.6469 - RCE Vulnerability Via CommandServlet URI and backup_filename (CVE-2022-2143)
998941	CVE-2022-2099	WEB-WORDPRESS WooCommerce Plugin Prior to 6.6.0 - Payment Gateway HTML Injection Vulnerability (CVE-2022-2099)

Signature update version 89

New signatures rules are generated for the vulnerabilities identified in the week 2022-07-08. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 89 applicable for NetScaler 11.1, NetScaler 12.0, NetScaler 12.1, NetScaler 13.0, NetScaler 13.1 platforms.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998942	CVE-2022-32532	WEB-MISC Apache Shiro Prior to 1.9.1 - RegexRequestMatcher Bypass Vulnerability Via Line Feed (CVE-2022-32532)
998943	CVE-2022-32532	WEB-MISC Apache Shiro Prior to 1.9.1 - RegexRequestMatcher Bypass Vulnerability Via Carriage Return (CVE-2022-32532)
998944	CVE-2022-30157	WEB-MISC Microsoft SharePoint - RCE Via Deserialization of Untrusted Data Vulnerability (CVE-2022-30157)
998945	CVE-2022-29847	WEB-MISC In Progress Ipswitch WhatsUp Gold - Unauthenticated Server-Side Request Forgery Vulnerability (CVE-2022-29847)
998946	CVE-2022-29535	WEB-MISC Zoho ManageEngine OpManager Multiple Versions - SQL Injection Vulnerability Via bview (CVE-2022-29535)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
998947	CVE-2022-29535	WEB-MISC Zoho ManageEngine OpManager Multiple Versions - SQL Injection Vulnerability Via category (CVE-2022-29535)
998948	CVE-2022-28219	WEB-MISC Zoho ManageEngine ADAudit Plus Prior to 7060 - Remote Code Execution Vulnerability (CVE-2022-28219)
998949	CVE-2022-28219	WEB-MISC Zoho ManageEngine ADAudit Plus Prior to 7060 - XXE Injection Vulnerability Via Task New Content (CVE-2022-28219)
998950	CVE-2022-28219	WEB-MISC Zoho ManageEngine ADAudit Plus Prior to 7060 - XXE Injection Vulnerability Via Task Content (CVE-2022-28219)
998951	CVE-2022-23642	WEB-MISC Sourcegraph Prior to 3.37 - gitserver Service Remote Code Execution Vulnerability (CVE-2022-23642)
998952	CVE-2022-23206	WEB-MISC Apache Traffic Control Traffic Ops Prior to 5.1.6 and 6.1.0 - SSRF Vulnerability (CVE-2022-23206)
998953	CVE-2022-1609	WEB-WORDPRESS Weblizar School Management Pro Plugin Prior to 9.9.7 - Remote Code

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
		Execution Vulnerability (CVE-2022-1609)
998954	CVE-2022-1209	WEB-WORDPRESS WordPress Plugin Ultimate Member Prior to 2.3.2 - Open Redirect Vulnerability (CVE-2022-1209)
998955	CVE-2021-46360	WEB-MISC Composr-CMS - Remote Code Execution Vulnerability (CVE-2021-46360)
998956	CVE-2021-43350	WEB-MISC Apache Traffic Control Traffic Ops Prior to 5.1.4 and 6.0.1 - LDAP Injection Vulnerability (CVE-2021-43350)
998957	CVE-2017-9248	WEB-MISC Telerik UI for ASP.NET AJAX before R2 2017 SP1 - Encryption Key Disclosure Vulnerability (CVE-2017-9248)

Signature update version 88

New signatures rules are generated for the vulnerabilities identified in the week 2022-06-16. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 88 applicable for NetScaler 11.1, NetScaler 12.0, NetScaler 12.1, NetScaler 13.0, NetScaler 13.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Signature update version 87

New signatures rules are generated for the vulnerabilities identified in the week 2022-06-07. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 87 applicable for NetScaler 11.1, NetScaler 12.0, NetScaler 12.1, NetScaler 13.0, NetScaler 13.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998964	CVE-2022-30525	WEB-MISC Zyxel Firewalls Multiple Versions - Unauthenticated OS Command Injection Vulnerability in setWanPortSt (CVE-2022-30525)
998965	CVE-2022-29108	WEB-MISC Microsoft SharePoint - RCE Via Deserialization of Untrusted Data Vulnerability (CVE-2022-29108)
998966	CVE-2022-26134	WEB-MISC Atlassian Confluence Multiple Versions - Unauthenticated OGNL Injection Vulnerability (CVE-2022-26134)
998967	CVE-2022-26019	WEB-MISC pfSense CE < 2.6.0 - Remote Code Execution Vulnerability Via

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
		services_ntpd_gps.php and gpsport (CVE-2022-26019)
998968	CVE-2022-26019	WEB-MISC pfSense CE < 2.6.0 - Remote Code Execution Vulnerability Via services_ntpd.php and gpsport (CVE-2022-26019)
998969	CVE-2022-24288	WEB-MISC Apache Airflow Up To 2.2.3 - DAG Example Remote Code Execution Vulnerability via my_param (CVE-2022-24288)
998970	CVE-2022-24288	WEB-MISC Apache Airflow Up To 2.2.3 - DAG Example Remote Code Execution Vulnerability via foo or miff (CVE-2022-24288)
998971	CVE-2022-22978	WEB-MISC Spring Security Up to 5.5.6 and 5.6.3 - RegexRequestMatcher Bypass Vulnerability Via Line Feed (CVE-2022-22978)
998972	CVE-2022-22978	WEB-MISC Spring Security Up to 5.5.6 and 5.6.3 - RegexRequestMatcher Bypass Vulnerability Via Carriage Return (CVE-2022-22978)
998973	CVE-2022-22957	WEB-MISC VMware Multiple Products - Remote Code Execution Vulnerability (CVE-2022-22957)
998974	CVE-2021-45232	WEB-MISC Apache APISIX Dashboard Prior to 2.10.1 - Authentication Bypass

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
		Vulnerability Via export (CVE-2021-45232)
998975	CVE-2021-45232	WEB-MISC Apache APISIX Dashboard Prior to 2.10.1 - Authentication Bypass Vulnerability via import (CVE-2021-45232)
998976	CVE-2021-41739	WEB-MISC Artica Proxy - OS Command Injection Vulnerability Via cyrus.events.php (CVE-2021-41739)
998977	CVE-2021-37927	WEB-MISC ManageEngine ADManager Plus Prior to 7111 - Authentication Bypass Vulnerability (CVE-2021-37927)
998978	CVE-2021-36356	WEB-MISC Kramer VIA VSM Server - Unauthenticated Remote Code Execution Vulnerability in writeBrowseFilePathAjax (CVE-2021-36356)
998979	CVE-2021-25094	WEB-WORDPRESS Plugin Tatsu Builder Prior to 3.3.12 - Remote Code Execution Vulnerability (CVE-2021-25094)

Signature update version 86

New signatures rules are generated for the vulnerabilities identified in the week 2022-05-20. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Signature version

Signature version 86 applicable for NetScaler 11.1, NetScaler 12.0, NetScaler 12.1, NetScaler 13.0, NetScaler 13.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998980	CVE-2022-30525	WEB-MISC Zyxel Firewalls Multiple Versions - Unauthenticated OS Command Injection Vulnerability in setWanPortSt (CVE-2022-30525)
998981	CVE-2021-25094	WEB-WORDPRESS Plugin Tatsu Builder Prior to 3.3.12 - Remote Code Execution Vulnerability (CVE-2021-25094)

Signature update version 85

New signatures rules are generated for the vulnerabilities identified in the week 2022-05-13. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 85 applicable for NetScaler 11.1, NetScaler 12.0, NetScaler 12.1, NetScaler 13.0, NetScaler 13.1 platforms.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998982	CVE-2022-26352	WEB-MISC dotCMS - Arbitrary File Upload Vulnerability Via PUT (CVE-2022-26352)
998983	CVE-2022-26352	WEB-MISC dotCMS - Arbitrary File Upload Vulnerability Via POST (CVE-2022-26352)
998984	CVE-2022-1388	WEB-MISC F5 BIG-IP - iControl REST Authentication Bypass Vulnerability (CVE-2022-1388)
998985	CVE-2022-1162	WEB-MISC Gitlab CE/EE Multiple Versions - Hard-coded Credentials Vulnerability (CVE-2022-1162)
998986	CVE-2022-0888	WEB-WORDPRESS Plugin Ninja Forms File Uploads Prior to 3.3.1 - Arbitrary File Upload Vulnerability (CVE-2022-0888)
998987	CVE-2021-35244	WEB-MISC SolarWinds Orion Prior to 2020.2.6 HF3 - Arbitrary File Upload Vulnerability Via WriteToFile Action (CVE-2021-35244)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Signature update version 84

New signatures rules are generated for the vulnerabilities identified in the week 2022-05-08. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 84 applicable for NetScaler 11.1, NetScaler 12.0, NetScaler 12.1, NetScaler 13.0, NetScaler 13.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998988	CVE-2022-26986	WEB-MISC ImpressCMS Prior to 1.4.3 - SQL Injection Vulnerability via mimetypeid (CVE-2022-26986)
998989	CVE-2022-24112	WEB-MISC Apache APISIX batch-requests Plugin - IP Restriction Bypass Vulnerability (CVE-2022-24112)
998990	CVE-2021-37558	WEB-MISC Centreon Prior to 20.04.14, 20.10.8 and 21.04.2 - SQL Injection Vulnerability Via service_description (CVE-2021-37558)
998991	CVE-2021-37558	WEB-MISC Centreon Prior to 20.04.14, 20.10.8 and 21.04.2 - SQL Injection

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
		Vulnerability Via host_name (CVE-2021-37558)
998992	CVE-2021-22056	WEB-MISC VMware Workspace ONE Access and Identity Manager - Server Side Request Forgery vulnerability (CVE-2021-22056)

Signature update version 83

New signatures rules are generated for the vulnerabilities identified in the week 2022-05-04. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 83 applicable for NetScaler 11.1, NetScaler 12.0, NetScaler 12.1, NetScaler 13.0, NetScaler 13.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
998993	CVE-2022-29464	WEB-MISC WSO2 Multiple Products - Unrestricted File Upload Vulnerability (CVE-2022-29464)
998994	CVE-2022-22954	WEB-MISC VMware Workspace ONE Access and Identity Manager - Remote Code Execution Vulnerability

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
		via deviceType (CVE-2022-22954)
998995	CVE-2022-22954	WEB-MISC VMware Workspace ONE Access and Identity Manager - Remote Code Execution Vulnerability via deviceUdid (CVE-2022-22954)
998996	CVE-2022-1329	WEB-WORDPRESS WordPress Elementor Website Builder Prior to 3.6.3 - Unauthorized AJAX Action Vulnerability (CVE-2022-1329)

Signature update version 82

New signatures rules are generated for the vulnerabilities identified in the week 2022-04-23. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 82 applicable for NetScaler 11.1, NetScaler 12.0, NetScaler 12.1, NetScaler 13.0, NetScaler 13.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
998997	CVE-2022-27924	WEB-MISC Zimbra Collaboration Joule - Cache Poisoning Vulnerability (CVE-2022-27924)
998998	CVE-2022-21907	WEB-MISC Microsoft HTTP Protocol Stack - Remote Code Execution Vulnerability (CVE-2022-21907)
998999	CVE-2021-37930	WEB-MISC ManageEngine ADManager Plus Prior to 7111 - Arbitrary File Upload Vulnerability Via sm_domainName (CVE-2021-37930)
999000	CVE-2021-37930	WEB-MISC ManageEngine ADManager Plus Prior to 7111 - Arbitrary File Upload Vulnerability Via sm_operationId (CVE-2021-37930)

Signature update version 81

New signatures rules are generated for the vulnerabilities identified in the week 2022-04-08. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 81 applicable for NetScaler 11.1, NetScaler 12.0, NetScaler 12.1, NetScaler 13.0, NetScaler 13.1 platforms.

NOTE

Enabling Post body and Response body signature rules might affect NetScaler CPU.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
999001	CVE-2022-0479	WEB-WORDPRESS Popup Builder Plugin Prior to 4.1.1 - SQL Injection Vulnerability (CVE-2022-0479)
999002	CVE-2021-36393	WEB-MISC Moodle Prior to 3.11.1 - SQL Injection Vulnerability (CVE-2021-36393)
999003	CVE-2021-26599	WEB-MISC ImpressCMS Prior to 1.4.3 - SQL Injection Vulnerability (CVE-2021-26599)

Signature update version 80

New signatures rules are generated for the vulnerabilities identified in the week 2022-04-04. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 80 applicable for NetScaler 11.1, NetScaler 12.0, NetScaler 12.1, NetScaler 13.0, NetScaler 13.1 platforms.

NOTE:

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
999004	CVE-2022-22965	WEB-MISC Spring4Shell Spring Core Framework - RCE Vulnerability (CVE-2022-22965)

Signature update version 79

New signatures rules are generated for the vulnerabilities identified in the week 2022-03-29. You can download and configure these signature rules to protect your appliance from security vulnerable attack.

Signature version

Signature version 79 applicable for NetScaler 11.1, NetScaler 12.0, NetScaler 12.1, NetScaler 13.0, NetScaler 13.1 platforms.

NOTE:

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
18959(updated rule)	CVE-2022-22965	WEB-MISC VMware Spring4Shell, SpringSource Spring Framework class.classloader RCE attempt
999005	CVE-2022-22963	WEB-MISC Spring Cloud Function - Code Injection Vulnerability (CVE-2022-22963)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Signature update version 78

New signatures rules are generated for the vulnerabilities identified in the week 2022-03-29. You can download and configure these signature rules to protect your appliance from security vulnerable attack.

Signature version

Signature version 78 applicable for NetScaler 11.1, NetScaler 12.0, NetScaler 12.1, NetScaler 13.0, NetScaler 13.1 platforms.

NOTE:

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
999006		WEB-MISC Zabbix Multiple Versions - Remote Code Execution Vulnerability Via items.php
999007	CVE-2022-24266	WEB-MISC Cuppa CMS v1.0 - SQL Injection Vulnerability via order_orientation (CVE-2022-24266)
999008	CVE-2022-24266	WEB-MISC Cuppa CMS v1.0 - SQL Injection Vulnerability via order_by (CVE-2022-24266)
999009	CVE-2022-22005	WEB-MISC Microsoft SharePoint - RCE Via Deserialization of Untrusted Data Vulnerability (CVE-2022-22005)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
999010	CVE-2022-21705	WEB-MISC OctoberCMS Prior to Build 474 and v1.1.10 - Remote Code Execution Vulnerability (CVE-2022-21705)
999011	CVE-2022-0557	WEB-MISC Microweber Prior to 1.2.11 - Remote Code Execution Vulnerability (CVE-2022-0557)
999012	CVE-2022-0513	WEB-WORDPRESS WP Statistics Plugin Prior to 13.1.5 - Blind SQL Injection Vulnerability (CVE-2022-0513)
999013	CVE-2022-0332	WEB-MISC Moodle 3.11.0 to 3.11.4 - H5P Activity SQL Injection Vulnerability (CVE-2022-0332)
999014	CVE-2021-46088	WEB-MISC Zabbix Multiple Versions - Remote Code Execution Vulnerability (CVE-2021-46088)
999015	CVE-2021-43789	WEB-MISC PrestaShop Prior to 1.7.8.2 - SQL Injection Vulnerability Via sortOrder (CVE-2021-43789)
999016	CVE-2021-43789	WEB-MISC PrestaShop Prior to 1.7.8.2 - SQL Injection Vulnerability Via orderBy (CVE-2021-43789)
999017	CVE-2021-43408	WEB-WORDPRESS Duplicate Post Plugin Prior to 1.1.9 - SQL Injection

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
		Vulnerability (CVE-2021-43408)
999018	CVE-2021-43319	WEB-MISC Zoho ManageEngine NCM Prior to 125488 - OS Command Injection Vulnerability (CVE-2021-43319)
999019	CVE-2021-41282	WEB-MISC pfSense 2.5.2 - Remote Code Execution Vulnerability (CVE-2021-41282)
999020	CVE-2021-39115, CVE-2021-43947	WEB-MISC Atlassian Jira Server and Data Center - Server Side Template Injection Vulnerability (CVE-2021-39115, CVE-2021-43947)
999021	CVE-2021-38452	WEB-MISC Moxa MXview Network Management Prior to 3.2.2 - Path Traversal Vulnerability (CVE-2021-38452)
999022	CVE-2021-37918	WEB-MISC Zoho ManageEngine ADManager Plus Prior to 7111 - Path Traversal Vulnerability Via domainName (CVE-2021-37918)
999023	CVE-2021-37918	WEB-MISC Zoho ManageEngine ADManager Plus Prior to 7111 - Path Traversal Vulnerability Via bm_operationId (CVE-2021-37918)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
999024	CVE-2021-37918	WEB-MISC Zoho ManageEngine ADManager Plus Prior to 7111 - RCE Via Arbitrary File Upload Vulnerability (CVE-2021-37918)
999025	CVE-2021-32649	WEB-MISC OctoberCMS Prior to Build 473 and v1.1.6 - Remote Code Execution Vulnerability via Twig (CVE-2021-32649)
999026	CVE-2021-32648	WEB-MISC OctoberCMS Prior to Build 472 and v1.1.5 - Password Reset Vulnerability (CVE-2021-32648)
999027	CVE-2021-32099, CVE-2020-26518	WEB-MISC Artica Pandora Prior to 743 - SQL Injection Vulnerability Via chart_generator (CVE-2021-32099, CVE-2020-26518)
999028	CVE-2021-32098	WEB-MISC Artica Pandora Prior to 743 - Phar Deserialization Vulnerability Via progressbubble (CVE-2021-32098)
999029	CVE-2021-32098	WEB-MISC Artica Pandora Prior to 743 - Phar Deserialization Vulnerability Via progressbar (CVE-2021-32098)
999030	CVE-2021-30149	WEB-MISC Composr 10.0.36 - Remote Code Execution Vulnerability (CVE-2021-30149)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
999031	CVE-2021-25114	WEB-WORDPRESS Paid Memberships Pro Plugin Prior to 2.6.7 - SQLi Vulnerability Via rest_route and discount_code (CVE-2021-25114)
999032	CVE-2021-25114	WEB-WORDPRESS Paid Memberships Pro Plugin Prior to 2.6.7 - SQLi Vulnerability Via wp-json and discount_code (CVE-2021-25114)
999033	CVE-2021-21984	WEB-MISC VMware vRealize Business for Cloud 7.x prior to 7.6.0 - Remote Code Execution Vulnerability (CVE-2021-21984)

Signature update version 77

New signatures rules are generated for the vulnerabilities identified in the week 2022-02-25. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 77 applicable for NetScaler 11.1, NetScaler 12.0, NetScaler 12.1, NetScaler 13.0, NetScaler 13.1 platforms.

NOTE:

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
999034		WEB-WORDPRESS WordPress 5.9 - Stored XSS Vulnerability Via Page Excerpt in Json Object
999035		WEB-WORDPRESS WordPress 5.9 - Stored XSS Vulnerability Via Page Excerpt in Form
999036		WEB-WORDPRESS WordPress 5.9 - Stored XSS Vulnerability Via post.php
999037		WEB-WORDPRESS WordPress 5.9 - Stored XSS Vulnerability Via Post Excerpt in Json Object
999038		WEB-WORDPRESS WordPress 5.9 - Stored XSS Vulnerability Via Post Excerpt in Form
999039		WEB-MISC Path Traversal Vulnerability Via Form Field Values
999040		WEB-MISC Path Traversal Vulnerability Via URI
999041	CVE-2022-23221	WEB-MISC H2 Console Prior to 2.1.210 - Remote Code Execution Vulnerability Via test.do (CVE-2022-23221)
999042	CVE-2022-23221	WEB-MISC H2 Console Prior to 2.1.210 - Remote Code Execution Vulnerability Via login.do (CVE-2022-23221)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
999043	CVE-2022-21662	WEB-WORDPRESS WordPress Prior to 5.8.3 - Stored Cross-Site Scripting Vulnerability (CVE-2022-21662)
999044	CVE-2022-0320	WEB-WORDPRESS The Essential Addons for Elementor Plugin Prior to 5.0.5 - LFI Via eael_product_gallery (CVE-2022-0320)
999045	CVE-2022-0320	WEB-WORDPRESS The Essential Addons for Elementor Plugin Prior to 5.0.5 - LFI Via woo_product_pagination_product (CVE-2022-0320)
999046	CVE-2022-0320	WEB-WORDPRESS The Essential Addons for Elementor Plugin Prior to 5.0.5 - LFI Via load_more (CVE-2022-0320)

Signature update version 76

New signatures rules are generated for the vulnerabilities identified in the week 2022-02-20. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 76 applicable for NetScaler 11.1, NetScaler 12.0, NetScaler 12.1, NetScaler 13.0 platforms.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE:

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
999047	CVE-2022-23863	WEB-MISC FusionPBX Prior to 4.5.30 - OS Command Injection Via fax_page_size (CVE-2021-43406)
999048	CVE-2021-44515	WEB-MISC JetBrains TeamCity - Remote Code Execution Vulnerability Via Agent Push (CVE-2021-43193)
999049	CVE-2021-43406	WEB-MISC GoAhead Prior to 5.1.5 - CGI Environment Variable Injection Vulnerability (CVE-2021-42342)
999050	CVE-2021-43193	WEB-MISC SonicWall Secure Mobile Access - Remote Code Execution Vulnerability (CVE-2021-20045)
999051	CVE-2021-42342	WEB-MISC GoAhead Prior to 5.1.5 - CGI Environment Variable Injection Vulnerability (CVE-2021-42342)
999052	CVE-2021-20045	WEB-MISC SonicWall Secure Mobile Access - Remote Code Execution Vulnerability (CVE-2021-20045)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
999053	CVE-2021-20044	WEB-MISC SonicWall Secure Mobile Access - Command Injection Vulnerability (CVE-2021-20044)
999054		WEB-WORDPRESS AdSanity Plugin - Remote Code Execution Vulnerability Via HTML5 File Upload

Signature update version 75

New signatures rules are generated for the vulnerabilities identified in the week 2022-01-20. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signature version 75 applicable for NetScaler 11.1, NetScaler 12.0, NetScaler 12.1, NetScaler 13.0 platforms.

NOTE:

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
999055	CVE-2021-44224	WEB-MISC Apache HTTP Server - Malformed UDS Vulnerability Via Forward and Reverse Proxy (CVE-2021-44224)
999056	CVE-2021-43815	WEB-MISC Apache Grafana - TestData DB Data Source

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
		Path Traversal Vulnerability (CVE-2021-43815)
999057	CVE-2021-43813	WEB-MISC Apache Grafana - Path Traversal Vulnerability Via Markdown (CVE-2021-43813)
999058	CVE-2021-43405	WEB-MISC FusionPBX Prior to 4.5.30 - OS Command Injection Via fax_extension (CVE-2021-43405)
999059	CVE-2021-42392	WEB-MISC H2 Console Prior to 2.0.206 - Remote Code Execution Vulnerability (CVE-2021-42392)
999060	CVE-2021-42362	WEB-WORDPRESS Popular Post Plugin Prior to 5.3.3 - Arbitrary File Upload Vulnerability (CVE-2021-42362)
999061	CVE-2021-42129	WEB-MISC Ivanti Avalanche Prior to 6.3.3 - OS Command Injection Vulnerability Via txtUpass (CVE-2021-42129)
999062	CVE-2021-42129	WEB-MISC Ivanti Avalanche Prior to 6.3.3 - OS Command Injection Vulnerability Via txtUname (CVE-2021-42129)
999063	CVE-2021-42129	WEB-MISC Ivanti Avalanche Prior to 6.3.3 - OS Command Injection Vulnerability Via txtUncPath (CVE-2021-42129)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
999064	CVE-2021-40345	WEB-MISC Nagios XI Prior to 5.8.6 - OS Command Injection Vulnerability Via Maliciously Crafted ZIP File (CVE-2021-40345)
999065	CVE-2021-37928	WEB-MISC Zoho ManageEngine ADManager Plus Prior to 7110 - Unrestricted File Upload Vulnerability (CVE-2021-37928)
999066	CVE-2021-25037	WEB-WORDPRESS All In One SEO Plugin Prior to 4.1.5.3 - SQL Injection Vulnerability Via objects REST API and rest_route
999067	CVE-2021-25037	WEB-WORDPRESS All In One SEO Plugin Prior to 4.1.5.3 - SQL Injection Vulnerability Via objects REST API
999068	CVE-2021-25036	WEB-WORDPRESS All In One SEO Plugin Prior to 4.1.5.3 - Privilege Escalation Vulnerability Via REST API and rest_route
999069	CVE-2021-25036	WEB-WORDPRESS All In One SEO Plugin Prior to 4.1.5.3 - Privilege Escalation Vulnerability Via REST API
999070	CVE-2021-21917	WEB-MISC Advantech R-SeeNet Prior to 2.4.17 - SQL Injection Vulnerability Via ord (CVE-2021-21917)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
999071	CVE-2021-20040	WEB-MISC SonicWall Secure Mobile Access - Arbitrary File Write Vulnerability (CVE-2021-20040)
999072	CVE-2021-20039	WEB-MISC SonicWall Secure Mobile Access - Command Injection Vulnerability (CVE-2021-20039)

Signature update version 74

New signatures rules are generated for the vulnerabilities identified in the week 2021-12-21. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signatures are compatible with the following software versions of Citrix Application Delivery Controller (ADC) 11.1, 12.0, 12.1, 13.0 and 13.1.

NetScaler version 12.0 has reached end of life (EOL). For more information, see release life cycle page.

NOTE:

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
999073	CVE-2021-44077	WEB-MISC Zoho ManageEngine ServiceDesk Plus Prior to 11306 - PreAuth RCE Vulnerability Via

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
		ImportTechnicians (CVE-2021-44077)
999074	CVE-2021-43798	WEB-MISC Apache Grafana 8.0.0 Up to 8.3.0 - Path Traversal Vulnerability (CVE-2021-43798)
999075	CVE-2021-35216	WEB-MISC SolarWinds Orion Prior to 2020.2.6 - Deserialization Vulnerability Via EditTopXX.aspx (CVE-2021-35216)
999076	CVE-2021-34993	WEB-MISC Commvault CommCell - CVSearchService Authentication Bypass Vulnerability (CVE-2021-34993)

Signature update version 73

New signatures rules are generated for the vulnerabilities identified in the week 2021-12-13. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signatures are compatible with the following software versions of Citrix Application Delivery Controller (ADC) 11.1, 12.0, 12.1, 13.0 and 13.1.

NetScaler version 12.0 has reached end of life (EOL). For more information, see release life cycle page.

NOTE:

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description that are updated.

NOTE:

The below signature rules (999077, 999078, 999079, 999080) addresses both CVEs (CVE-2021-44228, and CVE-2021-45046).

SIGNATURE RULE	CVE ID	DESCRIPTION
999077	CVE-2021-44228, CVE-2021-45046	WEB-MISC Apache Log4j - Remote Code Execution Vulnerability via FORM (CVE-2021-44228, CVE-2021-45046)
999078	CVE-2021-44228, CVE-2021-45046	WEB-MISC Apache Log4j - Remote Code Execution Vulnerability via BODY (CVE-2021-44228, CVE-2021-45046)
999079	CVE-2021-44228, CVE-2021-45046	WEB-MISC Apache Log4j - Remote Code Execution Vulnerability via HEADER (CVE-2021-44228, CVE-2021-45046)
999080	CVE-2021-44228, CVE-2021-45046	WEB-MISC Apache Log4j - Remote Code Execution Vulnerability via URL (CVE-2021-44228, CVE-2021-45046)

Signature update version 72

New signatures rules are generated for the vulnerabilities identified in the week 2021-12-11. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Signature version

Signatures are compatible with the following software versions of Citrix Application Delivery Controller (ADC) 11.1, 12.0, 12.1, 13.0 and 13.1.

NetScaler version 12.0 has reached end of life (EOL). For more information, see release life cycle page.

NOTE:

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
999077	CVE-2021-44228	WEB-MISC Apache Log4j - Remote Code Execution Vulnerability via FORM (CVE-2021-44228)
999078	CVE-2021-44228	WEB-MISC Apache Log4j - Remote Code Execution Vulnerability via BODY (CVE-2021-44228)
999079	CVE-2021-44228	WEB-MISC Apache Log4j - Remote Code Execution Vulnerability via HEADER (CVE-2021-44228)
999080	CVE-2021-44228	WEB-MISC Apache Log4j - Remote Code Execution Vulnerability via URL (CVE-2021-44228)
999081	CVE-2021-42847	WEB-MISC Zoho ManageEngine ADAudit Plus Prior to 7006 - Unauthenticated Arbitrary File

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
		Write Vulnerability (CVE-2021-42847)
999082	CVE-2021-42321	WEB-MISC Microsoft Exchange Server - Remote Code Execution Vulnerability (CVE-2021-42321)
999083	CVE-2021-42258	WEB-MISC BQE BillQuick Web Suite 2021 - Unauthenticated SQL Injection Vulnerability Via txtID (CVE-2021-42258)
999084	CVE-2021-42258	WEB-MISC BQE BillQuick Web Suite 2020 - Unauthenticated SQL Injection Vulnerability Via txtID (CVE-2021-42258)
999085	CVE-2021-42258	WEB-MISC BQE BillQuick Web Suite 2019 - Unauthenticated SQL Injection Vulnerability Via txtID (CVE-2021-42258)
999086	CVE-2021-42258	WEB-MISC BQE BillQuick Web Suite 2018 - Unauthenticated SQL Injection Vulnerability Via txtID (CVE-2021-42258)
999087	CVE-2021-42237	WEB-MISC Sitecore From 7.5.0 To 8.2.7 - Remote Code Execution Vulnerability (CVE-2021-42237)
999088	CVE-2021-41950	WEB-MISC ResourceSpace 9.6 prior to rev 18277 - Unauthenticated Path

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
		Traversal Vulnerability via variant (CVE-2021-41950)
999089	CVE-2021-41950	WEB-MISC ResourceSpace 9.6 prior to rev 18277 - Unauthenticated Path Traversal Vulnerability via provider (CVE-2021-41950)
999090	CVE-2021-41349	WEB-MISC Microsoft Exchange Server - Cross-Site Scripting Vulnerability (CVE-2021-41349)
999091	CVE-2021-35217	WEB-MISC SolarWinds Orion Prior to 2020.2.6 HF1 - Deserialization Vulnerability Via WSAsyncExecuteTasks.aspx (CVE-2021-35217)
999092	CVE-2021-34416	WEB-MISC Zoom Meeting Connector 4.6.360.20210325 - Remote Code Execution Vulnerability (CVE-2021-34416)
999093	CVE-2021-22941	WEB-MISC Citrix ShareFile Storage Prior To 5.11.20 - Improper Access Control Vulnerability (CVE-2021-22941)
999094	CVE-2020-35136	WEB-MISC Dolibarr Prior to 12.0.4 - Remote Code Execution Vulnerability Via zipfilename_template and bz (CVE-2020-35136)
999095	CVE-2020-35136	WEB-MISC Dolibarr Prior to 12.0.4 - Remote Code Execution Vulnerability Via

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
		zipfilename_template and gz (CVE-2020-35136)
999096	CVE-2020-2950, CVE-2021-2456	WEB-MISC Oracle BI Publisher - Arbitrary Files Upload Vulnerability (CVE-2020-2950, CVE-2021-2456)
999097	CVE-2020-2950, CVE-2021-2456	WEB-MISC Oracle BI Publisher - Remote Code Execution Vulnerability (CVE-2020-2950, CVE-2021-2456)

Signature update version 71

New signatures rules are generated for the vulnerabilities identified in the week 2021-11-18. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signatures are compatible with the following software versions of Citrix Application Delivery Controller (ADC) 11.1, 12.0, 12.1, 13.0 and 13.1.

NetScaler version 12.0 has reached end of life (EOL). For more information, see release life cycle page.

NOTE:

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
999098	CVE-2021-41765	WEB-MISC ResourceSpace 9.5 and 9.6 prior to rev 18274 - SQL Injection Vulnerability (CVE-2021-41765)
999099	CVE-2021-41288	WEB-MISC Zoho ManageEngine OpManager Prior to Build 125467 - SQL Injection Vulnerability Via getReportData API (CVE-2021-41288)
999100	CVE-2021-40493	WEB-MISC Zoho ManageEngine OpManager Prior to Build 125437 - SQL Injection Vulnerability Via deviceName (CVE-2021-40493)
999101	CVE-2021-40493	WEB-MISC Zoho ManageEngine OpManager Prior to Build 125437 - SQL Injection Vulnerability Via pollingObject (CVE-2021-40493)
999102	CVE-2021-40438	WEB-MISC Apache HTTP Server - mod_proxy Request Forward Vulnerability (CVE-2021-40438)
999103	CVE-2021-39341	WEB-WORDPRESS OptinMonster Plugin Up to 2.6.4 - REST_ROUTE Permission Bypass Vulnerability (CVE-2021-39341)
999104	CVE-2021-39341	WEB-WORDPRESS OptinMonster Plugin Up to 2.6.4 - REST API Permission

999158	CVE-2021-22005	WEB-MISC VMWare vCenter - File Upload Vulnerability Via Telemetry Stage Log (CVE-2021-22005)
999159	CVE-2021-22005	WEB-MISC VMWare vCenter - File Upload Vulnerability Via Telemetry Prod Log (CVE-2021-22005)
999160	CVE-2021-20081	WEB-MISC Zoho ManageEngine Service Desk Prior to 11.2.0.5 - Remote Code Execution Vulnerability (CVE-2021-20081)
999161	CVE-2020-29453	WEB-MISC Atlassian Jira Server and Data Center - Information Disclosure Vulnerability Via WEB-INF (CVE-2020-29453)
999162	CVE-2020-29453	WEB-MISC Atlassian Jira Server and Data Center - Information Disclosure Vulnerability Via META-INF (CVE-2020-29453)

Signature update version 68

New signatures rules are generated for the vulnerabilities identified in the week 2021-09-11. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Signature version

Signatures are compatible with the following software versions of Citrix Application Delivery Controller (ADC) 11.1, 12.0, 12.1, 13.0 and 13.1.

NetScaler version 12.0 has reached end of life (EOL). For more information, see release life cycle page.

NOTE:

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
999163	CVE-2021-37556	WEB-MISC Centreon Multiple Versions - SQL Injection Vulnerability Via End Parameter (CVE-2021-37556)
999164	CVE-2021-37556	WEB-MISC Centreon Multiple Versions - SQL Injection Vulnerability Via Start Parameter (CVE-2021-37556)
999165	CVE-2021-37353	WEB-MISC Nagios XI Docker Wizard Prior to 1.1.3 - SSRF Vulnerability Via host Parameter Without URI Scheme (CVE-2021-37353)
999166	CVE-2021-37353	WEB-MISC Nagios XI Docker Wizard Prior to 1.1.3 - SSRF Vulnerability Via host Parameter With URI Scheme (CVE-2021-37353)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
999167	CVE-2021-34638	WEB-WORDPRESS Download Manager Plugin Prior to 3.1.25 - Directory Traversal Vulnerability (CVE-2021-34638)
999168	CVE-2021-33766	WEB-MISC Microsoft Exchange Server - Information Disclosure Vulnerability (CVE-2021-33766)
999169	CVE-2021-32682	WEB-MISC elFinder Prior To 2.1.59 - Command Injection Vulnerability Via Archive (CVE-2021-32682)
999170	CVE-2021-26084	WEB-MISC Confluence Server and Data Center - OGNL Injection Vulnerability Via doenterpagevariables (CVE-2021-26084)
999171	CVE-2021-26084	WEB-MISC Confluence Server and Data Center - OGNL Injection Vulnerability Via createpage-entervariables (CVE-2021-26084)
999172	CVE-2021-23394	WEB-MISC elFinder Prior To 2.1.59 - Remote Code Execution Vulnerability Via Phar Makefile (CVE-2021-23394)
999173	CVE-2021-23394	WEB-MISC elFinder Prior To 2.1.59 - Remote Code Execution Vulnerability Via Phar Rename (CVE-2021-23394)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
999174	CVE-2021-23394	WEB-MISC elFinder Prior To 2.1.59 - Remote Code Execution Vulnerability Via Phar Upload (CVE-2021-23394)
999175	CVE-2020-36289	WEB-MISC Atlassian Jira Server - Information Disclosure Vulnerability Via QueryComponentRendererValue (CVE-2020-36289)
999176	CVE-2020-16245	WEB-MISC Advantech iView Prior to 5.7.03.6112 - Path Traversal Vulnerability Via findSummaryCfgDeviceListExport (CVE-2020-16245)
999177	CVE-2020-16245	WEB-MISC Advantech iView Prior to 5.7.03.6112 - Path Traversal Vulnerability Via findUpdateDeviceListExport (CVE-2020-16245)
999178	CVE-2020-13774	WEB-MISC Ivanti Endpoint Manager Multiple Versions - RCE Vulnerability Via EditLaunchPadDialog.aspx (CVE-2020-13774)
999179	CVE-2020-1147	WEB-MISC Microsoft SharePoint Server - Remote Code Execution Vulnerability Via Custom Page (CVE-2020-1147)
999180	CVE-2020-1147	WEB-MISC Microsoft SharePoint Server - Remote Code Execution Vulnerability Via quicklinksdialogform.aspx (CVE-2020-1147)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
999181	CVE-2020-1147	WEB-MISC Microsoft SharePoint Server - Remote Code Execution Vulnerability Via quicklinks.aspx (CVE-2020-1147)
999182	CVE-2020-11110	WEB-MISC Apache Grafana Up to 6.7.1 - XSS Vulnerability (CVE-2020-11110)
999522	CVE-2020-13379	WEB-MISC Grafana 3.0.1 Through 7.0.1 - CSRF Bypass Leading To DOS Vulnerability (CVE-2020-13379)

Signature update version 67

New signatures rules are generated for the vulnerabilities identified in the week 2021-08-29. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signatures are compatible with the following software versions of Citrix Application Delivery Controller (ADC) 11.1, 12.0, 12.1, 13.0 and 13.1.

NetScaler version 12.0 has reached end of life (EOL). For more information, see release life cycle page.

NOTE:

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
999183	CVE-2021-37557	WEB-MISC Centreon Multiple Versions - SQL Injection Vulnerability (CVE-2021-37557)
999184	CVE-2021-35501	WEB-MISC Artica Pandora FMS Up to 7.54 - Visual Console Stored XSS Vulnerability (CVE-2021-35501)
999185	CVE-2021-35464	WEB-MISC ForgeRock Access Management and OpenAM - Remote Code Execution Vulnerability (CVE-2021-35464)
999186	CVE-2021-34523	WEB-MISC Microsoft Exchange Server - Elevation of Privilege Vulnerability (CVE-2021-34523)
999187	CVE-2021-34473	WEB-MISC Microsoft Exchange Server - Server Side Request Forgery Authentication Bypass Vulnerability Via Query (CVE-2021-34473)
999188	CVE-2021-34473	WEB-MISC Microsoft Exchange Server - Server Side Request Forgery Authentication Bypass Vulnerability Via Cookie (CVE-2021-34473)
999189	CVE-2021-33203	WEB-MISC Django - TemplateDetailView File Existence Disclosure Vulnerability via Absolute Path (CVE-2021-33203)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
999190	CVE-2021-33203	WEB-MISC Django - TemplateDetailView File Existence Disclosure Vulnerability via Path Traversal (CVE-2021-33203)
999191	CVE-2021-33203	WEB-MISC Django - TemplateDetailView File Existence Disclosure Vulnerability via backslash (CVE-2021-33203)
999192	CVE-2021-33203	WEB-MISC Django - TemplateDetailView File Existence Disclosure Vulnerability Via Slash (CVE-2021-33203)
999193	CVE-2021-3287, CVE-2020-28653	WEB-MISC Zoho ManageEngine OpManager Prior to 12.5.329 - Unauthenticated RCE Vulnerability (CVE-2021-3287, CVE-2020-28653)
999194	CVE-2021-32789	WEB-WORDPRESS WooCommerce Plugin Up to 5.5.0 - SQL Injection Vulnerability Via taxonomy and rest_route (CVE-2021-32789)
999195	CVE-2021-32789	WEB-WORDPRESS WooCommerce Plugin Up to 5.5.0 - SQL Injection Vulnerability Via taxonomy (CVE-2021-32789)
999196	CVE-2021-32604	WEB-MISC SolarWinds Serv-U Prior to 15.2.3 - Cross-Site

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
		Scripting Vulnerability Via SenderEmail Parameter (CVE-2021-32604)
999197	CVE-2021-32093	WEB-MISC National Security Agency Emissary 5.9.0 - Arbitrary File Read Vulnerability (CVE-2021-32093)
999198	CVE-2021-31760	WEB-MISC Webmin Prior to 1.974 - CSRF Vulnerability Lead to RCE Via run.cgi (CVE-2021-31760)
999199	CVE-2021-31207	WEB-MISC Microsoft Exchange Server - Security Feature Bypass Vulnerability (CVE-2021-31207)
999200	CVE-2021-31195	WEB-MISC Microsoft Exchange Server - Remote Code Execution Vunerability (CVE-2021-31195)
999201	CVE-2021-28474	WEB-MISC Microsoft SharePoint Server - Remote Code Execution Vulnerability (CVE-2021-28474)
999202	CVE-2021-24385	WEB-WORDPRESS FileBird Plugin 4.7.3 - SQL Injection Vulnerability Via selectedFolder Parameter and rest_route (CVE-2021-24385)
999203	CVE-2021-24385	WEB-WORDPRESS FileBird Plugin 4.7.3 - SQL Injection Vulnerability Via

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
		selectedFolder Parameter (CVE-2021-24385)
999204	CVE-2021-24385	WEB-WORDPRESS FileBird Plugin 4.7.3 - SQL Injection Vulnerability Via JSON-Encoded Body (CVE-2021-24385)
999205	CVE-2021-24356	WEB-WORDPRESS Simple 301 Redirects Plugin Prior to 2.0.4 - Arbitrary Plugin Activation Vulnerability (CVE-2021-24356)
999206	CVE-2021-23024	WEB-MISC F5 BIG-IQ Multiple Versions - Remote Code Execution Vulnerability (CVE-2021-23024)
999207	CVE-2021-22911	WEB-MISC Rocket.Chat Server 3.11, 3.12 and 3.13 - Blind NOSQL Injection Vulnerability (CVE-2021-22911)
999208	CVE-2021-22900	WEB-MISC Pulse Connect Secure Prior To 9.1R11.4 - Remote Code Execution Vulnerability Via smimeCert.cgi (CVE-2021-22900)
999209	CVE-2021-22900	WEB-MISC Pulse Connect Secure Prior To 9.1R11.4 - Remote Code Execution Vulnerability Via admincert.cgi (CVE-2021-22900)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
999210	CVE-2021-22900	WEB-MISC Pulse Connect Secure Prior To 9.1R11.4 - Remote Code Execution Vulnerability Via clientauthcert.cgi (CVE-2021-22900)
999211	CVE-2021-22160	WEB-MISC Apache Pulsar - JSON Web Tokens Authentication Bypass Vulnerability (CVE-2021-22160)
999212	CVE-2021-21809	WEB-MISC Moodle - Remote Code Execution Vulnerability Via Spellchecker Plugin and getSuggestions Method (CVE-2021-21809)
999213	CVE-2021-21809	WEB-MISC Moodle - Remote Code Execution Vulnerability Via Spellchecker Plugin and checkWords Method (CVE-2021-21809)
999214	CVE-2021-21809	WEB-MISC Moodle - Remote Code Execution Vulnerability Via s__aspellpath (CVE-2021-21809)
999215	CVE-2021-21805	WEB-MISC Advantech R-SeeNet - Unauthenticated Remote Code Execution Vulnerability (CVE-2021-21805)
999216	CVE-2021-21804	WEB-MISC Advantech R-SeeNet - Local File Inclusion Vulnerability Via sub_opt (CVE-2021-21804)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
999217	CVE-2021-21587	WEB-MISC Dell Wyse Management Suite Prior to 3.3 - Path Traversal Vulnerability Via /image/os/ listfiles (CVE-2021-21587)
999218	CVE-2021-21587	WEB-MISC Dell Wyse Management Suite Prior to 3.3 - Path Traversal Vulnerability Via /image/app/ rsp/listfiles (CVE-2021-21587)
999219	CVE-2021-21586	WEB-MISC Dell Wyse Management Suite Prior to 3.3 - Path Traversal Vulnerability Via /image/app and fileName (CVE-2021-21586)
999220	CVE-2021-21586	WEB-MISC Dell Wyse Management Suite Prior to 3.3 - Path Traversal Vulnerability Via /image/os and fileName (CVE-2021-21586)
999221	CVE-2021-21586	WEB-MISC Dell Wyse Management Suite Prior to 3.3 - Path Traversal Vulnerability Via /image/os and filePath (CVE-2021-21586)
999222	CVE-2020-25223	WEB-MISC Sophos SG UTM - Remote Code Execution Via SID and /var (CVE-2020-25223)
999223	CVE-2020-25223	WEB-MISC Sophos SG UTM - Remote Code Execution Via

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
		SID and /webadmin.plx (CVE-2020-25223)
999224	CVE-2020-21056	WEB-MISC FusionPBX 4.5.7 - Path Traversal Vulnerability Via foldernew (CVE-2020-21056)
999225	CVE-2020-21055	WEB-MISC FusionPBX 4.5.7 - Path Traversal Vulnerability Via File Rename Feature (CVE-2020-21055)
999226	CVE-2020-16245	WEB-MISC Advantech iView Prior to 5.7.03.6112 - Path Traversal Vulnerability in findSummaryUpdateDeviceListExpo (CVE-2020-16245)
999227	CVE-2020-16245	WEB-MISC Advantech iView Prior to 5.7.03.6112 - Path Traversal Vulnerability Via findCfgDeviceListExport (CVE-2020-16245)
999228	CVE-2020-14181	WEB-MISC Atlassian Jira Server - Information Disclosure Vulnerability Via ViewUserHover.jspa (CVE-2020-14181)
999229	CVE-2020-14005	WEB-MISC SolarWinds Orion Prior to 2020.2.1 HF 2 - Remote Code Execution Via ExecuteVBScript Action Type (CVE-2020-14005)
999230	CVE-2020-14005	WEB-MISC SolarWinds Orion Prior to 2020.2.1 HF 2 - Remote Code Execution Via ExecuteExternalProgram

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
		Action Type (CVE-2020-14005)

Signature update version 66

New signatures rules are generated for the vulnerabilities identified in the week 2021-07-08. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signatures are compatible with the following software versions of Citrix Application Delivery Controller (ADC) 11.1, 12.0, 12.1, 13.0 and 13.1.

NetScaler version 12.0 has reached end of life (EOL). For more information, see release life cycle page.

NOTE:

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
999231	CVE-2021-34074	WEB-MISC Artica Pandora FMS Up to 7.54 - Arbitrary File Upload Vulnerability Via Relative Path (CVE-2021-34074)
999232	CVE-2021-32633	WEB-MISC Plone CMS - Zope Page Templates Remote Code Execution Vulnerability Via Upload (CVE-2021-32633)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
999233	CVE-2021-32633	WEB-MISC Plone CMS - Zope Page Templates Remote Code Execution Vulnerability Via New (CVE-2021-32633)
999234	CVE-2021-31181	WEB-MISC Microsoft SharePoint Server - Remote Code Execution Vulnerability (CVE-2021-31181)
999235	CVE-2021-24370	WEB-WORDPRESS Fancy Product Designer Plugin Prior to 5.6.9 - RCE Vulnerability Via fpd_custom_uplod_file (CVE-2021-24370)
999236	CVE-2021-24370	WEB-WORDPRESS Fancy Product Designer Plugin Prior to 5.6.9 - RCE Vulnerability Via custom-image-handler.php (CVE-2021-24370)
999237	CVE-2021-24354	WEB-WORDPRESS Simple 301 Redirects Plugin Prior to 2.0.4 - Arbitrary Plugin Installation Vulnerability (CVE-2021-24354)
999238	CVE-2021-24352	WEB-WORDPRESS Simple 301 Redirects Plugin Prior to 2.0.4 - Redirect Export Vulnerability (CVE-2021-24352)
999239	CVE-2021-1497, CVE-2021-1498	WEB-MISC Cisco HyperFlex HX Prior to 4.0(2e) - Remote Code Execution Vulnerability (CVE-2021-1497, CVE-2021-1498)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
999240	CVE-2020-21057	WEB-MISC FusionPBX 4.5.7 - Path Traversal Vulnerability Via folderdelete Feature (CVE-2020-21057)
999241	CVE-2020-16245	WEB-MISC Advantech iView Prior to 5.7.03.6112 - Path Traversal Vulnerability Via backupDatabase (CVE-2020-16245)
999242	CVE-2020-10148	WEB-MISC SolarWinds Orion Multiple Versions - Authentication Bypass Vulnerability (CVE-2020-10148)

Signature update version 65

New signatures rules are generated for the vulnerabilities identified in the week 2021-06-02. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signatures are compatible with the following software versions of Citrix Application Delivery Controller (ADC) 11.1, 12.0, 12.1, 13.0 and 13.1.

NetScaler version 12.0 has reached end of life (EOL). For more information, see release life cycle page.

NOTE:

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
		SQL Injection Vulnerability Via lists_id (CVE-2020-13592)
999273	CVE-2020-13591	WEB-MISC Rukovoditel Project Management App - SQL Injection Vulnerability (CVE-2020-13591)
999274	CVE-2020-13550	WEB-MISC Advantech WebAccess/SCADA - Path Traversal Vulnerability Via fileName (CVE-2020-13550)

Signature update version 64

New signatures rules are generated for the vulnerabilities identified in the week 2021-04-22. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signatures are compatible with the following software versions of Citrix Application Delivery Controller (ADC) 11.1, 12.0, 12.1, 13.0 and 13.1.

NetScaler version 12.0 has reached end of life (EOL). For more information, see release life cycle page.

NOTE:

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
999275	CVE-2021-3378	WEB-MISC FortiLogger 4.4.2.2 - Unauthenticated Arbitrary File Upload Vulnerability (CVE-2021-3378)
999276	CVE-2021-28925	WEB-MISC Nagios Network Analyzer Prior to 2.4.3 - SQL Injection Vulnerability (CVE-2021-28925)
999277	CVE-2021-28924	WEB-MISC Nagios Network Analyzer Prior to 2.4.3 - XSS Vulnerability (CVE-2021-28924)
999278	CVE-2021-27927	WEB-MISC Zabbix - CSRF Vulnerability Via action=authentication.update (CVE-2021-27927)
999279	CVE-2021-26295	WEB-MISC Apache OFBiz 17.12.06 - Unauthenticated Arbitrary Deserialization Vulnerability (CVE-2021-26295)
999280	CVE-2021-25770	WEB-MISC JetBrains YouTrack Prior to 2020.5.3123 - Server-Side Template Injection Vulnerability (CVE-2021-25770)
999281	CVE-2021-25283	WEB-MISC SaltStack Prior to 3002.5 - Remote Code Execution Vulnerability (CVE-2021-25283)
999282	CVE-2021-25283	WEB-MISC SaltStack Prior to 3002.5 - Remote Code

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
		Execution Vulnerability Via JSON Object (CVE-2021-25283)
999283	CVE-2021-24218	WEB-WORDPRESS Facebook for WordPress Plugin Prior to 3.0.4 - Stored Cross-Site Scripting Vulnerability (CVE-2021-24218)
999284	CVE-2021-24217	WEB-WORDPRESS Facebook for WordPress Plugin Prior to 3.0.2 - PHP Object Injection Vulnerability (CVE-2021-24217)
999285	CVE-2021-24209	WEB-WORDPRESS WP Super Cache Plugin Prior to 1.7.2 - Remote Code Execution Vulnerability in wp-cache-config.php (CVE-2021-24209)
999286	CVE-2021-24209	WEB-WORDPRESS WP Super Cache Plugin Prior to 1.7.2 - Arbitrary Code Injection Vulnerability (CVE-2021-24209)
999287	CVE-2021-24165	WEB-WORDPRESS Ninja Forms Plugin Prior to 3.4.34 - Open Redirect Vulnerability (CVE-2021-24165)
999288	CVE-2021-21975	WEB-MISC vRealize Operations Manager - Unauthenticated Server Side Request Forgery Vulnerability (CVE-2021-21975)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
999289	CVE-2020-35578	WEB-MISC Nagios XI Prior to 5.8.0 - Remote Code Execution Vulnerability (CVE-2020-35578)
999290	CVE-2020-2766	WEB-MISC Oracle WebLogic Server - Unauthenticated SSRF Vulnerability (CVE-2020-2766)
999291	CVE-2020-17523	WEB-MISC Apache Shiro Prior to 1.7.1 - Authentication Bypass Vulnerability Via Space (CVE-2020-17523)
999292	CVE-2020-17523	WEB-MISC Apache Shiro Prior to 1.7.1 - Authentication Bypass Vulnerability Via Dot (CVE-2020-17523)
999293	CVE-2020-15160	WEB-MISC PrestaShop Prior to 1.7.6.8 - SQL Injection Vulnerability (CVE-2020-15160)

Signature update version 63

New signatures rules are generated for the vulnerabilities identified in the week 2021-04-08. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signatures are compatible with the following software versions of Citrix Application Delivery Controller (ADC) 11.1, 12.0, 12.1, 13.0 and 13.1.

NetScaler version 12.0 has reached end of life (EOL). For more information, see release life cycle page.

Signature update version 62

New signatures rules are generated for the vulnerabilities identified in the week 2021-03-11. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signatures are compatible with the following software versions of Citrix Application Delivery Controller (ADC) 11.1, 12.0, 12.1, 13.0 and 13.1.

NetScaler version 12.0 has reached end of life (EOL). For more information, see release life cycle page.

NOTE:

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
999307	CVE-2021-27065	WEB-MISC Microsoft Exchange Server - Remote Code Execution Vulnerability (CVE-2021-27065)

Signature update version 61

New signatures rules are generated for the vulnerabilities identified in the week 2021-03-11. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signatures are compatible with the following software versions of Citrix Application Delivery Controller (ADC) 11.1, 12.0, 12.1, 13.0 and 13.1.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NetScaler version 12.0 has reached end of life (EOL). For more information, see release life cycle page.

NOTE:

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
999308	CVE-2021-21302	WEB-MISC PrestaShop Prior to 1.7.7.2 - CSV Injection Vulnerability (CVE-2021-21302)
999309	CVE-2020-35749	WEB-WORDPRESS Simple Job Board Prior to 2.9.4 - Arbitrary File Disclosure Vulnerability (CVE-2020-35749)
999310	CVE-2019-16012	WEB-MISC Cisco SD-WAN vManage Prior to 19.2.2 - SQL Injection Vulnerability (CVE-2019-16012)

Signature update version 60

New signatures rules are generated for the vulnerabilities identified in the week 2021-03-09. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signatures are compatible with the following software versions of Citrix Application Delivery Controller (ADC) 11.1, 12.0, 12.1, 13.0 and 13.1.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NetScaler version 12.0 has reached end of life (EOL). For more information, see release life cycle page.

NOTE:

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
999311	CVE-2021-26855	WEB-MISC Microsoft Exchange Server - Remote Code Execution Vulnerability Via X-AnonResource-Backend (CVE-2021-26855)
999312	CVE-2021-26855	WEB-MISC Microsoft Exchange Server - Remote Code Execution Vulnerability Via X-BEResource (CVE-2021-26855)

Signature update version 59

New signatures rules are generated for the vulnerabilities identified in the week 2021-03-08. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signatures are compatible with the following software versions of Citrix Application Delivery Controller (ADC) 11.1, 12.0, 12.1, 13.0 and 13.1.

NetScaler version 12.0 has reached end of life (EOL). For more information, see release life cycle page.

Signature update version 56

New signatures rules are generated for the vulnerabilities identified in the week 2021-01-18. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Signature version

Signatures are compatible with the following software versions of Citrix Application Delivery Controller (ADC) 11.1, 12.0, 12.1, 13.0 and 13.1.

NetScaler version 12.0 has reached end of life (EOL). For more information, see release life cycle page.

NOTE:

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
999366	CVE-2020-8466	WEB-MISC Trend Micro IWSSVA 6.5 SP2 Prior to Build 1919 - Unauthenticated OS Command Injection Vulnerability (CVE-2020-8466)
999367	CVE-2020-6135	WEB-MISC OS4Ed OpenSIS Prior to 7.5 - SQLi Vulnerability Via Validator.php (CVE-2020-6135)
999368	CVE-2020-4001	WEB-MISC VMWare SD-WAN Orchestrator - Pass-the-Hash Vulnerability (CVE-2020-4001)
999369	CVE-2020-4000	WEB-MISC VMWare SD-WAN Orchestrator - Path Traversal Vulnerability (CVE-2020-4000)
999370	CVE-2020-3984	WEB-MISC VMWare SD-WAN Orchestrator - SQL

Signature update version 55

New signatures rules are generated for the vulnerabilities identified in the week 2020-12-17. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signatures are compatible with the following software versions of Citrix Application Delivery Controller (ADC) 11.1, 12.0, 12.1, 13.0 and 13.1.

NetScaler version 12.0 has reached end of life (EOL). For more information, see release life cycle page.

NOTE:

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
999377		WEB-WORDPRESS TI WooCommerce Wishlist Plugin Prior To 1.21.11 - Information Disclosure Vulnerability Via tinvwl_export_settings
999378		WEB-WORDPRESS TI WooCommerce Wishlist Plugin Prior To 1.21.11 - WP Options Change Vulnerability Via tinvwl_import_settings
999379	CVE-2020-6134	WEB-MISC OS4Ed OpenSIS Prior to 7.5 - SQLi Vulnerability Via MassDropModal.php (CVE-2020-6134)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
999380	CVE-2020-6133	WEB-MISC OS4Ed OpenSIS Prior to 7.5 - SQLi Vulnerability Via CourseMoreInfo.php (CVE-2020-6133)
999381	CVE-2020-6132	WEB-MISC OS4Ed OpenSIS Prior to 7.5 - SQLi Vulnerability Via ChooseCP.php (CVE-2020-6132)
999382	CVE-2020-6131	WEB-MISC OS4Ed OpenSIS Prior to 7.5 - SQLi Vulnerability Via MassScheduleSessionSet.php (CVE-2020-6131)
999383	CVE-2020-6130	WEB-MISC OS4Ed OpenSIS Prior to 7.5 - SQLi Vulnerability Via MassDropSessionSet.php (CVE-2020-6130)
999384	CVE-2020-6129	WEB-MISC OS4Ed OpenSIS Prior to 7.5 - SQLi Vulnerability Via CpSessionSet.php (CVE-2020-6129)
999385	CVE-2020-35234	WEB-WORDPRES Easy WP SMTP Plugin Prior to 1.4.4 - Information Disclosure Vulnerability (CVE-2020-35234)
999386	CVE-2020-25042	WEB-MISC Mara CMS 7.5 - Arbitrary File Upload Vulnerability (CVE-2020-25042)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
999387	CVE-2020-13526	WEB-MISC ProcessMaker - SQL Injection Vulnerability Via clientSetupAjax (CVE-2020-13526)
999388	CVE-2020-13525	WEB-MISC ProcessMaker - SQL Injection Vulnerability Via reportTables_Ajax (CVE-2020-13525)
999389	CVE-2020-12147	WEB-MISC Silver Peak Unity Orchestrator - Arbitrary MySQL Queries Vulnerability Via sqlExecution REST API (CVE-2020-12147)
999390	CVE-2020-12146	WEB-MISC Silver Peak Unity Orchestrator - Path Traversal Vulnerability Via debugFiles REST API (CVE-2020-12146)
999391	CVE-2020-12145	WEB-MISC Silver Peak Unity Orchestrator - Authentication Bypass Vulnerability (CVE-2020-12145)
999392	CVE-2019-8394	WEB-MISC Zoho ManageEngine ServiceDesk Plus Prior to 10.0 Build 10012 - Arbitrary File Upload Vulnerability (CVE-2019-8394)
999393	CVE-2019-11447	WEB-MISC CutePHP CuteNews 2.1.2 - Remote Code Execution Vulnerability (CVE-2019-11447)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Signature update version 54

New signatures rules are generated for the vulnerabilities identified in the week 2020-12-02. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signatures are compatible with the following software versions of Citrix Application Delivery Controller (ADC) 11.1, 12.0, 12.1, 13.0 and 13.1.

NetScaler version 12.0 has reached end of life (EOL). For more information, see release life cycle page.

NOTE:

Enabling Post body and Response body signature rules might affect NetScaler CPU. As part of signature update version 54, log string for signature 999720 is changed to ensure that it includes only ASCI characters.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
999394	CVE-2020-8255	WEB-MISC Pulse Connect Secure Prior To 9.1R9 - Information Disclosure Vulnerability (CVE-2020-8255)
999395	CVE-2020-6128	WEB-MISC OS4Ed OpenSIS Prior to 7.5 - SQLi Vulnerability Via CoursePeriodModal.php (CVE-2020-6128)
999396	CVE-2020-6126, CVE-2020-6127	WEB-MISC OS4Ed OpenSIS Prior to 7.5 - SQLi Vulnerability Via CoursePeriodModal.php

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
		(CVE-2020-6126, CVE-2020-6127)
999397	CVE-2020-28328	WEB-MISC SuiteCRM Prior to 7.11.16 - Remote Code Execution Vulnerability (CVE-2020-28328)
999398	CVE-2020-27995	WEB-MISC Zoho ManageEngine Applications Manager 14 Prior to Build 14560 - SQL Injection Vulnerability (CVE-2020-27995)
999399	CVE-2020-26879	WEB-MISC Ruckus vRIoT Server Prior to 1.6.0 - Authorization Bypass Vulnerability Via /service/ (CVE-2020-26879)
999400	CVE-2020-26879	WEB-MISC Ruckus vRIoT Server Prior to 1.6.0 - Authorization Bypass Vulnerability Via /reboot (CVE-2020-26879)
999401	CVE-2020-26879	WEB-MISC Ruckus vRIoT Server Prior to 1.6.0 - Authorization Bypass Vulnerability Via /patch/ (CVE-2020-26879)
999402	CVE-2020-26879	WEB-MISC Ruckus vRIoT Server Prior to 1.6.0 - Authorization Bypass Vulnerability Via /upgrade/ (CVE-2020-26879)
999403	CVE-2020-26879	WEB-MISC Ruckus vRIoT Server Prior to 1.6.0 - Authorization Bypass

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
		Vulnerability Via /module/ (CVE-2020-26879)
999404	CVE-2020-26878	WEB-MISC Ruckus vRIoT Server Prior to 1.6.0 - Arbitrary OS Command Injection Vulnerability (CVE-2020-26878)
999405	CVE-2020-25790	WEB-MISC Typesetter CMS 5.x Through 5.1 - Unsecure File Upload Vulnerability (CVE-2020-25790)
999406	CVE-2020-25540	WEB-MISC ThinkAdmin v6 - Directory Traversal Vulnerability (CVE-2020-25540)
999407	CVE-2020-14883	WEB-MISC Oracle WebLogic Server - Authenticated Remote Code Execution Vulnerability (CVE-2020-14883)
999408	CVE-2020-14882, CVE-2020-14750	WEB-MISC Oracle WebLogic Server - Authentication Bypass Vulnerability (CVE-2020-14882, CVE-2020-14750)
999409	CVE-2020-11975, CVE-2020-13942	WEB-MISC Apache Unomi Prior to 1.5.2 - Remote Code Execution Vulnerability (CVE-2020-11975, CVE-2020-13942)
999410	CVE-2020-11803	WEB-MISC Titan SpamTitan Prior To 7.08 - Remote Code Execution Vulnerability (CVE-2020-11803)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Signature update version 53

New signatures rules are generated for the vulnerabilities identified in the week 2020-11-10. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signatures are compatible with the following software versions of Citrix Application Delivery Controller (ADC) 11.1, 12.0, 12.1, 13.0 and 13.1.

NetScaler version 12.0 has reached end of life (EOL). For more information, see release life cycle page.

NOTE:

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
999411		WEB-WORDPRESS WordPress plug-in wpDiscuz 7.0.0 Up To 7.0.4 - Unauthenticated Arbitrary File Upload Vulnerability
999412		WEB-WORDPRESS Quiz & Survey Master - cross-site scripting Vulnerability in Questions Feature
999413		WEB-WORDPRESS WordPress plug-in File Manager Prior To 6.9 - Unauthenticated elFinder Commands Execution Vulnerability

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
999414	CVE-2020-11700	WEB-MISC Titan SpamTitan Prior To 7.08 - Information Disclosure Vulnerability (CVE-2020-11700)
999415	CVE-2020-9446	WEB-MISC Apache OFBiz 17.12.03 - XML-RPC Unsafe Deserialization Vulnerability (CVE-2020-9446)
999416	CVE-2020-9446	WEB-MISC Apache OFBiz 17.12.03 - XML-RPC Cross-Site Scripting Vulnerability (CVE-2020-9446)
999417	CVE-2020-9047	WEB-MISC exacqVision Web Service Up To 20.06.3.0 - OS Command Injection Vulnerability (CVE-2020-9047)
999418	CVE-2020-8866	WEB-MISC Horde Groupware Webmail Edition 5.2.22 - Unrestricted Upload of File Vulnerability Via edit.php (CVE-2020-8866)
999419	CVE-2020-8866	WEB-MISC Horde Groupware Webmail Edition 5.2.22 - Unrestricted Upload of File Vulnerability Via add.php (CVE-2020-8866)
999420	CVE-2020-8865	WEB-MISC Horde Groupware Webmail Edition 5.2.22 - Arbitrary File Inclusion Vulnerability Via edit.php (CVE-2020-8865)
999421	CVE-2020-8816	WEB-MISC Pi-hole Prior To 4.3.2 - Remote Code

SIGNATURE RULE	CVE ID	DESCRIPTION
999490	CVE-2020-10199	WEB-MISC Sonatype Nexus Repository Manager Prior to 3.21.2 - RCE Vulnerability Via REST Endpoint /docker/group (CVE-2020-10199)
999491	CVE-2019-19699	WEB-MISC Centreon Up To 19.10 - Remote Code Execution Vulnerability (CVE-2019-19699)
999492	CVE-2019-19499	WEB-MISC Apache Grafana Up To 6.4.3 - Arbitrary File Read Vulnerability (CVE-2019-19499)
999493	CVE-2019-18394	WEB-MISC Ignite Realtime Openfire Up To 4.4.2 - FaviconServlet Server Side Request Forgery Vulnerability (CVE-2019-18394)
999494	CVE-2019-18393	WEB-MISC Ignite Realtime Openfire Up To 4.4.2 - plug-inServlet Directory Traversal Vulnerability (CVE-2019-18393)
999495	CVE-2019-16759	WEB-MISC vBulletin Prior to 5.6.2 - Remote Code Execution Vulnerability Via Nested Template (CVE-2019-16759)
999496	CVE-2019-15715	WEB-MISC MantisBT Prior to 1.3.20 and 2.22.1 - Remote Code Execution Vulnerability Via neato_tool (CVE-2019-15715)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
999497	CVE-2019-15715	WEB-MISC MantisBT Prior to 1.3.20 and 2.22.1 - Remote Code Execution Vulnerability Via dot_tool (CVE-2019-15715)
999498	CVE-2019-11043	WEB-MISC PHP-FPM Multiple Versions - Out-Of-Bounds Write Vulnerability Allows Arbitrary Code Execution (CVE-2019-11043)
999499		WEB-WORDPRESS WordPress plug-in Autoptimize Up To 2.7.6 - Authenticated Arbitrary File Upload Vulnerability

Signature update version 52

New signatures rules are generated for the vulnerabilities identified in the week 2020-10-29. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signatures are compatible with the following software versions of Citrix Application Delivery Controller (ADC) 11.1, 12.0, 12.1, 13.0 and 13.1.

NetScaler version 12.0 has reached end of life (EOL). For more information, see release life cycle page.

NOTE:

Enabling Post body and Response body signature rules might affect NetScaler CPU. Also, vulnerable versions are mentioned in some of the signature rule log string. You must enable it accordingly.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
999500	CVE-2018-14667	WEB-MISC RichFaces Framework 3.X Through 3.3.4 - EL Injection Via UserResource (CVE-2018-14667)
999501	CVE-2018-12533	WEB-MISC RichFaces Framework 3.1.0 Through 3.3.4 - EL Injection Via Paint2DResource (CVE-2018-12533)
999502	CVE-2015-0279, CVE-2018-12532	WEB-MISC RichFaces Framework 4.X Through 4.5.17 - EL Injection Via MediaOutputResource (CVE-2015-0279,CVE-2018-12532)
999503	CVE-2013-2165	WEB-MISC RichFaces v4 Prior to 4.3.3 - Java Object Deserialization Vulnerability (CVE-2013-2165)
999504	CVE-2013-2165	WEB-MISC RichFaces v3 Prior to 3.3.4 - Java Object Deserialization Vulnerability (CVE-2013-2165)

Signature update version 51

New signatures rules are generated for the vulnerabilities identified in the week 2020-10-13. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

999515	CVE-2020-5768	WEB-WORDPRESS Icegram Email Subscribers & Newsletters plug-in Prior to 4.5.1 - SQL Injection Vulnerability (CVE-2020-5768)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
999516	CVE-2020-5767	WEB-WORDPRESS Icegram Email Subscribers & Newsletters plug-in Prior to 4.5.1 - CSRF Vulnerability (CVE-2020-5767)
999517	CVE-2020-15299	WEB-WORDPRESS KingComposer plug-in Prior To 2.9.5 - cross-site scripting Vulnerability (CVE-2020-15299)
999518	CVE-2020-13854	WEB-MISC Artica Pandora FMS - Privilege Escalation Vulnerability (CVE-2020-13854)
999519	CVE-2020-13852	WEB-MISC Artica Pandora FMS - Arbitrary File Upload Vulnerability Via File Manager (CVE-2020-13852)
999520	CVE-2020-13700	WEB-WORDPRESS WordPress plug-in acf-to-rest-api Before 3.3.0 - Information Disclosure Vulnerability Via URI (CVE-2020-13700)
999521	CVE-2020-13700	WEB-WORDPRESS WordPress plug-in acf-to-rest-api Before 3.3.0 - Information Disclosure Vulnerability Via URL (CVE-2020-13700)
999522	CVE-2020-13379	WEB-MISC Grafana 3.0.1 Through 7.0.1 - CSRF Bypass Leading To DOS Vulnerability (CVE-2020-13379)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
999523	CVE-2020-12851	WEB-MISC Pydio Cells Prior to 2.0.7 - Arbitrary File Write Vulnerability (CVE-2020-12851)
999524	CVE-2020-12848	WEB-MISC Pydio Cells Prior to 2.0.7 - Login as Temporary Shared User Vulnerability (CVE-2020-12848)
999525	CVE-2020-11749	WEB-MISC Artica Pandora FMS Prior To 7.47 - cross-site scripting Vulnerability Via SNMP Browser (CVE-2020-11749)
999526	CVE-2020-11579	WEB-MISC PHPKBV9 - File Exfiltration Vulnerability (CVE-2020-11579)
999527	CVE-2020-10546	WEB-MISC rConfig Prior to 3.9.5 - Unauthenticated SQLi Vulnerability in Compliance Policies Via searchColumn (CVE-2020-10546)
999528	CVE-2020-10546	WEB-MISC rConfig Prior to 3.9.5 - Unauthenticated SQLi Vulnerability in Compliance Policies Via searchField (CVE-2020-10546)
999529	CVE-2019-16876	WEB-MISC Portainer Prior To 1.22.1 - Directory Traversal Vulnerability (CVE-2019-16876)
999530		WEB-WORDPRESS - ADning plug-in Prior to 1.5.6 - Unauthenticated Arbitrary File Deletion Vulnerability

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
999531		WEB-WORDPRESS - ADning plug-in Prior to 1.5.6 - Unauthenticated Arbitrary File Upload Vulnerability

Signature update version 50

New signatures rules are generated for the vulnerabilities identified in the week 2020-09-26. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signatures are compatible with the following software versions of Citrix Application Delivery Controller (ADC) 11.1, 12.0, 12.1, 13.0 and 13.1.

NetScaler version 12.0 has reached end of life (EOL). For more information, see release life cycle page.

NOTE:

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
999532	CVE-2020-1956	WEB-MISC Apache Kylin - Cube Migrate Remote Code Execution Via dest-config (CVE-2020-1956)
999533	CVE-2020-1956	WEB-MISC Apache Kylin - Cube Migrate Remote Code Execution Via src-config (CVE-2020-1956)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
999534	CVE-2020-1956	WEB-MISC Apache Kylin - Cube Migrate Remote Code Execution Via projectName (CVE-2020-1956)
999535	CVE-2020-3247	WEB-MISC Cisco UCS Director - CopyFileRunnable Arbitrary Symlink Creation Vulnerability (CVE-2020-3247)
999536	CVE-2019-16872	WEB-MISC Portainer Prior To 1.22.1 - Incorrect Access Control Vulnerability Via Update Stacks (CVE-2019-16872)
999537	CVE-2019-16872	WEB-MISC Portainer Prior To 1.22.1 - Incorrect Access Control Vulnerability Via Create Stacks (CVE-2019-16872)
999538	CVE-2020-13855	WEB-MISC Artica Pandora FMS 7.44 - Arbitrary File Upload Vulnerability Via File Repository Manager (CVE-2020-13855)
999539	CVE-2020-5902	WEB-MISC F5 BIG-IP - Traffic Management User Interface RCE Vulnerability Via /hsqldb (CVE-2020-5902)
999540	CVE-2020-5902	WEB-MISC F5 BIG-IP - Traffic Management User Interface RCE Vulnerability Via /tmui (CVE-2020-5902)
999541		WEB-MISC WebERP 4.15.1 and Prior - Unauthenticated

999555	CVE-2020-11108	WEB-MISC Pi-hole Up To 4.4 - Authenticated RCE

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
		Vulnerability (CVE-2020-11108)

Signature update version 49

New signatures rules are generated for the vulnerabilities identified in the week 2020-08-26. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signatures are compatible with the following software versions of Citrix Application Delivery Controller (ADC) 11.1, 12.0, 12.1, 13.0 and 13.1.

NetScaler version 12.0 has reached end of life (EOL). For more information, see release life cycle page.

NOTE:

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
999556	CVE-2020-13241	WEB-MISC Microweber 1.1.18 - Unrestricted Upload of File with Dangerous Type Vulnerability (CVE-2020-13241)
999557	CVE-2020-3250	WEB-MISC Cisco UCS Director - REST API Path Traversal Vulnerability Via userAPIDownloadFile (CVE-2020-3250)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
999558		WEB-WORDPRESS PageBuilder KingComposer plug-in Prior to 2.9.4 - Arbitrary Deletion of Directories Via action=bulk-delete
999559		WEB-WORDPRESS PageBuilder KingComposer plug-in Prior to 2.9.4 - Remote Code Execution Vulnerability Via action=upload
999560	CVE-2018-1999024	WEB-MISC Moodle - MathJax Unicode cross-site scripting Vulnerability (CVE-2018-1999024)
999561	CVE-2020-13693	WEB-WORDPRESS bbPress plug-in Prior To 2.6.5 - Unauthenticated Privilege Escalation Vulnerability (CVE-2020-13693)
999562	CVE-2020-12847	WEB-MISC Pydio Cells Prior to 2.0.7 - Remote Code Execution Vulnerability (CVE-2020-12847)

Signature update version 48

New signatures rules are generated for the vulnerabilities identified in the week 2020-07-01. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signatures are compatible with the following software versions of Citrix Application Delivery Controller (ADC) 11.1, 12.0, 12.1, 13.0 and 13.1.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NetScaler version 12.0 has reached end of life (EOL). For more information, see release life cycle page.

NOTE:

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
999563		WEB-WORDPRESS Page Builder PageLayer plug-in Prior to 1.1.2 - cross-site scripting Vulnerability Via pagelayer_cf_to_email
999564		WEB-WORDPRESS Page Builder PageLayer plug-in Prior to 1.1.2 - cross-site scripting Vulnerability Via pagelayer-phone
999565		WEB-WORDPRESS Page Builder PageLayer plug-in Prior to 1.1.2 - cross-site scripting Vulnerability Via pagelayer-address
999566	CVE-2020-1961	WEB-MISC Apache Syncope - Server-Side Template Injection Vulnerability (CVE-2020-1961)
999567	CVE-2019-18935	WEB-MISC Progress Telerik UI For ASP.NET AJAX - RadAsyncUpload .NET Deserialization Vulnerability (CVE-2019-18935)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
999568	CVE-2020-9463	WEB-MISC Centreon 19.10 - OS Command Injection Vulnerability (CVE-2020-9463)
999569		WEB-WORDPRESS Support Review plug-in Prior to 3.7.6 - Unauthenticated Stored Cross Site Scripting Vulnerability
999570		WEB-WORDPRESS Page Builder PageLayer plug-in Prior to 1.1.2 - Improper Access Control Vuln Via pagelayer_save_template
999571		WEB-WORDPRESS Page Builder PageLayer plug-in Prior to 1.1.2 - Improper Access Control Vuln Via pagelayer_update_site_title
999572		WEB-WORDPRESS Page Builder PageLayer plug-in Prior to 1.1.2 - Improper Access Control Vuln Via pagelayer_save_content
999573		WEB-WORDPRESS Drag And Drop Upload For Contact Form 7 Prior To 1.3.3.3 - Arbitrary File Extension Upload Vulnerability
999574	CVE-2020-9314	WEB-MISC Oracle iPlanet Web Server 7.0.x - Image Injection Vulnerability (CVE-2020-9314)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
999575	CVE-2020-9484	WEB-MISC Apache Tomcat Multiple Versions - Deserialization of Untrusted Data (CVE-2020-9484)
999576	CVE-2020-13252	WEB-MISC Centreon Prior to 19.04.15 - Remote Code Execution Vulnerability (CVE-2020-13252)
999577	CVE-2020-11453	WEB-MISC Microstrategy Web - CSRF Vulnerability Via SOAP (CVE-2020-11453)
999578	CVE-2020-11453	WEB-MISC Microstrategy Web - CSRF Vulnerability (CVE-2020-11453)
999579	CVE-2020-7237	WEB-MISC Cacti Prior to 1.2.8 - Remote Code Execution Vulnerability (CVE-2020-7237)

Signature update version 47

New signatures rules are generated for the vulnerabilities identified in the week 2020-06-12. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signatures are compatible with the following software versions of Citrix Application Delivery Controller (ADC) 11.1, 12.0, 12.1, 13.0 and 13.1.

NetScaler version 12.0 has reached end of life (EOL). For more information, see release life cycle page.

Signature update version 46

New signatures rules are generated for the vulnerabilities identified in the week 2020-06-03. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signatures are compatible with the following software versions of Citrix Application Delivery Controller (ADC) 11.1, 12.0, 12.1, 13.0 and 13.1.

NetScaler version 12.0 has reached end of life (EOL). For more information, see release life cycle page.

NOTE:

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION

		API Email Template (CVE-2020-7799)
999664	CVE-2020-7799	WEB-MISC FusionAuth Prior To 1.11.0 - Remote Code Execution Vulnerability Via GUI Theme (CVE-2020-7799)
999665	CVE-2020-7799	WEB-MISC FusionAuth Prior To 1.11.0 - Remote Code Execution Vulnerability Via GUI Email Template (CVE-2020-7799)

Signature update version 45

New signatures rules are generated for the vulnerabilities identified in the week 2020-05-26. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signatures are compatible with the following software versions of Citrix Application Delivery Controller (ADC) 11.1, 12.0, 12.1, 13.0 and 13.1.

NetScaler version 12.0 has reached end of life (EOL). For more information, see release life cycle page.

NOTE:

Enabling Post body and Response body signature rules might affect NetScaler CPU. According to the latest Snort release, the signature rules with ID 1258, 1306, 2520, 2661, 5695, 10996, 11817, 12056, 15471, 17049 and 21634 have been removed.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
999666		WEB-WORDPRESS Duplicator plug-in Prior To 1.3.28 - Unauthenticated Arbitrary File Download Vulnerability
999667	CVE-2020-10220	WEB-MISC rConfig Through 3.94 - SQL Injection Vulnerability (CVE-2020-10220)
999668	CVE-2020-5844	WEB-MISC Artica Pandora FMS 7.0 - Execution of Arbitrary Files of Dangerous Type Via /attachment/ files_repo/ (CVE-2020-5844)
999669	CVE-2020-8813	WEB-MISC Cacti Prior to 1.2.10 - Remote Code Execution Vulnerability Via graph_realtime.php (CVE-2020-8813)

		Injection Vulnerability (CVE-2019-15985) Via getVmHostData
999706	CVE-2020-8549	WEB-WORDPRESS Strong Testimonials plug-in Prior To 2.40.1 - Stored Cross Site Scripting Vulnerability (CVE-2020-8549)

Signature update version 42

New signatures rules are generated for the vulnerabilities identified in the week 2020-02-11. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signatures are compatible with the following software versions of Citrix Application Delivery Controller (ADC) 11.1, 12.0, 12.1, 13.0 and 13.1.

NetScaler version 12.0 has reached end of life (EOL). For more information, see release life cycle page.

NOTE:

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
999707		WEB-WORDPRESS WPCentral plug-in Prior to Version 1.4.8 - Privilege Escalation Vulnerability

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
999708	CVE-2019-15979	WEB-MISC Cisco Data Center Network Manager Prior To 11.3(1) - Command Injection Vulnerability (CVE-2019-15979)
999709	CVE-2019-15978	WEB-MISC Cisco Data Center Network Manager Prior To 11.3(1) - Command Injection Vulnerability (CVE-2019-15978)
999710	CVE-2019-15975	WEB-MISC Cisco Data Center Network Manager Prior To 11.3(1) - Authentication Bypass Vulnerability (CVE-2019-15975)
999711	CVE-2019-15976	WEB-MISC Cisco Data Center Network Manager Prior To 11.3(1) - Authentication Bypass Vulnerability (CVE-2019-15976)
999712	CVE-2019-16405	WEB-MISC Centreon Prior to Version 19.10.2 - Remote Code Execution Vulnerability (CVE-2019-16405)
999713	CVE-2020-7048	WEB-WORDPRESS WP Database Reset plug-in Up To 3.1 - Unauthenticated DataBase Table Reset Vulnerability (CVE-2020-7048)
999714	CVE-2020-7108	WEB-WORDPRESS LearnDash plug-in Prior to Version 3.1.2 - Reflected

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
		cross-site scripting Vulnerability (CVE-2020-7108)
999715	CVE-2019-15977	WEB-MISC Cisco Data Center Network Manager Prior To 11.3(1) - Authentication Bypass Vulnerability (CVE-2019-15977)
999716	CVE-2020-2096	WEB-MISC Jenkins Gitlab Hook plug-in Version 1.4.2 and Prior - cross-site scripting Vulnerability (CVE-2020-2096)

Signature update version 41

New signatures rules are generated for the vulnerabilities identified for the week 2020-02-04. You can download and configure these signature rules to protect your appliance from security vulnerable attacks. The signature update includes the signature ID, signature version, and list of CVEs addressed.

Signature version

Signatures are compatible with the following software versions of Citrix Application Delivery Controller (ADC) 11.1, 12.0, 12.1, 13.0 and 13.1.

NetScaler version 12.0 has reached end of life (EOL). For more information, see release life cycle page.

NOTE:

The signature update version 41 includes a fix for the incorrect signature rule 1861. Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
999717		WEB-WORDPRESS WordPress Version 5.3.x and Prior - Denial of Service Vulnerability Via xmlrpc.php pingback.ping Method
999718		WEB-WORDPRESS Backup And Staging By WP Time Capsule plug-in Prior To 1.21.16 - Authentication Bypass Vulnerability
999719	CVE-2019-19731	WEB-MISC Roxy Fileman For .NET 1.4.5 - Path Traversal Vulnerability Via RENAMEFILE (CVE-2019-19731)
999720	CVE-2019-19915	WEB-WORDPRESS 301 Redirects – Easy Redirect Manager plug-in Up To 2.4.0 - Multiple Vulnerabilities (CVE-2019-19915)
999721	CVE-2019-17662	WEB-MISC Cybele Software ThinVNC Prior to Version 1.0b1 - Directory Traversal Vulnerability (CVE-2019-17662)
999722	CVE-2020-6168	WEB-WORDPRESS Minimal Coming Soon And Maintenance Mode plug-in Prior To 2.17 - Maintenance Setting Vulnerability (CVE-2020-6168)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
999723	CVE-2020-6166	WEB-WORDPRESS Minimal Coming Soon And Maintenance Mode plug-in Prior To 2.17 - Theme Change Vulnerability (CVE-2020-6166)
999724	CVE-2020-6166	WEB-WORDPRESS Minimal Coming Soon And Maintenance Mode plug-in Prior To 2.17 - Export Settings Vulnerability (CVE-2020-6166)
999725		WEB-WORDPRESS InifiniteWP Client plug-in Prior to 1.9.4.5 - Authentication Bypass Vulnerability
999726	CVE-2019-16773	WEB-WORDPRESS WordPress Versions Prior to 5.3.1 - cross-site scripting Vulnerability Via REST API With JSON Object (CVE-2019-16773)
999727	CVE-2019-16773	WEB-WORDPRESS WordPress Versions Prior to 5.3.1 - cross-site scripting Vulnerability Via REST API With FORM FIELD (CVE-2019-16773)
999728	CVE-2019-16773	WEB-WORDPRESS WordPress Versions Prior to 5.3.1 - cross-site scripting Vulnerability Via user-edit.php (CVE-2019-16773)
999729	CVE-2019-16773	WEB-WORDPRESS WordPress Versions Prior to

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
		5.3.1 - cross-site scripting Vulnerability Via profile.php (CVE-2019-16773)
999730	CVE-2019-16113	WEB-MISC Bludit 3.9.2 - Image Upload Remote Code Execution Vulnerability Via uuid (CVE-2019-16113)
999731	CVE-2019-16113	WEB-MISC Bludit 3.9.2 - Image Upload Remote Code Execution Vulnerability Via filename (CVE-2019-16113)

Signature update version 40

New signatures rules are generated for the vulnerabilities identified for the week 2020-01-14. You can download and configure these signature rules to protect your appliance from security vulnerable attacks. The signature update includes the signature ID, signature version, and list of CVEs addressed.

Signature version

Signatures are compatible with the following software versions of Citrix Application Delivery Controller (ADC) 11.1, 12.0, 12.1, 13.0 and 13.1.

NetScaler version 12.0 has reached end of life (EOL). For more information, see release life cycle page.

NOTE:

The signature update version 40 includes a fix for the incorrect signature rule 1861. Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
999732	CVE-2019-1620	WEB-MISC Cisco Data Center Network Manager Prior To 11.2(1) - Arbitrary File Upload Vulnerability (CVE-2019-1620)
999733	CVE-2019-16702	WEB-MISC Integard Pro 2.2.0.9026 - NoJs Buffer Overflow Vulnerability (CVE-2019-16702)
999734	CVE-2019-1621	WEB-MISC Cisco Data Center Network Manager Prior To 11.2(1) - Arbitrary File Download Vulnerability (CVE-2019-1621)
999735	CVE-2019-8451	WEB-MISC Atlassian Jira Server Before 8.4.0 - Server Side Request Forgery Vulnerability (CVE-2019-8451)
999736		WEB-WORDPRESS GDPR Cookie Compliance plug-in Prior to 4.0.3 - Authenticated Arbitrary Settings Deletion Vulnerability
999737	CVE-2019-11287	WEB-MISC Pivotal RabbitMQ 3.7.x prior to 3.7.21 and 3.8.x prior to 3.8.1 - Denial of Service Vulnerability (CVE-2019-11287)
999738		WEB-WORDPRESS Ultimate Addons For Elementor Prior To 1.20.1 - Authentication Bypass Via Facebook Login Vulnerability

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
999739		WEB-WORDPRESS Ultimate Addons For Elementor Prior To 1.20.1 - Authentication Bypass Via Google Login Vulnerability
999740	CVE-2019-19366	WEB-MISC FusionPBX Prior to 4.4.10 - cross-site scripting Vulnerability in xml_cdr_search.php Via Redirect Parameter (CVE-2019-19366)
999741	CVE-2019-16931	WEB-WORDPRESS Visualizer plug-in Prior to Version 3.3.1 - Unauthenticated cross-site scripting Vulnerability (CVE-2019-16931)
999742	CVE-2019-16932	WEB-WORDPRESS Visualizer plug-in Prior to Version 3.3.1 - Unauthenticated SSRF (CVE-2019-16932)
999743	CVE-2019-1619	WEB-MISC Cisco Data Center Network Manager Prior To 11.1(1) - Authentication Bypass Vulnerability (CVE-2019-1619)
999744	CVE-2019-12562	WEB-MISC DotNetNuke Before 9.4.0 - Stored Cross Site Scripting Vulnerability (CVE-2019-12562)
999745	CVE-2019-8371	WEB-MISC OpenEMR Prior to 5.0.2 - Remote Code Execution Vulnerability Via

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
		Form_Filedata Field (CVE-2019-8371)
999746	CVE-2019-8371	WEB-MISC OpenEMR Prior to 5.0.2 - Remote Code Execution Vulnerability Via Form_Image Field (CVE-2019-8371)
999747		WEB-WORDPRESS Beaver Builder Ultimate Addons Prior To 1.24.1 - Authentication Bypass Via Facebook Login Vulnerability
999748		WEB-WORDPRESS Beaver Builder Ultimate Addons Prior To 1.24.1 - Authentication Bypass Via Google Login Vulnerability
999749	CVE-2019-19650	WEB-MISC Zoho ManageEngine AM Prior to Build 13640 - SQLi Via Agent Servlet (CVE-2019-19650)
999750		WEB-MISC Zoho ManageEngine AM Prior to Build 13620 - API Key Disclosure Via OPMRequestHandlerServlet Servlet
999751	CVE-2019-1622	WEB-MISC Cisco Data Center Network Manager 11.0(1) - Information Disclosure Vulnerability (CVE-2019-1622)

SIGNATURE RULE	CVE ID	DESCRIPTION
		Code Execution Vulnerability (CVE-2019-16759)
999753		WEB-WORDPRESS Featured Image from URL plug-in Prior to 2.7.8 - Missing Access Controls on REST API Vulnerability
999754	CVE-2019-10098	WEB-MISC Apache HTTP Server Up To 2.4.39 - mod_rewrite Self-Referential Redirect Vulnerability (CVE-2019-10098)
999755	CVE-2019-1936	WEB-MISC Cisco UCS Director 6.0 to 6.6.1.0 and 6.7.0.0 to 6.7.1.0 - Command Injection Vulnerability (CVE-2019-1936)
999756	CVE-2019-19649	WEB-MISC Zoho ManageEngine AM Prior to Build 13620 - Unauthenticated SQLi Via EventID Parameter (CVE-2019-19649)
999757	CVE-2019-19649	WEB-MISC Zoho ManageEngine AM Prior to Build 13620 - Unauthenticated SQLi Via Entity Parameter (CVE-2019-19649)
999758	CVE-2019-15036	WEB-MISC JetBrains TeamCity Before 2019.1 - OS Command Injection Vulnerability (CVE-2019-15036)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
999759	CVE-2019-17239	WEB-WORDPRESS Download plug-ins and Themes from Dashboard plug-in Up To 1.5 - Stored cross-site scripting Vulnerability (CVE-2019-17239)

Signature update version 39

New signatures rules are generated for the vulnerabilities identified in the week 2019-12-19. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signatures are compatible with the following software versions of Citrix Application Delivery Controller (ADC) 11.1, 12.0, 12.1, 13.0 and 13.1.

NetScaler version 12.0 has reached end of life (EOL). For more information, see release life cycle page.

NOTE:

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
999760		WEB-MISC FusionPBX Versions Prior to 4.4.7 and 4.5.5 - Remote Code Execution Vulnerability Via / app/exec/exec.php

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
999761	CVE-2019-12747	WEB-MISC Typo3 Prior to 8.7.27 and 9.5.8 - Deserialization of Untrusted Data (CVE-2019-12747)
999762	CVE-2019-13608	WEB-MISC Citrix StoreFront Server - XML External Entity Injection Vulnerability (CVE-2019-13608)
999763		WEB-WORDPRESS WordPress Prior To 5.2.4 - Unauthenticated View Of Private or Draft Posts/Pages Vulnerability Via FORM
999764		WEB-WORDPRESS WordPress Prior To 5.2.4 - Unauthenticated View Of Private or Draft Posts/Pages Vulnerability Via URL
999765	CVE-2019-15954	WEB-MISC Total.js CMS 12.0.0 - Widget JavaScript Code Injection Vulnerability Via JSON (CVE-2019-15954)
999766	CVE-2019-15954	WEB-MISC Total.js CMS 12.0.0 - Widget JavaScript Code Injection Vulnerability Via FORM (CVE-2019-15954)
999767		WEB-WORDPRESS SyntaxHighlighter Evolved plug-in Prior To 5.3.1 - Stored Cross-Site Scripting Vulnerability Via Comment
999768		WEB-WORDPRESS SyntaxHighlighter Evolved

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
		plug-in Prior To 5.3.1 - Stored Cross-Site Scripting Vulnerability Via POST
999769		WEB-WORDPRESS SyntaxHighlighter Evolved plug-in Prior To 5.3.1 - Stored Cross-Site Scripting Vulnerability Via JSON
999770	CVE-2019-16120	WEB-WORDPRESS Event Tickets plug-in Before 4.10.7.2 - CSV Injection Vulnerability (CVE-2019-16120)
999771	CVE-2019-15029	WEB-MISC FusionPBX Prior to 4.4.8 - Remote Code Execution Vulnerability (CVE-2019-15029)
999772		WEB-WORDPRESS Sassy Social Share plug-in Prior To 3.3.4 - Unauthenticated Cross-Site Scripting Vulnerability
999773		WEB-WORDPRESS Email Subscribers & Newsletters plug-in Version 4.3.1 and Prior - Unauthenticated Blind SQLi Vulnerability
999774	CVE-2019-3398	WEB-MISC Atlassian Confluence or Data Center - downloadallattachments Path Traversal Vulnerability (CVE-2019-3398)
999775	CVE-2019-15952	WEB-MISC Total.js CMS 12.0.0 - Page Template Path

SIGNATURE RULE	CVE ID	DESCRIPTION
		Site Scripting Vulnerability (CVE-2019-1262)

Signature update version 37

New signatures rules are generated for the vulnerabilities identified in version 37. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signatures are compatible with the following software versions of Citrix Application Delivery Controller (ADC) 11.1, 12.0, 12.1, 13.0 and 13.1.

NetScaler version 12.0 has reached end of life (EOL). For more information, see release life cycle page.

NOTE:

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
999806	CVE-2019-3394	WEB-MISC Atlassian Confluence or Data Center - Local File Disclosure Vulnerability (CVE-2019-3394)
999807	CVE-2019-13569	WEB-WORDPRESS Icegram Email Subscribers & Newsletters plug-in Prior to 4.1.8 - SQLi Via Esfpx_lists Param (CVE-2019-13569)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
999808	CVE-2019-13569	WEB-WORDPRESS Icegram Email Subscribers & Newsletters plug-in Prior to 4.1.8 - SQLi Via Order Param (CVE-2019-13569)
999809	CVE-2019-2768	WEB-MISC Oracle BI Publisher - Predictable Session Token Vulnerability (CVE-2019-2768)
999810	CVE-2019-1003001	WEB-MISC Jenkins Pipeline Groovy plug-in Up To 2.61 - Sandbox Bypass Vulnerability Via Job Update (CVE-2019-1003001)
999811	CVE-2019-13575	WEB-WORDPRESS WPEverest Everest Forms plug-in Prior to 1.5.0 - SQL Injection (CVE-2019-13575)
999812	CVE-2019-15896	WEB-WORDPRESS LifterLMS plug-in Up To 3.34.5 - Security Bypass Vulnerability (CVE-2019-15896)
999813	CVE-2019-3396	WEB-MISC Atlassian Confluence or Data Center - Remote Code Execution Vulnerability (CVE-2019-3396)
999814	CVE-2019-5475	WEB-MISC Sonatype Nexus Repository Manager Prior to 2.14.14 - Remote Code Execution Via Createrepo Path (CVE-2019-5475)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
999815	CVE-2019-5475	WEB-MISC Sonatype Nexus Repository Manager Prior to 2.14.14 - Remote Code Execution Via Mergerepo Path (CVE-2019-5475)
999816	CVE-2019-15104	WEB-MISC Zoho ManageEngine OpManager Version Prior to 12.4 - SQL Injection Vulnerability (CVE-2019-15104)

Signature update version 36

New signatures rules are generated for the vulnerabilities identified in version 36. You can download and configure the signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signatures are compatible with the following software versions of Citrix Application Delivery Controller (ADC) 11.1, 12.0, 12.1, 13.0 and 13.1.

NetScaler version 12.0 has reached end of life (EOL). For more information, see release life cycle page.

NOTE:

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Signature update version 35

New signatures rules are generated for the vulnerabilities identified in version 35. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signatures are compatible with the following software versions of Citrix Application Delivery Controller (ADC) 11.1, 12.0, 12.1, 13.0 and 13.1.

NetScaler version 12.0 has reached end of life (EOL). For more information, see release life cycle page.

NOTE:

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
999834	CVE-2019-13024	WEB-MISC Centreon Version 19.04 and Prior - Command Injection Vulnerability
999835	CVE-2019-5420	WEB-MISC Rails Development Mode - Secret Token Disclosure Vulnerability
999836	CVE-2019-5418	WEB-MISC Rails Action View - File Content Disclosure Vulnerability
999837	CVE-2018-12426, CVE-2019-11185	WEB-WORDPRESS WP Live Chat Support Pro plug-in Prior to 8.0.26 - Arbitrary File Upload

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
999838	CVE-2019-10270	WEB-WORDPRESS WordPress plug-in Ultimate Member Prior to Version 2.0.40 - Arbitrary Password Reset
999839	CVE-2019-12826	WEB-WORDPRESS WordPress plug-in Widget Logic Prior To 5.10.2 - CSRF Vulnerability
999840	WEB-WORDPRESS WordPress plug-in All-In-One Event Calendar Prior To 2.5.39 - cross-site scripting Vulnerability	
999841	CVE-2019-11565	WEB-WORDPRESS WordPress plug-in Print My Blog Prior To 1.6.7 - Unauthenticated SSRF Vulnerability
999842	WEB-WORDPRESS WordPress plug-in Ultimate Member Prior to Version 2.0.46 - Multiple `cross-site scripting</LogString`	

Signature update version 34

New signatures rules are generated for the vulnerabilities identified in version 34. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signatures are compatible with the following software versions of Citrix Application Delivery Controller (ADC) 11.1, 12.0, 12.1, 13.0 and 13.1.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NetScaler version 12.0 has reached end of life (EOL). For more information, see release life cycle page.

NOTE:

Enabling Post body and Response body signature rules might affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
999843		WEB-WORDPRESS WordPress plug-in Ultimate Member Prior to Version 2.0.46 - Setting Arbitrary File For Read
999844	WEB-WORDPRESS WordPress plug-in Ultimate Member Prior to Version 2.0.46 - Arbitrary File Read	
999845	WEB-WORDPRESS WordPress plug-in Ultimate Member Prior to Version 2.0.46 - File Removal Via File Replacement	
999846	WEB-WORDPRESS WordPress plug-in Ultimate Member Prior to Version 2.0.46 - File Removal	
999847	WEB-WORDPRESS WordPress plug-in Shortlinks Prior To 2.1.10 - CSV Injection Vulnerability	
999848	WEB-WORDPRESS WordPress plug-in Shortlinks Prior To 2.1.10 -

Signature update version 32

New signatures rules are generated for the vulnerabilities identified in version 32. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signatures are compatible with the following software versions of Citrix Application Delivery Controller (ADC) 11.1, 12.0, 12.1, 13.0 and 13.1.

NetScaler version 12.0 has reached end of life (EOL). For more information, see release life cycle page.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE:

Enabling Post body and Response body signature rules may affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
999875	CVE-2016-4438, CVE-2016-3087	WEB-STRUTS Apache Struts 2.3.20 Through 2.3.28.1 Remote Execution Vulnerability Via URL
999876	CVE-2019-10867	WEB-MISC Pimcore Prior to 5.7.1 - Deserializing Vulnerability (CVE-2019-10867)

Signature update version 30

New signatures rules are generated for the vulnerabilities identified in version 30. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signatures are compatible with the following software versions of Citrix Application Delivery Controller (ADC) 11.1, 12.0, 12.1, 13.0 and 13.1.

NetScaler version 12.0 has reached end of life (EOL). For more information, see release life cycle page.

NOTE:

Enabling Post body and Response body signature rules may affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

Signature update version 29

New signatures rules are generated for the vulnerabilities identified in version 29. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

Signature version

Signatures are compatible with the following software versions of Citrix Application Delivery Controller (ADC) 11.1, 12.0, 12.1, 13.0 and 13.1.

NetScaler version 12.0 has reached end of life (EOL). For more information, see release life cycle page.

Note:

Enabling Post body and Response body signature rules may affect NetScaler CPU.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIGNATURE RULE	CVE ID	DESCRIPTION
999896	CVE-2019-2725	Weblogic 10.3.6 Remote Code Execution
999897	CVE-2019-2725	Weblogic 10.3.6 Remote Code Execution

Signature update version 28

New signatures rules are generated for the vulnerabilities identified in version 28. You can download and configure these signature rules to protect your appliance from security vulnerable attacks. The signature update includes the signature ID, signature version, and list of CVEs addressed.

Signature version

Signatures are compatible with the following software versions of Citrix Application Delivery Controller (ADC) 11.1, 12.0, 12.1, 13.0 and 13.1.

NetScaler version 12.0 has reached end of life (EOL). For more information, see release life cycle page.

Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

SIGNATURE RULE	CVE ID	DESCRIPTION
999898	CVE-2018-12895	WEB-MISC WordPress before 4.9.7-Directory Traversal Vulnerability.
999899	CVE-2019-9618	WEB-MISC-GraceMedia Media Player WordPress plug-in 1.0 Arbitrary Local File Inclusion Vulnerability
999900	CVE-2018-20714	WEB-MISC WordPress plug-in WooCommerce before 3.4.6 - File Deletion Vulnerability.

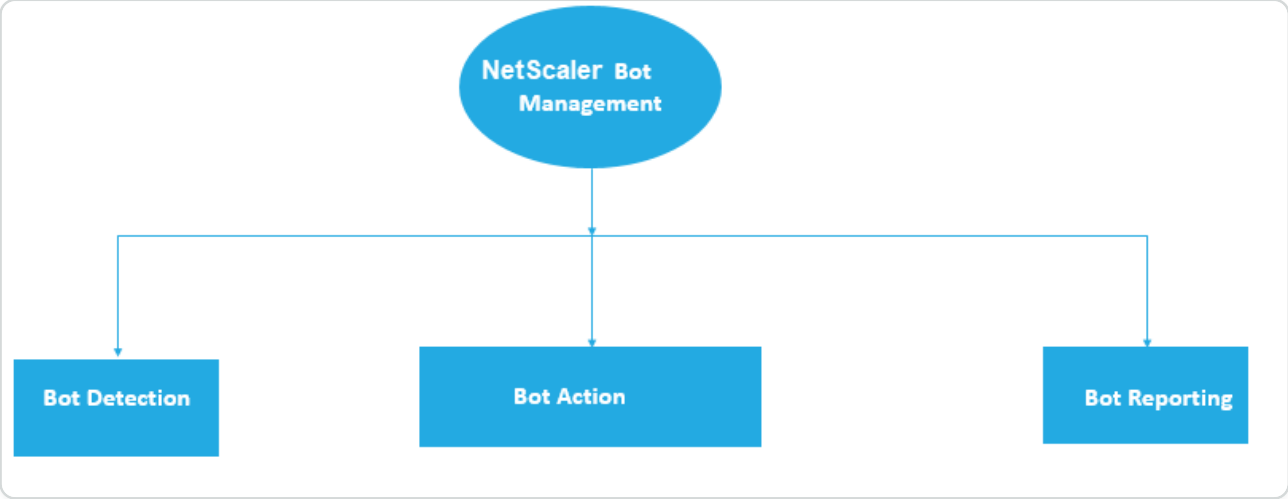
Bot Management

Sometimes the incoming web traffic is comprised of bots and most organizations suffer from bot attacks. Web and mobile applications are significant revenue drivers for business and most companies are under the threat of advanced cyberattacks, such as bots. A bot is a software program that automatically performs certain actions repeatedly at a much faster rate than a human. Bots can interact with webpages, submit forms, run actions, scan texts, or download content. They can access videos, post comments, and tweet on social media platforms. Some bots, known as chatbots, can hold basic conversations with human users. A bot that performs a helpful service, such as customer service, automated chat, and search engine crawlers are good bots. At the same time, a bot that can scrape or download content from a website, steal user credentials, spam content, and perform other kinds of cyberattacks are bad bots. With a good number of bad bots performing malicious tasks, it is essential to manage bot traffic and protect your web applications from bot attacks. By using NetScaler® bot management, you can detect the incoming bot traffic and mitigate bot attacks to protect your web applications. NetScaler bot management helps identify bad bots and protect your appliance from advanced security attacks. It detects good and bad bots and identifies if incoming traffic is a bot attack. By using bot management, you can mitigate attacks and protect your web applications.

NetScaler bot management provides the following benefits:

- **Defend against bots, scripts, and toolkits**. Provides real-time threat mitigation using static signature based defense and device fingerprinting.
- **Neutralize automated basic and advanced attacks**. Prevents attacks, such as App layer DDoS, password spraying, password stuffing, price scrapers, and content scrapers.
- **Protect your APIs and investments**. Protects your APIs from unwarranted misuse and protects infrastructure investments from automated traffic.

Some use cases where you can benefit by using the NetScaler bot management system are:

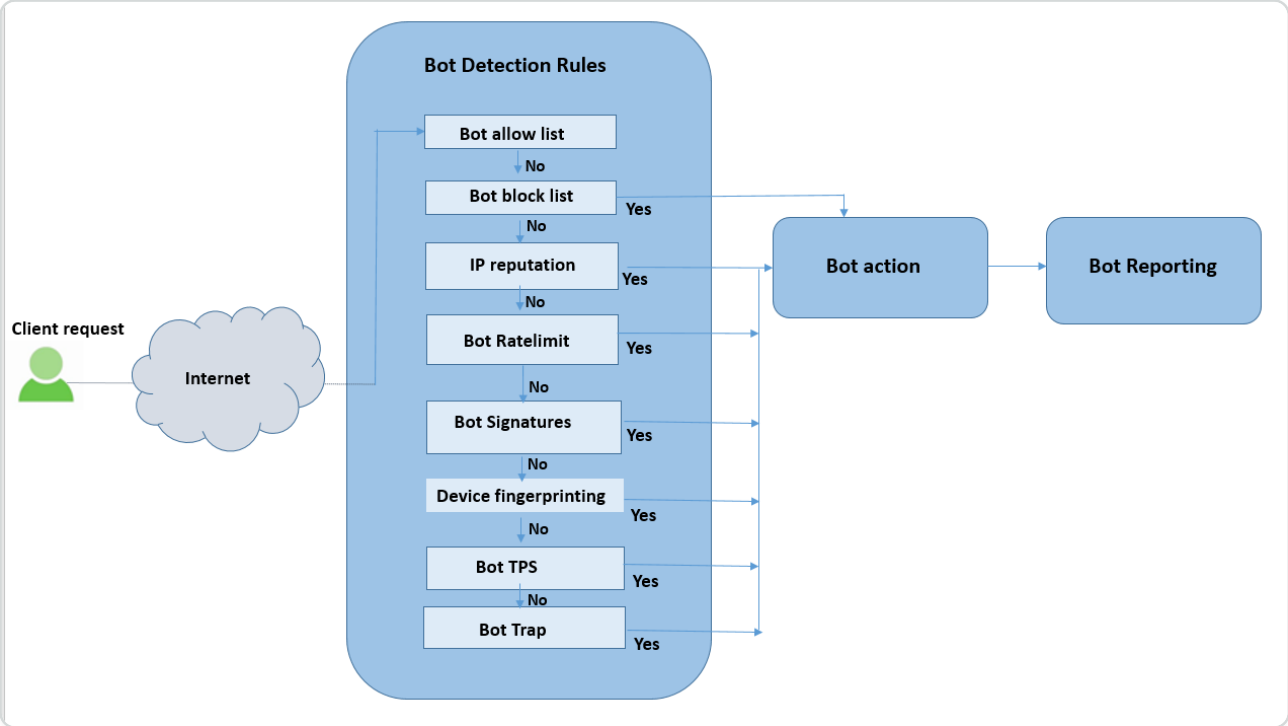


- Brute force login. A government web portal is constantly under attack by bots attempting to brute force user logins. The organization discovered the attack by looking through web logs and seeing specific users being select over and over again with rapid login attempts and passwords incrementing using a dictionary attack approach. By law, they must protect themselves and their users. By deploying the NetScaler bot management, they can stop brute force login using device fingerprinting and rate limiting techniques.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Block bad bots and device fingerprint unknown bots. A web entity gets 100,000 visitors each day. They have to upgrade the underlying footprint and they are spending a fortune. In a recent audit, the team discovered that 40 percent of the traffic came from bots, scraping content, picking news, checking user profiles, and more. They want to block this traffic to protect their users and reduce their hosting costs. Using bot management, they can block known bad bots, and fingerprint unknown bots that are hammering their site. By blocking these bots, they can reduce bot traffic by 90 percent.

What does NetScaler bot management do



The NetScaler bot management helps organizations protect their web applications and public assets from advanced security attacks. When an incoming traffic is a bot, the bot management system detects the bot type, assigns an action, and generates bot insights, as shown in the following diagram.

How does NetScaler bot management work

The following diagram shows how the NetScaler bot management works. The process involves eight detection techniques that help in detecting the incoming traffic as a good or a bad bot. By default good bots detected by signatures are allowed and bad bots detected by signatures are dropped.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. The process starts by enabling the bot management feature on the appliance.
2. When a client sends a request, the appliance evaluates the traffic using bot policy rules. If the incoming request is identified as a bot, the appliance applies a bot detection profile.
3. You must bind the default or custom bot signature file to the bot detection profile. The bot signature file has a list of bot signature rules for identifying the incoming bot type.
4. The bot detection rules are available under eight detection categories in the signature file. The categories are allow list, block list, static signature, IP reputation, device fingerprint, and rate limiting. Based on the bot traffic, the system applies a detection rule to the traffic.
5. If the incoming bot traffic matches an entry in the bot allow list, the system bypasses other detection techniques and the associated action logs the data.
6. For detection techniques other than bot allow list, if an incoming request matches a configured rule, the corresponding action is applied. The possible actions are drop, redirect, reset, mitigation, and log. CAPTCHA is a mitigation action which is supported for IP reputation, device fingerprinting, and TPS detection techniques.

Bot Detection

The NetScaler bot management system uses various techniques to detect the incoming bot traffic. The techniques are used as detection rules to detect the bot type. The techniques are as follows:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE:

Bot management supports a maximum of 32 configuration entities for block list, allow list, and rate limiting techniques.

Bot Allowed list - A customized list of IP addresses (IPv4 and IPv6), subnets (IPv4 and IPv6), and policy expressions that can be bypassed as an allowed list.

Bot Blocked list - A customized list of IP addresses (IPv4 and IPv6), subnets (IPv4 and IPv6), and policy expressions that have to be blocked from accessing your web applications.

IP reputation - This rule detects if the incoming bot traffic is from a malicious IP address.

Device fingerprint - This rule detects if the incoming bot traffic has the device fingerprint ID in the incoming request header and browser attributes of an incoming client bot traffic.

LIMITATION:

1. Java Script must be enabled in the client browser.
2. Does not work for XML responses.

Bot log expression - The detection technique enables you to capture additional information as log messages. The data can be the name of the user who requested the URL, the source IP address, and the source port from which the user sent the request or data generated from an expression.

Rate limit - This rule rate limits multiple requests coming from the same client.

Bot trap - Detects and blocks automated bots by advertising a trap URL in the client response. The URL appears invisible and not accessible if the client is a human user. The detection technique is effective in blocking attacks from automated bots.

TPS - Detects incoming traffic as bots if the maximum number of requests and percentage increase in requests exceeds the configured time interval.

CAPTCHA - This rule uses a CAPTCHA for mitigating bot attacks. A CAPTCHA is a challenge-response validation to determine if the incoming traffic is from a human user or an automated bot. The validation helps block automated bots that cause security violations to web applications. You can configure CAPTCHA as a bot action in IP reputation and device fingerprint detection techniques.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Now, let us see how you can configure each technique to detect and manage your bot traffic.

How to upgrade your appliance to NetScaler CLI-based bot management configuration

If you are upgrading your appliance from an older version (NetScaler release 13.0 build 58.32 or earlier), you must first manually convert the existing bot management configuration to the NetScaler CLI based bot management configuration only once. Complete the following steps to manually convert your bot management configuration.

1. After upgrading to the latest version connect to the upgrade tool "upgrade_bot_config.py" by using the following command

   At the command prompt, type:

   ```
   shell "/var/python/bin/python /netscaler/upgrade_bot_config.py > /var/bot_upgrade_commands.txt"
   ```

2. Run the configuration using the following command.

   At the command prompt, type:

   ```
   batch -f /var/bot_upgrade_commands.txt
   ```

3. Save the upgraded configuration.

```
save ns config
```

Configure NetScaler CLI-based bot management

The bot management configuration enables you to bind one or more bot detection techniques to a specific bot profile. You must complete the following steps to configure NetScaler-based bot management:

1. Enable bot management
2. Import bot signature
3. Add bot profile
4. Bind bot profile
5. Add bot policy
6. Bind bot policy
7. Configure bot settings

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE:

If you are upgrading your appliance from an older version, you must first manually convert the existing bot management configuration. For more information, see How to upgrade to NetScaler CLI-based bot management configuration section.

Enable bot management

Before you can begin, ensure that the Bot Management feature is enabled on the appliance. If you have a new NetScaler or VPX, you must enable the feature before you configure it. If you are upgrading a NetScaler appliance from an earlier version to the current version, you must need to enable the feature before you configure it. At the command prompt, type:

```
enable ns feature Bot
```

Import bot signature

You can import the default signature bot file and bind it to the bot profile. At the command prompt, type:

```
import bot signature [<src>] <name> [-comment <string>] [-overwrite]
```

Where:

`src` - Local path name, or URL (protocol, host, path, and file name). Maximum Length: 2047.

NOTE:

The import fails if the object to be imported is on an HTTPS server that requires client certificate authentication for access.

`name` - Name of the bot signature file object. This is a mandatory argument. Maximum Length: 31.

`comment` - Description about the signature file object. Maximum Length: 255.

`overwrite` - Action that overwrites the existing file.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE:

Use the `overwrite` option to update the content in the signature file. Alternately, use the `update bot signature <name>` command to update the signature file on the NetScaler appliance.

Example

```
import bot signature http://www.example.com/signature.json signaturefile
-comment commentsforbot –overwrite
```

NOTE:

You can use the overwrite option to update the content in the signature file. Also, you can use the `update bot signature <name>` command to update the signature file in the NetScaler appliance.

Add bot profile

A bot profile is a collection of profile settings to configure bot management on the appliance. You can configure the settings to perform bot detection.

At the command prompt, type:

```
add bot profile <name> [-signature <string>] [-errorURL <string>] [-trapURL
<string>] [-whiteList ( ON | OFF )] [-blackList ( ON | OFF )] [-rateLimit ( ON |
OFF )] [-deviceFingerprint ( ON | OFF )] [-deviceFingerprintAction ( none | log |
drop | redirect | reset | mitigation )] [-ipReputation ( ON | OFF )] [-trap ( ON
| OFF )]
```

Example:

```
add bot profile profile1 -signature signature -errorURL http://www.example.com/
error.html -trapURL /trap.html -whitelist ON -blacklist ON -ratelimit ON
-deviceFingerprint ON -deviceFingerprintAction drop -ipReputation ON -trap ON
```

Bind bot profile

After you create a bot profile, you must bind the bot detection mechanism to the profile.

At the command prompt, type:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
bind bot profile <name> | (-ipReputation [-category <ipReputationCategory>] [-enabled ( ON | OFF )] [-action ( none | log | drop | redirect | reset | mitigation )] [-logMessage <string>]
```

Example:

The following example is for binding the IP reputation detection technique to a specific bot profile.

```
bind bot profile profile5 -ipReputation -category BOTNET -enabled ON -action drop -logMessage message
```

Add bot policy

You must add the bot policy for evaluating bot traffic.

At the command prompt, type:

```
add bot policy <name> -rule <expression> -profileName <string> [-undefAction <string>] [-comment <string>] [-logAction <string>]
```

Where,

`Name` - Name for the bot policy. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Can be changed after the bot policy is added.

`Rule` - An expression that the policy uses to determine whether to apply the bot profile on the specified request. This is a mandatory argument. Maximum Length: 1499

`profileName` - Name of the bot profile to apply if the request matches this bot policy. This is a mandatory argument. Maximum Length: 127

`undefAction` - Action to perform if the result of policy evaluation is undefined (UNDEF). An UNDEF event indicates an internal error condition. Maximum Length: 127

`Comment` - Description about this bot policy. Maximum Length: 255

`logAction` - Name of the log action to use for requests that match this policy. Maximum Length: 127

Example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add bot policy pol1 –rule "HTTP.REQ.HEADER(\"header\").CONTAINS(\"custom\")" -profileName profile1 -undefAction drop –comment commentforbotpolicy –logAction log1
```

Bind bot policy global

At the command prompt, type:

```
bind bot global -policyName <string> -priority <positive_integer> [-gotoPriorityExpression <expression>][-type ( REQ_OVERRIDE | REQ_DEFAULT )] [-invoke (-labelType ( vserver | policylabel ) -labelName <string>) ]
```

Example:

```
bind bot global –policyName pol1 –priority 100 –gotoPriorityExpression NEXT -type REQ_OVERRIDE
```

Bind bot policy to a virtual server

At the command prompt, type:

```
bind lb vserver <name>@ ((<serviceName>@ [-weight <positive_integer>] ) | <serviceGroupName>@ | (-policyName <string>@ [-priority <positive_integer>] [-gotoPriorityExpression <expression>]
```

Example:

```
bind lb vserver lb-server1 –policyName pol1 –priority 100 –gotoPriorityExpression NEXT -type REQ_OVERRIDE
```

Configure bot settings

You can customize the default settings if necessary. At the command prompt, type:

```
set bot settings [-defaultProfile <string>] [-javaScriptName <string>] [-sessionTimeout <positive_integer>] [-sessionCookieName <string>] [-dfpRequestLimit <positive_integer>] [-signatureAutoUpdate ( ON | OFF )] [-signatureUrl <URL>] [-proxyServer <ip_addr|ipv6_addr|*>] [-proxyPort <port|*>]
```

Where,

© 1997–2026 Citrix Systems, Inc. All rights reserved.

`defaultProfile` - Profile to use when a connection does not match any policy. Default setting is " ", which sends unmatched connections back to the NetScaler without attempting to filter them further. Maximum Length: 31

`javaScriptName` - Name of the JavaScript that the BotNet feature uses in response. Must begin with a letter or number, and can consist of from 1 to 31 letters, numbers, and the hyphen (-) and underscore (_) symbols. The following requirement applies only to the NetScaler CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my cookie name" or 'my cookie name'). Maximum Length: 31

`sessionTimeout` - Session times out, in seconds, after which a user session is terminated.

`Minimum value` - 1, Maximum value: 65535

`sessionCookieName` - Name of the SessionCookie that the BotNet feature uses it for tracking. Must begin with a letter or number, and can consist of from 1 to 31 letters, numbers, and the hyphen (-) and underscore (_) symbols. The following requirement applies only to the NetScaler CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my cookie name" or 'my cookie name'). Maximum Length: 31

`dfpRequestLimit` - Number of requests to allow without bot session cookie if device fingerprint is enabled. Minimum value: 1, Maximum Value: 4294967295

`signatureAutoUpdate` - Flag used to enable/disable bot auto update signatures. Possible values: ON, OFF. Default value: OFF

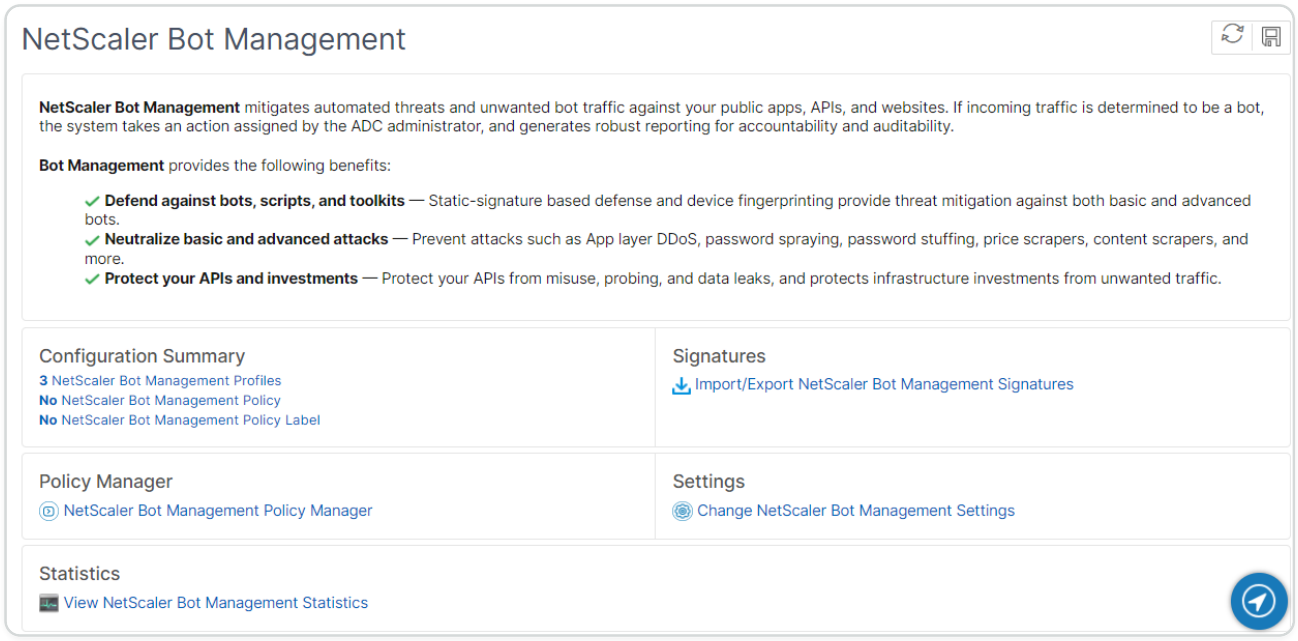
`signatureUrl` - URL to download the bot signature mapping file from the server. Default value: `https://nsbotsignatures.s3.amazonaws.com/BotSignatureMapping.json`. Maximum Length: 2047

`proxyServer` - Proxy Server IP to get updated signatures from AWS.

`proxyPort` - Proxy Server Port to get updated signatures from AWS. Default value: 8080

`proxyUsername` - User name to authenticate to the proxy server for downloading signature updates.

`proxyPassword` – Password to authenticate to the proxy server for downloading signature updates.



Example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
set bot settings –defaultProfile profile1 –javaScriptName json.js –
sessionTimeout 1000 –sessionCookieName session -proxyServer 10.102.30.112
-proxyPort 3128 -proxyUsername defaultuser -proxyPassword defaultPassword
```

Configuring bot management by using NetScaler GUI

You can configure NetScaler bot management by first enabling the feature on the appliance. Once you enable, you can create a bot policy to evaluate the incoming traffic as bot and send the traffic to the bot profile. Then, you create a bot profile and then bind the profile to a bot signature. As an alternative, you can also clone the default bot signature file and use the signature file to configure the detection techniques. After creating the signature file, you can import it into the bot profile.

1. Enable bot management feature
2. Configure bot management settings
3. Clone NetScaler® bot default signature
4. Import NetScaler bot signature
5. Configure bot signature settings
6. Create bot profile
7. Create bot policy

Enable bot management feature

Complete the following steps to enable bot management:

1. On the navigation pane, expand **System** and then click **Settings > Configure Advanced Features**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. On the **Configure Advanced Features** page, select the **NetScaler Bot Management** checkbox.
3. Click **OK**.

Configure bot management settings for device fingerprint technique

Complete the following step to configure the device fingerprint technique:

1. Navigate to **Security** > **NetScaler bot Management**.
2. In the details pane, under **Settings** click **Change NetScaler bot Management Settings**.
3. In the **Configure NetScaler bot Management Settings**, set the following parameters.
    a. Default Profile. Select a bot profile.
    b. JavaScript Name. Name of the JavaScript file that bot management uses in its response to the client.
    c. Session Timeout. Timeout in seconds after which the user session is terminated.
    d. Session Cookie. Name of the session cookie that the bot management system uses for tracking.
    e. Device Fingerprint Request Limit. Number of requests to allow without a bot session cookie, if device fingerprint is enabled.
    f. Proxy Server - Proxy server IP address from where the latest signatures are uploaded.
    g. Proxy Port – Port number of machine from where the latest signatures are uploaded.
    h. Proxy Username – User name for the authentication of the proxy server
    i. Proxy Password - Password for the authentication of the proxy server.

    NOTE:

    Proxy User name and the Proxy Password fields are enabled if the Proxy Server and the Proxy Port fields are configured.

4. Click **OK**.

Clone bot signature file

Complete the following step to clone the bot signature file:

1. Navigate to **Security** > **NetScaler Bot Management** and **Signatures**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. In the **NetScaler Bot Management Signatures** page, select the default bot signatures record and click **Clone**.
3. In the **Clone Bot Signature** page, enter a name and edit the signature data.
4. Click **Create**.

Import bot signature file

If you have your own signature file, then you can import it as a file, text, or URL. Perform the following steps to import the bot signature file:

1. Navigate to **Security** > **NetScaler Bot Management** and **Signatures**.
2. On the **NetScaler Bot Management Signatures** page, import the file as URL, File, or text.
3. Click **Continue**.
4. On the Import NetScaler Bot Management Signature page, set the following parameters.
    a. Name - Name of the bot signature file.
    b. Comment - Brief description about the imported file.
    c. Overwrite - Select the checkbox to allow overwriting of data during file update.
    d. Signature Data - Modify signature parameters
5. Click **Done**.

Configure bot allow list by using NetScaler GUI

This detection technique enables you to bypass URLs that you configure an allowed listed one. Complete the following step to configure an allow list URL:

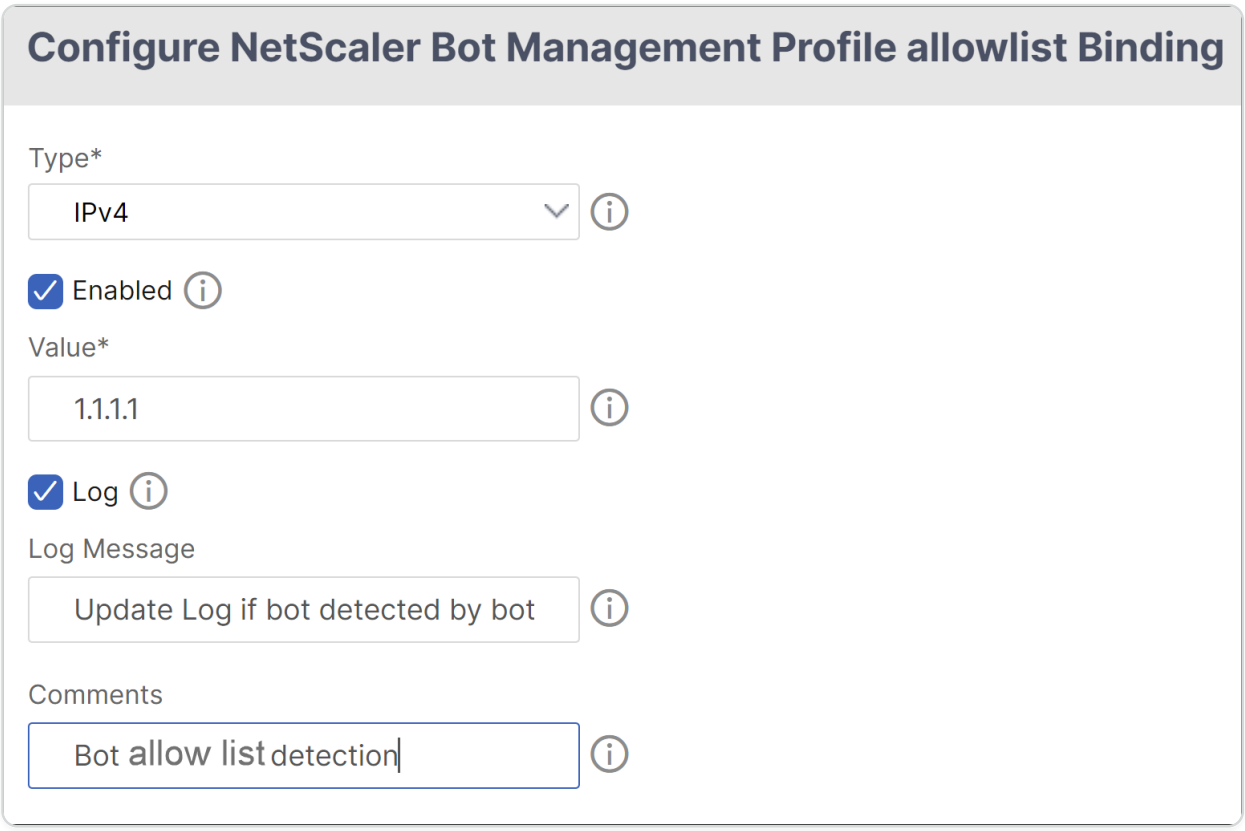
1. Navigate to **Security** > **NetScaler Bot Management** and **Profiles**.
2. On the **NetScaler Bot Management Profiles** page, select a file and click **Edit**.
3. On the **NetScaler Bot Management Profile** page, go to the **Signature Settings** section and click **White List**.
4. In the **White List** section, set the following parameters:
    a. Enabled. Select the checkbox to validate the allow list URLs as part of the detection process.
    b. Configure Types. Configure an allow list URL. The URL is bypassed during bot detection. Click Add to add a URL to the bot allow list.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

c. In the **Configure NetScaler Bot Management Profile Whitelist Binding** page, set the following parameters:

i. Type. URL type can be an IPv4 address, subnet IP address, or an IP address matching a policy expression.

ii. Enabled. Select the checkbox to validate the URL.



iii. Value. URL address.

iv. Log. Select the checkbox to store log entries.

v. Log Message. Brief description of the log.

vi. Comments. Brief description about the allow list URL.

vii. Click **OK**.

5. Click **Update**.
6. Click **Done**.

Configure bot block list by using NetScaler GUI

This detection technique enables you to drop the URLs that you configure as block listed one. Complete the following step to configure a block list URL.

1. Navigate to **Security** > **NetScaler Bot Management** and **Profiles**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. On the **NetScaler Bot Management Profiles** page, select a signature file and click **Edit**.
3. On the **NetScaler Bot Management Profile** page, go to the **Signature Settings** section and click **Black List**.
4. In the **Black List** section, set the following parameters:

    a. Enabled. Select the checkbox to validate block list URLs as part of the detection process.

    b. Configure Types. Configure a URL to be part of the bot block list detection process. These URLs are dropped during bot detection. Click Add to add a URL to the bot block list

    c. In the **Configure NetScaler Bot Management Profile Blacklist Binding** page, set the following parameters.

        i. Type. URL type can be an IPv4 address, subnet IP address, or IP address.

        ii. Enabled. Select the checkbox to validate the URL.

        iii. Value. URL address.

        iv. Log. Select the checkbox to store log entries.

        v. Log Message. Brief description of the login.

        vi. Comments. Brief description about the block list URL.

        vii. Click **OK**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

5. Click **Update**.
6. Click **Done**.

Configure IP reputation by using NetScaler GUI

The IP reputation bot technique uses Webroot's IP reputation database and cloud service provider database to verify if a client request is a malicious IP address or a public cloud IP address. As part of the bot categories is configured and then a bot action is associated to it. Complete the following steps to configure Webroot IP reputation and cloud service provider database categories.

1. Navigate to **Security** > **NetScaler bot Management** and **Profiles**.
2. On the **NetScaler bot Management Profiles** page, select a profile and click **Edit**.
3. On the **NetScaler bot Management Profile** page, go to the **Profile Settings** section and click **IP Reputation**.
4. On the **IP Reputation** section, set the following parameters:

    a. Enabled. Select the checkbox to validate incoming bot traffic as part of the detection process.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

b. Configure Categories. You can use the IP reputation technique for incoming bot traffic under different categories. Based on the configured category, you can drop or redirect the bot traffic. Click **Add** to configure a malicious bot category.

c. In the **Configure NetScaler bot Management Profile IP Reputation Binding** page, set the following parameters:

   i. Category. Select a Webroot IP reputation bot category to validate a client request as a malicious IP address.

      i. IP_BASED - This category checks whether the client IP address (IPv4 and IPv6) is malicious or not.

      ii. BOTNET - This category includes Botnet C&C channels, and infected zombie machines controlled by Bot master.

      iii. SPAM_SOURCES - This category includes tunneling spam messages through a proxy, anomalous SMTP activities, and forum spam activities.

      iv. SCANNERS - This category includes all reconnaissance such as probes, host scan, domain scan, and password brute force attack.

      v. DOS - This category includes DOS, DDOS, anomalous sync flood, and anomalous traffic detection.

      vi. REPUTATION - This category denies access from IP addresses (IPv4 and IPv6) currently known to be infected with malware. This category also includes IP addresses with average low Webroot Reputation Index score. Enabling this category prevents access from sources identified to contact malware distribution points.

      vii. PHISHING - This category includes IP addresses (IPv4 and IPv6) hosting phishing sites and other kinds of fraud activities such as ad click fraud or gaming fraud.

      viii. PROXY - This category includes IP addresses (IPv4 and IPv6) providing proxy services.

      ix. NETWORK - IPs providing proxy and anonymization services including The Onion Router aka TOR or dark net.

      x. MOBILE_THREATS - This category checks the client IP address (IPv4 and IPv6) with the list of addresses harmful for mobile devices.

   ii. Category. Select a Webroot public cloud service provider category to validate a client request is a public cloud IP address.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

i. AWS - This category checks client IP address with list of public cloud addresses from AWS.

ii. GCP - This category checks client IP address with list of public cloud addresses from the Google Cloud Platform.

iii. AZURE - This category checks client address with list of public cloud addresses from Azure.

iv. ORACLE - This category checks client IP address with list of public cloud addresses from Oracle

v. IBM - This category checks client IP address with list of public cloud addresses from IBM.

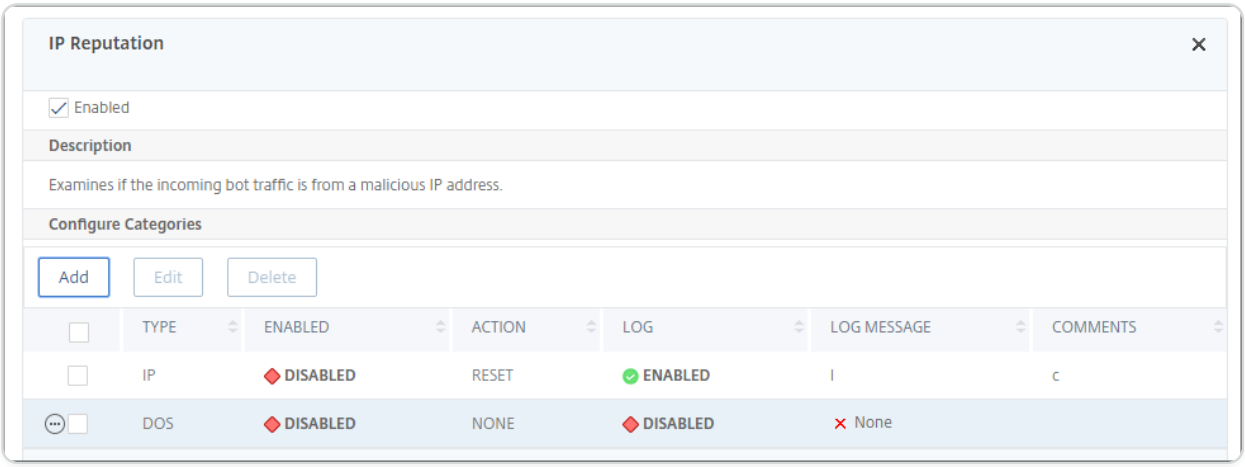
vi. SALESFORCE - This category checks client IP address with list of public cloud addresses from Salesforce.

Possible values for Webroot IP reputation bot category: IP, BOTNETS, SPAM_SOURCES, SCANNERS, DOS, REPUTATION, PHISHING, PROXY, NETWORK, MOBILE_THREATS.

Possible values for Webroot public cloud service provider category: AWS, GCP, AZURE, ORACLE, IBM, SALESFORCE.

iii. Enabled. Select the checkbox to validate the IP reputation signature detection.

iv. Bot action. Based on the configured category, you can assign no action, drop, redirect, or mitigation action.



v. Log. Select the checkbox to store log entries.

vi. Log Message. Brief description of the log.

vii. Comments. Brief description about the bot category.

5. Click **OK**.
6. Click **Update**.
7. Click **Done**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE

If you disable **IP reputation**, ensure to stop its downloads. Complete the following steps to stop the IP reputation downloads:

1. Navigate to **Security > NetScaler bot Management > Change NetScaler bot Management Settings**
2. Change the **Default Nonintrusive Profile** to **BOT_BYPASS**.

Configure bot rate limit technique

The bot rate limit technique enables you to limit bot traffic within certain timeframe based on the user's geolocation, client IP address, session, cookie, or configured resource (URL). By configuring the bot rate limit technique, you can ensure the following:

- Block malicious bot activity.
- Reduce traffic strain to web servers.

Configure bot rate limit by using NetScaler CLI

At the command prompt, type:

```
bind bot profile <name>... -ratelimit  -type <type> Geolocation
-countryCode <countryName> -rate  <positive_integer> -timeSlice
<positive_integer> [-action <action> ...] [-limitType ( BURSTY | SMOOTH )]
[-condition <expression>] [-enabled ( ON | OFF )]
```

Where,

`*SOURCE_IP` - Rate-limiting based on the client IP address.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

`*SESSION` - Rate-limiting based on the configured cookie name.

`*URL` - Rate-limiting based on the configured URL.

`*GEOLOCATION` - Rate-limiting based on the configured country name.

`Possible values` - SESSION, SOURCE_IP, URL, GEOLOCATION

Example:

```
bind bot profile geo_prof -ratelimit -type Geolocation -countryCode IN
-rate 100 -timeSlice 1000 -limitType SMOOTH -condition
HTTP.REQ.HEADER("User-Agent").contains("anroid") -action log,drop -enabled
on
```

Configure bot rate limit by using NetScaler GUI

Complete the following steps to configure the bot rate limit detection technique:

1. Navigate to **Security > NetScaler Bot Management** and **Profiles**.
2. In the **NetScaler Bot Management Profiles** page, select a profile and click **Edit**.
3. In the **NetScaler Bot Management Profile** page, go to the **Profile Settings** section and click **Rate Limit**.
4. In the **Rate Limit** section, set the following parameters:
    a. Enabled. Select the checkbox to validate the incoming bot traffic as part of the detection process.
    b. Click **Add** to configure rate limit bindings.
5. In the **Configure NetScaler Bot Management Rate Limit** page, set the following parameters.
    a. Type - Rate limit bot traffic based on the following parameters:
        i. Geolocation - Rate limit based on user's geographic location.
        ii. Source_IP - Rate limit traffic based on client IP address.
        iii. Session - Rate limit bot traffic based on session or cookie name.
        iv. URL - Rate limit bot traffic based on the configured URL.
    b. Country - Select a geolocation as country or region.
    c. Rate Limit Type – Limits the type of traffic based on the following types.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Bursty – Forward all requests that are within the set threshold and specified time period.
- Smooth – Forward the requests evenly across the specified time period.

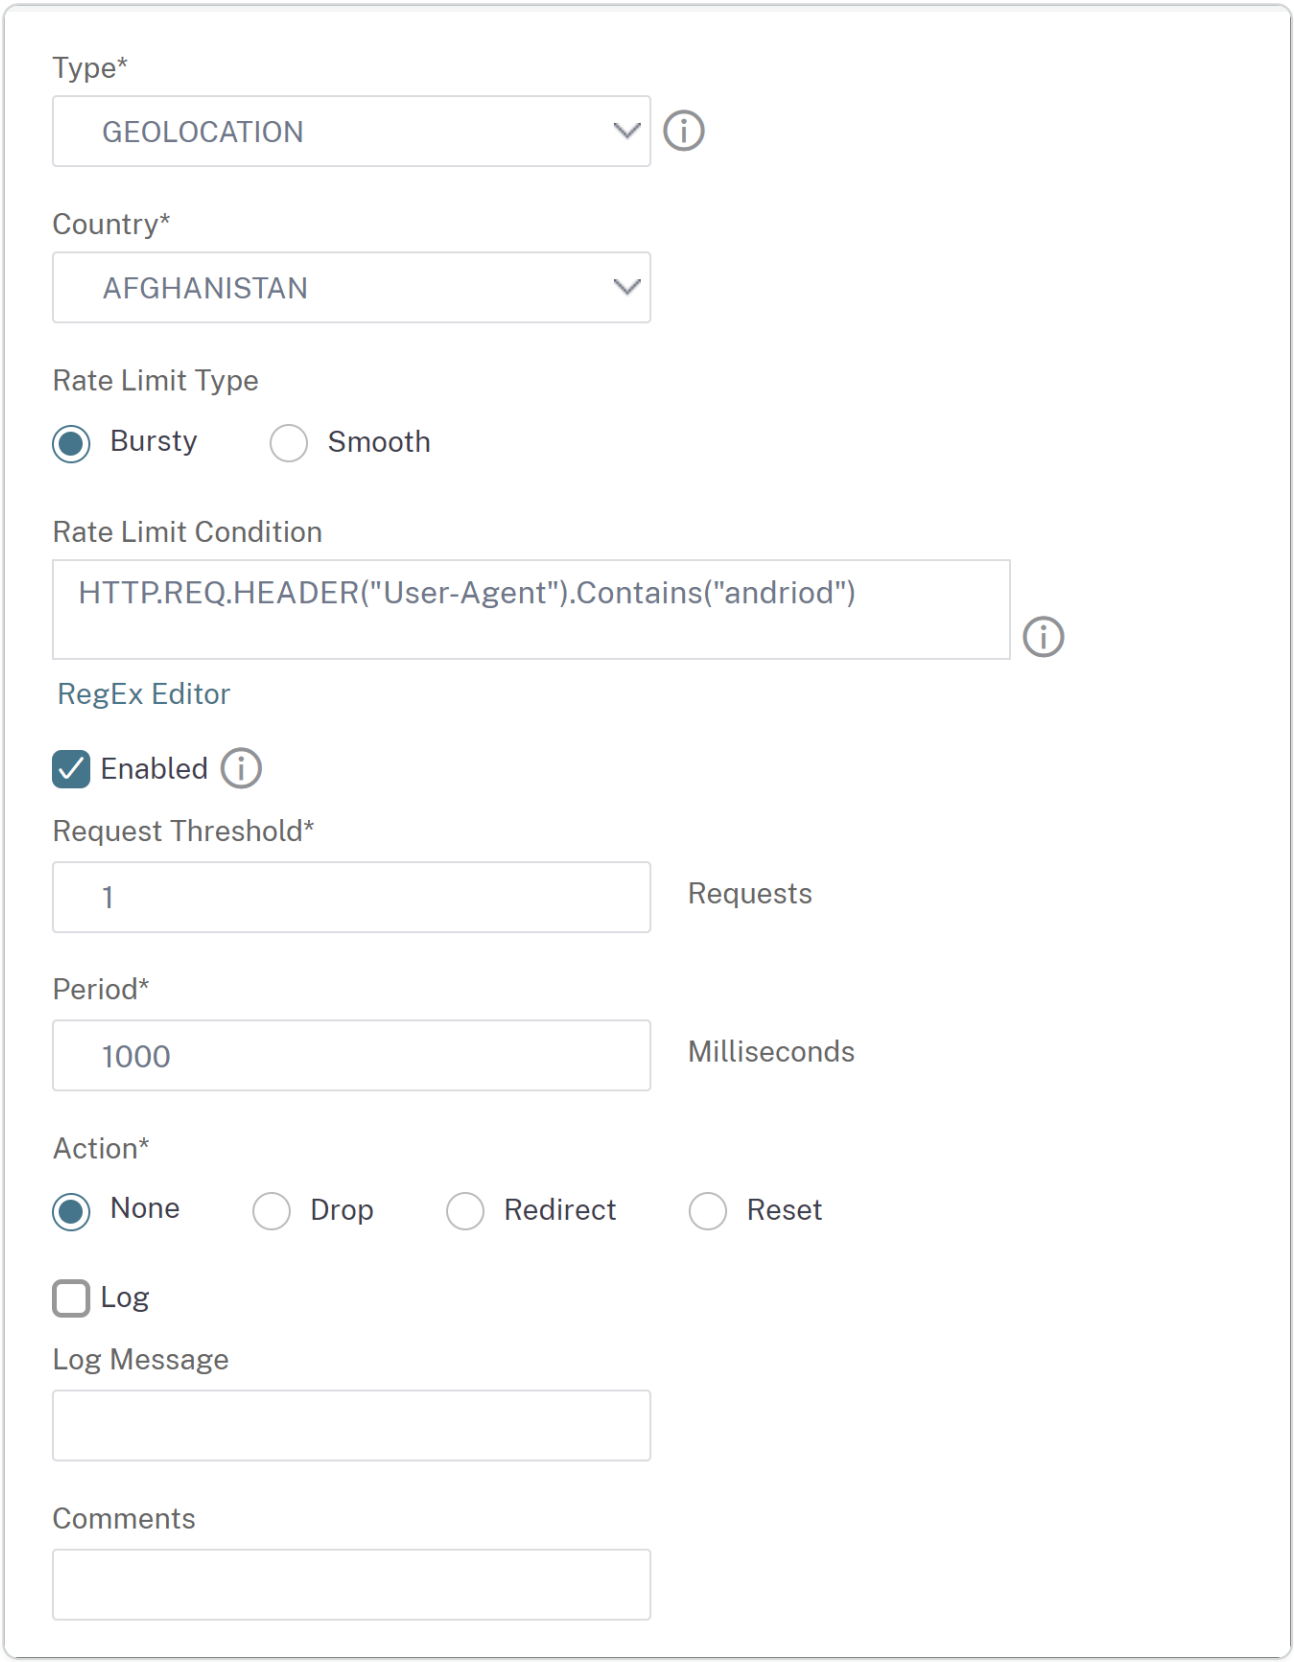
d. Rate Limit Connection - Allows you to create multiple rules for a condition.

e. Enabled - Select the checkbox to validate the incoming bot traffic.

f. Request Threshold - Maximum number of requests allowed within certain timeframe.

g. Period - Timeframe in milliseconds.

h. Action - Choose a bot action for the selected category.



i. Log - Select the checkbox to store log entries.

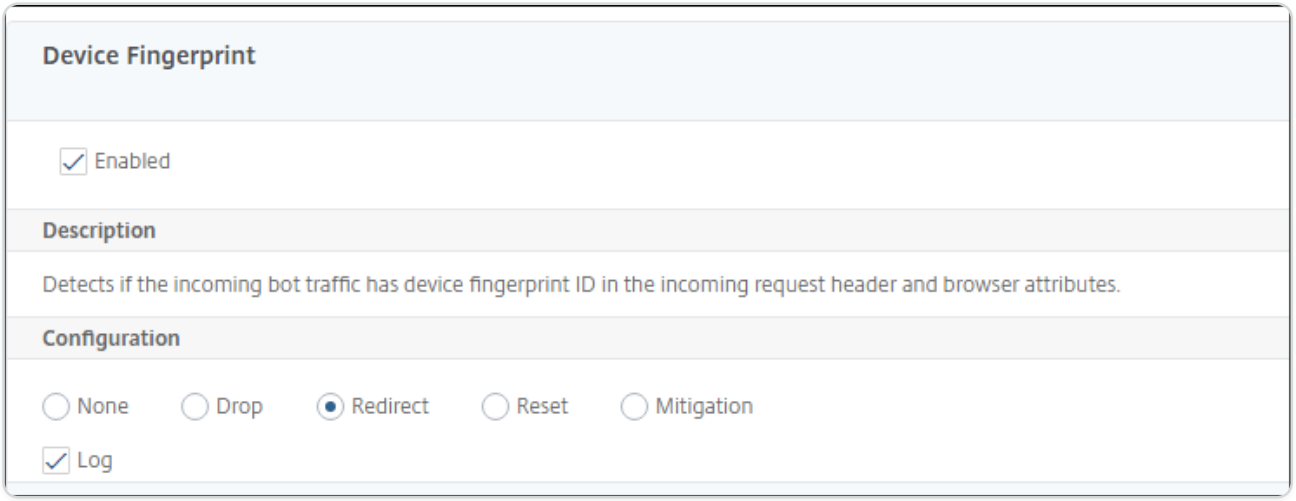
j. Log Message - Brief description of the log.

k. Comments - Brief description about the bot category.

6. Click **OK**.
7. Click **Update**.
8. Click **Done**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure device fingerprint technique by using NetScaler GUI



This detection technique sends a java script challenge to the client and extracts the device information. Based on device information, the technique drops or bypasses the bot traffic. Follow the steps to configure the detection technique.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. Navigate to **Security** > **NetScaler Bot Management** and **Profiles**.
2. On the **NetScaler Bot Management Profiles** page, select a signature file and click **Edit**.
3. On the **NetScaler Bot Management Profile** page, go to the **Signature Settings** section and click **Device Fingerprint**. In the **Device Fingerprint** section, set the following parameters:
   a. Enabled - Select to enable the rule.
   b. Configuration - Select one of the following options:
      i. None - Allows the traffic.
      ii. Drop - Drops the traffic.
      iii. Redirect - Redirects the traffic to error URL.
      iv. Mitigation, or CAPTCHA - Validates and allows the traffic.

> **NOTE:**
>
> During session replay attacks using the device fingerprint cookies, requests are dropped even if the device fingerprint configuration is set to **Mitigation**.

4. Click **Update**.
5. Click **Done**.

Configure device fingerprint technique for mobile (Android) applications

Device fingerprint technique detects an incoming traffic as a bot by inserting a JavaScript script in the HTML response to the client. The JavaScript script when invoked by the browser, it collects

© 1997–2026 Citrix Systems, Inc. All rights reserved.

browser and client attributes and sends a request to the appliance. The attributes are examined to determine whether the traffic is a Bot or a human.

The detection technique is further extended to detect bots on a mobile (Android) platform. Unlike web applications, in mobile (Android) traffic, bot detection based on JavaScript script do not apply. To detect bots in a mobile network, the technique uses a bot mobile SDK which is integrated with mobile applications on the client-side. The SDK intercepts the mobile traffic, collects device details, and sends the data to the appliance. On the appliance side, the detection technique examines the data and determines whether the connection is from a Bot or a human.

How the device fingerprint technique for the mobile application works

The following steps explain the bot detection workflow to detect if a request from a mobile device is from a human or a bot.

1. When a user interacts with a mobile application, the bot mobile SDK records the device's behavior.
2. Client sends a request to NetScaler appliance.
3. When sending the response, the appliance inserts a bot session cookie with session details, and parameters to collect client parameters.
4. When the mobile application receives the response, the NetScaler bot SDK which is integrated with the mobile application validates the response, retrieves the recorded device fingerprint parameters, and sends it to the appliance.
5. The device fingerprint detection technique on the appliance side validates the device details and updates the bot session cookie if it is a suspected bot or not.
6. When the cookie is expired or device fingerprint protection prefers to validate and collect device parameters periodically, the whole procedure or challenge is repeated.

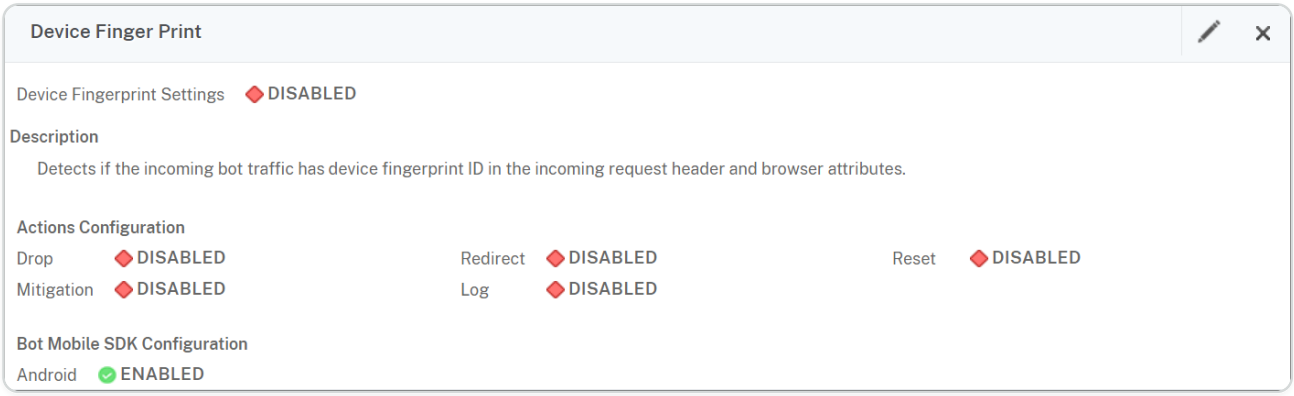
Pre-requisite

To get started with the NetScaler device fingerprint detection technique for mobile applications, you must download and install the bot mobile SDK in your mobile application.

Configure fingerprint detection technique for mobile (Android) applications by using the CLI

At the command prompt, type:

```
set bot profile <profile name> -deviceFingerprintMobile ( NONE | Android )
```



© 1997–2026 Citrix Systems, Inc. All rights reserved.

Example:

```
set bot profile profile 1 –deviceFingerprintMobile Android
```

Configure device fingerprint detection technique for mobile (Android) applications by using the GUI

1. Navigate to **Security** > **NetScaler Bot Management** and **Profiles**.
2. On the **NetScaler Bot Management Profiles** page, select a file and click **Edit**.
3. On the **NetScaler Bot Management Profile** page, click **Device Fingerprint** under **Profile Settings**.
4. In the **Configure Bot Mobile SDK** section, select the mobile client type.
5. Click **Update** and **Done**.

Configure bot log expression

If the client is identified as a bot, the NetScaler bot management enables you to capture additional information as log messages. The data can be the name of the user who requested the URL, the source IP address, and the source port from which the user sent the request or data generated from an expression. To perform custom logging, you must configure a log expression in the bot management profile.

Bind the log expression in the bot profile by using the CLI

At the command prompt, type:

```
bind bot profile <name> (-logExpression -name <string> -expression
<expression> [-enabled ( ON | OFF )]) -comment <string>
```

Example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
bind bot profile profile1 –logExpression exp1 –expression HTTP.REQ.URL –enabled ON -comment "testing log expression"
```

Bind log expression to bot profile by using the GUI

1. Navigate to **Security > NetScaler Bot Management > Profiles**.
2. On the **NetScaler Bot Management Profiles** page, select **Bot Log Expressions** from the **Profile Settings** section.
3. In the **Bot Log Expression Settings* section, click **Add**.
4. In the **Configure NetScaler Bot Management Profile Bot Log Expression Binding** page, set the following parameters.
    a. Log Expression Name. Name of the log expression.
    b. Expression. Enter the log expression.
    c. Enabled. Enable or disable the log expression binding.
    d. Comments. A brief description about the bot log expression binding.
5. Click**OK** and **Done**.

Configure bot trap technique

The NetScaler bot trap technique randomly or periodically inserts a trap URL in the server response. You can also create a trap URL list and add URLs for that The URL appears invisible and not accessible if the client is a human user. However, if the client is an automated bot, the URL is accessible and when accessed, the attacker is categorized as bot and any subsequent request from the bot is blocked. The trap technique is effective in blocking attacks from bots.

The trap URL is an alpha-numeric URL of configurable length and it is auto-generated at configurable interval. Also the technique allows you to configure a trap insertion URL for top visited websites or frequently visited websites. By doing this, you can mandate the purpose of inserting the bot trap URL for requests matching the trap insertion URL.

NOTE:

Although the bot trap URL is auto-generated, the NetScaler bot management still allows you to configure a customized trap URL in the bot profile. This is done to strengthen the bot detection technique and make it harder for attackers to access the trap URL.

To complete the bot trap configuration, you must complete the following steps.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. Enable bot trap URL
2. Configure bot trap URL in bot profile
3. Bind bot trap insertion URL to bot profile
4. Configure bot trap URL length and interval in bot settings

Enable bot trap URL protection

Before you can begin, you must ensure that the Bot trap URL protection is enabled on the appliance. At the command prompt, type:

```
enable ns feature Bot
```

Configure bot trap URL in bot profile

You can configure the bot trap URL and specify a trap action in the bot profile.

At the command prompt, type:

```
add bot profile <name> -trapURL <string> -trap ( ON | OFF ) -trapAction
<trapAction>
```

Where,

- `trapURL` is the URL that Bot protection uses as the Trap URL. Maximum Length: 127
- `trap` is to enable bot trap detection. Possible values: ON, OFF. Default value: OFF
- `trapAction` is an action to be taken based on bot detection. Possible values: NONE, LOG, DROP, REDIRECT, RESET, MITIGATION. Default value: NONE

Example:

```
add bot profile profile1 -trapURL www.bottrap1.com trap ON -trapAction RESET
```

Bind bot trap insertion URL to bot profile

You can configure the bot trap insertion URL and bind it to the bot profile. At the command prompt, type:

```
bind bot profile <profile_name> trapInsertionURL –url <url> -enabled ON|OFF
-comment <comment>
```

Where,

© 1997–2026 Citrix Systems, Inc. All rights reserved.

`URL` - The request URL regex pattern for which the bot trap URL is inserted. Maximum Length: 127

Example:

```
bind bot profile profile1 trapInsertionURL –url www.example.com –enabled ON –comment insert a trap URL randomly
```

Configure bot trap URL length and interval in bot settings

You can configure the bot trap URL length and also set the interval to auto generate the bot trap URL. At the command prompt, type:

```
set bot settings -trapURLAutoGenerate ( ON | OFF ) –trapURLInterval <positive_integer> -trapURLLength <positive_integer>
```

Where,

- `trapURLInterval` is the time in seconds after which the bot trap URL is updated. Default value: 3600, Minimum value: 300, Maximum value: 86400
- `trapURLLength`. Length of the auto-generated bot trap URL. Default value: 32, Minimum value: 10, Maximum value: 255

Example:

```
set bot settings -trapURLAutoGenerate ON –trapURLInterval 300 -trapURLLength 60
```

Configure bot trap URL by using the GUI

1. Navigate to **Security > NetScaler Bot Management > Profiles**.
2. In the **NetScaler Bot Management Profiles** page, click **Edit** to configure the bot trap URL technique.
3. In the **Create NetScaler Bot Management Profile** page, enter the bot trap URL in the general section.
4. In the **NetScaler Bot Management Profile** page, click **Bot Trap** from **Profile Settings**.
5. In the **Bot Trap** section, set the following parameters.
    a. Enabled. Select the checkbox to enable bot trap detection
    b. Description. Brief description about the URL.
    c. In the Configure Action section, set the following parameters.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

d. Action. Action to be taken for bot detected by bot trap access.

e. Log. Enable or disable logging for bot trap binding.

6. In the **Configure Trap Insertion URLs** section, click **Add**.
7. In the **Configure NetScaler Bot Management Profile Bot Trap Binding** page, set the following parameters.

   a. Trap URL. Type the URL that you want to confirm as the bot trap insertion URL.

   b. Enabled. Enable or disable bot trap insertion URL.

   c. Comment. A brief description about the trap insertion URL.

8. Click **Update** and **Done**.

Configure bot trap URL settings

Complete the following steps to configure bot trap URL settings:

1. Navigate to **Security > NetScaler Bot Management**.
2. In the details pane, under **Settings** click **Change NetScaler Bot Management Settings**.
3. In the **Configure NetScaler Bot Management Settings**, set the following parameters.

   a. Trap URL Interval. Time in seconds after which the bot trap URL is updated.

   b. Trap URL Length. Length of the auto-generated bot trap URL.

4. Click **OK** and **Done**.

Client IP policy expression for bot detection

The NetScaler bot management now enables you to configure an advanced policy expression to extract the client IP address from an HTTP request header, HTTP request body, HTTP request URL, or using an advanced policy expression. The extracted values are used by a bot detection mechanism (such as TPS, bot trap, or rate limit) to detect if the incoming request is a bot.

NOTE:

If you have not configured a client IP expression, the default or existing source client IP address is used for bot detection. If an expression is configured, then the evaluation result provides the client IP address that can be used for bot detection.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

You can configure and use the client IP expression to extract the actual client IP address if the incoming request is coming through a proxy server and if the client IP address is present in the header. By adding this configuration, the appliance can use the bot detection mechanism in providing more security to software clients and servers.

Configure client IP policy expression in bot profile by using the CLI

At the command prompt, type:

```
add bot profile <name> [-clientIPExpression <expression>]
```

Example:

```
add bot profile profile1 –clientIPExpression 'HTTP.REQ.HEADER("X-Forwarded-For")
ALT CLIENT.IP.SRC.TYPECAST_TEXT_T'
```

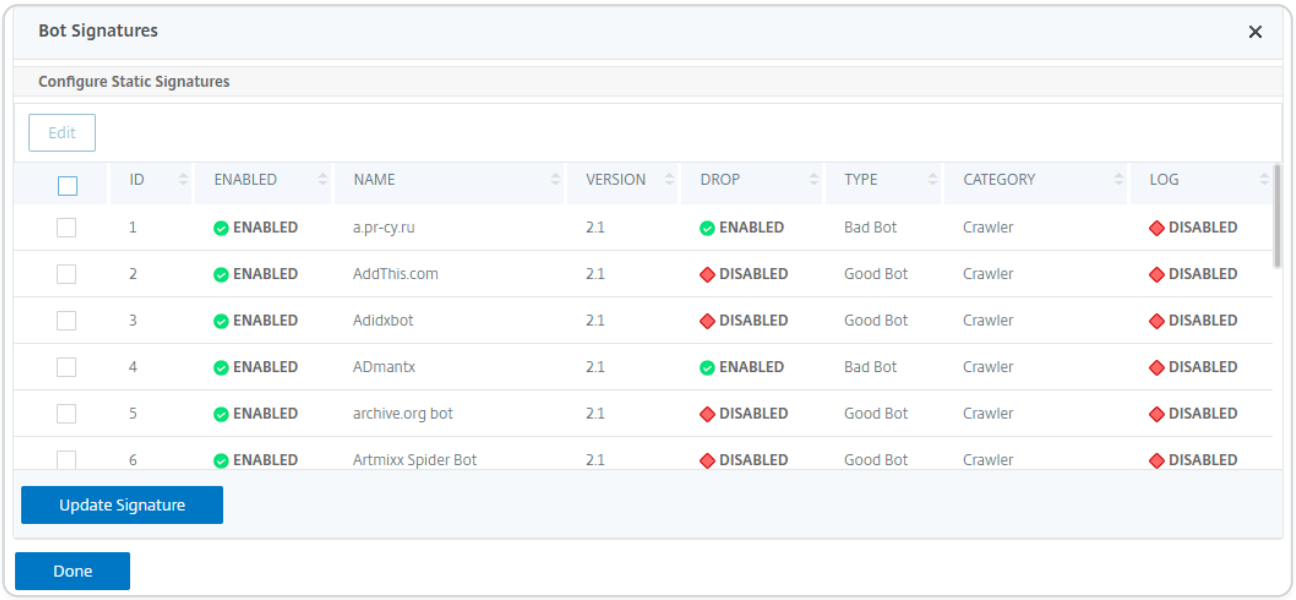
```
add bot profile profile1 –clientIPExpression 'HTTP.REQ.HEADER("X-Forwarded-For")
ALT CLIENT.IPv6.SRC.TYPECAST_TEXT_T'
```

Configure client IP policy expression in bot profile by using the GUI

1. Navigate to **Security > NetScaler Bot Management > Profiles**.
2. In the details pane, click **Add**.
3. In the **Create NetScaler Bot Management Profile** page, set the Client IP Expression.
4. Click **Create** and **Close**.

Configure CAPTCHA for IP reputation and device fingerprint detection

CAPTCHA is an acronym that stands for "Completely Automated Public Turing test to tell Computers and Humans Apart". CAPTCHA is designed to test if an incoming traffic is from a human user or an automated bot. CAPTCHA helps to block automated bots that cause security violations to web applications. In the NetScaler, CAPTCHA uses the challenge-response module to identify if the incoming traffic is from a human user and not an automated bot.



Configure bot static signatures

This detection technique enables you to identify the user agent info from the browser details. Based on user agent information, the bot is identified as a bad or a good bot and then you assign a bot action to it.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Perform the following the steps to configure the static signature technique:

1. On the navigation pane, expand **Security > NetScaler Bot Management > Signatures**.
2. On the **NetScaler Bot Management Signatures** page, select a signature file and click **Edit**.
3. On the **NetScaler Bot Management Signature** page, go to the **Signature Settings** section and click **Bot Signatures**.
4. In the **Bot Signatures** section, set the following parameters:
    a. Configure Static Signatures. This section has a list of bot static signature records. You can select a record and click **Edit** to assign a bot action to it.
    b. Click **OK**.
5. Click **Update Signature**.
6. Click **Done**.

Bot static signature delineation

NetScaler bot management protects your web application against bots. Bot static signatures help in identifying good and bad bots based on request parameters such as user-agent in the incoming request.

The list of signatures in the file is huge and also new rules get added and stale ones are removed periodically. As an administrator, you might want to search for a specific signature or list of signatures under a category. To filter signatures easily, the bot signature page provides an enhanced search capability. The search function enables you to find signature rules and configure

© 1997–2026 Citrix Systems, Inc. All rights reserved.

its property based on one or more signature parameters like action, signature ID, developer, and signature name.

Action - Select a bot action that you prefer to configure for a specific category of signature rules. Following are the available action types:

- Enable Selected - Enable all the selected signature rules.
- Disable Selected - Disable all the selected signatures rules.
- Drop Selected - Select the "Drop" action to all the selected signature rules.
- Redirect Selected - Apply the "Redirect" action to all the selected signature rules.
- Reset Selected - Apply the "Reset" action to all the selected signature rules.
- Log Selected - Apply the "Log" action to all the selected signature rules.
- Remove Drop Selected - Unset the drop action to all the selected signature rules.
- Remove Redirect Selected - Unset the redirect action to all the selected signature rules.
- Remove Reset Selected - Unset the reset action to all the selected signature rules.
- Remove Log Selected - Unset the log action to all the selected signature rules.

Category - Select a category to filter signature rules accordingly. Following is the list of categories that are available for sorting signature rules.

- Action - Sort based on bot action.
- Category - Sort based on bot category.
- Developer - Sort based on the host company publisher.
- Enabled - Sort based on signature rules that are enabled.
- Id - Sort based on signature rule ID.
- Log - Sort based on signature rules that have logging enabled.
- Name - Sort based on signature rule name.
- Type - Sort based on signature type.
- Version - Sort based on signature rule version.

Search bot static signature rules based on action and category types by using the NetScaler GUI

1. Navigate to **Security > NetScaler Bot Management > Signature**.
2. In the details page, click **Add**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. In the **NetScaler Bot Management Signatures** page, click edit in the **Static Signature** section.
4. In the **Configure Static Signature** section, select a signature action from the drop-down list.
5. Use the search function to select a category and filter the rules accordingly.
6. Click **Update**.

Edit the bot static signature rule property by using the NetScaler GUI

1. Navigate to **Security > NetScaler Bot Management > Signature**.
2. In the details page, click **Add**.
3. In the **NetScaler Bot Management Signatures** page, click edit in the **Static Signature** section.
4. In the **Configure Static Signature** section, select an action from the drop-down list.
5. Use the search function to select a category and filter the rules accordingly.
6. From the static signature list, select a signature to modify its property.
7. Click **OK** to confirm.

How CAPTCHA works in NetScaler bot management

In NetScaler bot management, CAPTCHA validation is configured as a policy action to be run after bot policy is evaluated. The CAPTCHA action is available only for IP reputation and device fingerprint detection techniques. Following are the steps to understand how CAPTCHA works:

1. If a security violation is observed during IP reputation or device fingerprint bot detection, the ADC appliance sends a CAPTCHA challenge.
2. The client sends the CAPTCHA response.
3. The appliance validates the CAPTCHA response and if the CAPTCHA is valid, the request is allowed and it is forwarded to the back-end server.
4. If the CATCHA response is invalid, the appliance sends a new CAPTCHA challenge until the maximum number of attempts is reached.
5. If the CAPTCHA response is invalid even after the maximum number of attempts, the appliance drops or redirects the request to the configured error URL.
6. If you have configured log action, then the appliance stores the request details in the ns.log file.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure CAPTCHA settings by using the NetScaler GUI

The bot management CAPTCHA action is supported only for IP reputation and device fingerprint detection techniques. Complete the following steps to configure the **CAPTCHA** settings.

1. Navigate to **Security > NetScaler Bot Management and Profiles**.
2. On the **NetScaler Bot Management Profiles** page, select a profile and click **Edit**.
3. On the **NetScaler Bot Management Profile** page, go to the **Profile Settings** section and click **CAPTCHA**.
4. In the **CAPTCHA Settings** section, click **Add to configure CAPTCHA** settings to the profile:
5. In the **Configure NetScaler Bot Management CAPTCHA** page, set the following parameters.
    a. URL. Bot URL for which the CAPTCHA action is applied during IP reputation and device fingerprint detection techniques.
    b. Enabled. Set this option to enable CAPTCHA support.
    c. Grace time. Duration until when no new CAPTCHA challenge is sent after the current valid CAPTCHA response is received.
    d. Wait time. Duration taken for the ADC appliance to wait until the client sends the CAPTCHA response.
    e. Mute Period. Duration for which the client which sent an incorrect CAPTCHA response must wait until allowed to try next. During this mute period, the ADC appliance does not allow any requests. Range: 60–900 seconds, Recommended: 300 seconds
    f. Request Length limit. Length of the request for which the CAPTCHA challenge is sent to the client. If the length is greater than the threshold value, the request is dropped. Default value is 10–3000 bytes.
    g. Retry Attempts. Number of attempts the client is allowed to retry to solve the CAPTCHA challenge. Range: 1–10, Recommended: 5.
    h. No Action/Drop/Redirect action to be taken if the client fails the CAPTCHA validation.
    i. Log. Set this option to store request information from the client when response CAPTCHA fails. The data is stored in `ns.log` file.
    j. Comment. A brief description about the CAPTCHA configuration.
6. Click **OK** and **Done**.
7. Navigate to **Security > NetScaler Bot Management > Signatures**.
8. On the **NetScaler Bot Management Signatures** page, select a signature file and click **Edit**.

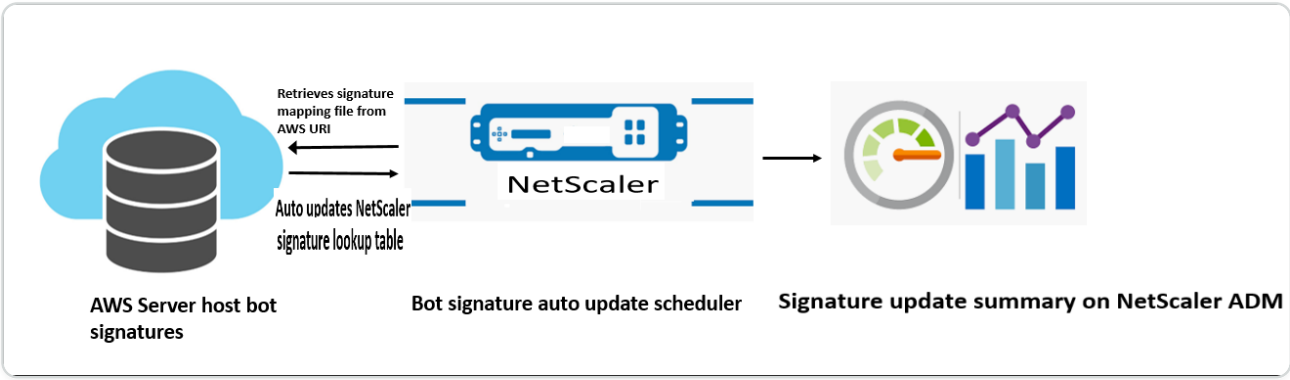
© 1997–2026 Citrix Systems, Inc. All rights reserved.

9. On the **NetScaler Bot Management Signature** page, go to the **Signature Settings** section and click **Bot Signatures**.
10. In the **Bot Signatures** section, set the following parameters:
11. Configure **Static Signatures**. Select a bot static signature record and click Edit to assign a bot action to it.
12. Click **OK**.
13. Click **Update Signature**.
14. Click **Done**.

Auto update for bot signatures

The bot static signature technique uses a signature lookup table with a list of good bots and bad bots. The bots are categorized based on user-agent string and domain names. If the user-agent string and domain name in incoming bot traffic matches a value in the lookup table, a configured bot action is applied. The bot signature updates are hosted on the AWS cloud and the signature lookup table communicates with the AWS database for signature updates. The auto signature update scheduler runs every 1-hour to check the **AWS database** and updates the signature table in the NetScaler appliance.

The signature auto update URL to configure is, `https://nsbotsignatures.s3.amazonaws.com/BotSignatureMapping.json`



NOTE:

You can also configure a proxy server and periodically update signatures from the AWS cloud to the appliance through the proxy. For proxy configuration, you must set the proxy IP address and port address in the bot settings.

How bot signature auto update works

The following diagram shows how the bot signatures are retrieved from the AWS cloud, updated on NetScaler, and viewed on NetScaler Console for signature update summary.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The bot signature auto-update scheduler does the following:

1. Retrieves the mapping file from the AWS URI.
2. Checks the latest signatures in the mapping file with the existing signatures in the ADC appliance.
3. Downloads the new signatures from AWS and verifies the signature integrity.
4. Updates the existing bot signatures with the new signatures in the bot signature file.
5. Generates an SNMP alert and sends the signature update summary to NetScaler Console.

Configure bot signature auto update

For configuring bot signature auto update, complete the following steps:

Enable bot signature auto update

You must enable the auto update option in the bot settings on the ADC appliance. At the command prompt, type:

```
set bot settings –signatureAutoUpdate ON
```

Configure proxy server settings (optional)

If you are accessing the AWS signature database through a proxy server, you must configure the proxy server and port. `set bot settings –proxyserver –proxyport`

Example:

```
set bot settings –proxy server 1.1.1.1 –proxyport 1356
```

Configure bot signature auto update using the NetScaler GUI

Complete the following steps to configure bot signature auto update:

1. Navigate to **Security > NetScaler Bot Management**.
2. In the details pane, under **Settings** click **Change NetScaler Bot Management Settings**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. In the **Configure NetScaler Bot Management Settings**, select the **Auto Update Signature** checkbox.
4. Click **OK** and **Close**.

Create bot management profile

A bot profile is a collection of bot management settings that are used for detecting the bot type. In a profile, you determine how the Web App Firewall applies each of its filters (or checks) to bot traffic to your websites, and responses from them.

Complete the following steps to configure the bot profile:

1. Navigate to **Security** > **NetScaler Bot Management** > **Profiles**.
2. In the details pane, click **Add**.
3. In the **Create NetScaler Bot Management Profile** page, set the following parameters.
    a. Name. Bot profile name.
    b. Signature. Name of the bot signature file.
    c. Error URL. URL for redirects.
    d. Comment. Brief description about the profile.
4. Click **Create** and **Close**.

Create bot policy

The bot policy controls the traffic going to the bot management system and also to control the bot logs sent to the auditlog server. Follow the procedure to configure the bot policy.

1. Navigate to **Security** > **NetScaler Bot Management** > **Bot Policies**.
2. In the details pane, click **Add**.
3. In the **Create NetScaler Bot Management Policy** page, set the following parameters.
    a. Name. Name of the Bot policy.
    b. Expression. Type the policy expression or rule directly in the text area.
    c. Bot Profile. Bot profile to apply the bot policy.
    d. Undefined Action. Select an action that you prefer to assign.
    e. Comment. Brief description about the policy.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

f. Log Action. Audit log message action for logging bot traffic. For more information about audit log action, see Audit logging topic.

4. Click **Create** and **Close**.

Bot Transactions Per second (TPS)

The Transactions Per Second (TPS) bot technique detects incoming traffic as a bot if the number of requests per second (RPS) and percentage increase in RPS exceeds the configured threshold value. The detection technique protects your web applications from automated bots that can cause web scraping activities, brute forcing login, and other malicious attacks.

NOTE:

The bot technique detects an incoming traffic as bot only if both the parameters are configured and if both values increase beyond the threshold limit. Let us consider a scenario, where the appliance receives many requests coming from a specific URL and you want the NetScaler bot management to detect if there is a bot attack. The TPS detection technique examines the number of requests (configured value) coming from the URL within 1 second and the percentage increase (configured value) in the number of requests received within 30 minutes. If the values exceed the threshold limit, the traffic is considered as bot and the appliance runs the configured action.

Configure bot transactions per second (TPS) technique

To configure TPS, you must complete the following steps:

1. Enable bot TPS
2. Bind TPS settings to bot management profile

Bind TPS settings to bot management profile

Once you enable the bot TPS feature, you must bind the TPS settings to the bot management profile.

At the command prompt, type:

```
bind bot profile <name>… (-tps [-type ( SourceIP | GeoLocation | RequestURL | Host )] [-threshold <positive_integer>] [-percentage <positive_integer>] [-action ( none | log | drop | redirect | reset | mitigation )] [-logMessage <string>])
```

Example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
bind bot profile profile1 -tps -type RequestURL -threshold 1 -percentage 100000 -action drop -logMessage log
```

Enable bot transaction per second (TPS)

Before you can begin, you must ensure that the Bot TPS feature is enabled on the appliance. At the command prompt, type:

```
set bot profile profile1 –enableTPS ON
```

Configure bot transactions per second (TPS) by using the NetScaler GUI

Complete the following steps to configure bot transactions per second:

1. Navigate to **Security > NetScaler Bot Management > Profiles**.
2. In the **NetScaler Bot Management Profiles** page, select a profile and click **Edit**.
3. In the **Create NetScaler Bot Management Profile** page, click **TPS** under **Signature Settings** section.
4. In the **TPS** section, enable the feature and click **Add**.
5. In **Configure NetScaler bot Management Profile TPS Binding** page, set the following parameters.
    a. Type - Select any one of the following type:

        SOURCE_IP – TPS based on client IP address.

        GEOLOCATION – TPS based on the client's geographic location.

        HOST - TPS based on client requests forwarded to a specific back-end server IP address.

        URL – TPS based on client requests coming from a specific URL.

    b. Fixed Threshold - Maximum number of requests allowed from a TPS input type within 1 second time interval.
    c. Percentage Threshold - Maximum percentage increase in requests from a TPS input type within 30 minute time interval.
    d. Action - Action to be taken for bot detected by TPS binding.
    e. Log - Enable or disable logging for TPS binding.
    f. Log Message. Message to log for bot detected by TPS binding. Maximum Length: 255.
    g. Comments - A brief description about the TPS configuration. Maximum Length: 255
6. Click **OK** and then **Close**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Bot detection based on mouse and keyboard dynamics

To detect bots and mitigate web scraping anomalies, the NetScaler bot management uses an enhanced bot detection technique based on mouse and keyboard behavior. Unlike conventional bot techniques that require direct human interaction (for example, CAPTCHA validation), the enhanced technique passively monitors the mouse and the keyboard dynamics. The NetScaler appliance then collects the real-time user data and analyses the behavioral between a human and a bot.

The passive bot detection using mouse and keyboard dynamics has the following benefits over existing bot detection mechanisms:

- Provides continuous monitoring throughout the user session, and eliminates single checkpoint.
- Requires no human interaction and it is transparent to users.

How bot detection using mouse and keyboard dynamics works

The bot detection technique using keyboard and mouse dynamics consists of two components, a webpage logger and bot detector. The webpage logger is a JavaScript that records keyboard and mouse movements when a user is performing a task on the webpage (for example, filling a registration form). The logger then sends the data in batches to the NetScaler appliance. The appliance then stores the data as a KM record and sends it to the bot detector on the NetScaler Console server, which analyses if the user is a human or bot.

The following steps explain how the components interact with each other:

1. The NetScaler admin configures policy expression through the ADM StyleBook, CLI, or NITRO or any other method.
2. The URL is set in the bot profile when the admin enables the feature on the appliance.
3. When a client sends a request, the NetScaler appliance tracks the session and all requests in the session.
4. The appliance inserts a JavaScript (webpage logger) in the response if the request matches the configured expression on the bot profile.
5. The JavaScript then collects all the keyboard, mouse activity and sends the KM data in a POST URL (transient).
6. The NetScaler appliance stores the data and sends it to the NetScaler Console server at the end of the session. Once the appliance receives the complete data of a POST request, the data is sent it to the ADM server.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

7. The NetScaler Console Service analyses the data and based on the analysis, the result is available on the NetScaler Console service GUI.

The JavaScript logger records the following mouse and keyboard movements:

- Keyboard events – all events
- Mouse events - mouse move, mouse up, mouse down
- Clipboard events - paste
- Custom events - autofill, autofill cancel
- timestamp of each event

Configure bot detection using mouse and keyboard dynamics

The NetScaler bot management configuration includes enabling or disabling the keyboard and mouse-based detection feature, and configures the JavaScript URL in the bot profile. Complete the following steps to configure bot detection using mouse and keyboard dynamics:

1. Enable keyboard and mouse-based detection
2. Configure expression to decide when the JavaScript can be injected in the HTTP response

Enable keyboard mouse-based bot detection

Before you begin the configuration, ensure you have enabled the keyboard and mouse-based bot detection feature on the appliance.

At the command prompt, type:

```
add bot profile <name> -KMDetection ( ON | OFF )
```

Example:

```
add bot profile profile1 –KMDetection ON
```

Configure bot expression for JavaScript insertion

Configure bot expression to evaluate the traffic and insert JavaScript. The JavaScript is inserted only if the expression is evaluated as true.

At the command prompt, type:

```
bind bot profile <name> -KMDetectionExpr -name <string> -expression
<expression> -enabled ( ON | OFF ) –comment <string>
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Example:

```
bind bot profile profile1 -KMDetectionExpr -name test -expression
http.req.url.startswith("/testsite") -enabled ON
```

Configure JavaScript file name inserted in the HTTP response for keyboard-mouse based bot detection

To collect the user action details, the appliance sends a JavaScript file name in the HTTP response. The JavaScript file collects all the data in a KM record and sends it to the appliance.

At the command prompt, type:

```
set bot profile profile1 – KMJavaScriptName <string>
```

Example:

```
set bot profile profile1 –KMJavaScriptName script1
```

Configure behavior biometrics size

You can configure the maximum size of mouse and keyboard behavior data that can be sent as KM record to the appliance and processed by the ADM server.

At the command prompt, type:

```
set bot profile profile1 -KMEventsPostBodyLimit <positive_integer>
```

Example:

```
set bot profile profile1 – KMEventsPostBodyLimit 25
```

After you have configured the NetScaler appliance to configure the JavaScript and collect keyboard and mouse behavior biometrics, the appliance sends the data to the NetScaler Console server. For more information on how the NetScaler Console server detects bots from behavior biometrics, see Bot Violations topic.

Configure keyboard and mouse bot expression settings by using the GUI

1. Navigate to **Security > NetScaler Bot Management and Profiles**.
2. On the **NetScaler Bot Management Profiles** page, select a profile and click **Edit**.
3. On the **NetScaler Bot Management Profile** page, click edit icon.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. In the **Basic Setting**, under **Keyboard and mouse based bot detection** section, set the following parameters:

    a. Enable detection. Select the checkbox to detect the bot based keyboard and mouse dynamics behavior.

    b. Event post body limit. Size of the keyboard and mouse dynamics data sent by the browser to be processed by the NetScaler appliance.

5. Click **OK**.
6. On the **NetScaler bot Management Profile** page, go to the **Profile Settings** section and click **Keyboard and Mouse Based Bot Expression Settings**.
7. In the **Keyboard and Mouse Based Bot Expression Settings** section, click **Add**.
8. In the **Configure NetScaler bot Management Profile Bot Keyboard and Mouse Expression Binding** page, set the following parameters:

    a. Expression Name. Name of the bot policy expression for detection keyboard and mouse dynamics.

    b. Expression. Bot policy expression.

    c. Enabled. Select the checkbox to enable the keyboard and bot keyboard and mouse expression binding.

    d. Comments. A brief description about the bot policy expression and its binding to the bot profile.

    e. Click **OK** and **Close**.

9. In the **Keyboard and Mouse Based Bot Expression Settings** section, Click **Update**.

Verbose logging for bot traffic

When an incoming request is identified as a bot, the NetScaler appliance logs more HTTP header details for monitoring and troubleshooting. The bot verbose logging capability is similar to the verbose logging in the Web App Firewall module.

Consider an incoming traffic from a client. If the client is identified as a bot, the NetScaler appliance uses the verbose logging functionality to log full HTTP header information such as domain address, URL, user-agent header, cookie header. The log details are then sent to the ADM server for monitoring and troubleshooting the purpose. The verbose log message is not stored in the "ns.log" file.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure bot verbose logging by using the CLI

To capture detailed HTTP header information as logs, you can configure the verbose logging parameter in the bot profile. At the command prompt, type:

```
set bot profile <name> [-verboseLogLevel ( NONE | HTTP_FULL_HEADER ) ]
```

Example:

```
set bot profile p1 –verboseLogLevel HTTP_FULL_HEADER
```

Configure bot verbose logging by using the NetScaler GUI

Follow the procedure to configure the verbose log level in the bot profile.

1. On the navigation pane, navigate to **Security > NetScaler Bot Management**.
2. In the **NetScaler Bot Management Profiles** page, click **Add**.
3. In the **Create NetScaler Bot Management Profile** page, select verbose log level as **HTTP Full Header**.
4. Click **OK** and **Done**.

Configure an action for spoofed bot requests

An attacker might attempt to impersonate a good bot and send requests to your application server. Such bots are identified as spoofed bots using the bot signature. Configure the following actions against spoofed bots to protect your application server:

- DROP
- NONE
- REDIRECT
- RESET

Configure an action for spoofed bot requests using CLI

Run the following command to configure an action for spoofed bot requests:

```
set bot profile <bot-profile-name> -spoofedReqAction <action> LOG
```

Example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
set bot profile bot_profile -spoofedReqAction DROP LOG
```

In this example, the requests from spoofed bots are dropped and logged in a NetScaler appliance.

TIP

To log events from the spoofed bots, specify `LOG` in the command.

Configure an action for spoofed bot requests using GUI

Follow the steps to configure an action for the spoofed bot requests:

1. Navigate to **Security > NetScaler Bot Management**.
2. In the **NetScaler Bot Management Profiles** page, click **Add**.
3. Select an action from the **Spoofed Request Action** list.
4. Select **Log Spoofed Request**.

   This action logs the events from spoofed bots.
5. Click **Create**.

Request headers dropped by the NetScaler bot Management

Many of the request headers related to caching is dropped to view every request within the context of a session. Similarly, if the request includes an encoding header to allow the web server to send compressed responses, the bot management deletes this header so that the contents in the uncompressed server response is inspected by the bot management to insert the JavaScript.

The bot management drops the following request headers:

Range - Used to recover from a failed or partial file transfers.

If-Range - Allows a client to retrieve a partial object when it contains a part of that object in its cache already (conditional GET).

If-Modified-Since - If the requested object is not modified since the time specified in this field, an entity is not returned from the server. You get an HTTP 304 not modified error.

If-None-Match - Allows efficient updates of cached information with a minimum amount of overhead.

Accept-Encoding - What encoding methods are allowed for a particular object, such as gzip.

Bot Management

Following are some of the troubleshooting scenarios covered in NetScaler bot management.

1. How to handle false positive cases?

   You can use the bot allow list functionality to manage false positive cases and these transactions can be bypassed.

2. How to find more details about bad bot traffic?

   You can use the audit logging functionality to get details about the traffic classified as bad bots.

3. Why should you change the default signature name?

   You can change the default signature name if there are conflicts detected at the end point resources served by the NetScaler appliance.

Bot Management

1. What is NetScaler bot management?

   NetScaler bot management detects and distinguishes traffic from good bots, bad bots, and human clients. The bot management functionality protects your web applications from bad bots by applying a configured action on incoming requests.

2. Why NetScaler must manage bots for your web application?

   Malicious bots constitute 30% of your internet traffic. Malicious bots impact web applications in various ways such as initiating a DoS attack, spamming email addresses, slowing down the application using downloader programs, downloading the content from websites and so forth. In addition, bots can easily bypass some of the well known detection mechanisms leading to loss of data, revenue, and reputation to your organization.

3. What are the techniques used for detecting an incoming bot?

   The appliance uses detection techniques such as IP reputation, rate limiting, device fingerprinting, TPS, and Bot trap detection techniques. In addition, you can configure a customized block list on the NetScaler GUI to categorize organization specific bad bots.

4. What is a bot signature file and its purpose?

   The bot signature file contains the footprint of known good and bad bots. The signature file is updated periodically to include the latest bot signatures for better bot protection.

5. What type of NetScaler license must I purchase?

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Bot management is available with the ADC Premium license.

6. Where can I find bot logs for troubleshooting?

   NetScaler audit logs provide detected bot details. For more information, see Audit Logging topic.

7. Is there an auto update functionality for the bot signature files?

   Yes, NetScaler bot management supports auto update functionality.

8. Is there a pre-requisite for using the bot IP reputation technique?

   Enable the IP reputation feature before enabling and configuring the IP reputation in the bot profile.

Bot signature auto update

The Bot signature auto update functionality enables you to get the latest signatures that provide better protection and traffic management from both good and bad bots.

The signatures are auto updated on an hourly basis thereby, eliminating the need to constantly check for the availability of the most recent update. If you have enabled the Signature Auto Update functionality, NetScaler connects to the server hosting the signatures to check if a newer version is available.

The latest bot signatures hosted on the Amazon cloud are configured as the default Signature URL to check for the latest update. For the auto update feature to work, you must also configure the DNS server to access the external site.

Update signatures

All the user defined signature objects that are created using the bot default signature object have a version greater than zero. If you enable Signature Auto Update, all signatures are updated automatically. You can update the default action for bot signatures either by selecting a signature or a group of signatures using the search functionality on the NetScaler bot management GUI.

NOTES:

Signatures are updated every one hour. For details regarding a specific signature, refer to its associated alert article.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Bot signature update URL: `https://nsbotsignatures.s3.amazonaws.com/BotSignatureMapping.json`

Configure the signature auto update

To enable the Signature Auto Update feature, you must run the following command:

At the command prompt, type:

```
set bot settings SignatureAutoUpdate ON
```

Update the signature manually

To manually update a zero version signature or any other user-defined signature, you must first get the latest update for the default signatures and then use this for updating the target user-defined signature. Ensure your NetScaler® can connect to the local server.

1. Download bot signature files to a local server.
2. From the NetScaler GUI, update the `Signature Auto Update URL` in the `Configure NetScaler Bot Management Settings` page to point to the local server hosting the bot signature files.

Update a signature file using the CLI

Run the following commands from the CLI :

```
```

update appfw signatures "*Default Signatures"

update appfw signatures Cenzic –mergedefault

```
```

Where Cenzic is the name of the signature file.

NOTES:

`Default Signatures` is case sensitive.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Update the signature file using the GUI

Ensure that the client machine accessing the NetScaler GUI has internet connectivity. Also, the client machine must be able to connect to the SNIP of the NetScaler, where it pushes the signature files for the update.

Perform the following steps:

1. Navigate to **Security > NetScaler Bot Management > NetScaler Bot Management Signatures**.
2. Click **Update Version**.

Import default signatures without internet access

It is recommended to configure a proxy server to point to the Amazon (AWS) server to get the latest updates. However, if NetScaler does not have an internet connection to the external sites, then the user can store the updated BOT signature files on a local server. NetScaler can then download the signatures from the local server. In this scenario, the user must constantly check the **Amazon site** to get the latest updates. You can download and verify the signature file against the corresponding sha1 file which was created by using the **Citrix public** key to protect against tampering.

To copy the Signature files to a local server, complete the following procedure:

1. Create a local directory such as `<MySignatures>` on a local server.
2. Open the AWS site.
3. Copy the `BotSignaturesMapping.json file` file to the `<MySignatures>` folder.

   If you open the `BotSignaturesMapping.json file` file, you can see all the json files for signatures and their corresponding digest files for different supported versions. One such pair is highlighted the following image.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
{
    "CopyRight": "Copyright 2024 Citrix Systems, Inc. All rights reserved.",
    "Date": "2024/09/12 11:20:15",
    "BotSignatures": [
        {
            "release": "14.1",
            "build": 0,
            "version": 19,
            "schema_version": 2,
            "file": "botsigs/sig-r14.1b0v19s2",
            "digest": "botsigs/sig-r14.1b0v19s2.digest"
        },
        {
            "release": "13.1",
            "build": 0,
            "version": 19,
            "schema_version": 2,
            "file": "botsigs/sig-r13.1b0v19s2",
            "digest": "botsigs/sig-r13.1b0v19s2.digest"
        },
        {
            "release": "13.0",
            "build": 76.31,
            "version": 19,
            "schema_version": 2,
            "file": "botsigs/sig-r13.0b76.31v19s2",
            "digest": "botsigs/sig-r13.0b76.31v19s2.digest"
        }
    ]
}
```

4. Create a subdirectory `<botsigs>` in the `<MySignatures>` folder.
5. Copy all pairs of the `files listed in the <file>` attribute and the `digest` files listed in the corresponding `digest` attribute of the `BotSignaturesMapping.json` file to the `<botsigs>` folder. The following are a few sample files that is copied to the `<botsigs>` folder:

   ```
   https://nsbotsignatures.s3.amazonaws.com/BotSignatureMapping.json

   https://nsbotsignatures.s3.amazonaws.com/botsigs/sig-r14.1b0v17s2

   https://nsbotsignatures.s3.amazonaws.com/botsigs/sig-
   r14.1b0v17s2.digest
   ```

6. Change the auto update URL in the Bot settings in NetScaler to `https://<local server>/MySignatures/BotSignatureMapping.json`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE:

You can give any name to the `<BOTMySignatures>` folder and it can be in any location but the subdirectory `<botsigs>` must be a subdirectory in the `<MySignatures>` folder where the mapping file is copied. In addition, ensure that as shown in the `BotSignaturesMapping.json`, the subdirectory name `<botsigs>` must have the exact name and is case sensitive. All Signature files and their corresponding sha1 files should be copied under this `<botsigs>` directory.

Bot signature alert Articles

NetScaler® bot management announces signature updates that you can download and apply on your appliance. When you detect a bot attack, you will receive an email notification about the new signature update. You can download the signature and apply it on your appliance.

To get updates about new bot signatures, you must configure the signature auto-update feature. For more information, see Bot Signature Auto Update topic.

Bot signature update for June 2026

Updated signatures rules are generated for the bots identified in the week 2026-06-08. You can download and configure these signature rules to protect your appliance from bot attacks.

Bot signature version

Signature version 29 applicable for NetScaler® platforms running on the following versions:

- 13.1-61.23 or later
- 14.1 56.74 or later

Bot signature update for April 2026

Updated signatures rules are generated for the bots identified in the week 2026-04-20. You can download and configure these signature rules to protect your appliance from bot attacks.

Bot signature version

Signature version 26 applicable for NetScaler platforms running on the following versions:

- 13.1-61.23 or later
- 14.1 56.74 or later

New bot signatures in this version

Following is a list of bot signature rule IDs, category and its type.

Cache Redirection

In a typical deployment, different clients ask web servers for the same content repeatedly. To relieve the origin web server of processing each request, a NetScaler appliance with cache redirection enabled can serve this content from a cache server instead of from the origin server.

The NetScaler appliance analyzes incoming requests, sends requests for cacheable data to cache servers, and sends non-cacheable requests and dynamic HTTP requests to origin servers.

Cache redirection is a policy-based feature. By default, requests that match a policy are sent to the origin server, and all other requests are sent to a cache server. For testing or maintenance, you might want to skip policy evaluation and direct all requests to the cache or to the origin server.

You can combine content switching with cache redirection to cache selective content and serve content from specific cache servers for specific types of requested content.

A NetScaler appliance configured for cache redirection can be deployed at the edge of a network, in front of the origin server, or anywhere along the network backbone. In an edge deployment, commonly used by Internet Service Providers (ISPs), cable companies, content delivery distribution networks, and enterprise networks, the NetScaler appliance resides directly in front of the clients. In a server-side deployment, the NetScaler appliance is closer to the origin servers.

Cache redirection is used most commonly with the HTTP service type, but it also supports the secure HTTPS protocol.

Cache redirection policies

A cache redirection virtual server applies cache redirection policies to each incoming request. By default, if a request matches one of the configured policies, it is considered non-cacheable, and the NetScaler appliance sends it to the origin server. Other requests are sent to a cache server. This behavior can be reversed, so that requests that match configured cache redirection policies are sent to cache servers.

The appliance provides a set of policies for cache redirection. If these built-in policies are not adequate for your deployment, you can configure user-defined cache redirection policies.

Note: Once you have determined which built-in cache redirection policies to use, or have created user-defined policies, proceed with configuring cache redirection. To use this feature, you must

© 1997–2026 Citrix Systems, Inc. All rights reserved.

configure at least one cache redirection virtual server, and, for normal operation, you must bind at least one cache redirection policy to that virtual server.

Built-in cache redirection policies

The NetScaler appliance provides built-in cache redirection policies that handle typical cache requests. These policies are based on HTTP methods, the URL or URL tokens of the incoming request, the HTTP version, or the HTTP headers and their values in the request.

Built-in cache redirection policies can be directly bound to a virtual server and do not need further configuration.

Built-in Advanced policy cache redirection policies

Built-in cache redirection policies based on Advanced policy expressions are called *Advanced policy cache redirection policies*. For a complete description of Advanced policy expressions and how to configure them, see Policies and Expressions.

In addition to the same types of evaluations done by classic cache redirection policies, Advanced policy cache redirection policies enable you to analyze more data (for example, the body of an HTTP request) and to configure more operations in the policy rule (for example, directing the request to either cache or origin server).

NetScaler appliances provide the following two built-in actions for the Advanced policy cache redirection policies:

- CACHE
- ORIGIN

As implied by their names, they direct the request to the cache server or the origin server, respectively.

Note: If you are using the built-in Advanced policy cache redirection policy, you cannot modify the action.

The NetScaler appliance provides the following built-in Advanced policy cache redirection policies:

BUILT-IN POLICY NAME	DESCRIPTION
bypass-non-get_adv	Bypass the cache if the request uses an HTTP method other than GET.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

BUILT-IN POLICY NAME	DESCRIPTION
bypass-cache-control_adv	Bypass the cache if the request header contains a Cache-Control: no-cache or Cache-Control: no-store header, or if the HTTP request contains a pragma header.
bypass-dynamic-url_adv	Bypass the cache if the URL suggests that the content is dynamic, as indicated by the presence of any of the following extensions: cgi, asp, exe, cfm, ex, shtml, or htx. Also bypass the cache if the URL starts with any of the following: /cgi-bin/, /bin/, or /exec/.
bypass-urltokens_adv	Bypass the cache because the request is dynamic, as indicated by one of the following tokens in the URL: ?, !, or =.
bypass-cookie_adv	Bypass the cache for any URL that has a cookie header and an extension other than .gif or .jpg.

Display the built-in cache redirection policies

You can display the available cache redirection polices by using the command line interface or the configuration utility.

Display the built-in cache redirection policies by using the CLI

At the command prompt, type:

```
show cr policy [<policyName>]
```

Example:

```
> show cr policy

1)

    Policy: bypass-non-get-adv Rule: HTTP.REQ.METHOD.EQ(GET).NOT
 Action: ORIGIN

    Hits: 0
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
2)

    Policy: bypass-cache-control-adv    Rule:
((HTTP.REQ.CACHE_C0NTR0L.IS_N0_ST0RE) ||
(HTTP.REQ.CACHE_C0NTR0L.IS_NO_CACHE) ||
(HTTP.REQ.HEADER("Pragma").C0NTAINS("no-cache")))

ction : ORIGIN

    Hits: 0

3)

    Policy: bypass-dynamic-url-adv Rule:
(HTTP.REQ.URL.ENDSWITH_ANY("ns_cr_dynamic_ext") ||
(HTTP.REQ.URL.PATH.STARTSWITH_ANY("ns_cr_dynamic_path")))    Action:
ORIGIN

    Hits: 0

4)

    Policy: bypass-urltokens-adv Rule: HTTP.REQ.URL.REGEX_MATCH(re/[?!=]/)
   Action: ORIGIN

    Hits: 0

5)

    Policy: bypass-cookie-adv    Rule: ((HTTP.REQ.HEADER("Cookie").EXISTS)
&& (!(HTTP.REQ.URL.ENDSWITH(".gif"))) && (!
(HTTP.REQ.URL.ENDSWITH(".jpeg")))) Action: ORIGIN

    Hits: 0

Done
```

Display the built-in cache redirection policies by using the GUI

1. Navigate to Traffic Management > Cache Redirection > Policies. The configured cache redirection policies appear in the details pane.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. Select one of the configured policies to view details.

Configure a cache redirection policy

A cache redirection policy includes an expression (also called a *rule*). The expression represents a condition that is evaluated when the client request is compared to the policy.

You do not explicitly configure actions for cache redirection policies.

A cache redirection policy has a name and includes an Advanced policy expression, or a set of Advanced policy expression clauses that are combined by using logical operators, and the following built-in actions:

- CACHE
- ORIGIN

For more information about Advanced policy expressions, see Policies and Expressions.

Add a cache redirection policy by using the CLI

At the command prompt, type the following commands to add a cache redirection policy and verify the configuration:

```
-  add cr policy <policyName> **-rule** <expression> -action<string> [-
logAction<string>]

-  show cr policy [<policyName>]
```

Examples:

Policy with a simple expression:

```
> add cr policy crpol1 -rule !(HTTP.REQ.URL.ENDSWITH(".jpeg")) -action
origin

 Done

> show cr policy crpoll

    Policy: crpol1 Rule: !(HTTP.REQ.URL.ENDSWITH(".jpeg")) Action: ORIGIN
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
    Hits: 0

 Done
```

Policy with a compound expression:

```
> add cr policy crpol11 -rule 'http.req.method.eq(post) &&
(HTTP.REQ.URL.ENDSWITH(".gif") || HTTP.REQ.URL.ENDSWITH(".cgi"))'  -action
cache

 Done

> show cr policy crpol11

    Policy: crpol11    Rule: http.req.method.eq(post) &&
(HTTP.REQ.URL.ENDSWITH(".gif") || HTTP.REQ.URL.ENDSWITH(".cgi"))  Action:
CACHE

    Hits: 0

 Done
```

Policy that evaluates a header:

```
> add cr policy crpol12 -rule http.req.header("If-Modified-Since").exists
-action origin

 Done

> show cr policy crpol12

    Policy: crpol12    Rule: http.req.header("If-Modified-Since").exists
Action: ORIGIN

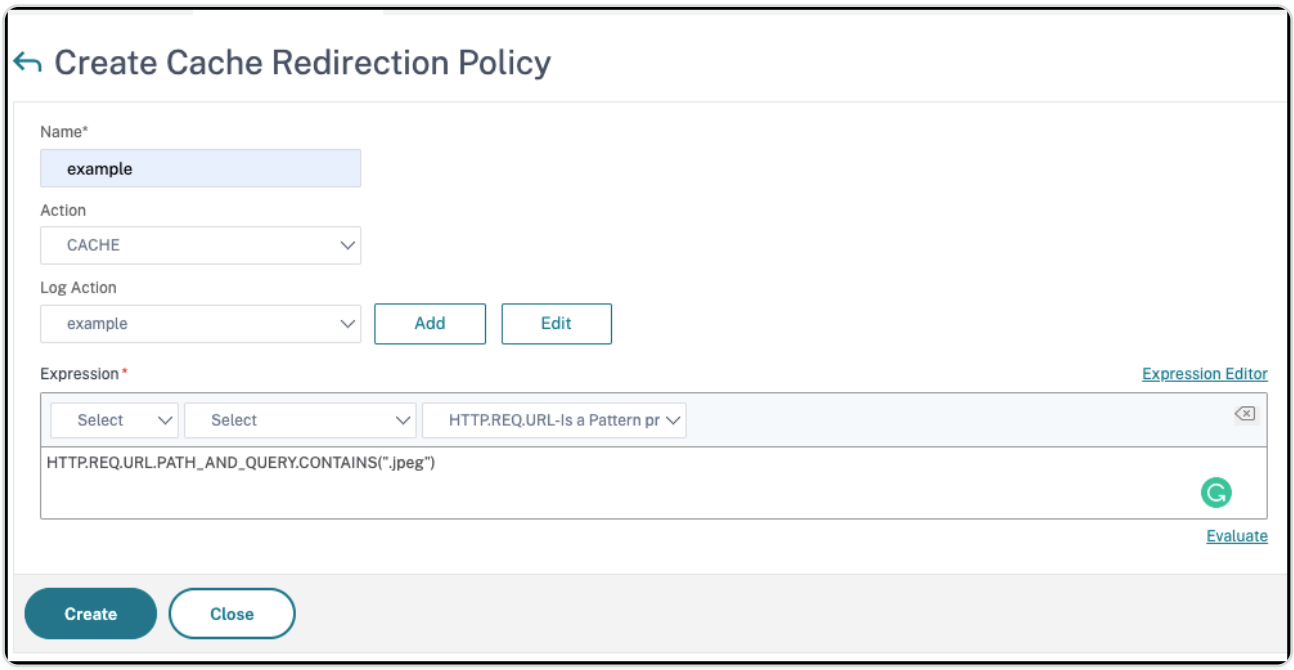
    Hits: 0

 Done
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Modify or remove a cache redirection policy by using the CLI

- To modify a cache redirection policy, use the set cr policy command, which is just like add cr policy command, except that you enter the name of an existing policy and you only have to provide the parameters that you want to modify.
- To remove a policy, use the `rm cr policy` command, which accepts only the \<name\> argument. If the policy is bound to a virtual server, you have to unbind the policy, before you can remove it.



For the details of unbinding a cache redirection policy, see Unbind a policy from a cache redirection virtual server.

Configure a cache redirection policy with a simple expression by using the GUI

1. Navigate to **Traffic Management > Cache Redirection > Policies**.
2. In the details pane, click **Add**.
3. In the **Create Cache Redirection Policy** dialog box, in the **Name** text box, type the name of the policy.
4. Select the appropriate action **CACHE** or **ORIGIN** from the **Action** drop-down list.
5. In the **Log Action** area, click **Add**. Type a name in the **Create Audit Message Action** dialog box.
    - Configure **Log Level** by choosing the appropriate value from the drop-down list:
        - **EMERGENCY**
        - **ALERT**
        - **CRITICAL**
        - **ERROR**
        - **WARNING**
        - **NOTICE**
        - **INFORMATIONAL**
        - **DEBUG**
    - Enter the expression in the **Expression** area. Configure an advanced expression. For more information, see Policy Expressions.
    - Click **Create**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

6. Configure the rule using the advanced expression. For more information see Policy Expressions.
7. When you are finished entering the expression, click **Create**.

Cache redirection configurations

Depending on your deployment and network topology, you can configure one of the following types of cache redirection:

- **Transparent**. A transparent cache can reside on a variety of points along a network backbone to alleviate traffic along the delivery route. In transparent mode, the cache redirection virtual server intercepts all traffic flowing to the NetScaler appliance and applies cache redirection policies to determine whether content should be served from the cache or from the origin server.
- **Forward proxy**. A forward proxy cache server resides on the edge of an enterprise LAN and faces the WAN. In the forward proxy mode, the cache redirection virtual server resolves the hostname of the incoming request by using a DNS server and forwards requests for non-cacheable content to the resolved origin servers. Cacheable requests are sent to the configured cache servers.
- **Reverse proxy**. Reverse proxy caches are configured for specific origin servers. Incoming traffic directed to the reverse proxy, can either be served from a cache server or be sent to the origin server with or without modification to the URL.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure transparent redirection

When you configure transparent cache redirection, the NetScaler appliance evaluates all traffic it receives, to determine whether it is cacheable. This mode alleviates traffic along the delivery route and is often used when the cache server resides on the backbone of an ISP or carrier.

By default, cacheable requests are sent to a cache server, and non-cacheable requests to the origin server. For example, when the NetScaler appliance receives a request that is directed to a web server, it compares the HTTP headers in the request with a set of policy expressions. If the request does not match the policy, the appliance forwards the request to a cache server. If the request does match a policy, the appliance forwards the request, unchanged, to the web server.

For details on how to modify this default behavior, see Direct policy hits to the cache instead of the origin.

To configure transparent redirection, first enable cache redirection and load balancing, and configure edge mode. Then, create a cache redirection virtual server with a wildcard IP address (*), so that this virtual server can receive traffic coming to the appliance on any IP address the appliance owns. To this virtual server, bind cache redirection policies that describe the types of requests that should not be cached. Then, create a load balancing virtual server that will receive traffic from the cache redirection virtual server for cacheable requests. Finally, create a service that represents a physical cache server and bind it to the load balancing virtual server.

Enable cache redirection and load balancing

The appliance cache redirection and load balancing features are not enabled by default. They must be enabled before any cache redirection configuration can take effect.

Enable cache redirection and load balancing by using the CLI

At the command prompt, type the following command to enable cache redirection and load balancing and verify the settings:

```
-  enable ns feature cr lb

-  show ns feature
```

Example:

```
> enable ns feature cr lb

 Done
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
> show ns feature

        Feature                         Acronym             Status

        -------                         -------             ------

 1)     Web Logging                     WL                  ON

 2)     Surge Protection                SP                  ON

 3)     Load Balancing                  LB                  ON

 4)     Content Switching               CS                  ON

 5)     Cache Redirection               CR                  ON

            ...

            ...

            ...

 23)    appliance Push                  push                OFF

 Done
```

Enable cache redirection and load balancing by using the GUI

1. In the navigation pane, expand **System**, and then click **Settings**.
2. To enable cache redirection, in the details pane, under **Modes and Features**, click **Configure Advanced Features**.
    a. In **Configure Advanced Features** dialog box, select the check box next to the **Cache Redirection**, and then click **OK**.
    b. In Enable/Disable Features? dialog box, click Yes.
3. To enable load balancing, in the details pane, under **Modes and Features**, click **Configure Basic Features**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

a. In **Configure Basic Features** dialog box, select the check box next to the Load Balancing, and then click **OK**.

b. In Enable/Disable Features? dialog box, click Yes.

Configure edge mode

When deployed at the edge of a network, the NetScaler appliance dynamically learns about the servers on that network. Edge mode enables the appliance to dynamically learn about up to 40,000 HTTP servers and proxy TCP connections for these servers.

This mode turns on the collection of statistics for the dynamically learned services and is typically used in transparent deployments for cache redirection.

Enable edge mode by using the CLI

At the command prompt, type the following commands to enable edge mode and verify the setting:

```
-  enable ns mode Edge

-  show ns mode
```

Example:

```
> enable ns mode edge

 Done

> show ns mode

        Mode                          Acronym             Status

        -------                       -------             ------

          ...

          ...

          ...
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
6)     MAC-based forwarding          MBF                ON

7)     Edge configuration            Edge               ON

8)     Use Subnet IP                 USNIP              OFF

          ...

          ...

          ...

16)    Bridge BPDUs                  BridgeBPDUs        OFF

Done
```

Enable edge mode by using the GUI

1. In the navigation pane, expand System, and then click Settings.
2. In the details pane, under Modes and Features, click Configure modes.
3. In Configure Modes dialog box, select the check box next to the Edge Configuration, and then click OK.
4. In Enable/Disable Feature(s)? dialog box, click Yes.

Configure a cache redirection virtual server

By default, a cache redirection virtual server forwards cacheable requests to the load balancing virtual server for the cache, and forwards non-cacheable requests to the origin server (except in a reverse proxy configuration, in which non-cacheable requests are sent to a load balancing virtual server). There are three types of cache redirection virtual servers: transparent, forward proxy, and reverse proxy.

A transparent cache redirection virtual server uses an IP address of * and a port number, usually 80, that can accept HTTP traffic sent to any IP address that the appliance represents. As a result, you can configure only one transparent cache redirection virtual server. Any additional cache redirection virtual servers that you configure must be forward proxy or reverse proxy redirection servers.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

add a cache redirection virtual server in transparent mode by using the cli

At the command prompt, type the following commands to add a cache redirection virtual server and verify the configuration:

```
-  add cr vserver <name> <serviceType> [<IPAddress> <port> ] [-cacheType
<cacheType>] [-redirect <redirect>]

-  show cr vserver [<name>]
```

Example:

```
add cr vserver Vserver-CRD-1 HTTP * 80 -cacheType TRANSPARENT -redirect
POLICY

> show cr vserver Vserver-CRD-1

        Vserver-CRD-1 (*:80) - HTTP     Type: CONTENT

        State: UP  ARP:DISABLED

        Client Idle Timeout: 180 sec

        Down state flush: ENABLED

        Disable Primary Vserver On Down : DISABLED

        Default:        Content Precedence: RULE        Cache: TRANSPARENT

        On Policy Match: ORIGIN L2Conn: OFF     OriginUSIP: OFF

        Redirect: POLICY        Reuse: ON       Via: ON ARP: OFF

 Done
```

Modify or remove a cache redirection virtual server by using the CLI

- To modify a virtual server, use the set cr vserver command, which is just like using the add cr vserver command, except that you enter the name of an existing virtual server.
- To remove a virtual server, use the `rm cr vserver` command, which accepts only the \<name\> argument.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Add a cache redirection virtual server in transparent mode by using the GUI

1. Navigate to Traffic Management > Cache Redirection > Virtual Servers.
2. In the details pane, click Add.
3. In the Create Virtual Server (Cache Redirection) dialog box, specify values for the following parameters as shown:
   - Name*—name
   - Port*—port

   *A required parameter
4. In the Protocol drop-down list, select a supported protocol (for example, **HTTP**). If the virtual server is to receive traffic on a port other than the standard port for the selected protocol, enter a new value in the Port field.
5. Click the Advanced tab.
6. Verify that Cache Type is set to TRANSPARENT and Redirect is set to POLICY.
7. Click Create, and then click Close. The Cache Redirection Virtual Servers pane displays the new virtual server.
8. Select the new cache redirection virtual server to display the details of its configuration.

Bind policies to the cache redirection virtual server

Cache redirection policies are not automatically bound to the cache redirection virtual server. A policy based cache redirection virtual server cannot function unless you bind at least one policy to it.

Bind policies to a cache redirection virtual server by using the CLI

At the command prompt, type:

```
-  bind cr vserver <name> -policyName <string>

-  show cr vserver [<name>]
```

Example:

```
> bind cr vserver Vserver-CRD-1 -policyName bypass-cache-control

 Done
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
> bind cr vserver Vserver-CRD-1 -policyName bypass-dynamic-url

 Done

> bind cr vserver Vserver-CRD-1 -policyName bypass-urltokens

 Done

> bind cr vserver Vserver-CRD-1 -policyName bypass-cookie

 Done

> show cr vserver Vserver-CRD-1

        Vserver-CRD-1 (*:80) - HTTP     Type: CONTENT

        State: UP  ARP:DISABLED

        Client Idle Timeout: 180 sec

        Down state flush: ENABLED

        Disable Primary Vserver On Down : DISABLED

        Default:        Content Precedence: RULE        Cache: TRANSPARENT

        On Policy Match: ORIGIN L2Conn: OFF     OriginUSIP: OFF

        Redirect: POLICY        Reuse: ON       Via: ON ARP: OFF

1)      Cache bypass  Policy: bypass-cache-control

2)      Cache bypass  Policy: bypass-dynamic-url

3)      Cache bypass  Policy: bypass-urltokens

4)      Cache bypass  Policy: bypass-cookie
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Done
```

Bind a user-defined policy to a cache redirection virtual server by using the GUI

1. Navigate to Traffic Management > Cache Redirection > Virtual Servers.
2. Click the virtual server that you want to configure, and click Open.
3. On the Policies tab, select type of the policy and then click Insert Policy.
4. Under Policy Name column, select the policy that you want to bind.
5. Click OK.

Unbind a policy from a cache redirection virtual server

When you unbind a policy from the cache redirection virtual server, the NetScaler appliance no longer applies the policy when evaluating client requests.

Unbind a policy from a cache redirection virtual server by using the command CLI

At the command prompt, type:

```
-  unbind cr vserver <name> -policyName <string>

-  show cr vserver [<name>]
```

Example:

```
unbind cr vserver Vserver-CR-1 -policyName bypass-non-get

> show cr vserver Vserver-CRD-1

        Vserver-CRD-1 (*:80) - HTTP     Type: CONTENT

        State: UP  ARP:DISABLED

        Client Idle Timeout: 180 sec

        Down state flush: ENABLED

        Disable Primary Vserver On Down : DISABLED

        Default:        Content Precedence: RULE        Cache: TRANSPARENT
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
        On Policy Match: ORIGIN L2Conn: OFF     OriginUSIP: OFF

        Redirect: POLICY        Reuse: ON       Via: ON ARP: OFF

1)      Cache bypass  Policy: bypass-cache-control

 Done
```

Unbind a user-defined policy from a cache redirection virtual server by using the GUI

1. Navigate to Traffic Management > Cache Redirection > Virtual Servers.
2. Click the virtual server that you want to configure, and then click Open.
3. On the Policies tab, under Policy Name, select the policy that you want to unbind.
4. Click Unbind Policy, and then click OK.

Create a load balancing virtual server

The cache redirection virtual server on the NetScaler appliance can send requests to either a cache server farm, if the request is cacheable, or to the origin server farm if the request is not cacheable.

Each cache server is represented on the appliance by a service, which is bound to a load balancing virtual server that receives requests from the cache redirection virtual server and forwards those requests to the servers.

For details on configuring load balancing virtual servers and other configuration options, see Load Balancing.

Create a load balancing virtual server by using the CLI

At the command prompt, type the following commands to create a load balancing virtual server and verify the configuration:

```
-  add lb vserver <name> <serviceType> [<IPAddress>] [<port>]

-  show lb vserver [<name>]
```

Example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
> add lb vserver Vserver-LB-CR HTTP 10.102.20.30 80

 Done

> show lb vserver Vserver-LB-CR

        Vserver-LB-CR (10.102.20.30:80) - HTTP  Type: ADDRESS

        State: DOWN

        Last state change was at Fri Jul  2 08:47:52 2010

        Time since last state change: 0 days, 00:00:08.470

        Effective State: DOWN

        Client Idle Timeout: 180 sec

        Down state flush: ENABLED

        Disable Primary Vserver On Down : DISABLED

        Port Rewrite : DISABLED

        No. of Bound Services :  0 (Total)       0 (Active)

        Configured Method: LEASTCONNECTION

        Mode: IP

        Persistence: NONE

        Vserver IP and Port insertion: OFF

        Push: DISABLED  Push VServer:

        Push Multi Clients: NO

        Push Label Rule: none

 Done
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Create a load balancing virtual server by using the GUI

1. Navigate to Traffic Management > Load Balancing > Virtual Servers.
2. In the details pane, click Add.
3. In the Create Virtual Server (Load Balancing) dialog box, specify values for the following parameters as shown:

   - Name*-name
   - IP Address*- IPAddress
   - Port*-port

   *A required parameter
4. In the Protocol list, select a supported protocol (for example, **HTTP**). If the virtual server is to receive traffic on a port other than the well-known port for the selected protocol, enter a new value in the Port field.
5. Click Create, and then click Close. The Load Balancing Virtual Servers pane displays the new virtual server.

Configure an HTTP service

On the NetScaler appliance, a service represents a physical server on the network. In the transparent cache redirection configuration, the service represents the cache server. Cacheable requests are sent by the cache redirection virtual server to the load balancing virtual server, which in turn forwards each request to the correct service, which passes it on to the cache server.

Configure an HTTP service by using the CLI

At the command prompt, type the following commands to create an HTTP service and verify the configuration:

```
-  add service <name> <IP> <serviceType> <port> -cacheType <cacheType>

-  show service [<name>]
```

Example:

```
> add service Service-HTTP-1 10.102.29.40 HTTP 80 -cacheType TRANSPARENT

 Done
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
> show service Service-HTTP-1

        Service-HTTP-1 (10.102.29.40:80) - HTTP

        State: DOWN

        Last state change was at Fri Jul  2 09:14:17 2010

        Time since last state change: 0 days, 00:00:13.820

        Server Name: 10.102.29.40

        Server ID : 0   Monitor Threshold : 0

        Max Conn: 0     Max Req: 0      Max Bandwidth: 0 kbits

        Use Source IP: NO

        Client Keepalive(CKA): NO

        Access Down Service: NO

        TCP Buffering(TCPB): NO

        HTTP Compression(CMP): YES

        Idle timeout: Client: 180 sec   Server: 360 sec

        Client IP: DISABLED

        Cache Type: TRANSPARENT Redirect Mode:

        Cacheable: NO

        SC: OFF

        SP: ON

        Down state flush: ENABLED

1)      Monitor Name: tcp-default
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
                State: DOWN     Weight: 1

                Probes: 3       Failed [Total: 3 Current: 3]

                Last response: Failure - Time out during TCP connection
establishment stage

                Response Time: N/A

 Done
```

Modify or remove a service by using the CLI

- To modify a service, use the set service command, which is just like using the add service command, except that you enter the name of an existing service.
- To remove a service, use the `rm service` command, which accepts only the \<name\> argument.

Add an HTTP service by using the GUI

1. Navigate to Traffic Management > Load Balancing > Services
2. In the details pane, click Add.
3. In the Create Service dialog box, specify values for the following parameters as shown:
   - Service Name*—name
   - Server*— IP
   - Port*—port

   *A required parameter
4. In the Protocol* drop-down list, select a supported protocol (for example, **HTTP**).
5. Click Create, and then click Close.

Bind/unbind a service to/from a load balancing virtual server

You must bind a service to the load balancing virtual server. This enables the load balancer to forward the request to the server that the service represents. If your configuration changes, you can unbind a service from the load balancing virtual server.

Bind a service to a load balancing virtual server by using the CLI

At the command prompt, type:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
-  bind lb vserver <name> <serviceName>

-  show lb vserver [<name>]
```

Example:

```
> bind lb vserver vserver-LB-CR service-HTTP-1

 Done

> show lb vserver Vserver-LB-CR

        Vserver-LB-CR (10.102.20.30:80) - HTTP  Type: ADDRESS

        State: DOWN

        Last state change was at Fri Jul  2 08:47:52 2010

        Time since last state change: 0 days, 00:42:25.610

        Effective State: DOWN

        Client Idle Timeout: 180 sec

        Down state flush: ENABLED

        Disable Primary Vserver On Down : DISABLED

        Port Rewrite : DISABLED

        No. of Bound Services :  1 (Total)       0 (Active)

        Configured Method: LEASTCONNECTION

        Mode: IP

        Persistence: NONE

        Vserver IP and Port insertion: OFF

        Push: DISABLED  Push VServer:
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
        Push Multi Clients: NO

        Push Label Rule: none

1) Service-HTTP-1 (10.102.29.40: 80) - HTTP State: DOWN Weight: 1

 Done
```

Unbind a service from a load balancing virtual server by using the CLI

To unbind a service, use the `unbind lb vserver` command instead of `bind lb vserver`.

Bind/unbind a service from a load balancing virtual server by using the GUI

1. Navigate to Traffic Management > Load Balancing > Virtual Servers
2. In the details pane, select the virtual server from which you want to bind/unbind the service, and then click Open.
3. On the Services tab, in the Active column, select/clear the check box next to the Service Name.
4. Click OK.

Disable the use the proxy port setting for transparent caching

If the use source IP (USIP) option is disabled on a cache service configured on the NetScaler appliance, the appliance forwards client requests to the cache service by using a appliance-owned subnet IP (SNIP) address or mapped IP (MIP) address as the source IP address and a random port as the source port. The randomly selected port is called the proxy port.

However, if you want to configure a fully transparent cache (a cache configuration in which the cache service receives the client's IP address and port number), you must not only enable the USIP option, either globally or on the cache service, but also disable the Use Proxy Port setting, either globally or on the cache service. Disabling the Use Proxy Port setting enables the appliance to use the client's source port as the source port when it connects to the cache service, and ensures a fully transparent cache configuration.

For more information about configuring the Use Proxy Port option globally or on a service, see Configuring the Source Port for Server-Side Connections.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Assign a port range to the NetScaler appliance

Sharing of the client IP address may create a conflict that makes network devices, such as routers, cache servers, origin servers, and other NetScaler appliances, unable to determine the appliance, and therefore the client, to which the response should be sent.

A method to solve this problem is to assign a source port range to the NetScaler appliance. This allotment enables network devices to unambiguously identify the NetScaler appliance that sent the request.

Assign a source port range to a NetScaler appliance by using the CLI

At the command prompt, type:

```
set ns param -crPortRange <startPortNumber-endPortNumber>
```

Assign a source port range to a NetScaler appliance by using the appliance GUI

1. In the navigation pane, click System, and then click Settings.
2. In the Settings group, click the Change global system settings link.
3. In the Cache Redirection Port Range group, specify the port range for the appliance by typing a port number for Start Port and a port number for End Port.
4. Click OK.

Enable load balancing virtual servers to redirect requests to cache

If a load balancing virtual server is configured to listen on a particular IP address and port combination, it takes precedence over the cache redirection virtual server for any requests destined for that address-port combination. Therefore, the cache redirection virtual server does not process those requests.

If you want to override this functionality and let the cache redirection virtual server decide whether the request should be served from the cache or not, configure the particular load balancing virtual server to be cacheable.

Such a configuration is typically used when an ISP uses a NetScaler appliance at the edge of its network and all traffic flows through the appliance.

Enable load balancing virtual servers to redirect requests to the cache by using the CLI

At the command prompt, type:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
-  set lb vserver <name> [-cacheable ( YES | NO)]

-  show lb vserver [<name>]
```

Example:

```
set lb vserver Vserver-LB-CR –cacheable YES

> show lb vserver vserver-LB-CR

        Vserver-LB-CR (10.102.20.30:80) - HTTP  Type: ADDRESS

        State: DOWN

        Last state change was at Fri Jul  2 08:47:52 2010

        Time since last state change: 0 days, 01:05:51.510

        Effective State: DOWN

        Client Idle Timeout: 180 sec

        Down state flush: ENABLED

        Disable Primary Vserver On Down : DISABLED

        Port Rewrite : DISABLED

        No. of Bound Services :  1 (Total)       0 (Active)

        Configured Method: LEASTCONNECTION

        Mode: IP

        Persistence: NONE

        Cacheable: YES  PQ: OFF SC: OFF

        Vserver IP and Port insertion: OFF

        Push: DISABLED  Push VServer:
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
        Push Multi Clients: NO

        Push Label Rule: none

1) Service-HTTP-1 (10.102.29.40: 80) - HTTP State: DOWN Weight: 1

 Done
```

For transparent cache redirection, the appliance intercepts all traffic and evaluates every request to determine whether it is cacheable. Non-cacheable requests are sent unchanged to the origin server.

When using transparent cache redirection, you may want to turn off cache redirection for load balancing virtual servers that always direct traffic to origin servers.

Turn off caching for a load balancing virtual server by using the CLI

To turn off caching for a load balancing virtual, use the unset lb vserver command instead of set lb vserver. Specify a value of NO value for the **cacheable** parameter.

Enable or disable load balancing virtual servers to redirect requests to the cache by using the GUI

1. Navigate to Traffic Management > Load Balancing > Virtual Servers.
2. In the details pane, select the virtual server from which you want to enable/disable the caching, and then click Open.
3. On the Advanced tab, select/clear Cache Redirection check box.
4. Click OK.

Configure forward proxy redirection

A forward proxy is a single point of contact for a client or group of clients. In this configuration, the NetScaler appliance redirects non-cacheable requests to an origin server and redirects cacheable requests to either a forward proxy cache or a transparent cache.

When the appliance is configured as a forward proxy, users must modify their browsers so that the browser sends requests to the forward proxy instead of the destination servers.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

A forward proxy cache redirection virtual server on the appliance compares the request with a policy for caching. If the request is not cacheable, the appliance queries a DNS load balancing virtual server for resolution of the destination, and then sends the request to the origin server. If the request is cacheable, the appliance forwards the request to a load balancing virtual server for the cache.

The appliance relies on a host domain name or IP address in the request's HOST header to determine the requested destination. If there is no HOST header in the request, the appliance inserts a HOST header based on the destination IP address in the request.

Typically, the NetScaler appliance acts as a forward proxy in an enterprise LAN. In such a configuration, the appliance resides at the edge of an enterprise LAN and intercepts client requests before they are fanned out to the WAN. Configuring the appliance in the forward proxy mode reduces traffic on the WAN.

To configure forward proxy cache redirection, first enable load balancing and cache redirection on the appliance. Then, configure a DNS load balancing virtual server and associated services. Also configure a load balancing virtual server and bind to it appropriate services for the cache. Configure a forward proxy cache redirection virtual server and bind the DNS and load balancing virtual servers to it. You must also configure caching policies and bind them to the cache redirection virtual server. To complete the setup, configure the client browsers to use the forward proxy.

For details on how to enable cache redirection and load balancing on the appliance, see Enable cache redirection and load balancing.

For details on how to create a load balancing virtual server, see Create a load balancing virtual server.

For details on how to configure services that represent the cache server, see Configure an HTTP service.

For details on how to bind the service to a virtual server, see Bind/unbind a service to/from a load balancing virtual server.

For details on how to create a forward proxy cache redirection server, see Configure a cache redirection virtual server, and create a virtual server of type TRANSPARENT or FORWARD.

For details on binding cache redirection policies to the cache redirection virtual server, see Configure a cache redirection policy.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Create a DNS service

A DNS service is a representation, on the NetScaler appliance, of a physical DNS server in the network. A DNS load balancing virtual server sends DNS requests to the DNS server in the network through such a service.

Create a DNS service by using the CLI

At the command line, type the following commands to create a DNS service and verify the configuration :

```
-  add service <name> <IP> <serviceType> <port>

-  show service [<name>]
```

Example:

```
add service Service-DNS-1 10.102.29.41 DNS 53

show service Service-DNS-1

        Service-DNS-1 (10.102.29.41:53) - DNS

        State: DOWN

        Last state change was at Fri Jul  2 10:14:32 2010

        Time since last state change: 0 days, 00:00:13.550

        Server Name: 10.102.29.41

        Server ID : 0   Monitor Threshold : 0

        Max Conn: 0     Max Req: 0      Max Bandwidth: 0 kbits

        Use Source IP: NO

        Client Keepalive(CKA): NO

        Access Down Service: NO

        TCP Buffering(TCPB): NO
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
        HTTP Compression(CMP): NO

        Idle timeout: Client: 120 sec   Server: 120 sec

        Client IP: DISABLED

        Cacheable: NO

        SC: OFF

        SP: OFF

        Down state flush: ENABLED

1)      Monitor Name: ping-default

                State: DOWN     Weight: 1

                Probes: 3       Failed [Total: 3 Current: 3]

                Last response: Failure - Probe timed out.

                Response Time: 2000.0 millisec

 Done
```

Add a DNS service by using the GUI

1. Navigate to Traffic Management > Load Balancing > Services.
2. In the details pane, click Add.
3. In the Create Service dialog box, specify values for the following parameters as shown:
    - Service Name*—name
    - Server*—IP
    - Port*—port

*A required parameter

1. In the Protocol* drop down list, select a supported protocol (for example, **DNS**).

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. Click Create, and then click Close.

Create a DNS load balancing virtual server

The DNS virtual server enables the forward proxy to perform DNS resolution before forwarding a client request to an origin server. The DNS load balancing virtual server is associated with the DNS service that represents the physical DNS server on the network.

Create a DNS load balancing virtual server by using the CLI

At the command line, type the following commands to create a DNS load balancing virtual server and verify the configuration:

```
-  add lb vserver <name> <serviceType>

-  show lb vserver [<name>]
```

Example:

```
> add lb vserver Vserver-DNS-1 DNS

 Done

> show lb vserver Vserver-DNS-1

        Vserver-DNS-1 (0.0.0.0:0) - DNS Type: ADDRESS

        State: DOWN

        Last state change was at Fri Jul  2 10:32:28 2010

        Time since last state change: 0 days, 00:00:08.10

        Effective State: DOWN  ARP:DISABLED

        Client Idle Timeout: 120 sec

        Down state flush: ENABLED

        Disable Primary Vserver On Down : DISABLED

        No. of Bound Services :  0 (Total)       0 (Active)
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
        Configured Method: LEASTCONNECTION

        Mode: IP

        Persistence: NONE

 Done
```

Create a DNS load balancing virtual server by using the GUI

1. Navigate to Traffic Management > Load Balancing > Virtual Servers.
2. In the details pane, click Add.
3. In the Create Virtual Server (Load Balancing) dialog box, in the Name box, type a name for the virtual server.
4. In the Protocol* drop down list, select a supported protocol (for example, **DNS**).
5. Click Create, and then click Close. The DNS Virtual Servers pane displays the new virtual server.

Bind the DNS service to the virtual server

For the DNS server to respond to DNS requests, the service representing the DNS server must be bound to the DNS virtual server.

Bind the DNS service to the load balancing virtual server by using the CLI

At the command prompt, type the following commands to bind the DNS service to the load balancing virtual server and verify the configuration:

```
-  bind lb vserver <name> <serviceName>

-  show lb vserver <name>
```

Example:

```
> bind lb vserver Vserver-DNS-1 Service-DNS-1

 Done

> show lb vserver Vserver-DNS-1
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
        Vserver-DNS-1 (0.0.0.0:0) - DNS Type: ADDRESS

        State: DOWN

        Last state change was at Fri Jul  2 10:32:28 2010

        Time since last state change: 0 days, 00:12:16.80

        Effective State: DOWN  ARP:DISABLED

        Client Idle Timeout: 120 sec

        Down state flush: ENABLED

        Disable Primary Vserver On Down : DISABLED

        No. of Bound Services :  1 (Total)       0 (Active)

        Configured Method: LEASTCONNECTION

        Mode: IP

        Persistence: NONE

1) Service-DNS-1 (10.102.29.41: 53) - DNS State: DOWN   Weight: 1

 Done

>
```

Unbind a DNS service from the load balancing virtual server by using the CLI

Use the `unbind lb vserver` command instead of `bind lb vserver`.

Bind/Unbind a DNS service to/from a load balancing virtual server by using the GUI

1. Navigate to Traffic Management > Load Balancing > Virtual Servers
2. In the details pane, select the virtual server to/from which you want to bind/unbind the DNS service, and then click Open.
3. On the Services tab, in the Active column, select/clear the check box next to the Service Name.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. Click OK.

Configure a client web browser to use a forward proxy

When you configure the NetScaler appliance as forward proxy cache redirection virtual server in the network, you must configure the client Web browser to send requests to the forward proxy. Typically, when you use a forward proxy, the only route to the servers in the network is through the forward proxy.

Refer the documentation for your browser to configure the browser to use a forward proxy. Specify the IP address and port number of the forward proxy cache redirection virtual server for this configuration.

Configure reverse proxy redirection

A reverse proxy resides in front of one or more web servers and shields the origin server from client requests. Often, a reverse proxy cache is a front-end for all client requests to a server. An administrator assigns a reverse proxy cache to a specific origin server. The reverse proxy cache is unlike transparent and forward proxy caches, which cache frequently requested content for all requests to any origin server, and the choice of a server is based on the request.

Unlike a transparent proxy cache, the reverse proxy cache has its own IP address and can replace destination domains and URLs in a non-cacheable request with new destination domains and URLs.

You can deploy reverse proxy cache redirection at the origin-server side or at the edge of a network. When deployed at the origin server, the reverse proxy cache redirection virtual server is a front-end for all requests to the origin server.

In the reverse proxy mode, when the appliance receives a request, the cache redirection virtual server evaluates the request and forwards it to either a load balancing virtual server for the cache or a load balancing virtual server for the origin. The incoming request can be transformed by changing the host header or the host URL before it is sent to the back-end server.

To configure reverse proxy cache redirection, first enable cache redirection and load balancing. Then, configure a load balancing virtual server and services to send cacheable requests to the cache servers. Also configure a load balancing virtual server and associated services for the origin servers. Then, configure a reverse proxy cache redirection virtual server and bind relevant cache redirection policies to it. Finally, configure mapping policies and bind them to the reverse proxy cache redirection virtual server.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The mapping policies have an associated action that enables the cache redirection virtual server to forward any non-cacheable request to the load balancing virtual server for the origin.

Be sure to create the default cache server destination.

For details on how to enable cache redirection and load balancing on the appliance, see Enable cache redirection and load balancing.

For details on how to create a load balancing virtual server, see Create a load balancing virtual server.

For details on how to configure services that represent the cache server, see Configure an HTTP service.

For details on how to bind the service to a virtual server, see Bind/unbind a service to/from a load balancing virtual server.

For details on how to create a reverse proxy cache redirection server, see Configure a cache redirection virtual server, and create a virtual server of type REVERSE.

For details on binding built-in cache redirection policies to the cache redirection virtual server, see Bind policies to the cache redirection virtual server.

Configure mapping policies

If an incoming request is non-cacheable, the reverse-proxy cache redirection virtual server replaces the domain and URL in the request with the domain and URL of a target origin server and forwards the request to the load balancing virtual server for the origin.

A mapping policy enables the reverse proxy cache redirection virtual server to replace the destination domain and URL and forward the request to the load balancing virtual server for the origin.

A mapping policy must first translate the domain and the URL, and then pass the request on to the origin load balancing virtual server.

A mapping policy can map a domain, a URL prefix, and a URL suffix, as follows:

- Domain mapping: You can map a domain without a prefix or suffix. The domain mapping is the default mapping for the virtual server (for example, mapping www.mycompany.com to www.myrealcompany.com).
- Prefix mapping: You can replace a specified pattern prefixed as part of the URL (for example, mapping www.mycompany.com/sports/index.html to www.mycompany.com/news/index.html).

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Suffix mapping: You can replace the file suffix in the URL (for example, mapping www.mycompany.com/sports/index.html to www.mycompany.com/sports/index.asp).

The source and the destination strings being mapped must be similar. If you specify a source domain, you must specify a destination domain, and if you specify a source suffix, you must specify a destination suffix. Similarly, if you specify an exact URL from the source, the target URL must also be an exact URL.

Once you configure mapping policies for the reverse proxy mode, you must bind them to the cache redirection virtual server.

You can use combinations of the source URL, target URL, and source and target domains to configure all three types of domain mapping.

Configure a mapping policy for reverse proxy mode by using the CLI

At the command prompt, type the following command to add a policy map and verify the configuration:

```
-  add policy map <mapPolicyName> -sd <string> [-su <string>] [-td
<string>] [-tu <string>]

-  show policy map [<mapPolicyName>]
```

Example:

The following command maps a domain in a client request to a target domain:

```
> add policy map myMappingPolicy -sd www.mycompany.com -td
www.myrealcompany.com

 Done

> show policy map myMappingPolicy

1)      Name: myMappingPolicy

        Source Domain: www.mycompany.com        Source Url:

        Target Domain: www.myrealcompany.com    Target Url:
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
 Done
```

Following is an example of mapping a URL suffix to a different URL suffix:

```
> add policy map myOtherMappingPolicy -sd www.mycompany.com -td
www.myrealcompany.com -su /news.html -tu /realnews.html

 Done

> show policy map myOtherMappingPolicy

1)      Name: myOtherMappingPolicy

        Source Domain: www.mycompany.com        Source Url: /news.html

        Target Domain: www.myrealcompany.com    Target Url: /realnews.html

 Done
```

Configure a mapping policy for reverse proxy mode by using the GUI

1. Navigate to **Traffic Management > Cache Redirection > Map Policies**.
2. In the details pane, click Add.
3. In the Create Map Policy dialog box, specify values for the following parameters as shown:
   - Name*- mapPolicyName
   - Source Domain*-sd
   - Target Domain*-td
   - Source URL-su
   - Target URL-tu

   *A required parameter
4. Click Create, and then click Close. The Map pane displays the new mapping policy.

Bind the mapping policy to the cache redirection virtual server by using the CLI

At the command prompt, type the following commands to bind the mapping policy to the cache redirection virtual server and verify the configuration:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
-  bind cr vserver <name> -policyName <string> [<targetVserver>]

-  show cr vserver <name>
```

Example:

```
> bind cr vserver Vserver-CRD-3 -policyName myMappingPolicy Vserver-LB-CR

 Done

> show cr vserver Vserver-CRD-3

        Vserver-CRD-3 (10.102.29.50:88) - HTTP  Type: CONTENT

        State: UP

        Client Idle Timeout: 180 sec

        Down state flush: ENABLED

        Disable Primary Vserver On Down : DISABLED

        Default: Vserver-LB-CR  Content Precedence: RULE        Cache:
REVERSE

        On Policy Match: ORIGIN L2Conn: OFF     OriginUSIP: OFF

        Redirect: POLICY        Reuse: ON       Via: ON ARP: OFF

1)      Policy:         Target: Vserver-LB-CR   Priority: 0     Hits: 0

1)      Map: myMappingPolicy Target: Vserver-LB-CR

 Done
```

Bind the mapping policy to the cache redirection virtual server by using the GUI

1. Navigate to **Traffic Management > Cache Redirection > Virtual Servers**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. In the details pane, select the virtual server from which you want to bind the mapping policy, and then click **Open**.
3. In the **Configure Virtual Server**(Cache Redirection), on the **Policies** tab, select **Map**, and then click **Insert Policy**.
4. In the **Policy Name** column, select the policy from the drop-down list.
5. In the **Target** column, click the down arrow, and then select the virtual server from the drop-down list.
6. Click **OK**.

Selective cache redirection

Selective cache redirection sends requests for particular types of content, for example, images, to one cache server or group of cache servers and sends other types of content to a different cache server or group of cache servers. You can configure advanced cache redirection in transparent, reverse proxy, or forward proxy modes.

In selective cache redirection, the NetScaler appliance intercepts a client request and forwards non-cacheable requests to the original destination in the client request. For cacheable requests, the appliance sends the requests to the destination cache server that can serve content of a specific content type.

Selective cache redirection involves configuring content switching policies in addition to cache redirection policies. The appliance first evaluates the cache redirection policies that are bound to the cache redirection virtual server. If a request matches a cache redirection policy, the cache redirection virtual server sends the request to the origin server or a load balancing virtual server for the origin. If no cache redirection policies match the request, the appliance evaluates the content switching policies bound to the cache redirection virtual server. If a content switching policy matches the request, the cache redirection virtual server redirects the request to a load balancing virtual server for the cache.

To configure selective cache redirection, first enable cache redirection, load balancing, and content switching on the NetScaler appliance. Then, configure a load balancing virtual server for the cache and an associated HTTP service. After this, configure a cache redirection virtual server and bind both the cache redirection and content switching policies to it. Once you have bound the policies, you can configure the virtual server to give precedence to either rule based or URL based content-switching policies.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

When configured for transparent mode cache redirection in an edge deployment topology, the appliance sends all cacheable HTTP traffic to a transparent cache farm. Clients access the Internet through the appliance, which is configured as a Layer 4 switch that receives traffic on port 80.

The appliance can direct requests for images (for example, .gif and .jpg files) to one server in the transparent cache farm, and all other requests for static content to other servers in the farm. For this configuration, you configure content switching policies to send images to the image cache and send all other cacheable content to a default cache.

Note: The configuration described here is for transparent selective cache redirection. Therefore, it does not require a load balancing virtual server for the origin, as would a reverse proxy configuration.

To configure this type of selective cache redirection, first enable cache redirection, load balancing, and content switching. Then, configure a load balancing virtual server for the cache and configure an associated HTTP service. Then, configure a cache redirection virtual server and create and bind both cache redirection and content switching policies to this virtual server.

For details on how to enable cache redirection and load balancing on the appliance, see Enable cache redirection and load balancing.

Enable content switching

To configure selective cache redirection, after you enable both the load balancing and cache redirection features on the appliance, you must enable content switching.

Enable content switching by using the CLI

At the command prompt, type:

```
-  enable ns feature CS

-  show ns feature
```

Example:

```
> enable ns feature cs

 Done
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
> show ns feature

        Feature                        Acronym             Status

        -------                        -------             ------

 1)     Web Logging                    WL                  ON

 2)     Surge Protection               SP                  ON

 3)     Load Balancing                 LB                  ON

 4)     Content Switching              CS                  ON

 5)     Cache Redirection              CR                  ON

          ...

          ...

          ...

 23)    appliance Push                 push                OFF

 Done
```

Enable cache redirection and load balancing by using the GUI

1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, under Modes and Features, click **Configure Basic Features**.
3. In **Configure Basic Features** dialog box, select the check box next to the **Content Switching**, and then click **OK**.
4. In Enable/Disable Features? dialog box, click Yes.

Configure a load balancing virtual server for the cache

Create a load balancing virtual server and an HTTP service for each type of cache server that will be used. For example, if you want to serve JPEG files from one cache server and GIF files from another cache server, and use a third cache server for the rest of the content, create an HTTP

© 1997–2026 Citrix Systems, Inc. All rights reserved.

service and virtual server for each of the three types of cache servers. Then bind each service to its respective virtual server.

For details on how to create a load balancing virtual server, see Create a load balancing virtual server.

For details on how to configure services that represent the cache server, see Configure an HTTP service.

For details on how to bind the service to a virtual server, see Bind/unbind a service to/from a load balancing virtual server.

For details on how to create a transparent proxy cache redirection server, see Configure a cache redirection virtual server, and create a virtual server of type TRANSPARENT.

For details on binding built-in cache redirection policies to the cache redirection virtual server, see Bind policies to the cache redirection virtual server.

Configure a cache redirection policy for a specific type of content

To identify requests that contain a .gif or .jpeg extension as cacheable, you configure a cache redirection policy and bind it to the cache redirection virtual server.

Note: If a request matches a policy, the NetScaler appliance forwards it to the origin server. As a result, in the following procedure, you configure policies to match requests that do *not* have ".gif" or ".jpeg" extensions.

To configure cache redirection for a specific type of content, configure a policy that uses a simple expression, as described in Configure a cache redirection policy.

Configure policies for content switching

You must create a content switching policy to identify specific types of content to be directed to one server or farm and identify other types of content to serve from another cache server or farm. For example, you can configure a policy to determine the location for image files with .gif and .jpeg extensions.

Before creating the content switching policy you must define a content switching action to describe which load balancing virtual server to select. This action is used in the content switching policy.

After defining the content switching policy, you bind it to a content switching virtual server and specify a load balancing virtual server. Requests that match the policy are forwarded to the named

© 1997–2026 Citrix Systems, Inc. All rights reserved.

load balancing virtual server. Requests that do not match the content switching policy are forwarded to the default load balancing virtual server for the cache.

For more details about the content switching feature and configuring content switching policies, see Content switching.

You must first create the content switching policy and then bind it to the content switching virtual server.

Create a content switching policy by using the command CLI

At the command line, type:

```
-  add cs action <name> [-targetLBVserver <string> | -targetVserver
<string> | -targetVserverExpr <expression>]

-  add cs policy <policyName> -rule <expression> [-action <string>]

-  show cs policy [<policyName>]
```

Examples:

```
> add cs action action-CS-JPEG -targetLBVserver lbcachejpeg

Done

> show cs action action-CS-JPEG

    Name: action-CS-JPEG

    Target LB Vserver: lbcachejpeg

    Hits: 0

    Undef Hits: 0

    Action Reference Count: 0

Done
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
> add cs policy policy-CS-JPEG -rule 'HTTP.REQ.URL.SUFFIX == "jpeg"' -
action action-CS-JPEG

Done

> show cs policy policy-CS-JPEG

    Policy: policy-CS-JPEG Rule: HTTP.REQ.URL.SUFFIX == "jpeg"

    Action: action-CS-JPEG

    HITS: 0

Done

>

> add cs action action-CS-GIF -targetLBVserver lbcachegif

Done

> show cs action action-CS-GIF

    Name: action-CS-GIF

    Target LB Vserver: lbcachegif

    Hits: 0

    Undef Hits: 0

    Action Reference Count: 0

Done

>
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
> add cs policy policy-CS-GIF -rule 'HTTP.REQ.URL.SUFFIX == "gif"' -action
action-CS-GIF

Done

> show cs policy policy-CS-GIF

    Policy: policy-CS-GIF Rule: HTTP.REQ.URL.SUFFIX == "gif"

    Action: action-CS-GIF

    Hits: 0

Done
```

Create a rule-based content switching policy by using the GUI

1. Navigate to **Traffic Management > Content Switching > Policies**.
2. In the details pane, click **Add**.
3. In the **Create Content Switching Policy** dialog box, in the **Name** text box, type a name for the policy.
4. Click **Add** in the **Action** tab to create a content switch action. Or select the available action from the drop-down list.
   - Type a name for the content swith action in the **Name** tab.
   - Choose the virtual server or Expression from the drop-down list:
     - **Loadbalancing Virtual Server**
     - **Global Server Loadbalancing Virtual Server**
     - **Authentication Virtual Server**
     - **NetScalar Gateway Virtual Server**
     - **Expression**
   - Click **Add** or **Edit** to configure the **Target Load Balancing Virtual Server**.
5. Click **Add** in the **Log Action** tab to create a audit message action. Or select the available audit message action from the drop-down list.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

6. In the **Expression** area, select the required type of expression.
7. In the **Expression Editor** dialog box, choose the expression syntax that you want to use.

   In the **Expression** area click **Evaluate** to evaluate an expression evaluator. The evaluator evaluates the expression you entered, to verify that it is valid, and displays an analysis of the expression's effect in **Result** area.
8. Enter your policy expressions.

   For information about using the advanced syntax, see Configure advanced policy expression: Get started.
9. Click **Create**. The policy you created appears in the **Content Switching Policies** pane.

Bind the content switching policy to a cache redirection virtual server by using the CLI

At the command prompt, type the following commands to bind the content switching policy to a cache redirection virtual server and verify the configuration:

```
-  bind cs vserver <name> (-lbvserver <string> | -vServer <string> (-
policyName <string> [-targetLBVserver <string>] [-
priority<positive_integer>] [-gotoPriorityExpression <expression>] [-type
<type>] [-invoke (<labelType> <labelName>) ] )

-  show cs vserver [<name>]
```

Example:

```
> bind cs vserver Vserver-CR-1 -policyName Policy-CS-JPEG -priority 100

 Done

> bind cs vserver Vserver-CR-1 -policyName Policy-CS-GIF -priority 200

 Done

> show cs vserver Vserver-CR-1

        Vserver-CR-1 (10.102.29.60:80) - HTTP   Type: CONTENT
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
        State: UP

 Done

>
```

Bind the content switching policy to a cache redirection virtual server by using the GUI

1. Navigate to **Traffic Management** > **Content Switching** > **Virtual Servers**.
2. In the details pane, select the virtual server for which you want to bind the policy (for example, **Vserver-CS-1**), and then click **Edit**.
3. In the **Content Switching Virtual Server** dialog box, on the **Policies** tab under **Advanced Settings**, click on **Add** icon, and then choose policy and choose type from **Choose Policy** and **Choose Type** drop-down list.
4. Click **Continue**.
5. In the **Policy Binding** tab, slect the available policy from the list and then click **Select** or click **Add** to create a new policy and then click **Create**.
6. Click **Bind** to bind the content switching policy to the virtual server.
7. Click **Done**

Configure precedence for policy evaluation

You can configure a content switching policy based on either a rule, which is a generic configuration to accommodate various content types, or a URL, which is more specific and defines exactly the type of content that has to be sent to a particular cache server. Essentially, the same content can be defined by either a rule based policy or a URL based policy.

Once you bind content switching policies of either type to a cache redirection virtual server, you can configure the virtual server to give precedence to either rule based or URL based policies. This will, in turn, decide which servers the particular requests are directed to.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To configure precedence for policy evaluation, use the precedence parameter, which specifies the type of policy (URL or RULE) that takes precedence on the content redirection virtual server.

Possible values: RULE, URL

Default value: RULE

Configure precedence for policy evaluation by using the CLI

At the command prompt, type the following commands to configure precedence for policy evaluation and verify the configuration:

```
-  set cr vserver <name> [-precedence (RULE | URL)]

-  show cr vserver <name>
```

Example:

```
> set cr vserver Vserver-CRD-1 -precedence URL

 Done

> show cr vserver Vserver-CRD-1

        Vserver-CRD-1 (*:80) - HTTP     Type: CONTENT

        State: UP  ARP:DISABLED

        Client Idle Timeout: 180 sec

        Down state flush: ENABLED

        Disable Primary Vserver On Down : DISABLED

        Default:        Content Precedence: URL Cache: TRANSPARENT

        On Policy Match: ORIGIN L2Conn: OFF     OriginUSIP: OFF

        Redirect: POLICY        Reuse: ON       Via: ON ARP: OFF

1)      Cache bypass  Policy: bypass-cache-control
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
2)      Cache bypass  Policy: Policy-CRD

 Done

>
```

Configure precedence for policy evaluation by using the GUI

1. Navigate to Traffic Management > Content Switching > Virtual Servers.
2. In the details pane, select the virtual server for which you want to configure precedence, (for example, **Vserver-CS-1**), and then click Open.
3. In the Configure Virtual Server (Content Switching) dialog box, on the Advanced tab, next to Precedence, click Rule or URL, and then click OK.

Administer a cache redirection virtual server

To administer a cache redirection virtual server, you need to view cache redirection statistics. You might need to enable or disable cache redirection servers, or direct policy hits to the cache instead of the origin. Administrative tasks also include backing up a cache redirection virtual server and managing client connections.

View cache redirection virtual server statistics

You can view properties of a cache redirection virtual server and statistics on the traffic that has passed through a cache redirection virtual server. You can also view the cache redirection virtual servers and policies that you have bound to load balancing virtual servers.

To view statistics for a specific cache redirection virtual servers, use the name parameter to specify the name of the virtual server for which statistics will be displayed. Otherwise, statistics for all cache redirection virtual servers are displayed. Maximum Length: 127

View statistics for a cache redirection virtual server by using the CLI

At the command prompt, type:

```
stat cr vserver [<name>]
```

Example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
> stat cr vserver Vserver-CRD-1

Vserver Summary

                         IP  port     Protocol        State

Vser...CRD-1         0.0.0.0    80         HTTP           UP

VServer Stats:

                                        Rate (/s)               Total

Requests                                        0                   0

Responses                                       0                   0

Request bytes                                   0                   0

Response bytes                                  0                   0

 Done

>
```

View statistics for a cache redirection virtual server by using the GUI

1. Navigate to Traffic Management > Cache Redirection > Virtual Servers
2. In the details pane, select the virtual server for which you want to view statistics, (for example, **Vserver-CRD-1**), and then click Statistics.

Omit the server name to display basic statistics for all cache redirection virtual servers. Include the server name to display detailed statistics for that virtual server, including number and size of requests and responses that pass through the virtual server

© 1997–2026 Citrix Systems, Inc. All rights reserved.

View the statistics of a cache redirection virtual server by using the monitoring and dashboard utilities

1. To view the statistics by using the monitoring utilities, click the Monitoring tab.
2. In the Select Group drop-down menu, choose CR Virtual Servers. A list of cache redirection virtual servers appears.
3. To view the statistics by using the dashboard utilities, click the Dashboard tab.
4. Click Applet Client or Web Start Client next to Statistical Utility.
5. In the Select Group drop-down menu, choose CR Virtual Servers. The dashboard displays summary statistics for the cache redirection virtual servers.
6. To see a chart of virtual server activity, click Chart. A graphical representation of the virtual server statistics appears.

Enable or disable a cache redirection virtual server

When you create a cache redirection virtual server, it is enabled by default. If you disable a cache redirection virtual server, its state changes to OUT OF SERVICE and it stops redirecting cacheable client requests. However, the NetScaler appliance continues to respond to ARP and ping requests for the IP address of this virtual server.

Enable or disable a cache redirection virtual server by using the CLI

At the command line, type one of the following commands:

```
-  enable cr vserver <name>

-  show cr vserver <name>

-  disable cr vserver <name>

-  show cr vserver <name>
```

Examples:

```
> enable cr vserver Vserver-CRD-1

 Done

> show cr vserver Vserver-CRD-1
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
        Vserver-CRD-1 (*:80) - HTTP     Type: CONTENT

        State: UP  ARP:DISABLED

        Client Idle Timeout: 180 sec

        Down state flush: ENABLED

        Disable Primary Vserver On Down : DISABLED

        Default:        Content Precedence: URL Cache: TRANSPARENT

        On Policy Match: ORIGIN L2Conn: OFF     OriginUSIP: OFF

        Redirect: POLICY        Reuse: ON       Via: ON ARP: OFF

1)      Cache bypass  Policy: bypass-cache-control

2)      Cache bypass  Policy: Policy-CRD

 Done

>

> disable cr vserver Vserver-CRD-1

 Done

> show cr vserver Vserver-CRD-1

        Vserver-CRD-1 (*:80) - HTTP     Type: CONTENT

        State: OUT OF SERVICE  ARP:DISABLED

        Client Idle Timeout: 180 sec

        Down state flush: ENABLED

        Disable Primary Vserver On Down : DISABLED
```

 Done

>
```

Enable or disable a cache redirection virtual server by using the GUI

1. Navigate to Traffic Management > Cache Redirection > Virtual Servers.
2. In the navigation pane, expand Cache Redirection, and then click Virtual Servers.
3. In the details pane, select the virtual server that you want to enable or disable, (for example, **Vserver-CRD-1**), and then click Statistics.
4. In the Proceed dialog box, click Yes.

Direct policy requests to cache instead of origin web server

By default, when a request matches a policy, the NetScaler appliance forwards the request either to the origin server directly, or to a load balancing virtual server for the origin, depending on how you have configured cache redirection.

You can change the default behavior so that when a request matches a policy, the request is forwarded to a load balancing virtual server for the cache.

To change the destination for a policy request to the origin or the cache, use the `onPolicyMatch` parameter, which specifies where to send requests that match the cache redirection policy.

The valid options are:

1. `CACHE` - Directs all matching requests to the cache.
2. `ORIGIN` - Directs all matching requests to the origin server.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE:

For this option to work, you must select the cache redirection type as `POLICY`.

Possible values: `CACHE`, `ORIGIN`

Default value: `ORIGIN`

Change the destination for a policy request to the origin or the cache by using the CLI

At the command prompt, type the following commands to change the destination for a policy hit and verify the configuration:

```
set cr vserver <name> [-onPolicyMatch (ORIGIN | CACHE)]
```

```
show cr vserver <name>
```

Example:

```
> set cr vserver Vserver-CRD-1 -onPolicyMatch CACHE

 Done

> show cr vserver Vserver-CRD-1

        Vserver-CRD-1 (*:80) - HTTP     Type: CONTENT

        State: UP  ARP:DISABLED

        Client Idle Timeout: 180 sec

        Down state flush: ENABLED

        Disable Primary Vserver On Down : DISABLED

        Default:        Content Precedence: URL Cache: TRANSPARENT

        On Policy Match: CACHE  L2Conn: OFF     OriginUSIP: OFF

        Redirect: POLICY        Reuse: ON       Via: ON ARP: OFF
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
1)      Cache bypass  Policy: bypass-cache-control

2)      Cache bypass  Policy: Policy-CRD

 Done
```

Change the destination for a policy hit to the origin or the cache by using the GUI

1. Navigate to **Traffic Management > Cache Redirection > Virtual Servers**.
2. In the details pane, select the virtual server for which you want to change the destination for a policy request, (for example, **Vserver-CRD-1**), and then click Open.
3. In the **Configure Virtual Server (Cache Redirection)** dialog box, click **Advanced**.
4. Select **CACHE** or **ORIGIN** from the **Redirect To** drop-down list.
5. Click **OK**.

Back up a cache redirection virtual server

Cache redirection can fail if the primary virtual server fails, or if it is unable to handle excessive traffic. You can specify a backup virtual server to take over the processing of traffic when the primary virtual server fails.

To specify a backup cache redirection virtual server, use the backupVServer parameter, which specifies Backup Virtual Server. Maximum Length: 127

Specify a backup cache redirection virtual server by using the CLI

At the command prompt, type the following commands to specify a backup cache redirection virtual server and verify the configuration:

```
-  set cr vserver <name> [-backupVServer <string>]

-  show cr vserver <name>
```

Example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
> set cr vserver Vserver-CRD-1 -backupVServer Vserver-CRD-2

 Done

> show cr vserver Vserver-CRD-1

        Vserver-CRD-1 (*:80) - HTTP     Type: CONTENT

        State: UP  ARP:DISABLED

        Client Idle Timeout: 180 sec

        Down state flush: ENABLED

        Disable Primary Vserver On Down : DISABLED

        Default:        Content Precedence: URL Cache: TRANSPARENT

        On Policy Match: CACHE  L2Conn: OFF     OriginUSIP: OFF

        Redirect: POLICY        Reuse: ON       Via: ON ARP: OFF

        Backup: Vserver-CRD-2

1)      Cache bypass  Policy: bypass-cache-control

2)      Cache bypass  Policy: Policy-CRD

 Done
```

Specify a backup cache redirection virtual server by using the GUI

1. Navigate to **Traffic Management > Cache Redirection > Virtual Servers**.
2. In the details pane, select the virtual server for which you want to change the destination for a policy request, (for example, **Vserver-CRD-1**), and then click Open.
3. In the Configure Virtual Server (Cache Redirection) dialog box, select the Advanced tab.
4. In the Backup Virtual Server drop-down list, select the virtual server.
5. Click OK.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Manage client connections for a virtual server

You can configure timeouts on a cache redirection virtual server so that client connections are not kept open indefinitely. You can also insert Via headers in requests. To possibly reduce network congestion, you can reuse open TCP connections. You can enable or disable delayed cleanup of cache redirection virtual server connections.

You can configure the appliance to send ICMP responses to PING requests according to your settings. On the IP address corresponding to the virtual server, set the ICMP RESPONSE to VSVR_CNTRLD, and on the virtual server, set the ICMP VSERVER RESPONSE.

The following settings can be made on a virtual server:

- When you set ICMP VSERVER RESPONSE to PASSIVE on all virtual servers, appliance always responds.
- When you set ICMP VSERVER RESPONSE to ACTIVE on all virtual servers, appliance responds even if one virtual server is UP.
- When you set ICMP VSERVER RESPONSE to ACTIVE on some and PASSIVE on others, appliance responds even if one virtual server set to ACTIVE is UP.

This document includes the following information:

- Configure client timeout
- Insert Via headers in the requests
- Reuse TCP connections
- Configure delayed connection cleanup

Configure client timeout

You can specify expiration of client requests by setting a timeout value for the cache redirection virtual server. The timeout value is the number of seconds for which the cache redirection virtual server waits to receive a response for the client request.

To configure a time-out value, use the cltTimeout parameter, which specifies the time, in seconds, after which the NetScaler appliance closes any idle client connections. The default value is 180sec for HTTP/SSL-based services and 9000sec for TCP-based services.

Configure client timeout by using the CLI

At the command prompt, type the following commands to configure client timeout and verify the configuration:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
-  set cr vserver <name> [-cltTimeout <secs>]

-  show cr vserver <name>
```

Example:

```
> set cr vserver Vserver-CRD-1 -cltTimeout 6000

 Done

> show cr vserver Vserver-CRD-1

        Vserver-CRD-1 (*:80) - HTTP     Type: CONTENT

        State: UP  ARP:DISABLED

        Client Idle Timeout: 6000 sec

        Down state flush: ENABLED

        Disable Primary Vserver On Down : DISABLED

        Default:        Content Precedence: URL Cache: TRANSPARENT

        On Policy Match: CACHE  L2Conn: OFF     OriginUSIP: OFF

        Redirect: POLICY        Reuse: ON       Via: ON ARP: OFF

        Backup: Vserver-CRD-2

1)      Cache bypass  Policy: bypass-cache-control

2)      Cache bypass  Policy: Policy-CRD

 Done
```

Configure client timeout by using the GUI

1. Navigate to Traffic Management > Cache Redirection > Virtual Servers.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. In the details pane, select the virtual server for which you want to configure client timeout, (for example, **Vserver-CRD-1**), and then click Open.
3. In Configure Virtual Server (Cache Redirection) dialog box, select the Advanced tab.
4. In the Client Time-out(secs) text box, enter the time-out value in seconds.
5. Click OK.

Insert Via headers in the requests

A Via header lists the protocols and recipients between the start and end points for a request or a response and informs the server of proxies through which the request was sent. You can configure the cache redirection virtual server to insert a Via header in each HTTP request. The via parameter is enabled by default when you create a cache redirection virtual server.

To enable or disable Via-header insertion in client requests, use the via parameter, which specifies the state of the system in inserting a Via header in the HTTP requests.

Possible values: ON, OFF

Default value: ON

Enable or disable Via-header insertion in client requests by using the CLI

At the command prompt, type:

```
-  set cr vserver <name> [-via (ON|OFF)]

-  show cr vserver <name>
```

Example:

```
> set cr vserver Vserver-CRD-1 -via ON

 Done

> show cr vserver Vserver-CRD-1

        Vserver-CRD-1 (*:80) - HTTP     Type: CONTENT

        State: UP  ARP:DISABLED

        Client Idle Timeout: 6000 sec
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
        Down state flush: ENABLED

        Disable Primary Vserver On Down : DISABLED

        Default:        Content Precedence: URL Cache: TRANSPARENT

        On Policy Match: CACHE  L2Conn: OFF     OriginUSIP: OFF

        Redirect: POLICY        Reuse: ON       Via: ON ARP: OFF

        Backup: Vserver-CRD-2

1)      Cache bypass  Policy: bypass-cache-control

2)      Cache bypass  Policy: Policy-CRD

 Done

>
```

Enable or disable Via-header insertion in client requests by using the GUI

1. Navigate to Traffic Management > Cache Redirection > Virtual Servers.
2. In the details pane, select the virtual server for which you want to configure client timeout, (for example, **Vserver-CRD-1**), and then click Open.
3. In Configure Virtual Server (Cache Redirection) dialog box, select the Advanced tab.
4. Select the Via check box.
5. Click OK.

Reuse TCP connections

You can configure the NetScaler appliance to reuse TCP connections to the cache and origin servers across client connections. This can improve performance by saving the time required to establish a session between the server and the appliance. The reuse option is enabled by default when you create a cache redirection virtual server.

To enable or disable the reuse of TCP connections, use the reuse parameter, which specifies the state of reuse of TCP connections to the cache or origin servers across client connections.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Possible values: ON, OFF

Default value: ON

Enable or disable the reuse of TCP connections by using the CLI

At the command prompt, type:

```
-  set cr vserver <name> [-reuse (ON|OFF)]

-  show cr vserver <name>
```

Example:

```
> set cr vserver Vserver-CRD-1 -reuse ON

 Done

> show cr vserver Vserver-CRD-1

        Vserver-CRD-1 (*:80) - HTTP     Type: CONTENT

        State: UP  ARP:DISABLED

        Client Idle Timeout: 6000 sec

        Down state flush: ENABLED

        Disable Primary Vserver On Down : DISABLED

        Default:        Content Precedence: URL Cache: TRANSPARENT

        On Policy Match: CACHE  L2Conn: OFF     OriginUSIP: OFF

        Redirect: POLICY        Reuse: ON       Via: ON ARP: OFF

        Backup: Vserver-CRD-2

1)      Cache bypass  Policy: bypass-cache-control

2)      Cache bypass  Policy: Policy-CRD
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
 Done
```

Enable or disable the reuse of TCP connections by using the GUI

1. Navigate to Traffic Management > Cache Redirection > Virtual Servers.
2. In the details pane, select the virtual server for which you want to configure client timeout, (for example, **Vserver-CRD-1**), and then click Open.
3. In Configure Virtual Server (Cache Redirection) dialog box, select the Advanced tab.
4. Select the Reuse check box.
5. Click OK.

Configure delayed connection cleanup

The down state flush option performs delayed cleanup of connections on a cache redirection virtual server. The down state flush option is enabled by default when you create a cache redirection virtual server.

To enable or disable the down state flush option, set the downStateFlush parameter.

Possible values: ENABLED, DISABLED

Default value: ENABLED

Enable of disable the down state flush option by using the CLI

At the command prompt, type the following commands to configure delayed connection clean up and verify the configuration:

```
-  set cr vserver <name> [-downStateFlush (ENABLED | DISABLED)]

-  show cr vserver <name>
```

Example:

```
> set cr vserver Vserver-CRD-1 -downStateFlush ENABLED

 Done

> show cr vserver Vserver-CRD-1

        Vserver-CRD-1 (*:80) - HTTP     Type: CONTENT
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
        State: UP  ARP:DISABLED

        Client Idle Timeout: 6000 sec

        Down state flush: ENABLED

        Disable Primary Vserver On Down : DISABLED

        Default:        Content Precedence: URL Cache: TRANSPARENT

        On Policy Match: CACHE  L2Conn: OFF     OriginUSIP: OFF

        Redirect: POLICY        Reuse: ON       Via: ON ARP: OFF

        Backup: Vserver-CRD-2

1)      Cache bypass  Policy: bypass-cache-control

2)      Cache bypass  Policy: Policy-CRD

 Done
```

Enable or disable the reuse of TCP connections by using the GUI

1. Navigate to Traffic Management > Cache Redirection > Virtual Servers.
2. In the details pane, select the virtual server for which you want to configure client timeout, (for example, **Vserver-CRD-1**), and then click Open.
3. In Configure Virtual Server (Cache Redirection) dialog box, click Advanced tab.
4. Select the Down state flush check box.
5. Click OK.

Enable external TCP health check for UDP virtual servers

In public clouds, you can use the NetScaler appliance as a second-tier load balancer when the native load balancer is used as a first tier. The native load balancer can be an application load balancer (ALB) or a network load balancer (NLB). Most of the public clouds do not support UDP health probes in their native load balancers. To monitor the health of the UDP application, public

© 1997–2026 Citrix Systems, Inc. All rights reserved.

clouds recommend adding a TCP-based endpoint to your service. The endpoint reflects the health of the UDP application.

The NetScaler appliance supports external TCP-based health check for a UDP virtual server. This feature introduces a TCP listener on the VIP of the cache redirection virtual server and the configured port. The TCP listener reflects the status of the virtual server.

To enable external TCP health check for UDP virtual servers by using CLI

At the command prompt, type the following command to enable an external TCP health check with the tcpProbePort option:

```
add cr vserver <name> <serviceType> -tcpProbePort <tcpProbePort>
```

Example:

```
add cr vserver Vserver-CR-1 HTTP -tcpProbePort 80
```

To enable external TCP health check for UDP virtual servers by using GUI

1. Navigate to **Traffic Management > Cache Redirection > Virtual Servers**, and then create a virtual server.
2. Click **Add** to create a virtual server.
3. In the **Basic Settings** pane, add the port number in the **TCP Probe Port** field.
4. Click **OK**.

N-Tier cache redirection

To efficiently handle large amounts of cached data, typically several gigabytes per second, an Internet Service Provider (ISP) deploys several dedicated cache servers. The cache redirection feature of the NetScaler appliance can help load balance the cache servers, but a single appliance or a couple of appliances might not efficiently handle the large volume of traffic.

You can solve the problem by deploying the NetScaler appliances in two tiers (layers), where the appliances in the upper tier load balance those in the lower tier and the appliances in the lower tier load balance the cache servers. This arrangement is called *n-tier cache redirection*.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

For purposes such as auditing and security, an ISP has to track client details such as the IP address, information provided, and the time of the interaction. Therefore, client connections through a NetScaler appliance have to be fully transparent. However, if you configure transparent cache redirection, with the NetScaler appliances deployed in parallel, the IP address of the client has to be shared among all the appliances. Sharing of the client IP address creates a conflict that makes network devices, such as routers, cache servers, origin servers, and other NetScaler appliances, unable to determine the appliance, and therefore the client, to which the response should be sent.

How N-tier cache redirection Is implemented

To solve the problem, appliance n-tier cache redirection splits the source port range among the appliances in the lower tier and includes the client IP address in the request sent to the cache servers. The upper-tier NetScaler appliances are configured to do sessionless load balancing in order to avoid unnecessary load on the appliances.

When the lower-tier NetScaler appliance communicates with a cache server, it uses a mapped IP address (MIP) to represent the source IP address. Therefore, the cache server can identify the appliance from which it received the request and send the response to the same appliance.

The lower-tier NetScaler appliance inserts the client IP address into the header of the request sent to the cache server. The client IP in the header helps the appliance to determine the client to which the packet should be forwarded when it receives the response from a cache server, or the origin server in case of a cache miss. The origin server determines the response to be sent according to the client IP inserted in the request header.

The origin server sends the response to an upper-tier appliance, including the source port number from which the origin server received the request. The entire source port range, 1024 to 65535, is distributed among the lower-tier NetScaler appliances. Each lower-tier appliance is exclusively assigned a group of addresses within the range. This allotment enables the upper-tier appliance to unambiguously identify the lower-tier NetScaler appliance that sent the request to the origin server. The upper-tier appliance can therefore forward the response to the correct lower-tier appliance.

The upper-tier NetScaler appliances are configured to do policy-based routing, and the routing policies are defined to determine the IP address of the destination appliance from the source port range.

Setup necessary for configuring N-Tier CRD

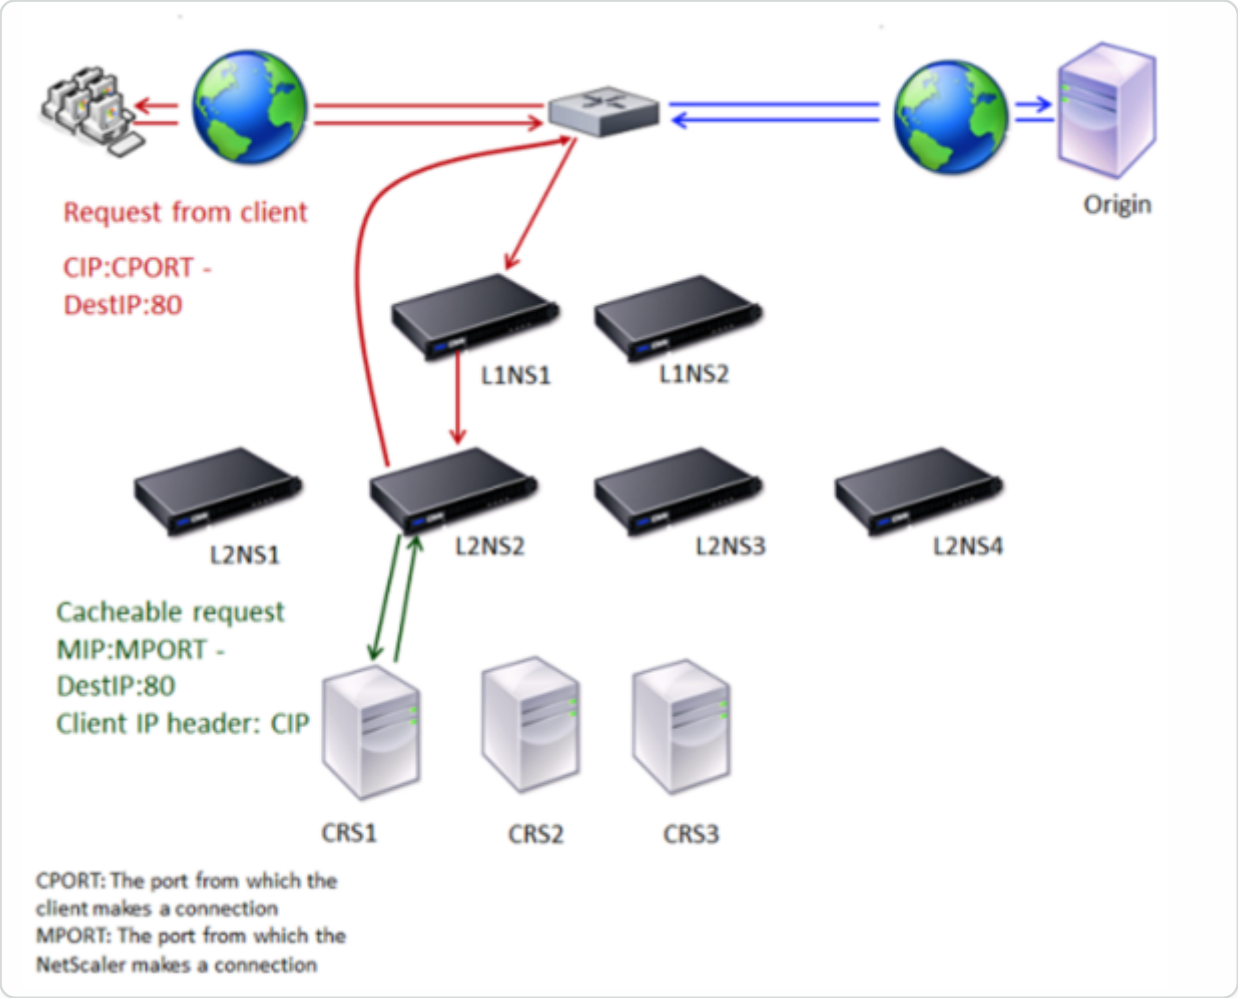
The following setup is necessary for the functioning of n-tier cache redirection:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

For each upper-tier NetScaler appliance:

- Enable Layer 3 mode.
- Define policies for policy-based routes (PBRs) so that traffic is forwarded according to the range of the destination port.
- Configure a load balancing virtual server.
- Configure the virtual server to listen to all the traffic coming from the client. Set the Service Type/Protocol to be ANY and IP Address as asterisk (*).
- Enable sessionless load balancing with MAC-based redirection mode to avoid unnecessary load on the upper-tier NetScaler appliances.
- Make sure that the Use Proxy Port option is enabled.
- Create a service for each lower-tier appliance and bind all the services to the virtual server.

For each lower-tier NetScaler appliance,



- Configure the cache redirection port range on the appliance. Assign an exclusive range to each lower-tier appliance.
- Configure a load balancing virtual server and enable MAC-based redirection.
- Create a service for each cache server that is to be load balanced by this appliance. When creating the service, enable insertion of client IP in the header. Then, bind all the services to the load balancing virtual server.
- Configure a transparent mode cache redirection virtual server with the following settings:
    - Enable the Origin USIP option.
    - Add a source IP expression to include the client IP in the header.
    - Enable the Use Port Range option.

How N-tier cache redirection works during a cache hit

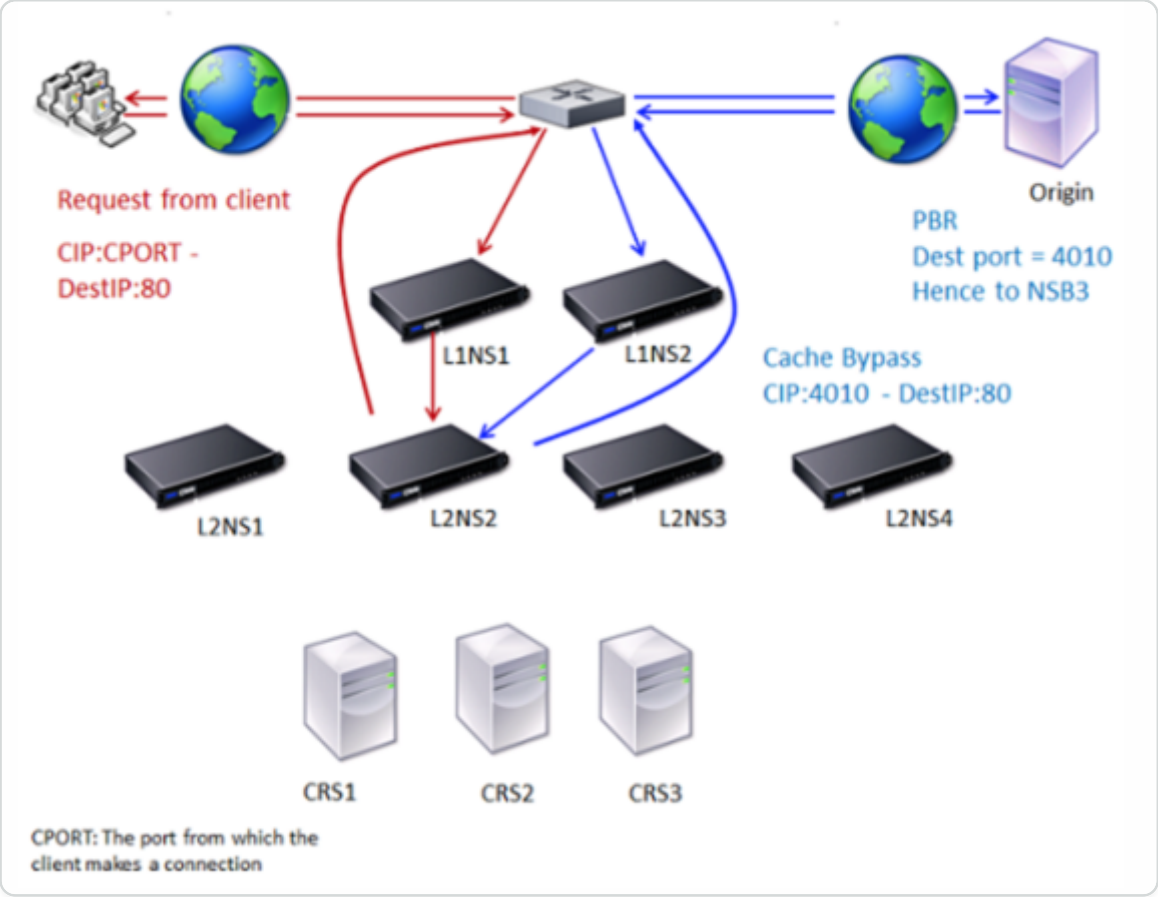
The following figure shows how cache redirection works when a client request is cacheable and the response is sent from a cache server.

Figure 1. Cache Redirection in Case of a Cache Hit

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Two NetScaler appliances, L1NS1 and L1NS2, are deployed in the upper tier, and four NetScaler appliances, L2NS1, L2NS2, L2NS3, and L2NS4, are deployed in the lower tier. Client A sends a request, which is forwarded by the router. Cache servers CRS1, CRS2, and CRS3 service the cache requests. Origin Server O services the uncached requests.

Traffic flow



1. Client sends a request, and the router forwards it to L1NS1.
2. L1NS1 load balances the request to L2NS2.
3. L2NS2 load balances the request to the cache server CRS1, and the request is cacheable. L2NS2 includes the client IP in the request header.
4. CRS1 sends the response to L2NS2 because L2NS2 used its MIP as the source IP address when connecting to CRS1.
5. With the help of the client IP address in the request header, L2NS2 identifies the client from which the request came. L2NS2 directly sends the response to the router, avoiding unnecessary load on the appliance in the upper tier.
6. The router forwards the response to Client A.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

How N-tier cache redirection works during a cache bypass

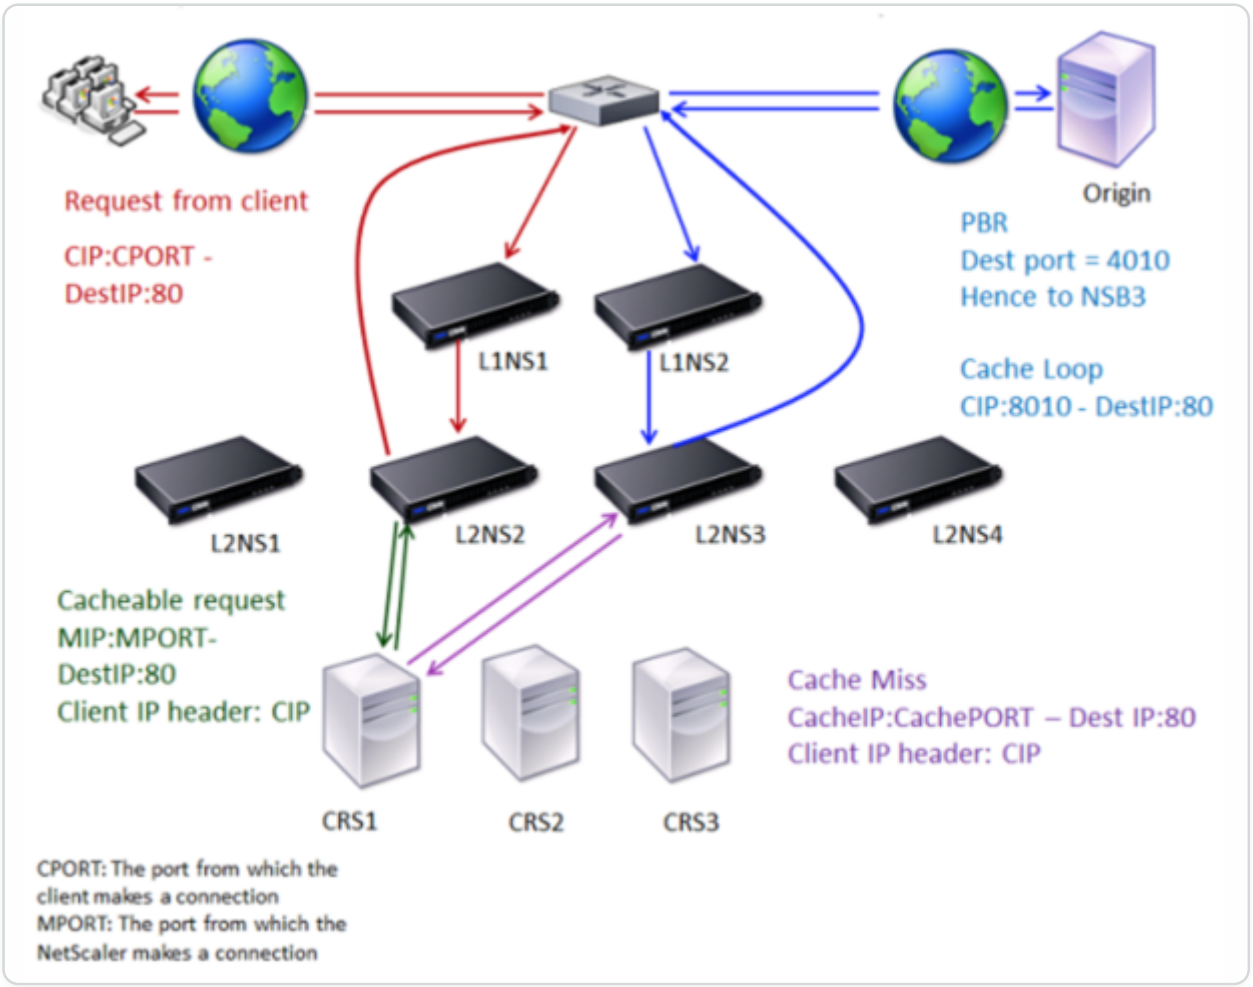
The following figure shows how cache redirection works when a client request is sent to an origin server for a response.

Figure 2. Cache Redirection in Case of a Cache Bypass

Two NetScaler appliances, L1NS1 and L1NS2, are deployed in the upper tier, and four NetScaler appliances, L2NS1, L2NS2, L2NS3, and L2NS4, are deployed in the lower tier. Client A sends a request, which is forwarded by the router. Cache servers CRS1, CRS2, and CRS3 service the cache requests. Origin Server O services the uncached requests.

Traffic flow

1. Client sends a request, and the router forwards it to L1NS1.
2. L1NS1 load balances the request to L2NS2.
3. The request is uncacheable (cache bypass). Therefore, L2NS2 sends the request to the origin server through the router.
4. The origin server sends the response to an upper-tier appliance, L1NS2.
5. According to the PBR policies, L1NS2 forwards the traffic to the appropriate appliance in the lower tier, L2NS2.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

6. L2NS2 uses the client IP address in the request header to identify the client from which the request came and sends the response directly to the router, avoiding unnecessary load on the appliance in the upper tier.
7. The router forwards the response to Client A.

How N-tier cache redirection works during a cache miss

The following figure shows how cache redirection works when a client request is not cached.

Figure 3. Cache Redirection in Case of a Cache Miss

Two NetScaler appliances, L1NS1 and L1NS2, are deployed in the upper tier, and four NetScaler appliances, L2NS1, L2NS2, L2NS3, and L2NS4, are deployed in the lower tier. Client A sends a request, which is forwarded by the router. Cache servers CRS1, CRS2, and CRS3 service the cache requests. Origin Server O services the uncached requests.

Traffic flow

1. Client sends a request, and the router forwards it to L1NS1.
2. L1NS1 load balances the request to L2NS2.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. L2NS2 load balances the request to the cache server CRS1 because the request is cacheable.
4. CRS1 does not have the response (cache miss). CRS1 forwards the request to the origin server through the appliance in the lower tier. L2NS3 intercepts the traffic.
5. L2NS3 takes the client IP from the header and forwards the request to the origin server. The source port included in the packet is the L2NS3 port from which the request is sent to the origin server.
6. The origin server sends the response to an upper-tier appliance, L1NS2.
7. According to the PBR policies, L1NS2 forwards the traffic to the appropriate appliance in the lower tier, L2NS3.
8. L2NS3 forwards the response to the router.
9. The router forwards the response to Client A.

Configure the upper-tier NetScaler appliances

Configure each of the upper-tier NetScaler appliances as follows.

Configure an upper-tier appliance for n-tier cache redirection by using the command CLI

At the command prompt, type the following commands:

- `add service <name>@ <serviceIP> <serviceType> <port>`

  Run this command for each service to be added.

- `add lb vserver <name>@ ANY * <port> -persistenceType <persistenceMethod> -lbMethod <lbMethod> -m MAC -sessionless ENABLED -cltTimeout <client_Timeout_Value>`
- `bind lb vserver <name>@ <serviceName>`

  Run this command for each service to be bound.

- `enable ns mode l3`
- `add ns pbr <name> <action> -srcPort <sourcePortNumber> -destPort <startPortNumber-endPortNumber> -nexthop <serviceIpAddress> -protocol TCP`
- `apply ns pbrs`

  Run this command after adding all the necessary PBRs.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure an upper-tier appliance for n-tier cache redirection by using the GUI

1. Enable L3 mode:
    a. In the navigation pane, click **System**, and then click **Settings**.
    b. In **Settings**, click **Configure modes**.
    c. Select **Layer 3 Mode (IP Forwarding)**.
    d. Click **OK**.
2. Configure policy-based routing (PBR):
    a. Navigate to **System > Network > PBRs**.
    b. In the **Policy-Based Routing (PBRs)** pane, click **Add**.
    c. Type a name for the PBR.
    d. Select the action as **Allow**.
    e. In **Next Hop**, type the IP address of the service, which represents a lower-tier appliance.
    f. In **Protocol**, select **TCP**.
    g. Type the source port and the range of the destination port corresponding to the lower-tier appliance being added.
    h. Click **Create**.
    i. In the details pane, select the PBR and click **Apply**.
    j. Repeat these steps for each lower-tier appliance.
3. Create a service for each lower-tier appliance:
    a. Navigate to **Traffic Management > Load Balancing > Services**.
    b. In the details pane, click **Add**.
    c. Specify the name, protocol, IP address, and port. The protocol should be **ANY**.
    d. Click **Create**.
4. Configure a load balancing virtual server:
    a. Navigate to **Traffic Management > Load Balancing > Virtual Servers**.
    b. In the details pane, click **Add**.
    c. Specify the name, protocol, IP address, and port. The protocol should be ANY and the IP address should be *.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

d. In **Services**, select the services that represent the lower-tier NetScaler appliances.

e. In **Advanced**, select **Redirection Mode** as **MAC Based** and select **Sessionless**.

f. Click **Create**.

Configure the lower-tier NetScaler appliances

Configure each of the lower-tier NetScaler appliances as follows.

Configure a lower-tier appliance for n-tier cache redirection by using the CLI

At the command prompt, type the following commands:

- `add service <name>@ <cacheServiceIP> <serviceType> <port> -cip ENABLED "ClientIP" –cachetype transparent`

  Repeat for each cache server.

- `add lb vserver <name>@ <serviceType> -m MAC`
- `bind lb vserver <name>@ <cacheServiceName>`

  Repeat for each cache server.

- `add cr vserver <name> <serviceType> * <port> -srcIPExpr "HTTP.REQ.HEADER("ClientIP")" -originusip ON –usePortRange ON`
- `set ns param-crPortRange <startPortNumber-endPortNumber>`

Configure a lower-tier appliance for n-tier cache redirection by using the GUI

1. Create a service for each cache server. To create a service:

   a. Navigate to Traffic Management > Load Balancing > Services.

   b. In the details pane, click Add, and specify the name and protocol. Clear the Directly Addressable check box.

   c. In the Advanced tab, select the Override Global check box and the Client IP check box, and then in the Header box, type ClientIP.

   d. In the Cache Type box, select Transparent Cache.

   e. Click Create.

2. Configure a load balancing virtual server:

   a. Navigate to Traffic Management > Load Balancing > Virtual Services.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

b. In the details pane, click Add and specify the name, protocol, IP address, and port. The IP address should be an asterisk (*).

c. In the Services tab, select the services that represent the cache servers.

d. In the Advanced tab, for Redirection Mode, select MAC Based.

e. Click Create.

3. Configure a cache redirection virtual server:

a. Navigate to Traffic Management > Load Balancing > Virtual Services.

b. In the details pane, click Add and specify the name, protocol, IP address, and port. The IP address should be *.

c. For Cache Type, select Transparent.

d. On the Advanced tab, in the Cache Server box, select the new load balancing virtual server and check the Origin USIP and Use Port Range check boxes. In the Source IP Expression box, type HTTP.REQ.HEADER("ClientIP").

e. Click Create.

4. Assign a source port range for the appliance:

a. In the navigation pane, click System, and then click Settings.

b. In the Settings group, click the Change global system settings link.

c. In the Cache Redirection Port Range group, specify the port range for the appliance by typing a port number for Start Port and a port number for End Port.

d. Click OK.

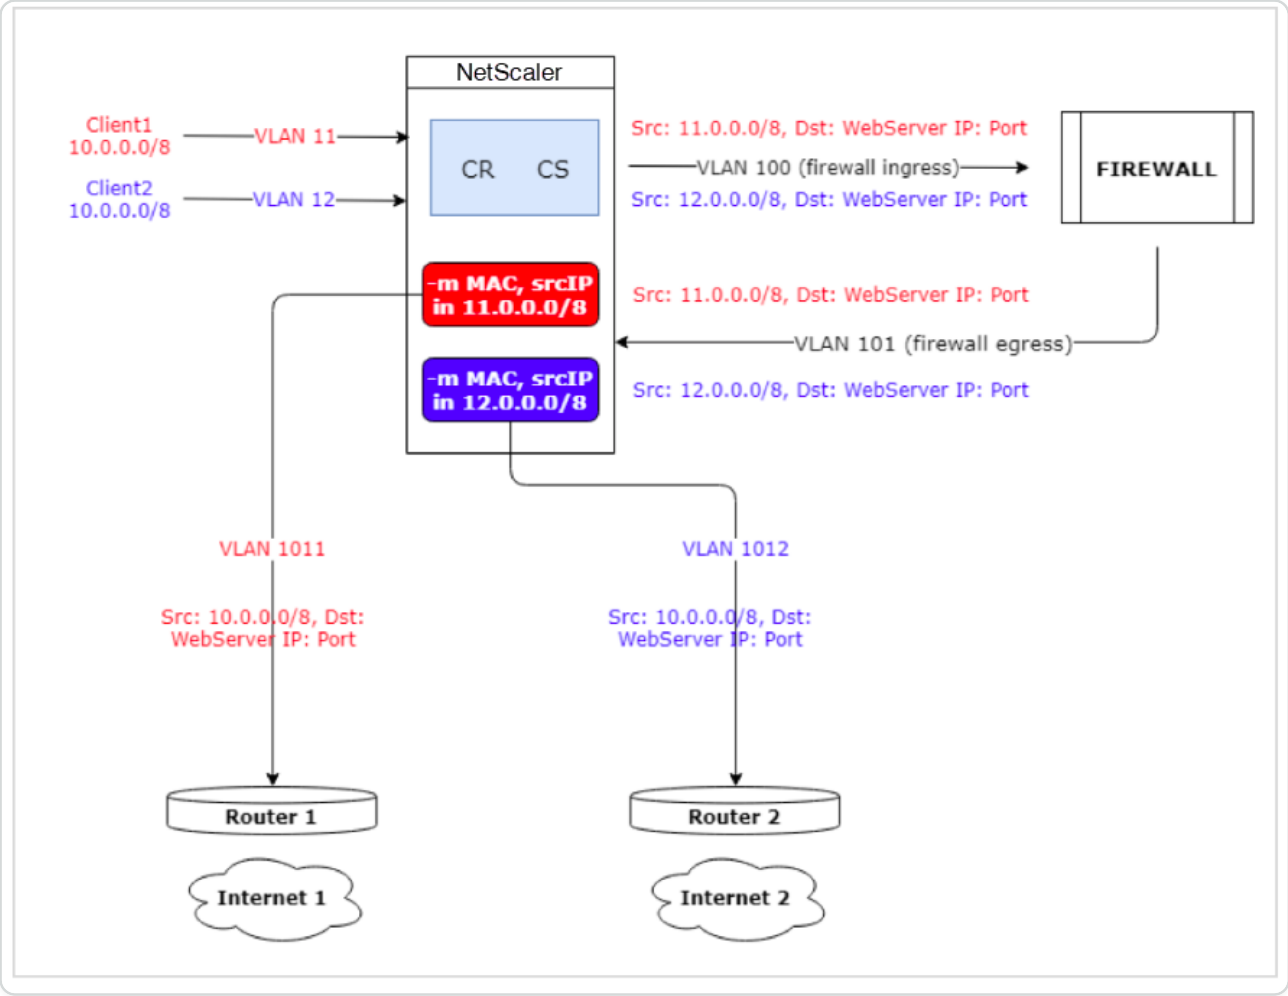
Translate destination IP address of a request to origin IP address

You can configure the forward proxy cache redirection virtual server on the NetScaler appliance to translate the destination IP address of the request landing on the cache redirection virtual server to the origin server IP address. This translation occurs irrespective of whether the request is sent to the cached servers or the origin server. Previously, forward proxy cache redirection virtual server in service provider environment could not be effectively used to send traffic across firewall because of the limitations in cache redirection using content switching policies. The cache redirection virtual server did not translate the origin IP address into the destination IP when the packet was sent to

© 1997–2026 Citrix Systems, Inc. All rights reserved.

cache. The destination IP address was that of the origin server only when the requests were served from cached server.

Note: Translation of destination IP address of a request to origin IP address is not supported for a transparent cache redirection virtual server. For a transparent cache redirection virtual server, this option must be set to OFF.



Use case

In a deployment that has NetScaler appliance configured for forward proxy cache redirection, firewall, and reused client IP addresses, firewall cannot distinguish/use the reused IP addresses. Therefore, these reused IP addresses must be translated to different IP addresses. To translate the reused IP addresses, the NetScaler appliance must perform the following:

1. Query a DNS load balancing virtual server for resolution of the destination.
2. Update the origin IP address and port number in the destination.
3. Send the request back to the firewall.

Consider the following deployment that has a NetScaler appliance configured for forward proxy cache redirection, firewall, two routers (Router 1 and Router 2). Network traffic flows to Internet 1 through Router 1 and to Internet 2 through Router 2 respectively.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

In this example, input requests from clients come from two different VLANs, VLAN11 or VLAN12. The client IP address (10.0.0.0) is reused. Based on the cache redirection and content switching policies, the request can go directly to the origin server or to the firewall.

- If the request has to bypass the firewall and go to the internet, then based on the input request VLAN, either Router 1 or Router 2 is selected and the request is sent to Internet 1 or Internet 2.
- If the request has to go through the firewall, then the source IP of the request must be translated to specific IP address. The translated IP address can be used to identify the VLAN through which request has come. For example, if the input request is coming from VLAN11, then the source IP address is translated to 11.x.x.x. If the request is coming from VLAN12, then the source IP address is translated to 12.x.x.x.

After the firewall processes the request, the request is sent back to the appliance. Using the combination of listen policy and net profiles, the appliance then translates the source IP address back to the original IP address and sends the request to Router 1 or Router 2 based on the input VLAN ID.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Note: The mode of the load balancing virtual server that is bound to the cache must always be set to MAC mode. Though IP mode for this feature is not blocked, setting to IP mode leads to unexpected behavior.

To translate the destination IP address and port number of the request to origin IP address by using the CLI

At the command prompt, type;

```
set cr vserver <vsname> -useoriginIpPortForCache <YES|NO>
```

Example:

```
set cr vserver cvsrv1 -useoriginIpPortForCache YES
```

When useoriginIpPortForCache is set to Yes and if the request must be served from the cached servers, then the request's destination IP is translated to the origin server IP address.

Note: If useoriginIpPortForCache is enabled, always set the load balancing virtual server that is bound to the cache to MAC mode.

To translate the destination IP address and port of the request to origin IP address by using the GUI

1. Navigate to **Traffic Management** > **Cache Redirection** > **Virtual Servers** and click **Add**.
2. Specify the details of the cache redirection virtual server.
3. Select **Use Origin IP Port** for cache to enable translation of the destination IP address of the request to origin IP address.
4. Click **OK**.

Clustering

NOTE

This feature is available with a NetScaler Advanced or Premium edition license.

A NetScaler cluster is a group of nCore appliances working together as a single system image. Each appliance of the cluster is called a node. The cluster can have one appliance or as many as 32 NetScaler nCore hardware or virtual appliances as nodes.

The client traffic is distributed between the nodes to provide high availability, high throughput, and scalability.

To create a cluster, you must perform the following steps:

- Add the appliances as cluster nodes.
- Set up communication between the nodes.
- Set up links to the client and server networks.
- Configure the appliances, and configure the distribution of client and server traffic.

Supportability matrix for NetScaler cluster

Clustering in the NetScaler appliance supports a wide-spread of features in NetScaler configurations.

The following table lists the NetScaler features and provides the supportability status across different NetScaler releases of cluster setups. The supportability status of some NetScaler features in a NetScaler BLX™ cluster is different than a NetScaler non-BLX (MPX, or VPX, SDX ADC) cluster.

IMPORTANT

The "Node-level" entry in the table indicates that the feature is supported only on individual cluster nodes.

Also, the following NetScaler configurations are supported:

Load balancing, load balancing persistency, DNS load balancing, SIP, maxClient, Spillover (connection and dynamic). Spillover based on bandwidth, DataStream, Compression control, Content filtering, TCP buffering, Cache redirection, distributed denial-of-service (DDoS). Client Keep-alive, Basic networking (IPv4 and IPv6), OSPF (IPv4 and IPv6), RIP (IPv4 and IPv6), RIP (IPv4 and IPv6). VLAN, ICMP, Fragmentation, MBF, ACL, Simple ACL, MSR, Path MTU discovery, IP-IP, SNMP, Policies (classic and advanced). Rewrite, Responder, HTTP callout, Web server logging, Audit logging (NSLOG and syslog). USIP, Location commands, NITRO API, AppExpert, KRPC.

Prerequisites

NetScaler appliances (MPX, VPX, SDX ADC, BLX) that are to be added to a cluster must meet the following prerequisites:

- All appliances must have the same software version and build.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

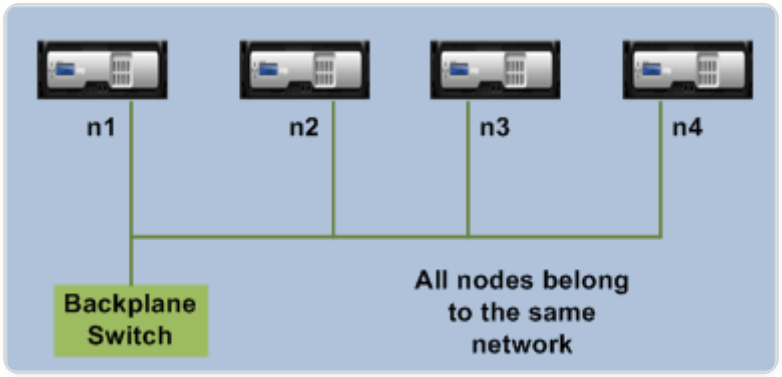
- All appliances must be of the same platform type. This means that a cluster must have either all hardware appliances (NetScaler MPX) or all NetScaler VPX appliances, or all NetScaler BLX appliances, or all NetScaler SDX ADC instances.

  Note:

  - For a cluster of hardware appliances (MPX), the appliances must be of the same model type.
  - For the formation of the heterogeneous cluster, all appliances must be of MPX platform type.
  - For a cluster of virtual appliances (VPX), the appliances must be deployed on the following hypervisors: XenServer®, Hyper-V, VMware ESX, and KVM.
  - For setting up a cluster of SDX NetScaler instances, see Set up a cluster of NetScaler instances.
  - Jumbo frames are supported on a NetScaler cluster that is made up of NetScaler SDX instances.
  - You can create L3 clusters of SDX instances.
  - For information about setting up a NetScaler BLX cluster, see NetScaler BLX cluster.

- Appliances can belong to different networks.
- Be initially configured and connected to a common client-side and server-side network.
- For a cluster of virtual appliances (NetScaler VPX, or NetScaler BLX, or NetScaler SDX ADC instance), it is recommended to use 6 GB RAM per vCPU for each node of the cluster.
- NetScaler VPX instances hosted on NetScaler SDX appliance must be provisioned with a dedicated core.

Cluster overview



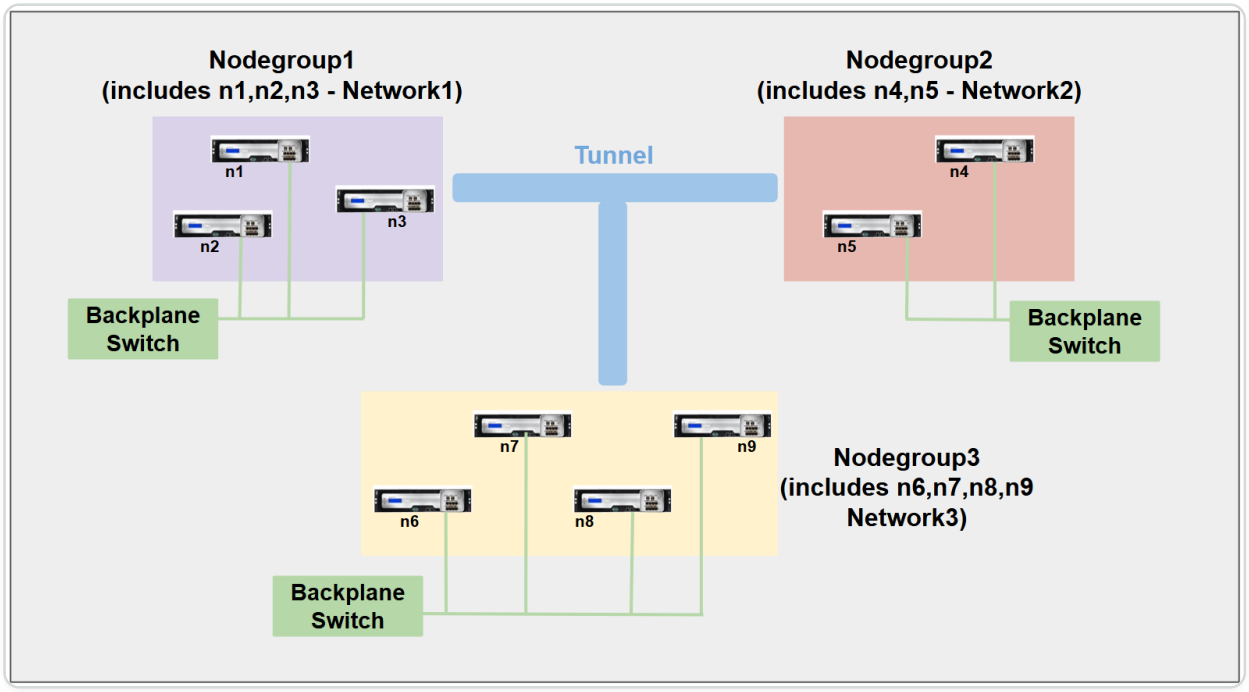
A NetScaler cluster is formed by grouping NetScaler appliances together. Based on the network location of the NetScaler appliances that you intend to add the cluster, you must be aware of the following cluster setups:

NOTE

Unless specified otherwise, cluster features and configurations are the same for L2 and L3 clusters.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **L2 cluster:** In this cluster deployment, all cluster nodes belong to the same network.

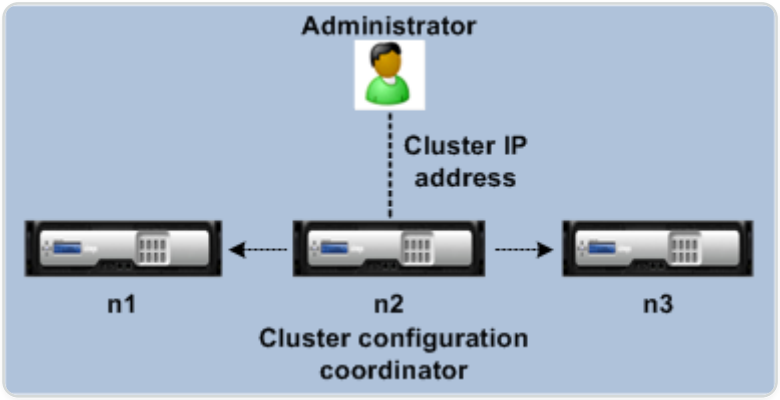


- **L3 cluster (also referred to as 'cluster in INC mode'):** In this cluster deployment, cluster nodes can belong to different networks. The cluster nodes from a specific network must be grouped into node groups that include only nodes from that network. From the following figure, we see that nodes n1, n2, n3 are in the same network and are grouped into Nodegroup1.

  Similarly, the case for nodes n4 and n5, that are grouped in Nodegroup2. In the third network, there are two node groups. Nodegroup3 includes n6 and n7 and Nodegroup4 includes n8 and n9.

NOTE

Supported from NetScaler 11.0 onwards.



- **Sync State:** The **show cluster** command displays the status of the cluster node. The following are the Sync States for the **show cluster node** command:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Enable:** This state shows that the node has the capability to do a configuration sync from other nodes.
- **In-progress:** This is a temporary state which is displayed when the node is syncing configurations from other nodes.
- **Success:** This state represents the status of the last sync that has happened on this node.

Synchronization across cluster nodes

All configurations on a NetScaler cluster are performed on the cluster IP address, which is the management address of the cluster. The cluster node owns the cluster IP address that is referred to as the cluster configuration coordinator (CCO) as shown in the following figure:

The configurations that are available on the CCO are automatically propagated to the other cluster nodes and therefore all cluster nodes have the same configurations.

- NetScaler allows only a few configurations to be performed on individual cluster nodes through their NSIP address. In these cases, you must ensure configuration consistency manually across all nodes in the cluster. These configurations are not propagated across the other cluster nodes. For more information on operations supported on each cluster node, see Operations Supported on Individual Cluster Nodes.
- The following commands when ran on the cluster IP address are not propagated to other cluster nodes:
  - **shutdown.** Shuts down only the configuration coordinator.
  - **reboot.** Reboots only the configuration coordinator.
  - **rm cluster instance.** Removes the cluster instance from the node that you are running the command on.
- For a command to propagate to other cluster nodes:
  - The quorum must be configured on the cluster instance.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Most the cluster quorum with (n/2 + 1) of the cluster nodes must be active for the cluster to be operational.
- A cluster can run with a minimum number of nodes when the majority rule (n/2 + 1) is relaxed.

When a node is added to a cluster, the configurations and the files (SSL certificates, licenses, DNS, and so on) that are available on the CCO are synchronized to the newly added cluster node. When an existing cluster node, that was intentionally disabled or that had failed, is once again added, the cluster compares the configurations available on the node with the configurations available on the CCO. If there is a mismatch in configurations, the node is synchronized by using one of the following:

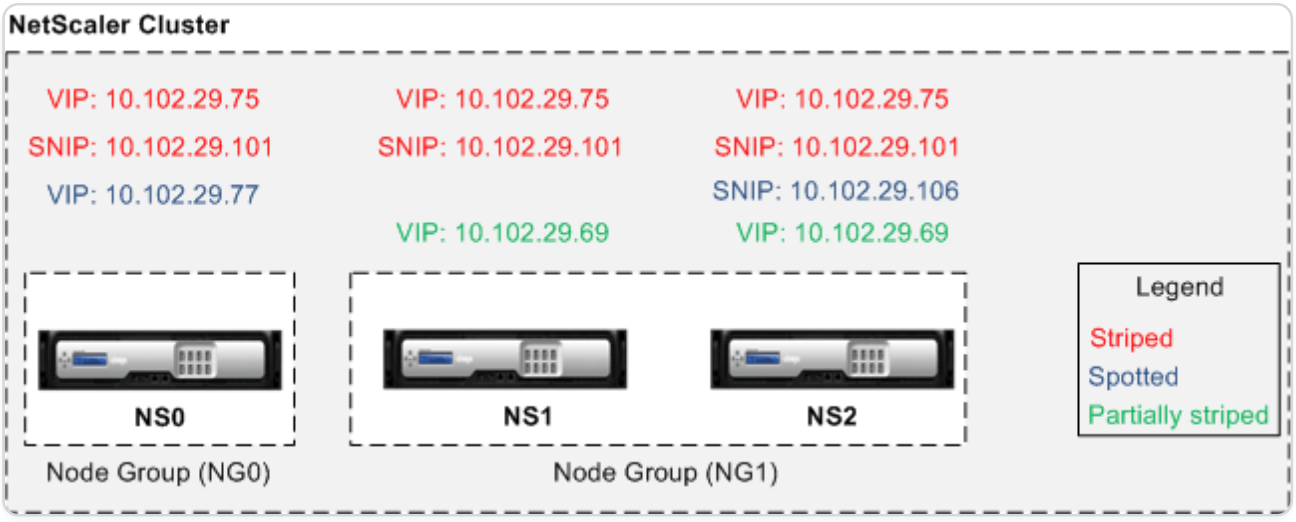
- **Full synchronization.** If the difference between configurations exceeds 255 commands, all the configurations of the CCO are applied to the node that is rejoining the cluster. The node remains operationally unavailable during the synchronization.
- **Incremental Synchronization.** If the difference between configurations is less than or equal to 255 commands, only the configurations that are not available are applied to the node that is rejoining the cluster. The operational state of the node remains unaffected.

NOTE

You can also manually synchronize the configurations and files. For more information, seeSynchronizing Cluster Configurations and Synchronizing Cluster Files.

Striped, partially striped, and spotted configurations

By virtue of command propagation, all nodes in a cluster have the same configurations. However, you might want some configurations to be available only on certain cluster nodes. While you cannot restrict the nodes on which the configurations are available, you can specify the nodes on which the configurations are active.



For example, you can:

- define a SNIP address to be active on only one node, or
- define a SNIP address to be active on all nodes, or
- define a VIP address to be active on only one node, or
- define a VIP address to be active on all nodes, or
- define a VIP address to be active only on two nodes of a 3-node cluster

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Depending on the number of nodes the configurations are active on, cluster configurations are referred to as striped, partially striped, or spotted configurations.

Figure 1. Three-node cluster with striped, partially striped, and spotted configurations

The following table provides more details on the types of configurations:

CONFIGURATION TYPE	ACTIVE ON	APPLICABLE TO	CONFIGURATIONS
Striped configuration	All the cluster nodes	All entries	No specific configuration required to make an entity striped. By default, all entities defined on a cluster IP address are striped on all the cluster nodes.
Partially striped configuration	A subset of cluster nodes	See Cluster Node groups	Bind the entities that you want to be partially striped, to a node group. The configuration is active only on the cluster nodes that belong to the node group.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

CONFIGURATION TYPE	ACTIVE ON	APPLICABLE TO	CONFIGURATIONS
Spotted configuration	Single cluster node	See List of spotted configuration	A spotted configuration can be defined using one of two approaches. **SNIP address** When creating the SNIP address, specify the node on which you want the SNIP address to be active, as the owner node. **Example**, `add ns ip 10.102.29.106 255.255.255.0 -type SNIP -ownerNode 2` (assuming node NS2 ID is 2). **Note**: You cannot change the ownership of a spotted SNIP address at run time. To change the ownership, you must first delete the SNIP address and add it again by specifying the new owner. **Entities that can be bound to a node group.** By binding the entity to a single-member node group.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE

- When you disable USIP, we recommend you to use spotted SNIP addresses. You can use striped SNIP addresses only if there is a shortage of IP addresses. The use of striped IP addresses can result in ARP flux issues if no spotted IP addresses are present in the same subnet for ARP resolution.
- When you enable USIP, we recommend you to use striped SNIP addresses as a gateway for server initiated traffic.

List of spotted configuration

- IPv4 addresses
- IPv6 addresses
- ARP entries
- Interface settings
- IPv6 static routes (Route6)
- IP tunnel
- IPv6 tunnel
- Reverse network address translation (RNAT)
- Policy-based routes for IPv4 (PBR)
- Policy-based routes for IPv6 (PBR6)
- Cluster LAG
- Neighbor discovery protocol (ND6) entries
- Failover interface set (FIS)
- Linksets
- SNMP MIB/engine ID
- Diameters
- Citrix® ADC VPX param
- Hostname

ARP owner support for striped IP

In a cluster setup, you can configure a specific node to respond to the ARP request for a striped IP. The configured node responds to the ARP traffic.

A new parameter “arpOwner” is introduced in the “add, set, and unset IP” commands.

To enable the ARP owner on a node by using the CLI.

At the command prompt, type:

```
add ns ip <ip_address> -arpOwner <node_id>
```

NOTE

The ARP owner parameter is supported only in the L2 cluster.

Neighbor discovery owner support for striped IPv6 address

In a cluster setup, you can configure a specific node as neighbor discovery (ND) owner for the striped IPv6 address to determine the link-layer address. A client sends a Neighbor Solicitation (NS) message to all the nodes in the cluster setup. The ND owner responds with a Neighbor Advertisement (NA) message with the link-layer address for the striped IPv6 address, and serves traffic.

To enable ND owner on a node by using the CLI

At the command prompt, type:

```
add ns ip6 <IPv6Address> -ndOwner <node id>

set  ns ip6 <IPv6Address> -ndOwner <node id>
```

Example:

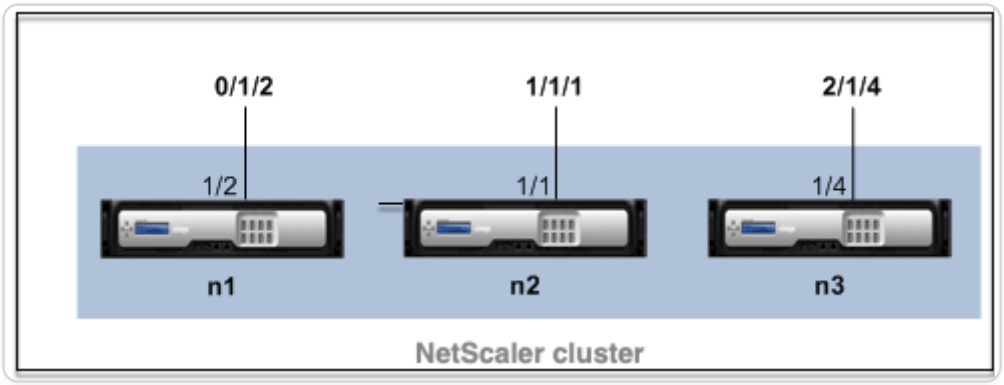
```
add ns ip6 2001::21/64 -ndOwner 1

set ns ip6 2001::21/64 -ndOwner 1
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To enable ND owner on a node by using the GUI

1. Navigate to **System > Network > IPs**.
2. In the **IPs** page, go to the **IPv6s** tab and click **Add**.
3. In the **Create IPv6** page, select one of the node IDs listed in the **NdOwner in Cluster** drop-down menu.



NOTE

The ND owner parameter is supported only in the L2 cluster.

Communication in a cluster setup

The interfaces of NetScaler appliances that are added to a cluster are prefixed with a node ID. It helps identify the cluster node to which the interface belongs. Therefore, the interface identifier c/u, where c is the controller number and u is the unit number, now becomes n/c/u, where n is the node ID. For example, in the following figure, interface 1/2 of node n1 is represented as 0/1/2, interface 1/1 of node n2 is represented as 1/1/1, and interface 1/4 of node n3 is represented as 2/1/4.

Figure 1. Interface naming convention in a cluster

- **Server communication**- The cluster communicates with the server through the physical connections between the cluster node and the server-side connecting device. The logical grouping of these physical connections is called the server data plane.
- **Client communication**- The cluster communicates with the client through the physical connections between the cluster node and the client-side connecting device. The logical grouping of these physical connections is called the client data plane.
- **Inter-node communication**- The cluster nodes can also communicate with each other. The manner in which they communicate depends on whether the node exists on the same network or across networks.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Cluster nodes within the same network communicate with each other by using the cluster backplane. The backplane is a set of interfaces in which one interface of each node is connected to a common switch, which is called the cluster backplane switch. The different types of traffic that goes through the backplane, which is used by internode communication are:
  - Node to Node Messaging (NNM)
  - Steered traffic
  - Configuration propagation and synchronization
- Each node of the cluster uses a special MAC cluster backplane switch address to communicate with other nodes through the backplane. The cluster special MAC is of the form: `0x02 0x00 0x6F <cluster_id> <node_id> <reserved>)`, where `cluster_id` is the cluster instance ID, `node_id` is the node number of the NetScaler appliance that is added to a cluster.

The following figures shows the communication interfaces in L2 clusters and L3 clusters.

Figure 2. Cluster communication interfaces - L2 cluster

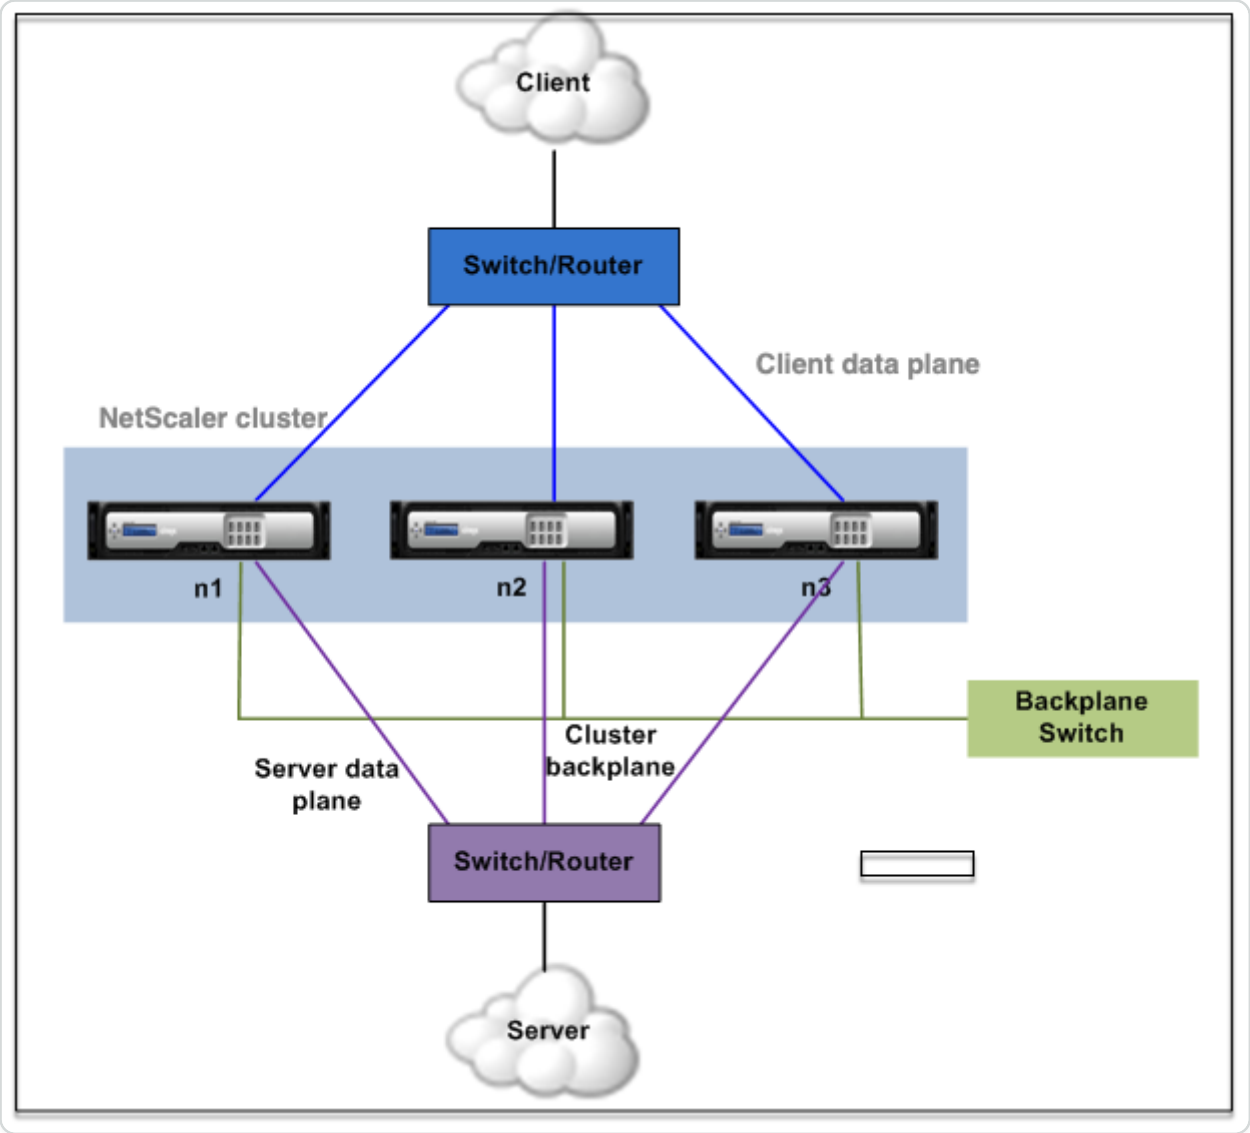

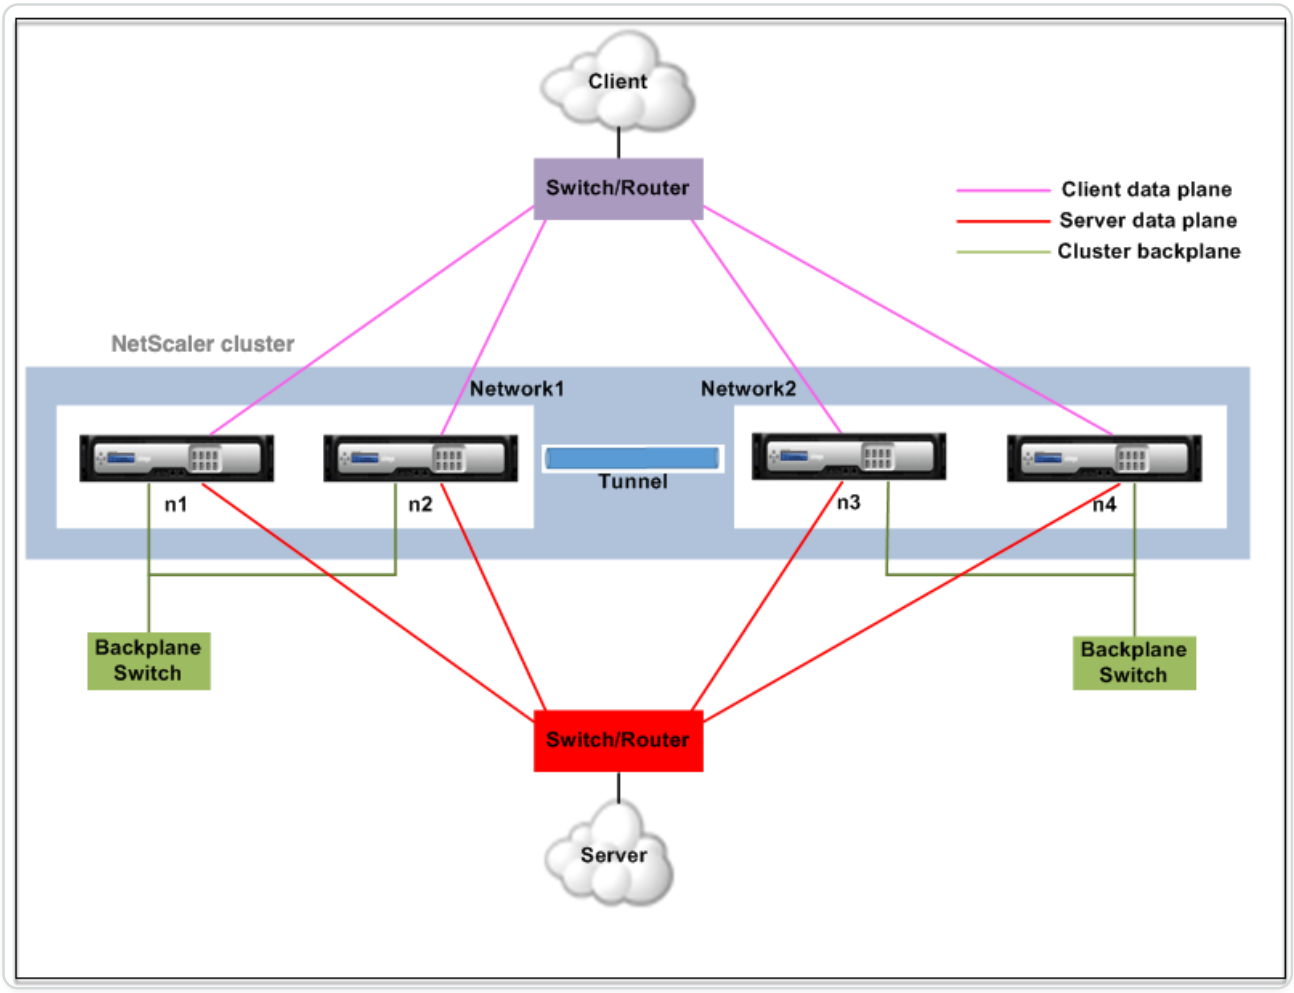

Figure 3. Cluster communication interfaces - L3 cluster

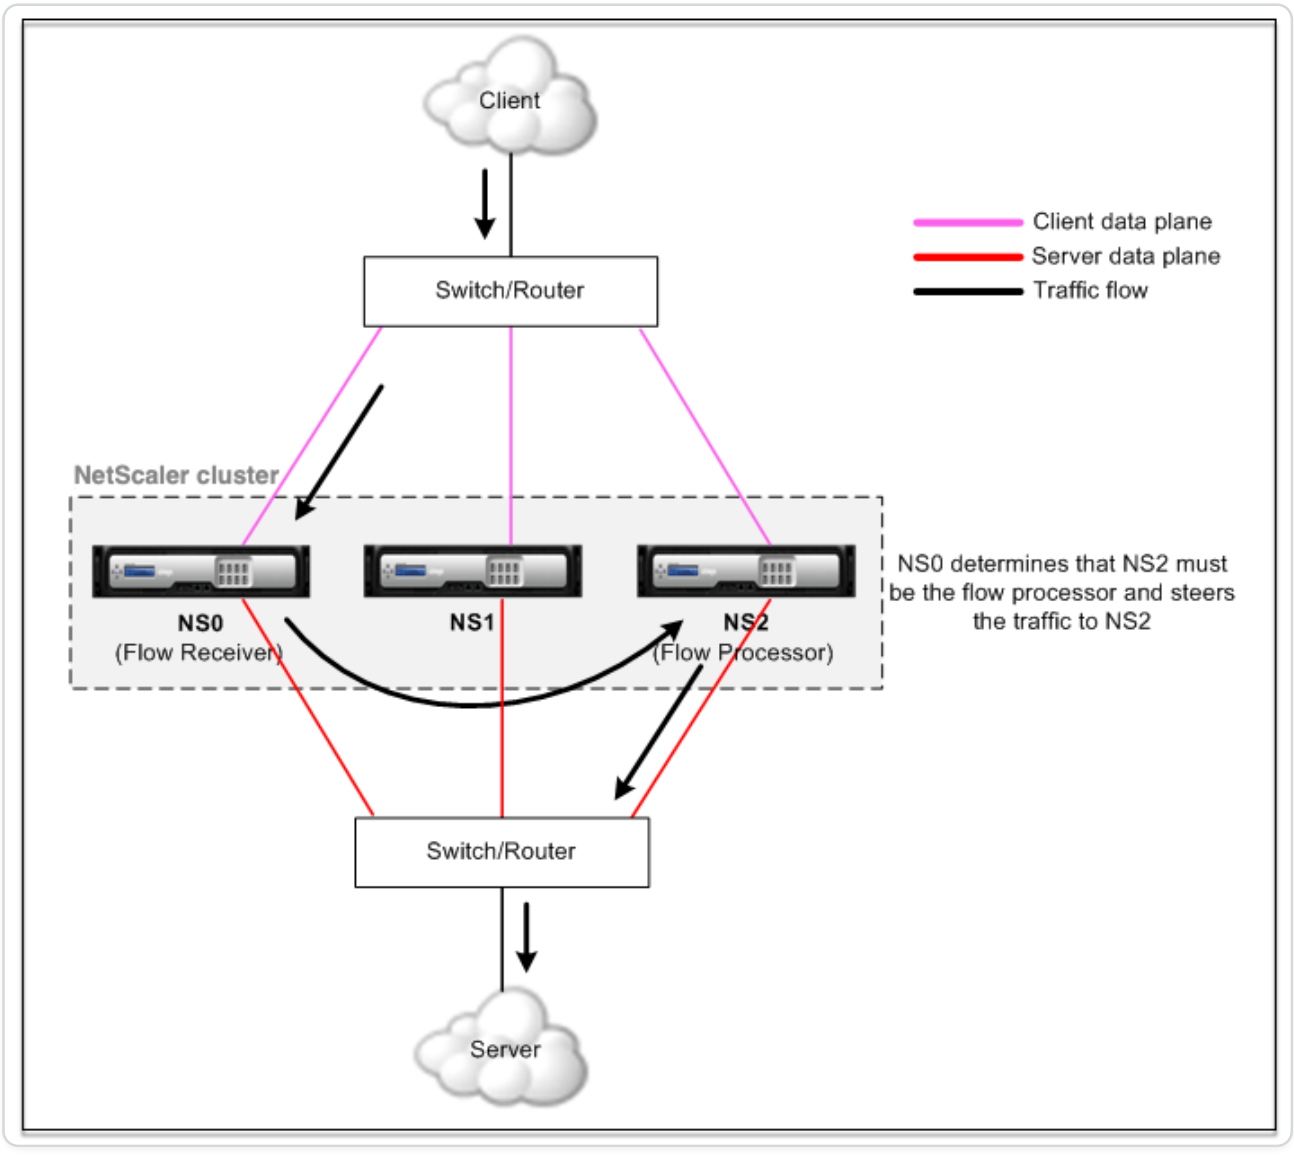
© 1997–2026 Citrix Systems, Inc. All rights reserved.

Traffic distribution in a cluster setup

In a cluster setup, external networks view the collection of NetScaler appliances as a single entity. So, the cluster must select a single node that must receive the traffic. The cluster does this selection by using the Equal Cost Multiple Path (ECMP) or cluster link aggregation traffic distribution mechanism. The selected node is called the flow receiver.

NOTE

For an L3 cluster (nodes across different networks), only the ECMP traffic distribution can be used.



The flow receiver gets the traffic and then, using internal cluster logic determines the node that must process the traffic. This node is called the flow processor. The flow receiver steers the traffic to the flow processor over the backplane if the flow receiver and the flow processor are on the same network. The traffic is steered through the tunnel if the flow receiver and the flow processor are on different networks.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE

- The flow receiver and flow processor must be nodes capable of serving traffic.
- From NetScaler 11 onwards, you can disable steering on the cluster backplane. For more information, see Disabling Steering on the Cluster Backplane.

Figure 1. Traffic distribution in a cluster

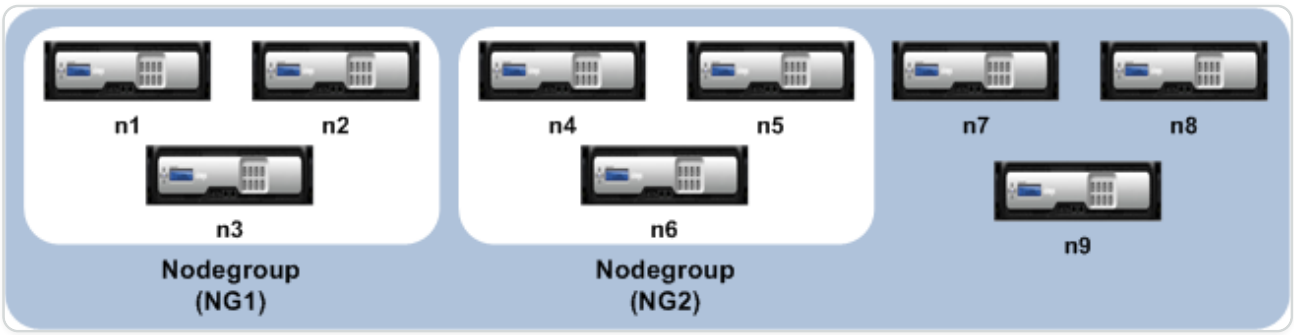
The preceding figure shows a client request flowing through the cluster. The client sends a request to a virtual IP (VIP) address. A traffic distribution mechanism configured on the client data plane selects one of the cluster nodes as the flow receiver. The flow receiver receives the traffic, determines the node that must process the traffic, and steers the request to that node (unless the flow receiver selects itself as the flow processor).

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The flow processor establishes a connection with the server. The server processes the request and sends the response to the subnet IP (SNIP) address that sent the request to the server.

- If the SNIP address is a striped or partially striped IP address, the traffic distribution mechanism configured on the server data plane selects one of the cluster nodes as the flow receiver. The flow receiver receives the traffic, determines the flow processor, and steers the request to the flow processor through the cluster backplane.
- If the SNIP address is a spotted IP address, the node that owns the SNIP address receives the response from the server.

In an asymmetric cluster topology (all cluster nodes are not connected to the external switch), you must use linksets either exclusively or combined with ECMP or cluster link aggregation. For more information, see Using Linksets.



Cluster node groups

NOTE

Node groups are supported from NetScaler 10.1 onwards.

As the name indicates, a cluster node group is a group of cluster nodes.

Figure 1. NetScaler cluster with node groups

The preceding figure shows a cluster which has node groups NG1 and NG2 that include 3 cluster nodes each. The cluster also has 3 nodes that are not part of any node group.

A node group can be configured for the following:

- To define spotted and partially striped configurations. For more information, see Node groups for Spotted and Partially Striped Configurations.
- To configure redundancy of node groups. For more information, see Configuring Redundancy for Node groups. Note: Supported from NetScaler 10.5 Build 52.1115.e onwards.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- To define an L3 cluster (also called a cluster in INC mode). In an L3 cluster, cluster nodes can be from different networks. You must group nodes that belong to a network in a single node group. For example, if n1, n2, n3 are in network1 and n4, n5, n6 are in network2, then NG1 must include nodes of network1 and NG2 must include nodes of network2. For setting up an L3 cluster, see Creating a NetScaler cluster.

NOTE

- Supported from NetScaler® 11 onwards.
- The preceding functions of a node group are mutually exclusive. It means that a node group can provide only one of the preceding mentioned functionalities.

Cluster and node states

For a cluster to be functional, most of the nodes (n/2 + 1) must be operationally active (operational state is ACTIVE).

IMPORTANT

From NetScaler release 10.5, you can configure the cluster to be functional even when the majority criteria is not satisfied. This configuration must be performed when creating a cluster.

For more information on states of a cluster node, refer to States of a cluster node.

Routing in a cluster

Routing in a cluster works in much the same way as routing in a standalone system. A few points to note:

- All routing configurations must be performed from the cluster IP address and the configurations are propagated to the other cluster nodes.
- Routes are limited to the maximum number of ECMP routes supported by the upstream router.
- Node-specific routing configurations must be performed by using the owner-node argument as follows:

```
router ospf

  owner-node 0
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
    ospf router-id 97.131.0.1

  exit-owner-node

!
```

The following command displays the consolidated cluster configuration for all nodes in VTYSH.

```
show cluster-config
```

The following command displays the cluster status on each node.

```
show cluser node
```

IPv4 routing in L2 cluster

The following section contains sample configurations that help you to configure IPv4 OSPF and BGP routing in the L2 cluster.

Adding spotted SNIP address and enabling dynamic routing

In the following configuration, OSPF, and BGP routing are enabled. Also, spotted SNIP addresses are added and dynamic routing is enabled on these SNIP addresses.

```
en ns fea ospf bgp

add vlan 10

add ns ip 10.10.10.1 255.255.255.0 -dynamicrouting enabled -ownernode 1

add ns ip 10.10.10.2 255.255.255.0 -dynamicrouting enabled -ownernode 2

add ns ip 10.10.10.3 255.255.255.0 -dynamicrouting enabled -ownernode 3

bind vlan 10 -ipaddress 10.10.10.1 255.255.255.0
```

VTYSH IPv4 OSPF configuration

For configuring IPv4 OSPF in the L2 cluster, you must:

- Set the priority to zero.
- Configure the Router-id as a spotted configuration.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE:

The OSPF configuration guidelines for the L2 cluster are applicable for OSPFv3 also.

In the following sample configuration IPv4 OSPF is configured.

```
interface vlan10

 IP OSPF PRIORITY 0

 !

router ospf

    owner-node 1

      ospf router-id 97.131.0.1

    exit-owner-node

    owner-node 2

      ospf router-id 97.131.0.2

    exit-owner-node

    owner-node 3

      ospf router-id 97.131.0.3

    exit-owner-node

network 10.10.10.0/24 area 0

redistribute kernel

 !
```

VTYSH IPv4 BGP configuration

In the following VTYSH sample configuration, IPv4 BGP is configured.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
owner-node 1
  router-id 10.10.10.1
exit-owner-node
owner-node 2
  router-id 10.10.10.2
exit-owner-node
owner-node 3
  router-id 10.10.10.3
exit-owner-node

router bgp 100
  neighbor 10.10.10.10 remote-as 200
 owner-node 1
  neighbor 10.10.10.10 update-source 10.10.10.1
 exit-owner-node

 owner-node 2
  neighbor 10.10.10.10 update-source 10.10.10.2
 exit-owner-node

 owner-node 3
  neighbor 10.10.10.10 update-source 10.10.10.3
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
 exit-owner-node

redistribute kernel

!
```

NOTE:

The update-source command is used for each neighbor with the owner-node argument in the following configuration to connect with proper source IP.

IPv6 routing in L2 cluster

The following section contains sample configurations that help you to configure IPv6 OSPF and BGP routing in the L2 cluster.

Enable IPv6 routing

Before configuring IPv6 routing in a L2 cluster, you must enable the IPv6 feature.

To enable IPv6 routing by using the CLI,

At the command prompt, type:

- `enable ns fea ipv6pt`

Adding spotted SNIP6 address and enabling dynamic routing

In the following configuration, OSPF, and BGP routing are enabled. Also, spotted SNIP6 addresses are added and dynamic routing is enabled on these SNIP6 addresses.

```
add ns ip6 3ffa::1/64 -dynamicrouting enabled -ownernode 1

add ns ip6 3ffa::2/64 -dynamicrouting enabled -ownernode 2

add ns ip6 3ffa::3/64 -dynamicrouting enabled -ownernode 3

add vlan 10
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
bind vlan 10 -ipaddress 3ffa::1/64
```

VTYSH IPv6 BGP configuration

In the following VTYSH sample configuration, IPv6 BGP is configured.

```
  owner-node 1

      router-id 10.10.10.1

  exit-owner-node

  owner-node 2

      router-id 10.10.10.2

  exit-owner-node

  owner-node 3

      router-id 10.10.10.3

  exit-owner-node

  router bgp 100

   neighbor 3ffa::10 remote-as 200

    owner-node 1

      neighbor 3ffa::10 update-source 3ffa::1

    exit-owner-node
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
    owner-node-2
      neighbor 3ffa::10 update-source 3ffa::2
    exit-owner-node

    owner-node-3
      neighbor 3ffa::10 update-source 3ffa::3
    exit-owner-node

   no neighbor 3ffa::10 activate
   address-family ipv6
    redistribute kernel
    neighbor 3ffa::10 activate
   exit-address-family
  !
```

Install IPv6 learned routes

The NetScaler cluster can use routes learned by various routing protocols after you install the routes in the NetScaler cluster routing table.

To install IPv6 learned routes to the internal routing table by using the CLI:

At the command prompt, type:

- `ns route-install ipv6 bgp`
- `ns route-install ipv6 ospf`
- `ns route-install default`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE:

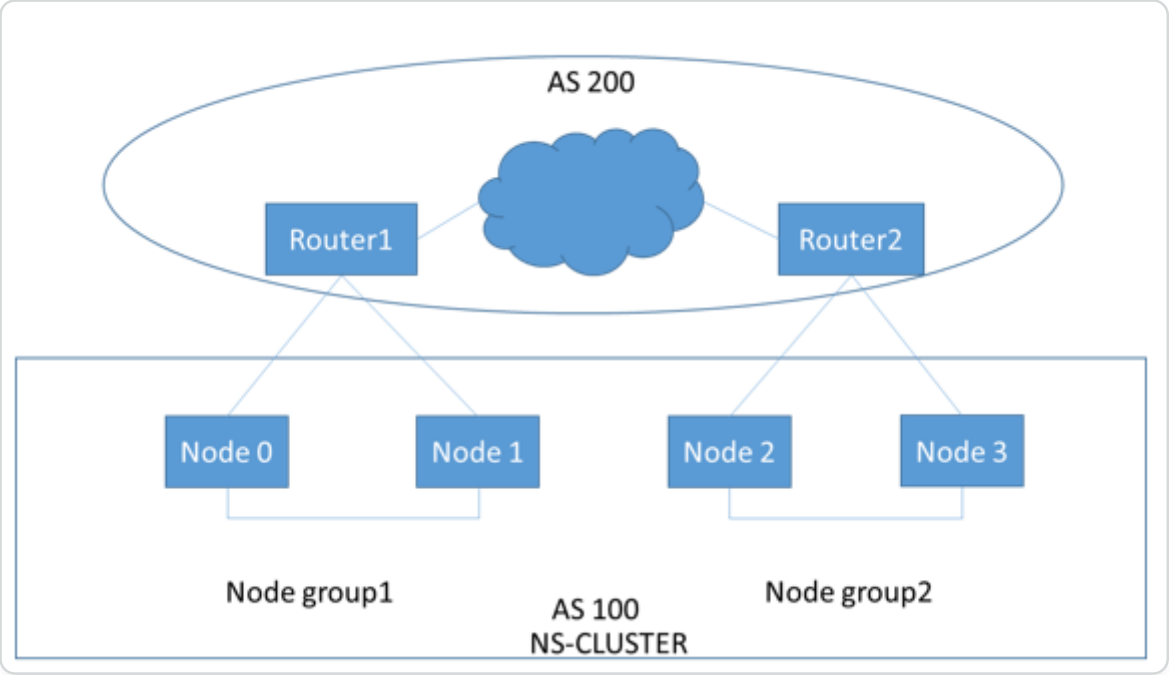
- If you have to exchange IPv4 routes on a IPv6 neighbor, you must remove the `no neighbor 3ffa::10 active` VTYSH command from the earlier configuration.
- The `update-source` VTYSH command must be used for each owner node to specify the right IPv6 source IP while connecting to the BGP peer as given in the BGP IPv4 configuration.

Routing in a L3 cluster

The routing in a L3 cluster works only when the following configurations are done on the NetScaler appliance.

- Enable the dynamic routing for a VLAN.

```
set vlan <id> -dynamicrouting enabled
```



- To reach all cluster nodes, the VIP, CLIP, and NetScaler IP (NSIP) must be advertised by routing protocols along with the `set vlan` command.

Deployment scenario for BGP in L3 cluster

Consider an example where all the cluster nodes are grouped in the AS 100 network, and the upstream routers are in a different AS 200.

The following figure depicts the AS 100 and AS 200 deployment in a cluster setup.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

In this deployment, CLIP advertises CCO to upstream routers. Some cluster nodes drop the advertised traffic, as an AS loop is detected.

To overcome the issue, configure the following command in VTYSH BGP router mode for each neighbor.

At the VTYSH command prompt, type:

```
neighbor <peer_ip> allowas-in 1
```

As a best practice, we recommend you to configure any one of the following:

- Configure route-maps to learn only desired networks such as; default route, NetScaler IP (NSIP), and NSIP subnets on cluster nodes.
- Configure upstream routes to advertise only desired networks such as; CLIP and NetScaler IP (NSIP) in cluster.

IP addressing for a cluster

In addition to the standard types of NetScaler-owned IP addresses—NetScaler NSIP, Virtual IP (VIP), and Subnet IP (SNIP)—a clustered NetScaler appliance can have a cluster management IP (CLIP) address. It can also have striped and spotted IP addresses.

- **CLIP address.** An IP address owned by the cluster coordinator node (CCO). The CLIP address can float between different nodes in a cluster setup. If the CLIP is moved to a different node of the cluster, that node becomes the CCO. The CCO is the NetScaler appliance that is responsible for management tasks in the cluster. A network administrator uses the CLIP

© 1997–2026 Citrix Systems, Inc. All rights reserved.

address to connect to the cluster to perform configuration and management tasks, such as accessing the unified GUI, reporting, tracing packet flow, and collecting logs. You can add multiple CLIP addresses in a cluster on the same or different networks. Only configurations performed on the CCO through the cluster IP address are propagated to other nodes in the cluster.

- **Striped IP address**. A logical IP address available on all nodes of the cluster, it can be either a VIP or SNIP address.
- **Spotted IP address**. A logical IP (preferably SNIP address) is available only on one node. A spotted IP address has visibility on only that node. To minimize traffic-steering overhead, Citrix® recommends that you use a spotted SNIP address for back-end communication with the server.

The following table provides the details of the configurations.

IP ADDRESS	NSIP	VIP	SNIP
Spotted	Yes	Yes	Yes
Striped	No	Yes	Yes

For example, in a four-node cluster group, you must configure each node with a spotted SNIP address. For more information on how to configure a spotted IP configuration, see Striped, Partially Striped, and Spotted Configurations.

You can define a SNIP address to be active on only one node, or active on all nodes. If the virtual IP address and subnet IP address are available only on a specific node, it is of spotted configuration. The configuration is defined as striped if the subnet IP address and virtual server IP address are available on all nodes. Spotted SNIP addresses help in reducing the steering and backplane traffic.

Best practices for VLAN bindings and route configuration while joining a node to the cluster

VLAN IP bindings

When you bind a VLAN with the spotted IP address, the NetScaler cluster must be configured with the spotted IP addresses in the same subnet on all the nodes. For example, in a two-node cluster with Node 0 and Node 1, you can have the following configuration:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add ns ip 192.254.101.101 255.255.255.0 -vServer DISABLED -dynamicRouting
ENABLED -ownerNode 1

add ns ip 192.254.101.102 255.255.255.0 -vServer DISABLED -dynamicRouting
ENABLED -ownerNode 0

add vlan 100

bind vlan 100 -IPAddress 192.254.101.101 255.255.255.0
```

Routing configuration

When routing configuration is required with the spotted IP address as the default gateway, then the ADC cluster must be configured with the spotted IP addresses in the same subnet on all the nodes. For example, in a two-node cluster with Node 0 and Node 1, you can have the following configuration:

```
add ns ip 192.254.101.101 255.255.255.0 -vServer DISABLED -dynamicRouting
ENABLED -ownerNode 1

add ns ip 192.254.101.102 255.255.255.0 -vServer DISABLED -dynamicRouting
ENABLED -ownerNode 0

add route 192.254.102.0 255.255.255.0 192.254.101.103
```

NOTE

In an L3 cluster setup, only spotted SNIP configuration is supported.

Configuring layer 3 clustering

Understanding the L3 cluster

The demand to expand the high availability deployment and increase the scalability of the client traffic across different networks guided to establish the L3 cluster. The L3 cluster lets you group NetScaler appliances across individual subnets (L2 cluster).

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The L3 cluster is also referred as “cluster in Independent Network Configuration (INC) mode”. In L3 cluster deployment, the cluster nodes in the same network are grouped to form a Node group. The L3 cluster uses GRE tunneling to steer the packets across networks. The heartbeat messages across the L3 clusters are routed.

Architecture

The L3 cluster architecture comprises the following components:

- **Nodegroup** - The cluster nodes from each network (n1, n2) and (n3, n4), as shown in the following figure, are grouped to form a Node group. These Node groups are terminated to the layer 3 switch on either side of the network.
    - The cluster communicates with the client through the physical connections between the cluster node and the client-side connecting device. The logical grouping of these physical connections is called the client data plane.
    - The cluster communicates with the server through the physical connections between the cluster node and the server-side connecting device. The logical grouping of these physical connections is called the server data plane.
- **Backplane Switch** - Cluster nodes within the same network communicate with each other by using the cluster backplane. The backplane is a set of interfaces in which one interface of each node is connected to a common switch, which is called the cluster backplane switch.
- **Tunnel** - By default, the packets between nodes in a L3 cluster are exchanged over an unencrypted GRE tunnel that uses the NSIP addresses of the source and destination nodes for routing. The steering mechanism changes for nodes belonging to the different network. The packets are steered through a GRE tunnel to the node on the other subnet, instead of rewriting the MAC.

  NOTE:

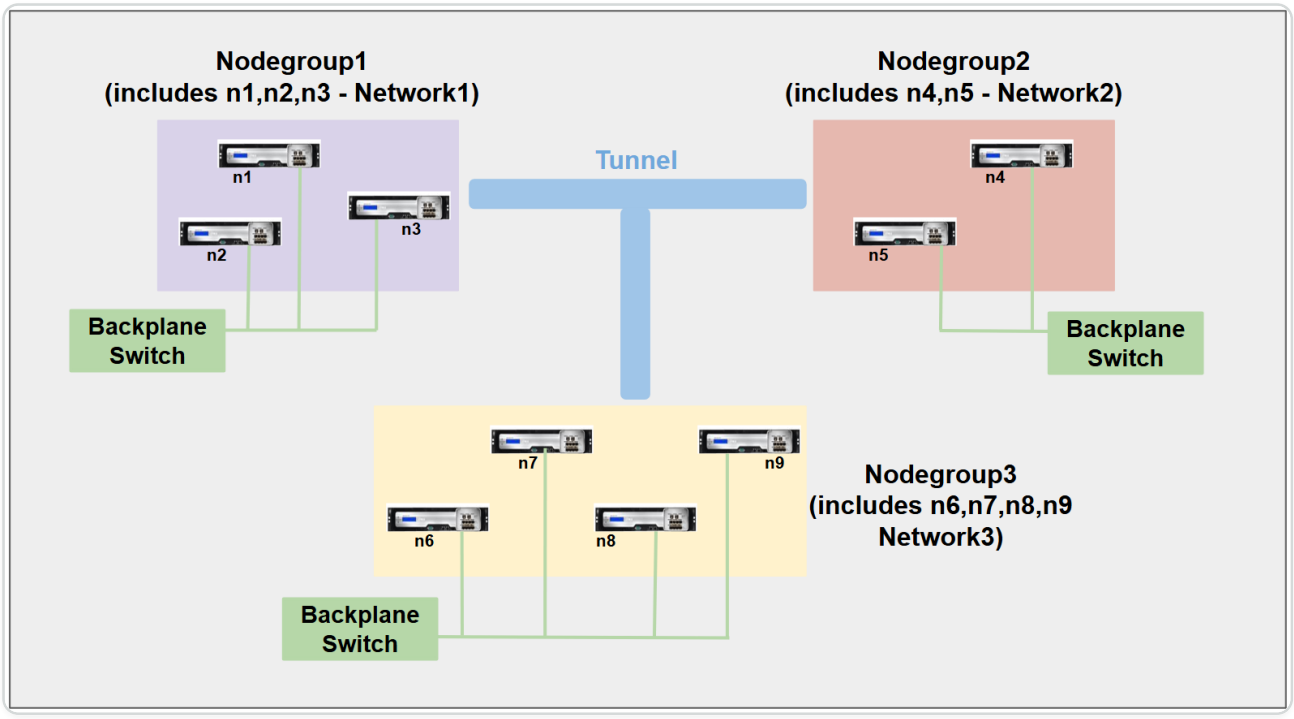
  For a new deployment, we recommend using the UDP tunnel to steer the packets across networks. The advantages of using a UDP tunnel are:

    - The steering between the packet engines is based on 4-tuple, which provides better distribution.
    - You can avoid the skewness in CPU utilization.

  Refer to the following table to understand how packets are steered in different tunnel modes.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

TUNNEL MODE	SAME NETWORK	DIFFERENT NETWORK
None	A backplane is used to steer the packets.	GRE tunnel is used to steer the traffic.
GRE	GRE tunnel is used to steer the packets.	GRE tunnel is used to steer the packets.
UDP	UDP tunnel is used to steer the packets.	UDP tunnel is used to steer the packets.



Example

Consider an example of an L3 cluster deployment consisting of the following:

- Three NetScaler appliances (n1, n2, and n3) nodes are grouped into Nodegroup1.
- Similarly, the nodes n4 and n5 are grouped in Nodegroup2. In the third network, there are four nodes: n6, n7, n8, and n9.
- The NetScaler appliances that belong to the same network are combined to form a node group.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Points to consider before configuring the L3 cluster

Consider the following points before configuring the L3 cluster on a NetScaler appliance:

- The backplane is not mandatory while configuring L3 subnets. If the backplane is not specified, the node does not go to the backplane fail state.

  NOTE:

  If you have more than one node in the same L2 network, it is mandatory to define the backplane interface. If the backplane interface is not mentioned, the nodes go to the backplane fail state.

- L2 features and striped SNIPs are not supported in the L3 cluster.
- The external traffic distribution in the L3 cluster supports only Equal Cost Multiple Path (ECMP).
- The ICMP errors and fragmentation are not processed when steering is disabled in an L3 cluster deployment:
- The networking entities (`route, route6, pbr` , and `pbr6`) must be bound to the configuration node group.
- VLAN, RNAT, and IP tunnel cannot be bound to a configuration node group.
- Configuration node group must always have property STRICT “YES.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- The cluster nodes must not be added to a config node group through the `add cluster node` command.
- The `add cluster instance -INC enabled` command clears the networking entities (route, route6, PBR, pb6, RNAT, IP tunnel, ip6tunnel).
- The `clear config extended+` command does not clear the entities (route, route6, PBR, pb6, RNAT, IP tunnel, ip6tunnel) in an L3 cluster.

Configuring the L3 cluster

In an L3 cluster configuration, the cluster command has different attributes to configure that is based on nodes, and node groups. The L3 cluster configuration also includes an IPv6 profile apart from IPv4 profiles.

Configuring an L3 cluster on a NetScaler appliance consists of the following tasks:

- Create a cluster instance
- Create a node group in L3 cluster
- Add a NetScaler appliance to the cluster and group with node group
- Add the cluster IP address to the node
- Enable the cluster instance
- Save the configuration
- Add a node to an existing node group
- Create a node group in L3 cluster
- Group new nodes to the newly created node group
- Join the node to the cluster

Configuring the following by using the CLI

- **To create a cluster instance**

  `add cluster instance <clid> -inc <ENABLED|DISABLED> -processLocal <ENABLED|DISABLED>`

  NOTE:

  The “inc” parameter must be ENABLED for an L3 cluster.

- **To create a nodegroup in L3 cluster**

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add cluster nodegroup <name>
```

- **To add a NetScaler appliance to the cluster and to associate with nodegroup**

```
add cluster node <nodeid> <nodeip> -backplane <interface_name> nodegroup <ng> –tunnelmode UDP
```

- **To add the cluster IP address on this node**

```
add ns ip <IPAddress> <netmask> -type clip
```

- **Enable the cluster instance**

```
enable cluster instance <clId>
```

- **Save the configuration**

```
save ns config
```

- **Warm reboot the appliance**

```
reboot -warm
```

- **To add a new node to an existing nodegroup**

```
add cluster node <nodeid> <nodeip> -nodegroup <ng> –tunnelmode UDP
```

- **To create a new nodegroup in L3 cluster**

```
add cluster nodegroup <ng>
```

- **To group new nodes to the newly created nodegroup**

```
add cluster node <nodeid> <nodeip> -nodegroup <ng> –tunnelmode UDP
```

- **To join the node to the cluster**

```
join cluster –clip <ip_addr> -password <password>
```

```
Example: The following is an example configuration for nodegroup1 and
nodegroup2.

    > add cluster instance 1 –inc ENABLED –processLocal ENABLED

       Done
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
    > add cluster nodegroup ng1

       Done

    > add cluster node 0 1.1.1.1 –state ACTIVE -backplane 0/1/1 –nodegroup
ng1 –tunnelmode UDP

       Done

    > add ns ip 1.1.1.100 255.255.255.255 –type clip

       Done

    > enable cluster instance 1

       Done

    > save ns config

       Done
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
    > add cluster node 1 1.1.1.2 –state ACTIVE –nodegroup ng1 –tunnelmode
UDP

       Done

    > add cluster nodegroup ng2

       Done

    > add cluster node 4 2.2.2.1 –state ACTIVE –nodegroup ng2 –tunnelmode
UDP

       Done

    > add cluster node 5 2.2.2.2 –state ACTIVE –nodegroup ng2 –tunnelmode
UDP

       Done

    > join cluster -clip 1.1.1.100 -password nsroot
```

Advertising cluster IP address of a L3 cluster

Configure the cluster IP address to be advertised to the upstream router to make the cluster configuration accessible from any subnet. The cluster IP address is advertised as a kernel route by the dynamic routing protocols configured on a node.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Advertising the cluster IP address consists of the following tasks:

- **Enable the host route option of the cluster IP address**. The host route option pushes the cluster IP address to a ZebOS routing table for kernel route redistribution through dynamic routing protocols.
- **Configuring a dynamic routing protocol on a node**. A dynamic routing protocol advertises the cluster IP address to the upstream router. For more information on configuring a dynamic routing protocol, see Configuring Dynamic Routes.

To enable the host route option of the cluster IP address by using the CLI

At the command prompt, type:

- `add nsip <IPAddress> <netmask> -hostRoute ENABLED`
- `show nsip <IPAddress>`

```
> add ns ip 10.102.29.60 255.255.255.255 -hostRoute ENABLED

> Done
```

Spotted and partially striped configurations on L3 cluster

The spotted and partially striped configurations on the L3 cluster slightly differ from the L2 cluster. The configuration might differ from node to node as the nodes reside on different subnets. The network configurations can be node specific in the L3 cluster, hence you have to configure the spotted or partially striped configurations based on the below-mentioned parameters.

To configure spotted, partially striped configurations on a NetScaler appliance over the L3 cluster, perform the following tasks:

- Add a cluster owner group to an IPv4 static routing table
- Add a cluster owner group to an IPv6 static routing table
- Add a cluster owner group to an IPv4 policy based routing (PBR)
- Add a cluster owner group to an IPv6 PBR
- Add a VLAN
- Bind a VLAN to a specific owner group of cluster node group

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configuring the following by using the CLI

- **To add a cluster ownergroup to an IPv4 static route table of the NetScaler appliance**

  `add route <network> <netmask> <gateway> -owner group <ng>`

- **To add a cluster ownergroup to an IPv6 static route table of the NetScaler appliance**

  `add route6 <network> -owner group <ng>`

- **To add a cluster ownergroup to an IPv4 PBR**

  `add pbr <name> <action> -owner group <ng>`

- **To add a cluster ownergroup to an IPv6 PBR**

  `add pbr6 <name> <action> -owner group <ng>`

- **To add a VLAN**

  `add vlan <id>`

- **To bind a VLAN to a specific ownergroup of cluster nodegroup**

  `bind vlan <id> -ifnum – [IPAddress <ipv4_addr | ipv6_addr> [-owner group <ng>]`

  The following commands are sample examples of spotted and partially striped configurations, which can be configured by using the CLI.

```
> add route 10.102.29.0 255.255.255.0 10.102.29.2 –ownergroup ng2

    Done

> add route6 fe80::9404:60ff:fedd:a464/64 –ownergroup ng1

    Done

> add pbr pbr1 allow –ownergroup ng1
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
        Done

    > add pbr6 pbr2 allow –ownergroup ng2

        Done

    > add vlan 2

        Done

    > bind vlan 2 –ifnum 1/2 –[IPAddress 10.102.29.80 |
fe80::9404:60ff:fedd:a464/64-ownergroup ng1

        Done
```

Configure node group

In an L3 cluster, to replicate the same set of configurations on more than one node group, the following commands are used:

Configuring the following by using the CLI

- **To add an IPv4 static route to the routing table of the NetScaler appliance**

  `add route <network> <netmask> <gateway> -ownerGroup <ng>`

Sample Configuration:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add route 0 0 10.102.53.1 –ownerGroup ng1

add route 0 0 10.102.53.1 –ownerGroup ng2
```

You define a new node group 'all' to support the preceding configuration, and have to configure the following commands:

Configuring the following by using the CLI

- **To add a new nodegroup to cluster with strict parameter**

  `add cluster node group <name> -strict <YES | NO>`

- **To bind a cluster node or an entity to the given nodegroup**

  `bind cluster nodegroup <name> -node <nodeid>`

- **To add IPv4 static route to all ownergroup**

  `add route <network> <netmask> <gateway> -ownerGroup <ng>`

Sample configuration:

```
add cluster nodegroup all –strict YES

bind cluster nodegroup all –node 1

bind cluster nodegroup all –node 2

add route 0 0 10.102.53.1 –ownerGroup all
```

Traffic distribution in a L3 cluster

In a cluster setup, external networks view the collection of NetScaler appliances as a single entity. So, the cluster must select a single node that must receive the traffic. In the L3 cluster this selection is done using the ECMP. The selected node is called the flow receiver.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE:

For an L3 cluster (nodes across different networks), only the ECMP traffic distribution can be used.

The flow receiver gets the traffic and then, using internal cluster logic determines the node that must process the traffic. This node is called the flow processor. The flow receiver steers the traffic to the flow processor over the backplane if the flow receiver and the flow processor are on the same network. The traffic is steered through the tunnel if the flow receiver and the flow processor are on different networks.

NOTE:

- The flow receiver and flow processor must be nodes capable of serving traffic.
- From NetScaler 11 onwards, you can disable steering on the cluster backplane. For more information, see Disabling steering on the cluster backplane.

The preceding figure shows a client request flowing through the cluster. The client sends a request to a virtual IP (VIP) address. A traffic distribution mechanism configured on the client data plane selects one of the cluster nodes as the flow receiver. The flow receiver receives the traffic, determines the node that must process the traffic, and steers the request to that node (unless the flow receiver selects itself as the flow processor). If the flow processor and flow receiver are in the same node group, the packet is steered over the backplane. And if the flow processor and flow receiver are in different node groups, then the packet is steered through the tunnel over the routed path.

The flow processor establishes a connection with the server. The server processes the request and sends the response to the subnet IP (SNIP) address that sent the request to the server. Since in the L3 cluster the SNIP is always a spotted SNIP, the node that owns the SNIP address receives the response from the server.

Setting up a NetScaler cluster

NetScaler appliances that you want to add to the cluster must satisfy the criteria specified in Prerequisites for Cluster Nodes. Before actually setting up a cluster, you must be aware of cluster basics. For information, see Cluster Overview.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Forming a cluster requires you to set up inter-node communication, create the cluster (by adding the first NetScaler appliance), and then add the other cluster nodes. Each of these steps is explained with relevant details in subsequent topics.

NOTE

While there are some differences in setting up an L2 and L3 cluster, there are many similarities too. The subsequent topics explain the setup for both cluster types while highlighting the configurations that are specific to L3 clusters.

Setting up inter-node communication

The nodes in a cluster setup communicate with one another using the following inter-node communication mechanisms:

- Nodes that are within the network (the same subnet) communicate with each other through the cluster backplane. The backplane must be explicitly set up. The following are the detailed steps.
- Across networks, steering of packets is done through a GRE tunnel and other node-to-node communication is routed across nodes as required.

IMPORTANT

- From Release 11.0 all builds, a cluster can include nodes from different networks.
- From Release 13.0 build 58.3, GRE steering is supported on Fortville NICs in an L3 cluster.

To set up the cluster backplane, do the following for every node

1. Identify the network interface that you want to use for the backplane.
2. Connect an Ethernet or optical cable from the selected network interface to the cluster backplane switch.

For example, to use interface 1/2 as the backplane interface for node 4, connect a cable from the 1/2 interface of node 4 to the backplane switch.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Important points to note when setting up the cluster backplane

- Do not use the appliance's management interface (0/x) as the backplane interface. In a cluster, the interface 0/1/x is read as:

  0 -> node ID 0 1/x -> NetScaler interface
- Use a proper network topology to prevent any loops on the backplane interface. Ensure that the MAC address of the peer node's backplane interface is correctly resolved to the local node's backplane interface.
- Do not use the backplane interfaces for the client or server data planes.
- Citrix® recommends using the link aggregate (LA) channel for the cluster backplane.

  NOTE:

  After you unbind an interface from the LA channel, ensure that you set an appropriate MTU size for the unbound interface.
- In a two-node cluster, where the backplane is connected back-to-back, the cluster is operationally DOWN under any of the following conditions:
  - One of the nodes is rebooted.
  - The backplane interface of one of the nodes is disabled.

  Therefore, Citrix recommends that you dedicate a separate switch for the backplane, so that the other cluster node and traffic are not impacted. You cannot scale out the cluster with a back-to-back link. You might encounter a downtime in the production environment when you scale out the cluster nodes.
- Backplane interfaces of all nodes of a cluster must be connected to the same switch and bound to the same L2 VLAN.
- If you have multiple clusters with the same cluster instance ID, make sure that the backplane interfaces of each cluster are bound to a different VLAN.
- The backplane interface is always monitored, regardless of the HA monitoring settings of that interface.
- The state of MAC spoofing on the different virtualization platforms can affect the steering mechanism on the cluster backplane. Therefore, make sure that the appropriate state is configured:
  - XenServer® - Disable MAC spoofing

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Hyper-V - Enable MAC spoofing
- VMware ESX - Enable MAC spoofing (also make sure "Forged Transmits" is enabled)

- The Maximum Transmission Unit (MTU) value for the cluster backplane is automatically updated. However, if jumbo frames are configured on the cluster, the MTU of the cluster backplane must be explicitly configured.

  The configured MTU value must be the same across all nodes in the cluster for the following:

  ```
  -  Server data plane (X)

  -  Client data plane (Y)

  -  Backplane: The configured MTU value must be set to 78 + maximum of X
  and Y.
  ```

  NOTE:

  The MTU values for the server data plane (X) and client data plane (Y) do not need to be the same.

  For example, if the MTU of a server data plane is 7500 and of the client data plane is 8922 across the cluster, then the MTU of a cluster backplane must be set to 78 + 8922 = 9000 across the cluster.

  To set this MTU, use the following command:

  ```
  > set interface <backplane_interface> -mtu <value>
  ```

- The MTU for the interfaces of the backplane switch must be specified to be greater than or equal to 1,578 bytes. This requirement is applicable for the following:
  - All Layer 2 clusters.
  - Only within the node group for Layer 3 clusters.
  - The cluster that supports features like MBF, L2 policies, ACLs, CLAG routing, and vPath.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE:

The default MTU size for a backplane interface is 1578. To reset the MTU size to the default value, you must use the `unset interface <backplane_interface> -mtu` command.

UDP based tunnel support for L2 and L3 cluster

Starting from NetScaler release 13.0 build 36.x, NetScaler L2 and L3 cluster can steer the traffic using UDP based tunneling. It is defined for the inter-node communications of two nodes in a cluster. By using the “tunnel mode” parameter, you can set GRE or UDP tunnel mode from the add and set cluster node command.

In an L3 cluster deployment, packets between NetScaler nodes are exchanged over an unencrypted GRE tunnel that uses the NSIP addresses of the source and destination nodes for routing. When this exchange occurs over the internet, in the absence of an IPsec tunnel, the NSIPs are exposed on the internet, and might result in security issues.

IMPORTANT

Citrix recommends customers to establish their own IPsec solution when using a L3 cluster.

The following table helps you to categorize the tunnel support based on different deployments.

STEERING TYPES	AWS	MICROSOFT AZURE	ON -PREMISES
MAC	Not supported	Not supported	Supported
GRE tunnel	Supported	Not supported	Supported
UDP tunnel	Supported	Supported	Supported

IMPORTANT

In a L3 cluster, the tunnel mode is set to GRE by default.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configuring a UDP based tunnel

You can add a cluster node by setting the parameters of node ID and mention the state. Configure the backplane by providing the interface name, and select the tunnel mode of your choice (GRE or UDP).

NOTE:

You must configure the tunnel mode from the Cluster IP address.

CLI PROCEDURES

To enable the UDP tunnel mode by using the CLI.

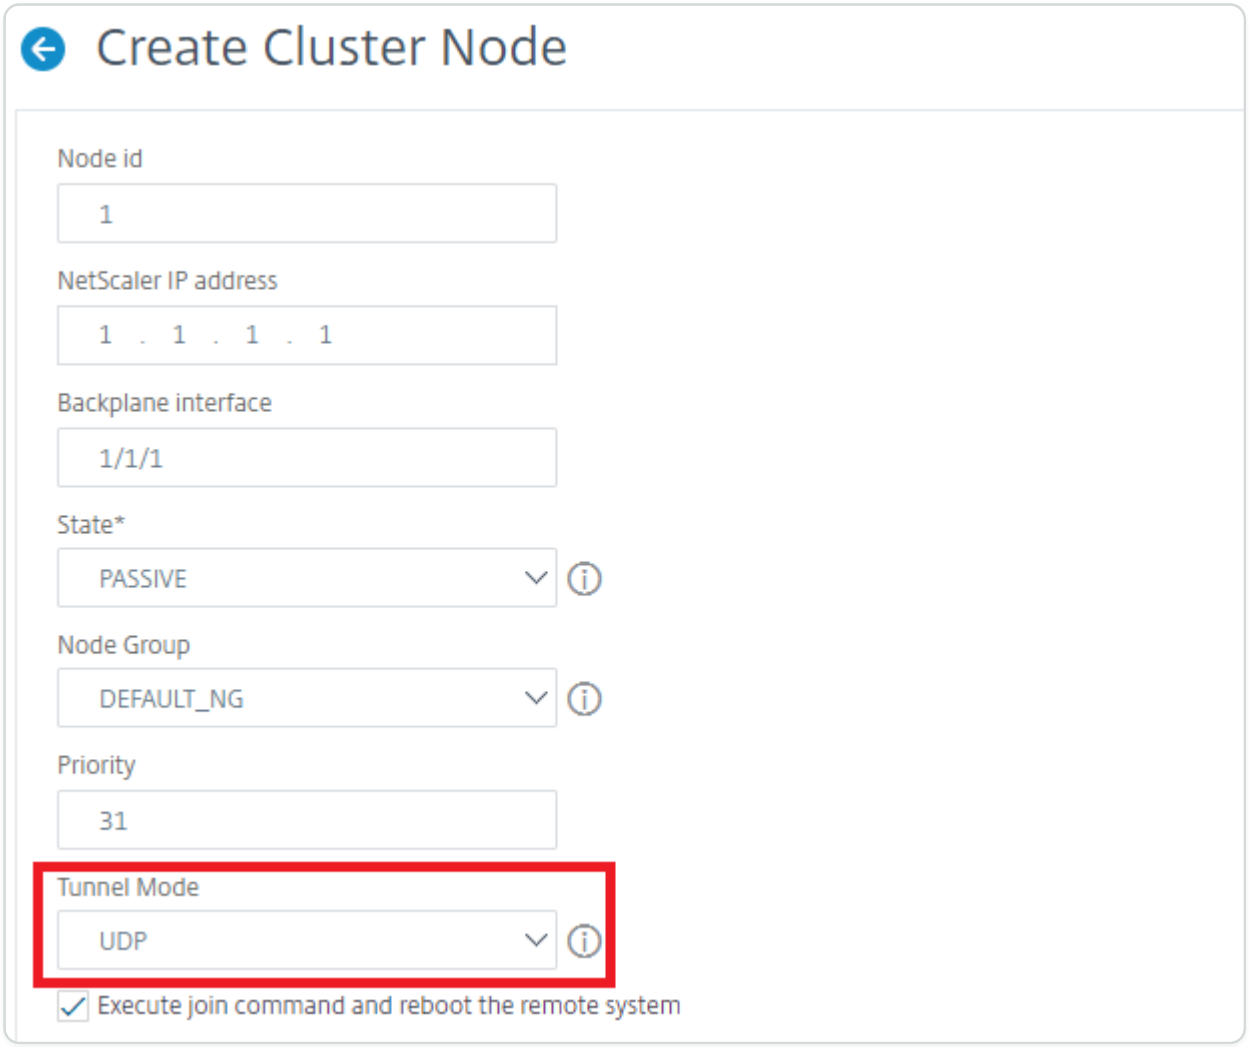
At the command prompt, type:

- `add cluster node <nodeId>@ [-state <state>] [-backplane <interface_name>] [-tunnelmode <tunnelmode>]`
- `set cluster node <nodeId>@ [-state <state>] [-tunnelmode <tunnelmode>]`

NOTE

Possible values for tunnel mode are NONE, GRE, UDP.

Example



- `add cluster node 1 –state ACTIVE –backplane 1/1/1 -tunnelmode UDP`
- `set cluster node 1 –state ACTIVE –tunnelmode UDP`

GUI PROCEDURES

To enable the UDP tunnel mode by using the GUI.

1. Navigate to **System > Cluster > Nodes**.
2. In the **Cluster Nodes** page, click **Add**.
3. In the **Create Cluster Node**, set the **Tunnel Mode** parameter to UDP and click **Create**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. Click **Close**.

Creating a NetScaler cluster

To create a cluster, start by taking one of the NetScaler appliances that you want to add to the cluster. On this node, you must create the cluster instance and define the cluster IP address. This node is the first cluster node and is called the cluster configuration coordinator (CCO). All configurations that are performed on the cluster IP address are stored on this node and then propagated to the other cluster nodes.

The responsibility of CCO in a cluster is not fixed to a specific node. It can change over time depending on the following factors:

- The priority of the node. The node with the highest priority (lowest priority number) is made the CCO. Therefore, if a node with a priority number lower than the existing CCO is added, the new node takes over as the CCO.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- If the current CCO goes down, the node with the next lowest priority number takes over as the CCO. If the priority is not set or if there are multiple nodes with the lowest priority number, the CCO is selected from one of the available nodes.

NOTES:

The configurations of the appliance (including SNIP addresses and VLANs) are cleared by implicitly running the `clear ns config extended` command. However, the default VLAN and NSVLAN are not cleared from the appliance. Therefore, if you want the NSVLAN on the cluster, make sure it is created before the appliance is added to the cluster and that the NSVLAN is same on all L2 cluster nodes. For an L3 cluster (cluster nodes on different networks), networking configurations are not cleared from the appliance.

- When forming a cluster, avoid making any other configuration changes until the cluster formation is complete. This helps prevent conflicts and ensures a smooth cluster formation process.

HA Monitor (HAMON) on a cluster setup is used to monitor the health of an interface on each node. The HAMON parameter must be enabled on each node to monitor the state of the interface. If the operational state of the HAMON enabled interface goes down due to any reason, the respective cluster node is marked as unhealthy (NOT UP) and that node cannot serve traffic.

Create a cluster by using the command line interface

- Log on to a NetScaler appliance (for example, appliance with NSIP address 10.102.29.60) that you want to add to the cluster.
- Add a cluster instance.

```
add cluster instance <clId> -quorumType <NONE | MAJORITY> -inc <ENABLED
| DISABLED> -backplanebasedview <ENABLED | DISABLED>
```

- The `-dfdretainl2params` option enables you to add the extended L2 headers for the backplane traffic.

  At the command prompt, type:

  `add cluster instance 1 -dfdretainl2params <ENABLED|DISABLED>`

  The following command diplays the status of the `-dfdretainl2params`:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

`show cluster instance <clusterid>`

Use the following command to enable or disable the `-dfdretainl2params`:

`set cluster instance 1 -dfdretainl2params <ENABLED|DISABLED>`

- The `-proxyarpstatus` option enables or disables the proxy arp functionality for cluster.

  At the command prompt, type:

  `add cluster instance 1 -proxyarpstatus <ENABLED|DISABLED>`

  The following command diplays the status of the `proxyarpstatus`:

  `show cluster instance <clusterid>`

  You can use the following command to enable or disable the `proxyarpstatus`:

  `set cluster instance 1 -proxyarpstatus <ENABLED|DISABLED>`

NOTE:

- The cluster instance ID must be unique within a LAN.
- The `-quorumType` parameter must be set to MAJORITY and not NONE in the following scenarios:
  - Topologies which do not have redundant links between cluster nodes. These topologies might be prone to network partition due to a single point of failure.
  - During any cluster operations such as node addition or removal.
- For an L3 cluster, make sure the `-inc` parameter is set to ENABLED. The `-inc` parameter must be disabled for an L2 cluster.
- When the `-backplanebasedview` parameter is enabled, the operational view (set of nodes that serve traffic) is decided based on heartbeats received only on the backplane interface. By default, this parameter is disabled. When this parameter is disabled, a node does not depend on the heartbeat reception only on the backplane.

1. Create a node group. In the next step, the newly added cluster node must be associated with this node group.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE:

This node group includes all or a subset of the NetScaler appliances that belong to the same network.

```
add cluster nodegroup <name>
```

2. Add the NetScaler appliance to the cluster.

```
add cluster node <nodeId> <IPAddress> -state <state> -backplane
<interface_name> -nodegroup <name>
```

NOTE:

For an L3 cluster:

- The node group parameter must be set to the name of the node group that is created.
- The backplane parameter is mandatory for nodes that are associated with a node group that has more than one node, so that the nodes within the network can communicate with each other.

Example:

Adding a node for an L2 cluster (all cluster nodes are in the same network).

```
add cluster node 0 10.102.29.60 -state PASSIVE -backplane 0/1/1
```

Adding a node for an L3 cluster that includes a single node from each network. Here, you do not have to set the backplane.

```
add cluster node 0 10.102.29.60 -state PASSIVE -nodegroup ng1
```

Adding a node for an L3 cluster that includes multiple nodes from each network. Here, you have to set the backplane so that nodes within a network can communicate with each other.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add cluster node 0 10.102.29.60 -state PASSIVE -backplane 0/1/1
-nodegroup ng1
```

3. Add the cluster IP address (for example, 10.102.29.61) on this node.

```
add ns ip <IPAddress> <netmask> -type clip
```

Example

```
add ns ip 10.102.29.61 255.255.255.255 -type clip
```

4. Enable the cluster instance.

```
enable cluster instance <clId>
```

5. Save the configuration.

```
save ns config
```

6. Warm reboot the appliance.

```
reboot -warm
```

Verify the cluster configurations by using the show cluster instance command. Verify that the output of the command displays the NSIP address of the appliance as a node of the cluster.

7. After the node is UP, login to the CLIP and change RPC credentials for both cluster IP address and Node IP address. For more information about changing an RPC node password, see Change an RPC node password.

To create a cluster by using the GUI

1. Log on to an appliance (for example, an appliance with NSIP address 10.102.29.60) that you intend to add to the cluster.
2. Navigate to **System > Cluster.**
3. In the details pane, click the **Manage Cluster** link.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. In the Cluster Configuration dialog box, set the parameters required to create a cluster. For a description of a parameter, hover the mouse cursor over the corresponding text box.
5. Click **Create.**
6. In the Configure cluster instance dialog box, select the Enable cluster instance checkbox.
7. In the Cluster Nodes pane, select the node and click **Open.**
8. In the Configure Cluster Node dialog box, set the State.
9. Click **OK**, and then click **Save.**
10. Warm reboot the appliance.
11. After the node is UP, login to the CLIP and change RPC credentials for both cluster IP address and Node IP address. For more information about changing an RPC node password, see Change an RPC node password.

Strict mode support for sync status of the cluster

You can now configure a cluster node to view errors when applying the configuration. A new parameter, “syncStatusStrictMode” is introduced in both the add and set cluster instance command to track the status of each node in a cluster. By default, the `syncStatusStrictMode` parameter is disabled.

To enable the strict mode by using the CLI

At the command prompt, type:

```
set cluster instance <clID> [-syncStatusStrictMode (ENABLED | DISABLED)]
```

Example:

```
set cluster instance 1 –syncStatusStrictMode ENABLED
```

To view the status of strict mode by using the CLI

```
    >show cluster instance

    1) Cluster ID: 1

        Dead Interval: 3 secs

        Hello Interval: 200 msecs
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
        Preemption: DISABLED

        Propagation: ENABLED

        Quorum Type: MAJORITY

        INC State: DISABLED

        Process Local: DISABLED

        Retain Connections: NO

        Heterogeneous: NO

        Backplane based view: DISABLED

        Cluster sync strict mode: ENABLED

        Cluster Status: ENABLED(admin), ENABLED(operational), UP

      WARNING(s):

        (1) - There are no spotted SNIPs configured on the cluster.
Spotted SNIPs can help improve cluster performance

        Member Nodes:

        Node ID     Node IP      Health     Admin State  Operational State

        -------     -------      ------     -----------  -----------------

    1)      1           192.0.2.20      UP         ACTIVE
ACTIVE(Configuration Coordinator)

    2)      2           192.0.2.21      UP         ACTIVE       ACTIVE

    3)      3           192.0.2.19*     UP         ACTIVE       ACTIVE
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To view the sync failure reason of a cluster node by using the GUI

1. Navigate to **System > Cluster > Cluster Nodes**.
2. In the **Cluster Nodes** page, scroll to the extreme right to view the details of the synchronization failure reason of the cluster nodes.

Adding a node to the cluster

You can seamlessly scale the size of a cluster to include a maximum of 32 nodes. When a NetScaler appliance is added to the cluster, the configurations from that appliance are cleared (by internally running the clear ns config -extended command). The SNIP addresses, **MTU** settings of the backplane interface, and all VLAN configurations (except the default VLAN and NSVLAN) are also cleared from the appliance.

The cluster configurations are then synchronized on this node. There can be an intermittent drop in traffic while the synchronization is in progress.

IMPORTANT:

Before you add a NetScaler appliance to a cluster:

- To join a node to the cluster, the `nsroot` account password of the configuration coordinator (CCO) node is required.
- If the `nsroot` account password of the joining node differs from the `nsroot` account password of the CCO node, the CCO node's `nsroot` account password is applied to the joining node after a successful join and reboot.
- Set up the backplane interface for the node. Check preceding topic.
- Check if the licenses that are available on the appliance match that are available on the configuration coordinator. The appliance is added only if the licenses match.
- If you want the NSVLAN on the cluster, make sure that the NSVLAN is created on the appliance before it is added to the cluster and that the NSVLAN is same on all L2 cluster nodes.
- Citrix® recommends that you add the node as a passive node. Then, after joining the node to the cluster, complete the node specific configuration from the cluster IP address. Run the force cluster sync command if the cluster has only spotted IP addresses. And which has L3 VLAN binding, or has static routes.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- When an appliance with a preconfigured link aggregate (LA) channel is added to a cluster, the LA channel continues to exist in the cluster environment. The LA channel is renamed from LA/x to nodeId/LA/x, where LA/x is the LA channel identifier.

To add a node to the cluster by using the CLI

NOTE:

When you add a node to a cluster setup, make sure that the default static route configured in the node is present in the cluster coordinator node (CCO). If the node has a static route not present in the CCO, the command fails with the following error.

```
Node cannot join cluster as static default gateway route is not present in CCO
```

1. Log on to the cluster IP address, at the command prompt, do the following:

   - Add the appliance (for example, 10.102.29.70) to the cluster.

   NOTE:

   For an L3 cluster:

   - The node group parameter must be set to a node group that has nodes of the same network.
   - If this node belongs to the same network as the first node that was added, then configure the node group that was used for that node.
   - If this node belongs to a different network, then create a node group and bind this node to the node group.
   - The backplane parameter is mandatory for nodes that are associated with a node group that has more than one node, so that the nodes within the network can communicate with each other.

   ```
   add cluster node <nodeId> <IPAddress> -state <state> -backplane
   <interface_name> -nodegroup <name>

   Example:
   ```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add cluster node 1 10.102.29.70 -state PASSIVE -backplane 1/1/1
```

- Save the configuration.

```
save ns config
```

2. Log on to the newly added node (for example, 10.102.29.70) and join the node to the cluster.

   Use the `nsroot` account password for the configuration coordinator (CCO) as the password in the following command:

```
join cluster -clip <ip_addr> -password <password>

Example:

join cluster -clip 10.102.29.61 -password nsroot
```

3. Configure the following commands on the CLIP.

   - Bind VLAN to an interface

     ```
     bind vlan <id> -ifnum <interface_name>
     ```

     Example:

     ```
     bind vlan 1 -ifnum 2/1/2
     ```

   - Add spotted IP address to the newly added node

     ```
     add ns ip <IpAddress> <netmask> -ownerNode <positive_interger>
     ```

     Example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add ns ip 97.131.0.3 255.0.0.0 -ownerNode 2
```

- Verify VLAN on NSIP

```
show vlan <id>
```

Example:

```
show vlan 1
```

4. Perform the following configurations:
   - If the node is added to a cluster that has only spotted IPs, the configurations are synchronized before the spotted IP addresses are assigned to that node. In such cases, L3 VLAN bindings can be lost. To avoid this loss, either add a striped IP or add the L3 VLAN bindings.
   - Define the required spotted configurations.
   - Set the MTU for the backplane interface.
5. Save the configuration.

```
save ns config
```

6. Warm reboot the appliance.

```
reboot -warm
```

7. After the node is UP and sync is successful, change RPC credentials for the node from the cluster IP address. For more information about changing an RPC node password, see Change an RPC node password.

```
set rpcNode <node-NSIP> -password <passwd>

Example:
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
set rpcNode 192.0.2.4 -password mypassword
```

8. Set the cluster node to Active.

```
set cluster node <nodeID> -state active.

Example:

set cluster node 1 -state active
```

To add a node to the cluster by using the GUI

1. Log on to the cluster IP address.
2. Navigate to **System > Cluster > Nodes**.
3. In the details pane, click **Add** to add the new node (for example, 10.102.29.70).
4. In the **Create Cluster Node** dialog box, we recommend to configure the new node in a PASSIVE state. For a description of a parameter, hover the mouse cursor over the corresponding text box.
5. Click **Create**. When prompted to perform a warm reboot, click **Yes.**
6. After the node is UP and sync is successful:
    a. Change RPC credentials for the node from the cluster IP address. For more information about changing an RPC node password, see Change an RPC node password.
    b. Ensure that you configure the necessary spotted configuration on the cluster nodes. For more information on the list of spotted configuration, see List of spotted configuration and Supportability matrix for NetScaler cluster.
    c. Go to **Configuration > System > Cluster** and click **Force cluster sync** to avoid any configuration inconsistencies.
7. Navigate to **System > Cluster > Nodes > Edit**.
8. Modify the State to **ACTIVE** and confirm.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To join a previously added node to the cluster by using the GUI

If you have used the CLI to add a node to the cluster, but have not joined the node to the cluster, you can use the following procedure.

NOTE

When a node joins the cluster, it takes over its share of traffic from the cluster and hence an existing connection can get terminated.

1. Log on to the node that you want to join to the cluster (for example, 10.102.29.70).
2. Navigate to **System > Cluster.**
3. In the details pane, under Get Started, click the Join Cluster link.
4. In the Join to existing cluster dialog box, set the cluster IP address and the `nsroot` password of the configuration coordinator. For a description of a parameter, hover the mouse cursor over the corresponding text box.
5. Click **OK.**

Viewing the details of a cluster

You can view the details of the cluster instance and the cluster nodes by logging on to the cluster IP address.

To view details of a cluster instance by using the CLI

Log on to the cluster IP address and, at the command prompt, type:

```
show cluster instance &lt;clId>
```

NOTE

When the preceding command is run from the NSIP address of the non-CCO node, the command displays the status of the cluster on this node.

To view details of a cluster node by using the CLI

Log on to the cluster IP address and, at the command prompt, type:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
show cluster node &lt;nodeId>
```

To view details of a cluster instance by using the GUI

1. Log on to the cluster IP address.
2. Navigate to **System > Cluster.**
3. In the details pane, under **Get Started**, click the **Manage Cluster** link to view the details of the cluster.

To view details of a cluster node by using the GUI

1. Log on to the cluster IP address.
2. Navigate to **System > Cluster > Nodes.**
3. In the details pane, click the node for which you want to view the details.

Distributing traffic across cluster nodes

After you have created the NetScaler cluster and performed the required configurations, you must deploy Equal Cost Multiple Path (ECMP) or cluster Link Aggregation (LA) on the client data plane (for client traffic) or server data plane (for server traffic). These mechanisms distribute external traffic across the cluster nodes.

Policy-based backplane steering

The policy-based backplane steering (PBS) is a mechanism in cluster deployment, which steers the traffic across cluster nodes based on the hash method defined for the flow. The flow is defined by a combination of L2 and L3 parameters similar to the Access Control List (ACL).

The PBS supports both IPv4 and IPv6 traffic. In the case of IPv6 deployments, the steering supports an extra option `[dfdprefix <positive_integer>]`. It provides the flexibility to choose the same flow processor for the same IP prefix. The prefix option is supported for source IP or destination IP hash methods only.

NOTE

If the PBS mechanism is not used to steer the traffic, the traffic is steered through the default method.

To configure the new ACL attributes, at the CLI, type the following commands:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

CLI commands for IPv4

- `add ns acl <aclname> <aclaction> [-type (classic | dfd)] [-dfdhash <dfdhash>]`
- `set ns acl <aclname> <aclaction> [-dfdhash <dfdhash>`
- `show ns acl [<aclname>][-type (classic | DFD)]`
- `apply ns acls [-type (classic | DFD)]`
- `clear ns acls [-type (classic | DFD)]`
- `renumber ns acls [-type (classic | DFD)]`

CLI commands for IPv6

- `add ns acl6 <acl6name> <acl6action> [-type (classic | dfd)][-dfdhash <dfdhash>][-dfdprefix <positive_interger>]`
- `set ns acl6 <acl6name> <acl6action> [-dfdhash <dfdhash>][-dfdprefix <positive_interger>]`
- `show ns acl6 [<acl6name>][-type (classic | DFD)]`
- `apply ns acls6 [-type (classic | DFD)]`
- `clear ns acls6 [-type (classic | DFD)]`
- `renumber ns acls6 [-type (classic | DFD)]`

The following are the different types of hash methods that you can specify to steer the packet to the flow processor:

- SIP-SPORT-DIP-DPORT
- SIP
- DIP
- SIP-DIP
- SIP-SPORT

Limitations

1. The traffic flow distribution across the cluster nodes is not ensured, as the flow processor is decided by the admin configured rules.
2. L2 mode is not supported.
3. The node groups and striped SNIPs are not supported, as there is no deployment scenarios.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. MPTCP is not supported.
5. Support only for TCP, UDP, and ICMP traffic.
6. Cluster over L3 mode is not supported.
7. Process local at service level is not supported.

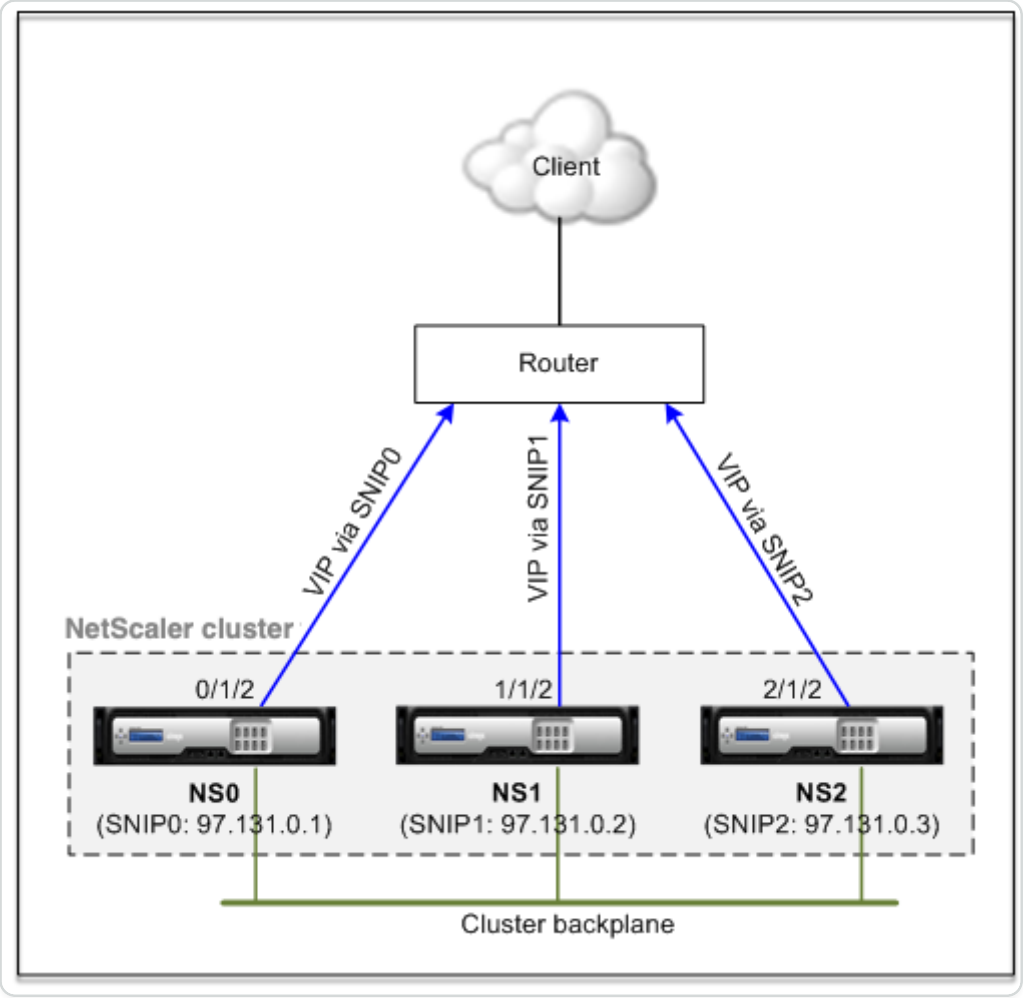
Using the Equal Cost Multiple Path (ECMP)

By using the Equal Cost Multiple Path (ECMP) mechanism on a cluster deployment, active cluster nodes advertise the virtual server IP addresses. The cluster node which receives the advertised traffic steers the traffic to the node that must process the traffic. There can be redundant steering in spotted and partially striped virtual servers. Therefore, from NetScaler® 11 onwards, spotted and partially striped virtual server IP addresses advertise the owner nodes, which reduce the redundant steering.

You must have detailed knowledge of routing protocols to use ECMP. For more information, see Configuring Dynamic Routes. For more information on routing in a cluster, see Routing in a Cluster.

To use ECMP, you must first perform the following:

- Enable the required routing protocol (OSPF, RIP, BGP, or ISIS) on the cluster IP address.
- Bind the interfaces and the spotted IP address (with dynamic routing enabled) to a VLAN.
- Configure the selected routing protocol and redistribute the kernel routes on the ZebOS by using the VTYSH shell.



Perform similar configurations on the cluster IP address and on the external connecting device.

NOTE

- Make sure that the licenses on the cluster support dynamic routing, otherwise ECMP does not work.
- ECMP is not supported for wildcard virtual servers since RHI needs a VIP address to advertise to a router and wildcard virtual servers. As they do not have associated VIP addresses.

Figure 1. ECMP topology

© 1997–2026 Citrix Systems, Inc. All rights reserved.

When you use the ECMP mechanism for traffic distribution on a cluster deployment, the active cluster nodes advertise the virtual server IP addresses to the upstream router. The ECMP router can reach the VIP address via SNIP0, SNIP1, or SNIP2. The traffic flow in the Figure 1 is described as follows:

1. The client sends a request to the VIP hosted on the cluster.
2. The upstream router, based on the learned routes of the VIP, forwards the packet to any one of the nodes. Let's say NS1. The node NS1 is the flow receiver.
3. The flow receiver (NS1) determines the node that must process the traffic, which is called the flow processor. For example, Node NS2 is the flow processor.
4. The flow receiver (NS1) with SNIP1 (97.131.0.2) steers the request to the flow processor (NS2) with SNIP2 (97.131.0.3).
5. The flow processor (NS2) establishes a connection with the server.
6. The server processes the request and sends the response to the SNIP address that sent the request to the server.

Notes:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Only ACTIVE nodes advertise VIP routes.
- INACTIVE nodes do not advertise VIP routes.
- All ACTIVE nodes advertise striped VIPs.
- Only ACTIVE owner nodes advertise spotted or partially striped VIPs.

To configure ECMP on the cluster by using the command line interface

1. Log on to the cluster IP address.
2. Enable the routing protocol.

   ```
   enable ns feature &lt;feature>
   ```

   Example: To enable the OSPF routing protocol.

   ```
   enable ns feature ospf
   ```

3. Add a VLAN.

   ```
   add vlan &lt;id>
   ```

   Example

   ```
   add vlan 97
   ```

4. Bind the interfaces of the cluster nodes to the VLAN.

   ```
   bind vlan &lt;id> -ifnum &lt;interface_name>
   ```

   Example

   ```
   bind vlan 97 -ifnum 0/1/2 1/1/2 2/1/2
   ```

5. Add a spotted SNIP address for each node and enable dynamic routing on it.

   ```
   add ns ip &lt;SNIP> &lt;netmask> -ownerNode &lt;positive_integer>
   -dynamicRouting ENABLED
   ```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Example

```
add ns ip 97.131.0.1 255.0.0.0 -ownerNode 0 -dynamicRouting ENABLED
-type SNIP

add ns ip 97.131.0.2 255.0.0.0 -ownerNode 1 -dynamicRouting ENABLED
-type SNIP

add ns ip 97.131.0.3 255.0.0.0 -ownerNode 2 -dynamicRouting ENABLED
-type SNIP
```

6. Bind one of the spotted SNIP addresses to the VLAN. When you bind one spotted SNIP address to a VLAN, all other spotted SNIP addresses defined on the cluster in that subnet are automatically bound to the VLAN.

```
bind vlan &lt;id> -IPAddress &lt;SNIP> &lt;netmask>
```

Example

```
bind vlan 97 -ipAddress 97.131.0.1 255.0.0.0
```

NOTE

You can use NSIP addresses of the cluster nodes instead of adding SNIP addresses. If so, you do not have to perform steps 3–6.

7. Configure the routing protocol on ZebOS using the VTYSH shell.

Example:

To configure an OSPF routing protocol on node IDs 0, 1, and 2.

```
vtysh

! interface vlan97 !

 router ospf   owner-node 0

ospf router-id 97.131.0.1   exit-owner-node
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
owner-node 1    ospf router-id 97.131.0.2

exit-owner-node

owner-node 2

ospf router-id 97.131.0.3   exit-owner-node   redistribute kernel
network 97.0.0.0/8 area 0  !
```

NOTE

For VIP addresses to be advertised, RHI setting is done by using the vserverRHILevel parameter as follows:

```
add ns ip &lt;IPAddress> &lt;netmask> -type VIP -vserverRHILevel
&lt;vserverRHILevel>
```

For OSPF specific RHI settings, there are more settings that can be done as follows:

```
add ns ip &lt;IPAddress> &lt;netmask> -type VIP -ospfLSAType ( TYPE1 |
TYPE5 ) -ospfArea &lt;positive_integer>
```

Use the add ns ip6 command to perform the preceding commands on IPv6 addresses.

8. Configure ECMP on the external switch. The following sample configurations are provided for the Cisco Nexus 7000 C7010 Release 5.2(1) switch. Similar configurations must be performed on other switches.

```
//For OSPF (IPv4 addresses) Global config: Configure terminal  feature
ospf    Interface config:  Configure terminal  interface Vlan10      no
shutdown      ip address 97.131.0.5/8    Configure terminal  router
ospf 1  network 97.0.0.0/8 area 0.0.0.0
 --------------------------------

//For OSPFv3 (IPv6 addresses) Global config:  Configure terminal
 feature ospfv3    Configure terminal  interface Vlan10      no
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
shutdown      ipv6 address use-link-local-only      ipv6 router ospfv3
1 area 0.0.0.0    Configure terminal  router ospfv3 1
```

Router monitoring cluster nodes in ECMP deployment

In a cluster setup, on an owner node that has a spotted SNIP address configuration, you can now disable the ownerDownResponse option. By default, the option is enabled, allowing the node to respond to an ICMP/ARP/ICMP6/ND6 request coming from the upstream router. You can now disable this option to allow the router to monitor if a cluster node is active or inactive. When the router sends a request, if the option is disabled, it identifies the owner node to be inactive and unavailable for traffic distribution.

TO CONFIGURE ECMP FOR STATIC ROUTES TRAFFIC DISTRIBUTION BY USING THE COMMAND LINE INTERFACE

```
add ns ip &lt;ipddress> &lt;netmask> -ownernode &lt;node-id> –
ownerDownResponse disable
```

Use Case: ECMP with BGP routing

To configure ECMP with BGP routing protocol, perform the following steps:

1. Log on to the cluster IP address.
2. Enable BGP routing protocol.

```
> enable ns feature bgp
```

3. Add VLAN and bind the required interfaces.

```
> add vlan 985

> bind vlan 985 -ifnum 0/0/1 1/0/1
```

4. Add the spotted IP address and bind them to the VLAN.

```
> add ns ip 10.100.26.14 255.255.255.0 -ownerNode 1 -dynamicRouting
ENABLED

> add ns ip 10.100.26.15 255.255.255.0 -ownerNode 2 -dynamicRouting
ENABLED
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
> bind vlan 985 -ipAddress 10.100.26.10 255.255.255.0
```

5. Configure BGP routing protocol on ZebOS using the VTYSH shell.

```
> vtysh conf t router bgp 65535
```

neighbor 10.100.26.1 remote-as 65535

6. Configure BGP on the external switch. The following sample configurations are provided for the Cisco Nexus 7000 C7010 Release 5.2(1) switch. Similar configurations must be performed on other switches.

```
> router bgp 65535 no synchronization

  bgp log-neighbor-changes neighbor 10.100.26.14 remote-as 65535
neighbor 10.100.26.15 remote-as 65535 no auto-summary

  dont-capability-negotiate

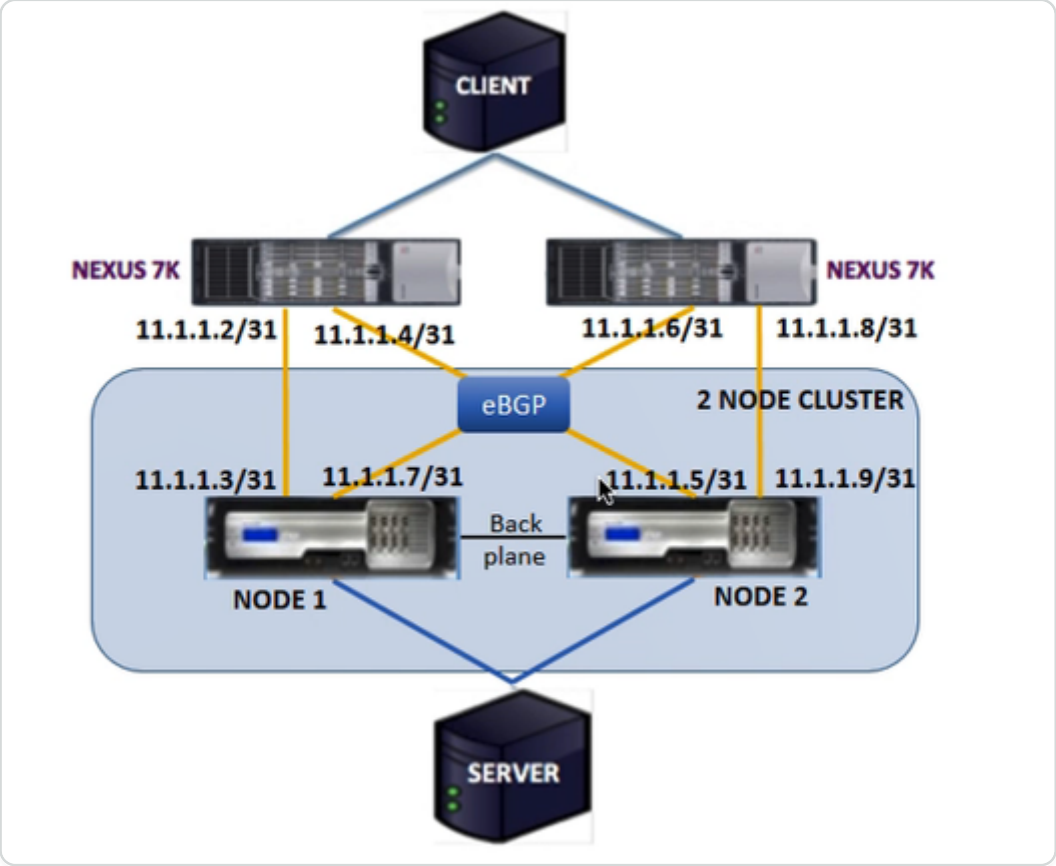
  dont-capability-negotiate

  no dynamic-capability
```

Configuration of cluster ECMP by using Cisco Nexus 7000 switch with routing Protocol

With ECMP over a cluster setup, a NetScaler appliance is able to handle the traffic through a routing protocol. The ECMP mechanism helps in advertising the virtual server IP addresses through all active cluster nodes.

To use ECMP, you must first enable the BGP protocol on the cluster IP address. Bind the interfaces and the spotted IP address (with dynamic routing enabled) to a VLAN. Configure the selected routing protocol and redistribute the kernel routes on the ZebOS by using the VTYSH shell.



Use Case: Cluster ECMP by using Cisco Nexus 7000 switch with routing Protocol

Consider an example of a cluster deployment with a Cisco Nexus 7000 switch:

- Two NetScaler appliances (Node 1 and Node 2), connected to the Nexus switch (upstream).
- Two Cisco Nexus 7000 switch.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Client and server (drawing HTTP traffic through the Nexus switch). With Hot Standby Router Protocol (HSRP) enabled on the client-side.

Prerequisites

Consider the following points before configuring cluster nodes on a NetScaler appliance.

1. All appliances must be of the same platform type.
2. Border Gateway Protocol (BGP) must be enabled on the cluster nodes.

Configuring by using the CLI on a NetScaler appliance

1. Log on to an appliance (for example, appliance with NSIP address 1.1.1.1)
2. To add a cluster node.

```
add cluster node 0 1.1.1.2 –state ACTIVE –backplane 0/10/8
```

3. To add the cluster IP address

```
add ns ip 1.1.1.10 255.255.255.254 –type clip
```

4. Save the configuration

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
save ns config
```

5. Warm reboot the appliance

```
reboot -warm
```

6. To add node 1 using CLIP

```
add cluster node 1 2.2.2.2 –state ACTIVE –backplane 1/10/8
```

7. To join a node to the cluster

```
join cluster –clip 1.1.1.10 –password nsroot
```

8. Perform the following configuration on CLIP

   - `enable ns feature bgp ospf DYNAMICROUTING`
   - `add ns ip 11.1.1.3 255.255.255.254 –dynamicRouting ENABLED –ownerNode 0`
   - `add ns ip 11.1.1.7 255.255.255.254 –dynamicRouting ENABLED –ownerNode 0`
   - `add ns ip 11.1.1.5 255.255.255.254 –dynamicRouting ENABLED –ownerNode 1`
   - `add ns ip 11.1.1.9 255.255.255.254 –dynamicRouting ENABLED –ownerNode 1`

On the Cisco Nexus router (11.1.1.2/31 and 11.1.1.4/31), you must perform the following configurations by using the command line:

- `feature ospf`
- `feature bgp`
- `feature interface-vlan`
- `feature hsrp`

```
>  interface vlan100

    no shutdown

    ip address 50.1.1.1/8

     hsrp 50
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
       ip 50.50.50.50

>  interface Ethernet 4/15
     ip address 11.1.1.2/31
     no shutdown

>  interface Ethernet 4/19
     ip address 11.1.1.4/31
     no shutdown

>  interface Ethernet 4/22
     switchport
      switchport access vlan 100
```

On the Cisco Nexus router (11.1.1.6/31 and 11.1.1.8/31), you must perform the following configurations by using the command line:

- `feature ospf`
- `feature bgp`
- `feature interface-vlan`
- `feature hsrp`

```
 >  interface vlan100
     no shutdown
     no ip redirects
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
     ip address 50.1.1.2/8
      hsrp 50
      ip 50.50.50.50

  >  interface Ethernet 4/13
     ip address 11.1.1.6/31
     no shutdown

  >  interface Ethernet 4/15
     ip address 11.1.1.8/31
     no shutdown

  >  interface Ethernet 4/22
     switchport
     switchport access vlan 100
```

For the BGP protocol, you must perform the following configurations on CLIP of the NetScaler appliance:

```
>  vtysh
ns# router bgp 1
 redistribute kernel
 owner-node 0
 neighbor 11.1.1.2 remote-as 2
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
 neighbor 11.1.1.2 as-origination-interval 1
 neighbor 11.1.1.2 advertisement-interval 0
 neighbor 11.1.1.6 remote-as 2
 neighbor 11.1.1.6 as-origination-interval 1
 neighbor 11.1.1.6 advertisement-interval 0
owner-node 1
 neighbor 11.1.1.4 remote-as 2
 neighbor 11.1.1.4 as-origination-interval 1
 neighbor 11.1.1.4 advertisement-interval 0
 neighbor 11.1.1.8 remote-as 2
 neighbor 11.1.1.8 as-origination-interval 1
 neighbor 11.1.1.8 advertisement-interval 0
exit-owner-node
```

Perform the following configurations on the Cisco Nexus router (11.1.1.3 and 11.1.1.5)

```
> ip access-list acl1
  10 permit ip 50.0.0.0/8 any
  route-map test permit
  match ip address acl1
 router bgp 2
  address-family ipv4 unicast
   redistribute direct route-map test
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
   maximum-paths 2
 neighbor 11.1.1.3 remote-as 1
  address-family ipv4 unicast
  neighbor 11.1.1.5 remote-as 1
 address-family ipv4 unicast
```

Perform the following configurations on the Cisco Nexus router (11.1.1.7 and 11.1.1.9)

```
> ip access-list acl1
   10 permit ip 50.0.0.0/8 any
  route-map test permit 1
   match ip address acl1
  router bgp 2
   address-family ipv4 unicast
   redistribute direct route-map test
   maximum-paths 2
  neighbor 11.1.1.7 remote-as 1
   address-family ipv4 unicast
  neighbor 11.1.1.9 remote-as 1
   address-family ipv4 unicast
```

For the OSPF protocol, you must perform the following configurations on CLIP of the NetScaler appliance:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
> vtysh

ns# router osfp 1

redistribute kernel

owner-node 0

 network 15.1.1.2/31 area 0

 network 15.1.1.6/31 area 0

exit-owner-node

owner-node 1

 network 15.1.1.4/31 area 0

 network 15.1.1.8/31 area 0

exit-owner-node

route-map map2 permit 1

set metric 10
```

On the Cisco Nexus router (11.1.1.2/31 and 11.1.1.4/31), you must perform the following configurations by using the command line:

```
> route-map- map2 permit 1

   set metric 10

   interface Ethernet4/15

     ip address 15.1.1.2/31
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
     ip router ospf 1 area 0.0.0.0
     no shutdown

   interface Ethernet4/19
     ip address 15.1.1.4/31
     ip router ospf 1 area 0.0.0.0
     no shutdown

   router ospf 1
    router-id 1.1.1.1
    redistribute direct route-map map2
```

On the Cisco Nexus router (11.1.1.7/31 and 11.1.1.9/31), you must perform the following configurations by using the command line:

```
> route-map- map2 permit 1
    set metric 10

   interface Ethernet4/13
     ip address 15.1.1.6/31
     ip router ospf 1 area 0.0.0.0
     no shutdown

    interface Ethernet4/15
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
     ip address 15.1.1.8/31

     ip router ospf 1 area 0.0.0.0

     no shutdown

    router ospf 1

      router-id 1.1.1.2

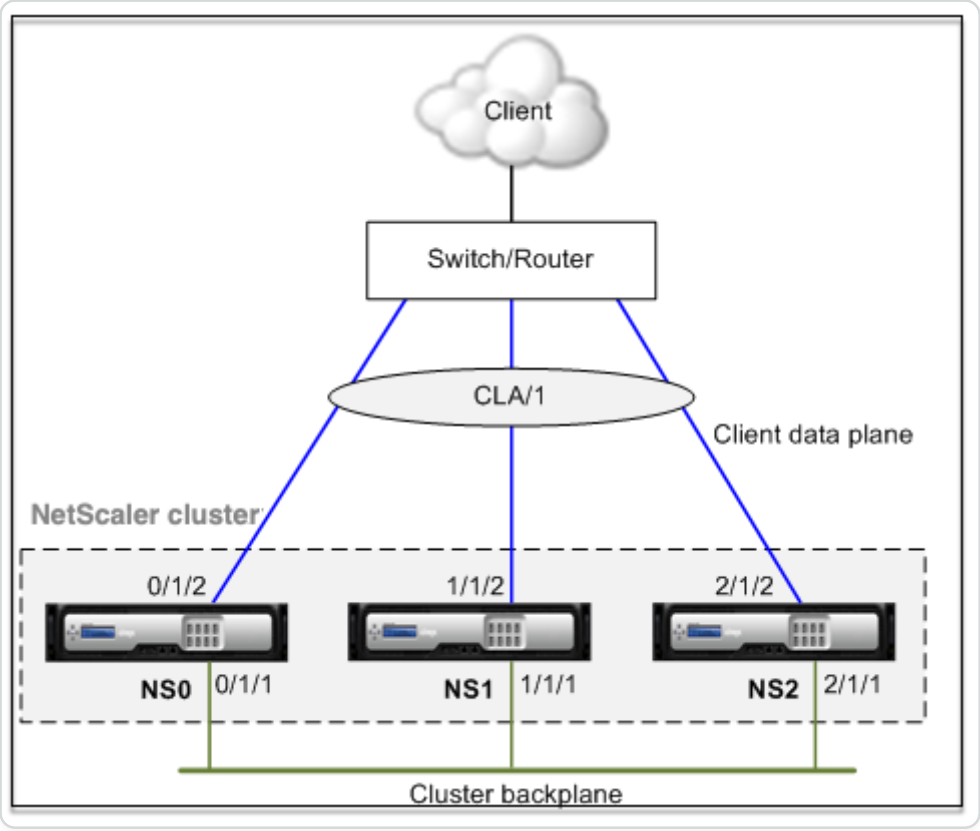
      redistribute direct route-map map2
```

Using cluster link aggregation

Cluster link aggregation is a group of interfaces of cluster nodes. It is an extension of NetScaler link aggregation. The only difference is that, while link aggregation requires the interfaces to be from the same device, in cluster link aggregation, the interfaces are from different nodes of the cluster. For more information about link aggregation, see Configuring Link Aggregation.

IMPORTANT

- Cluster link aggregation is supported for a cluster of hardware (MPX) appliances.
- Cluster link aggregation is supported for a cluster of virtual (VPX) appliances that are deployed on ESX and KVM hypervisors, with the following restrictions:
- Dedicated interfaces must be used. It means that the interfaces must not be shared with other virtual machines.
- When a node becomes INACTIVE, the corresponding cluster LA interface is marked as power DOWN, so that the data traffic is not sent to an INACTIVE node.
- When a node becomes ACTIVE, the corresponding cluster LA interface is marked as power ON.
- If the cluster link aggregation member interfaces are manually disabled or if cluster link aggregation itself is manually disabled, then interface power down capability is achieved only by the LACP timeout mechanism.
- Jumbo MTU is not supported on LACP cluster link aggregation.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

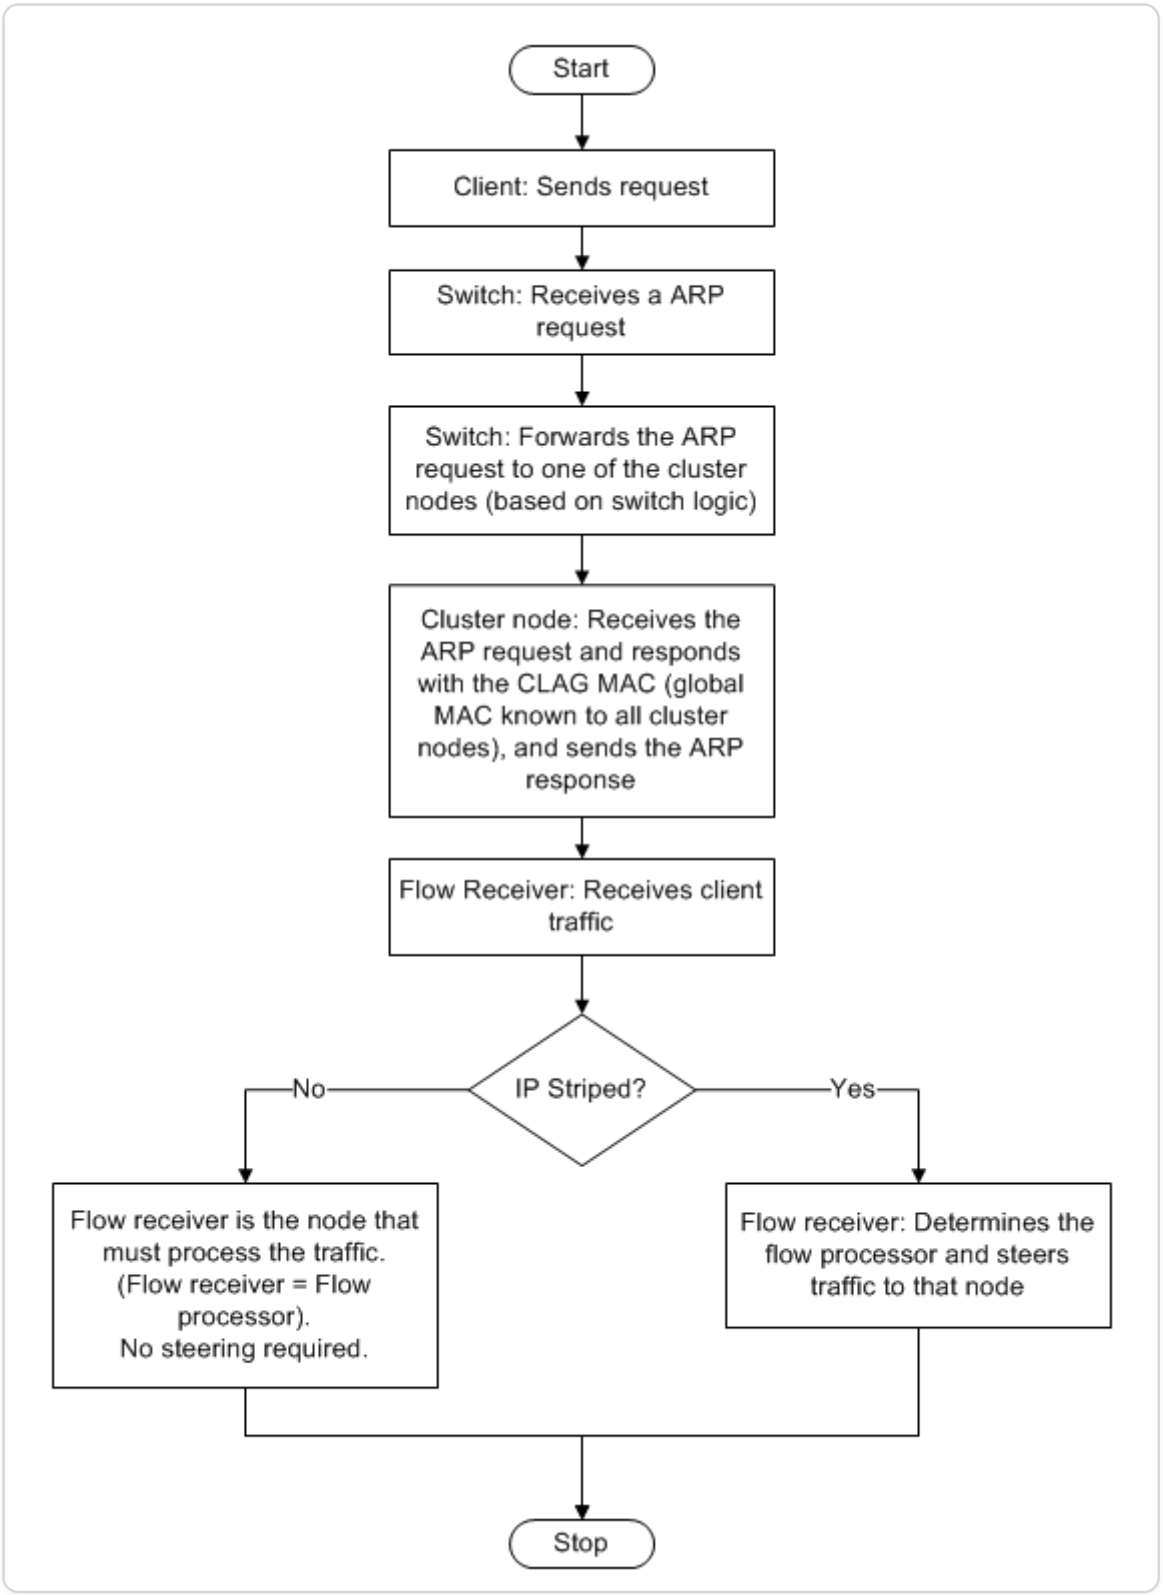
Note: Cluster link aggregation is not supported on VPX appliances that are deployed on XenServer®, AWS, and Hyper-V.

- Starting from 12. 0 release, cluster link aggregation is supported on NetScaler SDX appliances.
- The number of interfaces that can be bound to cluster LA is 16 (from each node). The maximum number of interfaces in cluster LA can be (16 * n), where n is the number of nodes in a cluster. The total number of interfaces in cluster LA depends on the number of interfaces for every port channel on the upstream switch.
- If a NetScaler appliance uses Intel Fortville interfaces, the switchover of a cluster node to passive mode might cause a few seconds of outage with CLAG. The issue occurs because LACP is enabled for CLAG to function properly, and the outage time depends on NIC LACP timers.

For example, consider a three-node cluster where all three nodes are connected to the upstream switch. A cluster LA channel (CLA/1) is formed by binding interfaces 0/1/2, 1/1/2, and 2/1/2.

Figure 1. Cluster Link Aggregation topology

A cluster LA channel has the following attributes:



- Each channel has a unique MAC agreed upon by cluster nodes.
- The channel can bind both local and remote nodes' interfaces.
- A maximum of four cluster LA channels are supported in a cluster.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Backplane interfaces cannot be part of a cluster LA channel.
- When an interface is bound to a cluster LA channel, the channel parameters have precedence over the network interface parameters. A network interface can be bound to one channel only.
- Management access to a cluster node, must not be configured on a cluster LA channel (for example, CLA/1) or its member interfaces. This is because when the node is INACTIVE, the corresponding cluster LA interface is marked as power down, and therefore looses management access.

Figure 2. Traffic distribution flow using cluster LA

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Backup and restore support of cluster LA on NetScaler MPX

You can backup and restore the cluster setup of LA on NetScaler MPX. The cluster LA MAC address is independent of the physical interface MAC address of the cluster nodes, and can change after the backup and restore process. The cluster LA can serve the traffic after a cluster

© 1997–2026 Citrix Systems, Inc. All rights reserved.

restore process is complete. For more information about backup and restore, see Backup and restore of cluster setup

Static cluster link aggregation

You must configure a static cluster LA channel on the cluster IP address and on the external connecting device. If possible, configure the upstream switch to distribute traffic based on IP address or port instead of MAC address.

To configure a static cluster LA channel by using the CLI

1. Log on to the cluster IP address.

   NOTE

   Make sure that you configure the cluster LA channel on the cluster IP address before configuring link aggregation on the external switch. Otherwise, the switch forwards traffic to the cluster even though the cluster LA channel is not configured. It can lead to loss of traffic.

2. Create a cluster LA channel.

   ```
   add channel &lt;id> -speed &lt;speed>
   ```

   Example

   ```
   add channel CLA/1 -speed 1000
   ```

   NOTE

   You must not specify the speed as AUTO. Rather, you must explicitly specify the speed as 10, 100, 1000, or 10000. Only interfaces that have the speed matching the `<speed>` attribute in the cluster LA channel are added to the active distribution list.

3. Bind the required interfaces to the cluster LA channel. Make sure that the interfaces are not used for the cluster backplane.

   ```
   bind channel &lt;id> &lt;ifnum>
   ```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Example

```
bind channel CLA/1 0/1/2 1/1/2 2/1/2
```

4. Verify the configurations.

```
show channel &lt;id>
```

Example

```
show channel CLA/1
```

NOTE

You can bind the cluster LA channel to a VLAN by using the `bind vlan` command. The interfaces of the channel are automatically bound to the VLAN.

5. Configure static LA on the external switch. The following sample configurations are provided for the Cisco Nexus 7000 C7010 Release 5.2(1). Similar configurations must be performed on other switches.

```
Global config:

Configure terminal

Interface level config:

interface Ethernet2/47

switchport

switchport access vlan 10

channel-group 7 mode on
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
no shutdown

interface Ethernet2/48

switchport

switchport access vlan 10

channel-group 7 mode on

no shutdown
```

Dynamic cluster link aggregation

Dynamic cluster LA channel uses the Link Aggregation Control Protocol (LACP).

You must perform similar configurations on the cluster IP address and on the external connecting device. If possible, configure the upstream switch to distribute traffic based on IP address or port instead of MAC address.

POINTS TO REMEMBER

- Enable LACP (by specifying the LACP mode as either ACTIVE or PASSIVE).

```
>**Note**

>

> Make sure the LACP mode is not set as PASSIVE on both the NetScaler
cluster and the external connecting device.
```

- Specify the same LACP key on each interface that you want to be the part of the channel. For creating a cluster LA channel, the LACP key can have a value from 5 through 8. For example, if you set the LACP key on interfaces 0/1/2, 1/1/2, and 2/1/2 to 5, CLA/1 is created. The interfaces 0/1/2, 1/1/2, and 2/1/2 are automatically bound to CLA/1. Similarly, if you set the LACP key to 6, the CLA/2 channel is created.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Specify the LAG type as Cluster.

To configure a dynamic cluster LA channel by using the CLI

On the cluster IP address, for each interface that you want to add to the cluster LA channel, type:

`set interface <id> -lacpMode <lacpMode> -lacpKey <positive_integer> -lagType CLUSTER`

Example:

To configure a cluster LA channel CLA/1 of 3 interfaces.

```
> set interface 0/1/2 -lacpMode active -lacpKey 5 -lagType Cluster

> set interface 1/1/2 -lacpMode active -lacpKey 5 -lagType Cluster

> set interface 2/1/2 -lacpMode active -lacpKey 5 -lagType Cluster
```

NOTE

Optionally, you can enable Link Redundancy in a Cluster with LACP.

Similarly, configure dynamic LA on the external switch. The following sample configurations are provided for the Cisco Nexus 7000 C7010 Release 5.2(1). Similar configurations must be performed on other switches.

```
Global config:

Configure terminal

feature lacp

Interface level config:

interface Ethernet2/47

switchport

switchport access vlan 10
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

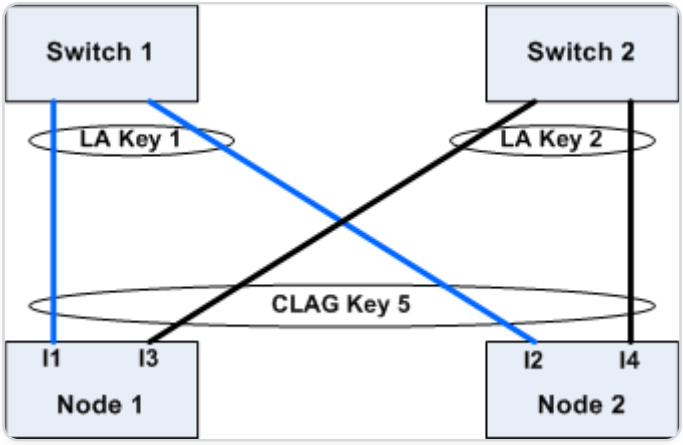
```
channel-group 7 mode active

no shutdown

interface Ethernet2/48

switchport

switchport access vlan 10



channel-group 7 mode active

no shutdown
```

Link redundancy in a cluster with LACP

A NetScaler cluster provides link redundancy for LACP to ensure that all nodes have the same partner key.

To understand the need for link redundancy, let us consider the example of the following cluster setup along with the accompanying cases (with attention to case 3):

In this setup, interfaces I1, I2, I3, and I4 are bound to the LACP channel with KEY 5. On the partner side, I1 and I2 are connected to Switch 1 to form a single LA channel with KEY 1. Similarly, I3 and I4 are connected to Switch 2 to form a single LA channel with KEY 2.

Now let us consider the following cases to understand the need for link redundancy:

- **Case 1: Switch 1 is up and Switch 2 is down**

© 1997–2026 Citrix Systems, Inc. All rights reserved.

In this case, cluster LA on both the nodes would stop receiving LACPDUs from Key2 and would start receiving LACPDUs from Key1. On both the nodes, cluster LA is connected to KEY 1 and I1 and I2 is UP and the channel on both the nodes would be UP.

- **Case 2: Switch1 goes down and Switch2 becomes UP**

  In this case, cluster LA on both the nodes would stop receiving LACPDUs from Key1 and would start receiving LACPDUs from Key2. On both the nodes, cluster LA is connected to Key2 and I3 and I4 is UP and the channel on both the nodes would be UP.

- **Case 3: Both Switch1 and Switch2 are UP**

  In this case, it is possible that cluster LA on node1 chooses Key1 as its partner and cluster LA on node2 chooses Key2 as its partner. It means that I1 on node1 and I4 on node2 are receiving traffic which is undesirable. It can happen because the LACP state machine is node-level and chooses its partners on first-come first-serve basis.

  To solve these concerns, link redundancy of dynamic cluster LA is supported. To configure link redundancy on a channel or interface, you must enable it and optionally specify the threshold throughput as follows:

  ```
  set channel CLA/1 -linkRedundancy ON -lrMinThroughput <positive_integer>
  ```

  The throughput of the partner channels is checked against the configured threshold throughput. The partner channel that satisfies the threshold throughput is selected in a first-in-first-out (FIFO) manner. If none of the partner channel meets the threshold, or if threshold throughput is not configured, the partner channel with the maximum number of links is selected.

  NOTE

  The threshold throughput can be configured from NetScaler® 11 onwards.

Using USIP mode in cluster

In use source IP (USIP) mode, the cluster, or NetScaler appliance forwards each packet to the appropriate back-end server with the client IP address.

USIP mode traffic distribution

The USIP mode behavior differs traffic distribution across client data plane and server data plane in ECMP and CLAG deployment. The following section provides more information about USIP mode behavior. For more information related to CLAG on USIP mode, see Using cluster link aggregation.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

USIP mode

The cluster uses the client IP to open the server-side connection. The source port may or might not be preserved based on the `useproxyport` setting.

USIP `useproxyport` scenarios

The USIP `useproxyport` is ON for the traffic flow, the source port is selected in a way that the reverse traffic hashes to the flow processor. It ensures single steering on the server side.

The USIP `useproxyport` is OFF for the traffic flow, the source port is preserved and hence there is double steering on the server side.

IMPORTANT

- When USIP is ON, the client IP is used in back end server connection, and traffic distribution for response is needed across cluster nodes. You can use ECMP or CLAG deployment for traffic distribution on the server side. In the absence of traffic distribution on the server side, the whole return traffic might land on a single cluster node, resulting in congestion.
- The `set rsskeytype –rsskey symmetric` command is used to reduce double steering to single steering of traffic in the `useproxyport` off deployments. Where the 4-tuple for the connection remains the same for the server and client side. For example, wildcard MAC mode virtual server.

Limitations

The USIP does not work when the process local is disabled.

USIP mode deployment

The following figure depicts a USIP mode deployment in a cluster setup.

Configure the following using CLI

1. Enable the routing protocol.

   ```
   enable ns feature &lt;feature>
   ```

   Example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
enable ns feature ospf
```

2. Add a spotted SNIP address for each node and enable dynamic routing on it.

```
add ns ip &lt;SNIP> &lt;netmask> -dynamicRouting ( ENABLED | DISABLED )
–ownerNode &lt;positive_interger> –ownerdownResponse ( YES | NO )
```

Example

```
-  add ns ip 192.0.2.1 255.255.255.0 -dynamicRouting ENABLED –ownerNode
0 –ownerDownResponse NO

-  add ns ip 192.0.2.2 255.255.255.0 -dynamicRouting ENABLED –ownerNode
1 –ownerDownResponse NO

-  add ns ip 192.0.2.3 255.255.255.0 -dynamicRouting ENABLED –ownerNode
2 –ownerDownResponse NO
```

3. Add a VLAN.

```
add vlan &lt;id>
```

Example

```
add vlan 300
```

4. Bind the interfaces of the cluster nodes to the VLAN.

```
bind vlan &lt;id> -ifnum &lt;interface_name>
```

Example

```
bind vlan 300 -ifnum 0/1/2 1/1/2 2/1/2
```

5. Bind one of the spotted SNIP addresses to the VLAN. When you bind one spotted SNIP address to a VLAN, all other spotted SNIP addresses defined on the cluster in that subnet are automatically bound to the VLAN.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
bind vlan &lt;id> -IPAddress &lt;ip_addr | ipv6_addr> -netmask
```

Example

```
bind vlan 300 –IPAddress 192.0.2.1 255.255.255.0
```

6. Configure the routing protocol on ZebOS using the VTYSH shell. Configure OSPF routing protocol on node IDs 0, 1, and 2.

```
vtysh

configure terminal

ns block-sec-rtadv

router ospf

owner -node 0

router-id 192.0.2.1

exit-owner-node

owner-node 1

router-id 192.0.2.2

exit-owner-node

owner-node 2

router-id 192.0.2.3

exit-owner-node

network 192.0.2.0/24 area 0

default-information originate always
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

7. Perform the following configurations on the Cisco 3750 router by using the CLI.

```
Configure terminal

feature ospf

interface vlan300

no shutdown

ip address 192.0.2.100/24

Configure terminal

router ospf 1

router-id 192.0.2.100

network 192.0.2.0 0.0.0.255 area 0
```

NOTES

- Traffic distribution on client and server need not be the same. For example, you can configure ECMP on the client side and CLAG on the server side or the opposite way.
- Plan for extra capacity of the backplane as there is more steering overhead in the USIP deployment.
- The Configuration related to CLAG and Monitor Static Route (MSR) must remain the same on the server side.
- Traffic steering is more in the USIP mode deployments.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Managing the NetScaler cluster

After you have created a cluster and configured the required traffic distribution mechanism, the cluster is able to serve traffic. During the lifetime of the cluster, you can perform the following cluster tasks:

- Configuring node groups
- Disabling nodes of a cluster
- Discovering NetScaler appliances
- Viewing statistics
- Synchronizing cluster configurations, and cluster files
- Synchronizing the time across the nodes
- Upgrading or downgrading the software of cluster nodes

Configuring linksets

Linkset is a group of interfaces of cluster nodes that belong to the same broadcast domain. In linksets, each node has the information about which interfaces of other nodes are connected to the same broadcast domain.

NOTE

Linksets are a mandatory configuration in the following scenarios:

- For deployments that require MAC-Based Forwarding (MBF).
- For "-m MAC" mode that is enabled at the virtual server along with MBF mode enabled globally.
- To improve the manageability of ACL and L2 policies involving interfaces. You define a linkset of the interfaces and add ACL and L2 policies based on linksets.

In a cluster setup, the following features use MBF internally.

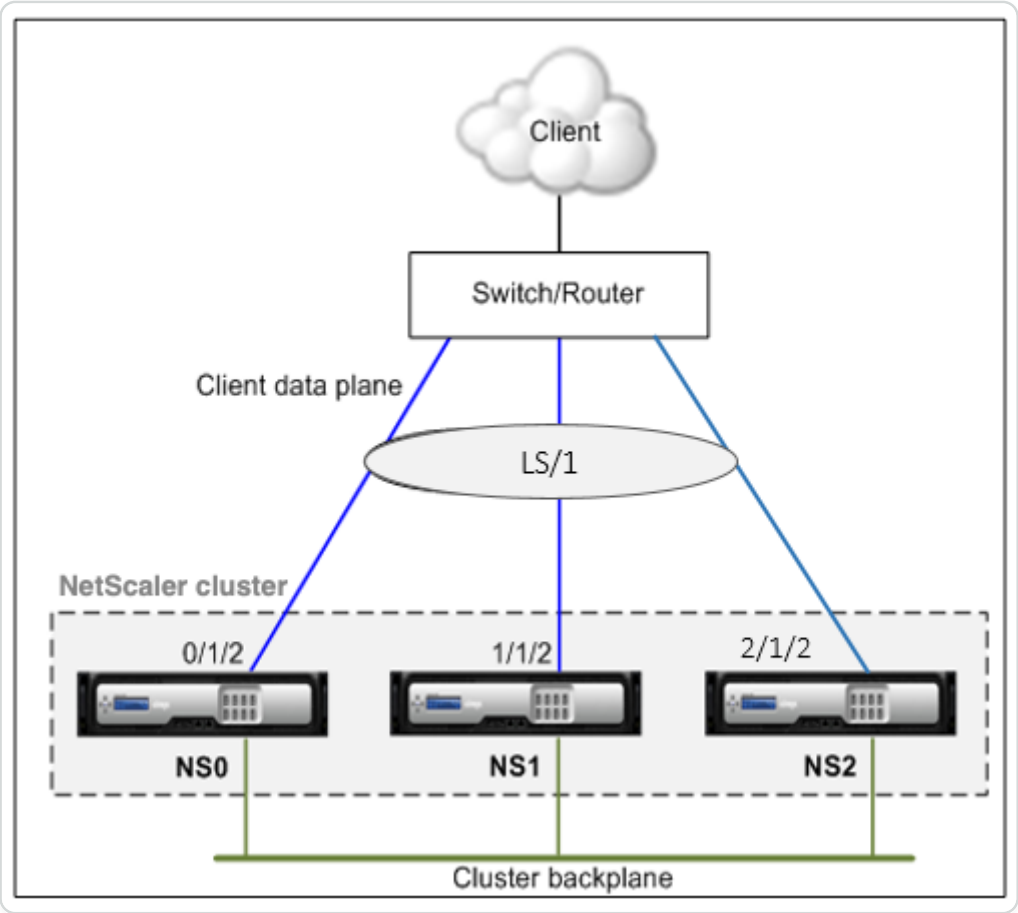
- Forwarding session
- L2Conn
- MAC mode virtual server
- Transparent monitor
- LLB

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Linksets must be configured only through the cluster IP address.

Consider an example with a three node cluster. In the following figure, the interfaces 0/1/2, 1/1/2, and 2/1/2 are in the same broadcast domain and therefore can be configured as linkset (LS/1).

Figure 1. Linksets topology



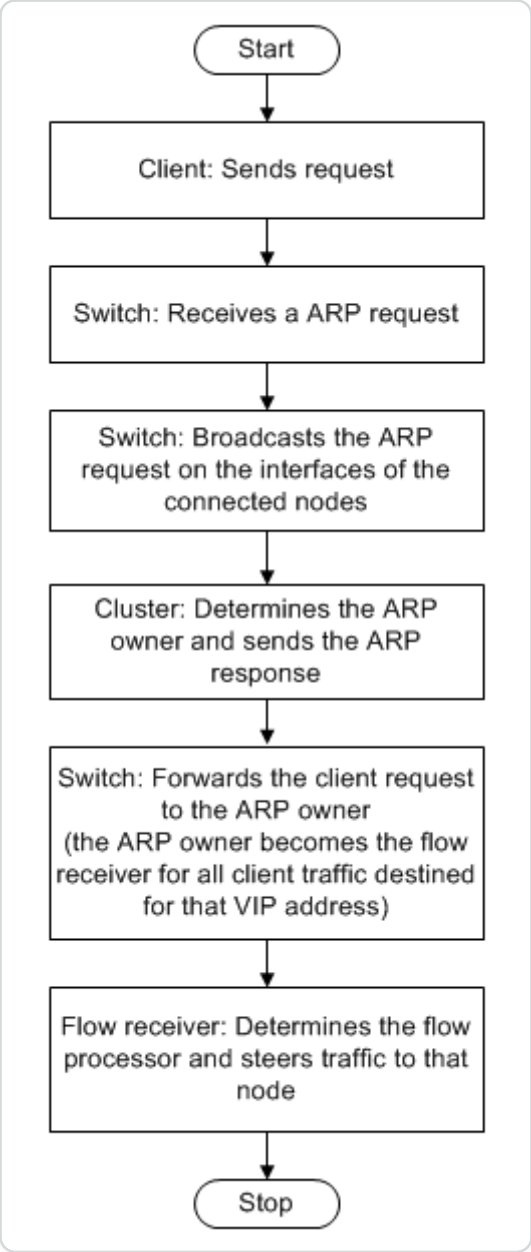


Figure 2. Traffic distribution flow using linksets

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To configure a linkset by using the CLI

1. Log on to the cluster IP address.
2. Create a linkset.

   ```
   add linkset <id>
   ```

   Example

   ```
   add linkset LS/1
   ```

3. Bind the required interfaces to the linkset. Make sure the interfaces are not used for the cluster backplane.

   ```
   bind linkset <id> -ifnum <interface_name> ...
   ```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Example

```
bind linkset LS/1 -ifnum 0/1/2 1/1/2 2/1/2
```

4. Verify the linkset configurations.

```
show linkset <id>
```

Example

```
show linkset LS/1
```

NOTE

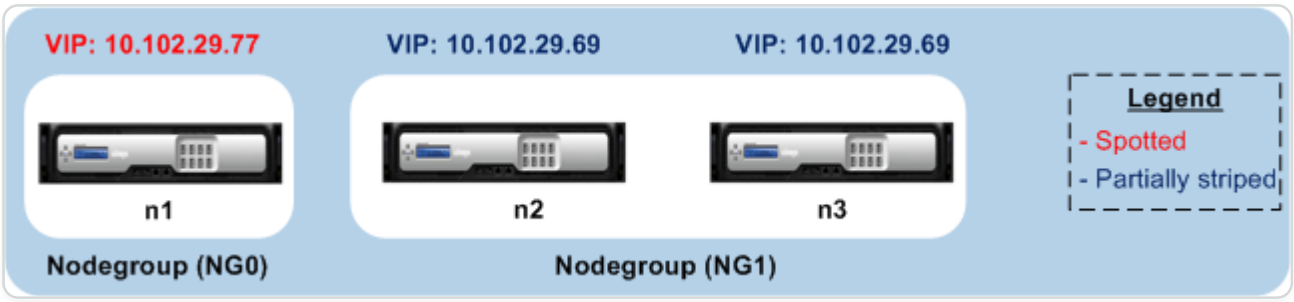
You can bind the linkset to a VLAN by using the `bind vlan` command. The interfaces of the linkset are automatically bound to the VLAN.

To configure a linkset by using the GUI

1. Log on to the cluster IP address.
2. Navigate to **System > Network > Linksets**.
3. In the details pane, click **Add**.
4. In the **Create Linkset** dialog box:
   - Specify the name of the linkset by setting the Linkset parameter.
   - Specify the Interfaces to be added to the linkset and click Add. Repeat this step for each interface you want to add to the linkset.
5. Click **Create**, and then click **Close**.

Node groups for spotted and partially striped configurations

By virtue of the default cluster behavior, all configurations performed on the cluster IP address are available on all nodes of the cluster. However, there might be cases where you need some configurations to be available only on specific cluster nodes.



You can achieve this requirement by defining a node group that includes the specific cluster nodes, and then binding the configuration to that node group. It ensures that the configuration is active only on those cluster nodes. These configurations are called partially striped or spotted (if active only one a single node). For more information, see Striped, Partially Striped, and Spotted Configurations.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

For example, consider a cluster with three nodes. You create a node group NG0 that includes node n1 and another node group NG1 that includes n2 and n3. Bind load balancing virtual servers 0.77 to NG0 and load balancing virtual server 0.69 to NG1.

It means that virtual server 0.77 is active only on n1 and therefore only n1 receives the traffic that is directed to 0.77. Similarly, virtual server 0.69 is active only on nodes n2 and n3 and therefore only n2 and n3 receives traffic that is directed to 0.69.

Figure 1. NetScaler cluster with node groups configured for spotted and partial-striped configurations

The entities or configurations that you can bind to a node group are:

- Load balancing, content switching, cache redirection, authentication, authorization, and auditing virtual servers

  NOTE

  FTP load balancing virtual servers cannot be bound to node groups.

- VPN virtual server (Supported from NetScaler 10.5 Build 50.10 onwards)
- Global Server Load Balancing (GSLB) sites and other GSLB entities (Supported from NetScaler 10.5 Build 52.11 onwards)
- Limit identifiers and stream identifiers

Behavior of node groups

Due to the interoperability of node groups with different NetScaler features and entities, there are some behavioral aspects to be noted. Nodes in a node group can also be backed up. Read on for more information.

General behavior of a cluster node group

- A node group that has entities bound to it cannot be removed.
- A cluster node that belongs to a node group with entities bound to it, cannot be removed.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- A cluster instance that has node groups with entities bound to it, cannot be removed.
- You cannot add an entity that has a dependency on another entity. It must not be a part of the node group. If you must do so, first remove the dependency. Then, add both the entities to the node group and reassociate the entities.

  Examples:

  - Assume you have a virtual server, VS1, whose backup is virtual server VS2. To add VS1 to a node group, first make sure that VS2 is removed as the backup server of VS1. Then, bind each server individually to the node group, and then configure VS2 as the backup for VS1.
  - Assume you have a content switching virtual server, CSVS1, whose target load balancing virtual server is LBVS1. To add CSVS1 to a node group, first remove LBVS1 as the target. Then, bind each server individually to the node group, and then configure LBVS1 as the target.
  - Assume you have a load balancing virtual server, LBVS1, that has a policy which invokes another load balancing virtual server, LBVS2. To add either one of the virtual servers, first remove the association. Then, bind each server individually to the node group, and then reassociate the virtual servers.

- You cannot bind an entity to a node group. It has no nodes and that has the strict option enabled. Therefore, you cannot unbind the last node of a node group that has entities bound to it and that has the strict option enabled.
- The strict option cannot be modified for a node group that has no nodes but has entities bound to it.

Backing up nodes in a node group

By default, a node group is designed to provide back up nodes for members of a node group. If a node group member goes down, a cluster node that is not a member of the node group dynamically replaces the failed node. This node is called the replacement node.

NOTE

For a single-member node group, a backup node is automatically preselected when an entity is bound to the node group.

When the original member of the node group comes up, the replacement node, by default, is replaced by the original member node.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

From NetScaler 10.5 Build 50.10 onwards, however, the NetScaler allows you to change this replacement behavior. When you enable the sticky option, the replacement node is retained even after the original member node comes up. The original node takes over only when the replacement node goes down.

You can also disable the backup functionality. To do it, you must enable the strict option. In this scenario, when a node group member goes down, no other cluster node is picked up as a backup node. The original node continues being part of the node group when it comes up. This option ensures that entities bound to a node group are active only on node group members.

NOTE

The strict and sticky option can be set only when creating a node group.

Configuring node groups for spotted and partially striped configurations

To configure a node group for spotted and partially striped configurations you must first create a node group and then bind the required nodes to the node group. You then associate the required entities to that node group. The entities that are bound to the node group are of the following:

- **Spotted** - If bound to a node group that has a single node.
- **Partially Striped** - If bound to a node group that has more than one node.

Some points to remember:

- GSLB is supported on a cluster only when GSLB sites are bound to node groups that have a single cluster node. For more information, see Setting Up GSLB in a Cluster.
- NetScaler Gateway is supported on a cluster only when the VPN virtual servers are bound to node groups that have a single cluster node. The sticky option must be enabled on the node group.
- For versions prior to NetScaler® 11, the application firewall is supported only on individual cluster nodes (spotted configuration). Application firewall profiles can be associated only with virtual servers that are bound to node groups that have a single cluster node. It means that application you are not allowed to do the following:
  - Bind application firewall profiles to striped or partially striped virtual servers.
  - Bind the policy to a global bind point or to user-defined policy labels.
  - Unbind, from a node group, a virtual server that has application firewall profiles.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- NetScaler 11 introduced application firewall support for striped and partially striped configurations. For more information, see Application Firewall Support for Cluster Configurations.

Check NetScaler Features Supported in a Cluster to see the NetScaler versions from which GSLB, NetScaler Gateway, and application firewall are supported in a cluster.

To configure a node group by using the command line interface

1. Log on to the cluster IP address.
2. Create a node group. Type:

   ```
   add cluster nodegroup <name> -strict (YES | NO)
   ```

   Example

   ```
   add cluster nodegroup NG0 -strict YES
   ```

3. Bind the required nodes to the node group. Type the following command for each member of the node group:

   ```
   bind cluster nodegroup <name> -node <nodeId>
   ```

   Example

   To bind nodes with IDs 1, 5, and 6.

   ```
   > bind cluster nodegroup NG0 -node 1

   > bind cluster nodegroup NG0 -node 5

   > bind cluster nodegroup NG0 -node 6
   ```

4. Bind the entity to the node group. Type the following command once for every entity that you want to bind:

   ```
   bind cluster nodegroup <name> (-vServer <string> | -identifierName <string> | -gslbSite <string> -service <string>)
   ```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE

The gslbSite and service parameters are available from NetScaler 10.5 onwards.

Example

To bind virtual servers VS1 and VS2 and rate limit identifier named identifier1.

```
> bind cluster nodegroup NG0 -vServer VS1

> bind cluster nodegroup NG0 -vServer VS2

> bind cluster nodegroup NG0 -identifierName identifier1
```

5. Verify the configurations by viewing the details of the node group. Type:

   `show cluster nodegroup <name>`

   Example

   ```
   > show cluster nodegroup NG0
   ```

To configure a node group by using the configuration utility

1. Log on to the cluster IP address.
2. Navigate to **System > Cluster > Node Groups.**
3. In the details pane, click **Add.**
4. In the **Create Node Group** dialog box, configure the node group:
   a. Under **Cluster Nodes**, click the **Add** button.
      - The Available list displays the nodes that you can bind to the node group and the Configured list displays the nodes that are bound to the node group.
      - Click the **+** sign in the Available list to bind the node. Similarly, click the **-** sign in the Configured list to unbind the node.
   b. Under **Virtual Servers**, select the tab corresponding to the type of virtual server that you want to bind to the node group. Click the **Add** button.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- The Available list displays the virtual servers that you can bind to the node group and the Configured list displays the virtual servers that are bound to the node group.
- Click the **+** sign in the Available list to bind the virtual server. Similarly, click the - sign in the Configured list to unbind the virtual server.

Configuring redundancy for node groups

NOTE

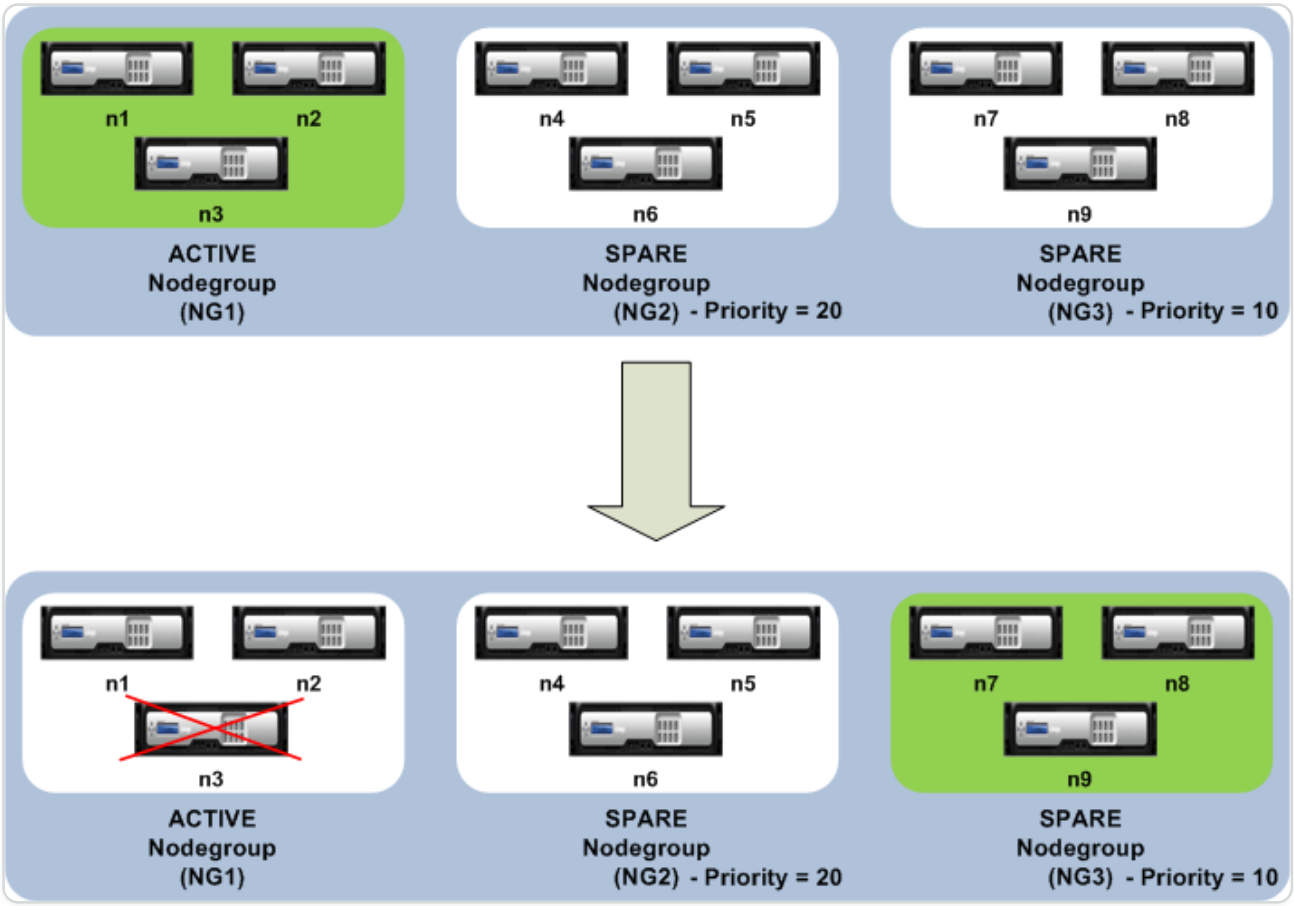
Supported from NetScaler 10.5 Build 52.1115.e onwards.

Node groups can be configured such that when one node group goes down, another node group can take over and process traffic. For example, when a node group NG1 goes down, NG2 takes over.

NOTE

This functionality can be used to configure data center redundancy where each node group is configured as a data center.

To achieve this use case, cluster nodes must be logically grouped into node groups, where some node groups must be configured as ACTIVE and others as SPARE. The active node group with the highest priority (that is, the lowest priority number) is made operationally active and therefore serves traffic. When a node from this operationally active node group goes down, the node count of this node group is compared with the node count of the other active node groups in order of their priority. If a node group has a higher or equal node count, that node group is made operationally active. Else, the spare node groups are checked.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE

- Only one state-specific node group can be active at a given point in time.
- A cluster node inherits the state of the node group. So, if a node with "SPARE" state is added to the node group with state as "ACTIVE", the node automatically behaves as an active node.
- The pre-emption parameter that is defined for the cluster instance decides whether the initial active node group takes the control when it comes up again.
- A spare node group can take up a node group and host active traffic when an active node group goes down.

The following figure shows a node group setup that has node group redundancy defined. NG1 is initially the active node group. When it loses one of the nodes, the spare node group (NG3) with the highest priority starts serving traffic.

Figure 1. NetScaler cluster with node group redundancy configured.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configuring redundancy for node groups

1. Log on to the cluster IP address.
2. Create the active node group and bind the required cluster nodes.

```
> add cluster nodegroup NG1 -state ACTIVE

> bind cluster nodegroup NG1 -node n1

> bind cluster nodegroup NG1 -node n2

> bind cluster nodegroup NG1 -node n3
```

3. Create the spare node group and bind the requisite nodes.

```
> add cluster nodegroup NG2 -state SPARE -priority 20

> bind cluster nodegroup NG2 -node n4

> bind cluster nodegroup NG2 -node n5

> bind cluster nodegroup NG2 -node n6
```

4. Create another spare node group and bind the requisite nodes.

```
> add cluster nodegroup NG3 -state SPARE -priority 10

> bind cluster nodegroup NG3 -node n7

> bind cluster nodegroup NG3 -node n8

> bind cluster nodegroup NG3 -node n9
```

Disabling steering on the cluster backplane

NOTE

Supported from NetScaler® 11 onwards.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The default behavior of a NetScaler cluster is to direct the traffic that it receives (flow receiver) to another node (flow processor). The flow processor must then process the traffic. This process of directing the traffic from flow receiver to flow processor occurs over the cluster backplane and is called steering.

If necessary, you can disable steering so that the process becomes local to the flow receiver and therefore makes the flow receiver as the flow processor. Such a configuration setup can come handy when you have a high latency link.

NOTE

This configuration is applicable only for striped virtual servers.

- For partially striped virtual servers, if the flow receiver is a non-owner node, the traffic is steered to an owner node. If the flow receiver is an owner node, steering is disabled.
- For spotted virtual servers, the flow receiver is the flow processor, and hence there is no need for steering.

Some points to remember when disabling the steering mechanism:

- Striped SNIPs are not supported as steering is disabled.
- MPTCP and FTP do not work.
- L2 mode must be disabled.
- If USIP is enabled, traffic might not reach back to the same node as steering is disabled.
- Traffic that is directed to the cluster IP address is steered to the configuration coordinator.
- Fragmentation is not supported as steering is disabled.
- When a node joins or leaves a cluster, it is possible that more than 1/N connections are affected. It is because a change in the nodes available might cause the routes to be rehashed. As a result, the traffic is routed to another node and due to the non-availability of steering, the traffic is not processed.

Steering can be disabled at the individual virtual server level or at the global level. The global configuration takes precedence over the virtual server setting.

- Disabling backplane steering for all striped virtual servers

  Configured at the cluster instance level. Traffic meant for any striped virtual server is not steered on the cluster backplane.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add cluster instance <clId> -processLocal ENABLED
```

- Disabling backplane steering for a specific striped virtual server

  Configured on a striped virtual server. Traffic meant for the virtual server is not steered on the cluster backplane.

```
add lb vserver <name> <serviceType> -processLocal ENABLED
```

Synchronizing cluster configurations

NetScaler configurations that are available on the configuration coordinator are synchronized to the other nodes of the cluster when:

- A node joins the cluster
- A node rejoins the cluster
- A new command is run through the cluster IP address

Also, you can forcefully synchronize the configurations that are available on the configuration coordinator (full synchronization) to a specific cluster node. Make sure you synchronize one cluster node at a time, otherwise the cluster can get affected.

To synchronize cluster configurations by using the CLI:

At the command prompt of the appliance on which you want to synchronize the configurations, type:

```
force cluster sync
```

To synchronize cluster configurations by using the GUI:

1. Log on to the appliance on which you want to synchronize the configurations.
2. Navigate to **System > Cluster.**
3. In the details pane, under **Utilities**, click Force cluster sync.
4. Click **OK.**

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Display list of commands failed during cluster config synchronization

In a cluster setup, with sync status strict mode `syncStatusStrictMode` enabled, you can display the list of commands failed during a cluster synchronization on a non-CCO node.

You can determine the cluster synchronization state of a non-CCO node by running the `show node` operation. `PARTIAL SUCCESS` Synchronization state indicates that some commands failed on the non-CCO node during the cluster synchronization.

To view the list of commands failed on a node during the cluster synchronization by using CLI:

- `show cluster syncFailures`

Sample configuration

```
    > show cluster node

    1) Node ID: 1

            IP:                 10.102.201.24

            Backplane:          1/1/1

            Health:             UP

            Admin State:        ACTIVE

            Operational State:  ACTIVE(Configuration Coordinator)

            Sync State:         ENABLED

            Priority:           31

            Tunnel Mode:        NONE

            Node Group:         DEFAULT_NG

    2) Node ID: 2

            IP:                 10.102.201.62*
```

    ERROR: Operation not allowed on loopback interface.
```

Synchronizing time across cluster nodes

The cluster uses a Precision Time Protocol (PTP) to synchronize the time across cluster nodes. PTP uses multicast packets to synchronize the time. If there are some issues in time synchronization, you must disable PTP and configure Network Time Protocol (NTP) on the cluster.

To enable/disable PTP by using the command line interface

At the command prompt of the cluster IP address, type:

```
set ptp -state disable
```

To enable/disable PTP by using the configuration utility

1. Log on to the cluster IP address.
2. Navigate to **System > Cluster.**

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. In the details pane, under **Utilities**, click **Configure PTP Settings.**
4. In the **Enable/Disable PTP** dialog box, select whether you want to enable or disable PTP.
5. Click **OK.**

Synchronizing cluster files

The files available on the configuration coordinator are called cluster files. These files are automatically synchronized on the other cluster nodes when the node is added to the cluster and periodically, during the lifetime of the cluster. Also, you can manually synchronize the cluster files.

Important: Removing any certificate or key files in a cluster environment restricts further configuration on the ADC appliance. Add the files back at the same location to make any configuration changes.

The directories and files from the configuration coordinator that are synchronized are:

- /nsconfig/ssl/
- /var/netscaler/ssl/
- /var/vpn/bookmark/
- /nsconfig/dns/
- /nsconfig/monitors/
- /nsconfig/nstemplates/
- /nsconfig/ssh/
- /nsconfig/rc.netscaler
- /nsconfig/resolv.conf
- /nsconfig/inetd.conf
- /nsconfig/syslog.conf
- /nsconfig/snmpd.conf
- /nsconfig/ntp.conf
- /nsconfig/httpd.conf
- /nsconfig/sshd_config
- /nsconfig/hosts
- /nsconfig/enckey
- /var/nslw.bin/etc/krb5.conf

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- /var/nslw.bin/etc/krb5.keytab
- /var/lib/likewise/db/
- /var/download/
- /var/wi/tomcat/webapps/
- /var/wi/tomcat/conf/Catalina/localhost/
- /var/wi/java_home/lib/security/cacerts
- /var/wi/java_home/jre/lib/security/cacerts
- /nsconfig/license/
- /nsconfig/rc.conf

TIP

Files (certificates and key files) that are copied to the cluster configuration coordinator manually (or through the shell) are not automatically available on the other cluster nodes. Run the "sync cluster files" command from the cluster IP address before running a command that depends on these files.

To synchronize cluster files by using the command line interface

At the command prompt of the cluster IP address, type:

```
sync cluster files &lt;mode>
```

To synchronize cluster files by using the configuration utility

1. Log on to the cluster IP address.
2. Navigate to **System > Cluster.**
3. In the details pane, under **Utilities**, click Synchronize cluster files.
4. In the **Synchronize** cluster files dialog box, select the files to be synchronized in the Mode drop-down list.
5. Click **OK.**

Viewing the statistics of a cluster

You can view the statistics of a cluster instance and cluster nodes to evaluate the performance or to troubleshoot the operation of the cluster.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To view the statistics of a cluster instance by using the command line interface

At the command prompt of the cluster IP address, type:

```
stat cluster instance &lt;clId>
```

To view the statistics of a cluster node by using the command line interface

At the command prompt of the cluster IP address, type:

```
stat cluster node &lt;nodeid>
```

NOTE

The `stat cluster node <nodeid>` command displays the cluster level statistics when you run the command from the cluster IP address. However, when you run from the NSIP address of a cluster node, the command displays node level statistics.

To view the statistics of a cluster instance by using the configuration utility

1. Log on to the cluster IP address.
2. Navigate to **System > Cluster.**
3. In the details pane, in the center of the page, click **Statistics.**

To view the statistics of a cluster node by using the configuration utility

1. Log on to the cluster IP address.
2. Navigate to **System > Cluster > Nodes.**
3. In the details pane, select a node and click **Statistics** to view the statistics of the node. To view the statistics of all the nodes, click **Statistics** without selecting a specific node.

Discovering NetScaler appliances

You can discover the appliances present in the same subnet as the current node. The required discovered appliances can then be selectively added to the cluster. This operation can be performed to either create a cluster or to add nodes to an existing cluster.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE

- The discover operation can be performed only through the configuration utility.
- This operation cannot discover NetScaler appliances from different networks.
- When performing this operation to add nodes to an existing cluster, the L3 VLAN configurations are cleared from the node. You make sure to define these configurations once the appliance is added to the cluster.

To discover appliances by using the GUI

1. Log on to the cluster IP address.
2. Navigate to **System > Cluster > Nodes.**
3. In the details pane, at the bottom of the page, click **Discover NetScalers.**
4. In the **Discover NetScalers** dialog box, set the following parameters:
   - **IP address range** - Specify the range of IP addresses within which you want to discover appliances. For example, you can search for all NSIP addresses between 10.102.29.4 to 10.102.29.15 by specifying this option as 10.102.29.4 - 15.
   - **Backplane interface** - Specify the interfaces to be used as the backplane interface. It is an optional parameter. If you do not specify this parameter, you must update it after the node is added to the cluster.
5. Click **OK.**
6. Select the appliances that you want to add to the cluster.
7. Click **OK.**

Disabling a cluster node

You can temporarily remove a node from a cluster by disabling the cluster instance on that node. A disabled node is not synchronized with the cluster configurations. When the node is enabled again, the cluster configurations are automatically synchronized on it. For more information, see Synchronization across cluster nodes.

A disabled node cannot serve traffic and all existing connections on this node are terminated.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE

If the configurations of a disabled non-configuration coordinator node are modified (through the NSIP address of the node), the configurations are not automatically synchronized on that node. You can manually synchronize the configurations as described in Synchronizing Cluster Configurations.

To disable a cluster node by using the command line interface

At the command prompt of the node that you want to disable, type:

```
disable cluster instance &lt;clId>
```

NOTE

To disable the cluster, run the disable cluster instance command on the cluster IP address.

To disable a cluster node by using the configuration utility

1. On the node that you want to disable, navigate to **System > Cluster**, and click **Manage Cluster.**
2. In the **Configure** cluster instance dialog box, unselect the **Enable** cluster instance check box.

   NOTE

   To disable the cluster instance on all the nodes, perform the preceding procedure on the cluster IP address.

Removing a cluster node

When a node is removed from the cluster, the cluster configurations are cleared from the node (by internally running the clear ns config -extended command). The SNIP addresses, **MTU** settings of the backplane interface, and all VLAN configurations (except the default VLAN and NSVLAN) are also cleared from the appliance.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE:

- If the deleted node was the cluster configuration coordinator (CCO), another node is automatically selected as the CCO, and the cluster IP address is assigned to that node. All the current cluster IP address sessions are invalid and you have to start a new session.
- To delete the whole cluster, you must remove each node individually. When you remove the last node, the cluster IP addresses are deleted.
- When an active node is removed, the traffic serving capability of the cluster is reduced by one node. Existing connections on this node are terminated.

To remove a cluster node by using the CLI

1. Log on to the cluster IP address and at the command prompt, type:

```
rm cluster node &lt;nodeId>

save ns config
```

2. Log on to the removed node, NSIP address, and at the command prompt, type:

```
save ns config

reboot
```

NOTE:

If the cluster IP address is unreachable from the node, run the `rm cluster instance` command on the NSIP address of that node itself.

1. On the cluster IP address, navigate to **System > Cluster > Nodes**. Select the node you want to remove and click **Remove.**
2. On the NSIP of the removed node, navigate to **System > Reboot**.
3. On the **Reboot** page, select **Save configuration** and **Warm reboot**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. Click **OK**.

Removing a node from a cluster deployed using cluster link aggregation

To remove a node from a cluster that uses cluster link aggregation as the traffic distribution mechanism, you must make sure that the node is made passive so that it does not receive any traffic and then, on the upstream switch, remove the corresponding interface from the channel.

For detailed information on cluster link aggregation, see Using Cluster Link Aggregation.

To remove a node from a cluster that uses cluster link aggregation as the traffic distribution mechanism

1. Log on to the cluster IP address.
2. Set the state of the cluster node that you want to remove to PASSIVE.

```
set cluster node &lt;nodeId> -state PASSIVE
```

3. On the upstream switch, remove the corresponding interface from the channel by using switch-specific commands.

NOTE

You do not have to manually remove the nodes interface on the cluster link aggregation channel. It is automatically removed when the node is deleted in the next step.

4. Remove the node from the cluster.

```
rm cluster node &lt;nodeId>
```

Detecting jumbo probe on a cluster

If a jumbo frame is enabled on a cluster interface, the backplane interface must be large enough to support the all packets in the jumbo frame. It is achieved by setting the Maximum Transmission Unit (MTU) of the backplane.

The configured MTU value must be the same across all nodes in the cluster for the following:

- Server data plane (X)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Client data plane (Y)
- Backplane: The configured MTU value must be set to 78 + a maximum of X and Y.

NOTE:

The MTU values for the server data plane (X) and client data plane (Y) need not be the same.

For example, if the MTU of a server data plane is 7500 and of the client data plane is 8922 across the cluster, then the MTU of a cluster backplane must be set to 78 + 8922 = 9000 across the cluster.

To verify the preceding configuration, you must send a jumbo probe (of the preceding computational size) to all the peer nodes of a cluster setup. If the probe does not succeed, the appliance displays a warning message in the output of the `show cluster instance` command.

In the command interface mode, type the following command:

```
> show cluster instance

  Cluster ID: 1

  Dead Interval: 3 secs

  Hello Interval: 200 msecs

  Preemption: DISABLED

  Propagation: ENABLED

  Quorum Type: MAJORITY

  INC State: DISABLED

  Process Local: DISABLED

  Cluster Status: ENABLED(admin),    ENABLED(operational), UP
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

WARNING:

The MTU for a backplane interface must be large enough to handle all packets in the frame. It must be equal to `<MTU\_VAL>`. If the recommended value is not user configurable, you must review the MTU value of jumbo interfaces.

SL. NO	MEMBER NODES	HEALTH	ADMIN STATE	OPERATION STATE
1	Node ID: 1; Node IP: 10.102.53.167	UP	Active	ACTIVE (Configuration Coordinator)
2	Node ID: 2; Node IP: 10.102.53.168	UP	Active	Active

Route monitoring for dynamic routes in cluster

You can use a route monitor to make a cluster node dependent on the internal routing table whether it contains or does not contain a dynamically learned route. A route monitor on each node checks the internal routing table to ensure there is a route entry for reaching a particular network is always present. If the route entry is not present, the state of the route monitor changes to DOWN.

In a cluster deployment, if the client-side or server side-link of a node goes down, traffic is steered to this node through the peer nodes for processing. The steering of traffic is implemented by configuring dynamic routing and adding static ARP entries, pointing to the special MAC address of each node, on all the nodes. If there are many nodes in a cluster deployment, adding and managing static ARP entries with special MAC addresses on all the nodes is a cumbersome task. Now, nodes implicitly use special MAC addresses for steering packets. Therefore, static ARP entries pointing to special MAC addresses are no longer required to be added to the cluster nodes.

To bind a cluster node using the CLI

At the command prompt, type:

```
bind cluster node &lt;nodeId&gt; (-routeMonitor &lt;ip_addr|ipv6_addr|*&gt;
[&lt;netmask&gt;])
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
unbind cluster node &lt;nodeId> (-routeMonitor &lt;ip_addr|ipv6_addr|*>
[&lt;netmask>])
```

Consider a scenario where Node 1 is bound to route monitor 1.1.1.0 255.255.255.0. When a dynamic route fails, Node 1 become INACTIVE. The health status is available in the `show cluster node` command by node id as per following.

```
Node ID: 1

IP:  10.102.169.96

Backplane:  1/1/2

Health: NOT UP

Reason(s): Route Monitor(s) of the node have failed

Route Monitor -  Network: 1.1.1.0   Netmask: 255.255.255.0   State: DOWN
```

Monitoring cluster setup using SNMP MIB with SNMP link

SNMP MIB is device specific information that is configured on the SNMP agent for identifying a NetScaler appliance. It can identify information such as, appliance name, administrator, and location. In a cluster setup, you can now configure the SNMP MIB in any node by including the "ownerNode" parameter in the set SNMP MIB command. Without this parameter, the set SNMP MIB command applies only to the Cluster Coordinator (CCO) node.

To display the MIB configuration for a cluster node other than the CCO, include the "ownerNode" parameter in the show SNMP MIB command.

Configuring SNMP MIB on CLIP

To configure and view MIB configuration on CLIP by using the command line interface.

```
set snmp mib [-contact &lt;string>] [-name &lt;string>] [-location
&lt;string>]

      [-customID &lt;string>] [-ownerNode &lt;positive_integer>]

Done
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
show snmp mib [-ownerNode &lt;positive_integer>]

 > set mib -contact John -name NS59 -location San Jose -customID 123
-ownerNode 3

Done

> sh mib -ownerNode 3

        --------------------

         Cluster Node ID: 3

        --------------------

        NetScaler® system MIB:

        sysDescr:    NetScaler NS11.1: Build 46.4.a.nc, Date: Jun  7 2016,
10:27:29

        sysUpTime:   124300

        sysObjectID: .1.3.6.1.4.1.5951.1.1

        sysContact:  John

        sysName:     NS59

        sysLocation: San Jose

        sysServices: 72

        Custom ID: 123

 Done

> unset mib -contact -name -location -customID -ownerNode 3

 Done
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
> sh mib -ownerNode 3

        --------------------

         Cluster Node ID: 3

        --------------------

        NetScaler system MIB:

        sysDescr:    NetScaler NS11.1: Build 46.4.a.nc, Date: Jun 7 2016,
10:27:29

        sysUpTime:   146023

        sysObjectID: .1.3.6.1.4.1.5951.1.1

        sysContact:  WebMaster (default)

        sysName:     NetScaler

        sysLocation: POP (default)

        sysServices: 72

        Custom ID: Default

 Done
```

Cluster SNMP trap messages

In cluster setup, the SNMP trap alarm configurations must be done from the CLIP. The commands are propagated to each of the nodes.

For more information on configuring SNMP, see Configuring the NetScaler to generate SNMP traps.

The following are the cluster specific traps that are available:

```
>sh snmp alarm | grep cluster

    CLUSTER-BACKPLANE-HB-MISSING N/A N/A 86400   ENABLED - ENABLED
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
    CLUSTER-CCO-CHANGE N/A N/A N/A ENABLED - ENABLED

    CLUSTER-NODE-HEALTH N/A N/A 86400 ENABLED - ENABLED

    CLUSTER-NODE-QUORUM N/A N/A 86400 ENABLED - ENABLED

    CLUSTER-OVS-CHANGE N/A N/A N/A ENABLED - ENABLED

    CLUSTER-PROP-FAILURE N/A N/A N/A ENABLED - ENABLED

    CLUSTER-SYNC-FAILURE N/A N/A N/A ENABLED - ENABLED

    CLUSTER-SYNC-PARTIAL-SUCCESS N/A N/A N/A ENABLED - ENABLED

    CLUSTER-VERSION-MISMATCH N/A N/A 86400 ENABLED - ENABLED
```

Monitoring command propagation failures in a cluster deployment

In a cluster deployment, you can use the new command "show prop status" for faster monitoring and troubleshooting of issues. The issues related to command-propagation failure on non-CCO nodes. This command displays up to 20 of the most recent command propagation failures on all non-CCO nodes. You can use either the NetScaler appliance CLI or GUI to perform this operation. You can access them through the CLIP address or through the NSIP address of any node in the cluster deployment.

Graceful shutdown of nodes

In a cluster setup, some of the existing connections (1/Nth connections, where N is the cluster size) at the cluster level or specific virtual server level are lost. This behavior is observed if a node leaves or joins the system. To address the loss, you must gracefully handle the existing connections. Graceful handling is done by configuring the `retain connections on cluster` option in the CLIP address and specifying a timeout interval in the node's NSIP.

Graceful handling of connections is applicable in two scenarios:

1. Cluster upgrade
2. New node addition

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Graceful handling of Nodes in cluster upgrade

To upgrade a cluster, you must upgrade one node at a time. Before upgrading a node, you must set it to passive state and then set it to active state after the upgrade. To avoid terminating existing connections when upgrading the node, shut it down gracefully with a configured timeout interval. Otherwise, 1/Nth (where N is the cluster size) of the cluster's connections are terminated.

NOTE:

- If existing sessions are not completed within the configured timeout interval, they get terminated after the grace time.
- To check the timeout interval, you must use the CLIP or NSIP address of the node, which is set to passive.

Following are the steps to gracefully handle nodes in a cluster upgrade scenario:

1. Consider a cluster setup of five nodes (n0, n1, n2, n3, n4).
2. Before you shut down a node, you must configure the `retainConnectionsOnCluster` option. It helps to retain all existing connections of this node at the cluster level or virtual server level for a specific time interval.

   Example

   On CLIP

   `set cluster instance <clusterID> –retainConnectionsOnCluster YES`

   OR

   `set lb vserver <vserver name> –retainConnectionsOnCluster Yes`
3. Now, log on to the NSIP address of node n3 and set the node n3 to PASSIVE with a timeout internal.

   Example

   ```
   set cluster node n3 –state PASSIVE –delay 60

   saveconfig
   ```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. After the grace period expires, close all connections, shut down n3 and reboot the NetScaler appliance.
5. Upgrade the appliance. Then, with the CLI connected to the appliance's NSIP address, set the node to ACTIVE.

   Example

   ```
   set cluster node n3 –state ACTIVE

   saveconfig
   ```

6. Repeat steps 4–6 for all nodes in the cluster.
7. After all nodes are upgraded and set to ACTIVE, reset the `retainConnectionsOnCluster` option from the CLIP address.

   Example

   `set cluster instance <clusterID> -retainConnectionsOnCluster NO`

   OR

   ```
   set lb vserver <vserver name> –retainConnectionsOnCluster NO

   saveconfig
   ```

NOTE:

If there is a version mismatch when upgrading a cluster, cluster propagation is automatically disabled and no commands are allowed on the CLIP.

Graceful handling of nodes during a new node addition

The graceful handling of nodes describes how a new node can be added to the existing NetScaler cluster. Consider you have a NetScaler cluster that is already serving traffic. And you want to add an extra appliance as a node to the cluster without terminating its existing connections. To accomplish the preceding scenario, set the option to retain existing connections either at a Global level or at a specific virtual server level. Once done, save the configuration. Now set the option to retain connections to NO, to allow existing connections from other nodes to be reassigned to the new node.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Following are the steps to gracefully handle nodes if a node newly added:

1. Save the existing configuration that has the `retainConnectionsOnCluster` option enabled. By doing so, you can retain all existing connections of this node at the cluster level or virtual server level for a specific time interval.

   On CLIP

   ```
   set cluster instance x – retainConnectionsOnCluster YES
   ```

   OR

   ```
   set lb vserver xxxx –retainConnectionsOnCluster Yes
   ```

2. Add a node n5 to the cluster setup.
3. Disable the `retainConnectionOnCluster` option to `NO` for distributing existing connections from other nodes to the newly added node n5.

   On CLIP

   ```
   set cluster instance x – retainConnectionsOnCluster NO
   ```

   OR

   ```
   set lb vserver xxxx –retainConnectionsOnCluster NO
   ```

NOTE:

The backplane steering depends on the type of traffic distribution mechanism (ECMP, CLAG, and USIP) on a cluster setup. The increase in backplane steering is based on the traffic type.

Configuring graceful shutdown of nodes in a cluster

To configure graceful shutdown of nodes in a cluster, do the following:

1. Configure the `retainConnectionsonCluster` option at Global (cluster) level.
2. Configure the `retainConnectionsonCluster` option at the virtual server level.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. Set the node (leaving the system) to the passive state with a graceful timeout interval specified in the node's NSIP address.
4. Monitor the existing connections to make sure all transactions are completed within the grace period.

To retain existing connections at the global (cluster) level by using the CLI

You can retain existing connections either at a global level or at a specific virtual server level. This option is configured to retain all existing connections at the global level. By default, this option is disabled.

At the command prompt type:

```
-  set cluster instance &lt;clusterID> –retainConnectionsOnCluster YES

-  set cluster instance 60 – retainConnectionsOnCluster YES
```

To retain existing connections of a specific virtual server in the cluster by using the CLI

This option is configured to retain existing connections specific to a load balancing virtual server. To retain those connections, we enable this option at the virtual server level. By default, this option is disabled.

At the command prompt, type:

```
-  set lb vserver &lt;clusterID> –retainConnectionsOnCluster Yes

-  set lb vserver v1 –retainConnectionsOnCluster Yes
```

To set a cluster node to passive state by using the CLI

To set a cluster node to passive state with a graceful timeout interval. This setting is performed in the node's NSIP as propagation is disabled during cluster upgrade.

At the command prompt, type:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
-  set cluster node &lt;clusterID> -state passive

-backplane &lt;interface_name>@

-priority &lt;positive_integer>

-delay &lt;mins>

-  set cluster node 4 –state PASSIVE -delay 60

-  set cluster instance 60 – retainConnectionsOnCluster YES

-  set lb vserver v1 –retainConnectionsOnCluster Yes

-  set cluster node 4 –state PASSIVE -delay 60
```

NOTE:

You might observe the following behavior on a cluster node when it is set to passive with a delay option configured from a CLIP:

- After the timeout, the node shows as passive from the NSIP of the node.
- The **show cluster instance** command on CLIP displays the node as active from the CLIP. Whereas the **show cluster node** command on the CLIP displays the node as passive.

To configure graceful shutdown of nodes by using the GUI

1. Navigate to **Configuration > System > Cluster** and click **Manage Cluster.**
2. On the **Manage Cluster** page, select **Retain Connections on Cluster** option.
3. Click **OK**, and then click **Done**.

Graceful shutdown of services

Starting with NetScaler 12.1 build 49.xx, NetScaler clusters support graceful shutdown of services. To gracefully shut down the services, you can perform one of the following tasks.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Explicitly disable the service, and
  - Set a delay (in seconds).
  - Enable graceful shutdown.
- Add a TROFS code or string to the monitor.

For more details, see Graceful shutdown of services.

To configure graceful shutdown for a service by using the CLI

Disable with graceful option only:

At the command prompt, type:

```
disable service <name> [-graceFul (YES|NO)]

show service <name>
```

Example

```
disable service svc1 -graceFul YES

Done

sh service svc1

                svc1 (10.102.225.11:80) - HTTP

                State: GOING OUT OF SERVICE   Graceful (number of active
clients: 1)

                Last state change was at Wed Jul 25 10:46:29 2018

                Time since last state change: 0 days, 00:00:02.680

                …….

                …….

                Traffic Domain: 0
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
1)            Monitor Name: tcp-default

                                State: UP             Weight: 1
  Passive: 0

                                Probes: 26           Failed [Total: 0
Current: 0]

                                Last response: Success - TCP syn+ack
received.

                                Response Time: 0.0 millisec
```

Disable with timeout and graceful option:

At the command prompt, type:

```
disable service <name> [<delay>] [-graceFul (YES|NO)]

show service <name>
```

Example

```
disable service svc1 2000 -graceFul YES

Done

> sh service svc1

                svc1 (10.102.225.11:80) - HTTP

                State: GOING OUT OF SERVICE (Graceful (number of active
clients: 1), Out Of Service in 1998 seconds)

                Last state change was at Wed Jul 25 10:49:08 2018
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
                Time since last state change: 0 days, 00:00:01.710

                ……….

NOTE

CLIP displays the aggregated value of all active clients connections from all cluster nodes.

To configure graceful shutdown for a service by using the GUI

1. Navigate to **Traffic Management > Load Balancing > Services**.
2. Open the service, and from the Action list, click **Disable**. Enter a wait time, and select Graceful.

To configure a TROFS code or string in a monitor by using the CLI

At the command prompt, type one of the following commands:

```
add lb monitor <monitor-name> HTTP -trofsCode <respcode>

add lb monitor <monitor-name> HTTP-ECV  -trofsString <resp string>

add lb monitor <monitor-name> TCP-ECV  -trofsString <resp string>
```

To configure a TROFS code or string in a monitor by using the GUI

1. Navigate to **Traffic Management > Load Balancing > Monitors**.
2. On the Monitors pane, click Add, and do one of the following steps:
   - Select Type as HTTP, and specify a TROFS Code.
   - Select Type as HTTP-ECV or TCP-ECV, and specify a TROFS String.

IPv6 ready logo support for clusters

You can test clustered appliances for IPv6 Ready Logo certification. Modified commands for testing IPv6 core protocols, such as for ND test cases, Router Solicitation processing, and sending route advertisement and router redirection messages are available in a clustered setup. Following are the IPv6 functionalities available for testing the IPv6 core protocols.

Following are the modified functionalities available to pass IPv6 core protocols, such as ND test cases, Router Solicitation processing and sending Route advertisement and router redirection messaging in the IPv6readylogo phase2 test suite.

- Link Local SNIPs

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Address Resolution and Neighbor Unreachability
- Router and Prefix Discovery
- Router Redirection
- DoDAD

With these modified commands, the following configurations are supported in a clustered appliance.

Supportable configurations for testing IPv6 core protocols

For a clustered setup to pass IPv6 Ready Logo test cases, you can run the following configurations on the Cluster Management IP address (CLIP).

- global IP6 configuration
- basic IPv6 configuration
- more IPv6 configurations

Global configuration

A global IPv6 configuration enables you to set the global IPv6 parameters (such as relearning, routeRedirection, ndBasereachTime, nRetransmissionTime, `natprefix`, td, and doodad) to run the basic IPv6 configuration.

At the command prompt, type the following:

```
set ipv6 [-ralearning ( ENABLED | DISABLED )] [-routerRedirection (ENABLED
| DISABLED )] [-ndBasereachTime&lt;positive_integer>][-
ndRetransmissionTime &lt;positive_integer>] [-natprefix &lt;ipv6_addr|*>[-
td&lt;positive_integer>]] [-doDAD ( ENABLED | DISABLED )]
```

Basic IPv6 configuration

The basic IPv6 configuration enables you to create an IPv6 address and bind to a VLAN interface. You can perform the following configurations to test the IPv6 core protocols.

To add a VLAN to the clustered setup by using the CLI

At the command prompt, type:

```
add vlan &lt;id>
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To add another VLAN to the clustered setup by using the CLI

At the command prompt, type:

```
add vlan &lt;id>
```

To bind an interface to a VLAN by using the CLI

At the command prompt, type:

```
bind vlan &lt;id> -ifnum &lt;interface_name>
```

To bind an interface to a VLAN by using the CLI

This command adds the global prefix as on-link prefix into RA information for subsequent Router Advertisements. At the command prompt, type:

```
bind vlan &lt;id> -ifnum &lt;interface_name>
```

To add the IPv6 SNIP address on a VLAN by using the CLI

At the command prompt, type the following:

```
add ns ip6 &lt;IPv6Address>@ [-scope ( global | link-local )][-type
&lt;type>
```

To add the IPv6 address on VLAN by using the CLI

At the command prompt, type the following:

```
add ns ip6 &lt;IPv6Address>@ [-scope ( global | link-local )][-type
&lt;type>
```

To bind IPv6 address to VLAN by using the CLI

At the command prompt, type the following:

```
bind vlan &lt;id> [-ifnum &lt;interface_name> [-tagged]][-IPAddress
<ip_addr|ipv6_addr|
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To bind the IPv6 address to VLAN by using the CLI

At the command prompt, type the following:

```
bind vlan &lt;id> [-ifnum &lt;interface_name> [-tagged]][-IPAddress
<ip_addr|ipv6_addr|
```

To display the link local IPv6 address attached to VLAN by using the CLI

At the command prompt, type the following:

```
sh VLAN
```

Example 1

```
add vlan 2

add vlan 3

bind vlan 2 -ifnum 1/2

bind vlan 3 -ifnum 1/3

add ip6 fe80::9404:60ff:fedd:a464/64 -vlan 2 -scope link-local -type SNIP

add ip6 fe80::c0ee:7bff:fede:263f/64 -vlan 3 -scope link-local -type SNIP

add ip6 3ffe:501:ffff:100:9404:60ff:fedd:a464/64 -vlan 2

add ip6 3ffe:501:ffff:101:c0ee:7bff:fede:263f/64 -vlan 3

bind vlan 2 -ipAddress 3ffe:501:ffff:100:9404:60ff:fedd:a464/64

bind vlan 3 -ipAddress 3ffe:501:ffff:101:c0ee:7bff:fede:263f/64
```

Example 2

```
sh vlan

1)      VLAN ID: 2      VLAN Alias Name:

        Interfaces : 1/6
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
        IPs :

             3ffe:501:ffff:100:2e0:edff:fe15:ea2a/64

3)      VLAN ID: 3      VLAN Alias Name:

        Link-local IPv6 addr: fe80::9404:60ff:fedd:a464/64

        Interfaces : 1/5

        IPs :

             3ffe:501:ffff:101:2e0:edff:fe15:ea2b/64

 Done
```

More IPv6 cluster configuration

To test IPv6 core protocols, you can use the following new or modified IPv6 configurations.

To set VLAN specific Router Advertisement parameters by using the CLI

At the command prompt, type:

```
set nd6RAvariables -vlan &lt;positive_integer> [-ceaseRouterAdv ( YES |
NO)] [-sendRouterAdv ( YES | NO )] [-srcLinkLayerAddrOption ( YES | NO )]
[-onlyUnicastRtAdvResponse ( YES | NO )] [-managedAddrConfig ( YES | NO)]
[-otherAddrConfig ( YES | NO )] [-currHopLimit &lt;positive_integer>][-
maxRtAdvInterval &lt;positive_integer>] [-
minRtAdvInterval&lt;positive_integer>] [-linkMTU &lt;positive_integer>] [-
reachableTime&lt;positive_integer>] [-retransTime &lt;positive_integer>]
[-defaultLifeTime&lt;integer>]
```

To set an on-link global prefix’s configurable parameters by using the CLI

At the command prompt, type:

```
set onLinkIPv6Prefix &lt;ipv6Prefix> [-onlinkPrefix ( YES | NO )][-
autonomusPrefix ( YES | NO )] [-depricatePrefix ( YES | NO )][-
decrementPrefixLifeTimes ( YES | NO )] [-prefixValideLifeTime
&lt;positive_integer>] [-prefixPreferredLifeTime &lt;positive_integer>]
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To add configurable parameters to an on-link global prefix by using the CLI

At the command prompt, type:

```
add onLinkIPv6Prefix &lt;ipv6Prefix> [-onlinkPrefix ( YES | NO )][-
autonomusPrefix ( YES | NO )] [-depricatePrefix ( YES | NO )][-
decrementPrefixLifeTimes ( YES | NO )]-prefixValideLifeTime
&lt;positive_integer>][-prefixPreferredLifeTime &lt;positive_integer>]
```

To set an on-link link to the IPv6 prefix's configurable parameters by using the CLI

At the command prompt, type the following:

```
help set onLinkIPv6Prefix
```

To bind an on-link link to the IPv6 prefix's configurable parameters by using the CLI

At the command prompt, type:

```
help bind nd6RAvariables
```

To show nd6RAvariables by using the CLI

At the command prompt, type:

```
help sh nd6RAvariables
```

Example

```
> sh nd6RAvariables

  1) Vlan : 1

     SendAdvert     : NO   CeaseAdv       : NO        SourceLLAddress: YES

```
Done
```

Managing cluster heartbeat messages

Managing heartbeat messages in a cluster is similar to managing them in a high availability (HA) configuration. Nodes can send and receive heartbeat messages to and from each other on all interfaces that are enabled. To avoid increased traffic resulting from heartbeat messages, you can now disable the heartbeat option on node interfaces. However, the heartbeat option on the backplane interface cannot be disabled, because it is required for maintaining connectivity among the cluster nodes.

For more information about managing heart messages, see Managing High Availability Heartbeat Messages on a NetScaler Appliance.

To manage heartbeat messages on a node interface by using the NetScaler CLI

At the command prompt, type:

```
set interface &lt;ID> [-HAHeartBeat (ON | OFF)]

Show interface &lt;ID>
```

Configuring owner node response status

You can configure the ownerDownResponse option on a node which has a spotted SNIP address. By default, the option is enabled. It allows the spotted IP address to respond to PING or ARP requests (coming from the upstream router) when the node is inactive. If you disable the option, the IP address cannot respond to the router requests when the owner node is inactive.

To know how this feature is used for monitoring static routes in ECMP deployment, see Using Equal Cost Multiple Path (ECMP) topic.

To set owner node response status by using the NetScaler CLI

At the command prompt, type:

```
add ns ip &lt;IPAddress> [-ownerNode &lt;positive_integer>] [-
ownerDownResponse (YES | NO )] [-td &lt;positive_integer>]
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Example

```
add ns ip 2.2.2.2 255.255.255.0 -ownernode 6 –ownerdownResponse YES
```

To set owner node response status by using the NetScaler GUI

1. Navigate to **System > Network > IPs** and click **Add** to create a spotted SNIP address.
2. On the **Create IP Address** page, select, or clear the **ownerDownResponse** check box.

To edit owner node response status by using the NetScaler GUI

Navigate to **System > Network > IPs**, select an IP address, and click **Edit** to select or clear the **ownerDownResponse** check box.

Monitor static route (MSR) support for inactive nodes in a spotted cluster configuration

In a cluster set up with the MSR option enabled on the route, only active nodes can probe to a static route. It can reach a network while inactive and spare nodes have no link to the route and cannot probe to it. You can now configure an inactive or spare node to send PING and ARP probe to IPv4 route and send ping6 and nd6 probe to IPv6 route. You can perform this only in a spotted cluster configuration in which the SNIP address is active and owned exclusively only by one node.

VRRP interface binding in a single node active cluster

When you migrate a high availability (HA) setup to a cluster setup, all configurations must be compatible and must be supportable in the cluster. To achieve this, you can now configure virtual router IDs (VRIDs and VRID6s) on a node interface.

IMPORTANT

Currently, only a single-node active cluster system supports VRIDs and VRID6s.

For instructions for configuring VRIDs and VRID6s, see Configuring Virtual MAC Addresses.

To configure a virtual router ID on a single-node active cluster, add the VRID or VRID6 and bind it to the cluster-node interface.

To add a VRID by using the NetScaler CLI

At the command prompt, type:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add vrID &lt;ID>
```

To bind a VRID to the cluster-node interface by using the NetScaler CLI

At the command prompt, type:

```
Bind vrid &lt;ID> -ifnum &lt;interface_name> | -trackifNum <interface_name

Add vrID 100

Bind vrid 100 –ifnum 1/1  1/2

done
```

To add a VRID6 by using the NetScaler CLI

At the command prompt, type:

```
add vrID6 &lt;ID>
```

To bind a VRID6 to a cluster node interface by using the CLI

At the command prompt, type:

```
bind vrid6 &lt;ID> -ifnum &lt;interface_name> | -trackifNum
&lt;interface_name>

Add vrID6 100

Bind vrid6 100 –ifnum 1/1  1/2

Done
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Cluster setup and usage scenarios

This section explains some scenarios in which the NetScaler cluster can be set up, and configured for different features and network topologies. Provide feedback if you want any other scenarios to be documented.

Creating a two-node cluster

A two-node cluster is an exception to the rule that a cluster is functional only when a minimum of (n/2 +1) nodes, where n is the number of cluster nodes, are able to serve traffic. If the same formula is applied to a two-node cluster, the cluster would fail if one node went down (n/2 +1=2).

A two-node cluster is functional even if only one node is able to serve traffic.

Creating a two node cluster is the same as creating any other cluster. You add a one node as the configuration coordinator and the other node as the other cluster node.

NOTE

Incremental configuration synchronization is not supported in a two-node cluster. Only full synchronization is supported.

Migrating an HA setup to a cluster setup

Migrating an existing high availability (HA) setup to a cluster setup requires you to first remove the NetScaler appliances from the HA setup and create a backup of the HA configuration file. You can then use the two appliances to create a cluster and upload the backed-up configuration file to the cluster.

NOTE

- Before uploading the backed-up HA configuration file to the cluster, you must modify it to make it cluster compatible. Refer to the relevant step of the procedure.
- Use the **batch -f \<backup_filename\>** command to upload the backed-up configuration file.

The preceding approach is a basic migration solution which results in downtime for the deployed application. As such, it must be used only in deployments where there is no consideration to application availability.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

However, in most deployments, the availability of the application is of paramount importance. For such cases, you must use the approach where an HA setup can be migrated to a cluster setup without any resulting downtime. In this approach, an existing HA setup is migrated to a cluster setup by first removing the secondary appliance and using that appliance to create a single-node cluster. After the cluster becomes operational and serves traffic, the primary appliance of the HA setup is added to the cluster.

To convert a HA setup to cluster setup (without any downtime) by using the command line interface

Let us consider the example of a HA setup with primary appliance (NS1) - 10.102.97.131 and secondary appliance (NS2) - 10.102.97.132.

1. Make sure the configurations of the HA pair are stable.
2. Log on to any one of the HA appliances, go to the shell, and create a copy of the ns.conf file (for example, ns_backup.conf).
3. Log on to the secondary appliance, NS2, and clear the configurations. This operation removes NS2 from the HA setup and makes it a standalone appliance.

   ```
   > clear ns config full
   ```

   NOTE

   - This step is required to make sure that NS2 does not start owning VIP addresses, now that it is a standalone appliance.
   - At this stage, the primary appliance, NS1, is still active and continues to serve traffic.

4. Create a cluster on NS2 (now no longer a secondary appliance) and configure it as a PASSIVE node.

   ```
   > add cluster instance 1

   > add cluster node 0 10.102.97.132 -state PASSIVE -backplane 0/1/1
   ```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
> add ns ip 10.102.97.133 255.255.255.255 -type CLIP

> enable cluster instance 1

> save ns config

> reboot -warm
```

5. Modify the backed-up configuration file as follows:

   - Remove the features that are not supported on a cluster. For the list of unsupported features, see NetScaler Features Supported by a Cluster. It is an optional step. If you do not perform this step, the execution of unsupported commands fails.
   - Remove the configurations that have interfaces, or update the interface names from the c/u convention to the n/c/u convention.

     Example

     ```
     > add vlan 10 -ifnum 0/1
     ```

     must be changed to

     ```
     > add vlan 10 -ifnum 0/0/1 1/0/1
     ```

   - The backup configuration file can have SNIP addresses. These addresses are striped on all the cluster nodes. It is recommended that you add spotted IP addresses for each node.

     Example

     ```
      > add ns ip 1.1.1.1 255.255.255.0 -ownerNode 0
     ```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
> add ns ip 1.1.1.2 255.255.255.0 -ownerNode 1
```

- Update the host name to specify the owner node.

  Example

```
> set ns hostname ns0 -ownerNode 0

> set ns hostname ns1 -ownerNode 1
```

- Change all other relevant networking configuration that depends on spotted IPs. For example, L3 VLAN, RNAT configuration which uses SNIPs as NATIP, INAT rules that refers to SNIPs/MIPs).

6. On the cluster, do the following:

   - Make the topological changes to the cluster by connecting the cluster backplane, the cluster link aggregation channel, and so on.
   - Apply configurations from the backed-up and modified configuration file to the configuration coordinator through the cluster IP address.

```
> batch -f ns_backup.conf
```

   - Configure external traffic distribution mechanisms like ECMP or cluster link aggregation.

7. Switch the traffic from the HA setup to the cluster.

   - Log on to the primary appliance, NS1, and disable all the interfaces on it.

```
> disable interface &lt;interface_id>
```

   - Log on to the cluster IP address and configure NS2 as an ACTIVE node.

```
> set cluster node 0 -state ACTIVE
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE

There might be a small amount (in the order of seconds) of downtime between disabling the interfaces and making the cluster node active.

8. Log on to the primary appliance, NS1, and remove it from the HA setup.
   - Clear all the configurations. This operation removes NS1 from the HA setup and makes it a standalone appliance.

     ```
     > clear ns config full
     ```

   - Enable all the interfaces.

     ```
     > enable interface <interface_id>
     ```

9. Add NS1 to the cluster.
   - Log on to the cluster IP address and add NS1 to the cluster.

     ```
     > add cluster node 1 10.102.97.131 -state PASSIVE -backplane 1/1/1
     ```

   - Log on to NS1 and join it to the cluster by sequentially running the following commands:

     ```
     > join cluster -clip 10.102.97.133 -password nsroot

     > save ns config

     > reboot -warm
     ```

10. Log on to NS1 and perform the required topological and configuration changes.
11. Log on to the cluster IP address and set NS1 as an ACTIVE node.

    ```
    > set cluster node 1 -state ACTIVE
    ```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Migrate a two-node cluster to an HA setup

This document describes a guided procedure to migrate from a two-node cluster (nodes n0 and n1) to a two-node high availability (HA) setup. The procedure helps you preserve service continuity while you transition cluster-specific networking and configuration dependencies to an HA model.

NOTES:

- These steps are primarily for a two-node cluster (n0 and n1) to two-node HA migration.
- The sequence of steps in this document is provided as guidance only. You might have to adjust it to fit your specific environment and requirements.

Before you begin

- Validate your topology requirements.
- Identify feature-specific impacts, such as CLAG, ECMP, and GSLB.

Procedure

1. Mark node n1 as passive.
   - Optional: use the passive timeout feature to drain connections gracefully before making n1 passive. For more information, see Graceful shutdown of nodes.
2. Take a full backup.
   - Back up `ns.conf` and ZebOS.
   - From the CLIP CLI, run the following command:

     ```
     add system backup
     ```

   - For more information, see Backup and restore of cluster setup.
   - Back up spotted configuration by using the following command:

     ```
     > shell spottedconfig <nodeID>
     ```

     This command is supported in release 14.1 and later.
3. If CLAG is configured, make the necessary topology-specific adjustments.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- If only one interface is used between a node and the upstream switch, remove the LACP configuration from the upstream switch.
- If multiple links are used from a node (for example, n1) to the upstream switch, convert cluster-level LAG to node-level LAG on n1.
- Ensure that the LACP key (`lacpKey`) configured on the link aggregation (LA) channel is updated consistently on both nodes to match the upstream switch configuration.

4. If ECMP is used for traffic distribution, update the dynamic routing configuration to align with the target HA traffic flow.

   For more information, see Using the Equal Cost Multiple Path (ECMP).

5. Remove cluster node n1 from the CLIP address.
6. Configure HA node n1 as secondary by setting the HA status as StaySecondary.

```
set ha node -hastatus STAYSECONDARY

add ha node 1 &lt;NSIP_of_n0>
```

7. Apply the required configuration on node n1.
   - Apply the required extracted configuration and restructured spotted configuration taken in step 2.

     Example: In a cluster setup, GSLB configuration such as site bindings might be associated with a node group. Identify and adapt such cluster-specific settings during migration.
   - For spotted configuration details, see Striped, partially striped, and spotted configurations.
8. Take a backup on n0 (same as step 2).
9. Disable the cluster instance from the NSIP address of node n0.
10. On node n1, enable HA using the following command:

```
set ha node -hastatus ENABLE
```

11. Verify that node n1 processes application traffic.
12. Remove the cluster instance on node n0 from NSIP.
13. Apply topology changes on node n0.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Complete CLAG-related topology changes.
- Remove external traffic distribution mechanisms, if used (for example, ECMP), based on your topology plan.

14. Remove the backplane physically or disable backplane interfaces on both nodes.
    - If necessary, convert the backplane to a HA SYNC VLAN. For more information, see Restricting high availability synchronization traffic to a VLAN.
15. On node n0, add n1 as the HA peer.

```
add ha node 1 &lt;NSIP_of_n1>
```

16. If necessary, force HA synchronization on node n0. Then apply the backed-up spotted configuration and any remaining required configuration.

Transitioning between a L2 and L3 Cluster

NOTE

Supported from NetScaler® 11 onwards.

An L2 cluster is one where all the nodes are from the same network and an L3 cluster is one that can include nodes from different networks. You can seamlessly transition from one type of cluster to the other without any downtime for the applications that are deployed on the NetScaler.

Transitioning a cluster from L2 to L3

You can transition to an L3 cluster when you want the cluster to include nodes from other networks.

On the cluster IP address, do the following:

1. Create a node group.

   Example

```
> add cluster nodegroup NG0
```

   This node group is used in the next step to group all the nodes from the existing L2 cluster.
2. Transition the L2 cluster to an L3 cluster.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Example

```
> set cluster instance 1 -inc ENABLED -nodegroup NG0
```

This command achieves the dual purpose of transitioning to the L3 cluster and also adding all the nodes of the L2 cluster to the node group.

3. Now, you can add more nodes to the cluster as explained in Adding a Node to the Cluster.

Transitioning a cluster from L3 to L2

You can transition to an L2 cluster when you want to retain nodes that belong to a single network.

On the cluster IP address, do the following:

1. Remove the cluster nodes from the networks that you do not want to retain.

   Example

   ```
   > rm cluster node &lt;nodeId>
   ```

2. Transition the L3 cluster to a L2 cluster.

   Example

   ```
   > set cluster instance 1 -inc DISABLED
   ```

   The cluster now includes nodes only of a single network.

Setting up GSLB in a cluster

NOTE

Supported from NetScaler 10.5 Build 52.11 onwards.

To set up GSLB in a cluster you must bind the different GSLB entities to a node group. The node group must have a single member node.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTES

- If you have configured the static proximity GSLB method, make sure that the static proximity database is present on all the cluster nodes. It happens by default if the database file is available at the default location. However, if the database file is maintained in a directory other than /var/netscaler/locdb/, you must manually sync the file to all the cluster nodes.
- The `show gslb domain` command is not supported in a cluster setup.

To set up GSLB in a cluster by using the CLI:

Log on to the cluster IP address and perform the following operations at the command prompt:

1. Configure the different GSLB entities. For information, see GSLB Configuration Entities.

   NOTE

   When creating the GSLB site, make sure that you specify the cluster IP address and public cluster IP address. The public cluster IP address is needed only when the cluster is deployed behind a NAT device. While configuring a GSLB site, you must use the cluster IP address of the same site. These parameters are required to ensure the availability of the GSLB auto-sync functionality.

   ```
   add gslb site <siteName> <siteType> <siteIPAddress> -publicIP <ip_addr> -clip <ip_addr> <publicCLIP>
   ```

2. Create a cluster node group.

   ```
   add cluster nodegroup <name> <name>@ [-strict ( YES | NO )] [-sticky ( YES | NO )] [-state <state>] [-priority <positive_integer>]
   ```

   NOTE

   Enable the sticky option if you want to set up GSLB based for VPN users.

3. Bind a single cluster node to the node group.

   ```
   bind cluster nodegroup <name> -node <nodeId>
   ```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. Bind the local GSLB site to the node group.

   ```
   bind cluster nodegroup <name> -gslbSite <string>
   ```

   NOTE

   Make sure that the IP address of the local GSLB site IP address is striped (available across all cluster nodes).

5. Bind the ADNS (or ADNS-TCP) service or the DNS (or DNS-TCP) load balancing virtual server to the node group.

   To bind the ADNS service:

   ```
   bind cluster nodegroup <name> -service <string>
   ```

   To bind the DNS load balancing virtual server:

   ```
   bind cluster nodegroup <name> -vServer <string>
   ```

6. Bind the GSLB virtual server to the node group.

   ```
   bind cluster nodegroup <name> -vServer <string>
   ```

7. To set up GSLB based on VPN users, bind the VPN virtual server to the GSLB node group.

   ```
   bind cluster nodegroup <name> -vServer <string>
   ```

8. Verify the configurations.

   ```
   show gslb runningConfig
   ```

To set up GSLB in a cluster by using the GUI:

Log on to the cluster IP address and perform the following operations in the Configuration tab:

1. Configure the GSLB entities.

   Navigate to **Traffic Management > GSLB** to perform the required configurations.

2. Create a node group and perform other node group related configurations.

   Navigate to **System > Cluster > Node Groups** to perform the required configurations.

For the detailed configurations to be performed, see the description provided in the preceding CLI procedure.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Support for GSLB parent-child topology in a cluster

Starting with NetScaler 12.1 build 49.xx, GSLB parent-child topology is supported in cluster.

For more information about the parent-child topology, see Parent-child topology deployment using the MEP protocol.

To set up GSLB parent-child topology in a cluster by using the CLI

PARENT SITE

Perform the following configuration:

1. Create a cluster node group.

   ```
   add cluster nodegroup <name>
   ```

   Example:

   ```
   add cluster nodegroup parentng
   ```

2. Bind a single cluster node to the node group.

   ```
   bind cluster nodegroup <name> -node <nodeId>
   ```

   Example:

   ```
   bind cluster nodegroup parentng -node n2
   ```

3. Bind the local GSLB site to the node group.

   ```
   bind cluster nodegroup <name> -gslbSite <string>
   ```

   Example:

   ```
   bind cluster nodegroup parentng -gslbSite site1
   ```

4. Bind the ADNS (or ADNS-TCP) service or the DNS (or DNS-TCP) load balancing virtual server to the node group.

   ```
   bind cluster nodegroup <name> -service <string>
   ```

   Example:

   ```
   bind cluster nodegroup parentng – service ADNS
   ```

5. Bind the GSLB virtual server to the node group.

   ```
   bind cluster nodegroup <name> -vServer <string>
   ```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Example:

```
bind cluster nodegroup parentng -vServce gslbvs1
```

CHILD SITE

Perform the following configuration:

1. Create a cluster node group.

   ```
   add cluster nodegroup <name>
   ```

   Example:

   ```
   add cluster nodegroup childng
   ```

2. Bind a single cluster node to the node group.

   ```
   bind cluster nodegroup <name> -node <nodeId>
   ```

   Example:

   ```
   bind cluster nodegroup childng -node -n3
   ```

3. Bind the local GSLB site to the node group.

   ```
   bind cluster nodegroup <name> -gslbSite <string>
   ```

   Example:

   ```
   bind cluster nodegroup childng -gslbSite site1
   ```

NOTE

For parent and child sites to exchange aggregated statistics in metric-based load balancing methods, you must add local GSLB services on the child site. The metric-based load balancing methods are least connection, least bandwidth, and least packets.

To set up GSLB parent-child topology in a cluster by using the GUI

1. Configure the GSLB entities.

   Navigate to **Traffic Management** > **GSLB** to perform the required configurations.

2. Create a node group.

   Navigate to **System** > **Cluster** > **Node Groups** to perform the required configurations.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. In the Node Group page, select the node group to which you want to bind a node, click **Edit**, and perform the following tasks. You can also perform these tasks when adding a node group.

   - Bind a node to the node group.

     In **Advance Settings**, click **Cluster Nodes** and perform the following tasks:

     - In **Cluster Nodes** section, click **No Cluster Node**.
     - In **Select Cluster Node**, click > and select the node that you want to bind to the node group. You can also add a cluster node.

   - Bind the local GSLB site to the node group.

     In Advance Settings, click GSLB Sites and perform the following tasks:

     - In the **GSLB Sites** section, click No GSLB Site.
     - In the **Select GSLB Site**, click > and select the GSLB site that you want to bind to the node group. You can also add a GSLB site.

   - Bind the GSLB virtual server to the node group.

     In **Advance Settings**, click **Virtual Servers** and perform the following task:

     - In the **Virtual Servers** pane, click +.
     - In **Choose Virtual Server**, select the server that you want to bind to the node group.

   - Bind the ADNS (or ADNS-TCP) service or the DNS (or DNS-TCP) load balancing virtual server to the node group.

     In **Advance Settings**, click **Services** and perform the following tasks:

     - In **Services** section, click **No Service**.
     - In **Select Service**, select the service that you want to bind to the node group. You can also add a service.

NOTE

For child sites, you only have to bind the cluster node and local GSLB site to the node group.

Using cache redirection in a cluster

Cache redirection in a cluster works in the same way as it does on a standalone NetScaler appliance. The only difference is that the configurations are done on the cluster IP address. For more information on cache redirection, see Cache Redirection.

Points to remember when using cache redirection in transparent mode on a cluster:

- Before configuring cache redirection, make sure that you have connected all nodes to the external switch and that you have linksets configured. Otherwise, client requests are dropped.
- When MAC mode is enabled on a load balancing virtual server, make sure MBF mode is enabled on the cluster by using the enable ns mode MBF command. Otherwise, the requests are sent to origin server directly instead of being sent to the cache server.

Using L2 mode in a cluster setup

NOTE

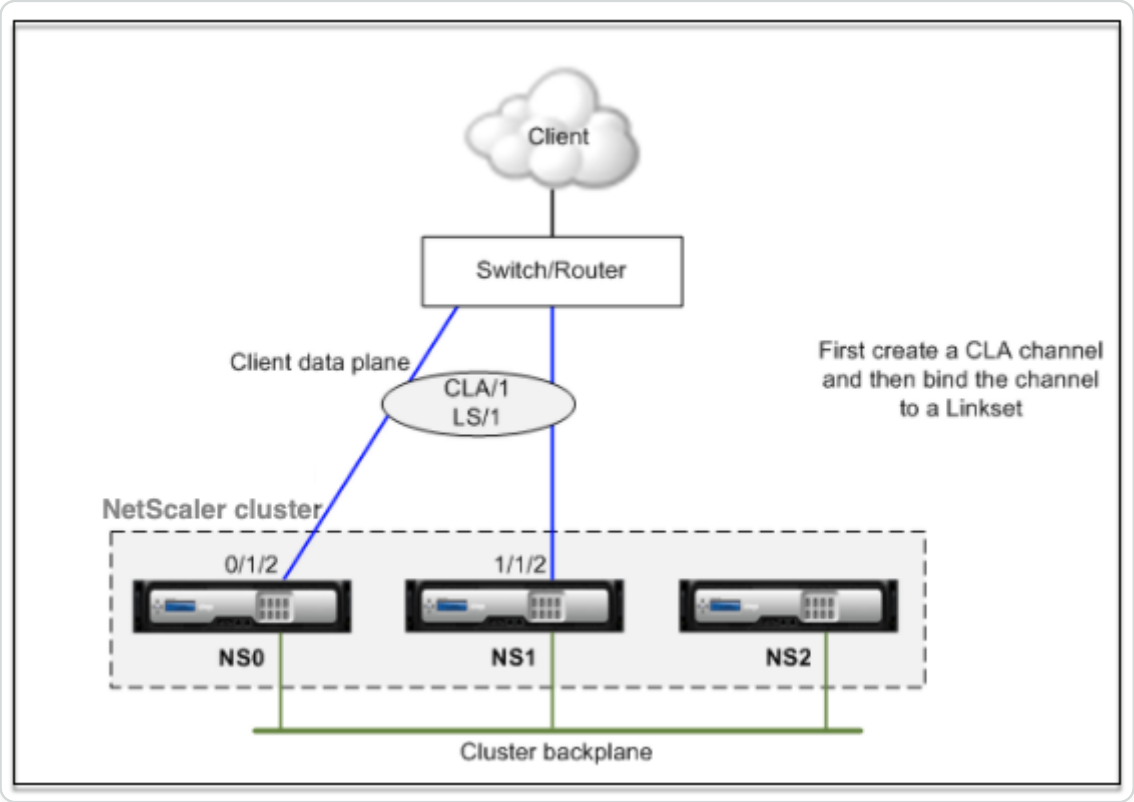
Supported from NetScaler 10.5 and later releases.

To use L2 mode in a cluster setup, you must make sure of the following:

- Spotted IP addresses must be available on all the nodes as required.
- Linksets must be used to communicate with the external network.
- Asymmetric topologies or asymmetric cluster LA groups are not supported.
- Cluster LA group is recommended.
- Traffic is distributed between the cluster nodes only for deployments where services exist.

Using cluster LA channel with linksets

In an asymmetric cluster topology, some cluster nodes are not connected to the upstream network. In such a case, you must use linksets. To optimize the performance, you can bind the interfaces that are connected to the switch as a cluster LA channel and then bind the channel to a linkset.



To understand how a combination of cluster LA channel and linksets can be used, consider a three-node cluster for which the upstream switch has only two ports available. You can connect two of the cluster nodes to the switch and leave the other node unconnected.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE

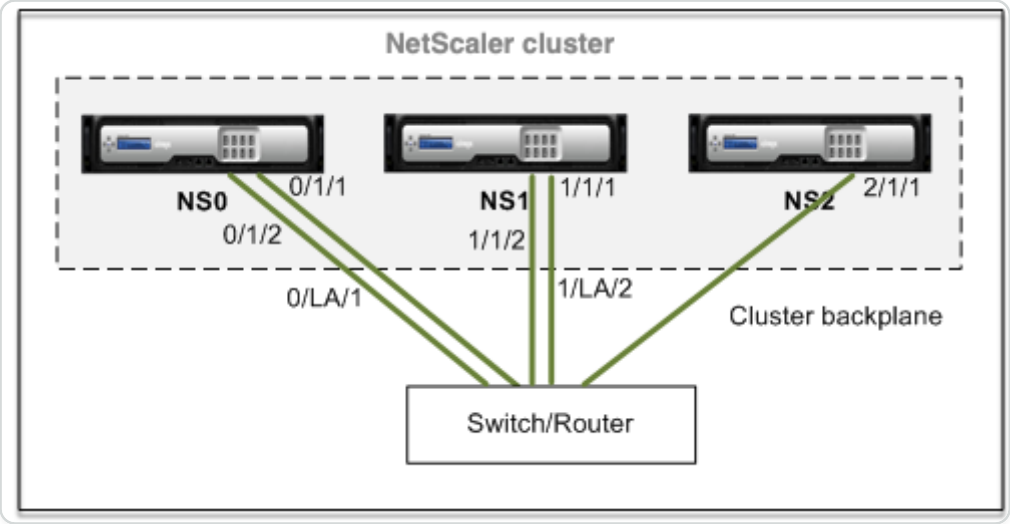
Similarly, you can also use a combination of ECMP and linksets in an asymmetric topology.

Figure 1. Linksets and cluster LA channel topology

To configure cluster LA channel and linksets by using the CLI

1. Log on to the cluster IP address.
2. Bind the connected interfaces to a cluster LA channel.

```
add channel CLA/1 –ifnum 0/1/2 1/1/2
```



3. Bind the cluster LA channel to the linkset.

```
add linkset LS/1 -ifnum CLA/1
```

Backplane on LA channel

In this deployment, LA channels are used for the cluster backplane.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- NS0 - nodeId: 0, NSIP: 10.102.29.60
- NS1 - nodeId: 1, NSIP: 10.102.29.70
- NS2 - nodeId: 2, NSIP: 10.102.29.80

To deploy a cluster with the backplane interfaces as LA channels

1. Create a cluster of nodes NS0, NS1, and NS2.

   a. Log on to the first node that you want to add to the cluster and do the following:

   ```
   > create cluster instance 1

   > add cluster node 0 10.102.29.60 -state ACTIVE

   > enable cluster instance 1

   > add ns ip 10.102.29.61 255.255.255.255 -type CLIP

   > save ns config

   > reboot -warm
   ```

   b. Log on to the cluster IP address and do the following:

   ```
   > add cluster node 1 10.102.29.70 -state ACTIVE

   > add cluster node 2 10.102.29.80 -state ACTIVE
   ```

   c. Log on to the nodes 10.102.29.70 and 10.102.29.80 to join the nodes to the cluster.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
> join cluster -clip 10.102.29.61 -password nsroot

> save ns config

> reboot -warm
```

As seen in the preceding commands, the interfaces 0/1/1, 1/1/1, and 2/1/1 are configured as the backplane interfaces of the three cluster nodes.

2. Log on to the cluster IP address and do the following:

   a. Create the LA channels for nodes NS0 and NS1.

   ```
   > add channel 0/LA/1 -ifnum 0/1/1 0/1/2

   > add channel 1/LA/2 -ifnum 1/1/1 1/1/2
   ```

   b. Configure the backplane for the cluster nodes.

   ```
   > set cluster node 0 -backplane 0/LA/1

   > set cluster node 1 -backplane 1/LA/2

   > set cluster node 2 -backplane 2/1/1
   ```

Common interfaces for client and server and dedicated interfaces for backplane

It is a one-arm deployment of the NetScaler cluster. In this deployment, the client and server networks use the same interfaces to communicate with the cluster. The cluster backplane uses dedicated interfaces for inter-node communication.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- NS0 - nodeId: 0, NSIP: 10.102.29.60
- NS1 - nodeId: 1, NSIP: 10.102.29.70
- NS2 - nodeId: 2, NSIP: 10.102.29.80

To deploy a cluster with a common interface for the client and server and a different interface for the cluster backplane

a. Create a cluster of nodes NS0, NS1, and NS2.

b. Log on to the first node that you want to add to the cluster and do the following:

```
> create cluster instance 1

> add cluster node 0 10.102.29.60 -state ACTIVE -backplane 0/1/1

> enable cluster instance 1

> add ns ip 10.102.29.61 255.255.255.255 -type CLIP

> save ns config

> reboot -warm
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

c. Log on to the cluster IP address and do the following:

```
> add cluster node 1 10.102.29.70 -state ACTIVE -backplane 1/1/1

> add cluster node 2 10.102.29.80 -state ACTIVE -backplane 2/1/1
```

d. Log on to the nodes 10.102.29.70 and 10.102.29.80 to join the nodes to the cluster.

```
> join cluster -clip 10.102.29.61 -password nsroot

> save ns config

> reboot -warm
```

As seen in the preceding commands, the interfaces 0/1/1, 1/1/1, and 2/1/1 are configured as the backplane interfaces of the three cluster nodes.

1. On the cluster IP address, create VLANs for the backplane interfaces and for the client and server interfaces.

   //For the backplane interfaces

   ```
   > add vlan 10

   > bind vlan 10 0/1/1 1/1/1 2/1/1
   ```

   //For the interfaces that are connected to the client and server networks.

   ```
   > add vlan 20

   > bind vlan 20 0/1/2 1/1/2 2/1/2
   ```

2. On the switch, create VLANs for the interfaces corresponding to the backplane interfaces and the client and server interfaces. The following sample configurations are provided for the Cisco Nexus 7000 C7010 Release 5.2(1) switch. Similar configurations must be performed on other switches.

   //For the backplane interfaces. Repeat for each interface...

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
> interface Ethernet2/47

  switchport access vlan 100

  switchport mode access

  end
```

//For the interfaces connected to the client and server networks. Repeat for each interface...

```
> interface Ethernet2/47

  switchport access vlan 200

  switchport mode access

  end
```

Common switch for client, server, and backplane

In this deployment, the client, server, and backplane use dedicated interfaces on the same switch to communicate with the NetScaler cluster.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- NS0 - nodeId: 0, NSIP: 10.102.29.60
- NS1 - nodeId: 1, NSIP: 10.102.29.70
- NS2 - nodeId: 2, NSIP: 10.102.29.80

To deploy a cluster with a common switch for the client, server, and backplane

a. Create a cluster of nodes NS0, NS1, and NS2.

b. Log on to the first node that you want to add to the cluster and do the following:

```
> create cluster instance 1

> add cluster node 0 10.102.29.60 -state ACTIVE -backplane 0/1/1
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
> enable cluster instance 1

> add ns ip 10.102.29.61 255.255.255.255 -type CLIP

> save ns config

> reboot -warm
```

c. Log on to the cluster IP address and do the following:

```
> add cluster node 1 10.102.29.70 -state ACTIVE -backplane 1/1/1

> add cluster node 2 10.102.29.80 -state ACTIVE -backplane 2/1/1
```

d. Log on to the nodes 10.102.29.70 and 10.102.29.80 to join the nodes to the cluster.

```
> join cluster -clip 10.102.29.61 -password nsroot

> save ns config

> reboot -warm
```

As seen in the preceding commands, the interfaces 0/1/1, 1/1/1, and 2/1/1 are configured as the backplane interfaces of the three cluster nodes.

1. On the cluster IP address, create VLANs for the backplane, client, and server interfaces.

   //For the backplane interfaces

```
> add vlan 10

> bind vlan 10 0/1/1 1/1/1 2/1/1
```

   //For the client-side interfaces

```
> add vlan 20

> bind vlan 20 0/1/2 1/1/2 2/1/2
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

//For the server-side interfaces

```
> add vlan 30

> bind vlan 30 0/1/3 1/1/3 2/1/3
```

2. On the switch, create VLANs for the interfaces corresponding to the backplane interfaces and the client and server interfaces. The following sample configurations are provided for the Cisco Nexus 7000 C7010 Release 5.2(1) switch. Similar configurations must be performed on other switches.

   //For the backplane interfaces. Repeat for each interface...

```
> interface Ethernet2/47

  switchport access vlan 100

  switchport mode access

  end
```

   //For the client interfaces. Repeat for each interface...

```
> interface Ethernet2/48

  switchport access vlan 200

  switchport mode access

  end
```

   //For the server interfaces. Repeat for each interface...

```
> interface Ethernet2/49

  switchport access vlan 300

  switchport mode access
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
end
```

Common switch for client and server and dedicated switch for backplane

In this deployment, the clients and servers use different interfaces on the same switch to communicate with the NetScaler cluster. The cluster backplane uses a dedicated switch for inter-node communication.

- NS0 - nodeId: 0, NSIP: 10.102.29.60
- NS1 - nodeId: 1, NSIP: 10.102.29.70
- NS2 - nodeId: 2, NSIP: 10.102.29.80

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To deploy a cluster with the same switch for the clients and servers and a different switch for the cluster backplane

1. Create a cluster of nodes NS0, NS1, and NS2.

   - Log on to the first node that you want to add to the cluster and do the following:

     ```
     > create cluster instance 1

     > add cluster node 0 10.102.29.60 -state ACTIVE -backplane 0/1/1

     > enable cluster instance 1

     > add ns ip 10.102.29.61 255.255.255.255 -type CLIP

     > save ns config

     > reboot -warm
     ```

   - Log on to the cluster IP address and do the following:

     ```
     > add cluster node 1 10.102.29.70 -state ACTIVE -backplane 1/1/1

     > add cluster node 2 10.102.29.80 -state ACTIVE -backplane 2/1/1
     ```

   - Log on to the nodes 10.102.29.70 and 10.102.29.80 to join the nodes to the cluster.

     ```
     > join cluster -clip 10.102.29.61 -password nsroot

     > save ns config

     > reboot -warm
     ```

   As seen in the preceding commands, the interfaces 0/1/1, 1/1/1, and 2/1/1 are configured as the backplane interfaces of the three cluster nodes.

2. On the cluster IP address, create VLANs for the backplane, client, and server interfaces.

   //For the backplane interfaces

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
> add vlan 10

> bind vlan 10 0/1/1 1/1/1 2/1/1
```

//For the client-side interfaces

```
> add vlan 20

> bind vlan 20 0/1/2 1/1/2 2/1/2
```

//For the server-side interfaces

```
> add vlan 30

> bind vlan 30 0/1/3 1/1/3 2/1/3
```

3. On the switch, create VLANs for the interfaces corresponding to the backplane interfaces and the client and server interfaces. The following sample configurations are provided for the Cisco Nexus 7000 C7010 Release 5.2(1) switch. Similar configurations must be performed on other switches.

   //For the backplane interfaces. Repeat for each interface...

   ```
   > interface Ethernet2/47

   > switchport access vlan 100

   > switchport mode access

   > end
   ```

   //For the client interfaces. Repeat for each interface...

   ```
   > interface Ethernet2/48

   > switchport access vlan 200

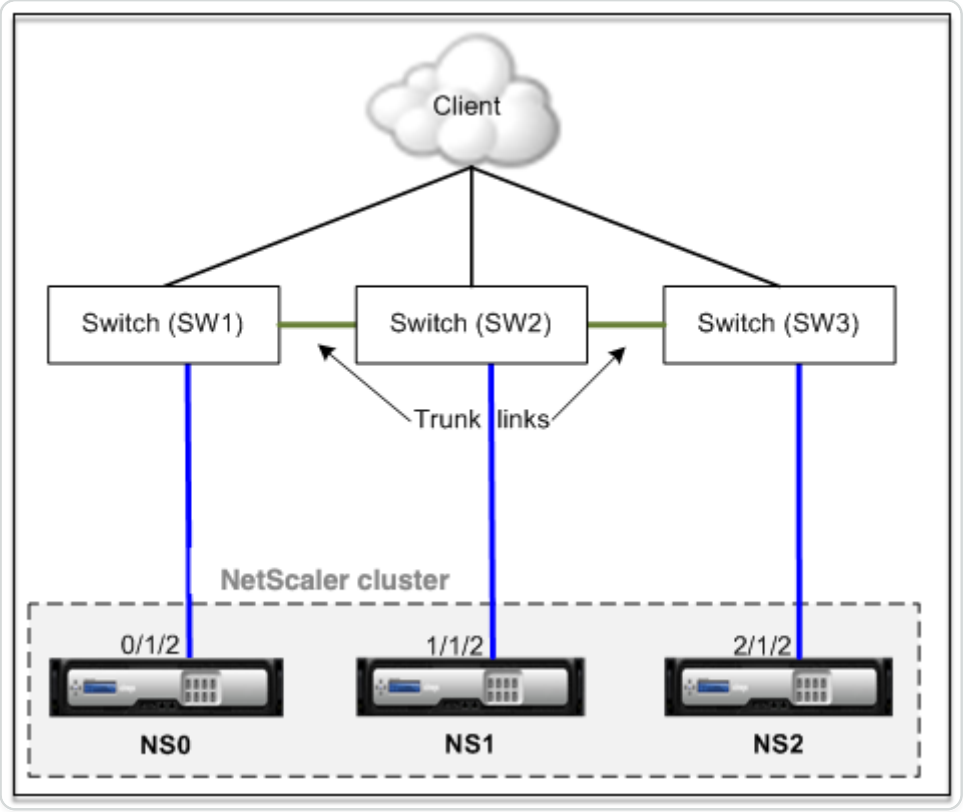
   > switchport mode access
   ```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
> end
```

//For the server interfaces. Repeat for each interface...

```
> interface Ethernet2/49



> switchport access vlan 300

> switchport mode access

> end
```

Different switch for every node

In this deployment, each cluster node is connected to a different switch and trunk links are configured between the switches.

The cluster configurations are the same as the other deployments scenarios. Most of the client-side configurations is done on the client-side switches.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Sample cluster configurations

The following example can be used to configure a four-node cluster with ECMP, cluster LA, or Linksets.

1. Create the cluster.

   - Log on to the first node.
   - Add the cluster instance.

     ```
     > add cluster instance 1
     ```

   - Add the first node to the cluster.

     ```
     > add cluster node 0 10.102.33.184 -backplane 0/1/1
     ```

   - Enable the cluster instance.

     ```
     > enable cluster instance 1
     ```

   - Add the cluster IP address.

     ```
     > add ns ip 10.102.33.185 255.255.255.255 -type CLIP
     ```

   - Save the configurations.

     ```
     > save ns config
     ```

   - Warm reboot the appliance.

     ```
     > reboot -warm
     ```

2. Add the other three nodes to the cluster.

   - Log on to cluster IP address.
   - Add the second node to the cluster.

     ```
     > add cluster node 1 10.102.33.187 -backplane 1/1/1
     ```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Add the third node to the cluster.

```
> add cluster node 2 10.102.33.188 -backplane 2/1/1
```

- Add the fourth node to the cluster.

```
> add cluster node 3 10.102.33.189 -backplane 3/1/1
```

3. Join the added nodes to the cluster. This step is not applicable for the first node.

   - Log on to each newly added node.
   - Join the node to the cluster.

```
> join cluster -clip 10.102.33.185 -password nsroot
```

   - Save the configuration.

```
> save ns config
```

   - Warm reboot the appliance.

```
> reboot -warm
```

4. Configure the NetScaler cluster through the cluster IP address.

   // Enable load balancing feature

```
> enable ns feature lb
```

   // Add a load balancing virtual server

```
> add lb vserver first_lbvserver http

....

....
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

5. Configure any one of the following (ECMP, cluster LA, or Linkset) traffic distribution mechanisms for the cluster.

   ECMP

   - Log on to the cluster IP address.
   - Enable the OSPF routing protocol.

     ```
     > enable ns feature ospf
     ```

   - Add a VLAN.

     ```
     > add vlan 97
     ```

   - Bind the interfaces of the cluster nodes to the VLAN.

     ```
     > bind vlan 97 -ifnum 0/1/4 1/1/4 2/1/4 3/1/4
     ```

   - Add a spotted SNIP on each node and enable dynamic routing on it.

     ```
     > add ns ip 1.1.1.10 255.255.255.0 -ownerNode 0 -dynamicRouting
     ENABLED

     > add ns ip 1.1.1.11 255.255.255.0 -ownerNode 1 -dynamicRouting
     ENABLED

     > add ns ip 1.1.1.12 255.255.255.0 -ownerNode 2 -dynamicRouting
     ENABLED

     > add ns ip 1.1.1.13 255.255.255.0 -ownerNode 3 -dynamicRouting
     ENABLED
     ```

   - Bind one of the SNIP addresses to the VLAN.

     ```
     > bind vlan 97 -ipAddress 1.1.1.10 255.255.255.0
     ```

   - Configure the routing protocol on ZebOS by using the VTYSH shell.

     Static cluster LA

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Log on to the cluster IP address.
- Add a cluster LA channel.

```
> add channel CLA/1 -speed 1000
```

- Bind the interfaces to the cluster LA channel.

```
> bind channel CLA/1 0/1/5 1/1/5 2/1/5 3/1/5
```

- Perform an equivalent configuration on the switch.

Dynamic cluster LA

- Log on to the cluster IP address.
- Add the interfaces to the cluster LA channel.

```
> set interface 0/1/5 -lacpmode active -lacpkey 5 -lagtype
cluster

> set interface 1/1/5 -lacpmode active -lacpkey 5 -lagtype
cluster

> set interface 2/1/5 -lacpmode active -lacpkey 5 -lagtype
cluster

> set interface 3/1/5 -lacpmode active -lacpkey 5 -lagtype
 cluster
```

- Perform an equivalent configuration on the switch.

Linksets. Assume that the node with nodeId 3 is not connected to the switch. You must configure a linkset so that the unconnected node can use the other node interfaces to communicate with the switch.

a. Log on to the cluster IP address.

b. Add a linkset.

```
> add linkset LS/1
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

c. Bind the connected interfaces to the linkset.

```
> bind linkset LS/1 -ifnum 0/1/6 1/1/6 2/1/6
```

6. Update the state of the cluster nodes to ACTIVE.

```
> set cluster node 0 -state ACTIVE

> set cluster node 1 -state ACTIVE

> set cluster node 2 -state ACTIVE

> set cluster node 3 -state ACTIVE
```

Using VRRP in a cluster setup

Virtual Router Redundancy Protocol (VRRP) is supported in a cluster setup for both IPv4 and IPv6. The two VRRP features supported in a cluster setup are Interface based VRRP and IP based VRRP.

IP based VRRP

In IP based VRRP, striped VIP addresses bound to the same VRID are configured on all nodes of a cluster setup. These VIP addresses are active on all the nodes

One of the cluster nodes acts as the VRID owner and sends out the VRRP advertisement to other nodes. If there is failure of the VRID owner node, another node in the cluster assumes the ownership of the VRID and starts sending VRRP advertisements. You can also assign a specific cluster node as the owner of the VRID.

NOTE

Citrix® recommends you to use IP based method for VRRP deployment in cluster.

Configuring IP based VRRP for IPv4

Perform the following tasks on a cluster setup for configuring IP based VRRP for IPv4:

- **Add a VRID**. A VRID is an integer used by the Cluster setup to form a virtual MAC address. The generic VMAC address is in the form of 00:00:5e:00:02:\<VRID\>.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **(Optional) Assign a node as the owner of the virtual MAC address**. You can set the owner node parameter (while adding or modifying VRID6) to the ID of the cluster node to assign it as the owner of the virtual MAC address. If the assigned owner node fails, one of the UP cluster nodes is dynamically elected as the owner of the virtual MAC address. You can set the owner node using the `set vrID <id> -ownerNode <positive_interger>` command.
- **Bind the VRID to the VIP address of the nodes**. Bind the created VRID to the striped VIP address.

To add a VRID by using the CLI

At the command prompt, type:

```
-  add vrid &lt;ID> [-ownerNode &lt;positive_integer>]

-  show vrid &lt;ID>
```

To bind the VRID to VIP address by using the CLI

At the command prompt, type:

- `set ns ip <IPv4Address> -vrid <ID>`
- `show vrid <ID>`

To add a VRID by using the GUI

1. Navigate to **System > Network > VMAC** and, on the **VMAC** tab, click **Add**.
2. On the Create **VMAC** page, specify a value in the **Virtual Router ID** field and then click **Create**.

To bind the VRID to a VIP address by using the GUI

1. Navigate to **System > Network > IPs**, on the **IPV4s** tab, select a VIP address and click **Edit**.
2. Set the **Virtual Router ID** parameter while editing the VIP configuration.

```
> add vrid 90

 Done

> set ns ip 192.0.2.90 –vrid 90

 Done
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configuring IP based VRRP for IPv6

Perform the following tasks on a cluster setup for configuring IP based VRRP for IPv6:

- **Add a VRID6**. A VRID6 is an integer used by the Cluster setup to form a virtual MAC6 address. The generic VMAC6 address is in the form of 00:00:5e:00:02:\<VRID6\>.
- **(Optional) Assign a node as the owner of the virtual MAC6 address**. You can set the owner node parameter (while adding or modifying VRID6) to the ID of the cluster node to assign it as the owner of the virtual MAC6 address. If the assigned owner node fails, one of the UP cluster nodes is dynamically elected as the owner of the virtual MAC6 address.
- **Bind the VRID6 to the VIP6 address of the nodes**. Bind the created VRID6 to the striped VIP6 address.

To add a VRID6 by using the CLI

At the command prompt, type:

- `add vrid6 <ID> [-ownerNode <positive_integer>]`
- `show vrid6 <ID>`

To bind the VRID6 to VIP6 address by using the CLI

At the command prompt, type:

- `set ns ip6 <IPv6Address> -vrid6 <ID>`
- `show vrid6 <ID>`

To add a VRID6 by using the GUI

1. Navigate to **System > Network > VMAC** and, on the **VMAC6** tab, click **Add**.
2. On the **Create virtual MAC6** page, specify a value in the **Virtual Router ID** field and then click **Create**.

To bind the VRID6 to a VIP6 address by using the GUI

1. Navigate to **System > Network > IPs**, on the **IPV6s** tab, select a VIP address and click **Edit**.
2. Set the **Virtual Router ID** parameter while editing the VIP6 configuration.

```
> add vrid6 90

 Done
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
> set ns ip6 2001:db8::5001 –vrid6 90

 Done
```

Interface based VRRP

In the interface based VRRP feature, the same virtual MAC address is configured on both the nodes of the cluster. This virtual MAC address is used in GARP advertisements and ARP responses for the IP addresses configured on a node. This feature is useful in an active-spare two-node cluster setup that has external devices/routers that do not accept GARP advertisements.

NOTE

The interface based VRRP feature is applicable only to a two-node cluster with one node in active state and the other node serving as a spare.

With the same virtual MAC address on both cluster nodes, when the active node goes down and the spare node takes over as active, the MAC address for the IP addresses on the new active node remain unchanged and the ARP tables on the external devices/routers do not need to be updated.

Configuring interface based VRRP for IPv4

Perform the following tasks on a cluster setup to configure interface based VRRP for IPv4:

- **Add a VRID**. A VRID is an integer used by the Cluster setup to form a virtual MAC address.
- **Bind the VRID to node interfaces**. Bind the interfaces to the created VRID. The bound interfaces (in the current active node) use the virtual MAC address in GARP advertisements and ARP responses for its IPv4 addresses. You must associate the VRID to the interfaces of both nodes of the active-spare cluster setup. This is because unlike in a high availability setup, interface IDs differ in a cluster setup.

To add a VRID by using the CLI

At the command prompt, type:

```
-  add vrid &lt;ID>

-  show vrid &lt;ID>
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To bind the VRID to an interface by using the CLI

At the command prompt, type:

```
-  bind vrid &lt;ID> -ifnum &lt;interface_name>

-  show vrid &lt;ID>
```

To add a VRID and bind it to interfaces by using the GUI

1. Navigate to **System > Network > VMAC** and, on the **VMAC** tab, click **Add**.
2. On the **Create virtual MAC** page, specify a value in the **Virtual Router ID*** field, bind interfaces in the **Associate Interfaces** section, and then click **Create**.

```
> add vrid 300

 Done

> bind vrid 300 -ifnum 1/1/2 2/1/3

 Done
```

Configuring interface based VRRP for IPv6

Perform the following tasks on a cluster setup to configure interface based VRRP for IPv6:

- **Add a VRID6**. A VRID6 is an integer used by the Cluster setup to form a virtual MAC6 address. The generic VMAC6 address is in the form of 00:00:5e:00:01:\<VRID6\>.
- **Bind the VRID6 to node interfaces**. Bind the interfaces to the created VRID6. The bound interfaces (in the current active node) use the virtual MAC6 address in GARP advertisements and ARP responses for its IPv6 addresses. You must associate the VRID6 to the interfaces of both nodes of the active-spare cluster setup. This is because unlike in a high availability setup, interface IDs differ in a cluster setup.

To add a VRID6 by using the CLI

At the command prompt, type:

```
-  add vrid6 &lt;ID>

-  show vrid6 &lt;ID>
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To bind the VRID6 to an interface by using the CLI

At the command prompt, type:

- `bind vrid6 <ID> -ifnum <interface_name>`
- `show vrid6 <ID>`

To add a VRID6 and bind it to interfaces by using the GUI

1. Navigate **System > Network > VMAC** and, on the **VMAC6** tab, click **Add**.
2. On the **Create virtual MAC6** page, specify a value in the **Virtual Router ID** field, bind interfaces in the **Associate Interfaces** section, and then click **Create**.

```
> add vrid6 100

 Done

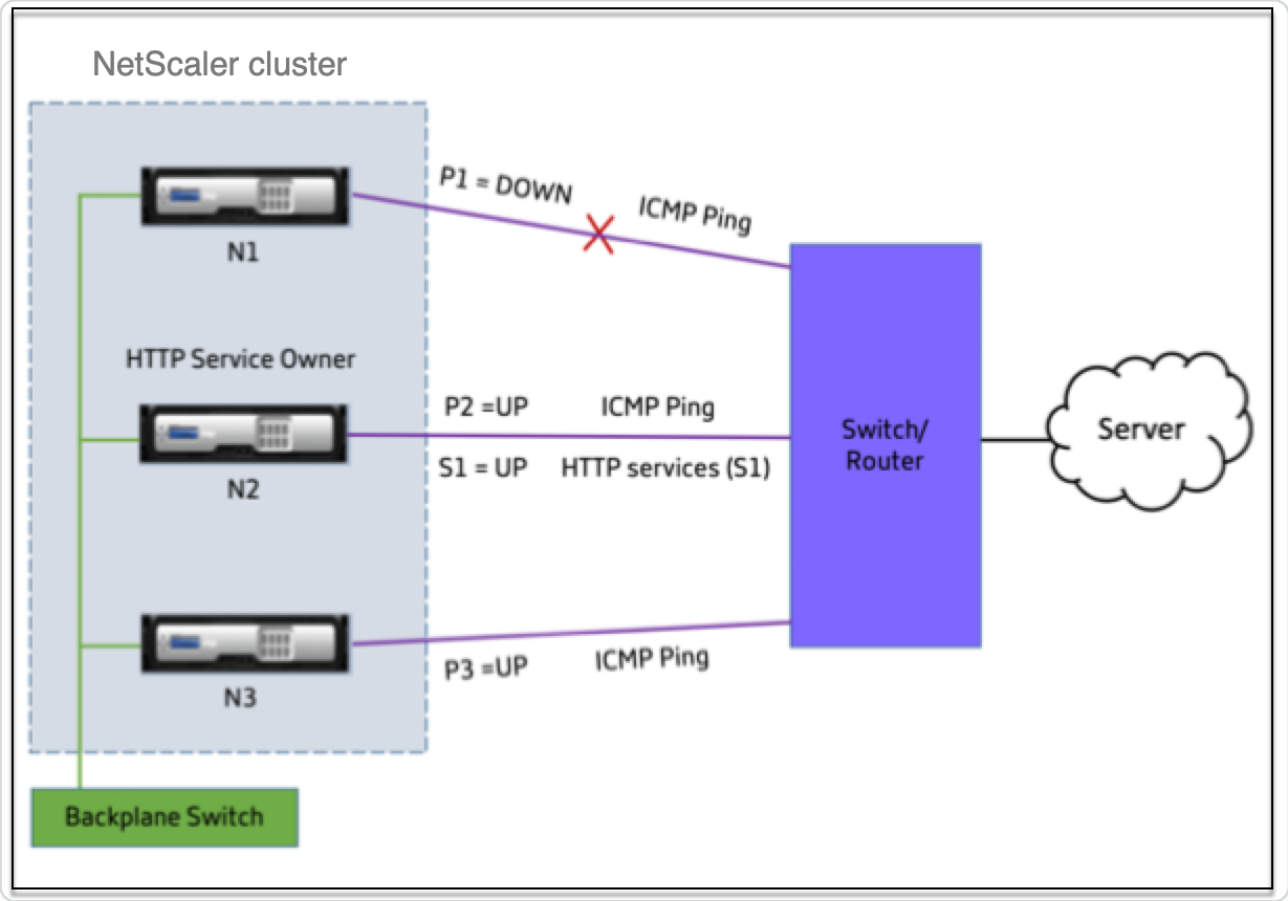
> bind vrid6 100 -ifnum 0/1/1 1/1/2 2/1/3

 Done
```

Monitoring services in a cluster using path monitoring

In a cluster setup, ownership for monitoring services is distributed among the nodes. Therefore, different nodes monitor different services. The node that monitors a service is called the service owner. Only the service owner probes the server to monitor the status of the services assigned to it. It further communicates the status of the services to all other nodes within the cluster. The drawback with distributed monitoring is that the network connectivity and link state between all nodes and the server is not determined. To overcome this drawback, you can use path monitoring.

NOTE



You cannot select a node to monitor a service. The selection of nodes to monitor a service is done through an internal mechanism. You can see the owner node to monitor services by using the `show service <service name>` and `show serviceGroup <service group name>` command.

Path monitoring checks the network connectivity and link state between a node and the service provided by the server. A node sends ICMP pings to verify whether the server is reachable or not.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

How path monitoring works

Consider an example of a NetScaler cluster consisting of three nodes N1, N2, and N3. N2 is the service owner that monitors the state of HTTP services (S1). It advertises the service state to other nodes in the cluster. Path monitoring is enabled on all nodes in the cluster, for all the services. Each node sends only an ICMP ping to the server. The service owner sends both the HTTP service request and an ICMP ping. Each node reports its path monitoring state to the service owner.

The following two parameters determine the service state of a node:

- S = service state advertised by the service owner
- P = path monitoring state of each node

Whether a node can reach a server or not, determines the path monitoring state for that node.

The following table shows the service state set based on the path monitoring state, when the pathMonitorIndv parameter is enabled or disabled.

PARAMETER	PATH MONITORING STATE	SERVICE STATE
pathMonitorIndv = NO; Is the default configuration.	P1 = DOWN	S1 = DOWN

© 1997–2026 Citrix Systems, Inc. All rights reserved.

PARAMETER	PATH MONITORING STATE	SERVICE STATE
	P2 = UP	S1 = DOWN
	P3 = UP	S1 = DOWN
pathMonitorIndv = YES	P1 = DOWN	S1 = DOWN
	P2 = UP	S1 = UP
	P3 = UP	S1 = UP

In this example, the service owner decides the service state for all the nodes based on the node whose path monitoring state is set to DOWN. If the path monitoring state for any of the nodes is DOWN, then the service owner sets the service state for all the nodes as DOWN. The service state for all the nodes is set to UP only if the path monitoring state for each of the node is UP.

You can use path monitoring for individual nodes by enabling the pathMonitorIndv parameter. This parameter enables the service owner to set the service state for each node based on the path monitoring state of that respective node.

NOTE

If the pathMonitorIndv parameter is set, some features like persistence might break.

Configuring path monitoring

Path monitoring is applicable for all the services and service groups. Path monitoring parameter is disabled by default.

To enable path monitoring for services/service groups by using the CLI

At the command prompt, type:

```
add service <service name> <IP address> <service type> <port> [-
pathMonitor <YES | NO>] [-pathMonitorIndv <YES | NO>]

add servicegroup <servicegroup name> <service type> [-pathMonitor <YES |
NO>] [-pathMonitorIndv <YES | NO>]
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Example:

```
add service s1 1.1.1.1 HTTP 80 -pathMonitor YES

add servicegroup sg_1 HTTP -pathMonitor YES

add service s1 1.1.1.1 HTTP 80 -pathMonitor YES -pathMonitorIndv YES

add servicegroup sg_1 HTTP -pathMonitor YES -pathMonitorIndv YES
```

You can also set the path monitoring parameter from the set command, as follows:

```
set service <service name> [-pathMonitor <YES | NO>] [-pathMonitorIndv
<YES | NO>]

set servicegroup <servicegroup name> [-pathMonitor <YES | NO>] [-
pathMonitorIndv <YES | NO>]
```

Example:

```
set service s1 -pathMonitor YES

set servicegroup sg_1 -pathMonitor YES

set service s1 -pathMonitorIndv YES

set servicegroup sg_1 -pathMonitorIndv NO
```

To enable path monitoring for services/service groups by using the GUI

1. Navigate to **Traffic Management** > **Load Balancing** > **Services**.

   For service groups, navigate to **Traffic Management** > **Load Balancing** > **Service Groups**.

2. In the **Services/Service Groups** pane, select a service/service group from the list, and then double-click to open it.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. On the **Service Settings** tab, click **Edit**.
4. Select **Path Monitoring**.
5. Select **Individual Path Monitoring**, if you want to apply it, and then click **OK**.

NOTE

You can enable Individual Path Monitoring only if you enable Path Monitoring.

Backup and restore of cluster setup

You can back up the current state of a NetScaler cluster node. Later, you can use the backed-up files to restore the node to the same cluster state. As a precautionary measure, you must use this feature before performing an upgrade on the cluster nodes.

Back up a cluster Setup

You can take a basic or full backup depending on the following:

- Type of data to be backed up.
- Frequency at which you create a backup.
- **Basic back up.** Backs up only configuration files. You might want to perform this type of backup frequently, because the files it backs up change constantly. The files that are backed up are listed in the table.

Directory

Sub-Directory or Files

/nsconfig/

- ns.conf
- ZebOS.conf
- rc.netscaler
- snmpd.conf
- nsbefore.sh
- nsafter.sh
- inetd.conf

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- ntp.conf
- syslog.conf
- newsyslog.conf
- crontab
- host.conf
- hosts
- ttys
- sshd_config
- httpd.conf
- monitrc
- rc.conf
- ssh_config
- local time
- issue
- issue.net

/var/

- download/*
- log/wicmd.log
- wi/tomcat/webapps/*
- wi/tomcat/logs/*
- wi/tomcat/conf/catalina/localhost/*
- nslw.bin/etc/krb.conf
- nslw.bin/etc/krb.keytab
- netscaler/locdb/*
- lib/likewise/db/*
- vpn/bookmark/*
- netscaler/crl
- nstemplates/*
- learnt_data/*

© 1997–2026 Citrix Systems, Inc. All rights reserved.

/netscaler/

- custom.html
- vsr.html
- **Full back up.** Apart from the files that are backed up by a basic backup, a full backup backs up some less frequently updated files. The files that are backed up when using the full backup option are listed in the table.

Directory

Sub-Directory or Files

/nsconfig/

- ssl/*
- license/*
- fips/*

/var/

- netscaler/ssl/*
- wi/java_home/jre/lib/security/cacerts/*
- wi/java_home/lib/security/cacerts/*

IMPORTANT

The backup and restore do not work if CLAG is configured on an SDX cluster setup.

The backup is stored as a compressed TAR file in the /var/ns_sys_backup/ directory. To avoid issues due to non-availability of disk space, you can store a maximum of 50 backup files in this directory. You can use the rm system backup command to delete existing backup files so that you can create more backups.

When you perform the back-up operation on a CLIP of a cluster setup, back up files are created on each of the cluster nodes.

How to back up a cluster setup

To back up the cluster setup on CLIP by using the NetScaler CLI.

At the command prompt, do the following:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Save the configuration.

  ```
  save ns config
  ```

- Create the backup file (basic or full).

  ```
  create system backup [<filename>][–level (basic | full)][-comment <string>]
  ```

  Example

  ```
  create system backup cluster-backup-1 –level basic
  ```

The preceding command creates a back-up TAR file on each of the cluster node with the specified file name. For example, the CLUSTER-backup-1.tgz file is created on each of the cluster node.

NOTE

If the file name is not specified, back up TAR files are created on each of the cluster nodes with the following naming convention:

- `backup_<level>_<nsip_address of the cluster node 0>_<date-timestamp>.tgz`
- `backup_<level>_<nsip_address of the cluster node 1>_<date-timestamp>.tgz`

For example, on a three node cluster setup,

- `backup_<level>_<nsip_address of the cluster node 0>_<date-timestamp>.tgz` is created on node0
- `backup _<level>_<nsip_address of the cluster node 1>_<date-timestamp>.tgz` is created on node1
- `backup_<level>_<nsip_address of the cluster node 2>_<date-timestamp>.tgz` is created on node2

- Verify the created backup files on CLIP.

  ```
  show system backup
  ```

Restore a cluster setup

When a cluster node becomes faulty, you can replace this node with a new node. You can set the new node for a cluster, using a backup file of the faulty node.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

For example, in a three-node cluster setup, if node1 becomes faulty, you can replace this faulty node with a new node as node1. Using the restore operation, you can restore one of the faulty node's backup files on the new node.

NOTE

The restore operation does not succeed if the backup file is renamed or if the contents of the file are modified.

How to restore a cluster node

To restore a cluster node by using the CLI

At the command prompt, do the following:

- Obtain a list of the backup files available on CLIP.

  ```
  show system backup
  ```

- Copy the backup tar file to the /var/ns_sys_backup directory of the cluster node, which is to be restored.
- Add the backup tar file to the cluster node memory by running the following command on the cluster node.

  ```
  add system backup <filename>
  ```

  Example

  ```
  add system backup CLUSTER-BACKUP-1.tgz
  ```

  NOTE

  The command must be run on the cluster node to be restored.

- Restore the cluster node by specifying the backup file.

  ```
  restore system backup <filename>
  ```

  Example

  ```
  restore system backup CLUSTER-BACKUP-1.tgz
  ```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE

The command must be run on the cluster node to be restored.

- Reboot the cluster node.

  reboot

NOTE

The command must be run on the cluster node to be restored.

Upgrading or downgrading the NetScaler cluster

All the nodes of a NetScaler cluster must be running the same software version. Therefore, to upgrade or downgrade the cluster, you must upgrade or downgrade each NetScaler appliance of the cluster, one node at a time.

A node that is being upgraded or downgraded is not removed from the cluster. The node remains a part of the cluster and serves traffic uninterrupted, except for the downtime when the node reboots after it is upgraded or downgraded.

When you upgrade or downgrade the first cluster node, configuration propagation is disabled automatically when there is a cluster version mismatch among the cluster nodes. Configuration propagation is enabled only after you upgrade or downgrade all the cluster nodes. You cannot perform any configuration through the cluster IP address when configuration propagation is disabled.

The following table explains when the configuration propagation is disabled during the upgrade or downgrade of the first cluster node.

UPGRADE/ DOWNGRADE	FROM VERSION	TO VERSION	DESCRIPTION
Upgrade	13.1 Build 21.50 or earlier	13.1 Build 24.38 or later	Configuration propagation is disabled on the cluster after the cluster node reboots and comes up. **Note:**

© 1997–2026 Citrix Systems, Inc. All rights reserved.

UPGRADE/ DOWNGRADE	FROM VERSION	TO VERSION	DESCRIPTION
			You must not perform any configurations through the cluster IP address while the node reboots.
Upgrade	13.1 Build 24.38 or later	13.1 Build 27.59 or later	Configuration propagation is disabled on the cluster just before the node reboots.
Downgrade	13.1 Build 24.38 or later	13.1 Build 21.50 or earlier	Configuration propagation is disabled on the cluster after the cluster node reboots and comes up. **Note:** You must not perform any configurations through the cluster IP address while the node reboots.
Downgrade	13.1 Build 27.59 or later	13.1 Build 24.38 or later	Configuration propagation is disabled on the cluster just before the node reboots.

You can also verify the status of command propagation using the following command:

```
show cluster instance
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTES:

- In a cluster setup with the maximum connection (maxConn) global parameter set to a non-zero value, CLIP connections might fail if any of the following conditions is met:
  - Upgrading the setup from NetScaler 13.0 76.x build to NetScaler 13.0 79.x build.
  - Restarting the CCO node in a cluster setup running NetScaler 13.0 76.x build.

  Workarounds:

  - Before upgrading a cluster setup from NetScaler 13.0 76.x build to NetScaler 13.0 79.x build, the maximum connection (maxConn) global parameter must be set to zero. After upgrading the setup, you can set the maxConn parameter to a desired value and then save the configuration.
  - NetScaler 13.0 76.x build is not suitable for cluster setups. Citrix recommends not to use the NetScaler 13.0 76.x build for a cluster setup.
- In a cluster setup, a NetScaler appliance might crash, when:
  - upgrading the setup from NetScaler 13.0 47.x or 13.0 52.x build to a later build, or
  - upgrading the setup to NetScaler 13.0 47.x or 13.0 52.x build

  Workaround: During the upgrade process, perform the following steps:

  - Disable all cluster nodes and then upgrade each cluster node.
  - Enable all cluster nodes after all the nodes are upgraded.

Points to note before upgrading or downgrading the cluster

- **IMPORTANT:**

  It is important that both the upgrade changes and your customizations are applied to an upgraded NetScaler appliance. So, if you have customized configuration files in the `/etc` directory, see Upgrade considerations for customized configuration files before you proceed with the upgrade.
- You cannot add cluster nodes while upgrading or downgrading the cluster software version.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- You can perform node-level configurations through the NSIP address of individual nodes. Make sure to perform the same configurations on all the nodes to maintain them in sync.
- You cannot run the `start nstrace` command from the cluster IP address when the cluster is being upgraded. However, you can get the trace of individual nodes by performing this operation on individual cluster nodes using their NSIP address.
- NetScaler 13.0 76.x build is not suitable for cluster setups. Citrix recommends not to use the NetScaler 13.0 76.x build for a cluster setup.
- NetScaler 13.0 47.x and 13.0 52.x builds are not suitable for a cluster setup. It is because the inter-node communications are not compatible in these builds.
- When a cluster is being upgraded, it is possible that the upgraded nodes have some additional features activated that are unavailable on the nodes that are not yet upgraded. It results in a license mismatch warning while the cluster is being upgraded. This warning is automatically resolved when all the cluster nodes are upgraded.

IMPORTANT

- Citrix® recommends that you wait for the previous node to become active before upgrading or downgrading the next node.
- Citrix recommends that the cluster configuration node must be upgraded/downgraded last to avoid multiple disconnects of cluster IP sessions.

To upgrade or downgrade the software of the cluster nodes

1. Make sure that the cluster is stable and the configurations are synchronized on all the nodes.
2. Using the cluster IP (CLIP) address, save the configuration (for example, by running the `save ns config` command). Do not make any further configuration changes from the CLIP while the upgrade or downgrade is in progress.
3. Access each node through its NSIP address and perform the following:
    - Upgrade or downgrade the cluster node. For detailed information about upgrading and downgrading the software of an appliance, see Upgrade and downgrade a NetScaler appliance.
    - Save the configurations.
    - Reboot the appliance.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. Repeat step 3 for each of the other cluster nodes.

Operations supported on individual cluster nodes

As a rule, NetScaler appliances that are a part of a cluster cannot be individually configured from their NSIP address. However, there are some operations that are an exception to this rule. These operations, when run from the NSIP address, are not propagated to other cluster nodes.

The operations are:

- cluster instance (set | rm | enable | disable)
- cluster node (set | rm)
- ns trace (start | show | stop)
- interface (set | enable | disable)
- route (add | rm | set | unset)
- ARP (add | rm | send -all)
- force cluster sync
- sync cluster files
- disable NTP sync
- save ns config
- reboot
- shutdown

For example, when you run the command `disable interface 1/1/1` from the NSIP address of a cluster node, the interface is disabled only on that node. Since the command is not propagated, the interface 1/1/1 remains enabled on all the other cluster nodes.

Support for heterogeneous cluster

NetScaler supports a heterogeneous cluster in a cluster deployment. A heterogeneous cluster spans nodes of different NetScaler hardware and you can have a combination of different platforms in the same cluster.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

IMPORTANT:

The formation or supportability of a heterogeneous cluster is possible and limited only to MPX hardware platforms.

The supportability and formation of the heterogeneous cluster depend on certain NetScaler models. The following table lists the platforms that are supported in the formation of a heterogeneous cluster, with an equal number of packet engines.

NUMBER OF PACKET ENGINES	MPX HARDWARE PLATFORMS	SUPPORTED MPX HARDWARE PLATFORMS TO FORM HETEROGENEOUS CLUSTER
5	MPX 11500	MPX 14020
7	MPX 11515	MPX 14040
9	MPX 11530	MPX 14060

For more information on how to form a heterogeneous cluster deployment of NetScaler MPX appliances with the different number of packet engines across different SSL chipsets, see the **Heterogeneous cluster deployments** section in SSL offloading configuration.

NOTE:

Before release 13.0 build 47.x, if you run the `join cluster` command from the node that has an unequal number of packet engines, the following error message appears: "Mismatch in the number of active PPEs between CCO and local node".

Points to note

1. The extra management CPU setting must be the same on all the cluster nodes.
2. The newly added node must have the same capacity on the data planes and backplane, as that of existing cluster nodes.
3. If there are mixed platform devices supporting different ciphers, then the cluster agrees upon a common cipher list.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

FAQs

A list of the FAQ about clustering.

How many NetScaler appliances can be included in a single NetScaler cluster?

A NetScaler cluster can include one appliance or as many as 32 NetScaler nCore hardware or virtual appliances. Each of these nodes must satisfy the criteria specified in Prerequisites for Cluster Nodes.

Can a NetScaler appliance be a part of multiple clusters?

No. A NetScaler appliance can belong to one cluster only.

What is a cluster IP address? What is its subnet mask?

The cluster IP address is the management address of a NetScaler cluster. All cluster configurations must be performed by accessing the cluster through this address. The subnet mask of the cluster IP address is fixed at 255.255.255.255.

How can I make a specific cluster node as the cluster configuration coordinator?

To manually set a specific node as the cluster configuration coordinator, you must set the priority of that node to the lowest numeric value (highest priority). To understand, let us consider a cluster with three nodes that have the following priorities:

n1 - 29, n2 - 30, n3 - 31

Here, n1 is the configuration coordinator. If you want to make n2 the configuration coordinator, you must set its priority to a value that is lower than n1, for example, 28. On saving the configuration, n2 becomes the configuration coordinator.

NOTE

n2 with its original priority value of 30 becomes the configuration coordinator when n1 goes down. The node with the next lowest priority value is selected in case the configuration coordinator goes down.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Why are the network interfaces of a cluster represented in 3-tuple (n/u/c) notation instead of the regular 2-tuple (u/c) notation?

When a NetScaler appliance is part of a cluster, you must be able to identify the node to which the interface belongs. Therefore, the network interface naming convention for cluster nodes is modified from u/c to n/u/c, where n denotes the node Id.

How can I set the host name for a cluster node?

The host name of a cluster node must be specified by running the **set ns hostname** command through the cluster IP address. For example, to set the host name of the cluster node with ID 2, the command is:

set ns hostname hostName1 -**ownerNode** 2

Can I automatically detect NetScaler appliances so that I can add them to a cluster?

Yes. The configuration utility allows you to discover appliances that are present in the same subnet as the NSIP address of the configuration coordinator. For more information, see Discovering NetScaler Appliances.

Is the traffic serving capability of a cluster affected if a node is removed or disabled or reboot or shutdown or made inactive?

Yes. When any of these operations are performed on an active node of the cluster, the cluster has one less node to serve traffic. Also, existing connections on this node are terminated.

I have multiple standalone appliances, each of which has different configurations. Can I add them to a single cluster?

Yes. You can add appliances that have different configurations to a single cluster. However, when the appliance is added to the cluster, the existing configurations are cleared. To use the configurations that are available on each of the individual appliances, you must:

1. Create a single *.conf file for all the configurations.
2. Edit the configuration file to remove features that are not supported in a cluster environment.
3. Update the naming convention of interfaces from 2-tuple (u/c) format to 3-tuple (n/u/c) format.
4. Apply the configurations to the configuration coordinator node of the cluster by using the batch command.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Can I migrate the configurations of a standalone NetScaler appliance or an HA setup to the clustered setup?

No. When a node is added to a clustered setup, its configurations are implicitly cleared by using the **clear ns config** command (with the **extended** option). In addition, the SNIP addresses and all VLAN configurations (except default VLAN and NSVLAN) are cleared. Therefore, it is recommended that you back up the configurations before adding the appliance to a cluster. Before using the backed-up configuration file for the cluster, you must:

1. Edit the configuration file to remove features that are not supported in a cluster environment.
2. Update the naming convention of interfaces from two-tuple (x/y) format to three-tuple (x/y/z) format.
3. Apply the configurations to the configuration coordinator node of the cluster by using the **batch** command.

Is backplane interfaces part of the L3 VLANs?

Yes, by default, backplane interfaces have presence on all the L3 VLANs that are configured on the cluster.

How can I configure a cluster that includes nodes from different networks?

NOTE

Supported from NetScaler 11.0 onwards.

A cluster that includes nodes from different networks is called a L3 cluster (sometimes referred to as a cluster in INC mode). In an L3 cluster, all nodes that belong to a single network must be grouped in a single node group. Therefore, if a cluster includes two nodes each from three different networks, you have to create 3 node groups (one for each network) and associate each of these node groups with the nodes that belong to that network. For configuration information, see the steps to set up a cluster.

How can I configure/un-configure the NSVLAN on a cluster?

Do either one of the following:

- To make the NSVLAN available in a cluster, make sure that each appliance has the same NSVLAN configured before it is added to a cluster.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- To remove the NSVLAN from a cluster node, first remove the node from the cluster and then delete the NSVLAN from the appliance.

I have a cluster set up where some NetScaler nodes are not connected to the external network. Can the cluster still function normally?

Yes. The cluster supports a mechanism called linksets, which allows unconnected nodes to serve traffic by using the interfaces of connected nodes. The unconnected nodes communicate with the connected nodes through the cluster backplane. For more information, see Using Linksets.

How can deployments that require MAC-Based Forwarding (MBF) be supported in a clustered setup?

Deployments that use MBF must use linksets. For more information, see Using Linksets.

Can I run commands from the NSIP address of a cluster node?

No. Access to individual cluster nodes through the NSIP addresses is read-only. Therefore, when you log on to the NSIP address of a cluster node you can only view the configurations and the statistics. You cannot configure anything. However, there are some operations you can run from the NSIP address of a cluster node. For more information, see Operations Supported on Individual Nodes.

Can I disable configuration propagation among cluster nodes?

No, you cannot explicitly disable the propagation of cluster configurations among cluster nodes. However, during a software upgrade or downgrade, a version mismatch error can automatically disable configuration propagation.

Can I change the NSIP address or change the NSVLAN of a NetScaler appliance when it is a part of the cluster?

No. To make such changes you must first remove the appliance from the cluster, perform the changes, and then add the appliance to the cluster.

Does the NetScaler cluster support L2 and L3 VLANs?

Yes. A cluster supports VLANs between cluster nodes. The VLANs must be configured on the cluster IP address.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **L2 VLAN.** You can create a layer2 VLAN by binding interfaces that belong to different nodes of the cluster.
- **L3 VLAN.** You can create a layer3 VLAN by binding IP addresses that belong to different nodes of the cluster. The IP addresses must belong to the same subnet. Make sure that one of the following criteria is satisfied. Otherwise, the L3 VLAN bindings can fail.
    - All nodes have an IP address on the same subnet as the one bound to the VLAN.
    - The cluster has a striped IP address and the subnet of that IP address is bound to the VLAN.

When you add a node to a cluster that has only spotted IPs, the sync happens before spotted IP addresses are assigned to that node. In such cases, L3 VLAN bindings can be lost. To avoid this loss, either add a striped IP or add the L3 VLAN bindings on the NSIP of the newly added node.

How can I configure SNMP on a NetScaler cluster?

SNMP monitors the cluster, and all the nodes of the cluster, in the same way that it monitors a standalone appliance. The only difference is that SNMP on a cluster must be configured through the cluster IP address. When generating hardware specific traps, two more varbinds are included to identify the node of the cluster: node ID and NSIP address of the node.

What details must I have available when I contact technical support for cluster-related issues?

The NetScaler appliance provides a **show techsupport -scope cluster** command that extracts configuration data, statistical information, and logs of all the cluster nodes. Run this command on the cluster IP address.

The output of this command is saved in a file named *collector_cluster_\<nsip_CCO\>_P_\<date-timestamp\>.tar.gz* which is available in the */var/tmp/support/cluster/* directory of the configuration coordinator.

Send this archive to the technical support team to debug the issue.

Can I use striped IP addresses as the default gateway of servers?

In cluster deployments, make sure the default gateway of the server points to a striped IP address (if you are using a NetScaler-owned IP address). For example, in the case of LB deployments with USIP enabled, the default gateway must be a striped SNIP address.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Can I view the routing configurations of a specific cluster node from the cluster IP address?

Yes. You can view and clear the configurations specific to a node by specifying the owner node while entering the VTYSH shell.

For example, to view the output of a command on nodes 0 and 1, the command is as follows:

```
\> vtysh

ns# owner-node 0 1

ns(node-0 1)&num; show cluster state

ns(node-0 1)&num; exit-cluster-node

ns&num;
```

How can I specify the node for which I want to set the LACP system priority?

NOTE

Supported from NetScaler 10.1 onwards.

In a cluster, you must set that node as the owner node by using the **set lacp** command.

For example: To set the LACP system priority for a node with ID 2:

```
set lacp -sysPriority 5 -ownerNode 2
```

How are IP tunnels configured in a cluster setup?

NOTE

Supported from NetScaler 10.1 onwards.

Configuring IP tunnels in a cluster is the same as on a standalone appliance. The only difference is that in a cluster setup, the local IP address must be a striped SNIP address.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

How can I add a failover interface set (FIS) on the nodes of a NetScaler cluster?

NOTE

Supported from NetScaler 10.5 onwards.

On the cluster IP address, specify the ID of the cluster node on which the FIS must be added, using the command as follows:

```
add fis <name> -ownerNode <nodeId>
```

NOTES

- The FIS name for each cluster node must be unique.
- A cluster LA channel can be added to a FIS. You make sure that the cluster LA channel has a local interface as a member interface.

For more information on FIS, see Configuring failover interface set.

How are net profiles configured in a cluster setup?

NOTE

Supported from NetScaler 10.5 onwards.

You can bind spotted IP addresses to a net profile. This net profile can then be bound to a spotted load balancing virtual server or service (that is defined using a node group). The following recommendations must be followed, failing which, the net profile configurations are not honored and the USIP/USNIP settings are used:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE

- If the **strict** parameter of the node group is set to **Yes**, the net profile must contain a minimum of one IP address from each node group member.
- If the **strict** parameter of the node group is set to **No**, the net profile must include at least one IP address from each of the cluster nodes.

How can I configure WIonNS in a cluster setup?

NOTE

Supported from NetScaler 11.0 Build 62.x onwards.

To use WIonNS on a cluster, you must do the following:

1. Make sure that the Java package and the WI package are present in the same directory on all the cluster nodes.
2. Create a load balancing virtual server that has persistency configured.
3. Create services with IP addresses as the NSIP address of each of the cluster nodes that you want to serve WI traffic. This step can only be configured using the NetScaler CLI.
4. Bind the services to the load balancing virtual server.

NOTE

If you are using WIonNS over a VPN connection, make sure that the load balancing virtual server is set as WIHOME.

Can the cluster LA channel be used for management access?

No. Management access to a cluster node, must not be configured on a cluster LA channel (for example, CLA/1) or its member interfaces. It is because when the node is INACTIVE, the corresponding cluster LA interface is marked as power down, and therefore looses management access.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

How cluster nodes communicate to each other and what are the different types of traffic that goes through the backplane?

A backplane is a set of interfaces in which one interface of each node is connected to a common switch, which is called the cluster backplane switch. The different types of traffic that goes through a backplane, which is used by internode communication are:

- Node to Node Messaging (NNM)
- Steered traffic
- Configuration propagation and synchronization

Each node of the cluster uses a special MAC cluster backplane switch address to communicate with other nodes through the backplane. The cluster special MAC is of the form: **0x02 0x00 0x6F \<cluster_id\> \<node_id\> \<reserved\>**, where \<cluster_id\> is the cluster instance ID. The `<node_id>` is the node number of the NetScaler appliance that is added to a cluster.

NOTE

The amount of traffic that is handled by a backplane has negligible CPU overhead.

What gets routed over the GRE tunnel for the Layer 3 cluster?

Only steered data traffic goes over the GRE tunnel. The packets are steered through the GRE tunnel to the node on the other subnet.

How Node to Node Messaging (NNM) and heartbeat messages are exchanged, and how are they routed?

The NNM, heartbeat messages, and cluster protocol are non-steering traffic. These messages are not sent through the tunnel, but they are routed directly.

What are the MTU recommendations for layer 3 cluster tunneled traffic?

The following are the layer 3 cluster recommendations of Jumbo MTU over GRE tunnel:

- The Jumbo MTU can be configured among cluster nodes across the L3 path to accommodate GRE tunnel overhead.
- The fragmentation does not happen for full sized packets which must be steered.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Steering of traffic continues to work even if Jumbo frames are not allowed, but with more overhead due to fragmentation.

How the global hash key is generated and shared across all nodes?

The `rsskey` for a standalone appliance is generated at the boot time. In a cluster setup, the first node holds the `rsskey` of the cluster. Every new node joining to the cluster synchronizes the `rsskey`.

What is the need of `set rsskeytype –rsskey symmetric` command for *:*, USIP on, `useproxyport` off, topologies?

It is not specific to a cluster, applies to a standalone appliance as well. With USIP ON, and use proxy port disabled, symmetric `rsskey` reduces both Core to Core (C2C) steering and node to node steering.

What are the factors that contribute to change the CCO node?

The first node added to form a cluster setup becomes the configuration coordinator (CCO) node. The following factors contribute to change the CCO node in the cluster setup:

- When the current CCO node is removed from the cluster setup
- When the current CCO node crashes
- When the priority of the non-CCO node is changed (lower priority has higher precedence)
- In dynamic conditions like, network reachability between the nodes
- When there is change in node states – active, spare, and passive. Active nodes are preferred as CCO.
- When there is a change in configuration, and the node having the latest configuration is preferred as CCO.

Can I form a cluster with nodes of different hardware platforms?

Yes. NetScaler appliance supports a heterogeneous cluster. A heterogeneous cluster can have a combination of different platforms in the same cluster. For more information, see Support for heterogeneous cluster.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Troubleshooting the NetScaler cluster

If a failure occurs in a NetScaler cluster, the first step in troubleshooting is to get information on the cluster instance. You can get the information by running the `show cluster instance clId` and `show cluster node nodeId` commands on the cluster nodes respectively.

If you are not able to find the issue by using the above two approaches, you can use one of the following:

- **Isolate the source of the failure.** Try bypassing the cluster to reach the server. If the attempt is successful, the problem is probably with the cluster setup.
- **Check the commands recently executed.** Run the history command to check the recent configurations performed on the cluster. You can also review the ns.conf file to verify the configurations that have been implemented.
- **Check the ns.log files.** Use the log files, available in the /var/log/ directory of each node, to identify the commands run, the status of commands, and the state changes.
- **Check the newnslog files.** Use the `newnslog` files, available in the /var/nslog/ directory of each node, to identify the events that have occurred on the cluster nodes. You can view multiple `newnslog` files as a single file, by copying the files to a single directory, and then running the following command:

  ```
  nsconmsg -K newnslog-node&lt;id> -K     newnslog.node&lt;id> -d current
  ```

If you still cannot resolve the issue, you can try tracing the packets on the cluster or use the show `techsupport -scope cluster` command. You can use the command to send the report to the technical support team.

Tracing the packets of a NetScaler cluster

The NetScaler operating system provides a utility called *ns trace* to get a dump of the packets that are received and sent out by an appliance. The utility stores the packets in trace files. You can use these files to debug problems in the flow of packets to the cluster nodes. The trace files must be viewed with the Wireshark application.

Some salient aspects of the ns trace utility are:

- Can be configured to trace packets selectively by using classic expressions and default expressions.
- Can capture the trace in multiple formats: ns trace format (.cap) and TCP dump format (.pcap).

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Can aggregate the trace files of all cluster nodes on the configuration coordinator.
- Can merge multiple trace files into a single trace file (only for.cap files).

You can use the ns trace utility from the NetScaler command line or the NetScaler shell.

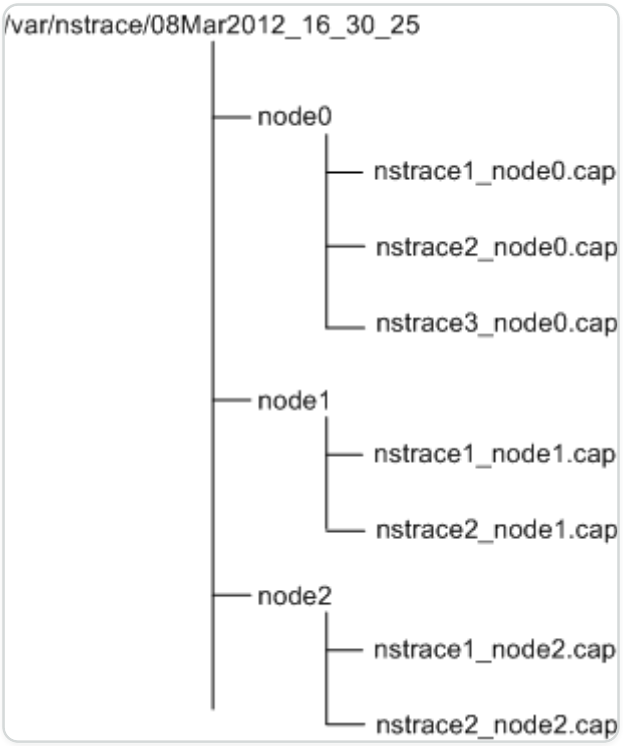
To trace packets of a standalone appliance

Run the start ns trace command on the appliance. The command creates trace files in the /var/nstrace/\<date-timestamp\> directory. The trace file names are of the form nstrace\<id\ >.cap.

You can view the status by running the show ns trace command. You can stop tracing the packets by running the stop ns trace command.

NOTE

You can also run the ns trace utility from the NetScaler shell by running the nstrace.sh file. However, it is recommended that you use the ns trace utility through the NetScaler command line interface.



To trace packets of a cluster

You can trace the packets on all the cluster nodes and obtain all the trace files on the configuration coordinator.

Run the start ns trace command on the cluster IP address. The command is propagated and run on all the cluster nodes. The trace files are stored in individual cluster nodes in the /var/nstrace/`<date-timestamp>` directory. The trace file names are of the form nstrace\<id\>_node\<id\ >.cap.

You can use the trace files of each node to debug the nodes operations. But if you want the trace files of all cluster nodes in one location, you must run the stop ns trace command on the cluster IP address. The trace files of all the nodes are downloaded on the cluster configuration coordinator in the /var/nstrace/`<date-timestamp>` directory as follows:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Merge multiple trace files

You can prepare a single file from the trace files (supported only for. Cap files) obtained from the cluster nodes. The single trace files give you a cumulative view of the trace of the cluster packets. The trace entries in the single trace file are sorted based on the time the packets were received on the cluster.

To merge the trace files, at the NetScaler shell, type:

```
> nstracemerge.sh -srcdir \&lt;DIR\> -dstdir \&lt;DIR\> -filename
\&lt;name\> -filesize \&lt;num\>
```

Where,

- `srcdir` is the directory from which the trace files are merged. All trace files within this directory are merged into a single file.
- `dstdir` is the directory where the merged trace file is created.
- `Filename` is the name of the trace file that is created.
- `Filesize` is the size of the trace file.

Examples

Following are some examples of using the ns trace utility to filter packets.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- To trace the packets on the backplane interfaces of three nodes:

  Using classic expressions:

  ```
  > start nstrace -filter "INTF == 0/1/1 && INTF == 1/1/1 && INTF ==
  2/1/1"
  ```

  Using default expressions:

  ```
  > start nstrace -filter "CONNECTION.INTF.EQ("0/1/1") &&
  CONNECTION.INTF.EQ("1/1/1") && CONNECTION.INTF.EQ("2/1/1")"
  ```

- To trace the packets from a source IP address 10.102.34.201 or from a system whose source port is greater than 80 and the service name is not "s1":

  Using classic expressions

  ```
  > start nstrace -filter "SOURCEIP == 10.102.34.201 || (SVCNAME != s1 &&
  SOURCEPORT > 80)"
  ```

  Using default expressions

  ```
  > start nstrace -filter "CONNECTION.SRCIP.EQ(10.102.34.201) ||
  (CONNECTION.SVCNAME.NE("s1") && CONNECTION.SRCPORT.GT(80))"
  ```

NOTE

For more information about filters used in ns trace, see ns trace.

Capturing SSL Session Keys During a Trace

When you run the "start ns trace" command, you can set the new `capsslkeys` parameter to capture the SSL master keys for all SSL sessions. If you include this parameter, a file named nstrace.sslkeys is generated along with the packet trace. This file can be imported into Wireshark to decrypt the SSL traffic in the corresponding trace file.

This functionality is similar to web browsers exporting session keys that can later be imported into Wireshark for decrypting SSL traffic.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Advantages of using SSL session keys

Following are the advantages of using SSL session keys:

1. Generates smaller trace files that do not include the extra packets created by the SSLPLAIN mode of capturing.
2. Provides the ability to view plaintext \[SP(1\] from the trace and choose whether to share the master keys file or protect sensitive data by not sharing it.

Limitations of using SSL session keys

Following are the limitations of using SSL session keys:

1. SSL sessions cannot be decrypted if the initial packets of the session are not captured.
2. SSL sessions cannot be captured if the Federal Information Processing Standard (FIPS) mode is enabled.

TO CAPTURE SSL SESSION KEYS BY USING THE COMMAND LINE INTERFACE (CLI)

At the command prompt, type the following commands to enable or disable SSL session keys in a trace file and verify trace operation.

```
> start nstrace -capsslkeys ENABLED

> show nstrace

Example

> start nstrace -capsslkeys ENABLED

> show nstrace

      State:  RUNNING          Scope:  LOCAL            TraceLocation:  "/
var/nstrace/04May2016_17_51_54/..."

      Nf:  24                  Time:  3600              Size:  164
      Mode:  TXB NEW_RX

      Traceformat:  NSCAP      PerNIC:  DISABLED        FileName:
 04May2016_17_51_54 Link:  DISABLED

      Merge:  ONSTOP           Doruntimecleanup:  ENABLED TraceBuffers:
 5000      SkipRPC:  DISABLED
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
     SkipLocalSSH:  DISABLED  Capsslkeys:  ENABLED     InMemoryTrace:
DISABLED

Done
```

To configure SSL session keys by using the NetScaler GUI

1. Navigate to **Configuration > System > Diagnostics > Technical Support Tools** and click **Start new Trace** to start tracing encrypted packets on an appliance.
2. On the **Start Trace** page, select the **Capture SSL Master Keys** check box.
3. Click **OK** and **Done**.

To import the SSL Master Keys into Wireshark

On the Wireshark GUI, navigate to **Edit > Preferences > Protocols > SSL > (Pre)-Master-Secret log filename** and specify the master key files obtained from the appliance.

Troubleshooting common issues

While joining a node to the cluster, I get the following message, "ERROR: Invalid interface name/number." What must I do to resolve this error?

The said error occurs if you provided an invalid or incorrect backplane interface while using the add cluster node command to add the node. To resolve this error, verify the interface you provided while adding the node. Make sure that you have not specified the appliance's management interface as the backplane interface, and that the \<nodeId\> bit of the interface is the same as the node's Id. For example, if the nodeId is 3, the backplane interface must be 3/\<c\>/<u>.

While joining a node to the cluster, I get the following message, "ERROR: Clustering cannot be enabled, because the local node is not a member of the cluster." What must I do to resolve this error?

This error occurs when you try to join a node without adding the node's NSIP to the cluster. To resolve this error, you must first add the node's NSIP address to the cluster by using the **add cluster node** command and then run the **join cluster** command.

While joining a node to the cluster, I get the following message, "ERROR: Connection refused." What must I do to resolve this error?

This error can occur due to the following reasons:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Connectivity problems.** The node cannot connect to the cluster IP address. Try pinging the cluster IP address from the node that you are trying to join.
- **Duplicate cluster IP address.** Check to see if the cluster IP address exists on some non-cluster node. If it does, create a cluster IP address and try rejoining the cluster.

While joining a node to the cluster, I get the following message, "ERROR: License mismatch between the configuration coordinator and the local node." What must I do to resolve this error?

The appliance that you are joining to the cluster must have the same licenses as the configuration coordinator. This error occurs when the licenses on the node you are joining do not match the licenses on the configuration coordinator. To resolve this error, run the following commands on both the nodes and compare the outputs.

From the command line:

- `show ns hardware`
- `show ns license`

From the shell:

- `nsconmsg -g feature -d stats`
- `ls /nsconfig/license`
- View the contents of the /var/log/license.log file

What must I do when the configurations of a cluster node are not in synchronize with the cluster configurations?

Usually, the configurations are automatically synchronized between all the cluster nodes. However, if you feel that the configurations are not synchronized on a specific node, you must force the synchronization by running the force cluster sync command from the node that you want to synchronize. For more information, see Synchronizing Cluster Configurations.

When configuring a cluster node, I get the following message, "ERROR: Session is read-only; connect to the cluster IP address to modify the configuration."

All configurations on a cluster must be done through the cluster IP address and the configurations are propagated to the other cluster nodes. All sessions established through the NSIP address of individual nodes are read-only.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Why does the node state show "INACTIVE" when the node health shows "UP"?

A healthy node can be in the INACTIVE state for various reasons. A scan of the ns.log or error counters can help you determine the exact reason.

How can I resolve the health of a node when its health shows "NOT UP"?

Node health "**Not UP**" indicates that there are some issues with the node. To know the root cause, you must run the **show cluster node** command. This command displays the node properties and the reason for the node failure.

What must I do when the health of a node shows as "NOT UP" and the reason indicates that configuration commands have failed on a node?

This issue arises when some commands are not run on the cluster nodes. In such cases, you must make sure that the configurations are synchronized using one of the following options:

- If some of the cluster nodes are in this state, you must perform the force cluster synchronization operation on those nodes. For more information, see Synchronizing Cluster Configurations.
- If all cluster nodes are in this state, you must disable and then enable the cluster instance on all the cluster nodes.

When I run the set virtual server command, I get the following message, "No such resource." What must I do to resolve this issue?

The **set vserver** command is not supported in clustering. The **unset vserver, enable vserver, disable vserver,** and **rm vserver** commands are also not supported. However, the **show vserver** command is supported.

I cannot configure the cluster over a Telnet session. What must I do?

Over a telnet session, the cluster IP address can be accessed only in read-only mode. Therefore, you cannot configure a cluster over a telnet session.

I notice a significant time difference across the cluster nodes. What must I do to resolve this issue?

When PTP packets are dropped due to the backplane switch or if the physical resources are over-committed in a virtual environment, the time will not get synchronized.

To synchronize the times, you must do the following on the cluster IP address:

1. Disable PTP.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

set ptp -state disable

2. Configure Network Time Protocol (NTP) for the cluster. For more information, see Setting up Clock Synchronization.

What must I do, if there is no connectivity to the cluster IP address and the NSIP address of a cluster node?

If you cannot access to the cluster IP address or the NSIP of a cluster node, you must access the appliance through the serial console. If the NSIP address is reachable, you can SSH to the cluster IP address from the shell by running the following command at the shell prompt:

```
# ssh nsroot@<cluster IP address>
```

What must I do to recover a cluster node that has connectivity issues?

To recover a node that has connectivity issues:

1. Disable the cluster instance on that node (since you cannot run commands from the NSIP of a cluster node).
2. Run the commands required to recover the node.
3. Enable the cluster instance on that node.

Some nodes of the cluster have two default routes. How can I remove the second default route from the cluster node?

To delete the additional default route, do the following on each node that has the extra route:

1. Disable the cluster instance.

   ```
   disable cluster instance <clId>
   ```

2. Remove the route.

   ```
   rm route <network> <netmask> <gateway>
   ```

3. Enable the cluster instance.

   ```
   enable cluster instance <clId>
   ```

The cluster functionality gets affected when an existing cluster node comes online. What must I do to resolve this issue?

If the RPC password of a node is changed from the cluster IP address when that node is out of the cluster, then, when the node comes online, there is a mismatch in RPC credentials and can affect

© 1997–2026 Citrix Systems, Inc. All rights reserved.

cluster functionality. To solve this issue, use the set ns rpcNode command to update the password on the NSIP of the node which has come online.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Content Switching

In today's complex websites, you might want to present different content to different users. For example, you might want to allow users from the IP range of a customer or partner to have access to a special Web portal. You might want to present content relevant to a specific geographical area to users from that area. You might want to present content in different languages to the speakers of those languages. You might want to present content tailored to specific devices, such as smartphones, to them who use the devices. The NetScaler content switching feature enables the appliance to distribute client requests across multiple servers based on specific content that you want to present to those users.

To configure content switching, first create a basic content switching setup, and then customize it to meet your needs. This entails enabling the content switching feature, setting up load balancing for the server or servers that host each version of the content that is being switched, creating a content switching virtual server, creating policies to choose which requests are directed to which load balancing virtual server, and binding the policies to the content switching virtual server. You can then customize the setup to meet your needs by setting precedence for your policies, protecting your setup by configuring a backup virtual server, and improving the performance of your setup by redirecting requests to a cache.

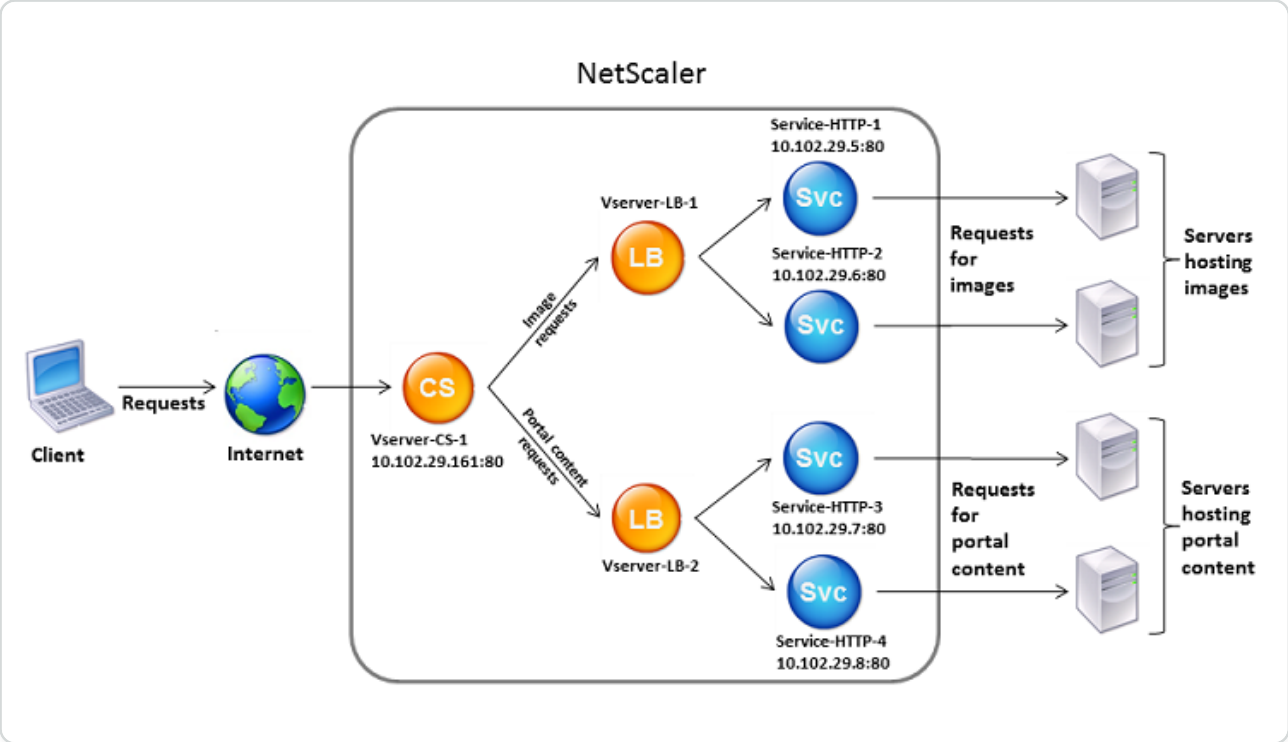
How Content Switching Works

Content Switching enables the NetScaler appliance to direct requests sent to the same Web host to different servers with different content. For example, you can configure the appliance to direct requests for dynamic content (such as URLs with a suffix of .asp, .dll, or .exe) to one server and requests for static content to another server. You can configure the appliance to perform content switching based on TCP/IP headers and payload.

You can also use content switching to configure the appliance to redirect requests to different servers with different content based on various client attributes. Some of those client attributes are:

- **Device Type.** The appliance examines the user agent or custom HTTP header in the client request for the type of device from which the request originated. Based on the device type, it directs the request to a specific Web server. For example, if the request came from a cell phone, the request is directed to a server, capable of serving content that the user can view on

© 1997–2026 Citrix Systems, Inc. All rights reserved.



the cell phone. A request from a computer is directed to a different server, capable of serving content designed for a computer screen.

- **Language.** The appliance examines the Accept-Language HTTP header in the client request and determines the language used by the client's browser. The appliance then sends the request to a server that serves content in that language. For example, using content switching based on language, the appliance can send someone whose browser is configured to request content in French to a server with the French version of a newspaper. It can send someone else whose browser is configured to request content in English to a server with the English version.
- **Cookie.** The appliance examines the HTTP request headers for a cookie that the server set previously. If it finds the cookie, it directs requests to the appropriate server, which hosts custom content. For example, if a cookie is found that indicates that the client is a member of a customer loyalty program, the request is directed to a faster server or one with special content. If it does not find a cookie, or if the cookie indicates that the user is not a member, the request is directed to a server for the general public.
- **HTTP Method.** The appliance examines the HTTP header for the method used, and sends the client request to the right server. For example, GET requests for images can be directed to an image server, while POST requests can be directed to a faster server that handles dynamic content.
- **Layer 3/4 Data.** The appliance examines requests for the source or destination IP, source or destination port, or any other information present in the TCP or UDP headers, and directs the client request to the right server. For example, requests from source IPs that belong to customers can be directed to a custom web portal on a faster server, or one with special content.

A typical content switching deployment consists of the entities described in the following diagram.

Figure 1. Content Switching Architecture

© 1997–2026 Citrix Systems, Inc. All rights reserved.

A content switching configuration consists of a content switching virtual server, a load balancing setup consisting of load balancing virtual servers and services, and content switching policies. To configure content switching, you must configure a content switching virtual server and associate it with policies and load balancing virtual servers. This process creates a *content group—*a group of all virtual servers and policies involved in a particular content switching configuration.

Content switching can be used with HTTP, HTTPS, TCP, and UDP connections. For HTTPS, you must enable SSL Offload.

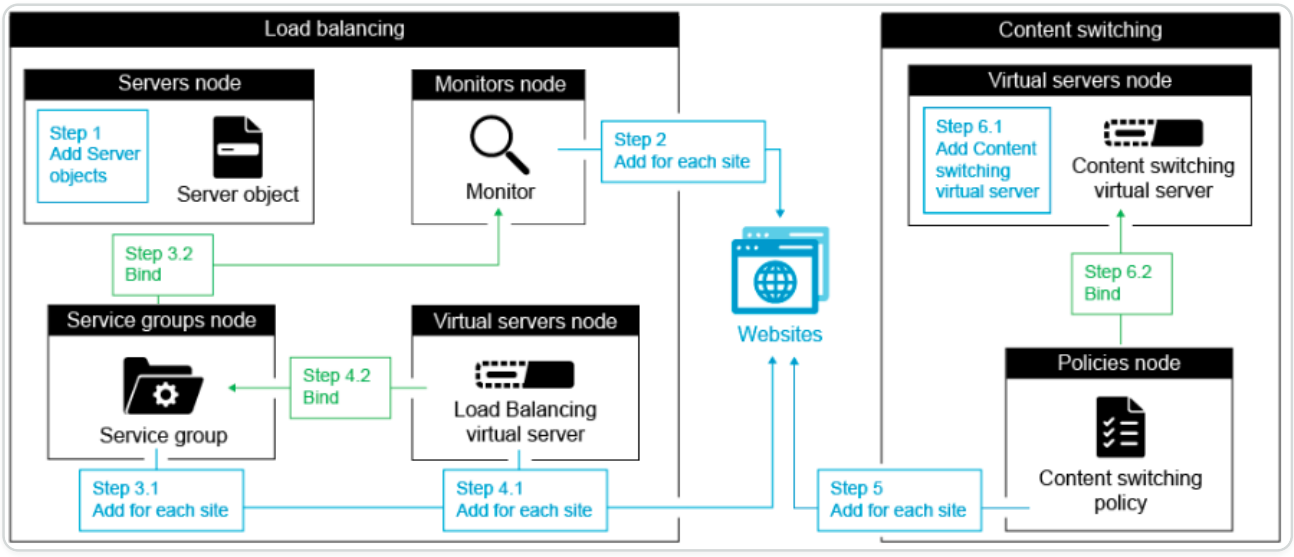
When a request reaches the content switching virtual server, the virtual server applies the associated content switching policies to that request. The priority of the policy defines the order in which the policies bound to the content switching virtual server are evaluated. If you are using Advanced policy policies, when you bind a policy to the content switching virtual server, you must assign a priority to that policy. If you are using NetScaler classic policies, you can assign a priority to your policies, but are not required to do so. If you assign priorities, the policies are evaluated in the order that you set. If you do not, the NetScaler appliance evaluates your policies in the order in which they were created.

In addition to configuring policy priorities, you can manipulate the order of policy evaluation by using Goto expressions and policy bank invocations. For more details about Advanced policy configuration, see Configure advanced policy expressions in a policy.

After it evaluates the policies, the content switching virtual server routes the request to the appropriate load balancing virtual server, which sends it to the appropriate service.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Content switching virtual servers can only send requests to other virtual servers. If you are using an external load balancer, you must create a load balancing virtual server for it and bind its virtual server as a service to the content switching virtual server.



Configure basic content switching

Before you configure content switching, you must understand how content switching is set up and how the services and virtual servers are connected.

To configure a basic, functional content switching setup, first enable the content switching feature. Then, create at least one content group. For each content group, create a content switching virtual server to accept requests to a group of websites that use content switching. Also create a load balancing setup, which includes a group of load balancing virtual servers to which the content switching virtual server directs requests. To specify which requests to direct to which load balancing virtual server, create at least two content switching policies, one for each type of request that is to be redirected. When you have created the virtual servers and policies, bind the policies to the content switching virtual server. You can also bind a policy to multiple content switching virtual servers. When you bind a policy, you specify the load balancing virtual server to which requests that match the policy are to be directed.

In addition to binding individual policies to a content switching virtual server, you can bind policy labels. If you create more content groups, you can bind a policy or policy label to more than one of the content switching virtual servers.

The following figure illustrates the steps involved in content switching configuration.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE

After creating a content group, you can modify its content switching virtual server to customize the configuration.

Enable content switching

To use the content switching feature, you must enable content switching. You can configure content switching entities even though the content switching feature is disabled. However, the entities do not work.

Enable content switching by using the CLI

At the command prompt, type the following commands to enable content switching and verify the configuration:

```
enable ns feature CS

show ns feature
```

Example:

```
> enable  feature ContentSwitch

    Done

> show feature

    Feature                       Acronym             Status

    -------                       -------             ------

1)     Web Logging                    WL                  OFF

2)     Surge Protection               SP                  ON

3)     Load Balancing                 LB                  ON
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
4)     Content Switching             CS                  ON

.

.

.

22)    Responder                     RESPONDER           ON

23)    HTML Injection                HTMLInjection       ON

24)    NetScaler Push                push                OFF

Done
```

Enable content switching by using the GUI

Navigate to **System > Settings** and, in the **Modes and Features** group, select **Configure Basic Features**, and select **Content Switching**.

Create content switching virtual servers

You can add, modify, and remove content switching virtual servers. The state of a virtual server is DOWN when you create it, because the load balancing virtual server is not yet bound to it.

Create a virtual server by using the CLI

At the command prompt, type:

```
add cs vserver <name> <protocol> <IPAddress> <port>
```

Example:

```
add cs vserver Vserver-CS-1 HTTP 10.102.29.161 80
```

Add a content switching virtual server by using the GUI

1. Navigate to **Traffic Management > Content Switching > Virtual Servers**, and add a virtual server.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. Specify a name for the content switching virtual server.

   NOTE

   There is a different Content Switching virtual server for each protocol. (For example, HTTP and SSL).

3. Populate the relevant fields and click **OK**.

Content switching virtual server statistics

The content switching virtual server statistics display information such as virtual server select, request bytes, response bytes, total packets received, total packets sent, spillover threshold, spillover select, current client established connections, and virtual server down backup select.

The content switching virtual server statistics also display the summary details of the bound default load balancing virtual server.

View statistics of content switching virtual server by using the CLI

At the command prompt, type:

```
stat cs vserver <name>
```

Example:

```
stat cs vserver CS_stats
```

View statistics of content switching virtual server by using the GUI

1. Navigate to **Traffic Management** > **Content Switching** > **Virtual Servers**.
2. Select the virtual server and click **Statistics**.

Configure a load balancing setup for content switching

The content switching virtual server redirects all requests to a load balancing virtual server. You must create one load balancing virtual server for each version of the content that is being switched. It is true even when your setup has only one server for each version of the content, and you are therefore not doing any load balancing with those servers. You can also configure actual load balancing with multiple load-balanced servers that mirror each version of the content. In either

© 1997–2026 Citrix Systems, Inc. All rights reserved.

scenario, the content switching virtual server needs to have a specific load balancing virtual server assigned to each version of the content that is being switched.

The load balancing virtual server then forwards the request to a service. If it has only one service bound to it, it selects that service. If it has multiple services bound to it, it uses its configured load balancing method to select a service for the request, and forwards that request to the service that it selected.

To configure a basic load balancing setup, you need to perform the following tasks:

- Create load balancing virtual servers
- Create services
- Bind services to the load balancing virtual server

For more information on load balancing, see How load balancing works. For detailed instructions on setting up a basic load balancing configuration, see Set up basic load balancing.

Configure a content switching action

You specify the target load balancing virtual server for a content switching policy when binding the policy to the content switching virtual server. Therefore, you have to configure one policy for each load balancing virtual server to which to direct traffic.

However, if your content switching policy uses a default syntax rule, you can configure an action for the policy. In the action, you can specify the name of the target load balancing virtual server, or you can configure a request-based expression that, at run time, computes the name of the load balancing virtual server to which to send the request. The action expression must be specified in the default syntax.

The expression option can drastically reduce the size of your content switching configuration, because you need only one policy per content switching virtual server. Content switching policies that use an action can also be bound to multiple content switching virtual servers, because the target load balancing virtual server is no longer specified in the content switching policy. The ability to bind a single policy to multiple content switching virtual servers helps to further reduce the size of your content switching configuration.

After you create an action, you create a content switching policy and specify the action in the policy, so that the action is performed when that policy matches a request.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE

You can also, for a content switching policy that uses a default syntax rule, specify the target load balancing virtual server when binding the policy to a content switching virtual server, instead of using a separate action. For domain-based policies, URL-based policies, and rule-based policies that use classic expressions, an action is not available. So, for these types of policies, you specify the name of the target load balancing virtual server when binding the policy to a content switching virtual server.

Configure an action that specifies the name of the target load balancing virtual server

If you choose to specify the name of the target load balancing virtual server in a content switching action, you need as many content switching policies as you have target load balancing virtual servers. Content switching decisions, in this case, are based on the rules in the content switching policy, and the action merely specifies the target load balancing virtual server. When a request matches the policy, the request is forwarded to the specified load balancing virtual server.

Create and verify a content switching action that specifies the name of the target load balancing virtual server, by using the CLI

At the command prompt, type:

```
add cs action <name> -targetLBVserver <string> [-comment <string>]

show cs action <name>
```

Example:

```
> add cs action mycsaction -targetLBVserver mylbvserver -comment "Forwards
requests to mylbvserver."

 Done

> show cs action mycsaction

    Name: mycsaction
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
    Target LB Vserver: mylbvserver

    Hits: 0

    Undef Hits: 0

    Action Reference Count: 0

    Comment: "Forwards requests to mylbvserver."

 Done

>
```

Configure a content switching action that specifies the name of the target load balancing virtual server, by using the GUI

1. Navigate to **Traffic Management > Content Switching > Actions**.
2. Configure a content switching action, and specify the name of the target load balancing virtual server.

Configure an action that specifies an expression for selecting the target at run time

If you choose to configure a request-based expression that can dynamically compute the name of the target load balancing virtual server, you need to configure only one content switching policy to select the appropriate virtual server. The rule for the policy can be a simple TRUE (the policy matches all requests) because, in this case, content switching decisions are based on the expression in the action. By configuring an expression in an action, you can drastically reduce the size of your content switching configuration.

If you choose to configure a request-based expression for computing the name of the target load balancing virtual server at run time, you must carefully consider how to name the load balancing virtual servers in the configuration. You must be able to derive their names by using the request-based policy expression in the action.

For example, if you are switching requests based on the URL suffix (extension of the requested resource), when naming the load balancing virtual servers, you can follow the convention of

© 1997–2026 Citrix Systems, Inc. All rights reserved.

appending the URL suffix to a predetermined string, such as `mylb_`. For example, load balancing virtual servers for HTML pages and PDF files can be named `mylb_html` and `mylb_pdf`, respectively. In that case, the rule that you can use in the content switching action, to select the appropriate load balancing virtual server, is `"mylb_"+HTTP.REQ.URL.SUFFIX`. If the content switching virtual server receives a request for an HTML page, the expression returns `mylb_html`, and the request is switched to the virtual server `mylb_html`.

Create a content switching action that specifies an expression, by using the CLI

At the command line, type the following commands to create a content switching action that specifies an expression and verify the configuration:

```
add cs action <name> -targetVserverExpr <expression>) [-comment <string>]

show cs action <name>
```

Example:

```
> add cs action mycsaction1 -targetvserverExpr '"mylb_" +
HTTP.REQ.URL.SUFFIX'

 Done

> show cs action mycsaction1

    Name: mycsaction1

    Target Vserver Expression: "mylb_" + HTTP.REQ.URL.SUFFIX

    Target LB Vserver: No_Target

                …

 Done

>
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure a content switching action that specifies an expression by using the GUI

1. Navigate to **Traffic Management > Content Switching > Actions**.
2. Configure a content switching action, and specify an expression that will dynamically compute the name of the target load balancing virtual server.

Configure content switching policies

A content switching policy defines a type of request that is to be directed to a load balancing virtual server. These policies are applied in the order of the priorities assigned to them.

The NetScaler compares incoming data to expressions specified in the policies. You create the policies by using a default syntax expression.

NOTE:

A rule-based policy can be configured with an optional action. A policy with an action can be bound to multiple virtual servers or policy labels.

If you set a priority when binding your policies to the content switching virtual server, the policies are evaluated in the order of priority. If you do not set specific priorities when binding your policies, the policies are evaluated in the order in which they were created.

Create a content switching policy by using the CLI

At the command prompt, type:

```
add cs policy <policyName> -rule <expression> [-action <string>] [-
logAction <string>]
```

Example:

```
add cs policy Policy-CS-1 -rule "CLIENT.IP.SRC.SUBNET(24).EQ(10.217.84.0)"

add cs policy Policy-CS-2 -rule "SYS.TIME.BETWEEN(GMT 2009 Nov,GMT 2009
Dec)"
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add cs policy Policy-CS-3 -rule "http.req.method.eq(GET)" -action act1
```

Rename a content switching policy by using the CLI

At the command prompt, type:

```
rename cs policy <policyName> <newName>
```

Example:

```
rename cs policy myCSPolicy myCSPolicy1
```

Rename a content switching policy by using the GUI

Navigate to **Traffic Management > Content Switching > Policies**, select a policy and, in the Action list, select **Rename**.

Create a content switching policy by using the GUI

1. Navigate to **Traffic Management > Content Switching > Policies**, and click **Add**.
2. Populate the relevant fields and click **Create**.

Configure content switching policy labels

A policy label is a user-defined bind point to which policies are bound. When a policy label is invoked, all the policies bound to it are evaluated in the order of the priority that you assigned to them. A policy label can include one or more policies, each of which can be assigned its own result. A match on one policy in the policy label can result in proceeding to the next policy, invoking a different policy label or appropriate resource, or an immediate end to policy evaluation and return of control to the policy that invoked the policy label. You can create policy labels for default syntax policies only.

A content switching policy label consists of a name, a label type, and a list of policies bound to the policy label. The policy label type specifies the protocol that was assigned to the policies bound to the label. It must match the service type of the content switching virtual server to which the policy that invokes the policy label is bound. For example, you can bind TCP Payload policies to a policy

© 1997–2026 Citrix Systems, Inc. All rights reserved.

label of type TCP only. Binding TCP Payload policies to a policy label of type HTTP is not supported.

Each policy in a content switching policy label is associated with either a target (which is equivalent to the action that is associated with other types of policies, such as rewrite and responder policies) or a gotoPriorityExpression option and an invoke option. That is, for a given policy in a content switching policy label, you can specify a target, or you can set the gotoPriorityExpression option and the invoke option. Also, if multiple policies evaluate to true, only the target of the last policy that evaluates to true is considered.

You can use either the Citrix® ADC CLI or the GUI to configure content switching policy labels. In the Citrix ADC CLI, you first create a policy label by using the add cs policy label command. Then, you bind policies to the policy label, one policy at a time, by using the bind cs policy label command. In the Citrix ADC GUI, you perform both tasks in a single dialog box.

Create a content switching policy label by using the CLI

At the command prompt, type:

```
add cs policylabel <labelName> <cspolicylabelTypetype>`
```

Example:

```
add cs policylabel testpollab http
```

Rename a content switching policy label by using the CLI

At the command prompt, type:

```
rename cs policylabel <labelName> <newName>`
```

Example:

```
rename cs policylabel oldPolicyLabelName newPolicyLabelName
```

Rename a content switching policy label by using the GUI

Navigate to **Traffic Management > Content Switching > Policy Labels**, select a policy label and, in the Action list, select **Rename**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Bind a policy to a content switching policy label by using the CLI

At the command prompt, type the following commands to bind a policy to a policy label and verify the configuration:

```
bind cs policylabel <labelName> <policyName> <priority>[-targetVserver
<string>] | [-gotoPriorityExpression <expression>] | [-invoke <labeltype>
<labelName>] ]

show cs policylabel <labelName>
```

Example:

```
bind cs policylabel testpollab test_Pol 100 -targetVserver LBVIP

show cs policylabel testpollab

        Label Name: testpollab

        Label Type: HTTP

        Number of bound policies: 1

        Number of times invoked: 0

        Policy Name: test_Pol

        Priority: 100

        Target Virtual Server: LBVIP
```

NOTE

If a policy is configured with an action, the target virtual server (targetVserver), go to priority expression (gotoPriorityExpression), and invoke (invoke) parameters are not required. If a policy is not configure with an action, you need to configure at least one of the following parameters: targetVserver, gotoPriorityExpression, and invoke.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Unbind a policy from a policy label by using the CLI

At the command prompt, type the following commands to unbind a policy from a policy label and verify the configuration:

```
unbind cs policylabel <labelName> <policyName>

show cs policylabel <labelName>
```

Example:

```
unbind cs policylabel testpollab test_Pol

show cs policylabel testpollab

        Label Name: testpollab

        Label Type: HTTP

        Number of bound policies: 0

        Number of times invoked: 0
```

Remove a policy label by using the CLI

At the command prompt, type:

```
rm cs policylabel <labelName>
```

Manage a content switching policy label by using the GUI

Navigate to **Traffic Management > Content Switching > Policy Labels**, configure a policy label, bind policies to the label, and optionally specify a priority, gotoPriority expression, and an invoke option.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Bind policies to a Content Switching virtual server

After you create your content switching virtual server and policies, you bind each policy to the content switching virtual server. When binding the policy to the content switching virtual server, you specify the target load balancing virtual server.

NOTE

If your content switching policy uses a default syntax rule, you can configure a content switching action for the policy. If you configure an action, you must specify the target load balancing virtual server when you are configuring the action, not when you are binding the policy to the content switching virtual server. For more information about configuring a content switching action, see Configuring a Content Switching Action section.

Bind a policy to a content switching virtual server and select a target load balancing virtual server by using the CLI

At the command prompt, type:

```
bind cs vserver <name>[-lbvserver<string> -targetLBVServer<string>
-policyname <string> -priority <positive_integer>] [-
gotoPriorityExpression <expression>] [-type ( REQUEST | RESPONSE )] [-
invoke (<labelType> <labelName>)]
```

Example:

```
bind cs vserver csw-vip2 -policyname csw-ape-policy2 -priority 14
-gotoPriorityExpression NEXT

bind cs vserver csw-vip3 -policyname rewrite-policy1 -priority 17
-gotoPriorityExpression

'q.header("a").count' -flowtype REQUEST -invoke policylabel label1

bind cs vserver Vserver-CS-1 Vserver-LB-1 -policyname Policy-CS-1
-priority 20
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE

The parameters, target load balancing virtual server (targetVserver), go to priority expression (gotoPriorityExpression), and the invoke method (invoke) cannot be used if a policy has an action.

Bind a policy to a content switching virtual server and select a target load balancing virtual server by using the GUI

Navigate to **Traffic Management > Content Switching > Virtual Servers**, open a virtual server and, in the **Content Switching Policy Binding** section, bind a policy to the virtual server, and specify a target load balancing virtual server.

Configure policy-based logging for content switching

You can configure policy-based logging for a content switching policy. Policy-based logging enables you to specify a format for the log messages. The contents of the log message are defined by using a default syntax expression in the content switching policy. When the content switching action specified in the policy is performed, the Citrix ADC appliance constructs the log message from the expression and writes the message to the log file. Policy-based logging is useful if you want to test and troubleshoot a configuration in which content switching actions identify the target load balancing virtual server at run time.

NOTE

If multiple policies bound to a given virtual server evaluate to TRUE and are configured with an audit message action, the Citrix ADC appliance does not perform all the audit message actions. It performs only the audit message action that is configured for the policy whose content switching action is performed.

To configure policy-based logging for a content switching policy, you must first configure an audit message action. For more information about configuring an audit message action, see Configuring the Citrix ADC appliance for audit logging. After you configure the audit message action, you specify the action in a content switching policy.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure policy-based logging for a content switching policy by using the CLI

At the command line, type the following commands to configure policy-based logging for a content switching policy and verify the configuration:

```
set cs policy <policyName> -logAction <string>

show cs policy <policyName>
```

Example:

```
> set cs policy cspol1 -logAction csLogAction

 Done

> show cs policy cspol1

    Policy: cspol1  Rule: TRUE  Action: csact1

    LogAction: csLogAction

    Hits: 0

1)  CS Vserver: csvs1

    Priority: 10

 Done

>
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure policy-based logging for a content switching policy by using the GUI

Navigate to **Traffic Management > Content Switching > Policies**, open a policy and, in the Log Action list, select a log action for the policy.

Verify the configuration

To verify that your content switching configuration is correct, you need to view the content switching entities. To verify proper operation after your content switching configuration has been deployed, you can view the statistics that are generated as the servers are accessed.

View the properties of content switching virtual servers

You can view the properties of content switching virtual servers that you have configured on the Citrix ADC appliance. You can use the information to verify whether the virtual server is correctly configured and, if necessary, to troubleshoot. In addition to details such as name, IP address, and port, you can view the various policies bound to a virtual server, and its traffic-management settings.

The content switching policies are displayed in the order of their priority. If more than one policy has the same priority, they are shown in the order in which they are bound to the virtual server.

NOTE

If you have configured the content switching virtual server to forward traffic to a load balancing virtual server, you can also view the content switching policies by viewing the properties of the load balancing virtual server.

View the properties of content switching virtual servers by using the CLI

To list basic properties of all content switching virtual servers in your configuration, or detailed properties of a specific content switching virtual server, at the command prompt, type one of the following commands:

```
show cs vserver

show cs vserver <name>
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Example

```
1.

show cs vserver Vserver-CS-1

Vserver-CS-1 (10.102.29.161:80) - HTTP Type: CONTENT

State: UP

Last state change was at Thu Jun 30 10:48:59 2011

Time since last state change: 6 days, 20:03:00.760

View content switching policies

You can view the properties of the content switching policies that you defined, such as the name, domain, and URL or expression, and use the information to find any mistakes in the configuration, or to troubleshoot if something is not working as it must.

View the properties of content switching policies by using the CLI

To view the content switching policies configuration details, type one of the following commands:

```
show cs policy

show cs policy <PolicyName>
```

Example:

```
show cs policy

show cs policy Policy-CS-1
```

View the properties of content switching policies by using the GUI

Navigate to **Traffic Management** > **Content Switching** > **Policies**, select a policy and, in the Action list, select **Show Bindings**.

View a content switching virtual server configuration by using the visualizer

The Content Switching Visualizer is a tool that you can use to view a content switching configuration in graphical format. You can use the visualizer to view the following configuration items:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- A summary of the load balancing virtual servers to which the content switching virtual server is bound.
- All services and service groups that are bound to the load balancing virtual server and all monitors that are bound to the services.
- The configuration details of any displayed element.
- Any policies bound to the content switching virtual server. These policies need not be content switching policies. Rewrite policies can also be bound to a content switching virtual server.

After you complete the content switching and load balancing configuration, you can export the entire configuration to an application template file.

NOTE

The Visualizer requires a graphical interface, so it is available only through the GUI.

View a content switching configuration by using the Visualizer in the GUI

1. Navigate to **Traffic Management > Content Switching > Virtual Servers**.
2. In the details pane, select the virtual server that you want to view, and then click **Visualizer**.
3. In the **Content Switching Visualizer** window, you can adjust the viewable area as follows:
   - Click the **Zoom In** and **Zoom Out** icons to increase or decrease the viewable area.
   - Click the **Save Image** icon to save the graph as an image file.
   - In the Search in text field, begin typing the name of the item you are looking for. When you have typed enough characters to identify the item, its location is highlighted. To restrict the search, click the drop-down menu and select the type of element that you want to search for.
4. To view configuration details for entities that are bound to this virtual server, you can do the following:
   - To view policies that are bound to the virtual server, in the tool bar at the top of the dialog box select one or more feature-specific policy icons. If policy labels are configured, they appear in the main view area.
   - To view the configuration details for a bound service or service group, click the icon for the service, click the Related Tasks tab, and then click Show Member Services.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- To view the configuration details for a monitor, click the icon for the monitor, click the **Related Tasks** tab, and then click **View Monitor**.

5. To view statistics for any virtual server in the content switching configuration, click the virtual server for which you want to view statistics, then click the **Related Tasks** tab, and then click **Statistics**.
6. To view a comparative list of the parameters whose values either differ or are not defined across service containers for a load balancing virtual server, click the icon for a container, click the **Related Tasks** tab, and then click **Service Attributes Diff**.
7. To view monitor binding details for the services in a container, in the Service Attributes Diff dialog box, in the Group column for the container, click **Details**. This comparative list helps you determine which service container has the configuration you want to apply to all the service containers.
8. To view the number of requests received per second at a given point in time by the virtual servers in the configuration, and the number of select per second at a given point in time for rewrite, responder, and cache policies, click Show Stats. The statistical information is displayed on the respective nodes in the Visualizer. This information is not updated in real time. It is refreshed manually. To refresh the information, click Refresh Stats.

   NOTE

   This option is available only on Citrix ADC nCore builds.

9. To copy configuration details for an element to a document or spreadsheet, click the icon for that element, click Related Tasks, click Copy Properties, and then paste the information into a document.
10. To export the entire configuration that is displayed in the Visualizer to an application template file, click the icon for the content switching virtual server, click Related Tasks, and then click Create Template. When creating the application template, you can configure variables in some policy expressions and actions. For more information, see AppExpert.

Customizing the basic content switching configuration

After you configure a basic content switching setup, you might need to customize it to meet your requirements. You can configure HTTP and SSL content switching virtual servers to listen on multiple ports instead of creating separate virtual servers. If you want to configure content

© 1997–2026 Citrix Systems, Inc. All rights reserved.

switching for a specific virtual LAN, you can configure a content switching virtual server with a listen policy.

Support for Multiple Ports for HTTP and SSL Type Content Switching Virtual Servers

You can configure the NetScaler so that HTTP and SSL content switching virtual servers listen on multiple ports, without having to configure separate virtual servers. This feature is especially useful if you want to base a content switching decision on a part of the URL and other L7 parameters. Instead of configuring multiple virtual servers with the same IP address and different ports, you can configure one IP address and specify the port as *. As a result, the configuration size is also reduced.

To configure an HTTP or SSL content switching virtual server to listen on multiple ports by using the command line

At the command prompt, type:

```
add cs vserver <name> <serviceType> <IPAddress> Port *
```

Example

```
> add cs vserver cs1 HTTP 10.102.92.215 *

 Done

> sh cs vserver cs1

        cs1 (10.102.92.215:*) - HTTP    Type: CONTENT

        State: UP

        Last state change was at Tue May 20 01:15:49 2014

        Time since last state change: 0 days, 00:00:03.270

        Client Idle Timeout: 180 sec

        Down state flush: ENABLED

        Disable Primary Vserver On Down : DISABLED

        Appflow logging: ENABLED
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
        Port Rewrite : DISABLED

        State Update: DISABLED

        Default:        Content Precedence: RULE

        Vserver IP and Port insertion: OFF

        L2Conn: OFF     Case Sensitivity: ON

        Authentication: OFF

        401 Based Authentication: OFF

        Push: DISABLED  Push VServer:

        Push Label Rule: none

        IcmpResponse: PASSIVE

        RHIstate:  PASSIVE

        TD: 0

 Done
```

To configure an HTTP or SSL content switching virtual server to listen on multiple ports by using the configuration utility

1. Navigate to **Traffic Management > Content Switching > Virtual Servers**, and create a virtual server of type HTTP or SSL.
2. Use an asterisk (*) to specify the port.

Configuring per-VLAN Wildcard Virtual Servers

If you want to configure content switching for traffic on a specific VLAN, you can create a wildcard virtual server with a listen policy that restricts it to processing traffic only on the specified VLAN.

To configure a wildcard virtual server that listens to a specific VLAN by using the command line interface

At the command prompt, type:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add cs vserver <name> <serviceType> IPAddress `* Port *` -listenpolicy
<expression> [-listenpriority <positive_integer>]
```

Example:

```
add cs vserver Vserver-CS-vlan1 ANY * *

-listenpolicy "CLIENT.VLAN.ID.EQ(2)"  -listenpriority 10
```

To configure a wildcard virtual server that listens to a specific VLAN by using the configuration utility

Navigate to **Traffic Management > Content Switching > Virtual Servers**, and configure a virtual server. Specify a listen policy that restricts it to processing traffic only on the specified VLAN.

After you have created this virtual server, you bind it to one or more services as described in Setup basic load balancing.

Configuring the Microsoft SQL Server Version Setting

You can specify the version of Microsoft SQL Server for a content switching virtual server that is of type MSSQL. The version setting is recommended if you expect some clients to not be running the same version as your Microsoft SQL Server product. The version setting provides compatibility between the client-side and server-side connections by ensuring that all communication conforms to the server's version.

To set the Microsoft SQL Server version parameter by using the command line interface

At the command prompt, type the following commands to set the Microsoft SQL Server version parameter for a content switching virtual server and verify the configuration:

- `set cs vserver <name> -mssqlServerVersion <mssqlServerVersion>`
- `show cs vserver <name>`

Example

```
> set cs vserver myMSSQLcsvip -mssqlServerVersion 2008R2 Done > show cs
vserver myMSSQLcsvip myMSSQLcsvip (192.0.2.13:1433) - MSSQL Type: CONTENT
State: UP . . . . . MSsql Server Version: 2008R2 . . . . . Done >
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To set the Microsoft SQL Server version parameter by using the configuration utility

1. Navigate to **Traffic Management > Content Switching > Virtual Servers**, configure a virtual server, and specify the protocol as MSSQL.
2. In **Advanced Settings**, specify the **Server Version**.

Enable external TCP health check for UDP virtual servers

In public clouds, you can use the NetScaler appliance as a second-tier load balancer when the native load balancer is used as a first tier. The native load balancer can be an application load balancer (ALB) or a network load balancer (NLB). Most of the public clouds do not support UDP health probes in their native load balancers. To monitor the health of the UDP application, public clouds recommend adding a TCP-based endpoint to your service. The endpoint reflects the health of the UDP application.

The NetScaler appliance supports the external TCP-based health check for a UDP virtual server. This feature introduces a TCP listener on the VIP of the content switching virtual server and the configured port. The TCP listener reflects the status of the virtual server.

To enable external TCP health check for UDP virtual servers by using CLI

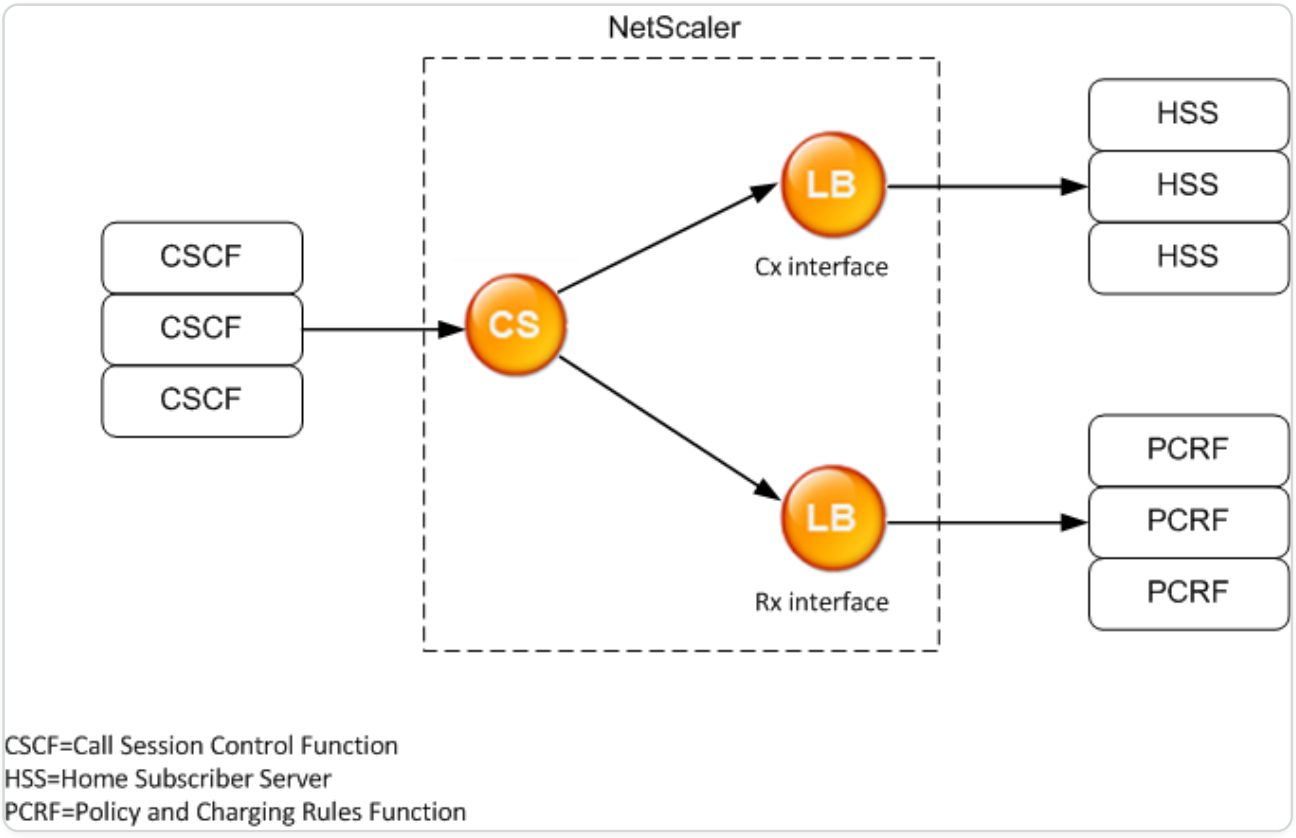
At the command prompt, type the following command to enable an external TCP health check with the tcpProbePort option:

```
add cs vserver <name> <protocol> <IPAddress> <port> -tcpProbePort
<tcpProbePort>
```

Example:

```
add cs vserver Vserver-CS-1 UDP 10.102.29.161 5002 -tcpProbePort 5000
```

To enable external TCP health check for UDP virtual servers by using GUI



1. Navigate to **Traffic Management > Content Switching > Virtual Servers**, and then create a virtual server.
2. Click **Add** to create a virtual server.
3. In the **Basic Settings** pane, add the port number in the **TCP Probe Port** field.
4. Click **OK**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Content Switching for Diameter Protocol

For Diameter-protocol traffic, you can configure the NetScaler appliance (or virtual appliance) to act as a relay agent that load balances and forwards a packet to the appropriate destination on the basis of the message content (AVP value in the message). Since the appliance does not perform any application-level processing, it provides relaying services for all diameter applications as specified by the configured content switching policies. Therefore, the appliance advertises the Relay Application ID in the capability exchange answer (CEA) message when the client establishes a diameter connection. You must configure a content switching virtual server, load balancing virtual servers, and services to represent the diameter nodes. When a request reaches the content switching virtual server, the virtual server applies the content switching policies associated with that type of request. After evaluating the policies, the content switching virtual server routes the request to the appropriate load balancing virtual server, which sends it to the appropriate service.

A diameter interface provides a connection between the different diameter nodes. The following sample deployment uses Cx and Rx interfaces. A Cx interface provides a connection between a CSCF and an HSS. An Rx interface provides a connection between a CSCF and a PCRF. All the messages reach the NetScaler appliance. Depending on whether the message is for a Cx or an Rx interface, and on the content switching policies defined, the NetScaler selects an appropriate load balancing server pool.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Sample Configuration

1. For each entity, create a service, a load balancing server, and bind the service to the virtual server.

```
add service svc_pcrf[1-3] 1.1.1.1[1-3] DIAMETER 3868

add service svc_hss[1-3] 1.1.1.2[1-3] DIAMETER 3868

add lb vserver vs_rx DIAMETER -persistenceType DIAMETER –persistavpno
263

add lb vserver vs_cx DIAMETER -persistenceType DIAMETER –persistavpno
263

bind lb vserver vs_rx svc_pcrf[1-3]

bind lb vserver vs_cx svc_hss[1-3]
```

2. Create a content switching virtual server and two actions (one for each load balancing virtual server). Create two content switching policies and bind these policies to the content switching virtual server, specifying a priority for each policy.

```
add cs vserver cs_diameter DIAMETER 10.1.1.10 3868

add cs action cx_action -targetLBVserver vs_cx

add cs action rx_action –targetLBvserver vs_rx

add cs policy cx_policy -rule
"DIAMETER.REQ.AUTH_APPLICATION_ID.EQ(16777216)" -action cx_action

add cs policy rx_policy -rule
"DIAMETER.REQ.AUTH_APPLICATION_ID.EQ(16777236)" -action rx_action

bind cs vserver cs_diameter -policyName rx_policy -priority 100

bind cs vserver cs_diameter -policyName cx_policy -priority 110
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Protecting the Content Switching Setup against Failure

Content switching may fail when the content switching virtual server goes DOWN or fails to handle excessive traffic, or for other reasons. To reduce the chances of failure, you can take the following measures to protect the content switching setup against failure:

Configuring a Backup Virtual Server

If the primary content switching virtual server is marked DOWN or DISABLED, the Citrix® ADC appliance can direct requests to a backup content switching virtual server. It can also send a notification message to the client regarding the site outage or maintenance. The backup content switching virtual server is a proxy and is transparent to the client.

When configuring the backup virtual server, you can specify the configuration parameter Disable Primary When Down to ensure that, when the primary virtual server comes back up, it remains the secondary until you manually force it to take over as the primary. This is useful if you want to ensure that any updates to the database on the server for the backup are preserved, enabling you to synchronize the databases before restoring the primary virtual server.

You can configure a backup content switching virtual server when you create a content switching virtual server or when you change the optional parameters of an existing content switching virtual server. You can also configure a backup content switching virtual server for an existing backup content switching virtual server, thus creating cascaded backup content switching virtual servers. The maximum depth of cascaded backup content switching virtual servers is 10. The appliance searches for a backup content switching virtual server that is up and accesses that content switching virtual server to deliver the content.

NOTE

If a content switching virtual server is configured with both a backup content switching virtual server and a redirect URL, the backup content switching virtual server takes precedence over the redirect URL. The redirect is used when the primary and backup virtual servers are down.

To set up a backup content switching virtual server by using the command line interface

At the command prompt, type:

```
set cs vserver <name> -backupVserver <string> -disablePrimaryOnDown (ON|
OFF)
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Example

```
set cs vserver Vserver-CS-1 -backupVserver Vserver-CS-2
-disablePrimaryOnDown ON
```

To set up a backup content switching virtual server by using the configuration utility

1. Navigate to **Traffic Management > Content Switching > Virtual Servers**, configure a virtual server and specify the protocol as MYSQL.
2. In **Advanced Settings**, select **Protection**, and specify a **Backup Virtual Server**.

Diverting Excess Traffic to a Backup Virtual Server

The spillover option diverts new connections arriving at a content switching virtual server to a backup content switching virtual server when the number of connections to the content switching virtual server exceeds the configured threshold value. The threshold value is dynamically calculated, or you can set the value. The number of established connections (in case of TCP) at the virtual server is compared with the threshold value. When the number of connections reaches the threshold, new connections are diverted to the backup content switching virtual server.

If the backup content switching virtual servers reach the configured threshold and are unable to take the load, the primary content switching virtual server diverts all requests to the redirect URL. If a redirect URL is not configured on the primary content switching virtual server, subsequent requests are dropped.

To configure a content switching virtual server to divert new connections to a backup virtual server by using the command line interface

At the command prompt, type:

```
set cs vserver <name> -soMethod <methodType> -soThreshold <thresholdValue>
-soPersistence <persistenceValue> -soPersistenceTimeout <timeoutValue>
```

Example

```
set cs vserver Vserver-CS-1 -soMethod Connection -soThreshold 1000
-soPersistence enabled -soPersistenceTimeout 2
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To set a content switching virtual server to divert new connections to a backup virtual server by using the configuration utility

1. Navigate to **Traffic Management > Content Switching > Virtual Servers**, configure a virtual server and specify the protocol as MYSQL.
2. In **Advanced Settings**, select **Protection**, and configure spillover.

Configuring a Redirection URL

You can configure a redirect URL to communicate the status of the Citrix ADC appliance if a content switching virtual server of type HTTP or HTTPS is DOWN or DISABLED. This URL can be local or remote.

Redirect URLs can be absolute URLs or relative URLs. If the configured redirect URL contains an absolute URL, the HTTP redirect is sent to the configured location, regardless of the URL specified in the incoming HTTP request. If the configured redirect URL contains only the domain name (relative URL), the HTTP redirect is sent to a location after appending the incoming URL to the domain configured in the redirect URL.

Citrix recommends using an absolute URL. That is, a URL ending in /, for example `www.example.com/` instead of a relative URL. A relative URL redirection might result in the vulnerability scanner reporting a false positive.

NOTE

If a content switching virtual server is configured with both a backup virtual server and a redirect URL, the backup virtual server takes precedence over the redirect URL. A redirect URL is used when the primary and backup virtual servers are down.

When redirection is configured and the content switching virtual server is unavailable, the appliance issues an HTTP 302 redirect to the user's browser.

To configure a redirect URL for when the content switching virtual server is unavailable by using the command line interface

At the command prompt, type:

```
set cs vserver <name> -redirectURL <URLValue>
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Example

```
set cs vserver Vserver-CS-1 -redirectURL http://www.newdomain.com/mysite/
maintenance
```

To configure a redirect URL for when the content switching virtual server is unavailable by using the configuration utility

1. Navigate to **Traffic Management > Content Switching > Virtual Servers**, configure a virtual server and specify the protocol as MYSQL.
2. In **Advanced Settings**, select **Protection**, and specify a Redirect URL.

Configuring the State Update Option

The content switching feature enables the distribution of client requests across multiple servers based on the specific content presented to the users. For efficient content switching, the content switching virtual server distributes the traffic to the load balancing virtual servers according to the content type, and the load balancing virtual servers distribute the traffic to the physical servers according to the specified load balancing method.

For smooth traffic management, it is important for the content switching virtual server to know the status of the load balancing virtual servers. The state update option helps to mark the content switching virtual server DOWN if the load balancing virtual server bound to it is marked DOWN. A load balancing virtual server is marked DOWN if all the physical servers bound to it are marked DOWN.

When State Update is disabled:

The status of the content switching virtual server is marked as UP. It remains UP even if there is no bound load balancing virtual server that is UP.

When State Update is enabled:

When you add a new content switching virtual server, initially, its status is shown as DOWN. When you bind a load balancing virtual server whose status is UP, the status of the content switching virtual server becomes UP.

If more than one load balancing virtual server is bound and if one of them is specified as the default, the status of the content switching virtual server reflects the status of the default load balancing virtual server.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

If more than one load balancing virtual server is bound without any of them being specified as the default, the status of the content switching virtual server is marked UP only if all the bound load balancing virtual servers are UP.

To configure the state update option by using the command line interface

At the command prompt, type:

```
add cs vserver <name> <protocol> <ipAddress> <port> -stateUpdate ENABLED
```

Example

```
add cs vserver csw_vserver HTTP 10.18.250.154 80 -stateupdate ENABLED
-cltTimeout 180
```

To configure the state update option by using the configuration utility

1. Navigate to **Traffic Management > Content Switching > Virtual Servers**, configure a virtual server, and specify the protocol as MYSQL.
2. In **Advanced Settings**, select **Traffic Settings**, and then select **State Update**.

Flushing the Surge Queue

When a physical server receives a surge of requests, it becomes slow to respond to the clients that are currently connected to it, which leaves users dissatisfied and disgruntled. Often, the overload also causes clients to receive error pages. To avoid such overloads, the Citrix ADC appliance provides features such as surge protection, which controls the rate at which new connections to a service can be established.

The appliance does connection multiplexing between clients and physical servers. When it receives a client request to access a service on a server, the appliance looks for an already established connection to the server that is free. If it finds a free connection, it uses that connection to establish a virtual link between the client and the server. If it does not find an existing free connection, the appliance establishes a new connection with the server, and establishes a virtual link between the client and the server. However, if the appliance cannot establish a new connection with the server, it sends the client request to a surge queue. If all the physical servers bound to the load balancing or content switching virtual server reach the upper limit on client connections (max client value, surge protection threshold or maximum capacity of the service), the appliance cannot establish a connection with any server. The surge protection feature uses the surge queue to

© 1997–2026 Citrix Systems, Inc. All rights reserved.

regulate the speed at which connections are opened with the physical servers. The appliance maintains a different surge queue for each service bound to the virtual server.

The length of a surge queue increases whenever a request comes for which the appliance cannot establish a connection, and the length decreases whenever a request in the queue gets sent to the server or a request gets timed out and is removed from the queue.

If the surge queue for a service or service group becomes too long, you may want to flush it. You can flush the surge queue of a specific service or service group, or of all the services and service groups bound to a load balancing virtual server. Flushing a surge queue does not affect the existing connections. Only the requests present in the surge queue get deleted. For those requests, the client has to make a fresh request.

You can also flush the surge queue of a content switching virtual server. If a content switching virtual server forwards some requests to a particular load balancing virtual server, and the load balancing virtual server also receives some other requests, when you flush the surge queue of the content switching virtual server, only the requests received from this content switching virtual server are flushed. The other requests in the surge queue of the load balancing virtual server are not flushed.

NOTE

You cannot flush the surge queues of cache redirection, authentication, VPN, or GSLB virtual servers or GSLB services. Do not use the Surge Protection feature if Use Source IP (USIP) is enabled.

To flush a surge queue by using the command line interface

The flush ns surgeQ command works in the following manner:

- You can specify the name of a service, service group, or virtual server whose surge queue has to be flushed.
- If you specify a name while running the command, the surge queue of the specified entity will be flushed. If more than one entity has the same name, the appliance flushes surge queues of all those entities.
- If you specify the name of a service group, and a server name and port while running the command, the appliance flushes the surge queue of only the specified service group member.
- You cannot directly specify a service group member (`<serverName>` and `<port` >) without specifying the name of the service group (`<name>`) and you cannot specify `<port>` without

© 1997–2026 Citrix Systems, Inc. All rights reserved.

a `<serverName>`. Specify the `<serverName>` and `<port>` if you want to flush the surge queue for a specific service group member.

- If you run the command without specifying any names, the appliance flushes the surge queues of all the entities present on the appliance.
- If a service group member is identified with a server name, you must specify the server name in this command; you cannot specify its IP address.

At the command prompt, type:

```
flush ns surgeQ [-name <name>] [-serverName <serverName> <port>].
```

Examples

```
1. flush ns surgeQ –name SVC1ANZGB –serverName 10.10.10.1 80

The above command flushes the surge queue of the service or virtual server
that is named SVC1ANZGB and has IP address as 10.10.10

2. flush ns surgeQ

The above command flushes all the surge queues on the appliance.
```

To flush a surge queue by using the configuration utility

Navigate to **Traffic Management > Content Switching > Virtual Servers**, select a virtual server and, in the Action list, select **Flush Surge Queue**.

Managing a content switching setup

After a content switching setup is configured, it might require periodic changes. When operating systems or software is updated, or hardware wears out and is replaced, you might need to take down your setup. Load on your setup might increase, requiring more resources. You might also modify the configuration to improve performance.

These tasks might require unbinding policies from the content switching virtual server, or disabling or removing content switching virtual servers. After you have changed your setup, you might need to re-enable servers and rebind policies. You might also want to rename your virtual servers.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Unbinding policies from the content switching virtual server

When you unbind a content switching policy from its virtual server, the virtual server no longer includes that policy when determining where to direct requests.

To unbind a policy from a content switching virtual server by using the CLI

At the command prompt, type:

```
unbind cs vserver <name> -policyname <string>
```

Example:

```
unbind cs vserver Vserver-CS-1 -policyname Policy-CS-1
```

To unbind a policy from a content switching virtual server by using the GUI

1. Navigate to **Traffic Management > Content Switching > Virtual Servers**, and open the virtual server.
2. Click **Policies** section, select the policy, and click **Unbind**.

Removing Content Switching Virtual Servers

You normally remove a content switching virtual server only when you no longer require the virtual server. When you remove a content switching virtual server, the NetScaler appliance first unbinds all policies from the content switching virtual server, and then removes it.

To remove a content switching virtual server by using the CLI

At the command prompt, type:

```
rm cs vserver <name>
```

Example:

```
rm cs vserver Vserver-CS-1
```

To remove a content switching virtual server by using the GUI

Navigate to **Traffic Management > Content Switching > Virtual Servers**, select a virtual server, and click **Delete**.

Disabling and Re-Enabling Content Switching Virtual Servers

Content switching virtual servers are enabled by default when you create them. You can disable a content switching virtual server for maintenance. If you disable the content switching virtual server,

© 1997–2026 Citrix Systems, Inc. All rights reserved.

the state of the content switching virtual server changes to Out of Service. While out of service, the content switching virtual server does not respond to requests.

To disable or re-enable a virtual server by using the CLI

At the command prompt, type one of the following commands:

- `disable cs vserver <name>`
- `enable cs vserver <name>`

Example:

`disable cs vserver Vserver-CS-1` `enable cs vserver Vserver-CS-1`

To disable or re-enable a virtual server by using the GUI

Navigate to **Traffic Management > Content Switching > Virtual Servers**, select a virtual server and, in the **Action** list, select **Enable** or **Disable**.

Renaming Content Switching Virtual Servers

You can rename a content switching virtual server without unbinding it. The new name is propagated automatically to all affected parts of the NetScaler configuration.

To rename a virtual server by using the CLI

At the command prompt, type:

`rename cs vserver <name> <newName>`

Example:

```
`rename cs vserver Vserver-CS-1 Vserver-CS-2`
```

To rename a virtual server by using the GUI

Navigate to **Traffic Management > Content Switching > Virtual Servers**, select a virtual server and, in the **Action** list, select **Rename**.

Managing content switching policies

You can modify an existing policy by configuring the rules or changing the URL of the policy, or you can remove a policy. You can also rename an existing advanced content switching policy. You can

© 1997–2026 Citrix Systems, Inc. All rights reserved.

create different policies based on the URL. URL-based policies can be of different types, as described in the following table.

For more information, see Examples of URL-Based Policies.

NOTE

You can configure rule-based content switching using classical policy expressions or advanced policy expressions.

To modify, remove, or rename a policy by using the CLI

At the command prompt, type one of the following commands:

- `set cs policy <policyName> [-rule <expression>] [-action <string>] [-logAction <string>]`
- `rm cs policy <policyName>`
- `rename cs policy <policyName> <newPolicyName>`

Example:

```
set cs policy pol-CS-1 -rule "CLIENT.IP.SRC.SUBNET(22).EQ(10.100.148.0)"

set cs policy pol-CS-2 -rule "SYS.TIME.BETWEEN(GMT 2010 Jun,GMT 2010 Jul)"

set cs policy pol-CS-1 -rule http.req.url.startswith ("/sports/")

rename cs pol-CS-1 Pol-CS-11

rm cs pol-CS-1
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To modify, remove, or rename a policy by using the GUI

1. Navigate to **Traffic Management > Content Switching > Policies**.
2. Select the policy, and either delete it, edit it or, in the **Action** list, click **Rename**.

Managing client connections

To ensure efficient management of client connections, you can configure the content switching virtual servers on the NetScaler appliance to use the following features:

- **Configuring the ICMP Response.** You can configure the NetScaler appliance to send ICMP responses to PING requests according to your settings. On the IP address corresponding to the virtual server, set the ICMP RESPONSE to VSVR_CNTRLD, and on the virtual server, set the ICMP virtual server RESPONSE. The following settings can be made on a virtual server:
  - When you set ICMP virtual server RESPONSE to PASSIVE on all virtual servers, the NetScaler appliance always responds.
  - When you set ICMP virtual server RESPONSE to ACTIVE on all virtual servers, the ADC appliance responds even if one virtual server is UP.
  - When you set ICMP virtual server RESPONSE to ACTIVE on some and PASSIVE on others, the ADC appliance responds even if one virtual server set to ACTIVE is UP.

Redirecting Client Requests to a Cache

The NetScaler cache redirection feature redirects HTTP requests to a cache. You can significantly reduce the burden of responding to HTTP requests and improve your website performance through proper implementation of the cache redirection feature.

A cache stores frequently requested HTTP content. When you configure cache redirection on a virtual server, the NetScaler appliance sends cacheable HTTP requests to the cache and non-cacheable HTTP requests to the origin Web server. For more information on cache redirection, see "Cache Redirection.

To configure cache redirection on a virtual server by using the CLI

At the command prompt, type:

```
set cs vserver <name> -cacheable <Value>
```

Example

```
set cs vserver Vserver-CS-1 -cacheable yes
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To configure cache redirection on a virtual server by using the GUI

1. Navigate to **Traffic Management > Content Switching > Virtual Servers**, and open a virtual server.
2. In **Advanced Settings**, select **Traffic Settings**, and select **Cacheable**.

Enabling Delayed Cleanup of Virtual Server Connections

Under certain conditions, you can configure the down state flush setting to terminate existing connections when a service or a virtual server is marked DOWN. Terminating existing connections frees resources and in certain cases speeds recovery of overloaded load balancing setups.

To configure the down state flush setting on a virtual server by using the CLI

At the command prompt, type:

```
set cs vserver <name> -downStateFlush <Value>
```

Example

```
set cs vserver Vserver-CS-1 -downStateFlush enabled
```

To configure the down state flush setting on a virtual server by using the GUI

1. Navigate to **Traffic Management > Content Switching > Virtual Servers**, and open a virtual server.
2. In **Advanced Settings**, select **Traffic Settings**, and then select **Down State Flush**.

Rewriting Ports and Protocols for Redirection

Virtual servers and the services that are bound to them might use different ports. When a service responds to an HTTP connection with a redirect, you might need to configure the NetScaler appliance to modify the port and the protocol to ensure that the redirection goes through successfully. You do it by enabling and configuring the redirectPortRewrite setting.

To configure HTTP redirection on a virtual server by using the CLI

At the command prompt, type:

```
set cs vserver <name> -redirectPortRewrite <Value>
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Example

```
set cs vserver Vserver-CS-1 -redirectPortRewrite enabled
```

To configure HTTP redirection on a virtual server by using the GUI

1. Navigate to **Traffic Management > Content Switching > Virtual Servers**, and open a virtual server.
2. In **Advanced Settings**, select **Traffic Settings**, and select **Rewrite**.

Inserting the IP Address and Port of a Virtual Server in the Request Header

If you have multiple virtual servers that communicate with different applications on the same service, you must configure the NetScaler appliance to add the IP address and port number of the appropriate virtual server to the HTTP requests that are sent to that service. This setting allows applications running on the service to identify the virtual server that sent the request.

If the primary virtual server is down and the backup virtual server is up, the configuration settings of the backup virtual server are added to the client requests. If you want the same header tag to be added, regardless of whether the requests are from the primary virtual server or backup virtual server, you must configure the required header tag on both virtual servers.

NOTE

This option is not supported for wildcard virtual servers or dummy virtual servers.

To insert the IP address and port of the virtual server in the client requests by using the CLI

At the command prompt, type:

```
set cs vserver <name> -insertVserverIPPort <vServerIPPORT>
```

Example

```
set cs vserver Vserver-CS-1 -insertVserverIPPort 10.201.25.136:80
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To insert the IP address and port of the virtual server in the client requests by using the GUI

1. Navigate to **Traffic Management > Content Switching > Virtual Servers**, and open a virtual server.
2. In **Advanced Settings**, select **Traffic Settings** and, in the Virtual Server IP Port Insertion list, select VIPADDR or V6TOV4MAPPING, and specify a port header in the virtual server IP Port Insertion Value.

Setting a Time-out Value for Idle Client Connections

You can configure a virtual server to terminate any idle client connections after a configured time-out period elapses. When you configure this setting, the NetScaler appliance waits for the time you specify and, if the client is idle after that time, it closes the client connection.

To set a time-out value for idle client connections by using the CLI

At the command prompt, type:

```
set cs vserver <name> -cltTimeout <Value>
```

Example

```
set cs vserver Vserver-CS-1 -cltTimeout 100
```

To set a time-out value for idle client connections by using the GUI

1. Navigate to **Traffic Management > Content Switching > Virtual Servers**, and open a virtual server.
2. In **Advanced Settings**, select **Traffic Settings**, and specify a **Client Idle Time-Out** value.

Identifying Connections with the 4-tuple and Layer 2 Connection Parameters

You can now set the L2Conn option for a content switching virtual server. With the L2Conn option set, connections to the content switching virtual server are identified by the combination of the 4-tuple (`<source IP>:<source port>::<destination IP>:<destination port>`) and Layer 2 connection parameters. The Layer 2 connection parameters are the MAC address, VLAN ID, and channel ID.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To set the L2Conn option for a content switching virtual server by using the CLI

At the command line, type the following commands to configure the L2Conn parameter for a content switching virtual server and verify the configuration:

```
-  set cs vserver <name> -l2Conn (**ON** | **OFF**)

-  show cs vserver <name>
```

Example

```
> set cs vserver mycsvserver -l2Conn ON

Done

> show cs vserver mycsvserver

     mycsvserver (192.0.2.56:80) - HTTP   Type: CONTENT

     State: UP

         . . .

         . . .

     L2Conn: ON Case Sensitivity: ON

         . . .

         . . .

Done

>
```

To set the L2Conn option for a content switching virtual server by using the GUI

1. Navigate to **Traffic Management > Content Switching > Virtual Servers**, and open a virtual server.
2. In **Advanced Settings**, select **Traffic Settings**, and then select **Layer 2 Parameters**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Persistence support for content switching virtual server

Applications are moving from monolithic architectures toward microservices architecture. Different versions of the same application can co-exist in the microservices architecture. NetScaler appliance must support continuous deployment of applications. It is achieved by platforms that perform Canary deployments (such as Spinnaker). In a continuous deployment setup, a newer version of an application is deployed automatically and exposed to client traffic in stages until the application is stable to take complete traffic. Also, there must be uninterrupted services to the client.

The NetScaler content switching feature enables NetScaler the appliance to distribute client requests across multiple load balancing virtual servers based on the policies bound to the content switching virtual server.

For continuous deployments, content switching is used to select the load balancing virtual server serving various versions of an application.

In content switching, the selection of a load balancing virtual server for a specific application version changes at runtime because of the change in the content switching policies. During this transition, if some sessions are present with older versions of the application, such traffic must continue to be served by older versions only. To support the requirement, the NetScaler appliance maintains persistence across multiple load balancing groups behind a content switching virtual server. Persistence for content switching virtual server enables seamless transition of clients from one version to another.

Supported persistence types on content switching virtual server

The following persistence types are supported on content switching virtual servers.

PERSISTENCE TYPE	DESCRIPTION
Source IP	**SOURCEIP**. Connections from the same client IP address are parts of the same persistence session. For more details, see Source IP address persistence.
HTTP Cookie	**COOKIEINSERT**. Connections that have the same HTTP Cookie header are parts of the same persistence session. The format of the cookie that the NetScaler appliance inserts is: **NSC_<vid_str of CSvserver>=<vid_str of Lbvserver>** where NSC_XXXX is the virtual

© 1997–2026 Citrix Systems, Inc. All rights reserved.

PERSISTENCE TYPE	DESCRIPTION
	server ID that is derived from the virtual server name. For more details, see HTTP cookie persistence.
SSL Session ID	**SSLSESSION**. Connections that have the same SSL Session ID are parts of the same persistence session. For more details, see SSL session ID persistence.

You can configure a timeout value for persistence that is based on HTTP cookies. If you set the timeout value to 0, the ADC appliance does not specify the expiration time, regardless of the HTTP cookie version used. The expiration time then depends on the client software, and such cookies are valid only if the software is running.

Depending on the type of persistence that you have configured, the virtual server can support either 250,000 simultaneous persistent connections or any number of persistent connections up to the limits imposed by the amount of memory on your NetScaler appliance. The following table shows which types of persistence fall into each category.

PERSISTENCE TYPE	NUMBER OF SIMULTANEOUS PERSISTENT CONNECTIONS SUPPORTED
Source IP, SSL Session ID	250,000
HTTP Cookie	Memory limit. In CookieInsert, if the timeout is not 0, the number of connections is limited by memory.

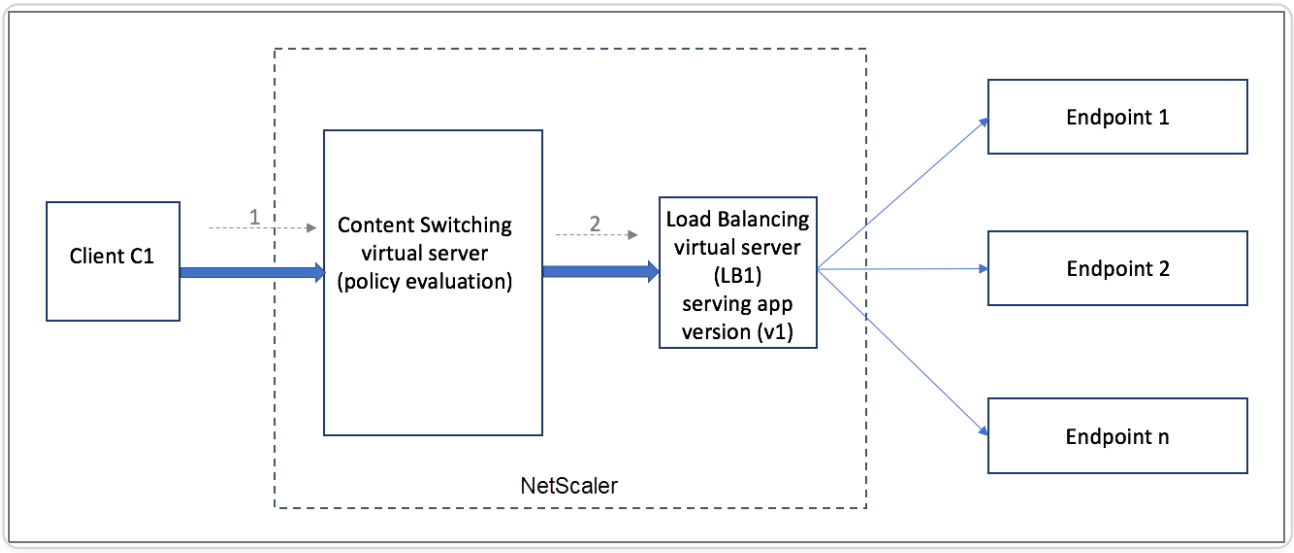
Some types of persistence are specific to particular types of virtual server. The following table lists each type of persistence and indicates which types of persistence are supported on which types of virtual server.

PERSISTENCE TYPE	HTTP	HTTPS	TCP	UDP/IP	SSL_BRIDGE	SSL_TCP	RTSP	SIP_UDP
SOURCEIP	Yes	Yes	Yes	Yes	Yes	Yes	No	No

© 1997–2026 Citrix Systems, Inc. All rights reserved.

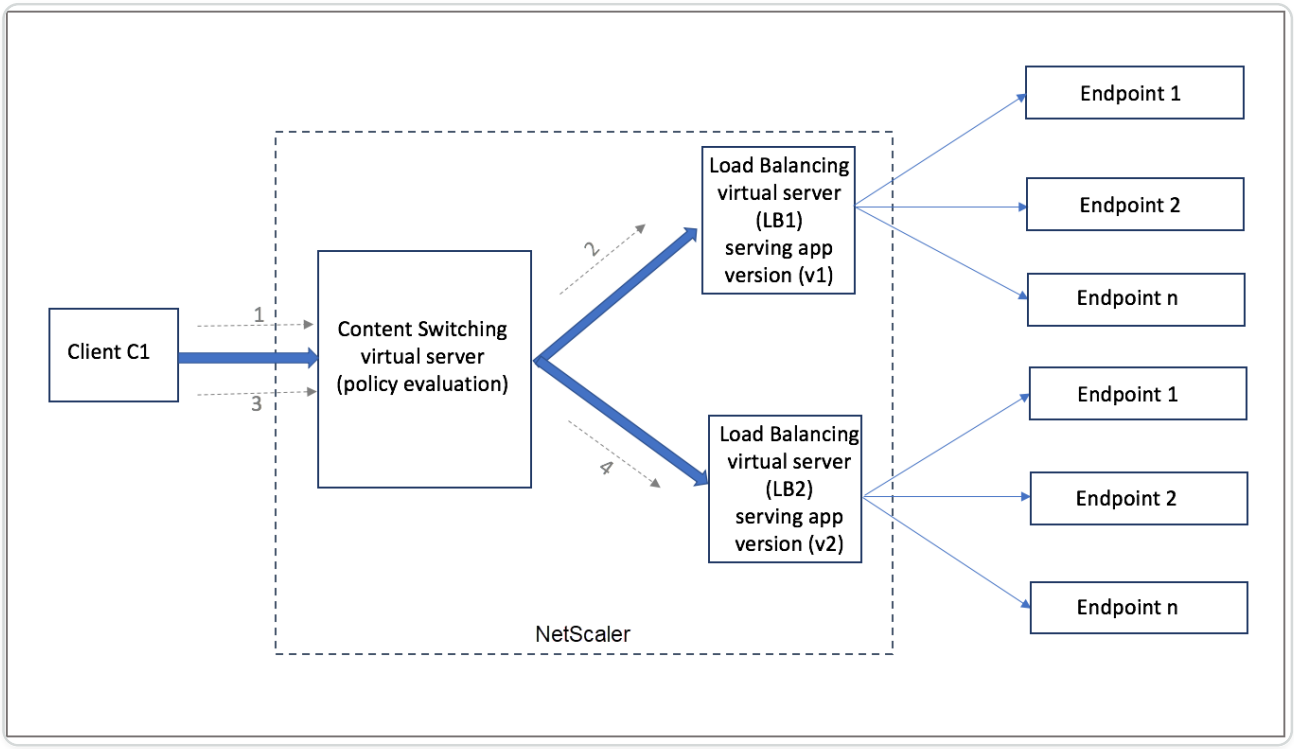
PERSISTENCE TYPE	HTTP	HTTPS	TCP	UDP/IP	SSL_BRIDGE	SSL_TCP	RTSP	SIP_UDP
COOKIEINSERT	Yes	Yes	No	No	No	No	No	No
SSLSESSION	No	Yes	No	No	Yes	Yes	No	No

Backup persistence support



You can configure the content switching virtual server to use the source IP persistence type as the backup persistence type when the cookie persistence type fails. It is useful for canary deployments in the microservices architecture. When the cookie persistence type fails, the appliance falls back to source IP based persistence only when the client browser does not return any cookie in the request. However, if the browser returns a cookie (not necessarily the persistence cookie) it is assumed that the browser supports cookies and hence backup persistence is not triggered. You can also set a timeout value for backup persistence. Timeout is the time period for which a persistence session is in effect.

How persistence on content switching virtual server works

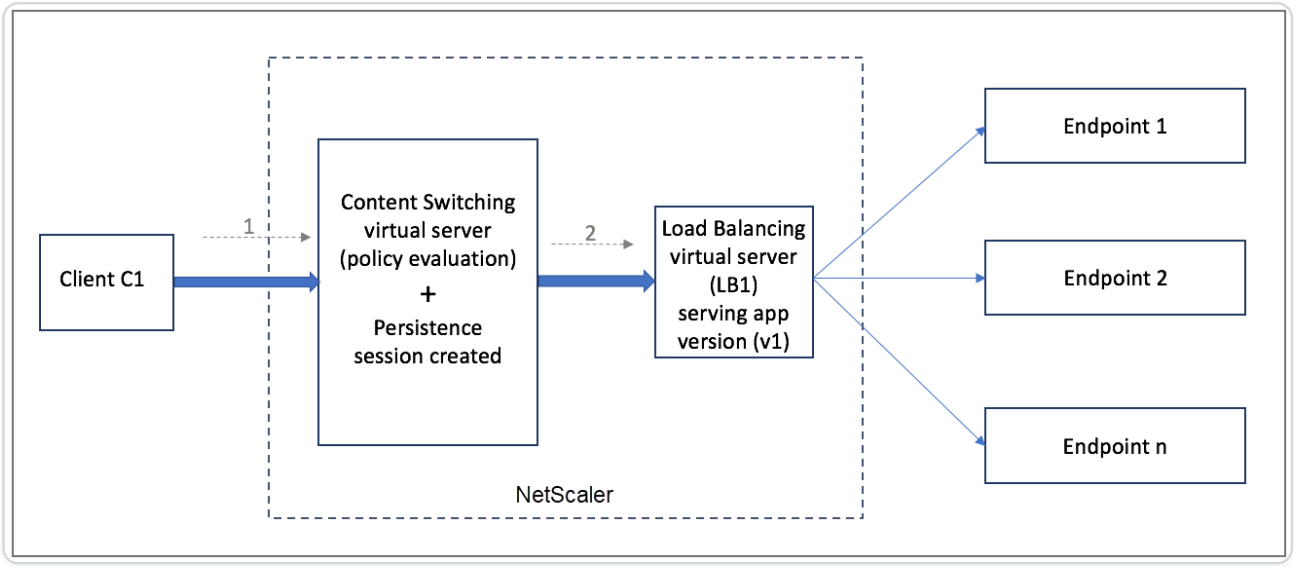


Scenario 1: A content switching virtual server without persistence

The following example illustrates the deployment of multiple versions of an application with a content switching virtual server without persistence.

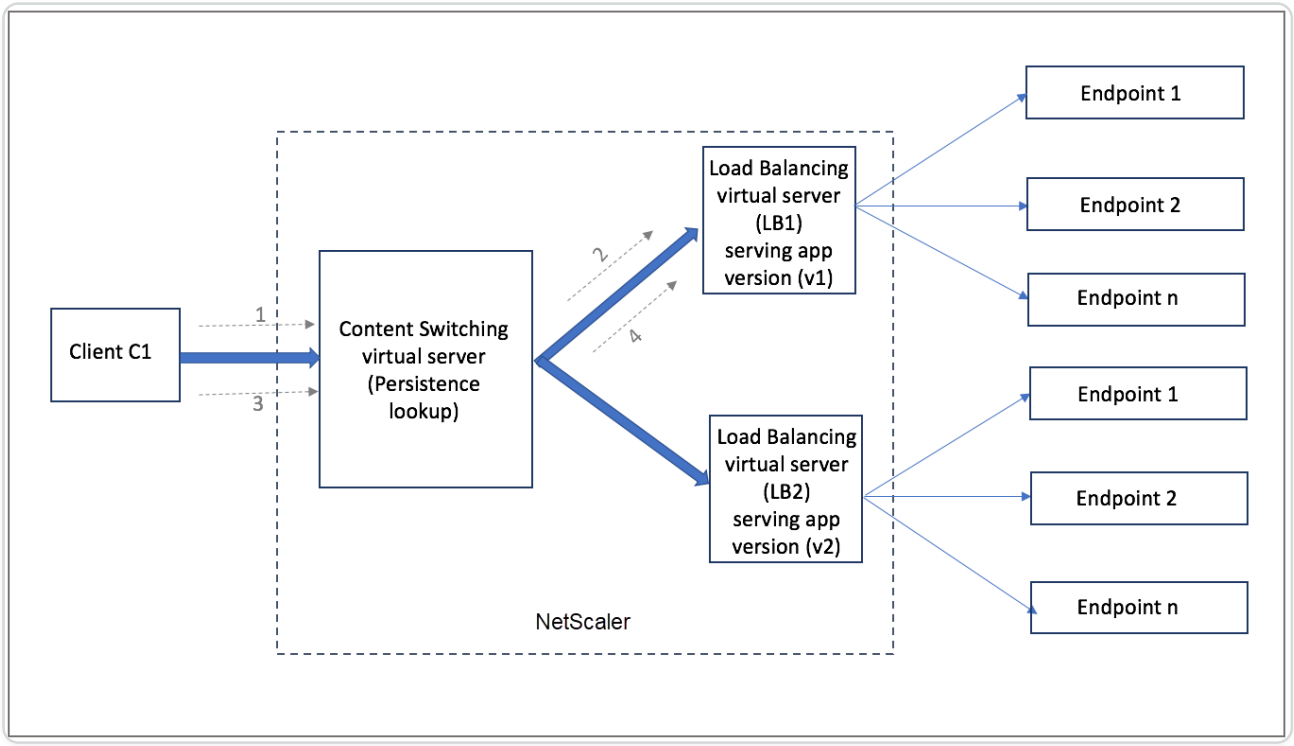
© 1997–2026 Citrix Systems, Inc. All rights reserved.

When client C1 sends a request to the application, the request is sent to the content switching virtual server in the NetScaler appliance. The content switching virtual server evaluates the policy and forwards the request to the load balancing virtual server (LB1) that is serving version v1 of the application.



Consider a new version v2 of the application is deployed and has to be exposed to a subset of users. The new load balancing virtual server (LB2) serving the v2 version is bound to the content switching virtual server by the appropriate content switching policy.

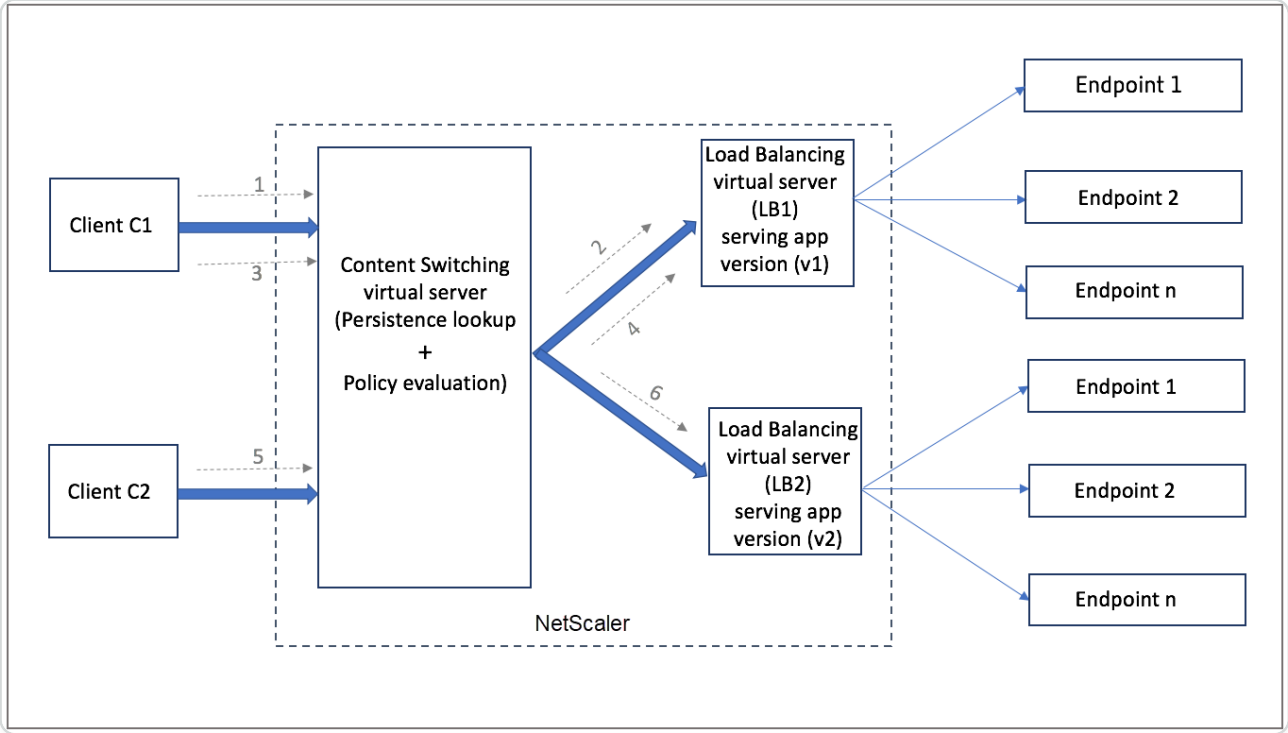
When client C1 sends a new request, the policy is evaluated again and the request is forwarded to the load balancing virtual server LB2. Thus, the transactions for stateful applications fail if multiple versions of the application are deployed.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

Scenario 2: Content switching virtual server with persistence

The following example illustrates the deployment of multiple versions of the application with a content switching virtual server with persistence.



When client C1 sends a request to the application, the request is sent to the content switching virtual server in the NetScaler appliance. The content switching virtual server evaluates the policy, creates a persistence session entry, and forwards the request to the load balancing virtual server LB1 that is serving version v1 of the application.

The same client C1 requests again for the application, and the request is sent to the content switching virtual server in the NetScaler appliance. A lookup for the persistence session is performed. Since an existing entry is found, the load balancing virtual server LB1 is selected from the existing persistence session, and the request is forwarded to LB1. Therefore, CS policy

© 1997–2026 Citrix Systems, Inc. All rights reserved.

evaluation is not performed in this scenario.No breakage of the existing transaction happens with this solution; thus, maintaining the stateful nature of the application.

Let's consider a new client C2. The new request C2 is sent to the newer version of the application through policy evaluation as there is no existing persistence session for this client. It results in a successful rollout of the newer version of the application without breaking its statefulness.

Because of the persistence support, customers can deploy multiple content or different versions of the application seamlessly without impacting the existing transactions, specifically for stateful applications. It is not possible without persistence in the picture.

Configure persistence type on content switching virtual server by using the CLI

At the command prompt, type:

```
set cs vserver <name> -PersistenceType <type> [-timeout <integer>]
```

Example:

```
set cs vserver Vserver-CS-1 -persistenceType SOURCEIP -timeout 60
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure persistence type on content switching virtual server by using the GUI

1. Navigate to **Traffic Management** > **Content Switching** > **Virtual Servers** and click **Add**.
2. In **Basic Settings**, configure the persistence details.

Troubleshooting

If the content switching feature does not work as expected after you have configured it, you can use some common tools to access NetScaler resources and diagnose the problem.

Resources for troubleshooting content switching

For best results, use the following resources to troubleshoot a content switching issue on a NetScaler appliance:

- Configuration file
- `newnslog` file generated when the issue occurred
- Trace files
- Network topology diagram for the network setup of the customer
- NetScaler® documentation, such as release notes, Knowledge Center articles, and Product documentation.

In addition to the preceding resources, the following tools expedite troubleshooting:

- The `iehttpheaders` or a similar utility
- The Wireshark application customized for the NetScaler trace files
- An SSH utility for command line access
- A HyperTerminal utility to access the console

Troubleshooting content switching issues

The most common content switching issues involve the content switching feature not working at all, or working only intermittently, and Service Unavailable responses.

- **Issue**

  The content switching feature is not functioning.

  Resolution

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Check the configuration as follows:

- Verify that the appliance is licensed for content switching.
- Verify that the feature is enabled.
- From the configuration file, verify that valid content switching policies are correctly bound to the load balancing virtual servers.

- **Issue**

  Client receives a 503 - Service Unavailable response.

  Resolution

  - Verify the URL and policy bindings. The client receives the 503 response when none of the policies you have configured is evaluated and no default load balancing virtual server is defined and bound to the content switching virtual server.
  - From the configuration, verify the policies and the URL is accessed by the client.
  - Verify that for every type of request the respective policy is evaluated. If the policy is not evaluated, check the policy expression and update it if necessary.
  - Verify the URL and HTTP request and response headers. To do so, record an `HTTPHeader` trace and, if necessary, record the packet traces on the appliance and the client.

- **Issue**

  Intermittently, the content switching feature is not working as expected.

  Resolution

  - Study the network topology diagram, if available, of the setup to understand the various devices installed between the client and the servers.
  - Verify the configuration and policy bindings. Make sure that the URL in the policy expression matches to the one in the client request.
  - Verify that appropriate priorities are assigned to the policies. An incorrect precedence or priority assigned to a policy can cause a problem.
  - Run the following commands to verify the bindings and the values of the policy select counters in the output of the commands:

    ```
    show cs vserver \<CS VServer\>
    ```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

`show cs policy \<CS Policy\>`

`stat cs vserver \<CS VServer\>`

- Using `iehttpheaders` or a similar utility, determine whether the HTTP headers for the requests or responses provide any pointers to the issue.
- Check the release notes and Knowledge Center articles.
- If the issue is still not resolved, contact Citrix® technical support with appropriate data for further investigation.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

DataStream

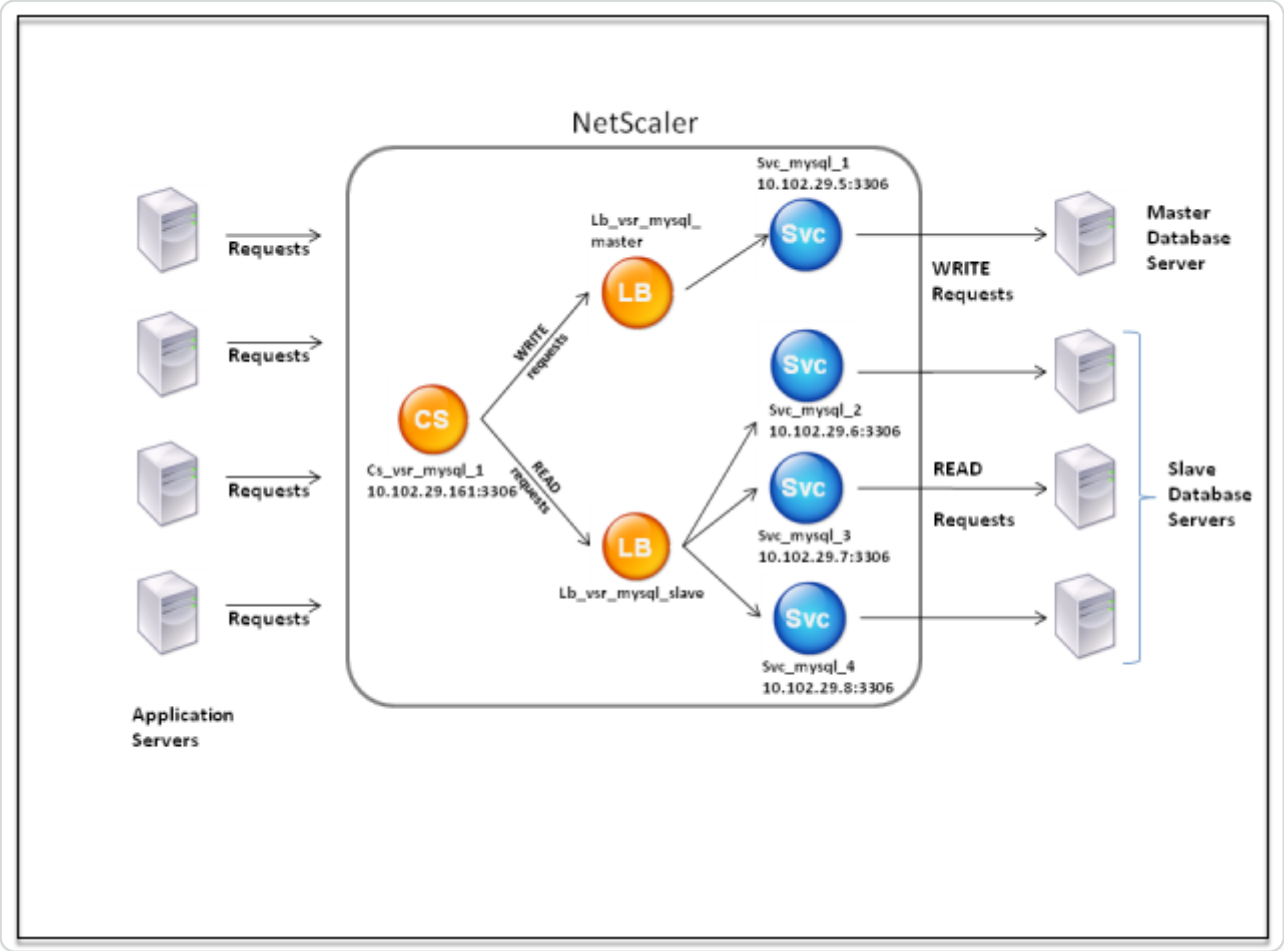
The NetScaler DataStream feature provides an intelligent mechanism for request switching at the database layer by distributing requests based on the SQL query being sent.

When deployed in front of database servers, a NetScaler appliance ensures optimal distribution of traffic from the application servers and Web servers. Administrators can segment traffic according to information in the SQL query and based on database names, user names, character sets, and packet size.

You can configure load balancing to switch requests based on load balancing algorithms. Alternately, you can elaborate the switching criteria by configuring content switching to make a decision based on an SQL query parameter. You can further configure monitors to track the state of database servers.

NOTE

NetScaler DataStream is supported only for MySQL and MS SQL databases. For information about the supported protocol version, character sets, special queries, and transactions, see DataStream Reference.



How DataStream works

In DataStream, the ADC appliance is placed in-line between the application or Web servers and the database servers. On the appliance, the database servers are represented by services.

A typical DataStream deployment consists of the entities described in the following diagram.

Figure 1. DataStream Entity Model

© 1997–2026 Citrix Systems, Inc. All rights reserved.

As shown in this figure, a DataStream configuration can consist of:

- An optional content switching virtual server (CS).
- A load balancing setup consisting of load balancing virtual servers (LB1 and LB2).
- Services (Svc1, Svc2, Svc3, and Svc4).
- Content switching policies (optional).

The clients (application or Web servers) send requests to the IP address of a content switching virtual server (CS) configured on the NetScaler appliance. The appliance, then, authenticates the clients using the database user credentials configured on the appliance. The content switching virtual server (CS) applies the associated content switching policies to the requests. After evaluating the policies, the content switching virtual server (CS) routes the requests to the appropriate load balancing virtual server (LB1 or LB2). Then, the load balancing virtual server distributes the requests to the appropriate database servers (represented by services on the appliance) based on the load balancing algorithm. The NetScaler appliance uses the same database user credentials to authenticate the connection with the database server.

If a content switching virtual server is not configured on the appliance, the clients (application or Web servers) send their requests to a load balancing virtual server configured on the appliance.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The NetScaler appliance authenticates the client by using the database user credentials configured on the appliance, and then uses the same credentials to authenticate the connection with the database server. The load balancing virtual server distributes the requests to the database servers according to the load balancing algorithm. The most effective load balancing algorithm for database switching is the least connection method.

DataStream uses connection multiplexing to enable multiple client-side requests to be made over the same server-side connection. The following connection properties are considered:

- User name
- Database name
- Packet size
- Character set

Configure database users

In databases, a connection is always stateful, which means that when a connection is established, it must be authenticated.

Configure your database user name and password on the NetScaler appliance. For example, if you have a user John configured on the database, you need to configure the user John on the ADC too. Adding database user names and passwords on the ADC adds them to the `nsconfig` file.

NOTE

Names are case sensitive.

The ADC uses these user credentials to authenticate the clients, and then authenticate the server connections with the database servers.

Add a database user by using the CLI

At the command prompt, type

```
add db user <username> - password <password>
```

Example:

```
add db user nsdbuser -password dd260427edf
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Add a database user by using the GUI

Navigate to **System > User Administration > Database Users**, and configure a database user.

If you have changed the password of the database user on the database server, you must reset the password of the corresponding user configured on the ADC appliance.

Reset the password of a database user by using the CLI

At the command prompt, type

```
set db user <username> -password <password>
```

Example:

```
set db user nsdbuser -password dd260538abs
```

Reset the password of database users by using the GUI

Navigate to **System > User Administration > Database Users**, select a user, and enter new values for the password.

If a database user no longer exists on the database server, you can remove the user from the ADC appliance. However, if the user continues to exist on the database server and you remove the user from the ADC appliance, any request from the client with this user name does not get authenticated. As a result, the request is not routed to the database server.

Remove a database user by using the CLI

At the command prompt, type

```
rm db user <username>
```

Example:

```
rm db user nsdbuser
```

Remove a database user by using the GUI

Navigate to **System > User Administration > Database Users**, select a user, and click **Delete**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure a database profile

A database profile is a named collection of parameters that is configured once but applied to multiple virtual servers that require those particular parameter settings. After creating a database profile, you bind it to load balancing or content switching virtual servers. You can create as many profiles as you need.

Create a database profile by using the CLI

At the command line, type the following commands to create a database profile and verify the configuration:

```
add db dbProfile <name> [-interpretQuery ( YES | NO )] [-stickiness (YES |
NO )] [-kcdAccount <string>]

show db dbProfile
```

Example:

```
> add dbProfile myDBProfile -interpretQuery YES -stickiness YES
-kcdAccount mykcdaccnt

 Done

> show dbProfile myDBProfile

    Name: myDBProfile

    Interpret Query: YES

    Stickyness: YES

    KCD Account: mykcdaccnt

    Reference count: 0

 Done
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
>
```

Create a database profile by using the GUI

Navigate to **System > Profiles** and, on the **Database Profiles** tab, configure a database profile.

Bind a database profile to a load balancing or content switching virtual server by using the CLI

At the command line, type:

```
set (lb | cs) vserver <name> -dbProfileName <string>
```

Bind a database profile to a load balancing or content switching virtual server by using the GUI

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers or Traffic Management > Content Switching > Virtual Servers**, and open a virtual server.
2. In **Advanced Settings**, select **Profiles** and, in the **DB Profile** list, select a profile to bind to the virtual server. To create a profile, click plus (+).

Configure load balancing for DataStream

Before configuring a load balancing setup, you must enable the load balancing feature. Then, begin by creating at least one service for each database server in the load balancing group. With the services configured, you are ready to create a load balancing virtual server and bind the services to the virtual server.

NOTE

.

For databases, the load balancing can only occur on homogenous database servers (database servers that contain the exact same databases). For a configuration that contains unique databases on different servers, you must use content switching. If some of your database servers host identical content, you can use load balancing on those servers only. You can then use content switching policies to send requests to the load balancing virtual server that manages load balancing for those databases.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The NetScaler appliance currently stores the database name and login information during the database session. When a query is made to the database, it uses that information to connect to the specific database server.

Parameter values specific to DataStream

- Protocol

  Use the MYSQL protocol type for MySQL databases and MSSQL protocol type for MS SQL databases while configuring virtual servers and services. The MySQL and TDS protocols are used by the clients to communicate with the respective database servers by using SQL queries. For information about the MySQL protocol, see `<http://dev.mysql.com/doc/internals/en/client-server-protocol.html>`. For information about the TDS protocol, see `<http://msdn.microsoft.com/en-us/library/dd304523(v=prot.13).aspx>`.

- Port

  Port on which the virtual server listens for client connections. Use port 3306 for MySQL database servers.

- Method

  It is recommended that you use the Least Connection method for better load balancing and lower server load. However, other methods, such as Round Robin, Least Response Time, Source IP Hash, Source IP Destination IP Hash, Least Bandwidth, Least Packets, and Source IP Source Port Hash, are also supported.

  Note: URL Hash method is not supported for DataStream.

- MS SQL Server version

  If you are using the Microsoft SQL Server, and you expect some clients running a different version from your Microsoft SQL Server product, set the Server Version parameter for the load balancing virtual server. The version setting provides compatibility between the client-side and server-side connections by ensuring that all communication conforms to the server's version. For more information about setting the Server Version parameter, see Configuring the MySQL and Microsoft SQL server version setting.

- MySQL Server version

  If you are using the MySQL Server, and you expect some clients running a different version from your MySQL Server product, set the Server Version parameter for the load balancing virtual server. The version setting provides compatibility between the client-side and server-side connections by ensuring that all communication conforms to the server's version. For more

© 1997–2026 Citrix Systems, Inc. All rights reserved.

information about setting the Server Version parameter, see Configuring the MySQL and Microsoft SQL server version setting.

Configure content switching for DataStream

You can segment traffic according to information in the SQL query, based on database names, user names, character sets, and packet size.

You can configure content switching policies with Advanced policy expressions to switch content based on connection properties. For example, user name and database name, command parameters, and the SQL query to select the server.

The Advanced policy expressions evaluate traffic associated with MYSQL and MS SQL database servers. Use request-based expressions in Advanced policy policies to make request switching decisions at the content switching virtual server bind point. Use response-based expressions (expressions that begin with MYSQL.RES) to evaluate server responses to user-configured health monitors.

For information about Advanced policy expressions, see Advanced policy Expressions: DataStream.

NOTE:

For databases, the load balancing can only occur on homogenous database servers (database servers that contain the exact same databases). For a configuration that contains unique databases on different servers, you must use content switching. If some of your database servers host identical content, you can use load balancing on those servers only. You can then use content switching policies to send requests to the load balancing virtual server that manages load balancing for those databases.

The NetScaler appliance currently stores the database name and login information during the database session. When a query is made to the database, it uses that information to connect to the specific database server.

Parameter values specific to DataStream

- Protocol

  Use the MYSQL protocol type for MySQL databases and MSSQL protocol type for MS SQL databases while configuring virtual servers and services. The MySQL and TDS protocols are

© 1997–2026 Citrix Systems, Inc. All rights reserved.

used by the clients to communicate with the respective database servers by using SQL queries. For information about the MySQL protocol, see `<http://dev.mysql.com/doc/internals/en/client-server-protocol.html>`. For information about the TDS protocol, see `<http://msdn.microsoft.com/en-us/library/dd304523(v=prot.13).aspx>`.

- Port

  Port on which the virtual server listens for client connections. Use port 3306 for MySQL database servers.

- MS SQL Server Version

  If you use Microsoft SQL Server, and expect some clients running a different version from your Microsoft SQL Server product, set the Server Version parameter for the content switching virtual server. The version setting provides compatibility between the client-side and server-side connections by ensuring that all communication conforms to the server's version. For more information about setting the Server Version parameter, see Configuring the Microsoft SQL Server Version Setting.

Configure monitors for DataStream

To track the state of each load balanced database server in real time, you need to bind a monitor to each service. The monitor is configured to test the service by sending periodic probes to the service, sometimes referred to as performing a health check. If the monitor receives a timely response to its probes, it marks the service as UP. If it does not receive a timely response to the designated number of probes, it marks the service as DOWN.

For DataStream, you need to use the built-in monitors: MYSQL-ECV and MSSQL-ECV. Using this monitor you can send an SQL request and parse the response for a string.

Before configuring monitors for DataStream, you must add database user credentials to your NetScaler appliance. For information about configuring monitors, see Configure monitors in a load balancing setup.

When you create a monitor, a TCP connection is established with the database server, and the connection is authenticated by using the user name provided while creating the monitor. You can then run an SQL query to the database server and evaluate the server response to check whether it matches the configured rule.

The following examples are for MYSQL servers.

Examples:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

In the following example, the value of the error message is evaluated to determine the state of the server.

```
add lb monitor lb_mon1 MYSQL-ECV -sqlQuery "select * from

table2;" -evalrule "mysql.res.error.message.contains("Invalid

User")"-database "NS" -userName "user1"
```

In the following example, the number of rows in the response is evaluated to determine the state of the server.

```
add lb monitor lb_mon4 MYSQL-ECV -sqlQuery "select * from

table4;" -evalrule "mysql.res.atleast_rows_count(7)" -database "NS"
-userName "user2"
```

In the following example, the value of a particular column is evaluated to determine the state of the server.

```
add lb monitor lb_mon3 MYSQL-ECV

-sqlQuery "select * from ABC;" -evalrule "mysql.res.row(1).double_elem(2)
== 345.12"

-database "NS" -userName "user3"
```

The following examples are for MSSQL servers.

Examples:

In the following example, the value of the error message is evaluated to determine the state of the server.

```
add lb monitor lb_mon1 MSSQL-ECV -sqlQuery "select * from

table2;" -evalrule "mssql.res.error.message.contains("Invalid

User")"-database "NS" -userName "user1"
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

In the following example, the number of rows in the response is evaluated to determine the state of the server.

```
add lb monitor lb_mon4 MSSQL-ECV -sqlQuery "select * from

table4;" -evalrule "mssql.res.atleast_rows_count(7)" -database "NS"
-userName "user2"
```

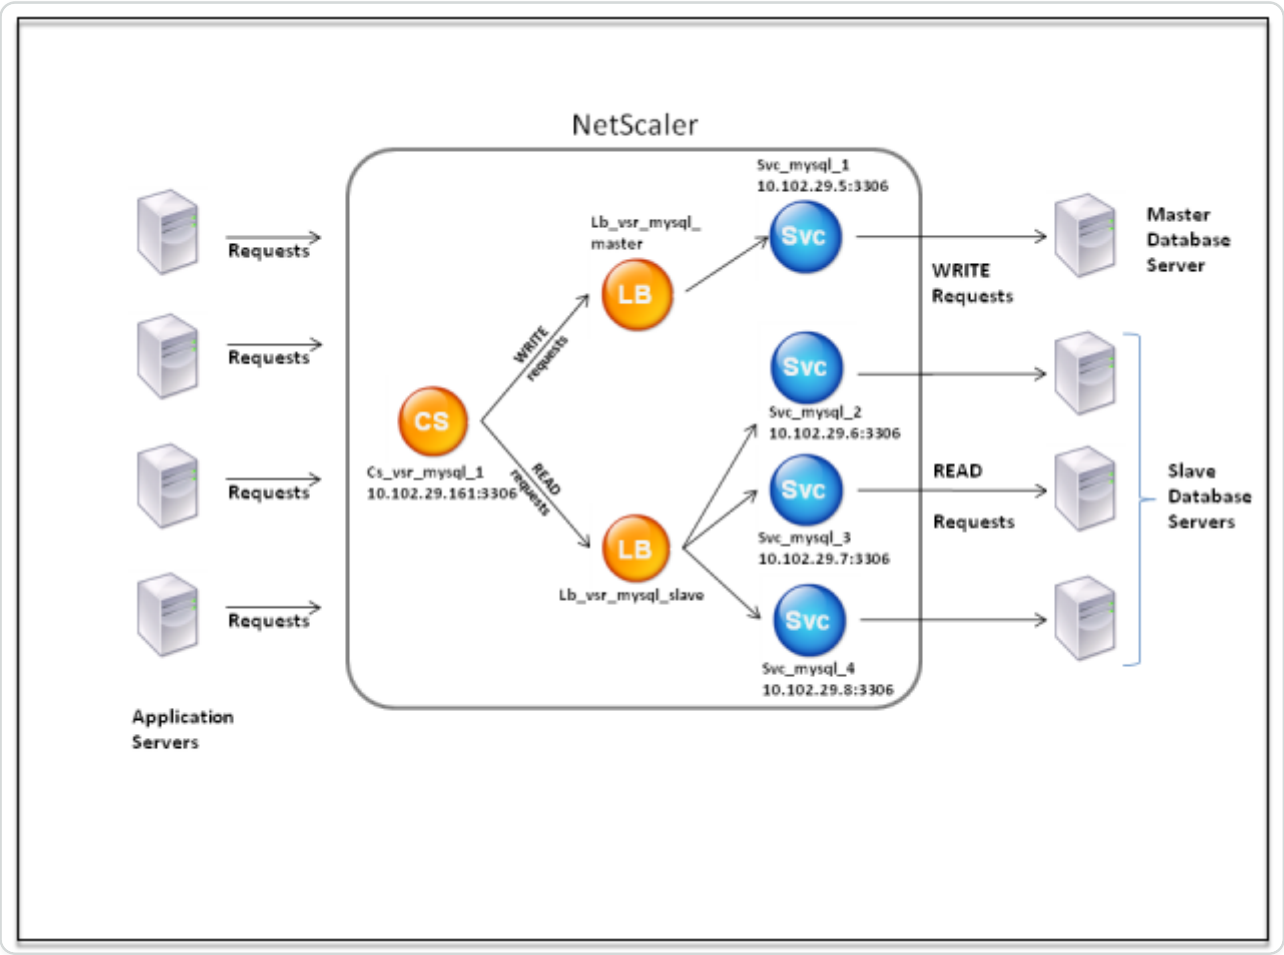
In the following example, the value of a particular column is evaluated to determine the state of the server.

```
add lb monitor lb_mon3 MSSQL-ECV

-sqlQuery "select * from ABC;" -evalrule "mssql.res.row(1).double_elem(2)
== 345.12"

-database "NS" -userName "user3"
```

Use Case 1: Configure DataStream for a primary/ secondary database architecture



A commonly used deployment scenario is the primary/secondary database architecture where the primary database replicates all information to the secondary databases.

For primary/secondary database architecture, you might want all WRITE requests to be sent to the primary database and all READ requests to the secondary databases.

The following figure shows the entities and the values of the parameters that you need to configure on the appliance.

Figure 1. DataStream Entity Model for Primary/Secondary Database Setup

© 1997–2026 Citrix Systems, Inc. All rights reserved.

In this example scenario, a service (Svc_mysql_1) is created to represent the primary database and is bound to a load balancing virtual server (Lb_vsr_mysql_primary). Three more services (Svc_mysql_2, Svc_mysql_3, and Svc_mysql_4) are created to represent the three secondary databases, and they are bound to another load balancing virtual server (Lb_vsr_mysql_secondary).

A content switching virtual server (Cs_vsr_mysql_1) is configured with associated policies to send all WRITE requests to the load balancing virtual server, Lb_vsr_mysql_primary. All READ requests are sent to the load balancing virtual server, Lb_vsr_mysql_secondary.

When a request reaches the content switching virtual server, the virtual server applies the associated content switching policies to that request. After evaluating the policies, the content switching virtual server routes the request to the appropriate load balancing virtual server, which sends it to the appropriate service.

The following table lists the names and values of the entities and the policy configured on the NetScaler appliance.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

ENTITY TYPE	NAME	IP ADDRESS	PROTOCOL	PORT	EXPRESSION
Services	Svc_mysql_1	198.51.100.5	MYSQL	3306	NA
	Svc_mysql_2	198.51.100.6	MYSQL	3306	NA
	Svc_mysql_3	198.51.100.7	MYSQL	3306	NA
	Svc_mysql_4	198.51.100.8	MYSQL	3306	NA
Monitor	lb_mon1	NA	MYSQL-ECV	NA	mysql.res.atleast_rows_count(1)
Load balancing virtual servers	Lb_vsr_mysql_primary	198.51.100.201	MYSQL	3306	NA
	Lb_vsr_mysql_secondary	198.51.100.202	MYSQL	3306	NA
Content switching virtual server	Cs_vsr_mysql_1	198.51.100.161	MYSQL	3306	NA
Content switching policy	Cs_select	NA	NA	NA	`MYSQL.REQ.QUERY.COMMAND.contains("select")`

Table 1. Entity and Policy Names and Values

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To configure DataStream for a primary/secondary database setup by using the command line interface

At the command prompt, type

```
add db user user1 -password user1

add service Svc_mysql_1 198.51.100.5 mysql 3306

add service Svc_mysql_2 198.51.100.6 mysql 3306

add service Svc_mysql_3 198.51.100.7 mysql 3306

add service Svc_mysql_4 198.51.100.8 mysql 3306

add lb monitor lb_mon1 MYSQL-ECV -sqlQuery "select * from table1;"
-evalrule "mysql.res.atleast_rows_count(1)" -database "NS" -userName
 "user1"

add lb vserver Lb_vsr_mysql_primary mysql 198.51.100.201 3306

add lb vserver Lb_vsr_mysql_secondary mysql 198.51.100.202 3306

bind lb vserver Lb_vsr_mysql_primary svc_mysql_1
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
bind lb vserver Lb_vsr_mysql_secondary svc_mysql_2

bind lb vserver Lb_vsr_mysql_secondary svc_mysql_3

bind lb vserver Lb_vsr_mysql_secondary svc_mysql_4

add cs vserver Cs_vsr_mysql_1 mysql 198.51.100.161 3306

add cs policy Cs_select –rule
"MYSQL.REQ.QUERY.COMMAND.contains(\"select"\)"

bind cs vserver Cs_vsr_mysql_1 Lb_vsr_mysql_primary

bind cs vserver Cs_vsr_mysql_1 Lb_vsr_mysql_secondary –policy Cs_select –
priority 10

bind service Svc_mysql_1 -monitorName lb_mon1

bind service Svc_mysql_2 -monitorName lb_mon1

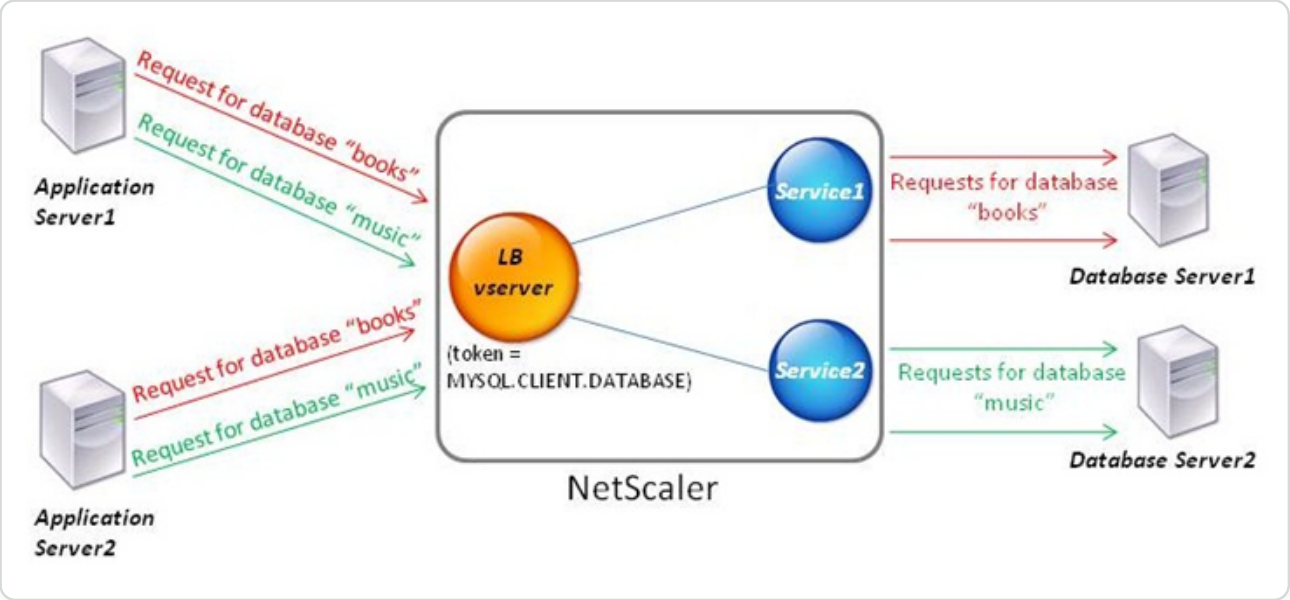
bind service Svc_mysql_3 -monitorName lb_mon1
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
bind service Svc_mysql_4 -monitorName lb_mon1
```

Use Case 2: Configure the token method of load balancing for DataStream

You can configure the token method of load balancing for DataStream to base the selection of database servers on the value of the token extracted from the client (application or web server) requests. These tokens are defined by using SQL expressions. For subsequent requests with the same token, the NetScaler appliance sends the requests to the same database server that handled the initial request. Requests with the same token are sent to the same database server until the maximum connection limit is reached or the session entry has aged out.



You can use the following sample SQL expressions to define tokens:

MYSQL	MS SQL
MYSQL.REQ.QUERY.TEXT	MSSQL.REQ.QUERY.TEXT
MYSQL.REQ.QUERY.TEXT(n)	MSSQL. REQ.QUERY.TEXT(n)
MYSQL.REQ.QUERY.COMMAND	MSSQL.REQ.QUERY.COMMAND
MYSQL.CLIENT.USER	MSSQL.CLIENT.USER
MYSQL.CLIENT.DATABASE	MSSQL.CLIENT.DATABASE
MYSQL.CLIENT.CAPABILITIES	

The following example shows how the NetScaler DataStream feature works when you configure the token method of load balancing.

Figure 1. DataStream and the Token Method of Load Balancing

© 1997–2026 Citrix Systems, Inc. All rights reserved.

In this example, the token is the name of the database. A request with token books is sent to Database Server1 and a request with token music is sent to Database Server2. All subsequent requests with token books are sent to Database Server1 and requests with token music are sent to Database Server2. This configuration provides pseudo persistence with the database servers.

Configure this example by using the CLI

At the command prompt, type:

```
add service Service1 192.0.2.9 MYSQL 3306

add service Service2 192.0.2.11 MYSQL 3306

add lb vserver token_lb_vserver MYSQL 192.0.2.15 3306 -lbmethod token
-rule MYSQL.CLIENT.DATABASE

bind lb vserver token_lb_vserver Service1

bind lb vserver token_lb_vserver Service2
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure this example by using the GUI

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**, configure a virtual server, and specify the protocol as **MYSQL**.
2. Click in the **Service** section, and configure two services specifying the protocol as MYSQL. Bind these services to the virtual server.
3. In **Advanced Settings**, click **Method** and, in the **Load Balancing Method** list, select **TOKEN** and specify the expression as **MYSQL.CLIENT.DATABASE**.

Use Case 3: Log MSSQL transactions in transparent mode

You can configure the NetScaler appliance to operate transparently between MSSQL clients and servers, and to only log or analyze details of all client-server transactions. Transparent mode is designed so that the NetScaler appliance only forwards MSSQL requests to the server, and then relays the server's responses to the clients. As the requests and responses pass through the appliance, the appliance logs information gathered from them, as specified by the audit logging or AppFlow configuration, or collects statistics, as specified by the Action Analytics configuration. You do not have to add database users to the appliance.

When operating in transparent mode, the NetScaler appliance does not perform load balancing, content switching, or connection multiplexing for the requests. However, it responds to a client's pre-login packet on behalf of the server so that it can prevent encryption from being agreed upon during the pre-login handshake. The login packet and subsequent packets are forwarded to the server.

Summary of configuration tasks

For logging or analyzing MSSQL requests in transparent mode, you have to do the following:

- Configure the NetScaler appliance as the default gateway for both clients and servers.
- Do one of the following on the NetScaler appliance:
    - **Configure the use source IP address (USIP) option globally:** Create a load balancing virtual server with a wildcard IP address and the port number on which the MSSQL servers listen for requests (a port-specific wildcard virtual server). Then, enable the USIP option globally. If you configure a port-specific wildcard virtual server, you do not have to create MSSQL services on the appliance. The appliance discovers the services based on the destination IP address in the client requests.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

    - **If you do not want to configure the USIP option globally:** Create MSSQL services with the USIP option enabled on each of them. If you configure services, you do not have to create a port-specific wildcard virtual server.

- Configure audit logging, AppFlow®, or Action Analytics to log or collect statistics about the requests. If you configure a virtual server, you can bind your policies either to the virtual server or to the global bind point. If you do not configure a virtual server, you can bind your policies to only the global bind point.

Configure transparent mode by using a wildcard virtual server

You can configure transparent mode by configuring a port-specific wildcard virtual server and enabling Use Source IP (USIP) mode globally. When a client sends its default gateway (the NetScaler appliance) a request with the IP address of an MSSQL server in the destination IP address header, the appliance checks whether the destination IP address is available. If the IP address is available, the virtual server forwards the request to the server. Otherwise, it drops the request.

Create a wildcard virtual server by using the CLI

At the command prompt, type the following commands to create a wildcard virtual server and verify the configuration:

```
add lb vserver <name> <serviceType> <IPAddress> <port>

show lb vserver <name>
```

Example:

```
> add lb vserver wildcardLbVs MSSQL * 1433

 Done

> show lb vserver wildcardLbVs

    wildcardLbVs (*:1433) - MSSQL   Type: ADDRESS

    State: UP
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
    . . .

 Done

>
```

Create a wildcard virtual server by using the GUI

Navigate to **Traffic Management > Load Balancing > Virtual Servers**, and create a virtual server. Specify MSSQL as the protocol and * as the IP address.

Enable Use Source IP (USIP) mode globally by using the CLI

At the command prompt, type the following commands to enable USIP mode globally and verify the configuration:

```
enable ns mode USIP

show ns mode
```

Example:

```
> enable ns mode USIP

 Done

> show ns mode

    Mode                          Acronym                    Status

    -------                       -------                    ------

               . . .

 3) Use Source IP                 USIP                       ON
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
                . . .

 Done

>
```

Enable USIP mode globally by using the GUI

1. Navigate to **System > Settings** and, in Modes and Features, select **Configure Modes**.
2. Select **Use Source IP**.

Configure transparent mode by using MSSQL services

You can configure transparent mode by configuring MSSQL services and enabling USIP on each service. When a client sends its default gateway (the NetScaler appliance) a request with the IP address of an MSSQL server in the destination IP address header, the appliance forwards the request to the destination server.

Create an MSSQL service and enable USIP mode on the service by using the CLI

At the command prompt, type the following commands to create an MSSQL service, with USIP enabled, and verify the configuration:

```
add service <name> (<IP> | <serverName>) <serviceType> <port> -usip YES`

show service <name>
```

Example

```
> add service myDBservice 192.0.2.0 MSSQL 1433 -usip YES

 Done

> show service myDBservice

    myDBservice (192.0.2.0:1433) - MSSQL

    State: UP
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
                . . .

    Use Source IP: YES      Use Proxy Port: YES

                . . .

 Done

>
```

Create an MSSQL service, with USIP enabled, by using the GUI

1. Navigate to **Traffic Management > Load Balancing > Services**, and configure a service.
2. Specify the protocol as **MSSQL** and, in **Settings**, select **Use Source IP**.

Use Case 4: Database specific load balancing

A database server farm must be load balanced not only based on the states of the servers, but also based on the availability of the database on each server. A service might be up, and a load balancing device might show it as being in the UP state, but the requested database might be unavailable on that service. The request is not served if a query is forwarded to a service on which the database in unavailable. Therefore, a load balancing device must be aware of the availability of a database on each service. And when making a load balancing decision, it must consider only those services on which the database is available.

As an example, consider that database servers server1, server2, and server3 host databases mydatabase1 and mydatabase2. If mydatabase1 becomes unavailable on server2, the load balancing device must be aware of that change in state. It must load balance requests for mydatabase1 across only server1 and server3. After mydatabase1 becomes available on server2, the load balancing device must include server2 in load balancing decisions. Similarly, if mydatabase2 becomes unavailable on server3, the device must load balance requests for mydatabase2 across only server1 and server2. It must include server3 in its load balancing decisions only when mydatabase2 becomes available. This load balancing behavior must be consistent across all the databases that are hosted on the server farm.

The NetScaler appliance implements this behavior by retrieving a list of all the databases that are active on a service. To retrieve the list of active databases, the appliance uses a monitor that is configured with an appropriate SQL query. If the requested database is unavailable on a service,

© 1997–2026 Citrix Systems, Inc. All rights reserved.

the appliance excludes the service from load balancing decisions until it becomes available. This behavior ensures uninterrupted service to clients.

NOTE

Database specific load balancing is supported for only MSSQL and MySQL service types. This support is also available for Microsoft SQL Server 2012 high availability deployment.

To set up database specific load balancing, you must configure the following:

- Enable the load balancing feature, and configure a load balancing virtual server of type MSSQL or MySQL.
- Configure the services that host the database, and bind the services to the virtual server. The monitor needs valid user credentials to log on to the database server, so you must configure a database user account on each of the servers and then add the user account to the NetScaler appliance.
- Then, you configure an MSSQL-ECV or MYSQL-ECV monitor and bind the monitor to each service.
- Finally, you must test the configuration to ensure that it is working as intended. Before you perform these configuration tasks, make sure you understand how database specific load balancing works.

How database specific load balancing works

For database specific load balancing, you configure a monitor that periodically queries each database server for the names of all the active databases on it. The NetScaler appliance stores the results, and regularly updates the records based on the information retrieved through monitoring. When a client queries a particular database, the appliance uses the configured load balancing method to select a service, and then checks its records to determine whether the database is available on that service. If the records indicate that the database is not available, it uses the configured load balancing method to select the next available service, and then repeats the check. The appliance forwards the query to the first available service on which the database is active.

Enable load balancing

You can configure load balancing entities such as services and virtual servers when the load balancing feature is disabled. The entities do not function until you enable the feature.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Enable load balancing by using the CLI

At the command prompt, type the following command to enable load balancing and verify the configuration:

```
enable ns feature LB

show ns feature
```

Example:

```
> enable ns feature LoadBalancing
 Done
> show ns feature

        Feature                         Acronym             Status
        -------                         -------             ------
 1)     Web Logging                     WL                  OFF
 2)     Surge Protection                SP                  ON
 3)     Load Balancing                  LB                  ON
 .
 .
 .
 24)    NetScaler Push                  push                OFF
 Done
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Enable load balancing by using the GUI

Navigate to **System > Settings** and, in **Configure Basic Features**, select **Load Balancing**.

Configure a load balancing virtual server for database specific load balancing

To configure a virtual server to load balance databases based on availability, you enable the database specific load balancing parameter on the virtual server. Enabling the parameter modifies the load balancing logic so that the NetScaler appliance refers the results of the monitoring probe sent to the selected service, before forwarding the query to that service.

Configure a load balancing virtual server for database specific load balancing using the CLI

At the command prompt, type the following command to configure a load balancing virtual server for database specific load balancing and verify the configuration:

```
add lb vserver <name> <serviceType> <ipAddress> <port> -dbsLb ENABLED

show lb vserver <name>
```

Configure services

After you enable the load balancing feature, you must create at least one service for each application server that is to be included in your load balancing setup. The services that you configure provide the connections between the NetScaler appliance and the load balanced servers. Each service has a name and specifies an IP address, a port, and the type of data that is served.

If you create a service without first creating a server object, the IP address of the service is also the name of the server that hosts the service. If you prefer to identify servers by name rather than IP address, you can create server objects and then specify a server's name instead of its IP address when you create a service.

Configure database users

In databases, a connection is always stateful, which means that when a connection is established, it must be authenticated.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure your database user name and password on the NetScaler. For example, if you have a user John configured on the database, you need to configure the user John on the ADC too. Database user names and passwords added to the ADC are added to the `nsconfig` file.

NOTE

Names are case sensitive.

The ADC uses these user credentials to authenticate the clients, and then authenticate the server connections with the database servers.

Add a database user by using the CLI

At the command prompt, type

```
add db user <username> - password <password>
```

Example:

```
add db user nsdbuser -password dd260427edf
```

Add a database user by using the GUI

Navigate to **System > User Administration > Database Users**, and configure a database user.

If you have changed the password of the database user on the database server, you must reset the password of the corresponding user configured on the NetScaler appliance.

Reset the password of a database user by using the CLI

At the command prompt, type

```
set db user <username> -password <password>
```

Example:

```
set db user nsdbuser -password dd260538abs
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Reset the password of database users by using the GUI

Navigate to **System > User Administration > Database Users**, select a user, and enter new values for the password.

If a database user no longer exists on the database server, you can remove the user from the NetScaler appliance. However, if the user continues to exist on the database server and you remove the user from the ADC appliance, any request from the client with this user name does not get authenticated. Therefore, the user name does not get routed to the database server.

Remove a database user by using the CLI

At the command prompt, type

```
rm db user <username>
```

Example:

```
rm db user nsdbuser
```

Remove a database user by using the GUI

Navigate to **System > User Administration > Database Users**, select a user, and click **Delete**.

Configure a monitor to retrieve the names of active databases

You can create a monitor to retrieve the list of all active databases on a database instance. The monitor logs on to the database server by using a valid user credentials and runs an appropriate SQL query. The SQL query you need to use depends on your SQL server deployment. For example, in an MSSQL database mirroring setup, you can use the following query to retrieve a list of active databases available on a server instance.

```
select name from sys.databases where state=0
```

In a MySQL database setup you can use the following queries to retrieve a list of active databases available on a server instance.

Show databases:

You also configure the monitor to evaluate the response for an error condition, and to store the results if there is no error. If the response contains an error, the monitor marks the service as

© 1997–2026 Citrix Systems, Inc. All rights reserved.

DOWN. The appliance excludes the service from load balancing decisions until an error is no longer returned.

NOTE

The database specific load balancing feature is supported only for the MSSQL and MySQL service types. Therefore, the monitor type must be MSSQL-ECV or MYSQL-ECV.

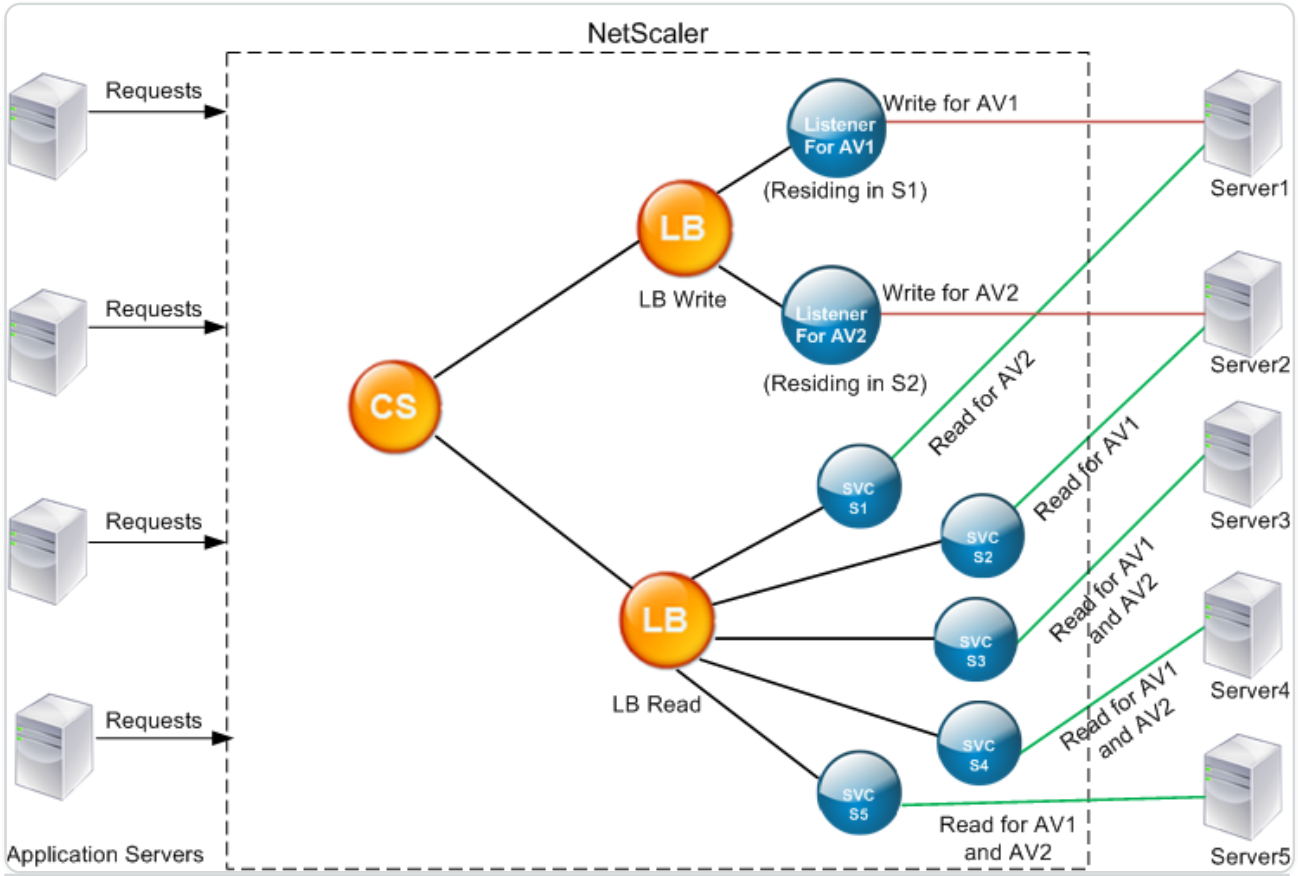
Configure a monitor to retrieve the names of all the active databases hosted on a service by using the CLI

At the command prompt, type the following commands to retrieve the names of all the active databases hosted on a service and verify the configuration:

```
add lb monitor <monitorName> <type> -userName <string> -sqlQuery <text>
-evalRule <expression> -storedb ENABLED

show lb monitor <monitorName>
```

Configure a monitor to retrieve the names of all the active databases hosted on a service by using the GUI



1. Navigate to **Traffic Management > Load Balancing > Monitors** and configure a monitor of type MSSQL-ECV or MYSQL-ECV.
2. In **Special Parameters**, specify a user name, query, and a rule. For example, for MSSQL-ECV, the query must be "select name from sys.databases where state=0"), and a rule must be MSSQL.RES.TYPE.NE(ERROR). For MYSQL-ECV, the query must be "show databases" and a rule must be MYSQL.RES.TYPE.NE(ERROR).

Availability groups deployment support for MSSQL

Consider the following scenario in which database specific load balancing is configured in a high availability group deployment. S1 through S5 is the services on the ADC appliance. DB1 through DB4 is the databases on the servers represented by the services S1 through S5. AV1 and AV2 are the availability groups. Each availability group contains up to one primary database server instance and up to four secondary database server instances. A service, representing the servers in the availability group, can be primary for one availability group and secondary for another availability group. Each availability group contains different databases and one listener, which is a service. All

© 1997–2026 Citrix Systems, Inc. All rights reserved.

requests arrive on the listener service that resides on the primary database. AVI contains databases DB1 and DB2. AV2 contains databases DB3 and DB4. L1 and L2 are the listeners on AV1 and AV2 respectively. S1 is the primary service for AV1 and S2 is the primary service for AV2.

SERVICE	LIST OF ACTIVE DATABASES ON THE SERVICE
S1	DB1, DB2, DB3, DB4
S2	DB3, DB4
S3	DB3, DB4
S4	DB1, DB2
S5	DB1, DB2

AVAILABILITY GROUP	DATABASES	SERVICES REPRESENTING THE SERVERS IN THE AVAILABILITY GROUP
AV1	DB1, DB2	S1, S4, S5

© 1997–2026 Citrix Systems, Inc. All rights reserved.

AVAILABILITY GROUP	DATABASES	SERVICES REPRESENTING THE SERVERS IN THE AVAILABILITY GROUP
AV2	DB3, DB4	S1, S2, S3

Queries flow as follows:

1. A READ query for AV1 is load balanced between S4 and S5. S1 is the primary for AV1.
2. A WRITE query for AV1 is directed to L1.
3. A READ query for AV2 is load balanced between S1 and S3. S2 is the primary for AV2.
4. A WRITE query for AV1 is directed to L2.

Sample configuration

1. Configure load balancing and content switching virtual servers.
   - `add lb vserver lbwrite -dbslb enabled`
   - `add lbvserver lbread MSSQL -dbslb enabled`
   - `add csvserver csv MSSQL 1.1.1.10 1433`
2. Configure two listener services, one for each availability group, and five services S1 through S5 representing databases DB1 through DB4.
   - `add service L1 1.1.1.11 MSSQL 1433`
   - `add service L2 1.1.1.12 MSSQL 1433`
   - `add service s1 1.1.1.13 MSSQL 1433`
   - `add service s2 1.1.1.14 MSSQL 1433`
   - `add service s3 1.1.1.15 MSSQL 1433`
   - `add service s4 1.1.1.16 MSSQL 1433`
   - `add service s5 1.1.1.17 MSSQL 1433`
3. Bind the services to the load balancing virtual servers.
   - `bind lbvserver lbwrite L1`
   - `bind lbvserver lbwrite L2`
   - `bind lbvserver lbread s1`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- `bind lbvserver lbread s2`
- `bind lbvserver lbread s3`
- `bind lbvserver lbread s4`
- `bind lbvserver lbread s5`

4. Configure database users.

   - `add db user nsdbuser1 -password dd260427edf`
   - `add db user nsdbuser2 -password ccd1234xyzw`

5. Configure two monitors, monitor_L1 and monitor_L2 for each listener service, to retrieve the list of active databases in that availability group. Add a monitor, monitor1 to retrieve the list of databases for the secondary database server instance.

   - `add lb monitor monitor_L1 MSSQL-ECV -userName user1 -sqlQuery "SELECT name FROM sys.databases a INNER JOIN sys.dm_hadr_availability_replica_states b ON a.replica_id=b.replica_id INNER JOIN sys.availability_group_listeners c on b.group_id = c.group_id INNER JOIN sys.availability_group_listener_ip_addresses d on c.listener_id = d.listener_id WHERE b.role = 1 and d.ip_address like '1.1.1.11'" -evalRule "MSSQL.RES.TYPE.NE(ERROR)” –storedb ENABLED`
   - `add lb monitor monitor_L2 MSSQL-ECV -userNameuser1 -sqlQuery "SELECT name FROM sys.databases a INNER JOIN sys.dm_hadr_availability_replicca_states b ON a.replica_id=b.replica_id INNER JOIN sys.availability_group_listeners c on b.group_id = c.group_id INNER JOIN sys.availability_group_listener_ip_addresses d on c.listener_id = d.listener_id WHERE b.role = 1 and d.ip_address like '1.1.1.12'" -evalRule "MSSQL.RES.TYPE.NE(ERROR)" -storedb ENABLED`
   - `add lb monitor monitor1 MSSQL-ECV -userNameuser1 -sqlQuery "SELECT name FROM sys.databases a INNER JOIN sys.dm_hadr_availability_replica_states b ON a.replica_id=b.replica_id WHERE b.role = 2" -evalRule "MSSQL.RES.TYPE.NE(ERROR)" -storedb ENABLED`

6. Configure read and write policies.

   - `add cs policy pol_write -rule "MSSQL.REQ.QUERY.TEXT.CONTAINS("insert")"`
   - `add cs policy pol_read -rule "MSSQL.REQ.QUERY.TEXT.CONTAINS("select")"`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

7. Bind the policies to the content switching virtual server.
   - `bind csvserver csv -targetLBVserver lbwrite -policyName pol_write -priority 11`
   - `bind csvserver csv -targetLBVserver lbread -policyName pol_read -priority 12`
8. Bind monitors to the services. Bind monitors to services L1 and L2 to get the list of active databases for the availability group for which it is the listener. Bind monitors to all the services that are bound to the read-only virtual server.
   - `bind service L1 -monitorName monitor_L1`
   - `bind service L2 -monitorName monitor_L2`
   - `bind service s1 -monitorName monitor1`
   - `bind service s2 -monitorName monitor1`
   - `bind service s3 -monitorName monitor1`
   - `bind service s4 -monitorName monitor1`
   - `bind service s5 -monitorName monitor1`

Configuration examples for MSSQL virtual server

To configure a load balancing virtual server for database specific load balancing:

```
add lb vserver DBSpecificLB1 MSSQL 192.0.2.10 1433 -dbsLb ENABLED

Done

show lb vserver DBSpecificLB1

DBSpecificLB1 (192.0.2.10:1433) - MSSQL Type: ADDRESS

. . .

DBS_LB: ENABLED
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Done
```

To configure services:

add service msservice1 5.5.5.5 MSSQL 1433

To configure a monitor to retrieve the names of all the active databases hosted on a service by using the command line:

```
add lb monitor mssql-monitor1 MSSQL-ECV -userName user1 -sqlQuery "select
name from sys.databases where state=0" -evalRule
"MSSQL.RES.TYPE.NE(ERROR)" -storedb EN

Done

show lb monitor mssql-monitor1

1)   Name.......: mssql-monitor1    Type......: MSSQL-ECV

...

Special parameters: Database.....:""

User name.....:"user1"

Query..:select name from sys.databases where state=0
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
EvalRule...:MSSQL.RES.TYPE.NE(ERROR)

Version...:70 STORE_DB...:ENABLED

Done
```

Configuration examples for MySQL virtual server

To configure a load balancing virtual server for database specific load balancing:

```
add lb vserver DBSpecificLB1 MYSQL 192.0.2.10 3306 -dbsLb ENABLED

Done

show lb vserver DBSpecificLB1

DBSpecificLB1 (192.0.2.10:3306) - MYSQL Type: ADDRESS

. . .

DBS_LB: ENABLED

Done
```

To configure services:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add service msservice1 5.5.5.5 MYSQL 3306
```

To configure a monitor to retrieve the names of all the active databases hosted on a service by using the command line:

```
add lb monitor mysql-monitor1 MYSQL-ECV -userName user1 -sqlQuery "show
databases" -evalRule "MYSQL.RES.TYPE.NE(ERROR)" -storedb ENABLED

Done

show lb monitor mysql-monitor1

1)     Name.......: mysql-monitor1  Type......: MYSQL-ECV  State....:
 ENABLED

...

Special parameters: Database.....:""

User name.....:"user1" Query..:show databases

EvalRule...:MYSQL.RES.TYPE.NE(ERROR) STORE_DB...:ENABLED

Done
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

DataStream reference

This reference describes the MySQL and TDS protocols, the database versions, the authentication methods, and the character sets supported by the DataStream feature. It also describes how the NetScaler handles transaction requests and special queries that modify the state of a connection.

You can also configure the NetScaler appliance to generate audit log messages for the DataStream feature.

Supported database versions, protocols, and authentication methods

	MYSQL DATABASE	MS SQL DATABASE
Database Versions	MySQL database versions 4.1, 5.0, 5.1, 5.4, 5.5, 5.6	MS SQL database versions 70, 2000, 2000SP1, 2005, 2008, 2008R2, 2012, 2014 (Kerberos Authentication support). You can configure the backend MS SQL server with TDS 7.4 on 2016, 2017, 2019, and 2022 by configuring NetScaler parameter `-mssqlServerVersion 2014`. Always On availability group is supported only in MS SQL versions 2012 and 2014.
Protocols	MySQL protocol version 10. For information about the MySQL protocol, see MySQL Client/Server Protocol	Tabular Data Stream (TDS) protocol version 7.1 to 7.4. For information about the TDS protocol, see Tabular Data Stream Protocol
Authentication Methods	MySQL native authentication is supported.	SQL server authentication and Windows Authentication (Kerberos/NTLM) are supported.

Character sets

The DataStream feature supports only the UTF-8 charset.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The character set used by the client while sending a request might be different from the character set used in the database server responses. Although the charset parameter is set during the connection establishment, it can be changed at any time by sending an SQL query. The character set is associated with a connection, and therefore, requests on connections with one character set cannot be multiplexed onto a connection with a different character set.

The NetScaler appliance parses the queries sent by the client and the responses sent by the database server.

The character set associated with a connection can be changed after the initial handshake by using the following two queries:

```
SET NAMES <charset> COLLATION <collation>

SET CHARACTER SET <charset>
```

Transactions

In MySQL, transactions are identified by using the connection parameter AUTOCOMMIT or the BEGIN:COMMIT queries. The AUTOCOMMIT parameter can be set during the initial handshake, or after the connection is established by using the query SET AUTOCOMMIT.

The NetScaler appliance explicitly parses each query to determine the beginning and end of a transaction.

In the MySQL protocol, the response contains two flags to indicate whether the connection is a transaction: the TRANSACTION and AUTOCOMMIT flags.

If the connection is a transaction, the TRANSACTION flag is set. Or, if the AutoCommit mode is OFF, the AUTOCOMMIT flag is not set. The ADC appliance parses the response, and if either the TRANSACTION flag is set or the AUTOCOMMIT flag is not set, it does not do connection multiplexing. When these conditions are no longer true, the ADC appliance begins connection multiplexing.

NOTE

Transactions are also supported for MS SQL.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Special queries

There are special queries, such as SET and PREPARE, that modify the state of the connection and might break request switching, and therefore, these queries need to be handled differently.

On receiving a request with special queries, the NetScaler appliance sends an OK response to the client and also, stores the request in the connection.

When a non-special query, such as INSERT and SELECT, is received along with a stored query, the ADC appliance looks for the server-side connection on which the stored query has already been sent to the database server. If no such connections exist, the ADC appliance creates a connection, and sends the stored query first, and then, sends the request with the non-special query.

In SET, USE db, and INIT_DB special queries, the appliance modifies a field in the server side connection corresponding to the special query. This modification results in better reuse of the server side connection.

Only 16 queries are stored in each connection.

The following is a list of the special queries for which the ADC appliance has a modified behavior.

- SET query

  The SET SQL queries define variables that are associated with the connection. These queries are also used to define global variables, but as of now, the ADC appliance is unable to differentiate between local and global variables. For this query, the ADC appliance uses the 'store and forward' mechanism.

- USE `<db>` query

  Using this query, the user can change the database associated with a connection. In this case, the ADC appliance parses the `<db>` value sent and modifies a field in the server side connection to reflect the new database to be used.

- INIT_DB command

  Using this query, the user can change the database associated with a connection. In this case, the ADC appliance parses the `<init_db>` value sent and modifies a field in the server side connection to reflect the new database to be used.

- COM_PREPARE

  The ADC appliance stops request switching on receiving this command.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- PREPARE query

  This query is used to create prepared statements that are associated with a connection. For this query, the ADC appliance uses the 'store and forward' mechanism.

Audit log message support

You can now configure the NetScaler appliance to generate audit log messages for the DataStream feature. Audit log messages are generated when client-side and server-side connections are established, closed, or dropped. The categories of messages that you can log and view are ERROR and INFO. Error messages for client-side connections begin with "CS" and error messages for server-side connections begin with "SS." Additional information is provided where necessary. For example, log messages for closed connections (CS_CONN_CLOSED) include only the connection ID. However, log messages for established connections (CS_CONN_ESTD) include information such as the user name, database name, and the client IP address in addition to the connection ID.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Domain Name System

Note: From release 13.0 build 41.x, the NetScaler appliance in ADNS and proxy mode is fully compliant with DNS flag day 2019.

You can configure the NetScaler appliance to function as an authoritative domain name server (ADNS server) for a domain. Add the DNS resource records that belong to the domain for which the appliance is authoritative and configure resource record parameters. You can also configure the appliance as a proxy DNS server that load balances a farm of DNS name servers that are either within or outside your network. Configure the appliance as an end resolver and forwarder. You can configure DNS suffixes that enable name resolution when fully qualified domain names are not configured. The appliance also supports the DNS ANY query that retrieves all the records that belong to a domain.

You can configure the appliance to concurrently function as an authoritative DNS server for one domain and a DNS proxy server for another domain. When you configure the appliance as the authoritative DNS server or DNS proxy server for a zone, you can enable the appliance to use the TCP for response sizes that exceed the size limit specified for the User Datagram Protocol (UDP).

How DNS Works on the NetScaler

You can configure the NetScaler appliance to function as an ADNS server, DNS proxy server, end resolver, and forwarder. You can add DNS resource records on the NetScaler appliance, including the following records:

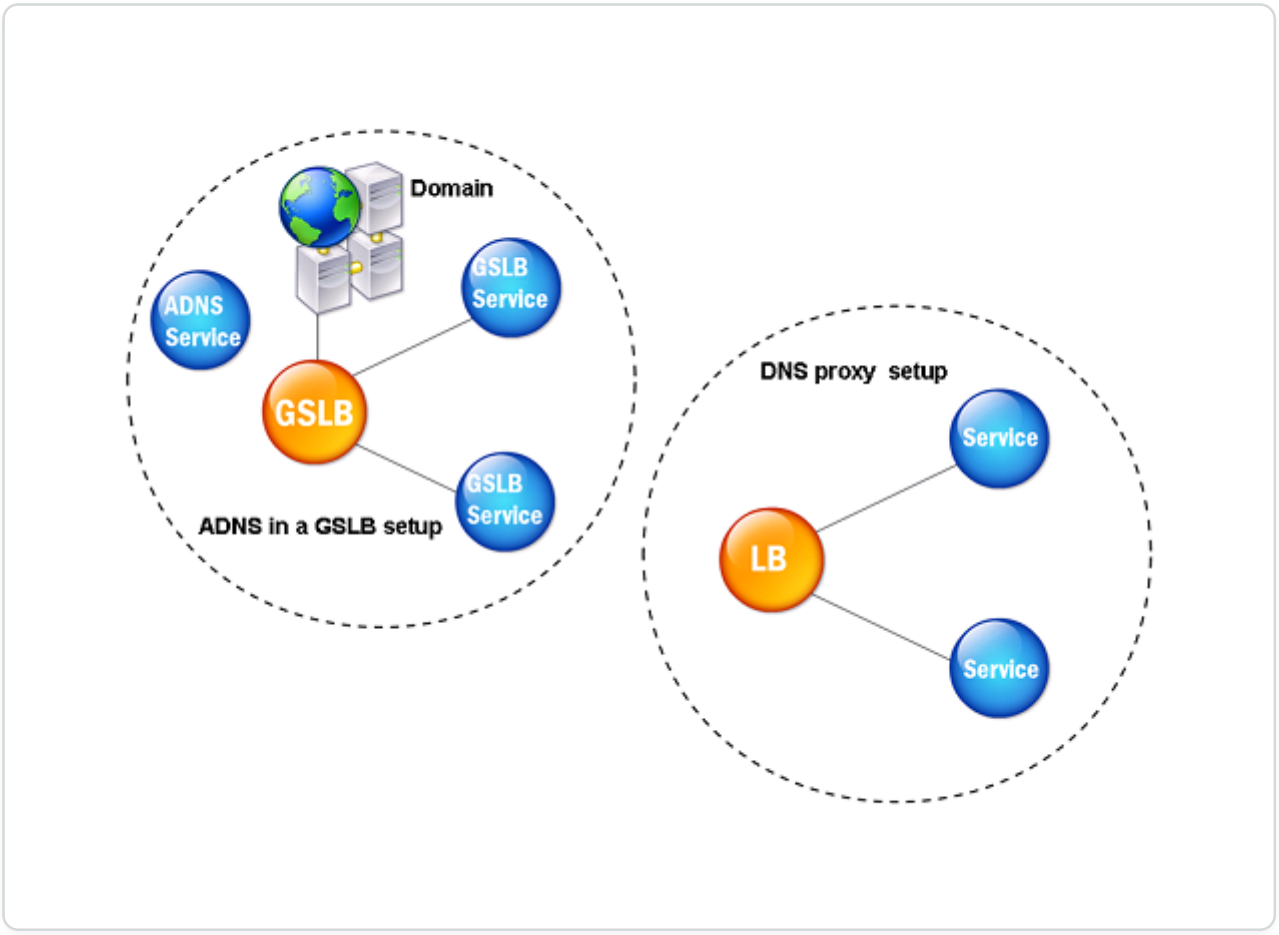
- Service (SRV) records
- IPv6 (AAAA) records
- Address (A) records
- Mail exchange (MX) records
- Canonical name (CNAME) records
- Pointer (PTR) records
- Start of authority (SOA) records
- Text (TXT) records
- Name Authority Pointer (NAPTR) records

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- DNSKEY records
- Certificate Authority Authorization (CAA) records

Also, you can configure the NetScaler to load balance external DNS name servers.

The NetScaler appliance can be configured as the authority for a domain. Add valid SOA and NS records for the domain.



An ADNS server is a DNS server that contains complete information about a zone.

To configure the NetScaler appliance as an ADNS server for a zone, you must add an ADNS service, and then configure the zone. To do so, you add valid SOA and NS records for the domain. When a client sends a DNS request, the NetScaler appliance searches the configured resource records for the domain name. You can configure the ADNS service to be used with the NetScaler Global Server Load Balancing (GSLB) feature.

You can delegate a subdomain, by adding NS records for the subdomain to the zone of the parent domain. You can then make the NetScaler authoritative for the subdomain, by adding a "glue record" for each of the subdomain name servers. If GSLB is configured, the NetScaler makes a GSLB load balancing decision based on its configuration and replies with the IP address of the selected virtual server. The following figure shows the entities in an ADNS GSLB setup and a DNS proxy setup.

Figure 1. DNS Proxy Entity Model

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The NetScaler appliance can function as a DNS proxy. Caching of DNS records, which is an important function of a DNS proxy, is enabled by default on the NetScaler appliance. Caching enables the NetScaler appliance to provide quick responses for repeated translations. Create a load balancing DNS virtual server, and DNS services, and then bind these services to the virtual server.

The NetScaler provides two options, minimum time to live (TTL) and maximum TTL for configuring the lifetime of the cached data. The cached data times out as specified by your settings for these two options. The NetScaler checks the TTL of the DNS record coming from the server. If the TTL is less than the configured minimum TTL, it is replaced with the configured minimum TTL. If the TTL is greater than the configured maximum TTL, it is replaced with the configured maximum TTL.

The NetScaler also allows caching of negative responses for a domain. A negative response indicates that information about a requested domain does not exist, or that the server cannot provide an answer for the query. The storage of this information is called *negative caching*. Negative caching helps speed up responses to queries on a domain, and can optionally provide the record type.

A negative response can be one of the following:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- NXDOMAIN error message - If a negative response is present in the local cache, the NetScaler returns an error message (NXDOMAIN). If the response is not in the local cache, the query is forwarded to the server, and the server returns an NXDOMAIN error to the NetScaler. The NetScaler caches the response locally, then returns the error message to the client.
- NODATA error message - The NetScaler sends a NODATA error message, if the domain name in query is valid but records of the given type are not available.

The NetScaler supports recursive resolution of DNS requests. In recursive resolution, the resolver (DNS client) sends a recursive query to a name server for a domain name. If the queried name server is authoritative for the domain, it responds with the requested domain name. Otherwise, the NetScaler queries the name servers recursively until the requested domain name is found.

Before you can apply the recursive query option, you must first enable it. You can also set the number of times the DNS resolver must send a resolution request (DNS retries) if a DNS lookup fails.

You can configure the NetScaler as a DNS forwarder. A forwarder passes DNS requests to external name servers. The NetScaler allows you to add external name servers and provides name resolution for domains outside the network. The NetScaler also allows you to set the name lookup priority to DNS or Windows Internet Name Service (WINS).

Enable the ADC appliance to use DNS to resolve the host name to its respective IP address

Note: You require an SSH utility to access the command line interface (CLI) of the appliance.

By default, the ADC appliance cannot resolve the host name to its respective IP address. Complete the following tasks to enable the name resolution on the appliance:

1. Define name servers.
2. Define a DNS suffix.

Points to note

Perform the DNS lookup from the CLI. DNS lookups from the shell prompt of the FreeBSD operating system fail because the entry in the /etc/resolv.conf file points to the 127.0.0.2 IP address.

The following commands are replaced with the `drill` command in the FreeBSD CLI of the appliance reachable with the `shell` command:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
-  host

-  dig

-  getent/MIP

-  nslookup
```

For example, instead of running `dig www.google.com @8.8.8.8` to query the "A" record "www.google.com" at the name server "8.8.8.8", you can run `drill www.google.com @8.8.8.8` command. The `drill` command performs exactly the same as the `dig` command does.

```
root@lab# drill www.google.com @8.8.8.8

;; ->>HEADER<<- opcode: QUERY, rcode: NOERROR, id: 57980

;; flags: qr rd ra ; QUERY: 1, ANSWER: 1, AUTHORITY: 0, ADDITIONAL: 0

;; QUESTION SECTION:

;; www.google.com. IN A

;; ANSWER SECTION:

www.google.com. 300 IN A 142.250.187.196

;; AUTHORITY SECTION:

;; ADDITIONAL SECTION:

;; Query time: 53 msec

;; SERVER: 8.8.8.8
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
;; WHEN: Thu Jun 9 11:04:55 2022

;; MSG SIZE rcvd: 48
```

If the appliance cannot ping the DNS server on its SNIP address, the server status shows as down. Successful ping is important when the appliance is behind a firewall.

CLI configuration

At the command prompt, type:

```
add dns nameServer <Name_Server_IP_Address>

add dns suffix <DNS_Suffix>
```

To verify the configuration, type:

```
show dns nameServer

show dns suffix
```

To test DNS resolution, type:

```
show dns addrec <Host_Name>
```

GUI configuration

1. Navigate to **Traffic Management > DNS > Names Servers > Add**.
2. In the **Create Name Server** dialog box enter the name server IP Address and click **Create**.
3. Navigate to **Traffic Management > DNS > DNS Suffix > Add**.
4. In the **Create DNS Suffix** dialog box, enter the DNS Suffix, such as example.com, to be used for all host queries and click **Create**.

Round Robin DNS

When a client sends a DNS request to find the DNS resource record, it receives a list of IP addresses resolving to the name in the DNS request. The client then uses one of the IP addresses

© 1997–2026 Citrix Systems, Inc. All rights reserved.

in the list, generally, the first record or IP address. Hence, a single server is used for the total TTL of the cache and is overloaded when many requests arrive.

When the NetScaler receives a DNS request, it responds by changing the order of the list of DNS resource records in a round robin method. This feature is called *round robin DNS*. Round robin distributes the traffic equally between data centers. The NetScaler performs this function automatically. You do not have to configure this behavior.

Functional Overview

If the NetScaler is configured as an ADNS server, it returns the DNS records in the order in which the records are configured. When the NetScaler is configured as a DNS proxy, it returns the DNS records in the order in which it receives the records from the server. The order of the records present in the cache matches the order in which records are received from the server.

The NetScaler then changes the order in which records are sent in the DNS response in a round robin method. The first response contains the first record in sequence, the second response contains the second record in sequence, and the order continues in the same sequence. Thus, clients requesting the same name can connect to different IP addresses.

Round Robin DNS Example

As an example of round robin DNS, consider DNS records that have been added as follows:

```
add dns addRec ns1 1.1.1.1  add dns addRec ns1 1.1.1.2  add dns addRec ns1
1.1.1.3  add dns addRec ns1 1.1.1.4
```

The domain, abc.com is linked to an NS record as follows:

```
add dns nsrec abc.com. ns1
```

When the NetScaler receives a query for the A record of ns1, the Address records are served in a round robin method as follows. In the first DNS response, 1.1.1.1 is served as the first record:

```
ns1.                    1H IN A         1.1.1.1  ns1.
 1H IN A         1.1.1.2  ns1.                    1H IN A         1.1.1.3
 ns1.                    1H IN A         1.1.1.4
```

In the second DNS response, the second IP address, 1.1.1.2 is served as the first record:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
ns1.                    1H IN A         1.1.1.2  ns1.
 1H IN A         1.1.1.3  ns1.                    1H IN A         1.1.1.4
 ns1.                    1H IN A          1.1.1.1
```

In the third DNS response, the third IP address, 1.1.1.2 is served as the first record:

```
ns1.                    1H IN A         1.1.1.3  ns1.
 1H IN A         1.1.1.4  ns1.                    1H IN A         1.1.1.1
 ns1.                    1H IN A          1.1.1.2
```

Configure DNS resource records

You configure resource records on the Citrix® ADC appliance when you configure the appliance as an ADNS server for a zone. You can also configure resource records on the appliance if the resource records belong to a zone for which the appliance is a DNS proxy server. On the appliance, you can configure the following record types:

- Service records
- AAAA records
- Address records
- Mail Exchange records
- Name Server records
- Canonical records
- Pointer records
- NAPTR records
- Start of Authority records
- Text records
- Certificate Authority Authorization (CAA) records

The following table lists the record types that you can configure for a domain name record on the NetScaler appliance. For example, you can configure a maximum of 25 IP addresses for one record.

Table 1. Record Type and Number Configurable

© 1997–2026 Citrix Systems, Inc. All rights reserved.

RECORD TYPE	NUMBER OF RECORDS
Address (A)	25
IPv6 (AAAA)	5
Mail exchange (MX)	12
Name server (NS)	16
Service (SRV)	8
Pointer (PTR)	20
Canonical name (CNAME)	1
Start of Authority (SOA)	1
Text (TXT)	20
Naming Authority Pointer (NAPTR)	20
Certificate Authority Authorization (CAA)	20

NOTE:

The maximum number of IP addresses for a specific host name is 25. However, the number of different address records can be more than 25.

Create SRV records for a service

The SRV record provides information about the services available on the NetScaler appliance. An SRV record contains the following information:

- Name of the service and the protocol
- Domain name
- TTL
- DNS class
- Priority of the target
- Weight of records with the same priority

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Port of the service
- Host name of the service.

The NetScaler chooses the SRV record that has the lowest priority setting first. If a service has multiple SRV records with the same priority, clients use the weight field to determine which host to use.

Add an SRV record by using the CLI

At the command prompt, type the following commands to add an SRV record and verify the configuration:

```
-  add dns srvRec <domain> <target> -priority <positive_integer> -weight
<positive_integer> -port <positive_integer> [-TTL <secs>]

-  sh dns srvRec <domain>
```

Example:

```
> add dns srvRec _http._tcp.example.com nameserver1.com -priority 1
-weight 1 -port 80

 Done

> show dns srvRec _http._tcp.example.com

1)      Domain Name : _http._tcp.example.com

        Target Host : nameserver1.com

        Priority : 1    Weight : 1

        Port : 80       TTL : 3600 secs

 Done
```

Modify or remove an SRV record by using the CLI

- To modify an SRV record, type:
    - The `set dns srvRec` command

© 1997–2026 Citrix Systems, Inc. All rights reserved.

    - The name of the domain for which the SRV record is configured
    - The name of the target host that hosts the associated service
    - The parameters to be changed, with their new values

- To remove an SRV record, type:
    - The `rm dns srvRec` command
    - The name of the domain for which the SRV record is configured
    - The name of the target host that hosts the associated service

Configure an SRV record by using the GUI

Navigate to **Traffic Management > DNS > Records > SRV Records** and create an SRV record.

Create AAAA records for a domain name

An AAAA resource record stores a single IPv6 address.

Add an AAAA record by using the CLI

At the command prompt, type the following commands to add an AAAA record and verify the configuration:

```
-  add dns aaaaRec <hostName> <IPv6Address> ... [-TTL <secs>]

-  show dns aaaaRec <hostName>
```

Example:

```
> add dns aaaaRec www.example.com 2001:0db8:0000:0000:0000:0000:1428:57ab

 Done

> show dns aaaaRec www.example.com

1)      Host Name : www.example.com

        Record Type : ADNS              TTL : 5 secs

        IPV6 Address : 2001:db8::1428:57ab
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Done
```

To remove an AAAA record and all the IPv6 addresses associated with the domain name, type the `rm dns aaaaRec` command and the domain name for which the AAAA record is configured. To remove only a subset of the IPv6 addresses associated with the domain name in an AAAA record, type the following:

- `rm dns aaaaRec` command
- The domain name for which the AAAA record is configured
- The IPv6 addresses that you want to remove

Add an AAAA record by using the GUI

Navigate to **Traffic Management > DNS > Records > AAAA Records** and create an AAAA record.

Create address records for a domain name

Address (A) records are DNS records that map a domain name to an IPv4 address.

You cannot delete Address records for a host participating in global server load balancing (GSLB). However, the NetScaler deletes Address records added for GSLB domains when you unbind the domain from a GSLB virtual server. Only user-configured records can be deleted manually. You cannot delete a record for a host referenced by records such as NS, MX, or CNAME.

Add an Address record by using the CLI

At the command prompt, type the following commands to add an Address record and verify the configuration:

```
-  add dns addRec <hostName> <IPAddress> [-TTL <secs>]

-  show dns addRec <hostName>
```

Example:

```
> add dns addRec ns.example.com 192.0.2.0

 Done
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
> show dns addRec ns.example.com

1)      Host Name : ns.example.com

        Record Type : ADNS                      TTL : 5 secs

        IP Address : 192.0.2.0

 Done
```

To remove an Address record and all the IP addresses associated with the domain name, type the `rm dns addRec` command and the domain name for which the Address record is configured. To remove only a subset of the IP addresses associated with the domain name in an Address record, type the following:

- `rm dns addRec` command
- The domain name for which the Address record is configured
- The IP addresses that you want to remove

Add an Address record by using the GUI

Navigate to **Traffic Management > DNS > Records > Address Records** and create an Address record.

Create MX records for a mail exchange server

Mail Exchange (MX) records are used to direct email messages across the Internet. An MX record contains an MX preference that specifies the MX server to be used. The MX preference values range from 0 through 65536. An MX record contains a unique MX preference number. You can set the MX preference and the TTL values for an MX record.

When an email message is sent through the Internet, a mail transfer agent sends a DNS query requesting the MX record for the domain name. This query returns a list of host names of mail exchange servers for the domain, along with a preference number. If there are no MX records, the request is made for the Address record of that domain. A single domain can have multiple mail exchange servers.

Add an MX record by using the CLI

At the command prompt, type the following commands to add an MX record and verify the configuration:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
-  add dns mxRec <domain> -mx <string> -pref <positive_integer> [-TTL
<secs>]

-  show dns mxRec <domain>
```

Example:

```
> add dns mxRec example.com -mx mail.example.com -pref 1

 Done

> show dns mxRec example.com

1)      Domain : example.com    MX Name : mail.example.com

        Preference :   1        TTL : 5 secs

 Done
```

Modify or remove an MX record by using the CLI

- To modify an MX record, type the `set dns mxRec` command, the name of the domain for which the MX record is configured, the name of the MX record, and the parameters to be changed, with their new values.
- To set the TTL parameter to its default value, type the `unset dns mxRec` command, the name of the domain for which the MX record is configured, the name of the MX record, and -TTL without any TTL value. You can use the `unset dns mxRec` command to unset only the TTL parameter.
- To remove an MX record, type the `rm dns mxRec` command, the name of the domain for which the MX record is configured, and the name of the MX record.

Add an MX record by using the GUI

Navigate to **Traffic Management > DNS > Records > Mail Exchange Records** and create an MX record.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Create NS Records for an authoritative server

Name Server (NS) records specify the authoritative server for a domain. You can configure a maximum of 16 NS records. You can use an NS record to delegate the control of a subdomain to a DNS server.

Create an NS record by using the CLI

At the command prompt, type the following commands to create an NS record and verify the configuration:

```
-  add dns nsRec <domain> <nameServer> [-TTL <secs>]

-  show dns nsRec <domain>
```

Example:

```
> add dns nsRec example.com nameserver1.example.com

 Done

> show dns nsRec example.com

1)      Domain : example.com    NameServer : nameserver1.example.com

        TTL : 5 sec

 Done
```

To remove an NS record, type the `rm dns nsRec` command, the name of the domain to which the NS record belongs, and the name of the name server.

Create an NS record by using the GUI

Navigate to **Traffic Management > DNS > Records > Name Server Records** and create an NS record.

Create CNAME records for a subdomain

A canonical name record (CNAME record) is an alias for a DNS name. These records are useful when multiple services query the DNS server. The host that has an address (A) record cannot have a CNAME record.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Sometimes, a NetScaler appliance in proxy mode requests an address record from the cache instead of the server.

Add a CNAME record by using the CLI

At the command prompt, type the following commands to create a CNAME record and verify the configuration:

```
-  add dns cnameRec <aliasName> <canonicalName> [-TTL <secs>]

-  show dns cnameRec <aliasName>
```

Example:

```
> add dns cnameRec www.example.com www.examplenw.com

 Done

> show dns cnameRec www.example.com

        Alias Name      Canonical Name  TTL

1)      www.example.com        www.examplenw.com       5 secs

 Done
```

To remove a CNAME record for a given domain, type the `rm dns cnameRec` command and the alias of the domain name.

Add a CNAME record by using the GUI

Navigate to **Traffic Management > DNS > Records > Canonical Records** and create a CNAME record.

Cache CNAME records

When deployed in a proxy mode, the ADC appliance does not always send the query for an address record to the back-end server. This behavior occurs when for an answer to a query for an address record, a partial CNAME chain is present in the cache. There are few conditions in which the ADC caches the partial CNAME record and serves the query from the cache. Following are the conditions:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- NetScaler must be deployed in a proxy mode.
- The response from the back-end server must have a CNAME chain, for which the record type of the last entry in the answer section must be a CNAME and the question type not a CNAME.
- The response from the back-end server cannot be a No-data or NX-Domain.
- The response from the back-end server has to be an authoritative response.

Create NAPTR records for telecommunications domain

NAPTR (Naming Address Pointer) is one of the most commonly used DNS records in the telecommunications domain. NAPTR records map the Internet telephony address space to the Internet address space. They therefore enable a mobile device to send a request to the correct server. The combination of NAPTR records with Service Records (SRV) allows the chaining of multiple records to form complex rewrite rules that produce new domain labels or uniform resource identifiers (URIs). The DNS code for NAPTR is 35.

NetScalers support NAPTR in two modes: ADNS mode and proxy mode. In proxy mode, the ADC caches the response from the servers and uses the cached records to server future queries. A maximum of 20 NAPTR records can be added for a particular domain in NetScaler. NetScaler caches the reply to a DNS NAPTR record query. Any subsequent requests for the NAPTR record are served from the cache.

Create a NAPTR record by using CLI

At the command prompt, type the following commands to add a NAPTR record and verify the configuration:

```
add dns naptrRec <order> <preference>[flags<string>]services<string>[-TTL<secs>]
```

Remove a NAPTR record by using CLU

```
rm dns naptrRec<domain> (<order> <preference> [-flags <string>] [-services <string>] (-regexp <expression> | -replacement <string>) ) | -recordId <positive_integer>@)
```

Configure a NAPTR record using GUI

Navigate to **Traffic Management > DNS > Records > NAPTR Records** and create an NAPTR record.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Create PTR records for IPv4 and IPv6 addresses

A pointer (PTR) record translates an IP address to its domain name. IPv4 PTR records are represented by the octets of an IP address in reverse order with the string "in-addr.arpa." appended at the end. For example, the PTR record for the IP address 1.2.3.4 is 4.3.2.1.in-addr.arpa.

IPv6 addresses are reverse mapped under the domain IP6.ARPA. IPv6 reverse-maps use a sequence of nibbles separated by dots with the suffix ".IP6.ARPA" as defined in RFC 3596. For example, the reverse lookup domain name corresponding to the address, 4321:0:1:2:3:4:567:89ab would be b.a.9.8.7.6.5.0.4.0.0.0.3.0.0.0.2.0.0.0.1.0.0.0.0.0.0.0.1.2.3.4.IP6.ARPA.

Add a PTR record by using the CLI

At the command prompt, type the following commands to add a PTR record and verify the configuration:

```
-  add dns ptrRec <reverseDomain> <domain> [-TTL <secs>]

-  show dns ptrRec <reverseDomain>
```

Example:

```
> add dns ptrRec 0.2.0.192.in-addr.arpa example.com

 Done

> show dns ptrRec 0.2.0.192.in-addr.arpa

1)      Reverse Domain Name : 0.2.0.192.in-addr.arpa

        Domain Name : example.com               TTL : 3600 secs

 Done
```

To remove a PTR record, type the `rm dns ptrRec` command and the reverse domain name associated with the PTR record

Add a PTR record by using the GUI

Navigate to **Traffic Management > DNS > Records > PTR Records** and create a PTR record.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Create SOA records for authoritative information

A Start of Authority (SOA) record is created only at the zone apex and contains information about the zone. The record includes, among other parameters, the primary name server, contact information (email), and default (minimum) time-to-live (TTL) values for records.

Create an SOA record by using the CLI

At the command prompt, type the following commands to add an SOA record and verify the configuration:

```
-  add dns soaRec <domain> -originServer <originServerName> -contact
<contactName>

-  sh dns soaRec <do main>
```

Example:

```
> add dns soaRec example.com -originServer nameserver1.example.com
-contact admin.example.com

 Done

> show dns soaRec example.com

1)      Domain Name : example.com

        Origin Server : nameserver1.example.com

        Contact : admin.example.com

        Serial No. : 100        Refresh : 3600 secs     Retry : 3 secs

        Expire : 3600 secs      Minimum : 5 secs        TTL : 3600 secs

 Done
```

Modify or remove an SOA record by using the CLI

- To modify an SOA record, type the `set dns soaRec` command, the name of the domain for which the record is configured, and the parameters to be changed, with their new values.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- To remove an SOA record, type the `rm dns soaRec` command and the name of the domain for which the record is configured.

Configure an SOA record by using the GUI

Navigate to **Traffic Management > DNS > Records > SOA Records** and create an SOA record.

Create TXT records for holding descriptive text

Domain hosts store TXT records for informative purposes. A TXT record's RDATA component, which consists of one or more character strings of variable length, can store practically any information that a recipient might need to know about the domain. It can also include information about the service provider, contact person, email addresses, and associated details. SPF (Sender Policy Framework) protection has been the most prominent use case for the TXT record.

All configuration types (authoritative DNS, DNS proxy, end resolver, and forwarder configurations) on the NetScaler appliance support TXT records. You can add a maximum of 20 TXT resource records to a domain. Each resource record is stored with a unique, internally generated record ID. A TXT resource record can contain up to six strings, each of which can contain up to 255 characters. You can view the ID of a record and use it to delete the record. However, you cannot modify a TXT resource record.

Create a TXT resource record by using the CLI

At the command prompt, type the following commands to create a TXT resource record and verify the configuration:

```
-  add dns txtRec <domain> <string> ... [-TTL <secs>]

-  show dns txtRec [<domain> | -type <type>]
```

Example:

```
> add dns txtRec www.example.com "Contact: Mark" "Email: mark@example.com"
-TTL 36000

 Done

> show dns txtRec www.example.com

1)  Domain : www.example.com    Record id: 13783       TTL : 36000 secs
Record Type : ADNS
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
        "Contact: Mark"

        "Email: mark@example.com"

 Done
```

Split the string in a TXT resource record using CLI

If you have a string that is more than 255 characters, you can split the strings, considering the six string limit. Each string can be of length 254 bytes.

```
add dns txtrec domain.com "string1" "string2" string3" "string4"
```

Example:

```
add dns txtrec exampledomain.com "Contact: Evan" "Email: evan@example.com"
"Contact: Mark" "Email: mark1@example.com"
```

Remove a TXT resource record by using the CLI

At the command prompt, type the following commands to remove a TXT resource record and verify the configuration:

```
-  rm dns txtRec <domain> (<string> ... | -recordId <positive_integer>)

-  show dns txtRec [<domain> | -type <type>]
```

Example: You can use the `show dns txtRec` command first to view the record ID of the TXT resource record that you want to remove, as shown:

```
> show dns txtRec www.example.com

1)  Domain : www.example.com    Record id: 36865       TTL : 36000 secs
Record Type : ADNS

        "Contact: Evan"

        "Email: evan@example.com"

2)  Domain : www.example.com    Record id: 14373       TTL : 36000 secs
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Record Type : ADNS

        "Contact: Mark"

        "Email: mark1@example.com"

 Done
```

The simpler method of deleting a TXT record is to use the record ID. If you want to provide the strings, enter them in the order in which they are stored in the record. In the following example, the TXT record is deleted by using its record ID.

```
>rm dns txtRec www.example.com -recordID 36865

 Done

> show dns txtRec www.example.com

1)  Domain : www.example.com    Record id: 14373       TTL : 36000 secs
Record Type : ADNS

        "Contact: Mark"

        "Email: mark1@example.com"

 Done
```

Configure a TXT record by using the GUI

Navigate to **Traffic Management > DNS > Records > TXT Records** and create a TXT record.

Create CAA records for a domain name

Certificate Authority Authorization (CAA) is a type of DNS record that allows the domain owners to specify which Certificate Authority (CA) can issue SSL certificates for the domain.

A secure connection to a service requires SSL/TLS certificates to ensure the identity of the host and establish a secure channel. Not having CAA records can cause a security risk as anybody can generate a Certificate Signing Request (CSR) for the domain and get the certificate signed by any CA.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

CAA records provide an extra layer of protection to your web presence by allowing the domain owner to declare which certificate authorities are allowed to issue a certificate for the domain. If there is a request for a certificate from a non-authorized CA, then the CAA record notifies the domain owner about the same. If a CAA record is not present for a domain, any CA is allowed to issue the certificate for that domain.

The NetScaler appliance supports DNS CAA records in the following modes:

- **Proxy**: The appliance caches CAA record response from back-end servers and responds to further queries of the same type from the cache.
- **ADNS**: The appliance responds to the CAA record type DNS queries from the configured DNS records.

Note:

- You can add a maximum of 20 CAA records per domain name.
- Recursive resolver and forwarder modes are not supported.

Add a CAA record using the CLI

At the command prompt, type the following command:

```
add dns caaRec <domain> <issuer-string> -tag <tag-string> -flag [None|
Critical] [-TTL <secs>]
```

Example:

```
> add dns caaRec newdomain string1 -tag Issue -flag None [-TTL 3600]
```

Show command details

```
> show dns caaRec

1)  Domain : newdomain  ECS Subnet : None      Record id: 39423 TTL : 3600
secs Record Type : ADNS

Value: string1
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Tag: issue

Flag: NONE

2)  Domain : test.com  ECS Subnet : None      Record id: 2572   TTL : 5
secs    Record Type : ADNS

Value: ca1.test.com

Tag: issue

Flag: NONE
```

To remove a CAA record, type the following command at the command prompt:

```
rm dns caaRec <domain> <issuer-string> -tag <tag-string> | -recordId
<positive_integer>@)
```

Example:

```
rm dns caaRec newdomain -recordId 39423
```

NOTE:

-recordId <positive_integer>@ is not supported in a cluster.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Add a CAA record using the GUI

Navigate to **Traffic Management > DNS > Records > CAA Records** and create an Address record.

View DNS statistics

You can view the DNS statistics generated by the NetScaler appliance. The DNS statistics include runtime, configuration, and error statistics.

View DNS records statistics by using the CLI

At the command prompt, type:

```
stat dns
```

Example:

```
> stat dns

DNS Statistics

Runtime Statistics

Dns queries                          21

Done
```

View DNS records statistics by using the GUI

1. Navigate to **Traffic Management > DNS**.
2. In the details pane, click **Statistics**.

Configure a DNS zone

A DNS zone entity on the NetScaler appliance facilitates the ownership of a domain on the appliance. A zone on the appliance also enables you to implement DNS Security Extensions (DNSSEC) for the zone, or to offload the zone's DNSSEC operations from the DNS servers to the appliance. DNSSEC sign operations are performed on all the resource records in a DNS zone. Therefore, if you want to sign a zone, or if you want to offload DNSSEC operations for a zone, you must first create the zone on the NetScaler appliance.

Create a DNS zone on the appliance in the following scenarios:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- The NetScaler appliance owns all the records in a zone, that is, the appliance is operating as the authoritative DNS server for the zone. The zone must be created with the proxyMode parameter set to NO.
- The NetScaler appliance owns only a subset of the records in a zone. All the other resource records in the zone are hosted on a set of back-end name servers. The appliance is configured as a DNS proxy server for these back-end servers. A typical configuration where the NetScaler appliance owns only a subset of the resource records in the zone is a global server load balancing (GSLB) configuration. The NetScaler appliance owns only the GSLB domain names, while the back-end name servers own all the other records. The zone must be created with the proxyMode parameter set to YES.
- You want to offload DNSSEC operations for a zone from your authoritative DNS servers to the appliance. The zone must be created with the proxyMode parameter set to YES. You might have to configure more settings for the zone.

The current topic describes how to create a zone for the first two scenarios. For more information about how to configure a zone for offloading DNSSEC operations to the appliance, see Offload DNSSEC operations to the NetScaler appliance.

NOTE

If the ADC appliance is operating as the authoritative DNS server for a zone, you must create the Start of Authority (SOA) and name server (NS) records for the zone before you create the zone. If the NetScaler is operating as the DNS proxy server for a zone, SOA and NS records must not be created on the NetScaler appliance. For more information about creating SOA and NS records, see Configure DNS resource records.

When you create a zone, all existing domain names and resource records that end with the name of the zone are automatically treated as a part of the zone. Also, any new resource records created with a suffix that matches the name of the zone are implicitly included in the zone.

Create a DNS zone on the NetScaler appliance by using the CLI

At the command prompt, type the following command to add a DNS zone to the NetScaler appliance and verify the configuration:

```
-  add dns zone <zoneName> -proxyMode ( YES | NO )

-  show dns zone [<zoneName> | -type <type>]
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Example:

```
> add dns zone example.com -proxyMode Yes

 Done

> show dns zone example.com

          Zone Name : example.com

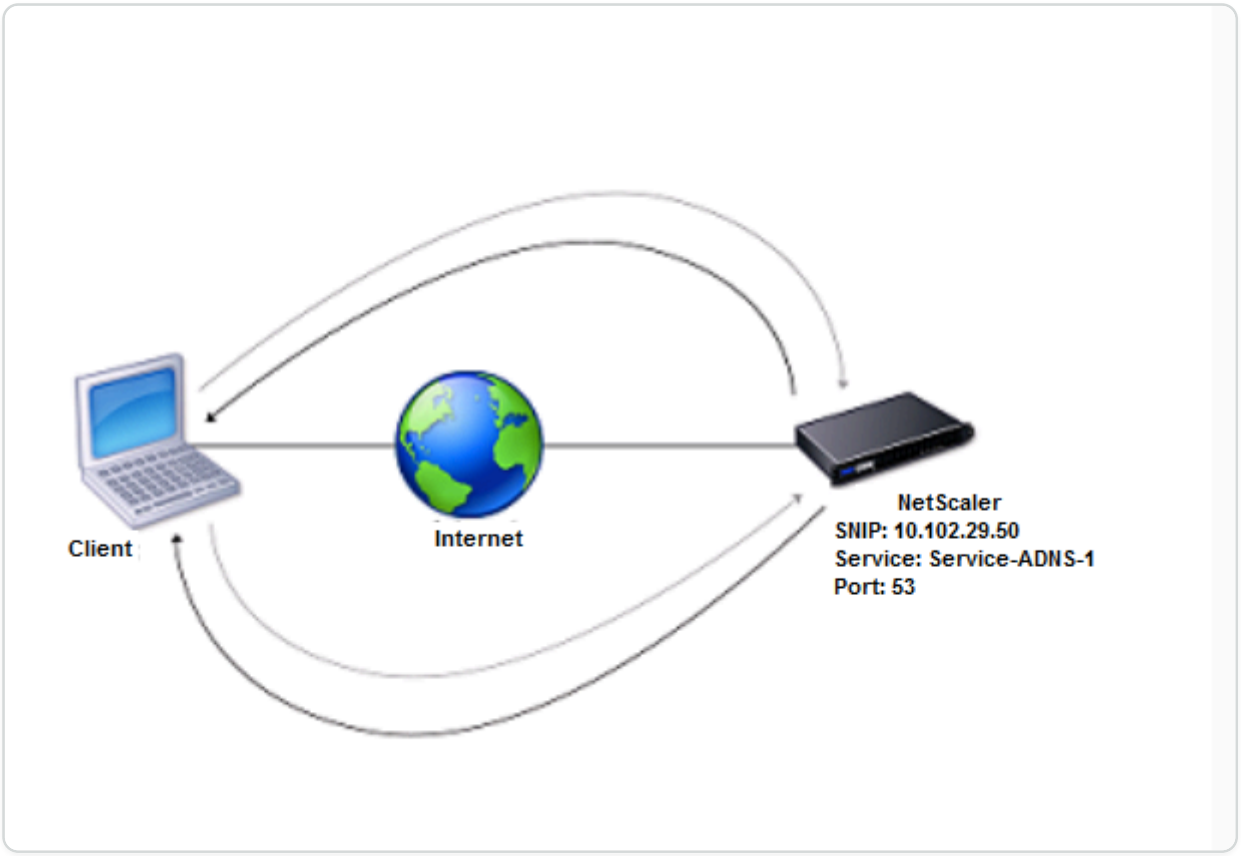
          Proxy Mode : YES

Done
```

Modify or remove a DNS zone by using the CLI

- To modify a DNS zone, type the `set dns zone` command, the name of the DNS zone, and the parameters to be changed, with their new values.
- To remove a DNS zone, type the `rm dns zone` command and the name of the DNS zone.

Configure a DNS zone by using the GUI



Navigate to **Traffic Management > DNS > Zones** and create a DNS zone.

Configure the NetScaler as an ADNS server

You can configure the ADC appliance to function as an authoritative domain name server (ADNS) for a domain. As an ADNS server for a domain, the NetScaler resolves DNS requests for all types of DNS records that belong to the domain. To configure the NetScaler to function as an ADNS server for a domain, you must create an ADNS service and configure NS and Address records for the domain on the NetScaler. The ADNS service can be configured using the subnet IP address (SNIP) or a separate IP address. The following topology diagram shows a sample configuration and the flow of requests and responses.

Figure 1. NetScaler as an ADNS

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The following table shows the parameters that are configured for the ADNS service illustrated in the preceding topology diagram.

ENTITY TYPE	NAME	IP ADDRESS	TYPE	PORT
ADNS Service	Service-ADNS-1	10.102.29.51	ADNS	53

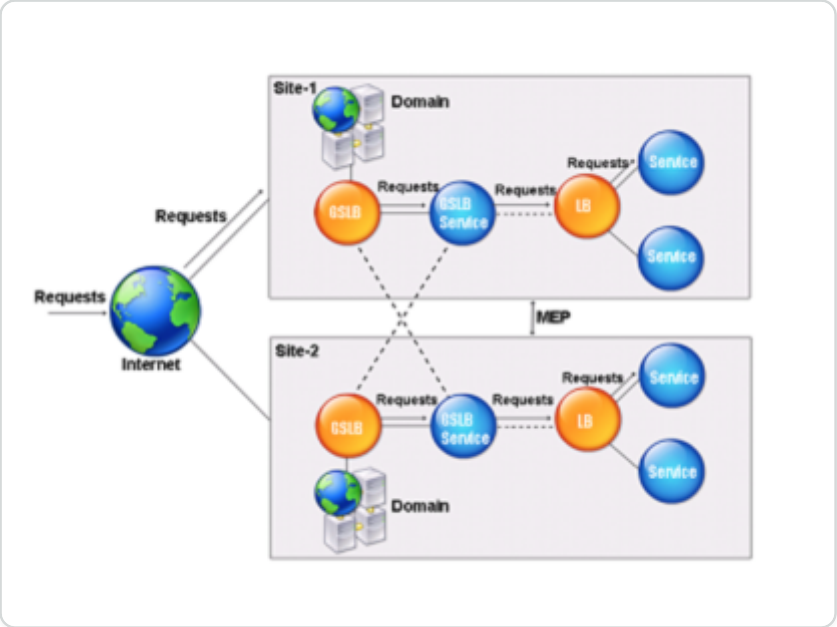


Table 1. Example of ADNS Service Configuration

To configure an ADNS setup, you must configure the ADNS service. For instructions on configuring the ADNS service, see Load balancing.

During DNS resolution, the ADNS server directs the DNS proxy or local DNS server to query the NetScaler for the IP address of the domain. Because the NetScaler is authoritative for the domain, it sends the IP address to the DNS proxy or local DNS server. The following diagram describes the placement and role of the ADNS server in a GSLB configuration.

Figure 2. GSLB Entity Model

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Note: In ADNS mode, if you remove SOA and ADNS records, the following do not function for the domain hosted by the NetScaler: ANY query (for more information about the ANY query, see DNS ANY query), and negative responses, such as NODATA and NXDOMAIN.

Create an ADNS service

An ADNS service is used for global service load balancing. For more information about creating a GSLB setup, see Global server load balancing. You can add, modify, enable, disable, and remove an ADNS service. For instructions on creating an ADNS service, see Configure services.

Note: You can configure the ADNS service to use SNIP or any new IP address.

When you create an ADNS service, the NetScaler responds to DNS queries on the configured ADNS service IP and port.

You can verify the configuration by viewing the properties of the ADNS service. You can view properties such as name, state, IP address, port, protocol, and maximum client connections.

Configure the ADNS setup to use TCP

By default, some clients use the User Datagram Protocol (UDP) for DNS, which specifies a limit of 512 bytes for the payload length of UDP packets. To handle payloads that exceed 512 bytes in size, the client must use TCP. To enable DNS communications over TCP, you must configure the NetScaler appliance to use the TCP protocol for DNS. The NetScaler then sets the truncation bit in the DNS response packets. The truncation bit specifies that the response is too large for UDP and that the client must send the request over a TCP connection. The client then uses the TCP protocol

© 1997–2026 Citrix Systems, Inc. All rights reserved.

on port 53 and opens a new connection to the NetScaler. The NetScaler listens on port 53 with the IP address of the ADNS service to accept the new TCP connections from the client.

To configure the NetScaler to use the TCP protocol, you must configure an ADNS_TCP service. For instructions on creating an ADNS_TCP service, see Load balancing.

IMPORTANT

To configure the NetScaler to use UDP for DNS and use TCP only when the payload length of UDP exceeds 512 bytes, you need to configure the ADNS and ADNS_TCP services. The IP address of the ADNS_TCP service must be the same as the IP address of the ADNS service.

Add DNS resource records

After you create an ADNS service, you can add DNS records. For instructions on adding DNS records, see Configure DNS resource records.

Remove ADNS services

For instructions on removing services, see Load balancing

Configure domain delegation

Domain delegation is the process of assigning responsibility for a part of the domain space to another name server. Therefore, during domain delegation, the responsibility for responding to the query is delegated to another DNS server. Delegation uses NS records.

In the following example, sub1.abc.com is the subdomain for abc.com. The procedure describes the steps to delegate the subdomain to the name server ns2.sub1.abc.com and add an Address record for ns2.sub1.abc.com.

To configure domain delegation, you need to perform the following tasks, which are described in the sections that follow:

1. Create an SOA record for a domain.
2. Create an NS record to add a name server for the domain.
3. Create an Address record for the name server.
4. Create an NS record to delegate the subdomain.
5. Create a glue record for the name server.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Create an SOA record

For instructions on configuring SOA records, see Create SOA records for authoritative information.

Create an NS record for a name server

For instructions on configuring an NS record, see Create NS records for an authoritative server. In the **Name Server** list, select the primary authoritative name server, for example, ns1.abc.com.

Create an address record

For instructions on configuring Address records, see Create address records for a domain name. In the Host Name and IP address text boxes, type the domain name for the DNS Address record and the IP address, for example, ns1.abc.com and 10.102.11.135, respectively.

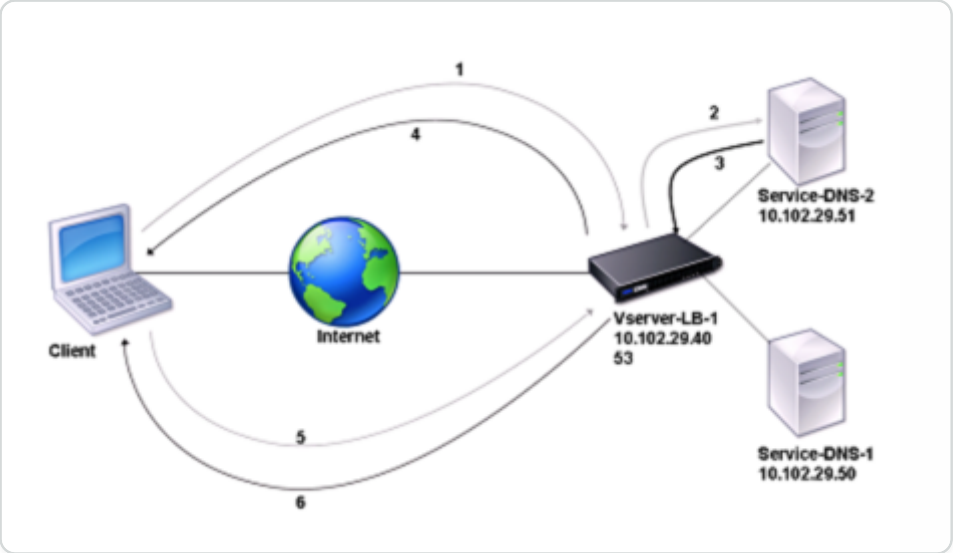
Create an NS record for domain delegation

For instructions on configuring NS records, see Create NS records for an authoritative server. In the **Name Server** list, select the primary authoritative name server, for example, ns2.sub1.abc.com.

Create a glue record

NS records are typically defined immediately after the SOA record (not a restriction.) A domain must have at least two NS records. If an NS record is defined within a domain, it must have a matching Address record. This Address record is referred to as a glue record. Glue records speed up DNS queries.

For instructions on adding glue records for a subdomain, see the procedure for adding an Address (A) record, Configure DNS resource records.



For instructions on configuring Address records, see Create address records for a domain name. In the Host Name and IP address text boxes, type the domain name for the DNS Address record and the IP address, for example, ns2.sub1.abc.com and 10.102.12.135, respectively.

Configure NetScaler as a DNS proxy server

As a DNS proxy server, NetScaler can function as a proxy for either a single DNS server or a group of DNS servers. The flow of requests and responses is illustrated in the following sample topology diagram.

Figure 1. NetScaler as DNS proxy

© 1997–2026 Citrix Systems, Inc. All rights reserved.

By default, NetScaler caches responses from DNS name servers. When the appliance receives a DNS query, it checks for the queried domain in its cache. If the address for the queried domain is present in its cache, the NetScaler returns the corresponding address to the client. Otherwise, it forwards the query to a DNS name server that checks for the availability of the address and returns it to the NetScaler. The NetScaler then returns the address to the client.

For requests for a domain that has been cached earlier, the NetScaler serves the Address record of the domain from the cache without querying the configured DNS server.

The appliance discards a record stored in its cache when the time-to-live (TTL) value of the record reaches the configured value. A client that requests an expired record has to wait until the NetScaler retrieves the record from the server and updates its cache. To avoid this delay, the NetScaler proactively updates the cache by retrieving the record from the server before the record expires.

The following table lists sample names and the values of the entities that need to be configured on the NetScaler.

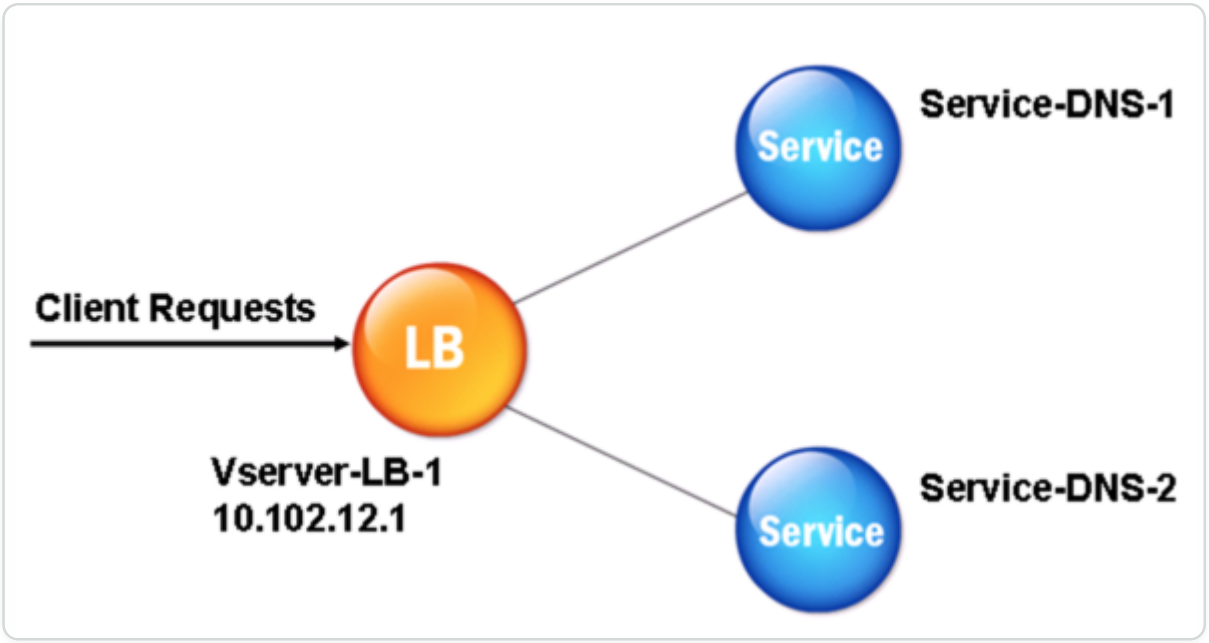


Table 1. Example of DNS Proxy Entity Configuration

ENTITY TYPE	NAME	IP ADDRESS	TYPE	PORT
LB virtual server	Vserver-DNS-1	10.102.29.40	DNS	53
Services	Service-DNS-1	10.102.29.50	DNS	53
Services	Service-DNS-2	10.102.29.51	DNS	53

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The following diagram shows the entities of a DNS Proxy and the values of the parameters to be configured on the NetScaler.

Figure 2. DNS Proxy Entity Model

NOTE

To configure the DNS proxy feature, you need to know how to configure load balancing services and virtual servers.

Create a load balancing virtual server

To configure a DNS Proxy on the NetScaler, configure a load balancing virtual server of type DNS. To configure a DNS virtual server to load balance a set of DNS servers that support recursive queries, you must set the Recursion Available option. With this option, the RA bit is set to ON in the DNS replies from the DNS virtual server.

For instructions on creating a load balancing virtual server, see Load Balancing.

Create DNS services

After creating a load balancing virtual server of type DNS, you must create DNS services. You can add, modify, enable, disable, and remove a DNS service. For instructions on creating a DNS service, see Load Balancing.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Bind a load balancing virtual server to DNS services

To complete the DNS Proxy configuration, you must bind the DNS services to the load balancing virtual server. For instructions on binding a service to a load balancing virtual server, see Load Balancing.

Configure the DNS proxy setup to use TCP

Some clients use the User Datagram Protocol (UDP) for DNS communications. However, UDP specifies a maximum packet size of 512 bytes. When payload lengths exceed 512 bytes, the client must use TCP. When a client sends NetScaler a DNS query, the appliance forwards the query to one of the name servers. If the response is too large for a UDP packet, the name server sets the truncation bit in its response to the NetScaler. The truncation bit indicates that the response is too large for UDP and that the client must send the query over a TCP connection. NetScaler relays the response to the client with the truncation bit intact. It waits for the client to initiate a TCP connection with the IP address of the DNS load balancing virtual server, on port 53. The client sends the request over a TCP connection. NetScaler then forwards the request to the name server and relays the response to the client.

To configure the NetScaler to use the TCP protocol for DNS, you must configure a load balancing virtual server and services, both of type DNS_TCP. You can configure monitors of type DNS_TCP to check the state of the services. For instructions on creating DNS_TCP virtual servers, services, and monitors, see Load Balancing.

For updating the records proactively, the NetScaler uses a TCP connection to the server to retrieve the records.

IMPORTANT

To configure the NetScaler to use UDP for DNS and use TCP only when the payload length of UDP exceeds 512 bytes, you need to configure both DNS and DNS_TCP services. The IP address of the DNS_TCP service must be the same as the IP address of the DNS service.

Configure time-to-live values for DNS entries

The TTL is the same for all DNS records with the same domain name and record type. If the TTL value is changed for one of the records, the new value is reflected in all records of the same domain name and type. The default TTL value is 3600 seconds. The minimum is 0, and the maximum is 604800. If a DNS entry has a TTL value less than the minimum or greater than the maximum, it is saved as the minimum or maximum TTL value, respectively.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Specify the minimum and maximum TTL by using the CLI

At the NetScaler command prompt, type the following commands to specify the minimum and maximum TTL and verify the configuration:

```
-  set dns parameter [-minTTL <secs>] [-maxTTL <secs>]

-  show dns parameter
```

Example:

```
> set dns parameter -minTTL 1200 -maxTTL 1800

 Done

> show dns parameter

        DNS parameters:

        DNS retries: 5

        Minimum TTL: 1200               Maximum TTL: 1800

            .

            .

            .

 Done

>
```

Specify the minimum and maximum TTL by using the GUI

1. Navigate to **Traffic Management > DNS**.
2. In the details pane, under Settings, click Change DNS settings.
3. In the Configure DNS Parameters dialog box, in TTL, in the Minimum and Maximum text boxes, type the minimum and maximum time to live (in seconds), respectively, and then click OK.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Note: When the TTL expires, the record is deleted from the cache. The NetScaler proactively contacts the servers and obtains the DNS record just before the DNS record expires.

Flush DNS records

You can delete all DNS records present in the cache. For example, you might want to flush DNS records when a server is restarted after modifications are made.

Delete all proxy records by using the CLI

At the NetScaler command prompt, type:

```
flush dns proxyRecords
```

Delete all proxy records by using the GUI

1. Navigate to **Traffic Management > DNS > Records**.
2. In the details pane, click Flush Proxy Records.

Add DNS resource records

You can add DNS records to a domain for which NetScaler is configured as a DNS proxy server. For information about adding DNS records, see Configuring DNS Resource Records.

Remove a load balancing DNS virtual server

For information about removing a load balancing virtual server, see Load Balancing.

Limit the number of concurrent DNS requests on a client connection

You can limit the number of concurrent DNS requests on a single client connection, which is identified by the `<clientip:port>-<vserver ip:port>` tuple. Concurrent DNS requests are those requests that NetScaler appiance has forwarded to the name servers and for which the appliance is awaiting responses. Limiting the number of concurrent requests on a client connection enables you to protect the name servers when a hostile client attempts a Distributed Denial of Service (DDoS) attack by sending a flood of DNS requests. When the limit for a client connection is reached, subsequent DNS requests on the connection are dropped until the outstanding request count goes below the limit. This limit does not apply to the requests that NetScaler serves out of its cache.

The default value for this parameter is 255. This default value is sufficient in most scenarios. If the name servers serve many concurrent DNS requests under normal operating conditions, you can specify either a large value or a value of zero (0). A value of 0 disables this feature and specifies

© 1997–2026 Citrix Systems, Inc. All rights reserved.

that there is no limit to the number of DNS requests that are allowed on a single client connection. This parameter is a global parameter and applies to all the DNS virtual servers that are configured on NetScaler.

Specify the maximum number of concurrent DNS requests allowed on a single client connection by using the CLI

At the command prompt, type the following commands to specify the maximum number of concurrent DNS requests allowed on a single client connection and verify the configuration:

```
-  set dns parameter -maxPipeline <positive_integer>

-  show dns parameter
```

Example:

```
> set dns parameter -maxPipeline 1000

 Done

> show dns parameter

        DNS parameters:

        DNS retries: 5

        .

        .

        .

        Max DNS Pipeline Requests: 1000

 Done
```

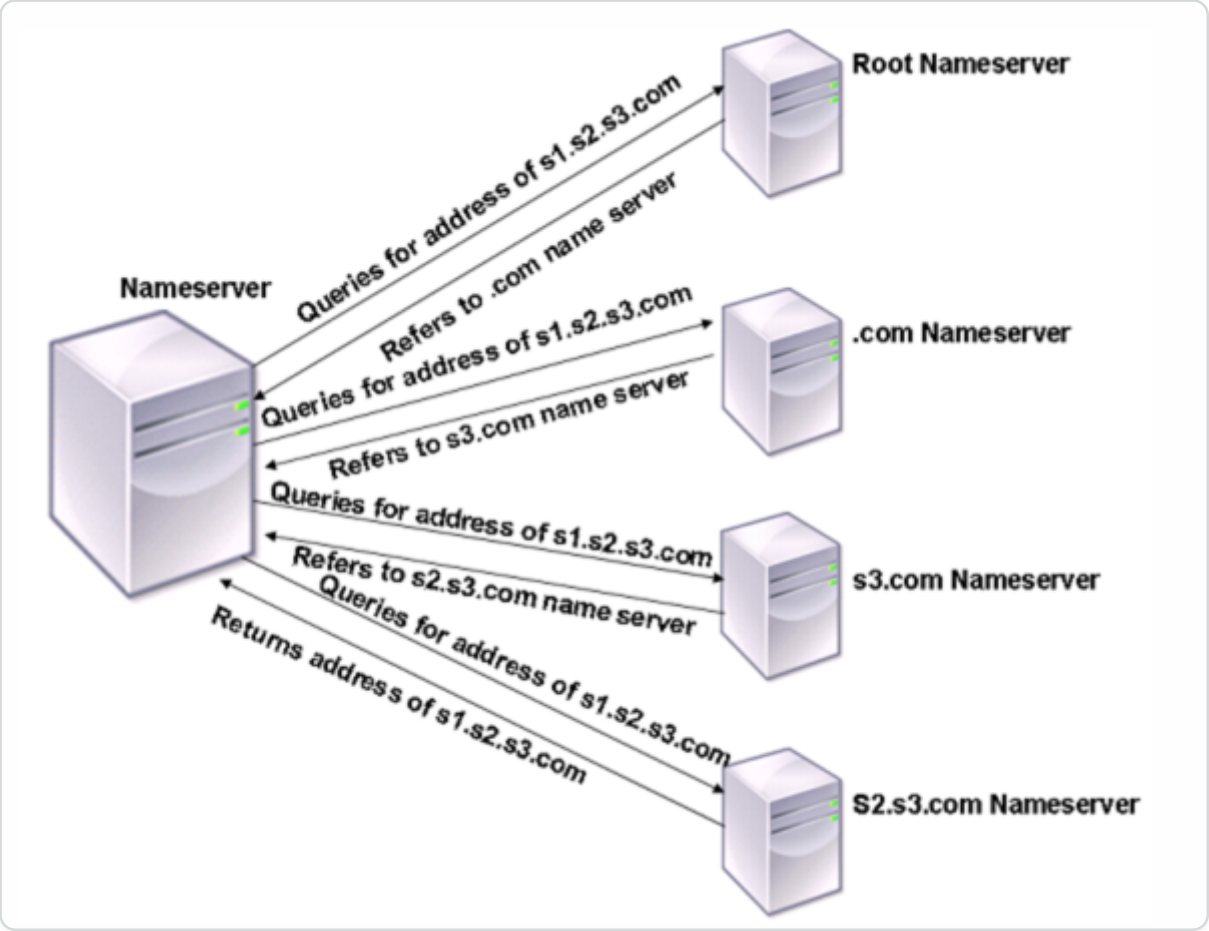
Specify the maximum number of concurrent DNS requests allowed on a single client connection by using the GUI

1. Navigate to **Traffic Management > DNS**.
2. In the details pane, click Change DNS settings.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. In the Configure DNS Parameters dialog box, specify a value for Max DNS Pipeline Requests.
4. Click OK.

Configure the NetScaler as an end resolver



A resolver is a procedure that is invoked by an application program that translates a domain/host name to its resource record. The resolver interacts with the LDNS, which looks up the domain name to obtain its IP address. The NetScaler can provide end-to-end resolution for DNS queries.

In recursive resolution, the NetScaler appliance queries different name servers recursively to access the IP address of a domain. When the NetScaler receives a DNS request, it checks its cache for the DNS record. If the record is not present in the cache, it queries the root servers configured in the ns.conf file. The root name server reports back with the address of a DNS server that has detailed information about the second-level domain. The process is repeated until the required record is found.

When you start the NetScaler appliance for the first time, 13 root name servers are added to the ns.conf file. The NS and Address records for the 13 root servers are also added. You can modify the ns.conf file, but the NetScaler does not allow you to delete all 13 records. At least one name server entry is required for the appliance to perform name resolution. The following diagram illustrates the process of name resolution.

Figure 1. Recursive resolution

© 1997–2026 Citrix Systems, Inc. All rights reserved.

In the process shown in the diagram, when the name server receives a query for the address of s1.s2.s3.com, it first checks the root name servers for s1.s2.s3.com. A root name server reports back with the address of the .com name server. If the address of s1.s2.s3.com is found in the name server, it responds with a suitable IP address. Otherwise, it queries other name servers for s3.com, then for s2.s3.com to retrieve the address of s1.s2.s3.com. In this way, resolution always starts from root name servers and ends with the domain's authoritative name server.

Note

For recursive resolution functionality, caching must be enabled.

Enable recursive resolution

To configure the NetScaler appliance to function as an end resolver, you must enable recursive resolution on the appliance. You must also add a DNS name server with the local option for the feature to work.

Enable recursive resolution by using the CLI

At the command prompt, type the following commands to enable recursive resolution and verify the configuration:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
-  set dns parameter -recursion ENABLED

-  show dns parameter
```

Example:

```
> set dns parameter -recursion ENABLED

 Done

> show dns parameter

        DNS parameters:

            .

            .

            .

        Recursive Resolution : ENABLED

            .

            .

            .

 Done
```

Enable recursive resolution by using the GUI

1. Navigate to **Traffic Management > DNS**.
2. In the details pane, under Settings, click Change DNS settings.
3. In the Configure DNS Parameters dialog box, select the Enable recursion check box, and then click OK.

Add a name server (when the NetScaler appliance acts as a resolver) by using the CLI

At the command prompt, type:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add dns nameServer ((<IP> [-local]) | <dnsVserverName>)
```

Example:

```
add dns nameServer 10.102.9.19 -local

show dns nameServer

1)  10.102.9.19 LOCAL -  State: UP  Protocol: UDP

Done
```

Local - Mark the IP address as one that belongs to a local recursive DNS server on the NetScaler appliance. The appliance recursively resolves queries received on an IP address that is marked as being local. For recursive resolution to work, the global DNS parameter, `recursion`, must also be set. If no name server is marked as being local, the appliance functions as a stub resolver and load balances the name servers.

Add a name server by using the GUI

Navigate to **Traffic Management** > **DNS** > **Name Servers** and create a name server.

Enable DNS root referral

DNS root referral is disabled by default. When enabled, the ADC appliance responds with the root referral records.

Send a root referral if a client queries a domain name that is unrelated to the domains configured/cached on the NetScaler appliance. If the setting is disabled, the appliance sends a blank response instead of a root referral. Applicable to domains for which the appliance is authoritative. Disable the parameter when the appliance is under attack from a client that is sending a flood of queries for unrelated domains.

Enable root referral by using the CLI

At the command prompt, type the following commands to enable recursive resolution and verify the configuration:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
-  set dns parameter -dnsrootReferral ENABLED

-  show dns parameter
```

Example:

```
> set dns parameter -recursion ENABLED

 Done

> show dns parameter

        DNS parameters:

            .

            .

            .

        DNS Root Referral : ENABLED

            .

            .

            .

 Done
```

Enable root referral by using the GUI

1. Navigate to **Traffic Management > DNS**.
2. In the details pane, under **Settings**, click **Change DNS settings**.
3. In the **Configure DNS Parameters** dialog box, select the **Enable Root Referral** check box, and then click **OK**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Set the Number of Retries

Configure the ADC appliance to make a preconfigured number of attempts (called DNS retries) when it does not receive a response from the server to which it sends a query. By default, the number of DNS retries is set to 5.

Set the number of DNS retries by using the CLI

At the command prompt, type the following commands to set the number of retries and verify the configuration:

```
-  set dns parameter -retries <positive_integer>

-  show dns parameter
```

Example:

```
> set DNS parameter -retries 3

 Done

> show dns parameter

        DNS parameters:

        DNS retries: 3

            .

            .

            .

 Done
```

Set the number of retries by using the GUI

1. Navigate to **Traffic Management > DNS**.
2. In the details pane, under Settings, click Change DNS settings.
3. In the Configure DNS Parameters dialog box, in the DNS Retries text box, type the DNS resolver request retry count, and then click OK.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure the NetScaler appliance as a forwarder

A forwarder is a server that forwards DNS queries to DNS servers that are outside the forwarder server's network. Queries that cannot be resolved locally are forwarded to other DNS servers. A forwarder accumulates external DNS information in its cache as it resolves DNS queries. To configure the NetScaler appliance as a forwarder, you must add an external name server.

The NetScaler appliance allows you to add external name servers to which it can forward the name resolution queries that cannot be resolved locally. To configure the NetScaler appliance as a forwarder, you must add the name servers to which it must forward name resolution queries. You can specify the lookup priority to specify the name service that the NetScaler appliance must use for name resolution.

NOTE:

The NetScaler appliance in forwarder mode supports TCP, UDP, and UDP-TCP name servers.

- If you have configured a TCP name server, then the NetScaler appliance sends the DNS request over TCP.
- If you have configured a UDP name server, then the NetScaler appliance sends the DNS request over UDP.
- If you have configured a UDP-TCP name server, then the NetScaler appliance sends the DNS request over UDP. However if the truncated bit is set in the DNS response, the appliance sends such DNS requests over TCP.

Add a name server

You can create a name server by specifying its IP address or by configuring an existing virtual server as the name server.

- **IP address-based name server** - An external name server to contact for domain name resolution. If multiple IP address-based name servers are configured on the appliance, and the local parameter is not set on any of them, incoming DNS queries are load balanced across all the name servers, in round robin fashion.
- **Virtual server-based name server** - A DNS virtual server configured in the NetScaler. For more fine-grained control on how external DNS name servers are load balanced (for example, you want a load balancing method other than round robin), do the following:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Configure a DNS virtual server on the appliance
- Bind the external name servers as its services
- Specify the name of the virtual server in this command.

To verify the configuration, you can use the `show dns nameServer` command.

To remove a name server, at the NetScaler CLI, type the `rm dns nameServer` command followed by the IP address of the name server.

To view the details of the DNS nameserver, at the NetScaler CLI, type the `show dns nameServer` command followed by the IP address of the name server.

Add a name server (when the NetScaler appliance acts as a forwarder) by using the CLI

At the command prompt, type;

```
add dns nameServer ((<IP>) | <dnsVserverName>)
```

Or

```
add dns nameServer ((<IP> | <dnsVserverName>) [-type <type>]
```

Examples:

```
add dns nameServer dnsVirtualNS

add dns nameServer 192.0.2.11 -type TCP

add dns nameServer 192.0.2.12 -type UDP_TCP

add dns nameServer 192.0.2.10
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
show dns nameServer 192.0.2.10

1) 192.0.2.10  -  State: UP  Protocol: UDP

Done
```

NOTE:

If the name server type is not specified, a UDP name server is created by default. To create a name server of type TCP or UDP_TCP, you must specify the type.

When you specify the type as UDP_TCP, two name servers (one UDP name server and one TCP name server) are created for the given IP address.

Add a name server (when the NetScaler appliance acts as a resolver) by using the CLI

Specify the `local` parameter for a recursive resolver. Enable recursion using the `set dns parameter` command.

At the command prompt, type:

```
add dns nameServer ((<IP> [-local]) | <dnsVserverName>)

show dns nameServer

set dns parameter -recursion ENABLED

show dns parameter
```

Example:

```
add dns nameServer 10.102.9.19 -local

show dns nameServer

1)  10.102.9.19 LOCAL -  State: UP  Protocol: UDP
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Done

set dns parameter -recursion ENABLED

Done

show dns parameter

        DNS parameters:

            .

            .

            .

        Recursive Resolution : ENABLED

            .

            .

            .

Done
```

Local - Mark the IP address as one that belongs to a local recursive DNS server on the NetScaler appliance. The appliance recursively resolves queries received on an IP address that is marked as being local. For recursive resolution to work, the global DNS parameter, `recursion`, must also be set. If no name server is marked as being local, the appliance functions as a stub resolver and load balances the name servers.

Add a name server by using the GUI

Navigate to **Traffic Management** > **DNS** > **Name Servers** and create a name server.

Set DNS lookup priority

You can set the lookup priority to either DNS or WINS. This option is used in the SSL VPN mode of operation.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Set the lookup priority to DNS by using the CLI

At the command prompt, type the following commands to set the lookup priority to DNS and verify the configuration:

```
-  set dns parameter -nameLookupPriority (DNS | WINS)

-  show dns parameter
```

Example:

```
> set dns parameter -nameLookupPriority DNS

 Done

> show dns parameter

            .

            .

            .

        Name lookup priority : DNS

            .

            .

            .

 Done
```

Set lookup priority to DNS by using the GUI

1. Navigate to **Traffic Management > DNS**.
2. In the details pane, under **Settings**, click **Change DNS settings**.
3. In the **Configure DNS Parameters** dialog box, under **Name Lookup Priority**, select DNS or WINS, and then click **OK**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE

If the DNS virtual server that you have configured is DOWN and if you set the `-nameLookupPriority` to DNS, the NetScaler does not attempt WINS lookup. Therefore, if a DNS virtual server is not configured or is disabled, set the `-nameLookupPriority` to WINS.

Disable and enable name servers

The following procedure describes the steps to enable or disable an existing name server.

Enable or disable a name server by using the CLI

At the command prompt, type the following commands to enable or disable a name server and verify the configuration:

```
-  (enable | disable) dns nameServer <IPAddress>

-  show dns nameServer <IPAddress>
```

Example:

```
> disable dns nameServer 10.102.9.19

 Done

> show dns nameServer 10.102.9.19

1)       10.102.9.19: LOCAL  -  State: OUT OF SERVICE

 Done
```

Enable or disable a name server by using the GUI

1. Navigate to **Traffic Management > DNS > Name Servers**.
2. In the details pane, select the name server that you want to enable or disable.
3. Click **Enable** or **Disable**. If a name server is enabled, the **Disable** option is available. If a name server is disabled, the **Enable** option is available.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure NetScaler as a non-validating security aware stub-resolver

Starting with NetScaler 12.1 build 49.xx, NetScaler acts as a non-validating security aware stub-resolver. To enable this support, the AD bit is set in the DNS header and the DO bit is unset in the OPT header. When the AD bit is set and the DO bit is unset, the upstream recursive resolver validates the DNSSEC response. If the validation is successful, the recursive resolver responds without DNSSEC RRs. If the DNSSEC validation fails, then the recursive resolver returns with a SERVFAIL response.

IMPORTANT:

The AD bit is set by default in the ADC forwarder. The AD bit is not set for DBS initiated queries.

Jumbo frames support for DNS to handle responses of large sizes

Starting with NetScaler 12.1 build 49.xx, DNS supports jumbo frames for handling UDP responses greater than 1,280 bytes. Previously, the NetScaler appliance only supported UDP packet size only up to 1,280 bytes.

You can set the maximum UDP packet size that the appliance can handle in proxy, ADNS, and forwarder modes by configuring the Maximum UDP Packet Size parameter value. For example, if the Maximum UDP Packet Size parameter value is set to 4096, the appliance can handle DNS response of size 4,096 bytes.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

IMPORTANT

- In proxy mode, the least size between the client request OPT payload size and the Maximum UDP Packet Size value is considered for sending DNS queries to the back end. For example, if the client request OPT payload size is 3000, and the Maximum UDP Packet Size value is 4096, 3,000 bytes DNS queries are sent to the back end.

  Also, from the back end, the appliance can receive responses of large sizes and process responses of large sizes.
- In forwarder mode, the appliance sets the OPT payload size equal to the UDP packet size parameter value.
- If the DNS records are local to the appliance, then the appliance can compose response sizes as large as the Maximum UDP Packet Size parameter value. This setting is applicable for ADNS, proxy, and recursive resolvers.

To configure the maximum UDP packet size using the CLI

At the command prompt, type:

```
set dns parameter [-maxUDPPacketSize <positive_integer>]
```

Example:

```
set dns parameter -maxUDPPacketSize 10000
```

NOTE:

The minimum and maximum value that you can set for the Maximum UDP Packet Size parameter is 512 and 16384 respectively. Default value is 1280.

To configure the maximum UDP packet size using the GUI

1. Navigate to **Traffic Management** > **DNS**.
2. In the details pane, click **Change DNS settings**.
3. In Maximum UDP Packet Size, specify the maximum UDP packet size.
4. Click **OK**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure DNS logging

You can configure the NetScaler appliance to log the DNS requests and responses that it handles. The appliance logs the DNS requests and responses in SYSLOG format. You can choose to log either DNS requests or DNS responses, or both, and send the syslog messages to a remote log server. The log messages can be used to:

- Audit the DNS responses to the client
- Audit DNS clients
- Detect and prevent DNS attacks
- Troubleshoot

A NetScaler appliance can log the following sections in the DNS request or response, based on your configuration:

- Header Section
- Questions Section
- Answer Section
- Authority Section
- **Additional** Section

DNS profiles

You can use a DNS profile to configure the various DNS parameters that you want the DNS endpoint to apply to the DNS traffic. In the profile, you can enable logging, caching, and negative caching.

Important: From the NetScaler 11.0 release, enabling DNS caching using global DNS parameters have been deprecated. You can enable or disable DNS caching using DNS profiles. You can now enable DNS caching for an individual virtual server by enabling DNS caching in a DNS profile and setting the DNS profile to the individual virtual server.

DNS profiles support the following types of DNS logging:

- DNS Query Logging
- DNS Answer Section Logging
- DNS Extended Logging
- DNS Error Logging

© 1997–2026 Citrix Systems, Inc. All rights reserved.

DNS query logging

You can configure a NetScaler appliance to log only the DNS queries that are received by the DNS endpoints on the appliance.

Note: If errors occur during processing of a query, they are logged if this option is set in the DNS profile.

Following is an example of a query log message:

```
DNS DNS_QUERY 143 0 :  U:10.102.27.70#61297:10.102.27.73#53/22142/Q/

(RD)/NO/1/0/0/0#test.com./1#
```

DNS answer section logging

You can configure a NetScaler appliance to log all the **Answer** sections in the DNS responses that the appliance sends to the client. DNS Answer Section logging is useful when the NetScaler is configured as a DNS resolver, or in GLSB use cases.

Following is an example of a DNS answer section log:

```
DNS DNS_RESPONSE 6678 0 :  U:100.100.100.210#32776:100.100.100.10#

53/61373/Q/(RD,AA,RA,R)/NO/1/1/2/4#n1.citrix.com1./

28#ANS#AAAA/120/1111:2345:6789:ffab:abcd:effa:1234:3212##
```

DNS extended logging

To configure a NetScaler appliance to log Authority and **Additional** sections in the DNS responses, enable Extended logging with Answer Section logging.

Note: If errors occur during processing of either queries or responses, the errors are logged if this option is set in the DNS profile.

Following is an example of a message logged when the cache lookup is completed and the response is embedded in the packet:

```
DNS DNS_RESPONSE 2252 0 :  T:100.100.100.118#21411:100.100.100.10

#53/48537/Q/(RD,AA,CD,RA,R)/NO/1/1/2/6#a1.citrix.com1./1#ANS#A/
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```

0/1280/DO##
```

DNS error logging

You can configure a NetScaler appliance to log the errors or failures that occur when it processes a DNS query or response. For these errors, the appliance logs the DNS header, **Question** sections and OPT records.

Following is an example of a message logged when an error occurs during processing of a DNS request or response:

```
DNS DNS_ERROR 149 0 :  U:10.102.27.70#27832:10.102.27.73#53/61153/Q/

(RD)/NO/1/0/0/0#test.com./1140#Packet Dropped
```

Policy based logging

You can configure custom logging based on DNS expressions by configuring the logAction on DNS policies, Rewrite, or Responder policies. You can specify that logging occurs only when a particular DNS policy evaluates to true. For more information, see Configure policy based logging for DNS.

Understand the NetScaler syslog log message format

NetScaler appliance logs DNS requests and responses in the following Syslog format:

```
<transport> :<client IP>#<client ephemeral port>:<DNS endpoint IP>#<port>

 : <query id> /opcode/header flags/rcode/question section count/answer
section count

/ auth section count / additional section count #<queried domain name>
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
/<queried type>#...
```

- **\<transport\>:**
  - T = TCP
  - U = UDP
- **\<client IP\>#\< client ephemeral port \>:** DNS client IP address and port number
- **\<DNS endpoint IP\>#\<port\>:** NetScaler DNS endpoint IP address and port number
- **\<query id\>:** Query ID
- **\<opcode\>:** Operation code. Supported Values:
  - Q: query
  - I: inverse query
  - S: status
  - X0: unassigned
  - N: notify
  - U: update
  - X1-10: unassigned values
- **\<header flags\>:** Flags. Supported Values:
  - RD: recursion desired
  - TC: truncated
  - AA: authoritative response
  - CD: check disabled
  - AD: authenticated data
  - Z: unassigned
  - RA: recursion available
  - R: response
- **\<rcode\>:** Response Code. Supported Values:
  - NO: no error
  - F format error

© 1997–2026 Citrix Systems, Inc. All rights reserved.

    - S: server failure
    - NX: non-existent domain
    - NI: not implemented
    - R: query refused
    - YX: Name Exists when it must not
    - YXR: RR Set Exists when it must not
    - NXR: RR Set that must exist does not
    - NAS: Server Not Authoritative for zone
    - NA: Not Authorized
    - NZ: Name not contained in zone
    - X1-5: unassigned

- **/question section count/answer section count/auth section count/additional section count:** Question section, Authority section count, and **Additional** section count in the DNS request
- **\<queried domain name\>/\<queried type\>:** Queried domain and queried type in the DNS request
- **#ANS#\<record type\>/\<ttl\>/.. #AUTH#\<domain name\>/\<record type\>/ \<ttl\>.. #ADD#\<domain name\>/\<record type\>/\<ttl\>…:**

  In DNS responses:

  Answer Section is logged if answer section logging is enabled in the DNS profile. Authority and **Additional** sections are logged if extended logging is enabled in the DNS profile. The log format would differ depending on the type of record. For more information see Understanding the Record Logging Format.

    - ANS: answer section
    - AUTH: authority
    - ADD: **Additional** section

- **OPT/\<edns version\>/UDP max payload size/DO:** OPT record format in the DNS log
- **OPT/\<EDNS version\>/\<UDP payload size\>/\<"DO"or empty based on whether DNSSEC OK bit is set or not\>/\<value of RDLEN\>/ECS/\<q>/\<option length\>/ \<Family\>/\<Source Prefix-Length\>/\<Scope Prefix-Length\>/\<ECS Address\>:**

© 1997–2026 Citrix Systems, Inc. All rights reserved.

If the DNS query or response includes the EDNS Client Subnet (ECS) option, then that is also logged in the OPT record format in the DNS log file.

When a DNS query with an ECS option that includes either an IPv4 or IPv6 address is sent, the ECS option is logged with either of the following options;

- "ECS/Q" indicating that the values in the log are from the query
- "ECS/R" indicating that the values in the log are from the response.

The value of Scope Prefix-Length is also set appropriately. In the DNS Query, it is set to zero, and for response, it is set to the calculated value.

The following table describes the logged details in various scenarios:

SCENARIO	ECS OPTION SET IN THE DNS QUERY	ECS OPTION SET IN THE DNS RESPONSE	LOGGED DETAILS
Both query logging and extended logging enabled	Yes	Yes	ECS option is logged with the string "ECS/R/" and the Scope Prefix-Length is set to the calculated value.
Both query logging and extended logging enabled	Yes	No	ECS option is logged with the string "ECS/Q" and the Scope Prefix-Length is set to zero.
Query logging is enabled, but extended logging is not enabled	Yes	Yes	ECS option is logged with the string "ECS/Q/" and the Scope Prefix-Length is set to zero.
Query logging & extended logging are not enabled	Yes	Yes	ECS option is not logged.
Query logging is enabled, but	Yes	No	ECS option is logged with the string "ECS/

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SCENARIO	ECS OPTION SET IN THE DNS QUERY	ECS OPTION SET IN THE DNS RESPONSE	LOGGED DETAILS
extended logging is not enabled			Q/" and the Scope Prefix-Length is set to zero.
Query logging is not enabled, but extended logging is enabled	Yes	Yes	ECS option is logged with the string "ECS/R/" and the Scope Prefix-Length is set to the calculated value.
Query logging is not enabled, but extended logging is enabled	Yes	No	ECS option is not logged.

Understand the record logging format

Following is an example of the record logging format in a Syslog message:

```
<domainname>/<record type>/ <record ttl> / <resource record data>#<resource record data>#.....##
```

Where:

RECORD TYPE	SAMPLE FORMAT	RESOURCE RECORD DATA / FORMAT
Address (A) record	A/5/1.1.1.1#1.1.1.2#1.1.1.3##	IPv4 address
AAAA record	AAAA/5/1::1#1::2#1::3##	IPv6 address
SOA record	SOA/3600/ ns1.dnslogging.test./ root.dnslogging.test./ 100/3600/3/3600/5##	Origin server, contact, and other details. Resource record format is: <originServer>/<contact>/ <serial number>/<refresh

© 1997–2026 Citrix Systems, Inc. All rights reserved.

RECORD TYPE	SAMPLE FORMAT	RESOURCE RECORD DATA / FORMAT
		rate>/<retry>/<expire>/ <minimum>##
NS record	NS/5/ns1.dnslogging.test	Host name of the nameserver.
MX record	#MX/5/10/ host1.dnslogging.test.#11/ host2.dnslogging.test.##	Preference followed by mail exchange server host name
CNAME record logging	CNAME/5/ host1.dnslogging.test.##	Canonical name
SRV record	SRV/5/1/2/3/ host1.dnslogging.test.#4/5/6/ host2.dnslogging.test.##	Resource record format: <priority>/<weight>/<port>/ <target>#
TXT record	TXT/5/dns+logging##	Data comprises all the texts.
NAPTR record	NAPTR/5/10/11//// dnslogging#20/21/R/SIP// sip.dnslogging.test##	Resource record format: <order>/<preference>/ <flags>/<services>/<regular expression>/<replacement string>#

RECORD TYPE	SAMPLE FORMAT	RESOURCE RECORD DATA / FORMAT
	fC8cnEHAS2/4W1FEPpRTyYtcdBq6Uc2orBaaxjhsZELvRcWMr+pDc=#1/3/5/AwEAAbJhKdI21LP0pPxv0k1pFBNClZW97TB4FlCW4e4Fuyq7rY7+aiYdDVxV8N9ZXt4RT3MdNznMVMl/R1ldWLjbCf5bFu9khaM1ME8I25HPTS3J2wK5rjj4HMFRMycUKZCK0UOgyUzd6Fm5b3G04wMIAoqkDHeqlwe7yWGaw94NbZuL##	
PTR record	PTR/3600/test.com.#test4.com.##	Domain name

Limitations of DNS logging

DNS logging has the following limitations:

- If response logging is enabled, only the following record types are logged:
  - Address (A) record
  - AAAA record
  - SOA record
  - NS record
  - MX record
  - CNAME record
  - SRV record
  - TXT record
  - NAPTR record
  - DNSKEY record
  - PTR record

  For all other record types, only L3/L4 parameters, DNS Header, and Question section are logged.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- RRSIG records are not logged even if response logging is enabled.
- DNS64 is not supported.
- DNS proactive update requests or responses are logged according to the settings in the default profile.
- On the virtual server, if the sessionless option and response logging is enabled, L3/L4 parameters, DNS Header, and DNS Question section are logged instead of the response.
- The maximum size of the syslog message is 1024 bytes.
- If you have set a DNS profile for a DNS policy with action type Rewrite Response, the NetScaler appliance does not log the query or the manipulated responses. To log the required information you must use an audit message action in the DNS policy.
- DNS transactions that are due to DNS monitoring traffic are not logged.

Configuring DNS logging

Following is an overview of configuring DNS logging:

1. Create a Syslog action and enable DNS in the action.
2. Create a Syslog policy and specify the Syslog action in the policy.
3. Globally bind the Syslog policy to enable logging of all NetScaler system events. Or, bind the Syslog policy to a specific load balancing virtual server.
4. Create a DNS profile and define any of the following types of logging that you want to enable:
    - DNS Query Logging
    - DNS Answer Section Logging
    - DNS Extended Logging
    - DNS Error Logging
5. Configure any of the following, based on your requirement:
    - DNS service and virtual server for DNS
    - ADNS service
    - NetScaler as a forwarder
    - NetScaler as a resolver
6. Set the created DNS profile to one of the DNS entities.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure DNS logging for NetScaler configured as DNS Proxy by using the CLI

1. Add a syslog action and enable DNS in the action. At the command prompt, type:

```
add audit syslogAction <name> (<serverIP> | -lbVserverName <string>) [-
serverPort <port>] -logLevel <logLevel> ... [-dateFormat <dateFormat>]
[-logFacility <logFacility>] [-tcp ( NONE | ALL )] [-acl ( ENABLED |
DISABLED )] [-timeZone ( GMT_TIME | LOCAL_TIME )] [-userDefinedAuditlog
( YES | NO )] [-appflowExport ( ENABLED |DISABLED )] [-lsn ( ENABLED |
DISABLED )] [-alg ( ENABLED | DISABLED )] [-transport ( TCP | UDP )] [-
tcpProfileName <string>] [-maxLogDataSizeToHold <positive_integer>] [-
dns ( ENABLED | DISABLED)]
```

   Example:

   `add audit syslogAction nssyslogact1 10.102.151.136 -logLevel CRITICAL ERROR WARNING NOTICE INFORMATIONAL DEBUG -logFacility LOCAL4 -timeZone LOCAL_TIME -dns ENABLED`

2. Create a syslog policy and specify the created syslog action in the policy. At the command prompt, type:

   `add audit syslogPolicy <name> <rule> <action>`

   Example:

   `add audit syslogPolicy syslogpol1 ns_true nssyslogact1`

3. Bind the syslog policy globally. At the command prompt, type:

   `bind audit syslogGlobal -policyName <string> [-priority <positive_integer>]`

   Example:

   `bind audit syslogGlobal syslogpol1`

4. Create a DNS profile and enable any of the following type of logs that you want to configure:

   - DNS Query Logging
   - DNS Answer Section Logging
   - DNS Extended Logging
   - DNS Error Logging

   At the command prompt, type:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add dns profile <dnsProfileName> [-dnsQueryLogging ( ENABLED | DISABLED )] [-dnsAnswerSecLogging ( ENABLED | DISABLED )] [-dnsExtendedLogging (ENABLED | DISABLED )] [-dnsErrorLogging ( ENABLED | DISABLED )] [-cacheRecords ( ENABLED | DISABLED )] [-cacheNegativeResponses ( ENABLED | DISABLED )]
```

Example:

```
add dns profile dnsprofile1 -dnsQueryLogging ENABLED
```

5. Configure a service of type DNS. At the command prompt, type:

```
add service <name> <serverName> <serviceType> <port>
```

Example:

```
add service svc1 10.102.84.140 dns 53
```

6. Configure a load balancing virtual server of service type DNS.

```
add lb vserver <name> <serviceType> <ip> <port>
```

Example:

```
add lb vserver lb1 dns 100.100.100.10 53
```

7. Bind the service to the virtual server. At the command prompt, type:

```
bind lb vserver <name> <serviceName>
```

Example:

```
bind lb vserver lb1 svc1
```

8. Set the created DNS profile to the virtual server. At the command prompt, type:

```
set lb vserver <name> [ - dnsProfileName <string>]
```

Example:

```
set lb vserver lb1 –dnsProfileName dnsprofile1
```

Done

> bind audit syslogGlobal syslogpol1

Done

> add dns profile dnsprofile1 -dnsqueryLogging ENABLED

Done

> set dns parameter -recursion enABLED

Done
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
> add nameserver 1.1.1.100 -local dnsProfileName dnsprofile1

Done
```

Configure policy based logging for DNS

Policy based logging enables you to specify a format for log messages. The contents of a log message are defined by using an Advanced policy expression. When the message action specified in the policy is performed, the NetScaler appliance constructs the log message from the expression and writes the message to the log file. You can configure the appliance to log only when a particular DNS policy evaluates to True.

NOTE

If you have set a DNS policy with a DNS profile for the request side, the NetScaler appliance logs only the query.

To configure policy based logging for a DNS policy, you must first configure an audit message action. For more information about configuring an audit message action, see Configure the NetScaler appliance for audit logging. After configuring the audit message action, specify the message action in a DNS policy.

Configure policy based logging for a DNS policy by using the CLI

At the command prompt, type the following commands to configure policy based logging for a DNS policy and verify the configuration:

```
-  add dns action <actionName> <actionType> [-IPAddress <ip_addr|
ipv6_addr> ... | -viewName <string> | -preferredLocList <string> ...] [-
TTL <secs>] [-dnsProfileName <string>]

-  set dns policy <name> [<rule>] [-actionName <string>] [-logAction
<string>]

-  show dns policy [<name>]
```

Example 1:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

In a GSLB deployment, if you want to respond with different IP addresses to the client requests coming from a particular subnet, instead of responding with IP addresses used for general purposes (such as the IP addresses of internal users), you can configure a DNS policy with the action type as DNS view. In this case, you can configure DNS logging on the specified DNS action such that you can log the specific responses.

```
> add dns profile dns_prof1 -dnsqueryLogging enABLED -dnsanswerSecLogging
enABLED

 Done

> add dns view dns_view1

 Done

> add dns action dns_act1 viewName -view dns_view1 –dnsprofilename
dns_prof1

 Done

> add dns policy dns_pol1
"CLIENT.IP.SRC.APPLY_MASK(255.255.255.0).EQ(100.100.100.0)”

dns_act1

 Done

> bind dns global dns_pol1 100 -gotoPriorityExpression END -type
REQ_DEFAULT

 Done

> bind gslb service site_1_svc -viewName dns_view1 123.1.1.1

 Done

> bind gslb service site_5_svc -view dns_view1 132.1.1.1

 Done
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE:

In the preceding configuration, if you query for the domain configured on a GSLB virtual server, for example, *sampletest.com*, all the internal users of subnet 100.100.100.0/24 are served with the DNS view IP addresses, and the responses are logged. Client requests for other subnets are not logged.

Example 2:

If you want to log only the queries for the domain *example.com*, you can create a DNS profile with query logging enabled and set the DNS profile to a DNS action with the action type **NOOP**, and then create a DNS policy and set the DNS action. For example:

```
>add dns profile query_logging -dnsqueryLogging ENABLED

Done

>add dns action dns_act1 NOOP -dnsprofileName query_logging

Done

>add dns policy dns_pol1 DNS.REQ.QUESTION.DOMAIN.EQ("example.com")
 dns_act1

Done
```

Configure log action for the DNS policy to log client IP address

Logging action can be used to log the source IPs for the DNS queries using the following expression and use it as part of the log action in the DNS policy.

```
> add audit messageaction log_act_custom INFORMATIONAL "\"ClientIP:
\"CLIENT.IP.SRC\" ECS IP:\"+((DNS.REQ.OPT.ECS.IP).typecast_text_t ALT
\"NONE\")"

Done
```

The earlier expression captures both the source IP as in the IP header and the ECS IP from the DNS ECS option, and either of it can be excluded as required.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Sample DNS logging configuration for a NetScaler appliance to log client IP address

If you want to sample the logging of the DNS queries, it can be done using the following expression. This logs one out of 10 queries.

```
> add audit messageaction log_action_srcip_1of10 INFORMATIONAL "\"OneOf10:
Source IP : \"+client.ip.src"

Done

> add responder policy logsrcip_1of10 "sys.random.mul(10).lt(1)" NOOP
-logAction log_action_srcip_1of10

Done
```

Configuring DNS suffixes

You can configure DNS suffixes that enable the NetScaler appliance to complete non-fully qualified domain names during name resolution. For example, while resolving a not fully qualified domain name abc, if a DNS suffix example.com is configured, the appliance appends the suffix to the domain name. Then it resolves the domain name. In this case, it would resolve abc.example.com. If DNS suffixes are not configured, the appliance appends a period to the non-fully qualified domain names and resolves the domain name.

Create DNS suffixes

DNS suffixes have significance and are valid only when the NetScaler is configured as an end resolver or forwarder. You can specify a suffix of up to 127 characters.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTES:

- The order of DNS suffixes is important. The ADC appliance tries the configured suffixes in a serial order and stops when it gets a successful response for a suffix.
- At a time only one domain name is processed. All the available suffixes are appended with the domain name until a successful response is received. **For Example:** If the domain name is `www` and the suffixes are `abc.com` and `abc`. The NetScaler appliance tries `www.abc.com` first and if that does not return a successful response, then the appliance tries `www.abc`. If `www.abc.com` returns a successful response, then the appliance will not try with the next suffix.
- The appliance uses all the suffixes in the order in which they are added until it receives a successful response.

Create DNS suffixes by using the CLI

At the command prompt, type the following commands to create a DNS suffix and verify the configuration:

```
-  add dns suffix <dnsSuffix>

-  show dns suffix <dnsSuffix>
```

Example:

```
> add dns suffix example.com

 Done

> show dns suffix example.com

1)      Suffix: example.com

Done
```

To remove a DNS suffix by using the NetScaler command line, at the command prompt, type the `rm dns suffix` command and the name of the DNS suffix.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Create DNS suffixes by using the GUI

Navigate to **Traffic Management > DNS > DNS Suffix** and create DNS suffixes.

DNS ANY query

An ANY query is a type of DNS query that retrieves all records available for a domain name. The ANY query must be sent to a name server that is authoritative for a domain.

Behavior in ADNS mode

In the ADNS mode, the NetScaler appliance returns the records held in its local cache. If there are no records in the cache, the appliance returns the NXDOMAIN (negative) response.

If the NetScaler can match the domain delegation records, it returns the NS records. Otherwise, it returns the NS records of the root domain.

Behavior in DNS proxy mode

In proxy mode, the NetScaler appliance checks its local cache. If there are no records in the cache, the appliance passes the query to the server.

Behavior for Global Server Load Balancing (GSLB) domains

If a GSLB domain is configured on the ADC appliance and an ANY query is sent for the GSLB (site) domain, the appliance returns the IP address of the GSLB service. It selects this service through a load balancing decision. If the multiple IP response (MIR) option is enabled, the IP addresses of all GSLB services are sent.

For the NetScaler to return these records when it responds to the ANY query, all records corresponding to a GSLB domain must be configured on the NetScaler.

NOTE

If records for a domain are distributed between the NetScaler and a server, only records configured on the NetScaler are returned.

The NetScaler provides the option to configure DNS views and DNS policies. These views and policies are used for performing global server load balancing. For more information, see Global Server Load Balancing.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure negative caching of DNS records

The NetScaler appliance supports caching of negative responses for a domain. A negative response indicates that information about a requested domain does not exist, or that the server cannot provide an answer for the query. The storage of this information is called negative caching. Negative caching helps speed up responses to queries about a domain.

NOTE:

Negative caching is supported only when the back-end server is configured as an authoritative DNS (ADNS) server for the queried domain.

A negative response can be one of the following:

- NXDOMAIN error message — The authoritative DNS servers respond with the NXDOMAIN error message when the queried domain name does not have any records configured on the server. This message implies that the queried domain is an invalid or a non-existent domain name.
- NODATA error message — If the domain name in the query is valid but records of the given type are not available, the appliance sends a NODATA error message.

When negative caching is enabled, the appliance caches the negative response from the DNS server and serves the future requests from the cache only. This action helps speed up responses to queries and also to reduce the back-end DNS traffic. Negative caching can be used in all deployments, that is, when a NetScaler appliance is serving as a proxy, as an end resolver, or as a forwarder.

You can enable or disable negative caching using a DNS profile, for more information see, DNS profiles. By default, negative caching is enabled in the default DNS profile (`default-dns-profile`) that are bound by default to a DNS virtual server or in the newly created DNS profile.

Enable or disable negative caching by using the CLI

At the command prompt, type the following commands to enable or disable negative caching and verify the configuration:

```
-  add dns profile <dnsProfileName> [-cacheRecords ( ENABLED | DISABLED )]
[-cacheNegativeResponses (ENABLED | DISABLED )]
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
-  show dns profile [<dnsProfileName>]
```

Example of a default DNS profile:

```
> sh dns profile default-dns-profile

    1)   default-dns-profile

        Query logging : DISABLED        Answer section logging : DISABLED

        Extended logging : DISABLED     Error logging : DISABLED

        Cache Records : ENABLED     Cache Negative Responses: ENABLED

Done
```

Example of a newly created DNS profile:

```
> add dnsprofile dns_profile1 -cacheRecords ENABLED
-cacheNegativeResponses ENABLED

Done

> show dns profile dns_profile1

    1)   dns_profile1

        Query logging : DISABLED        Answer section logging : DISABLED

        Extended logging : DISABLED     Error logging : DISABLED

        Cache Records : ENABLED     Cache Negative Responses: ENABLED

Done
```

Specify service or virtual server level DNS parameters by using the CLI

At the command prompt, perform the following:

1. Configure the DNS profile.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add dns profile <dnsProfileName> [-cacheRecords ( ENABLED | DISABLED )] [-cacheNegativeResponses (ENABLED | DISABLED )]
```

2. Bind the DNS profile to the service or virtual server.

   To bind the DNS profile to the service:

   ```
   set service <name> [-dnsProfileName <string>]
   ```

Example:

```
>set service service1 -dnsProfileName dns_profile1

Done
```

To bind the DNS profile to the virtual server:

```
set lb vserver <name> [-dnsProfileName <string>]
```

Example:

```
>set lb vserver lbvserver1 -dnsProfileName dns_profile1

Done
```

Specify service or virtual server level DNS parameters by using the GUI

1. Configure the HTTP profile.

   Navigate to **System** > **Profiles**> **DNS Profile**, and create the DNS profile.

2. Bind the HTTP profile to the service or virtual server.

   Navigate to **Traffic Management** > **Load Balancing**> **Services/Virtual Servers**, and create the DNS profile, that must be bound to the service or the virtual server.

Rate limiting negative response served by the appliance

You can set a threshold for negative responses being served by the NetScaler appliance from the cache. When the threshold is set, the appliance serves the response from the cache until the threshold is reached. Once the threshold is reached, the appliance drops the requests instead of responding with an NXDOMAIN response.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Setting a rate limit for negative responses has the following advantages.

- Save the resources on the NetScaler appliance.
- Prevent any malicious queries for non-existent domain names.

NOTE:

You can set a threshold for negative responses only for the domains for which the ADC appliance is configured as an authoritative domain name server. You cannot set a threshold for cached records received from the authoritative back-end name servers.

Rate limiting negative response served by the cache by using the CLI

At the command prompt, type

```
set dns parameter -NXDOMainRateLimitThreshold <positive-integer>
```

Example:

```
set dns parameter -NXDOMainRateLimitThreshold 1000
```

NXDOMainRateLimitThreshold: When this parameter is set to a positive integer value, responses are served from the cache until this threshold (in seconds) is reached. Once the threshold exceeds, the requests are dropped. The threshold configured is per packet engine.

Rate limiting negative response served by the cache by using the GUI

1. Navigate to **Traffic Management > DNS** and click **Change DNS Settings**.
2. In the **Configure DNS parameters** page, in the **NXDOMAIN Rate Limit Threshold** field, enter the threshold value until which the responses must be served from the cache.

Note: The value in the **NXDOMAIN Threshold Crossed** displays the number of times the requests are dropped after the threshold is reached.

Cache EDNS0 client subnet data when the NetScaler appliance is in proxy mode

In NetScaler Proxy mode, if a back-end server that supports an EDNS0 Client Subnet (ECS) sends a response containing the ECS option, the NetScaler appliance does the following:

- It forwards the response as-is to the client and

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Stores the response in the cache, along with the client subnet information.

DNS requests that are from the same subnet of the same domain, and for which the server would send the same response, are then served from the cache.

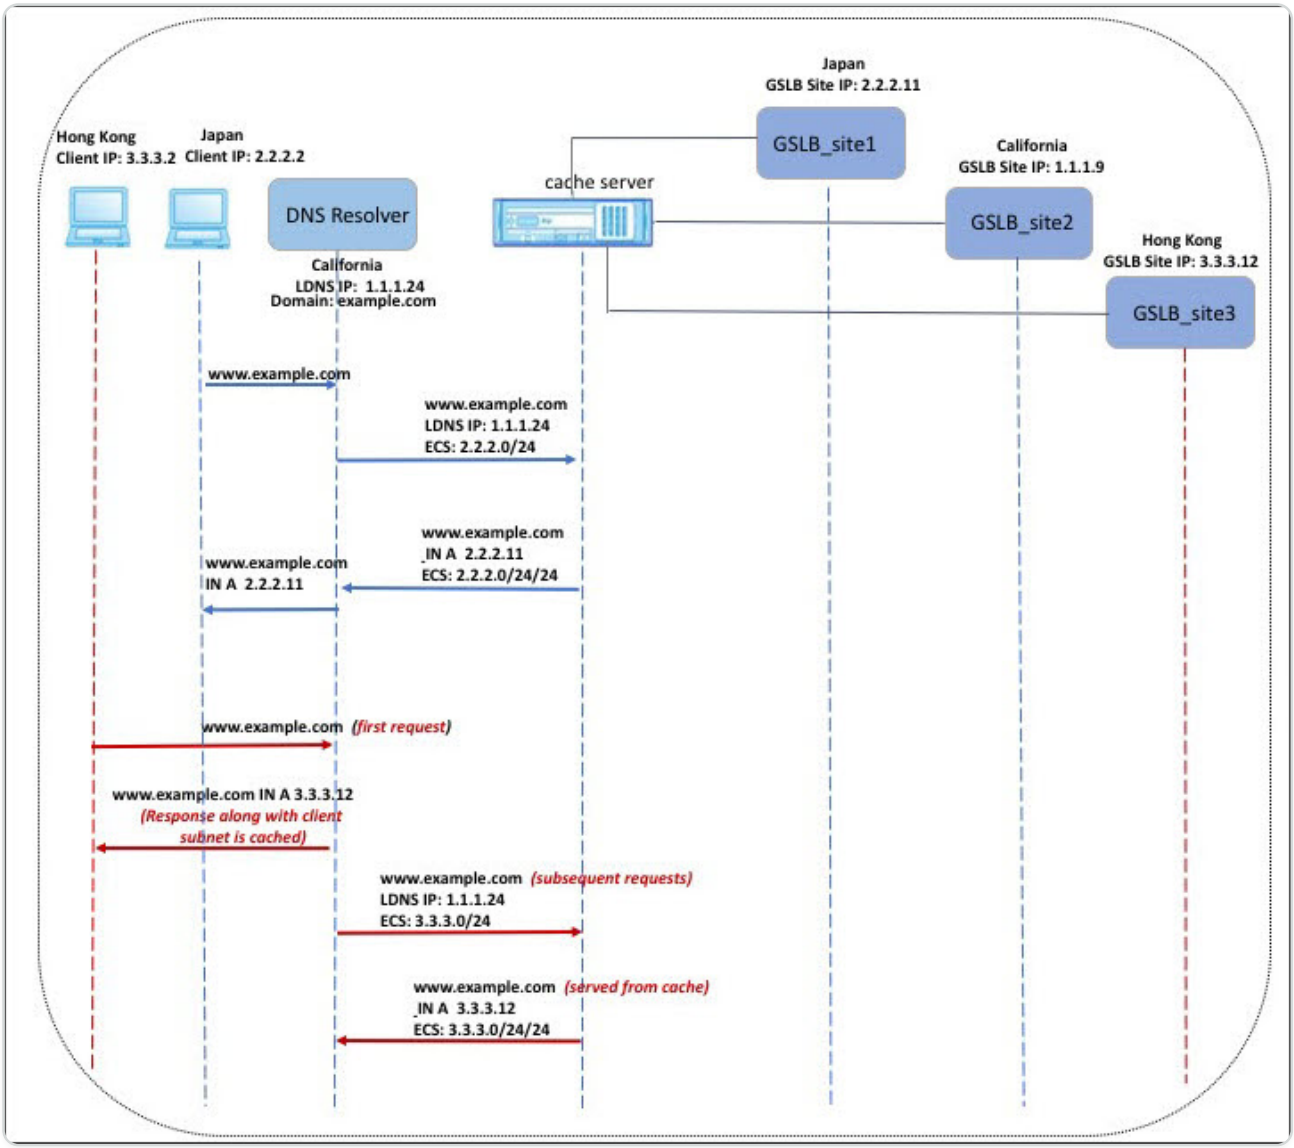
Note:

- ECS caching is disabled by default. Enable caching of EDNS0 client-subnet data in the associated DNS profile.
- The number of subnets that you can cache for a domain is limited to the available subnet IDs, that is, 1270 in the NetScaler appliance. Optionally, you can set the limit to a lower number (minimum value: 1 ipv4/ipv6).

Enable caching of ECS responses by using the CLI

At the command prompt, type:

```
set dns profile <dnsProfileName> -cacheECSResponses ( ENABLED | DISABLED )
```



Limit the number of subnets that can be cached per domain by using the CLI

At the command prompt, type:

```
set dns profile <dnsProfileName> -maxSubnetsPerDomain <positive_integer>
```

Example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

In the example shown in the preceding figure, the client at IP address 2.2.2.2 sends a query for www.example.com to the DNS resolver. The DNS resolver sends the following response:

www.example.com IN A, IP is 2.2.2.11, and ECS 2.2.2.0/24/24

At this point, the response and the client-subnet identifier (2.2.2.0/24) are cached. Further requests from the same subnet and domain are served from the cache.

For example, if the client's IP address is 2.2.2.100 and the query is for www.example.com, the query is served from the cache instead of being sent to the back-end server.

Domain name system security extensions

DNS Security Extensions (DNSSEC) is an Internet Engineering Task Force (IETF) standard. It aims to provide data integrity and data origin authentication in communications between name servers and clients while still transmitting UDP responses in clear text. DNSSEC specifies a

© 1997–2026 Citrix Systems, Inc. All rights reserved.

mechanism that uses asymmetric key cryptography and a set of new resource records that are specific to its implementation.

The DNSSEC specification is described in:

- RFC 4033, “DNS Security Introduction and Requirements”
- RFC 4034, “Resource Records for the DNS Security Extensions”
- RFC 4035, “Protocol Modifications for the DNS Security Extensions”

The operational aspects of implementing DNSSEC within DNS are discussed in RFC 4641, “DNSSEC Operational Practices.”

You can configure DNSSEC on the NetScaler. You can generate and import keys for signing DNS zones. You can configure DNSSEC for zones for which the NetScaler is authoritative. You can configure the ADC as a DNS proxy server for signed zones hosted on a farm of back-end name servers. If the ADC is authoritative for a subset of the records belonging to a zone for which the ADC is configured as a DNS proxy server, you can include the subset of records in the DNSSEC implementation.

Configure DNSSEC

Perform the following steps to configure DNSSEC:

1. Enable DNSSEC on the NetScaler appliance.
2. Create a zone signing key and a key signing key for the zone.
3. Add the two keys to the zone.
4. Sign the zone with the keys.

The NetScaler appliance does not act as a DNSSEC resolver. DNSSEC on the ADC is supported only in the following deployment scenarios:

1. ADNS—NetScaler is the ADNS and generates the signatures itself.
2. Proxy—NetScaler acts as a DNSSEC proxy. It is assumed that the NetScaler is placed in front of the ADNS/LDNS servers in a trusted mode. The ADC acts only as a proxy caching entity and does not validate any signatures.

Enable and disable DNSSEC

Enable DNSSEC on the NetScaler for the ADC to respond to DNSSEC-aware clients. By default, DNSSEC is enabled.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

You can disable the DNSSEC feature if you do not want the NetScaler to respond to clients with DNSSEC-specific information.

Enable or disable DNSSEC by using the CLI

At the command prompt, type the following commands to enable or disable DNSSEC and verify the configuration:

```
-  set dns parameter -dnssec ( ENABLED | DISABLED )

-  show dns parameter
```

Example:

```
> set dns parameter -dnssec ENABLED

 Done

> show dns parameter

        DNS parameters:

        DNS retries: 5

         .

         .

         .

         DNSEC Extension: ENABLED

        Max DNS Pipeline Requests: 255

 Done
```

Enable or disable DNSSEC by using the GUI

1. Navigate to **Traffic Management > DNS**.
2. In the details pane, click Change DNS settings.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. In the **Configure DNS Parameters** dialog box, select or clear the **Enable DNSSEC Extension** check box.

Create DNS keys for a zone

For each DNS zone that you want to sign, you must create two pairs of asymmetric keys. One pair, called the zone signing key (ZSK), is used to sign all the resource record sets in the zone. The second pair is called the key signing key (KSK) and is used to sign only the DNSKEY resource records in the zone.

When the ZSK and the KSK are created, the `suffix.key` is appended to the names of the public components of the keys. The `suffix.private` is appended to the names of their private components. The appending happens automatically.

The NetScaler also creates a Delegation Signer (DS) record and appends the suffix .ds to the name of the record. If the parent zone is a signed zone, you must publish the DS record in the parent zone to establish the chain of trust.

When you create a key, the key is stored in the `/nsconfig/dns/` directory, but it is not automatically published in the zone. After you create a key by using the `create dns key` command, you must explicitly publish the key in the zone by using the `add dns key` command. The process of generating a key is separate from the process of publishing the key in a zone to enable you to use alternative means to generate keys. For example, you can import keys generated by other key-generation programs (such as `bind-keygen`) by using the Secure FTP (SFTP) and then publish the keys in the zone. For more information about publishing a key in a zone, see Publish a DNS key in a zone.

Perform the steps described in this topic to create a zone signing key and then repeat the steps to create a key signing key. The example that follows the command syntax first creates a zone signing key pair for the zone example.com. The example then uses the command to create a key signing key pair for the zone.

From release 13.0 build 61.x, the NetScaler appliance now supports stronger crypto algorithms, such as RSASHA256 and RSASHA512, to authenticate a DNS zone. Previously, only the RSASHA1 algorithm was supported.

Create a DNS key by using the CLI

At the command prompt, type:

```
create dns key -zoneName <string> -keyType <keyType> -algorithm <algorithm>
-keySize <positive_integer> -fileNamePrefix <string>
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Example:

```
> create dns key -zoneName example.com -keyType zsk -algorithm RSASHA256
-keySize 1024 -fileNamePrefix example.com.zsk.rsasha1.1024

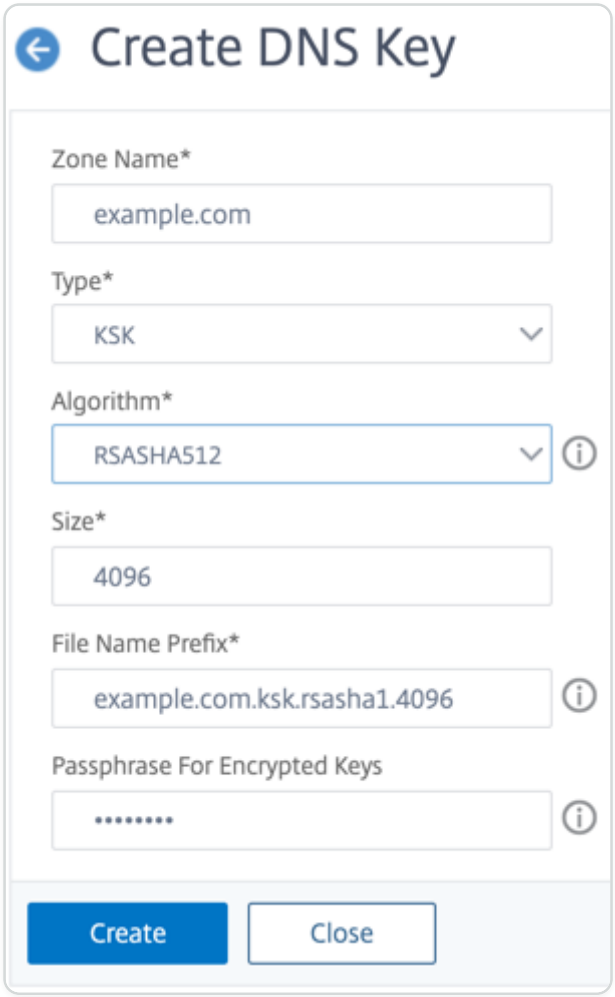
File Name: /nsconfig/dns/example.com.zsk.rsasha1.1024.key (public); /
nsconfig/dns/example.com.zsk.rsasha1.1024.private (private); /nsconfig/
dns/example.com.zsk.rsasha1.1024.ds (ds)

This operation may take some time, Please wait...

 Done

> create dns key -zoneName example.com -keyType ksk -algorithm RSASHA512
-keySize 4096 -fileNamePrefix example.com.ksk.rsasha1.4096

File Name: /nsconfig/dns/example.com.ksk.rsasha1.4096.key (public); /
nsconfig/dns/example.com.ksk.rsasha1.4096.private (private); /nsconfig/
dns/example.com.ksk.rsasha1.4096.ds (ds)



This operation may take some time, Please wait...

 Done
```

Create a DNS key by using the GUI

1. Navigate to **Traffic Management > DNS**.
2. In the details area, click **Create DNS Key**.
3. Enter values for the different parameters and click **Create**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Note: To modify the file name prefix of an existing key:

- Click the arrow next to the **Browse** button.
- Click either **Local** or **Appliance** (depending on whether the existing key is stored on your local computer or in the `/nsconfig/dns/` directory on the appliance)
- Browse to the location of the key, and then double-click the key. The **File Name Prefix** box is populated with only the prefix of the existing key. Modify the prefix accordingly.

Publish a DNS key in a zone

A key (zone signing key or key signing key) is published in a zone by adding the key to the ADC appliance. A key must be published in a zone before you sign the zone.

Before you publish a key in a zone, the key must be available in the **/nsconfig/dns/** directory. If you created the DNS key on another computer (for example, by using the `bind-keygen` program), ensure that the key is added to the `/nsconfig/dns/` directory. Then publish the key in the zone. Use the ADC GUI to add the key to the `/nsconfig/dns/` directory. Or, use some other program to import the key to the directory, such as the Secure FTP (SFTP).

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Use the `add dns key` command for each public-private key pair that you want to publish in a given zone. If you created a ZSK pair and a KSK pair for a zone, use the `add dns key` command to first publish one of the key pairs in the zone. Repeat the command to publish the other key pair. For each key that you publish in a zone, a DNSKEY resource record is created in the zone.

The example that follows the command syntax first publishes the zone signing key pair (that was created for the example.com zone) in the zone. The example then uses the command to publish the key signing key pair in the zone.

Publish a key in a zone by using the CLI

At the command prompt, type the following command to publish a key in a zone and verify the configuration:

```
-  add dns key <keyName> <publickey> <privatekey> [-expires
<positive_integer> [<units>]] [-notificationPeriod <positive_integer>
[<units>]] [-TTL <secs>]

-  show dns zone [<zoneName> | -type <type>]
```

Example:

```
> add dns key example.com.zsk example.com.zsk.rsasha1.1024.key
example.com.zsk.rsasha1.1024.private

 Done

> add dns key example.com.ksk example.com.ksk.rsasha1.4096.key
example.com.ksk.rsasha1.4096.private

 Done

> show dns zone example.com

         Zone Name : example.com

         Proxy Mode : NO

         Domain Name : example.com

                 Record Types : NS SOA DNSKEY
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
        Domain Name : ns1.example.com

                Record Types : A

        Domain Name : ns2.example.com

                Record Types : A

 Done
```

Publish a key in a DNS zone by using the GUI

Navigate to **Traffic Management > DNS > Keys**.

Note: For Public Key and Private Key, to add a key that is stored on your local computer, click the arrow next to the **Browse** button, click **Local**, browse to the location of the key, and then double-click the key.

Configure a DNS key

You can configure the parameters of a key that has been published in a zone. You can modify the key's expiry time period, notification period, and time-to-live (TTL) parameters. If you change the expiry time period of a key, the appliance automatically re-signs all the resource records in the zone with the key. The re-signing happens if the zone is signed with the particular key.

Configure a key by using the CLI

At the command prompt, type the following command to configure a key and verify the configuration:

```
-  set dns key <keyName> [-expires <positive_integer> [<units>]] [-
notificationPeriod <positive_integer> [<units>]] [-TTL <secs>]

-  show dns key [<keyName>]
```

Example:

```
> set dns key example.com.ksk -expires 30 DAYS -notificationPeriod 3 DAYS
-TTL 3600

 Done
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
> show dns key example.com.ksk

1)      Key Name: example.com.ksk

        Expires: 30 DAYS        Notification: 3 DAYS    TTL: 3600

        Public Key File: example.com.ksk.rsasha1.4096.key

        Private Key File: example.com.ksk.rsasha1.4096.private

 Done
```

Configure a key by using the GUI

1. Navigate to **Traffic Management > DNS > Keys**.
2. In the details pane, click the key that you want to configure, and then click Open.
3. In the Configure DNS Key dialog box, modify the values of the following parameters as shown:
   - Expires—expires
   - Notification Period—notificationPeriod
   - TTL—TTL
4. Click OK.

Sign and unsign a DNS zone

To secure a DNS zone, you must sign the zone with the keys that have been published in the zone. When you sign a zone, the NetScaler creates a Next Secure (NSEC) resource record for each owner name. Then, it uses the key signing key to sign the DNSKEY resource record set. Finally, it uses the ZSK to sign all the resource record sets in the zone, including the DNSKEY resource record sets and NSEC resource record sets. Each sign operation results in a signature for the resource record sets in the zone. The signature is captured in a new resource record called the RRSIG resource record.

After you sign a zone, save the configuration.

Sign a zone by using the CLI

At the command prompt, type the following command to sign a zone and verify the configuration:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
-  sign dns zone <zoneName> [-keyName <string> ...]

-  show dns zone [<zoneName> | -type (ADNS | PROXY | ALL)]

-  save config
```

Example:

```
> sign dns zone example.com -keyName example.com.zsk example.com.ksk

 Done

> show dns zone example.com

         Zone Name : example.com

         Proxy Mode : NO

         Domain Name : example.com

                 Record Types : NS SOA DNSKEY RRSIG NSEC

         Domain Name : ns1.example.com

                 Record Types : A RRSIG NSEC

         Domain Name : ns2.example.com

                 Record Types : A RRSIG

         Domain Name : ns2.example.com

                 Record Types : RRSIG NSEC

Done

> save config

 Done
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Unsign a zone by using the CLI

At the command prompt, type the following command to unsign a zone and verify the configuration:

```
-  unsign dns zone <zoneName> [-keyName <string> ...]

-  show dns zone [<zoneName> | -type (ADNS | PROXY | ALL)]
```

Example:

```
> unsign dns zone example.com -keyName example.com.zsk example.com.ksk

 Done

> show dns zone example.com

         Zone Name : example.com

         Proxy Mode : NO

         Domain Name : example.com

                 Record Types : NS SOA DNSKEY

         Domain Name : ns1.example.com

                 Record Types : A

         Domain Name : ns2.example.com

                 Record Types : A

 Done
```

Sign or unsign a zone by using the GUI

1. Navigate to **Traffic Management > DNS > Zones**.
2. In the details pane, click the zone that you want to sign, and then click Sign/Unsign.
3. In the Sign/Unsign DNS Zone dialog box, do one of the following:

    - To sign the zone, select the check boxes for the keys (zone signing key and key signing key) with which you want to sign the zone.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

You can sign the zone with more than one zone signing key or key signing key pair.

- To unsign the zone, clear the check boxes for the keys (zone signing key and key signing key) with which you want to unsign the zone.

  You can unsign the zone with more than one zone signing key or key signing key pair.

4. Click OK.

View the NSEC records for a given record in a zone

You can view the NSEC records that the NetScaler automatically creates for each owner name in the zone.

View the NSEC record for a given record in a zone by using the CLI

At the command prompt, type the following command to view the NSEC record for a given record in a zone:

```
show dns nsecRec [<hostName> | -type (ADNS | PROXY | ALL)]
```

Example:

```
> show dns nsecRec example.com

1)      Domain Name : example.com

        Next Nsec Name: ns1.example.com

        Record Types : NS SOA DNSKEY RRSIG NSEC

 Done
```

View the NSEC record for a given record in a zone by using the GUI

1. Navigate to **Traffic Management > DNS > Records > Next Secure Records**.
2. In the details pane, click the name of the record for which you want to view the NSEC record. The NSEC record for the record you select is displayed in the Details area.

Remove a DNS key

Remove a key from the zone in which it is published when the key has expired or if the key has been compromised. When you remove a key from the zone, the zone is automatically unsigned with the key. Removing the key with this command does not remove the key files present in the /

© 1997–2026 Citrix Systems, Inc. All rights reserved.

nsconfig/dns/ directory. If the key files are no longer needed, they have to be explicitly removed from the directory.

Remove a key from the NetScaler by using the CLI

At the command prompt, type the following command to remove a key and verify the configuration:

```
-  rm dns key <keyName>

-  show dns key <keyName>
```

Example:

```
> rm dns key example.com.zsk

 Done

> show dns key example.com.zsk

ERROR: No such resource [keyName, example.com.zsk]
```

Remove a key from the NetScaler by using the GUI

1. Navigate to **Traffic Management > DNS > Keys**.
2. In the details pane, click the name of the key that you want to remove from the ADC, and then click Remove.

Configure DNSSEC when the NetScaler is authoritative for a zone

When the NetScaler is authoritative for a given zone, all the resource records in the zone are configured on the ADC. To sign the authoritative zone, you must create the zone signing and the key signing keys for the zone, add the keys to the ADC, and then sign the zone. For more information, see:

- Create DNS keys for a zone
- Publish a DNS key in a zone
- Sign and unsign a DNS zone.

If any GSLB domains configured on the ADC belong to the zone being signed, the GSLB domain names are signed along with the other records that belong to the zone.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

After you sign a zone, responses to requests from DNSSEC-aware clients include the RRSIG resource records along with the requested resource records. DNSSEC must be enabled on the ADC. For more information about enabling DNSSEC, see Enable and disable DNSSEC.

Finally, after you configure DNSSEC for the authoritative zone, you must save the NetScaler configuration.

Configure DNSSEC for a zone for which the NetScaler is a DNS proxy server

The procedure for signing a zone for which the NetScaler is configured as a DNS proxy server depends on whether the ADC owns a subset of the zone information owned by the back-end name servers. If it does, the configuration is considered a partial zone ownership configuration. If the ADC does not own a subset of the zone information, the NetScaler configuration for managing the back-end servers is considered a zone-less DNS proxy server configuration. The basic DNSSEC configuration tasks for both NetScaler configurations are the same. However, signing the partial zone on the NetScaler requires some additional configuration steps.

Note: The terms zone-less proxy server configuration and partial zone are used only in the context of the NetScaler appliance.

Important: When configured in proxy mode, the ADC does not perform signature verification on DNSSEC responses before updating the cache.

If you configure the ADC as a DNS proxy to load balance DNSSEC aware resolvers (servers), you must set the Recursion Available option while configuring the DNS virtual server. If a DNSSEC query arrives with Checking Disabled (CD) bit set, the query is passed on to the server with the CD bit retained. The response from the server is not cached.

Configure DNSSEC for a zone-less DNS proxy server configuration

For a zone-less DNS proxy server configuration, zone signing must be performed on the back-end name servers. On the NetScaler, you configure the ADC as a DNS proxy server for the zone. Create a load balancing virtual server of protocol type DNS. Configure services on the ADC to represent the name servers. Then bind the services to the load balancing virtual server. For more information about these configuration tasks, see Configure the NetScaler as a DNS proxy server.

When a client sends the ADC a DNS request with the DNSSEC OK (DO) bit set, the ADC checks its cache for the requested information. If the resource records are not available in its cache, the ADC forwards the request to one of the DNS name servers. Then, it relays the response from the name server to the client. Also, the ADC caches the RRSIG resource records along with the

© 1997–2026 Citrix Systems, Inc. All rights reserved.

response from the name server. Subsequent requests from DNSSEC-aware clients are served from the cache (including the RRSIG resource records), subject to the time-to-live (TTL) parameter. If a client sends a DNS request without setting the DO bit, the ADC responds with only the requested resource records. It does not include the RRSIG resource records that are specific to DNSSEC.

Configure DNSSEC for a partial zone ownership configuration

In some ADC configurations, even though the authority for a zone lies with the back-end name servers, a subset of the resource records belonging to the zone might be configured on the ADC. The ADC owns (or is authoritative for) only this subset of records. Such a subset of records can be considered to constitute a *partial zone* on the ADC. The ADC owns the partial zone. All other records are owned by the back-end name servers.

A typical partial zone configuration on the NetScaler is seen when:

- Global Server Load Balancing (GSLB) domains are configured on the ADC
- The GSLB domains are a part of a zone for which the back-end name servers are authoritative.

Signing a zone that includes only a partial zone on the ADC involves:

- Including the partial zone information in the back-end name server zone files
- Signing the zone on the back-end name servers
- Signing the partial zone on the ADC.

The same key set must be used to sign the zone on the name servers and the partial zone on the ADC.

Sign the zone on the back-end name servers

1. Include the resource records that are contained in the partial zone, in the zone files of the name servers.
2. Create keys and use the keys to sign the zone on the back-end name servers.

Sign the partial zone on the NetScaler

1. Create a zone with the name of the zone owned by the back-end name servers. When configuring the partial zone, set the proxyMode parameter to YES. This zone is the partial zone that contains the resource records owned by the ADC.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

For example, if the name of the zone that is configured on the back-end name servers is example.com, you must create a zone named example.com on the ADC. Set the proxyMode parameter to YES. For more information about adding a zone, see Configure a DNS zone.

NOTE

Do not add SOA and NS records for the zone. These records must exist on the ADC for a zone for which the ADC is authoritative.

2. Import the keys (from one of the back-end name servers) to the ADC and then add them to the /nsconfig/dns/ directory. For more information about how you can import a key and add it to the ADC, see Publish a DNS key in a zone.
3. Sign the partial zone with the imported keys. When you sign the partial zone with the keys, the ADC generates RRSIG and NSEC records for the resource record sets and individual resource records in the partial zone, respectively. For more information about signing a zone, see sign and unsign a DNS zone.

Configure DNSSEC for global server load balancing (GSLB) domain names

If GSLB is configured on the NetScaler and the ADC is authoritative for the zone to which the GSLB domain names belong, all GLSB domain names are signed when the zone is signed. For more information about signing a zone for which the ADC is authoritative, see Configure DNSSEC when the NetScaler appliance is authoritative for a zone.

If the GSLB domains belong to a zone for which the back-end name servers are authoritative, you must:

- First sign the zone on the name servers.
- Then sign the partial zone on the ADC to complete the DNSSEC configuration for the zone.

For more information, see Configure DNSSEC for a partial zone ownership configuration.

Zone maintenance

From a DNSSEC perspective, zone maintenance involves rolling over Zone Signing Keys and Key Signing Keys when key expiry is imminent. These zone maintenance tasks must be performed manually. The zone is re-signed automatically and does not require any manual intervention.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Re-sign an updated zone

When a zone is updated (add a record or modify an existing record), the appliance automatically re-signs the new (or modified) record. If a zone contains multiple zone signing keys, the appliance re-signs the new (or modified) record with the key used to sign the zone.

Roll over DNSSEC keys

Note: Manually roll over the DNSSEC keys (KSK, ZSK) before they expire.

On the NetScaler, you can use the prepublish and double signature methods to perform a rollover of the Zone Signing Key and Key Signing Key. More information about these two rollover methods is available in RFC 4641, “DNSSEC Operational Practices.”

The following topics map commands on the ADC to the steps in the rollover procedures discussed in RFC 4641.

The key expiry notification is sent through an SNMP trap called dnskeyExpiry. Three MIB variables, dnskeyName, dnskeyTimeToExpire, and dnskeyUnitsOfExpiry are sent along with the dnskeyExpiry SNMP trap. For more information, see *NetScaler SNMP OID Reference* at NetScaler 12.0 SNMP OID Reference.

Prepublish key rollover

RFC 4641, “DNSSEC Operational Practices” defines four stages for the prepublish-key rollover method: initial, new DNSKEY, new RRSIGs, and DNSKEY removal. Each stage is associated with a set of tasks that you must perform on the ADC. Following are the descriptions of each stage and the tasks that you must perform. The rollover procedure described here can be used for both Key Signing Keys and Zone Signing Keys.

- **Stage 1: Initial.** The zone contains only those key sets with which the zone has currently been signed. The state of the zone in the initial stage is the state of the zone just before you begin the key rollover process.

  Example:

  Consider the key, example.com.zsk1, with which the zone example.com is signed. The zone contains only those RRSIGs generated by the example.com.zsk1 key, which is due for expiry. The Key Signing Key is example.com.ksk1.

- **Stage 2: New DNSKEY.** A new key is created and published in the zone. That is, the key is added to the ADC, but the zone is not signed with the new key until the pre-roll phase is complete. In this stage, the zone contains the old key, the new key, and the RRSIGs generated by the old key. Publishing the new key for the complete duration of the pre-roll phase gives the

© 1997–2026 Citrix Systems, Inc. All rights reserved.

DNSKEY resource record corresponding to the new key time to propagate to the secondary name servers.

Example:

A new key example.com.zsk2 is added to the example.com zone. The zone is not signed with example.com.zsk2 until the pre-roll phase is complete. The example.com zone contains DNSKEY resource records for both example.com.zsk1 and example.com.zsk2.

NetScaler commands:

Perform the following tasks on the ADC:

- Create a DNS key by using the `create dns key` command.

  For more information about creating a DNS key, including an example, see Create DNS keys for a zone.
- Publish the new DNS key in the zone by using the `add dns key` command.

  For more information about publishing the key in the zone, including an example, see Publish a DNS key in a zone.

- **Stage 3: New RRSIGs.** The zone is signed with the new DNS key and then unsigned with the old DNS key. The old DNS key is not removed from the zone and remains published until the RRSIGs generated by the old key expire.

  Example:

  The zone is signed with example.com.zsk2 and then unsigned with example.com.zsk1. The zone continues to publish example.com.zsk1 until the RRSIGs generated by example.com.zsk1 expire.

  NetScaler commands:

  Perform the following tasks on the ADC:

  - Sign the zone with the new DNS key by using the `sign dns zone` command.
  - Unsign the zone with the old DNS key by using the `unsign dns zone` command.

  For more information about signing and unsigning a zone, including examples, see Sign and unsign a DNS zone.
- **Stage 4: DNSKEY Removal.** When the RRSIGs generated by the old DNS key expire, the old DNS key is removed from the zone.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Example:

The old DNS key example.com.zsk1 is removed from the example.com zone.

NetScaler commands

On the ADC, you remove the old DNS key by using the `rm dns key` command. For more information about removing a key from a zone, including an example, see Remove a DNS key.

Double signature key rollover

RFC 4641, “DNSSEC Operational Practices” defines three stages for double signature key rollover: initial, new DNSKEY, and DNSKEY removal. Each stage is associated with a set of tasks that you must perform on the ADC. Following are the descriptions of each stage and the tasks that you must perform. The rollover procedure described here can be used for both Key Signing Keys and Zone Signing Keys.

- **Stage 1: Initial.** The zone contains only those key sets with which the zone has currently been signed. The state of the zone in the initial stage is the state of the zone just before you begin the key rollover process.

  Example:

  Consider the key, example.com.zsk1, with which the zone example.com is signed. The zone contains only those RRSIGs generated by the example.com.zsk1 key, which is due for expiry. The Key Signing Key is example.com.ksk1.
- **Stage 2: New DNSKEY.** The new key is published in the zone and the zone is signed with the new key. The zone contains the RRSIGs that are generated by the old and the new keys. The minimum duration for which the zone must contain both sets of RRSIGs is the time required for all the RRSIGs to expire.

  Example:

  A new key example.com.zsk2 is added to the example.com zone. The zone is signed with example.com.zsk2. The example.com zone now contains the RRSIGs generated from both keys.

  NetScaler commands

  Perform the following tasks on the ADC:

  - Create a DNS key by using the `create dns key` command.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

For more information about creating a DNS key, including an example, see Create DNS keys for a zone.

- Publish the new key in the zone by using the `add dns key` command.

  For more information about publishing the key in the zone, including an example, see Publish a DNS key in a zone.

- Sign the zone with the new key by using the `sign dns zone` command.

  For more information about signing a zone, including examples, see Sign and unsign a DNS zone.

- **Stage 3: DNSKEY Removal.** When the RRSIGs generated by the old DNS key expire, the old DNS key is removed from the zone.

  Example:

  The old DNS key example.com.zsk1 is removed from the example.com zone.

  NetScaler commands:

  On the ADC, you remove the old DNS key by using the `rm dns key` command.

  For more information about removing a key from a zone, including an example, see Remove a DNS key.

Offload DNSSEC operations to the NetScaler

For DNS zones for which your DNS servers are authoritative, DNSSEC operations can be offloaded to the ADC appliance. In a DNSSEC offloading deployment, a DNS server sends unsigned responses. The ADC signs the response dynamically before relaying it to the client. The ADC also caches the signed response. Apart from reducing the load on the DNS servers, offloading DNSSEC operations to the ADC gives you the following benefits:

- You can sign records that the DNS servers generate programmatically. Such records cannot be signed by routine zone signing operations performed on the DNS servers.
- You can serve signed responses to clients even if you have not implemented DNSSEC on your servers.

For setting up DNSSEC offloading, you must configure a DNS load balancing virtual server, configure services that represent the DNS servers, and then bind the services to the virtual server.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

For information about configuring a DNS load balancing virtual server, configuring services, and binding the services to the virtual server, see Configure a DNS zone.

Create a zone entity on the ADC for each DNS zone whose DNSSEC operations you want to offload. For each DNS zone, you must enable the Proxy Mode and DNSSEC Offload parameters. You can optionally configure NSEC record generation for an offloaded zone. To create a DNS zone entity for DNSSEC offloading, follow the instructions in this topic.

To complete the configuration, you must generate DNS keys for the zone, add the keys to the zone, and then sign the zone with the keys. This process is the same as for normal DNSSEC. For information about creating keys, adding keys to a zone, and signing the zone, see Domain name system security extensions.

After you configure DNS offloading, you must flush the DNS cache on the NetScaler. Flushing the DNS cache ensures that any unsigned records in the cache are removed and then replaced by signed records. For information about flushing the DNS cache, see Flush DNS records.

Enable DNSSEC offloading for a zone by using the CLI

At the command line, type the following commands to enable DNSSEC offloading for a zone and verify the configuration:

```
-  add dns zone <zoneName> -proxyMode YES -dnssecOffload ENABLED [-nsec
( ENABLED | DISABLED )

-  show dns zone
```

Example:

```
> add dns zone example.com -proxyMode YES -dnssecOffload ENABLED nsec
ENABLED

 Done

> show dns zone example.com

     Zone Name : example.com

     Proxy Mode : YES

     DNSSEC Offload: ENABLED    NSEC: ENABLED
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Done
```

Enable DNSSEC offloading for a zone by using the GUI

1. Navigate to **Traffic Management > DNS > Zones**.
2. In the details pane, do one of the following:
   - To create a zone on the NetScaler, click Add.
   - To configure DNSSEC offloading for an existing zone, double-click the zone.
3. In the Create DNS Zone or Configure DNS Zone dialog box, select the Proxy Mode and DNSSEC Offload check boxes.
4. Optionally, if you want the NetScaler to generate NSEC records for the zone, select the NSEC check box.

Admin partition support for DNSSEC

In a partitioned NetScaler appliance, the DNS keys that are generated are stored in the following locations:

- Default partition: /nsconfig/dns/
- Non-default partition: /nsconfig/partitions/\<partitionname\>/dns/

You can now add a password to the DNS key. To add a password to the DNS key, you must first add the password in the `create dns key` command. Then provide the same password in the `add dns key` command when adding the DNS key to the ADC appliance. For example:

`create dns key -zoneName com -keytype ksK -algorithm rsASHA1 -keysize 4096 -fileNamePrefix com.ksk.rsasha1.4096 -password 1jsfd3Wa`

`add dns key com.zsk.4096 /nsconfig/dns/com.zsk.rsasha1.4096.private -password 1jsfd3Wa`

Note:

- For a default partitioned environment, the keys are read from the default location/nsconfig/dns/. However, if the keys are stored in a different location, the path name has to be provided in the `add dns key –private` command. Example, `add dns key –private <path name>`.
- For a non-default partitioned environment, the keys are read from the default location `/nsconfig/partitions/<partitionname>/dns/`.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Supporting wildcard DNS domains

Wildcard DNS domains are used to handle requests for nonexistent domains and subdomains. In a zone, use wildcard domains to redirect queries for all nonexistent domains or subdomains to a particular server, instead of creating a separate Resource Record (RR) for each domain. The most common use of a wildcard DNS domain is to create a zone that can be used to forward mail from the internet to some other mail system.

In DNS resolution, wildcard RRs support the wildcard domain. The wildcard RRs are used to synthesize the responses to queries for a nonexistent domain name. For example, if you queried `http://image.example.com`, and the subdomain "image" did not exist, you might be redirected to example.com.

A wildcard record has an asterisk (*) character as the leftmost label of a domain name. For example, `*.example.com`. An asterisk at any other place in the domain name does signify a wildcard DNS record. For example, `new.*.example.com` is not a valid wildcard DNS record.

NOTE

- Wildcard domain is supported only when the NetScaler appliance is authoritative for the zone and is configured as an ADNS or a DNS proxy server.
- Wildcard domain is not supported for NS and SOA records.
- Wildcard domain cannot be applied when the query is in another zone.
- Wildcard domain cannot be applied when the QNAME or a name between the wildcard domain and the QNAME is known to exist.

Example configuration

```
add dns soaRec example.com -originServer n1.example.com -contact
admin.example.com

add dns nsRec example.com n1.example.com

add dns nsRec example.com n2.example.com
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add dns zone example.com  -proxyMode no

add dns addrec www.example.com 2.2.2.2

add dns addrec *.example.com 10.10.10.10

add dns addrec *.example.com 10.10.10.11

add dns aaaarec *.example.com 2001::1
```

In the example, a wildcard domain name is added for an A and AAAA record.

When a query is received for a domain name that exists in the zone, the NetScaler appliance responds with the corresponding response. For example, for `www.example.com`, the appliance responds with 2.2.2.2 in the example.

For a nonexistent domain name that matches with a wildcard type, a synthesized response is delivered.

In the example, the NetScaler appliance responds with 10.10.10.10 and 10.10.10.11 for a domain name nonexist.example.com or xyz.example.com.

Wildcard synthesis is not applicable for a domain name that exists in the zone.

For example, for the query `www.example.com` and type AAAA, the NetScaler appliance does not synthesize with wildcard, because `www.example.com` exists with type A. In the example, the NetScaler appliance responds with a NODATA response.

For a query say abc.example.com and type AAAA, the NetScaler appliance responds with a synthesized response. For example, for `www.example.com`, the appliance responds with 2001::1 in the example.

Mitigate DNS DDoS attacks

DNS servers are one of the most critical components of a network, and they must be defended against attacks. One of the most basic types of DNS attacks is the DDoS attack. Attacks of this type are on the rise and can be destructive. You can do the following to mitigate DDoS attacks:

- Flush negative records.
- Restrict the time to live (TTL) of negative records.
- Preserve NetScaler memory by limiting the memory consumed by the DNS cache.
- Retain DNS records in the cache.
- Enable DNS cache bypass.

Flush negative records

A DNS attack fills the cache with negative records (NXDOMAIN and NODATA). As a result, responses to legitimate requests are not cached, so new requests are sent to a back-end server for DNS resolution. Responses are therefore delayed.

You can now flush the negative DNS records from the NetScaler appliance's DNS cache.

Flush negative cache records by using the CLI

At the command prompt, type:

```
flush dns proxyrecords -type (dnsRecordType | negRecType) NXDOMAIN | NODATA
```

Example:

```
flush dns proxyrecords –negRecType NODATA
```

Flush of negative cache records by using the GUI

1. Navigate to **Configuration** > **Traffic Management** > **DNS** > **Records**.
2. In the details pane, click **Flush Proxy Records**.
3. In the **Flush Type** box, select **Negative Records**.
4. In the **Negative Records Type** box, select either **NXDOMAIN** or **NODATA**.

Protection against random subdomain and NXDOMAIN attacks

To prevent random subdomain and NXDOMAIN attacks, you can restrict the DNS cache memory, and you can adjust the TTL values for negative records.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To limit the amount of memory consumed by the DNS cache, specify the maximum cache size (in MB), and also the cache size (in MB) for storing negative responses. When either limit is reached, no more entries are added to the cache. Also, syslog messages are logged and, if you have configured SNMP traps, SNMP traps are generated. If these limits are not set, caching continues until the system memory is exhausted.

A higher TTL value for negative records can result in storing records that are not valuable for a long time. A lower TTL value results in sending more requests to the back-end server.

The TTL of the negative record is set to a value that can be the lesser of the TTL value or the ”Expires” value of the SOA record.

Note:

- This limitation is added per packet engine. For example, if the maxCacheSize is set to 5 MB and the appliance has 3 packet engines, the total cache size is 15 MB.
- The cache size for the negative records must be less than or equal to the maximum cache size.
- If you reduce the DNS cache memory limit to a value lower than the amount of data already cached, the cache size remains above the limit until the data ages out. That is, exceeds its TTL0 or is flushed (`flush dns proxyrecords` command, or Flush Proxy Records in the NetScaler GUI).
- To configure SNMP traps, see Configuring the NetScaler to Generate SNMP Traps.

Limit the memory consumed by the DNS Cache by using the CLI

At the command prompt, type:

```
set dns parameter -maxCacheSize <MBytes> -maxNegativeCacheSize <MBytes>
```

Example:

```
set dns parameter - maxCacheSize 100 -maxNegativeCacheSize 25
```

Limit the memory consumed by the DNS Cache by using the GUI

Navigate to **Configuration** > **Traffic Management** > **DNS**, click **Change DNS Settings**, and set the following parameters:

- Max Cache Size in MB
- Max Negative Cache Size in MB

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Restrict the TTL of negative records by using the CLI

At the command prompt, type:

```
set dns parameter -maxnegcacheTTL <secs>
```

Example:

```
set dns parameter -maxnegcacheTTL 360
```

Restrict the TTL of negative records by using the GUI

1. Navigate to **Configuration** > **Traffic Management** > **DNS**.
2. Click **Change DNS Settings** and set the **Max Negative Cache TTL in sec** parameter.

Retain DNS records in the cache

An attack can flood the DNS cache with non-important entries but can cause flushing of the already cached legitimate records to make room for the new entries. To prevent attacks from filling the cache with invalid data, you can retain the legitimate records even after they exceed their TTL values.

If you enable the cacheNoExpire parameter, the records currently in the cache are retained until you disable the parameter.

Note:

- This option can be used only when the maximum cache size is specified (maxCacheSize parameter).
- If maxnegcacheTTL is configured and cacheNoExpire is enabled, cacheNoExpire takes priority.

Retain DNS records in the cache by using the CLI

At the command prompt, type:

```
set dns parameter -cacheNoExpire ( ENABLED | DISABLED)
```

Example:

```
set dns parameter -cacheNoExpire ENABLED
```

Retain DNS records in the cache by using the GUI

1. Navigate to **Configuration** > **Traffic Management** > **DNS** and click **Change DNS Settings**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. Select **Cache No Expire**.

Enable DNS cache bypass

For greater visibility and control of DNS requests, set the cacheHitBypass parameter to forward all requests to the back-end servers and allow the cache to be built but not used. After the cache is built, you can disable the parameter so that requests are served from the cache.

Enable DNS cache bypass by using the CLI

At the command prompt, type:

```
set dns parameter -cacheHitBypass ( ENABLED | DISABLED )
```

Example:

```
set dns parameter -cacheHitBypass ENABLED
```

Enable DNS cache bypass by using the GUI

1. Navigate to **Configuration** > **Traffic Management** > **DNS** and click **Change DNS Settings**.
2. Select **Cache Hit Bypass**.

Prevent the `Slowloris` attack

A DNS query spanning multiple packets, presents the potential threat of a `Slowloris` attack. The NetScaler appliance can silently drop DNS queries that are split into multiple packets.

You can set the `splitPktQueryProcessing` parameter to ALLOW or DROP a DNS query if the query is split into multiple packets.

Note: This setting is applicable only for DNS TCP.

Limit the DNS queries to a single packet by using the CLI

At the command prompt, type:

```
set dns parameter -splitPktQueryProcessing ( ALLOW | DROP )
```

Example:

```
set dns parameter -splitPktQueryProcessing DROP
```

Limit DNS queries to a single packet by using the GUI

1. Navigate to **Configuration** > **Traffic Management** > **DNS** and click **Change DNS Settings**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. In the **Split Packet Query Processing** box, choose **ALLOW** or **DROP**.

Collect statistics of the DNS responses served from the cache

You can collect statistics of the DNS responses served from the cache. Then use these statistics to create a threshold beyond which more DNS traffic is dropped, and enforce this threshold with a bandwidth based policy. Previously, bandwidth calculation for a DNS load balancing virtual server was not accurate, because the number of requests served from the cache was not reported.

In proxy mode, the statistics for Request bytes, Response bytes, Total Packets received, and Total Packets sent statistics are continuously updated. Previously, these statistics were not always updated, particularly for a DNS load balancing virtual server.

Proxy mode also now enables you to determine the number of DNS responses served from the cache. To collect these statistics, the following options have been added to the `stat lb vserver <DNSvirtualServerName>` command:

- **Requests** – Total number of requests received by the DNS or DNS_TCP virtual server. Includes the requests forwarded to the back end and the requests answered from the cache.
- **Vserver hits** –Total number of requests forwarded to the back end. The number of requests served from the cache is the difference between the total number of requests and the number of requests served from the virtual server.
- **Responses** – Total number of responses sent by this virtual server. For example, if a DNS LB virtual server received 5 DNS requests, forwarded 3 of them to the back end, and served 2 of them from the cache, the corresponding value of each of these statistics would be as follows:
    - **Vserver hits**: 3
    - **Requests**: 5
    - **Responses**: 5

Federal Information Processing Standards

Federal Information Processing Standards (FIPS) is a set of standards developed by the National Institute of Standards and Technology (NIST) for the use of Defence, Federal, and State Government organizations. The FIPS systems provide security, compliance, interoperability, and best practices. In the financial services industry, FIPS compliance is essential for protecting sensitive customer information and ensuring the integrity of financial transactions. In the healthcare industry, FIPS compliance is critical for safeguarding patient data and ensuring the privacy of medical records. By implementing FIPS standards, financial services and healthcare organizations can enhance their security posture, reduce the risk of data breaches, and maintain compliance with regulatory requirements.

FIPS employs a secure cryptographic module as a core component to ensure data protection.There are standards that define the security requirements for cryptographic modules. FIPS 140-2 and FIPS 140-3 define the stringent security requirements for cryptographic modules, comprising algorithm selection, key management procedures, access controls, physical security measures, and operational environment specifications. These modules, which are the core components ensuring data protection within FIPS, can be implemented at various security levels depending on the intended use case and the organization's specific security needs.

The security levels are defined as follows:

- **Level 1**: Provides a foundational level of security, ensuring the correct implementation of cryptographic algorithms.
- **Level 2**: Builds upon Level 1 by incorporating tamper-evident mechanisms to detect unauthorized physical access or modifications.
- **Level 3**: Focuses on preventing physical tampering through robust protective measures, making it significantly more difficult for attackers to gain unauthorized access to sensitive information.
- **Level 4**: Offers the highest level of security, employing sophisticated countermeasures to protect against highly skilled and well-equipped adversaries.

NetScaler® FIPS compliance levels are as follows:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **NetScaler VPX**: NetScaler VPX, a software-based virtual system, typically achieves FIPS Level 1 compliance for both FIPS 140-2/FIPS-140-3.
- **NetScaler MPX**: NetScaler MPX, due to its hardware-based security measures, can achieve FIPS 140-2/FIPS 140-3 Level 2. This is because the physical security mechanisms inherent in hardware devices offer a higher degree of tamper resistance and protection against unauthorized access, aligning with the more stringent requirements of Level 2.

For more information about the NetScaler specific FIPS appliances, see VPX FIPS appliances and MPX FIPS appliances.

NetScaler 13.1 FIPS release notes

Release notes describe how the software has changed in a particular build, and the issues known to exist in the build.

The release notes document includes all or some of the following sections:

- **What's New**: The enhancements and other changes released in the build.
- **Fixed Issues**: The issues that are fixed in the build.
- **Known Issues**: The issues that exist in the build.
- **Points to Note**: The important aspects to keep in mind while using the build.
- **Limitations**: The limitations that exist in the build.

NOTE

- The labels under the issue descriptions are internal tracking IDs used by the NetScaler team.
- These release notes do not document security-related fixes. For a list of security related fixes and advisories, see the security bulletin.

To view the release notes document for a specific FIPS build of release 13.1, click the corresponding link in the following table. When the release notes are updated for a build, the published date is also updated. The published date of the release notes might differ from the GA date of the build.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

RELEASE NOTES FOR NETSCALER FIPS SOFTWARE VERSION 13.1	PUBLISHED DATE
Build 13.1–37.282	Oct 03, 2026

VPX FIPS appliances

The NetScaler VPX FIPS appliance is now certified `<https://csrc.nist.gov/projects/cryptographic-module-validation-program/certificate/5111>` for FIPS 140-3 Level 1 by the National Institute of Standards and Technology (NIST). More information about the FIPS 140-3 standard and validation program is available on the NIST and the Canadian Center for Cyber Security (CCCS) Cryptographic Module Validation Program (CMVP) website at `<https://csrc.nist.gov/projects/cryptographic-module-validation-program>`.

The NetScaler VPX FIPS appliance is NDcPP certified. For more information, see Common Criteria and search for "NetScaler" keyword, and Canadian Centre for Cyber Security: `<https://commoncriteriaportal.org/nfs/ccpfiles/files/epfiles/607-LSS%20CR%20v1.0.pdf>`.

NOTE

- Only the firmware versions listed under "NetScaler Release 13.1-FIPS" in the NetScaler downloads page are supported on the MPX 8900 FIPS, MPX 9100 FIPS, MPX 15000-50G FIPS, and VPX FIPS platforms.
- If you have configured classic policies on your NetScaler FIPS appliance running 12.1-FIPS software version, see `<https://support.citrix.com/article/CTX234821/citrix-adc-deprecated-classic-policy-based-features-and-functionalities-faqs>` before performing an upgrade to 13.1-FIPS.
- TLS 1.3 on 13.1-FIPS can only be configured using enhanced SSL profiles. For more information on how to configure TLS 1.3 using profiles, see TLS 1.3 protocol support as defined in RFC 8446.

Prerequisites

- For on-prem hypervisors download the special build from the Citrix® website. Download the complete VPX FIPS package for the respective hypervisor.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- A NetScaler VPX FIPS appliance requires a FIPS instance license and bandwidth pool to function as expected in the pooled licensing model. For non-pooled licenses, a single VPX FIPS license of the required bandwidth capacity is required.

Configuration

The module is available as a software package that includes both the application software and the operating system. After purchasing the NetScaler VPX FIPS license, get the latest NetScaler VPX FIPS image from the Citrix website.

Perform the following steps:

1. Upload the latest NetScaler VPX FIPS image to one of the following hypervisors: ESXi, Citrix Hypervisor, Hyper-V, KVM, AWS, Azure, or GCP.
2. Apply the NetScaler VPX FIPS Platform license and NetScaler VPX Bandwidth license, and warm reboot the appliance.
3. After the appliance starts, run the following command at the CLI:

   ```
   > show system fipsStatus
   ```

   You must get the following output.

   ```
   FipsStatus: System is operating in FIPS mode

   Done
   ```

   In case you get the following output, see the troubleshooting section for steps to resolve.

   ```
   FipsStatus: "System is operating in non FIPS mode"

   Done

   >
   ```

4. Follow the configuration guidelines in the Secure Deployment Guide.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Ciphers supported on a VPX FIPS appliance

All ciphers supported on a NetScaler MPX/SDX 14000 FIPS appliance, except the 3DES cipher, are supported on a VPX FIPS appliance. For the complete list of ciphers supported on a NetScaler VPX FIPS appliance, see the following topic:

- Cipher support on NetScaler VPX FIPS and MPX FIPS appliances.

Upgrade a VPX FIPS appliance

Follow the steps in Upgrade a NetScaler standalone appliance to upgrade the VPX FIPS appliance.

Important: Replace the `./installns` command with `./installns -F`.

NOTE:

When you upgrade to release 13.1 FIPS build 37.159 or later, adding a certificate-key pair using pfx files fails.

Workaround: Use FIPS-certified ciphers, such as AES256, to create a pfx file before the upgrade. Example:

```
root@ns# cd /nsconfig/ssl/

root@ns# openssl pkcs12 -export -out example.name.pfx -inkey example.key
-in example.pem -certpbe AES-256-CBC -keypbe AES-256-CBC
```

Limitations

- TACACS authentication is not supported on the VPX FIPS appliance.
- VPX FIPS is a separate image. Software version upgrade from VPX version to VPX FIPS version is not supported. Also, the VPX FIPS software version cannot be downgraded or upgraded to the VPX software version.
- VPX FIPS image is not supported on a NetScaler SDX and NetScaler SDX FIPS appliance.

Troubleshooting

When you run the `show system fipsStatus` command and the output is as follows:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
FipsStatus: "System is operating in non FIPS mode"

Done

>
```

The reason might be one of the following;

1. License is expired or incorrect.
2. The system is unable to come up in FIPS mode. This error might be due to POST failure on the management core or packet engine.

To resolve:

1. Check that the correct NetScaler VPX FIPS license is installed and that the license has not expired.
2. Check for Power-on self-test (POST) failure on the management core or on a packet engine. Run the following command:

   ```
   >shell

   #nsconmsg -g drbg -g ssl_err -g fips -d statswt0
   ```

   The `nsssl_err_fips_post_failed counter` increments if POST fails during bootup on the packet engine. That is, there is a data plane failure.

   If the counter does not increment, check the log file `(/var/log/FIPS-post.log)` for a failed algorithm test entry. That is, check for POST failure on the management core (control plane failure).

   In both cases, contact NetScaler® support.

MPX FIPS appliances

The NetScaler MPX 8900 FIPS, MPX 9100 FIPS, and MPX 15000-50G FIPS appliances are now certified `<https://csrc.nist.gov/projects/cryptographic-module-validation-program/certificate/4830>` by a third party laboratory for the security requirements of FIPS 140-3 Level 2. More information about the FIPS 140-3 standard and validation program is available on the National Institute of Standards and Technology (NIST) and the Canadian Center for Cyber Security

© 1997–2026 Citrix Systems, Inc. All rights reserved.

(CCCS) Cryptographic Module Validation Program (CMVP) website at `<https://csrc.nist.gov/projects/cryptographic-module-validation-program>`.

The NetScaler MPX 8900 FIPS, MPX 9100 FIPS, and MPX 15000-50G FIPS appliances are now NDcPP certified. For more information, see Common Criteria and search for "NetScaler" keyword, and Canadian Centre for Cyber Security: `<https://commoncriteriaportal.org/nfs/ccpfiles/files/epfiles/607-LSS%20CR%20v1.0.pdf>`.

NOTES

- The MPX 8900 FIPS, MPX 9100 FIPS, and the MPX 15000-50G FIPS appliances no longer use a third-party Hardware Security Module. The requirements to be FIPS validated are built into the system.
- Only the firmware versions listed under "NetScaler Release 13.1-FIPS" in the NetScaler downloads page are supported on the MPX 8900 FIPS, MPX 9100 FIPS, MPX 15000-50G FIPS, and VPX FIPS platforms.
- If you have configured classic policies on your NetScaler FIPS appliance running 12.1-FIPS software version, see `<https://support.citrix.com/article/CTX234821/citrix-adc-deprecated-classic-policy-based-features-and-functionalities-faqs>` before performing an upgrade to 13.1-FIPS.
- TLS 1.3 on 13.1-FIPS can only be configured using enhanced SSL profiles. For more information on how to configure TLS 1.3 using profiles, see TLS 1.3 protocol support as defined in RFC 8446.

Prerequisites

- FIPS platform license in addition to a bandwidth license.

Ciphers supported on MPX 8900 FIPS, MPX 9100 FIPS, and MPX 15000-50G FIPS appliances

All ciphers supported on a NetScaler MPX/SDX 14000 FIPS appliance, except the 3DES cipher, are supported on the MPX 8900, MPX 9100 FIPS, and MPX 15000-50G FIPS appliances. For the complete list of ciphers supported on these appliances, see Cipher support on NetScaler VPX FIPS and MPX FIPS appliances.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Upgrade an MPX FIPS appliance

Follow the steps in Upgrade a NetScaler standalone appliance to upgrade the MPX FIPS appliance.

NOTE:

When you upgrade to release 13.1 FIPS build 37.159 or later, adding a certificate-key pair using pfx files fails.

Workaround: Use FIPS-certified ciphers, such as AES256, to create a pfx file before the upgrade. Example:

```
root@ns# cd /nsconfig/ssl/

root@ns# openssl pkcs12 -export -out example.name.pfx -inkey example.key
-in example.pem -certpbe AES-256-CBC -keypbe AES-256-CBC
```

Limitation

TACACS authentication is not supported on the MPX FIPS appliance.

Configuration

1. After the appliance starts, run the following command at the CLI:

   ```
   > show system fipsStatus
   ```

2. You must get the following output.

   ```
   FipsStatus: "System is operating in FIPS mode"

   Done

   >
   ```

3. In case you get the following output, check the license.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
FipsStatus: "System is operating in non FIPS mode"

Done

>
```

Perform the following steps to initialize the MPX appliance for the FIPS mode of operation.

1. Enforce strong passphrase requirements.
2. Replace the default TLS certificate.
3. Disable HTTP access to the web GUI.
4. After initial configuration, disable local authentication and configure remote authentication using LDAP.

Enforce strong passphrase requirements using the GUI

Passphrases are used to derive keys using PBKDF2. As an admin, enable strong passphrase requirements using the GUI.

1. Navigate to **System > Settings**.
2. In the Settings section, click **Change Global System Settings**.
3. In the **Strong Password** field, select **Enable All**.
4. In the **Min Password Length** field, type "8."
5. Click **OK**.

Replace the default TLS certificate

By default, the MPX FIPS appliance includes a factory-provisioned RSA certificate for TLS connections (`ns-server.cert` and `ns-server.key`). This certificate is not intended for use in production deployments and must be replaced. Replace the default certificate with a new certificate after the initial installation.

To replace the default TLS certificate:

1. At the command prompt, type the following command to set the host name of the appliance.

   ```
   set ns hostName <hostname>
   ```

Create a Certificate Signing Request (CSR) using the GUI

1. Navigate to **Traffic Management > SSL > SSL Files**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. In the **CSR** tab, click **Create Certificate Signing Request (CSR)**.
3. Enter the values and click **Create**.

   NOTE

   The **Common Name** field contains the value of the host name set using the ADC CLI.

4. Submit the CSR file to a trusted certificate authority (CA). The CSR file is available in the `/nsconfig/ssl` directory.
5. After receiving the certificate from the CA, copy the file to the `/nsconfig/ssl` directory.
6. Navigate to **Traffic Management > SSL > Certificates > Server Certificates**.
7. Select **ns-server-certificate**.
8. Click **Update**.
9. Click **Update the certificate and key**.
10. In the **Certificate File Name** field, choose the certificate file that was received from the certificate authority (CA). Choose **Local** if the file is on your local computer. Otherwise, choose **Appliance**.
11. In the **Key File Name** field, specify the default private key file name (`ns-server.key`).
12. Select the **No Domain Check** option.
13. Click **OK**.

Disable HTTP access to the web GUI

To protect traffic to the administrative interface and web GUI, the appliance must be configured to use HTTPS. After adding new certificates, use the CLI to disable HTTP access to the GUI management interface.

At the command prompt, type:

```
set ns ip <NSIP> -gui SECUREONLY
```

Disable local authentication and configure remote authentication using LDAP

The superuser account is a default account with root CLI access privileges that is required for initial configuration. During initial configuration, disable local system authentication to block access to all local accounts (including the superuser account), and to ensure that superuser privileges are not assigned to any user account.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To disable local system authentication and enable external system authentication using the CLI:

At the command prompt, type:

```
set system parameter -localauth disabled
```

Follow the instructions in Configuring LDAP authentication to configure external system authentication to use LDAP.

Configure remote authentication using RADIUS

You can configure RADIUS authentication on FIPS environments.

NOTE:

The **Test RADIUS Reachability** option is not supported for RADIUS.

Configure RADIUS over TLS by using the CLI

At the command prompt type:

```
add authentication radiusAction <name> [-serverIP] [-serverPort ] [-
transport <transport>] [-targetLBVserver <string>]
```

Example

```
add authentication radiusAction RadAction -serverIP 1.1.1.1 -radkey 123
-transport TLS -targetLBVserver rad-lb
```

NOTE:

- For the TLS transport type, configure a target load balancing virtual server of type TCP and bind a service of type SSL_TCP to this virtual server.
- Server name is not supported.
- The IP address and the port number configured for RADIUS action must match the IP address and port number of the configured target load balancing virtual server.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure RADIUS over TLS by using the GUI

1. Navigate to **Security > AAA - Application Traffic > Policies > Authentication > Advanced Policies > Actions > Servers**.
2. Select an existing server or create a server.

   For details about creating a server, see To configure a RADIUS server by using the GUI.
3. In **Transport**, select **TLS**.
4. In **Target Load Balancing Virtual Server**, select the virtual server. For details about creating a load balancing virtual server, see Creating a virtual server.

   NOTE:

   - For the TLS transport type, configure a target load balancing virtual server of type TCP and bind a service of type SSL_TCP to this virtual server.
   - Server name is not supported.
   - The IP address and the port number configured for RADIUS action must match the IP address and port number of the configured target load balancing virtual server.
5. Click **Create.**

© 1997–2026 Citrix Systems, Inc. All rights reserved.

MPX 14000 FIPS appliances

IMPORTANT:

- The MPX 9700/10500/12500/15500 FIPS platform has reached end of life.
- Configuration steps for NetScaler MPX 14000 FIPS and NetScaler MPX 9700/10500/12500/15500 FIPS appliances are different. MPX 14000 FIPS appliances do not use firmware v2.2. A FIPS key created on the Hardware Security Module (HSM) of the MPX 9700 platform cannot be transferred to the HSM of the MPX 14000 platform. The other way round is also not supported. However, if you have imported an RSA key as a FIPS key, you can copy the RSA key to the MPX 14000 platform. Then import it as a FIPS key. Only 2048-bit and 3072-bit keys are supported.
- The firmware versions listed under "NetScaler Release 12.1-FIPS" and "NetScaler Release 12.1-NDcPP" in the NetScaler downloads page are not supported on the MPX 14000 FIPS or SDX 14000 FIPS platforms. These platforms can use other latest NetScaler firmware versions available on the downloads page.

A FIPS appliance is equipped with a tamper-proof (tamper-evident) cryptographic module—a Cavium CNN3560-NFBE-G—designed to comply with the FIPS 140-2 Level-3 specifications (from release 12.0 build 56.x). The Critical Security Parameters (CSPs), primarily the server's private-key, are securely stored and generated inside the cryptographic module, also referred to as the HSM. The CSPs are never accessed outside the boundaries of the HSM. Only the superuser (`nsroot`) can perform operations on the keys stored inside the HSM.

Before configuring a FIPS appliance, you must check the state of the FIPS card and then initialize the card. Create a FIPS key and server certificate, and add any additional SSL configuration.

For information about the FIPS ciphers supported, see FIPS Approved Algorithms and Ciphers.

For information about configuring FIPS appliances in an HA setup, see Configure FIPS on appliances in an HA setup.

Limitations

1. SSL renegotiation using the SSLv3 protocol is not supported on the back end of an MPX FIPS appliance.
2. 1024-bit and 4096-bit keys and exponent value of 3 aren't supported.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. 4096-bit server certificate isn't supported.
4. 4096-bit client certificate isn't supported (if client authentication is enabled on the back-end server).

Configure the HSM

Before configuring the HSM on an MPX 14000 FIPS appliance, check the state of your FIPS card to verify that the driver loaded correctly. Then initialize the card.

At the command prompt, type:

```
show fips

FIPS Card is not configured
```

The message "ERROR: Operation not permitted - no FIPS card present in the system" appears if the driver is not loaded correctly.

Initialize the FIPS card

The appliance must be restarted three times for proper initialization of the FIPS card.

IMPORTANT

- Verify that the `/nsconfig/fips` directory has been successfully created on the appliance.
- Do not save the configuration before you restart the appliance for the third time.

Perform the following steps to initialize the FIPS card:

1. Reset the FIPS card (`reset fips`).
2. Restart the appliance (`reboot`).
3. Set the security officer password for partitions 0 and 1, and the user password for partition (`set fips -initHSM Level-2 <soPassword> <oldsoPassword> <userPassword> -hsmLabel NSFIPS`).

   Note: The set or reset command takes more than 60 seconds to run.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. Save the configuration (`saveconfig`).
5. Verify that the password-encrypted key for the main partition (master_pek.key) has been created in the `/nsconfig/fips/` directory.
6. Restart the appliance (`reboot`).
7. Verify that the password-encrypted key for the default partition (default_pek.key) has been created in the `/nsconfig/fips/` directory.
8. Restart the appliance (`reboot`).
9. Verify that the FIPS card is UP (`show fips`).

Initialize the FIPS card by using the CLI

The `set fips` command initializes the Hardware Security Module (HSM) on the FIPS card and sets a new security officer password and user password.

Caution: This command erases all data on the FIPS card. You are prompted before proceeding with the command execution. A restart is required before and after running this command for the changes to apply. Save the configuration after running this command and before restarting the appliance.

At the command prompt, type the following commands:

```
reset fips

reboot

set fips -initHSM Level-2 so12345 so12345 user123 -hsmLabel NSFIPS

This command will erase all data on the FIPS card. You must save the
configuration (saveconfig) after executing this command. Do you want to
continue?(Y/N)y
```

Note: The following message appears when you run the `set fips` command:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
This command will erase all data on the FIPS card. You must save the
configuration (saveconfig) after executing this command. [Note: On MPX/SDX
14xxx FIPS platform, the FIPS security is at Level-3 by default, and the
-initHSM Level-2 option is internally converted to Level-3]  Do you want
to continue?(Y/N)y

saveconfig

reboot

reboot

show fips

        FIPS HSM Info:

                HSM Label               : NetScaler FIPS

```

Create a FIPS key

You can create a FIPS key on your MPX 14000 FIPS appliance or import an existing FIPS key to the appliance. The MPX 14000 FIPS appliance supports only 2048-bit and 3072-bit keys and an exponent value of F4 (whose value is 65537). For PEM keys, an exponent is not required. Verify that the FIPS key is created correctly. Create a certificate signing request and a server certificate. Finally, add the certificate-key pair to your appliance.

Specify the key type (RSA or ECDSA). For ECDSA keys, specify only the curve. ECDSA key creation with curve P_256 and P_384 are supported.

NOTE:

1024-bit and 4096-bit keys and an exponent value of 3 are not supported.

Create a FIPS key by using the CLI

At the command prompt, type:

```
create ssl fipsKey <fipsKeyName> -keytype ( RSA | ECDSA ) [-exponent ( 3 |
F4 )] [-modulus <positive_integer>] [-curve ( P_256 | P_384 )]
```

Example1:

```
create fipsKey f1 -keytype RSA -modulus 2048 -exponent F4
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
show ssl fipskey f1

FIPS Key Name: f1  Key Type: RSA Modulus: 2048   Public Exponent: F4 (Hex:
0x10001)
```

Example2:

```
> create fipskey f2 -keytype ECDSA -curve P_256

> sh fipskey f2

    FIPS Key Name: f2   Key Type: ECDSA Curve: P_256
```

Create a FIPS key by using the GUI

1. Navigate to **Traffic Management > SSL > FIPS**.
2. In the details pane, on the FIPS Keys tab, click **Add**.
3. In the Create FIPS Key dialog box, specify values for the following parameters:
   - FIPS Key Name*—fipsKeyName
   - Modulus*—modulus
   - Exponent*—exponent

   *A required parameter
4. Click **Create**, and then click **Close**.
5. On the FIPS Keys tab, verify that the settings displayed for the FIPS key that you created are correct.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Import a FIPS key

To use an existing FIPS key with your FIPS appliance, you need to transfer the FIPS key from the hard disk of the appliance into its HSM.

Note: To avoid errors when importing a FIPS key, ensure that the name of the key imported is the same as the original key name when it was created.

Import a FIPS key by using the CLI

At the command prompt, type:

```
import ssl fipsKey <fipsKeyName> -key <string> [-inform <inform>] [-
wrapKeyName <string>] [-iv<string>] -exponent  F4 ]
```

Example:

```
import fipskey Key-FIPS-2 -key Key-FIPS-2.key -inform SIM -exponent F4

import fipskey Key-FIPS-2 -key Key-FIPS-2.key -inform PEM
```

Verify that the FIPS key is created or imported correctly by running the `show fipskey` command.

```
show fipskey

1)      FIPS Key Name: Key-FIPS-2
```

Import a FIPS key by using the GUI

1. Navigate to **Traffic Management > SSL > FIPS**.
2. In the details pane, on the FIPS Keys tab, click **Import**.
3. In the Import as a FIPS Key dialog box, select FIPS key file and set values for the following parameters:
   - FIPS Key Name*

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Key File Name* — To put the file in a location other than the default, specify the complete path or click **Browse** and navigate to a location.
- Exponent*

*A required parameter

4. Click **Import**, and then click **Close**.
5. On the FIPS Keys tab, verify that the settings displayed for the FIPS key that you imported are correct.

Export a FIPS key

Citrix® recommends that you create a backup of any key created in the FIPS HSM. If a key in the HSM is deleted, you cannot create the same key again, and all the certificates associated with it are rendered useless.

In addition to exporting a key as a backup, you might need to export a key for transfer to another appliance.

The following procedure provides instructions on exporting a FIPS key to the `/nsconfig/ssl` folder on the appliance's CompactFlash and securing the exported key by using a strong asymmetric key encryption method.

Export a FIPS key by using the CLI

At the command prompt, type:

```
export ssl fipsKey <fipsKeyName> -key <string>
```

Example:

```
export fipskey Key-FIPS-1 -key Key-FIPS-1.key
```

Export a FIPS key by using the GUI

1. Navigate to **Traffic Management > SSL > FIPS**.
2. In the details pane, on the FIPS Keys tab, click **Export**.
3. In the Export FIPS key to a file dialog box, specify values for the following parameters:

- FIPS Key Name*—fipsKeyName

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- File Name*—key (To put the file in a location other than the default, you can either specify the complete path or click the Browse button and navigate to a location.)

*A required parameter

4. Click **Export**, and then click **Close**.

Import an external key

You can transfer FIPS keys that are created within the NetScaler appliance's HSM. You can also transfer external private keys (such as keys created on a standard NetScaler, Apache, or IIS) to a NetScaler FIPS appliance. External keys are created outside the HSM, by using a tool such as OpenSSL. Before importing an external key into the HSM, copy it to the appliance's flash drive under `/nsconfig/ssl`.

On the MPX 14000 FIPS appliances, the -exponent parameter in the `import ssl fipskey` command is not required while importing an external key. The correct public exponent is detected automatically when the key is imported, and the value of the -exponent parameter is ignored.

The NetScaler FIPS appliance does not support external keys with a public exponent other than 3 or F4.

You do not need a wrap key on the MPX 14000 FIPS appliances.

You cannot import an external, encrypted FIPS key directly to an MPX 14000 FIPS appliance. To import the key you need to first decrypt the key, and then import it. To decrypt the key, at the shell prompt, type:

```
openssl rsa -in <EncryptedKey.key> > <DecryptedKey.out>
```

Note: If you import an RSA key as a FIPS key, Citrix recommends that you delete the RSA key from the appliance for security purposes.

Import an external key as a FIPS key by using the CLI

1. Copy the external key to the appliance's flash drive.
2. If the key is in .pfx format, you must first convert it to PEM format. At the command prompt, type:

```
convert ssl pkcs12 <output file> -import -pkcs12File <input .pfx file
name> -password <password>
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. At the command prompt, type the following commands to import the external key as a FIPS key and verify the settings:

```
import ssl fipsKey <fipsKeyName> -key <string> -informPEM

show ssl fipskey<fipsKeyName>
```

Example:

```
convert ssl pkcs12 iis.pem -password 123456 -import -pkcs12File iis.pfx

import fipskey Key-FIPS-2 -key iis.pem -inform PEM

show ssl fipskey key-FIPS-2

FIPS Key Name: Key-FIPS-2 Modulus: 0   Public Exponent: F4 (Hex value
0x10001)
```

Import an external key as a FIPS key by using the GUI

1. If the key is in .pfx format, you must first convert it to PEM format.
    a. Navigate to **Traffic Management > SSL**.
    b. In the details pane, under Tools, click **Import PKCS#12**.
    c. In the Import PKCS12 File dialog box, set the following parameters:
        - Output File Name*
        - PKCS12 File Name*—Specify the .pfx file name.
        - Import Password*
        - Encoding Format *A required parameter
2. Navigate to **Traffic Management > SSL > FIPS**.
3. In the details pane, on the FIPS Keys tab, click **Import**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. In the Import as a FIPS Key dialog box, select PEM file, and set values for the following parameters:
   - FIPS Key Name*
   - Key File Name*—To put the file in a location other than the default, you can either specify the complete path or click Browse and navigate to a location.

   *A required parameter
5. Click **Import**, and then click **Close**.
6. On the FIPS Keys tab, verify that the settings displayed for the FIPS key that you imported are correct.

Configure FIPS on appliances in an HA setup

You can configure two appliances in an HA pair as FIPS appliances.

Prerequisites

- The Hardware Security Module (HSM) must be configured on both the appliances. For more information, see Configure the HSM.
- When using the GUI, ensure that the appliances are already in an HA setup. For more information about configuring an HA setup, see High availability.

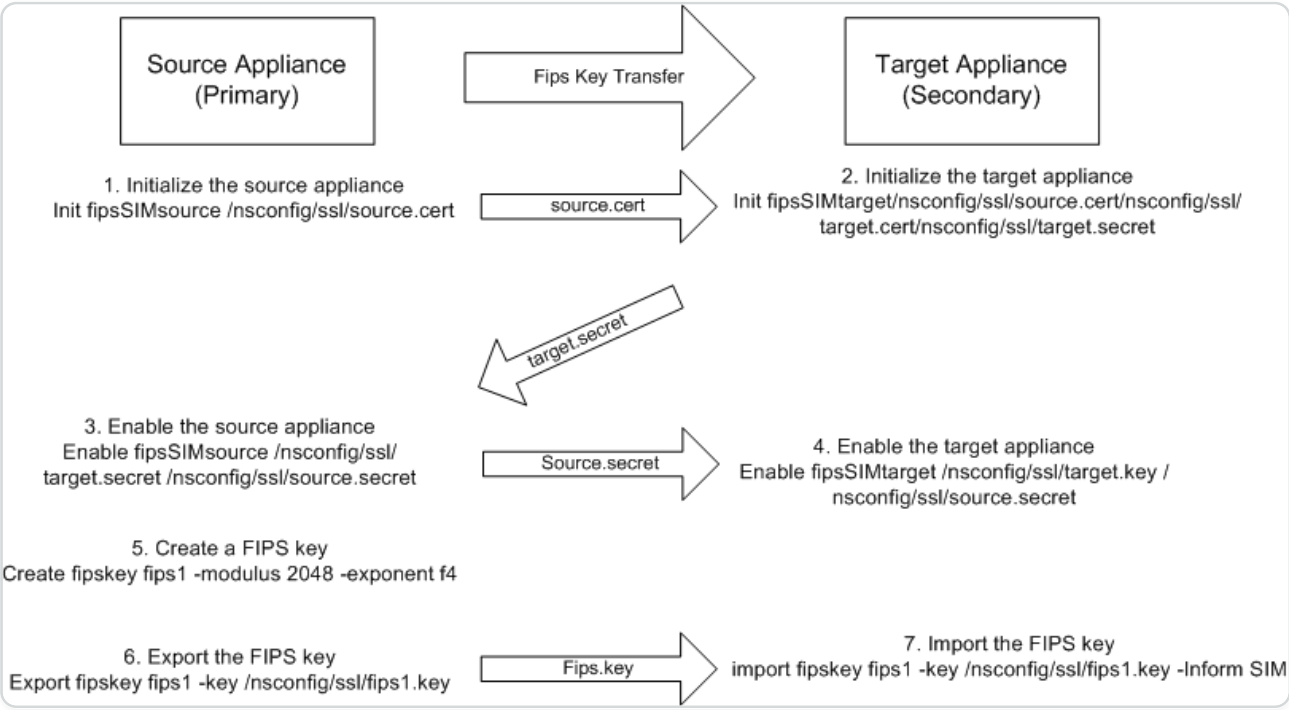
NOTE:

Citrix recommends that you use the configuration utility (GUI) for this procedure. If you use the command line (CLI), make sure that you carefully follow the steps as listed in the procedure. Changing the order of steps or specifying an incorrect input file might cause an inconsistency that requires an appliance restart. In addition, if you use the CLI, the `create ssl fipskey` command is not propagated to the secondary node. When you run the command with the same input values for modulus size and exponent on two different FIPS appliances, the keys generated are not the same. Create the FIPS key on one of the nodes and then transfer it to the other node. But if you use the configuration utility to configure FIPS appliances in an HA setup, the FIPS key that you create is automatically transferred to the secondary node. The process of managing and transferring the FIPS keys is known as secure information management (SIM).

Important: The HA setup must be completed within six minutes. If the procedure fails at any step, do the following:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. Restart the appliance or wait for 10 minutes.
2. Remove all the files created by the procedure.
3. Repeat the HA setup procedure.



> Do not reuse existing file names.

In the following procedure, appliance A is the primary node and appliance B is the secondary node.

Configure FIPS on appliances in an HA setup by using the CLI

The following diagram summarizes the transfer process on the CLI.

Figure 1. Transfer the FIPS key-summary

1. **On appliance A**, open an SSH connection to the appliance by using an SSH client, such as PuTTY.
2. Log on to the appliance, using the administrator credentials.
3. Initialize appliance A as the source appliance. At the command prompt, type:

```
init ssl fipsSIMsource <certFile>
```

Example:

```
init fipsSIMsource /nsconfig/ssl/nodeA.cert
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. Copy this `<certFile>` file to appliance B, in the /nconfig/ssl folder.

   Example:

   `scp /nsconfig/ssl/nodeA.cert nsroot@198.51.100.10:/nsconfig/ssl`

5. **On appliance B**, open an SSH connection to the appliance by using an SSH client, such as PuTTY.
6. Log on to the appliance, using the administrator credentials.
7. Initialize appliance B as the target appliance. At the command prompt, type:

   ```
   init ssl fipsSIMtarget <certFile> <keyVector> <targetSecret>
   ```

   Example:

   `init fipsSIMtarget /nsconfig/ssl/nodeA.cert /nsconfig/ssl/nodeB.key /nsconfig/ssl/nodeB.secret`

8. Copy this `<targetSecret>` file to appliance A.

   Example:

   `scp /nsconfig/ssl/fipslbdal0801b.secret nsroot@198.51.100.20:/nsconfig/ssl`

9. **On appliance A**, enable appliance A as the source appliance. At the command prompt, type:

   ```
   enable ssl fipsSIMSource <targetSecret> <sourceSecret>
   ```

   Example: `enable fipsSIMsource /nsconfig/ssl/nodeB.secret /nsconfig/ssl/nodeA.secret`

10. Copy this `<sourceSecret>` file to appliance B.

    Example: `scp /nsconfig/ssl/fipslbdal0801b.secret nsroot@198.51.100.10:/nsconfig/ssl`

11. **On appliance B**, enable appliance B as the target appliance. At the command prompt, type:

    ```
    enable ssl fipsSIMtarget <keyVector> <sourceSecret>
    ```

    Example: `enable fipsSIMtarget /nsconfig/ssl/nodeB.key /nsconfig/ssl/nodeA.secret`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

12. **On appliance A**, create a FIPS key, as described in Create a FIPS key.
13. Export the FIPS key to the appliance's hard disk, as described in Export a FIPS key.
14. Copy the FIPS key to the hard disk of the secondary appliance by using a secure file transfer utility, such as SCP.
15. **On appliance B**, import the FIPS key from the hard disk into the HSM of the appliance, as described in Import a FIPS key.

Configure FIPS on appliances in an HA setup by using the GUI

1. On the appliance to be configured as the source (primary) appliance, navigate to **Traffic Management > SSL > FIPS**.
2. In the details pane, on the FIPS Info tab, click **Enable SIM**.
3. In the **Enable SIM for HA Pair** dialog box, in the **Certificate File Name** text box, type the file name. The file name must contain the path to the location at which the FIPS certificate must be stored on the source appliance.
4. In the **Key Vector File Name** text box, type the file name. The file name must contain the path to the location at which the FIPS key vector must be stored on the source appliance.
5. In the **Target Secret File Name** text box, type the location for storing the secret data on the target appliance.
6. In the **Source Secret File Name** text box, type the location for storing the secret data on the source appliance.
7. Under **Secondary System Login Credential**, enter the values for **User Name** and **Password**.
8. Click **OK**. The FIPS appliances are now configured in HA mode.

Note: After configuring the appliances in HA, create a FIPS key, as described in Create a FIPS key. The FIPS key is automatically transferred from the primary to the secondary appliance.

Create a certificate signing request by using the CLI

At the command prompt, type:

```
create ssl certReq <reqFile> (-keyFile <input_filename> | -fipsKeyName
<string>) [-keyform ( DER | PEM )  {-PEMPassPhrase }] -countryName
<string> -stateName <string> -organizationName<string> [-
organizationUnitName <string>] [-localityName <string>] [-commonName
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
<string>] [-emailAddress <string>] {-challengePassword } [-companyName
<string>] [-digestMethod ( SHA1 | SHA256 )]
```

Example:

```
>create certreq f1.req –fipsKeyName  f1 -countryName US  -stateName CA
-organizationName Citrix -companyName Citrix -commonName ctx -emailAddress
test@example.com

Done
```

Create a server certificate by using the CLI

At the command prompt, type:

```
create ssl cert <certFile> <reqFile> <certType> [-keyFile
<input_filename>] [-keyform ( DER | PEM ) {-PEMPassPhrase }] [-days
<positive_integer>] [-certForm ( DER | PEM )] [-CAcert <input_filename>]
[-CAcertForm ( DER | PEM )] [-CAkey <input_filename>][-CAkeyForm ( DER |
PEM )] [-CAserial <output_filename>]
```

Example:

```
create cert f1.cert f1.req SRVR_CERT -CAcert ns-root.cert -CAkey ns-
root.key -CAserial ns-root.srl -days 1000

Done
```

The preceding example creates a server certificate using a local root CA on the appliance.

Add a certificate-key pair by using the CLI

At the command prompt, type:

```
add ssl certKey <certkeyName> (-cert <string> [-password]) [-key <string>
| -fipsKey <string> | -hsmKey <string>] [-inform <inform>][-expiryMonitor
( ENABLED | DISABLED ) [-notificationPeriod <positive_integer>]] [-bundle
( YES | NO )]
```

Example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add certkey cert1 -cert f1.cert -fipsKey f1
```

After creating the FIPS key and server certificate, you can add the generic SSL configuration. Enable the features that are required for your deployment. Add servers, services, and SSL virtual servers. Bind the certificate-key pair and the service to the SSL virtual server. Save the configuration.

```
enable ns feature SSL LB

add server s1 10.217.2.5

add service sr1 s1 HTTP 80

add lb vserver v1 SSL 10.217.2.172 443

bind ssl vserver v1 –certkeyName cert1

bind lb vserver v1 sr1

saveconfig
```

The basic configuration of your MPX 14000 FIPS appliance is now complete.

For information about configuring secure HTTPS, click Configure FIPS.

For information about configuring secure RPC, click Configure FIPS for the first time.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Update the license on an MPX 14000 FIPS appliance

Any update to the license on this platform requires two reboots.

1. Update the license in the `/nsconfig/license` folder.
2. Restart the appliance.
3. Log on to the appliance.
4. Restart the appliance again. **Note:** Do not add new commands, save the config, or check the system state before the second reboot.
5. Log on to the appliance and ensure that FIPS is initialized by running the `show ssl fips` command.

Support for hybrid FIPS mode on the MPX 14000 FIPS and SDX 14000 FIPS platforms

NOTE:

This feature is supported only on the new MPX/SDX 14000 FIPS platform containing one primary FIPS card and one or more secondary cards. It is not supported on a VPX platform or a platform containing only one type of hardware card.

On a FIPS platform, the asymmetric and symmetric encryption and decryption are performed on the FIPS card for security reasons. However, you can perform part of this activity (asymmetric) on a FIPS card and offload the bulk encryption and decryption (symmetric) to another card without compromising the security of your keys.

The new MPX/SDX 14000 FIPS platform contains one primary card and one or more secondary cards. If you enable the hybrid FIPS mode, the pre-master secret decryption commands are run on the primary card because the private key is stored on this card. However, the bulk encryption and decryption is offloaded to the secondary card. This offload significantly increases the bulk encryption throughput on an MPX/SDX 14000 FIPS platform as compared to non-hybrid FIPS mode and the existing MPX 9700/10500/12500/15000 FIPS platform. Enabling the hybrid FIPS mode also improves the SSL transaction per second on this platform.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTES:

- The hybrid FIPS mode is disabled by default to meet the strict certification requirements where all the crypto computation must be done inside a FIPS certified module. Enable the hybrid mode to offload the bulk encryption and decryption to the secondary card.
- On an SDX 14000 FIPS platform, you must first assign an SSL chip to the VPX instance before you enable the hybrid mode.

Enable hybrid FIPS mode by using the CLI

At the command prompt, type:

```
set SSL parameter -hybridFIPSMode {ENABLED|DISABLED}

Arguments

hybridFIPSMode

When this mode is enabled, system will use additional crypto hardware to
accelerate symmetric crypto operations.

Possible values: ENABLED, DISABLED

Default value: DISABLED
```

Example:

```
    set SSL parameter -hybridFIPSMode ENABLED

    show SSL parameter
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
    Advanced SSL Parameters

    ----------------------

    . . . . . . . . . . . .

    Hybrid FIPS Mode    : ENABLED

    . . . . . . . . . . . .
```

Enable hybrid FIPS mode by using the GUI

1. Navigate to **Traffic Management > SSL**.
2. In the details pane, under **Settings**, click **Change advanced SSL settings**.
3. In the **Change Advanced SSL Settings** dialog box, select **Hybrid FIPS Mode**.

Limitations:

1. Renegotiation is not supported.
2. The `stat ssl parameter` command on an SDX 14000 platform does not display the correct secondary card utilization percentage. It always displays 0.00% utilization.

```
stat ssl

SSL Summary

# SSL cards present 1

# SSL cards UP  1

# Secondary SSL cards present   4

# Secondary SSL cards UP    4

SSL engine status      1

SSL sessions (Rate)     963
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Secondary card utilization (%)     0.00
```

SDX 14000 FIPS appliances

NOTE

The firmware versions listed under "NetScaler Release 12.1-FIPS" and "NetScaler Release 12.1-NDcPP" in the NetScaler downloads page are not supported on the MPX 14000 FIPS or SDX 14000 FIPS platforms. These platforms can use other latest NetScaler firmware versions available on the downloads page.

A NetScaler SDX appliance is a multitenant platform on which you can provision and manage multiple virtual NetScaler instances. The SDX appliance addresses cloud computing and multitenancy requirements by allowing a single administrator to configure and manage the appliance and delegate the administration of each hosted instance to tenants.

A NetScaler SDX 14030/14060/14080 FIPS appliance provides the capabilities of an SDX appliance with FIPS functionality. It is equipped with a tamper-proof (tamper-evident) cryptographic module—a Cavium CNN3560-NFBE-G—designed to comply with the FIPS 140-2 Level-3 specifications (from release 12.0 build 56.x). The Critical Security Parameters (CSPs), primarily the server's private-key, are securely stored and generated inside the cryptographic module. This module is also referred to as the Hardware Security Module (HSM). The CSPs are never accessed outside the boundaries of the HSM. Only the superuser (`nsroot`) can perform operations on the keys stored inside the HSM.

A NetScaler SDX 14030/14060/14080 FIPS appliance contains one FIPS HSM module with 63 cores. The FIPS HSM module can be partitioned up to a maximum of 32 partitions. The SDX administrator can assign dedicated key storage, cryptographic resources, and number of crypto SSL FIPS cores to each partition. Keys and resources allocated to a partition are dedicated and secure and any other partition cannot access or share them.

The FIPS HSM partition that you create can be assigned or attached to a VPX instance at the time of provisioning the instance, or later by editing the instance. The FIPS partition created and attached to an instance acts like a virtual HSM module for that instance.

The VPX instances on an SDX 14030/14060/14080 FIPS appliance are assigned a FIPS virtual function (VF) partition, which is treated as an isolated FIPS virtual card or HSM. Therefore, the steps to configure a FIPS partition inside a VPX instance are similar to the steps to configure an

© 1997–2026 Citrix Systems, Inc. All rights reserved.

MPX FIPS appliance. For compliance details, see the security policy details on the U.S. National Institute of Standards and Technology (NIST) website.

For information about configuring FIPS appliances in a high availability setup, see Configure FIPS appliances in an HA setup.

IMPORTANT

Each key includes a private and a public key. As a result, it occupies two key spaces. Therefore, the maximum number of keys is limited to one less than half the key store size.

The SDX 14000 FIPS platform supports a hybrid FIPS mode. This mode allows you to offload part of the encryption and decryption activity to a non-FIPS card. For more information, see Hybrid FIPS mode.

Limitations

1. SSL renegotiation using the SSLv3 protocol is not supported on the back end of an SDX FIPS appliance.
2. 1024-bit and 4096-bit keys and an exponent value of 3 are not supported.
3. Backup and restore are not supported.
4. Cluster and administrative domains are not supported.
5. You can attach only one FIPS partition to an instance.
6. An instance with a FIPS partition can be assigned only one CPU core.
7. You can assign either a FIPS partition or an SSL core to an instance, but not both.
8. 4096-bit server certificate is not supported.
9. 4096-bit client certificate is not supported (if client authentication is enabled on the back-end server).

Terminology

Zeroize: Reset the HSM. All the data on the HSM is deleted. This step is mandatory before the HSM is initialized.

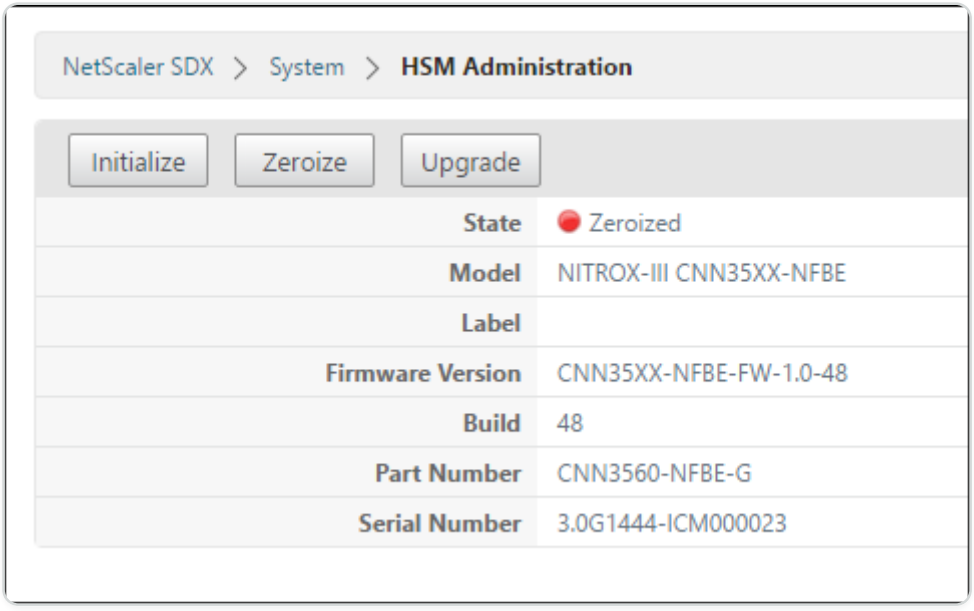
Initialize: Set the HSM capabilities. The NetScaler SDX FIPS appliance complies with FIPS-140-2 level 2. You can create partitions after you initialize the chip.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Key store size: Number of keys that can be stored on a partition. A maximum of 102235 keys can be specified. The maximum number of keys that can be stored is one less than half the number specified. For example, if you specify 100, you can create only 49 keys because one of the keys is the RSA key pair that consumes 2 key stores.

Crypto Core Capacity: Number of crypto cores assigned to a partition. A maximum of 63 cores are available.

SSL Context: Number of concurrent SSL connections that can be created on a partition.

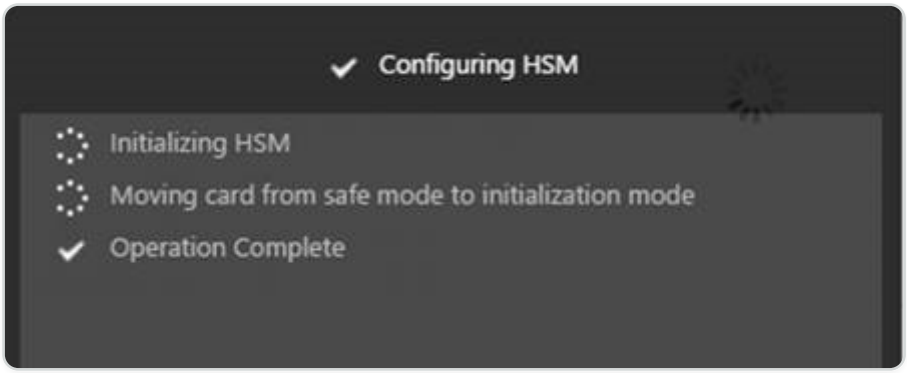


Initialize the HSM

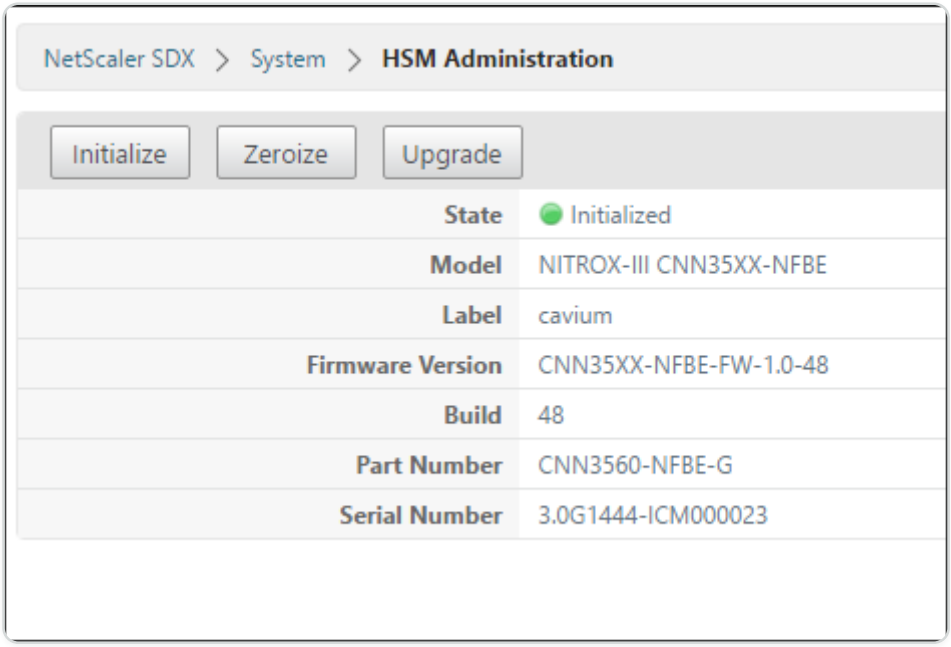
Before initializing the HSM, you must first zeroize it.

Zeroize the HSM by using the Management Service

1. Open a browser and log on to the appliance.
2. On the **Configuration** tab, navigate to **System > HSM Administration**, and in the details plane, click **Zeroize**.



All data is wiped from the FIPS chip, and the state appears as “Zeroized.” Any HSM partitions created earlier are deleted.



Initialize the HSM by using the Management Service

1. On the **Configuration** tab, navigate to **System > HSM Administration**, and in the details plane, click **Initialize**.
2. Type a new user name, specify a password, and click **OK**.

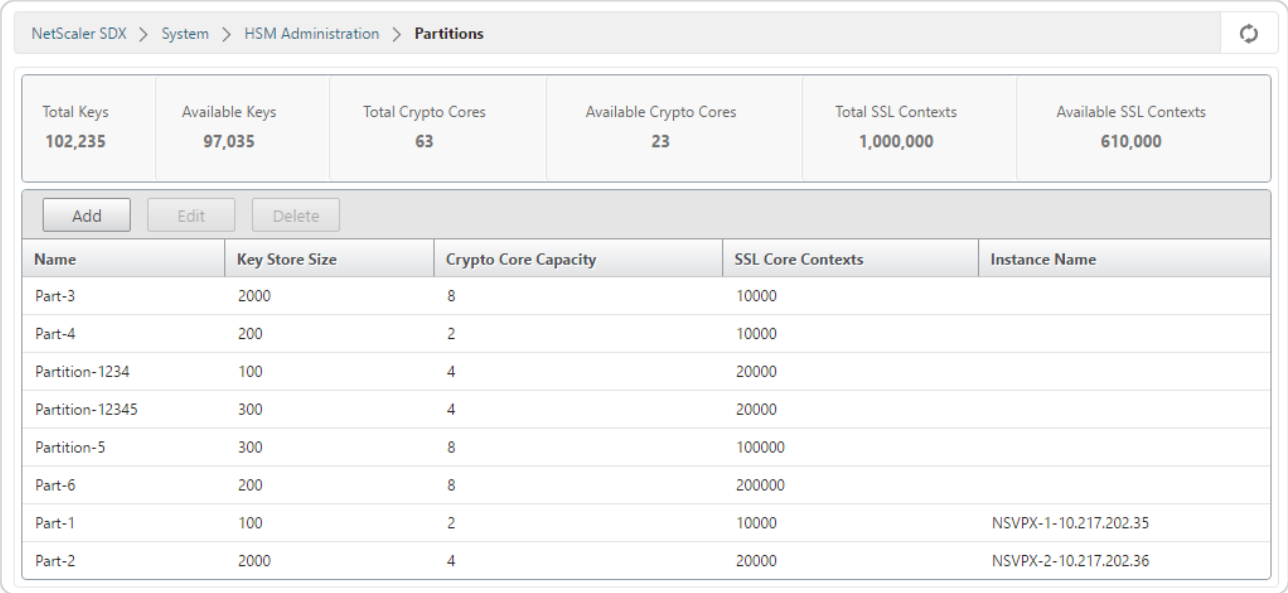
© 1997–2026 Citrix Systems, Inc. All rights reserved.

The card state appears as “Initialized.”

Create partitions

Create partitions for different tenants and specify the cryptographic resources for each partition. Each instance is assigned one partition, and a partition can be assigned to only one instance. Deleting an instance deletes the partition assigned to the instance. As a result, the partition data is also deleted and not left unsecured or accessible later. Number of keys and SSL context assignment depends on your application. For information about the number of cores to assign, see the NetScaler data sheet.

IMPORTANT



After you assign a key store size and cores to an HSM partition, you cannot change them at run time. First detach the partition from the instance.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Create a partition by using the Management Service

1. On the Configuration tab, navigate to **System** > **HSM Administration** > **Partitions**, and in the details plane, click **Add**.
2. Specify a name for the partition, and the resources to be assigned to this partition.
3. Click **OK**.

The summary page displays all the partitions that were created. Some partitions are assigned an instance while some are free partitions.

Provision a new instance or modify an existing instance and assign a partition

After creating the partitions, you must assign them to instances.

IMPORTANT:

- You can attach only one FIPS partition to an instance.
- An instance with a FIPS partition can be assigned only one CPU core.

Provision a new instance or modify an existing instance

1. On the Configuration tab, navigate to **NetScaler®** > **Instances**, and add or modify an instance.
2. Select **Enable FIPS**, and from the **Partitions** list, select a partition to attach to this instance.

You can verify that the partition is attached to an instance by using either the GUI or the CLI.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

In the GUI, navigate to **System** > **HSM Administration** > **Partitions**. The instance name attached to the partition is displayed.

To unassign a FIPS partition¸ navigate to **NetScaler** > **Instances**. Edit the instance and clear the **Enable FIPS** check box.

In the CLI, at the command prompt, type the following commands:

```
show fips

FIPS Card is not configured

 Done
```

If you see the following output, see the troubleshooting section for debugging.

ERROR: Operation not permitted - no FIPS card present in the system

Note

> When a partition is detached from any of the existing VPX instances, the data on the partition is cleared. As a result, any current configuration (for example FIPS keys) is lost. After a partition is detached or reattached to a new or previously bound VPX instance, it must be initialized as per the instructions in Configure the HSM before you can use the partition for any secure connections.

During this time (after the partition is detached or reattached), the corresponding VPX instance can be accessed through the GUI using HTTP and through the CLI using SSH.

Configure the HSM for an instance on an SDX 14030/14060/14080 FIPS appliance

First check the state of your FIPS card to verify that the driver loaded correctly, and then initialize the card.

At the command prompt, type:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
show fips

FIPS Card is not configured

Done
```

If the driver is not loaded correctly, the message "ERROR: Operation not permitted - no FIPS card present in the system" appears.

Initialize the FIPS card

IMPORTANT:

Verify that the `/nsconfig/fips` directory has successfully been created on the appliance.

Do not save the configuration before you restart the appliance for the third time.

Perform the following steps to initialize the FIPS card:

1. Reset the FIPS card (`reset fips`).
2. Restart the appliance (`reboot`).
3. Set the security officer password for partitions 0 and 1, and the user password for partition (`set fips -initHSM Level-2 <soPassword> <oldsoPassword> <userPassword> -hsmLabel NSFIPS`).

   Note: The set or reset command takes more than 60 seconds to run.
4. Save the configuration (`saveconfig`).
5. Verify that the password encrypted key for the main partition (master_pek.key) has been created in the /nsconfig/fips/ directory.
6. Restart the appliance (`reboot`).
7. Verify that the FIPS card is UP (`show fips`).

Initialize the FIPS card by using the CLI

At the command prompt, type the following commands:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
reset fips

reboot

set fips -initHSM Level-2 <soPassword> <oldsoPassword> <userPassword>
-hsmLabel <string>
```

Note: The following message appears when you run the **set fips** command:

```
This command will erase all data on the FIPS card. You must save the
configuration (saveconfig) after executing this command. [Note: On MPX/SDX
14xxx FIPS platform, the FIPS security is at Level-3 by default, and the
-initHSM Level-2 option is internally converted to Level-3]  Do you want
to continue?(Y/N)y

saveconfig

reboot

show fips
```

Example:

```
reset fips

Done

reboot
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
set fips -initHSM Level-2 so12345 so12345 user123 -hsmLabel NSFIPS

This command will erase all data on the FIPS card. You must save the
configuration (saveconfig) after executing this command. [Note: On MPX/SDX
14xxx FIPS platform, the FIPS security is at Level-3 by default, and the
-initHSM Level-2 option is internally converted to Level-3]  Do you want
to continue?(Y/N)y

Done

saveconfig

Done

reboot

show fips

    FIPS HSM Info:

    HSM Label : NSFIPS

    Initialization : FIPS-140-2 Level-2

    HSM Serial Number : 3.0G1532-ICM000228

    HSM State : 2
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
    HSM Model : NITROX-III CNN35XX-NFBE

    Hardware Version : 0.0-G

    Firmware Version : 1.0

    Firmware Build : NFBE-FW-1.0-48

    Max FIPS Key Memory : 1000

    Free FIPS Key Memory : 1000

    Total SRAM Memory : 557396

    Free SRAM Memory : 238088

    Total Crypto Cores : 4

    Enabled Crypto Cores : 4

Done
```

Create a FIPS key for an instance on an SDX 14030/14060/14080 FIPS appliance

You can create a FIPS key on your instance or import an existing FIPS key into the instance. An SDX 14030/14060/14080 FIPS appliance supports only 2048-bit and 3072-bit keys and an exponent value of F4. For PEM keys, an exponent is not required. Verify that the FIPS key is created correctly. Create a certificate signing request and a server certificate. Finally, add the certificate-key pair to your instance.

NOTE:

1024-bit and 4096-bit keys and an exponent value of 3 are not supported.

Create a FIPS key by using the CLI

At the command prompt, type:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
create ssl fipsKey <fipsKeyName> -keytype ( RSA | ECDSA ) [-exponent (3 |
F4 )] [-modulus <positive_integer>] [-curve ( P_256 | P_384 )]
```

Example:

```
create fipsKey f1 -keytype RSA -modulus 2048 -exponent F4

Done

show ssl fipskey ddvws

FIPS Key Name: f1  Key Type: RSA Modulus: 2048   Public Exponent: F4 (Hex:
0x10001)

Done
```

Import a FIPS key by using the CLI

At the command prompt, type:

```
import ssl fipsKey <fipsKeyName> -key <string> [-inform <inform>] [-
wrapKeyName <string>] [-iv<string>] [-exponent F4 ]
```

Example:

```
import fipskey Key-FIPS-2 -key Key-FIPS-2.key -inform SIM -exponent F4

Done

import fipskey Key-FIPS-2 -key Key-FIPS-2.key -inform PEM

Done
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Verify that the FIPS key is created or imported correctly by running the **show fipskey** command.

```
show fipskey

1)      FIPS Key Name: Key-FIPS-2

Done
```

Create a certificate signing request by using the CLI

At the command prompt, type:

```
create ssl certReq <reqFile> (-keyFile <input_filename> | -fipsKeyName
<string>) [-keyform ( DER | PEM )  {-PEMPassPhrase }] -countryName
<string> -stateName <string> -organizationName<string> [-
organizationUnitName <string>] [-localityName <string>] [-commonName
<string>] [-emailAddress <string>] {-challengePassword } [-companyName
<string>] [-digestMethod ( SHA1 | SHA256 )]
```

Example:

```
create certreq f1.req –fipsKeyName f1 -countryName US -stateName CA
-organizationName Citrix -companyName Citrix -commonName ctx -emailAddress
test@example.com`

`Done
```

Create a server certificate by using the CLI

At the command prompt, type:

```
create ssl cert <certFile> <reqFile> <certType> [-keyFile
<input_filename>] [-keyform ( DER | PEM ) {-PEMPassPhrase }] [-days
<positive_integer>] [-certForm ( DER | PEM )] [-CAcert <input_filename>]
[-CAcertForm ( DER | PEM )] [-CAkey <input_filename>] [-CAkeyForm ( DER |
PEM )] [-CAserial <output_filename>]
```

Example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
create cert f1.cert f1.req SRVR_CERT -CAcert ns-root.cert -CAkey ns-
root.key -CAserial ns-root.srl -days 1000

Done
```

The preceding example creates a server certificate using a local root CA on the appliance.

Add a certificate-key pair by using the CLI

At the command prompt, type:

```
add ssl certKey <certkeyName> (-cert <string> [-password]) [-key <string>
| -fipsKey <string> | -hsmKey <string>] [-inform <inform>] [-expiryMonitor
( ENABLED | DISABLED ) [-notificationPeriod   <positive_integer>]] [-
bundle ( YES | NO )]
```

Example:

```
add certkey cert1 -cert f1.cert -fipsKey f1

Done
```

After creating the FIPS key and server certificate, you can add the generic SSL configuration. Enable the features that are required for your deployment. Add servers, services, and SSL virtual servers. Bind the certificate-key pair and the service to the SSL virtual server, and save the configuration.

```
enable ns feature SSL LB

Done

add server s1 10.217.2.5

Done

add service sr1 s1 HTTP 80

Done

add lb vserver v1 SSL 10.217.2.172 443
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Done

bind ssl vserver v1 –certkeyName cert1

Done

bind lb vserver v1 sr1

Done

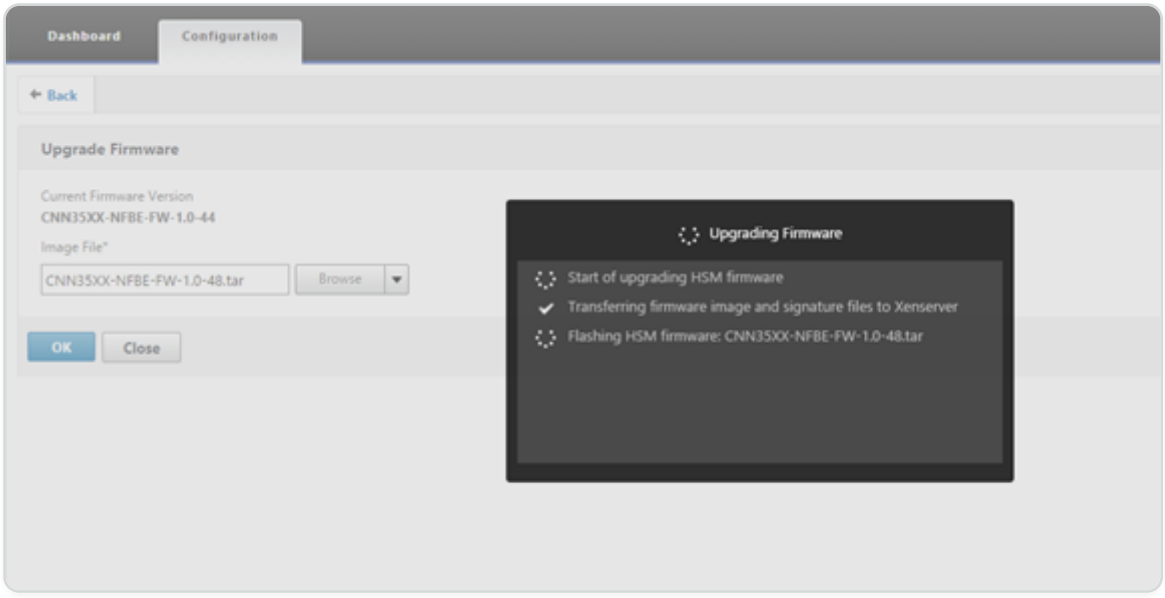
saveconfig

Done
```

For information about configuring secure HTTPS and secure RPC, click here.

Upgrade the FIPS HSM firmware on a VPX instance

NOTE



This upgrade applies to the FIPS card on the SDX 14000 appliance.

FIPS HSM firmware updates are released from time to time. Download the latest firmware from the NetScaler® download page and upload it to the appliance. The upgrade process might take up to 10 minutes to complete. The instance is restarted after the upgrade.

Upgrade the FIPS HSM firmware

1. Navigate to **System > HSM Administration > Firmware Images**.
2. Select **Upload**.
3. Navigate to the folder that contains the firmware image and select the file.
4. Navigate to **System > HSM Administration**, and select **Upgrade Firmware**.
5. Select the firmware image to upgrade to, and click **OK**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Support for Thales Luna Network hardware security module

A non-FIPS NetScaler appliance stores the server's private key on the hard disk. On a FIPS appliance, the key is stored in a cryptographic module known as a hardware security module (HSM). Storing a key in the HSM protects it from physical and software attacks. In addition, the keys are encrypted with special FIPS approved ciphers.

Only the NetScaler MPX and NetScaler SDX 14000 FIPS appliances support a FIPS card. Support for FIPS card is not available on other NetScaler MPX/NetScaler SDX appliances, or on NetScaler VPX. This limitation is addressed by supporting a Thales Luna network HSM on all NetScaler VPX, NetScaler MPX, NetScaler SDX appliances, and NetScaler MPX/NetScaler VPX FIPS certified platforms except the NetScaler MPX and NetScaler SDX 14000 FIPS appliances.

NOTE

Support for the appliances listed in Support for Intel Coleto and Intel Lewisburg SSL chip-based platforms is available in release 13.1 build 33.x and later.

A Thales Luna network HSM is designed to protect critical cryptographic keys and to accelerate sensitive cryptographic operations across a wide range of security applications.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Supported versions matrix

NETSCALER VERSION	SOFTWARE APPLIANCE VERSION	FIRMWARE VERSION	CLIENT VERSION
11.1, 12.0, 12.1	5.2.3-1	6.2.1	6.0.0
11.1, 12.0, 12.1	6.2.2-5	6.10.9	6.2.2
13.0	7.2.0-220	7.0.3	7.2.2 (7.2.0-220)
13.1	7.2.0-220	7.0.3	10.3.0

Prerequisites

Before you can use a Thales Luna network HSM with a NetScaler, make sure that the following prerequisites are met:

- A Thales Luna network HSM is installed in the network, ready to use, and accessible to the NetScaler. That is, the NSIP address or the SNIP address is added as an authorized client on the HSM.
- Licenses are available to support the required number of partitions on the HSM.
- The Thales Luna network HSM and the NetScaler can initiate connections with each other through port 1792.
- You are using NetScaler release 11.1 or later.
- The NetScaler appliance does not contain a FIPS card.

IMPORTANT

Thales Luna network HSMs are not supported on the NetScaler MPX 14000 FIPS and NetScaler SDX 14000 FIPS appliances.

Configure a Thales Luna client on the ADC

After you have configured the Thales Luna HSM and created the required partitions, you must create clients and assign them to partitions. Begin by configuring the Thales Luna clients on the NetScaler and setting up the network trust links (NTLs) between the Thales Luna clients and the Thales Luna HSM.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE

If you upgrade to software version 13.1, you must install the Thales Luna client version 10.3.0 and perform the following steps.

1. Change the directory to /var/safenet and install the Thales Luna client. At the shell prompt, type:

   ```
   cd /var/safenet
   ```

   To install Thales Luna client version 6.0.0, type:

   ```
   install_client.sh -v 600
   ```

   To install Thales Luna client version 6.2.2, type:

   ```
   install_client.sh -v 622
   ```

   To install Thales Luna client version 7.2.2, type:

   ```
   install_client.sh -v 722
   ```

   To install Thales Luna client version 10.3.0, type:

   ```
   install_client.sh -v 1030
   ```

2. Configure the NTLs between Thales Luna client (ADC) and HSM.

   After the '/var/safenet/' directory is created, perform the following tasks on the ADC.

   a) Change the directory to '/var/safenet/config/' and run the 'safenet_config' script. At the shell prompt, type:

   ```
   cd /var/safenet/config
   ```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
sh safenet_config
```

This script copies the “Chrystoki.conf” file into the /etc/ directory. It also generates a symbolic link 'libCryptoki2_64.so' in the '/usr/lib/' directory.

b) Create and transfer a certificate and key between the ADC and the Thales Luna HSM.

To communicate securely, the ADC and the HSM must exchange certificates. Create a certificate and key on the ADC and then transfer it to the HSM. Copy the HSM certificate to the ADC.

i) Change directory to /var/safenet/safenet/lunaclient/bin.

ii) Create a certificate on the ADC. At the shell prompt, type:

```
./vtl createCert -n <ip address of NetScaler>
```

This command also adds the certificate and key path to the “/etc/Chrystoki.conf” file.

iii) Copy this certificate to the HSM. At the shell prompt, type:

```
scp /var/safenet/safenet/lunaclient/cert/client/<ip address of NS>.pem
<LunaSA_HSM account>@<IP address of Luna SA>
```

iv) Copy the HSM certificate to the NetScaler. At the shell prompt, type:

```
scp <HSM account>@<HSM IP>:server.pem  /var/safenet/safenet/lunaclient/
server_<HSM ip>.pem
```

3. Register the NetScaler as a client and assign it a partition on the Thales Luna HSM.

   Log on to the HSM and create a client. Enter the NSIP as the client IP. This address must be the IP address of the ADC from which you transferred the certificate to the HSM. After the client is successfully registered, assign a partition to it. Run the following commands on the HSM.

   a) Use SSH to connect to the Thales Luna HSM and enter the password.

   b) Register the NetScaler on the Thales Luna HSM. The client is created on the HSM. The IP address is the client's IP address. That is, the NSIP address.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

At the prompt, type:

```
client register –client <client name> -ip <NetScaler ip>
```

c) Assign the client a partition from the partition list. To view the available partitions, type:

```
<luna_sh> partition list
```

Assign a partition from this list. Type:

```
<lunash:> client assignPartition -client <Client Name> -par <Partition
Name>
```

4. Register the HSM with its certificate on the NetScaler.

   On the ADC, change the directory to “/var/safenet/safenet/lunaclient/bin” and, at the shell prompt, type:

   ```
   ./vtl addserver -n <IP addr of HSM> -c /var/safenet/safenet/lunaclient/
   server_<HSM_IP>.pem
   ```

   To remove the HSM that is enrolled on the ADC, type:

   ```
   ./vtl deleteServer -n <HSM IP> -c <cert path>
   ```

   To list the HSM servers configured on the ADC, type:

   ```
   ./vtl listServer
   ```

   NOTE:

   Before removing the HSM by using `vtl`, make sure all the keys for that HSM are manually removed from the appliance. HSM keys cannot be deleted after the HSM server is removed.

5. Verify the network trust links (NTLs) connectivity between the ADC and HSM. At the shell prompt, type:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
./vtl verify
```

If verification fails, review all the steps. Errors are due to an incorrect IP address in the client certificates.

6. Save the configuration.

   The preceding steps update the “/etc/Chrystoki.conf” configuration file. This file is deleted when the ADC is started. Copy the configuration to the default configuration file, which is used when an ADC is restarted.

   At the shell prompt, type:

   ```
   root@ns# cp /etc/Chrystoki.conf /var/safenet/config/
   ```

   Recommended practice is to run this command every time there is a change to the Thales Luna related configuration.

7. Start the Thales Luna gateway process.

   At the shell prompt, type:

   ```
   sh /var/safenet/gateway/start_safenet_gw
   ```

8. Configure automatic start of the gateway daemon at boot time.

   Create the “safenet_is_enrolled” file, which indicates that Thales Luna HSM is configured on this ADC. Whenever the ADC restarts and this file is found, the gateway is automatically started.

   At the shell prompt, type:

   ```
   touch /var/safenet/safenet_is_enrolled
   ```

9. Restart the NetScaler appliance. At the command prompt, type:

   ```
   reboot
   ```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure Thales Luna HSMs in a high availability setup on the ADC

Configuring Thales Luna HSMs in a high availability (HA) ensures uninterrupted service even if all, but one of the devices, are unavailable. In an HA setup, each HSM joins an HA group in active-active mode. Thales Luna HSMs in an HA setup provide load balancing of all the group members to increase performance and response time while providing the assurance of high availability service. For more information, contact Thales Luna Sales and Support.

Prerequisites:

- Minimum two Thales Luna HSM devices. All the devices in an HA group must have either PED (trusted path) authentication or password authentication. A combination of trusted path authentication and password authentication in an HA group is not supported.
- Partitions on each HSM device must have the same password even if the label (name) is different.
- All partitions in HA must be assigned to the client (NetScaler appliance).

After configuring a Thales Luna client on the ADC as described in Configure a Thales Luna client on the ADC, perform the following steps to configure Thales Luna HSMs in HA:

1. On the NetScaler shell prompt, launch `lunacm` (/usr/safenet/lunaclient/bin)

   Example:

   ```
   root@ns# cd /var/safenet/safenet/lunaclient/bin/

   root@ns# ./lunacm
   ```

2. Identify the slot IDs of the partitions. To list the available slots (partitions), type:

   ```
   lunacm:> slot list
   ```

   Example:

   ```
       Slot Id ->              0

       HSM Label ->            trinity-p1

       HSM Serial Number ->    481681014
   ```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
    HSM Model ->            LunaSA 6.2.1

    HSM Firmware Version -> 6.10.9

    HSM Configuration ->    Luna SA Slot (PED) Signing With Cloning
Mode

    HSM Status ->           OK

    Slot Id ->              1

    HSM Label ->            trinity-p2

    HSM Serial Number ->    481681018

    HSM Model ->            LunaSA 6.2.1

    HSM Firmware Version -> 6.10.9

    HSM Configuration ->    Luna SA Slot (PED) Signing With Cloning
Mode

    HSM Status ->           OK

     Slot Id ->              2

     HSM Label ->            neo-p1

     HSM Serial Number ->    487298014

     HSM Model ->            LunaSA 6.2.1

     HSM Firmware Version -> 6.10.9

     HSM Configuration ->    Luna SA Slot (PED) Signing With Cloning
Mode

    HSM Status ->           OK
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
    Slot Id ->              3

    HSM Label ->            neo-p2

    HSM Serial Number ->    487298018

    HSM Model ->            LunaSA 6.2.1

    HSM Firmware Version -> 6.10.9

    HSM Configuration ->    Luna SA Slot (PED) Signing With Cloning
Mode

    HSM Status ->           OK

    Slot Id ->              7

    HSM Label ->            hsmha

    HSM Serial Number ->    1481681014

    HSM Model ->            LunaVirtual

    HSM Firmware Version -> 6.10.9

    HSM Configuration ->    Luna Virtual HSM (PED) Signing With Cloning
Mode

    HSM Status ->           N/A - HA Group

    Slot Id ->              8

    HSM Label ->            newha

    HSM Serial Number ->    1481681018

    HSM Model ->            LunaVirtual
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
    HSM Firmware Version -> 6.10.9

    HSM Configuration ->    Luna Virtual HSM (PED) Signing With Cloning
Mode

    HSM Status ->           N/A - HA Group

    Current Slot Id: 0
```

3. Create the HA group. The first partition is called the primary partition. You can add more than one secondary partitions.

```
lunacm:> hagroup createGroup -slot <slot number of primary partition>
-label <group name> -password <partition password >

lunacm:> hagroup createGroup -slot 1 -label gp12 -password ******
```

4. Add the secondary members (HSM partitions). Repeat this step for all partitions to be added to the HA group.

```
lunacm:> hagroup addMember -slot <slot number of secondary partition to
be added> -group <group name> -password <partition password>
```

Code:

```
lunacm:> hagroup addMember -slot 2 -group gp12 -password ******
```

5. Enable HA only mode.

```
lunacm:> hagroup HAOnly –enable
```

6. Enable active recovery mode.

```
lunacm:.>hagroup recoveryMode –mode active
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

7. Set auto recovery interval time (in seconds). Default is 60 seconds.

   ```
   lunacm:.>hagroup interval –interval <value in seconds>
   ```

   Example:

   ```
   lunacm:.>hagroup interval –interval 120
   ```

8. Set recovery retry count. A value of -1 allows an infinite number of retries.

   ```
   lunacm:> hagroup retry -count <xxx>
   ```

   Example:

   ```
   lunacm:> hagroup retry -count 2
   ```

9. Copy the configuration from `Chrystoki.conf` to the SafeNet configuration directory.

   ```
   cp /etc/Chrystoki.conf /var/safenet/config/
   ```

10. Restart the ADC appliance.

    ```
    reboot
    ```

Other ADC configuration

1. Generate a key on the HSM.

   Use third party tools to create keys on the HSM.

2. Add an HSM key on the ADC.

   Important! The # character is not supported in a key name. If the key name includes this character, the load key operation fails.

   To add a Thales Luna HSM key by using the CLI:

   At the command prompt, type:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add ssl hsmkey <KeyName> -hsmType SAFENET -serialNum <serial #>
-password
```

where:

-keyName is the key created on the HSM by using third party tools.

-serialNum is the serial number of the partition on the HSM on which the keys are generated.

Note: For HSM in a high availability setup, use the serial number of the high availability group.

-password is the password of the partition on which the keys are present.

To add a Thales Luna HSM key by using the GUI:

Navigate to **Traffic Management** > **SSL** > **HSM** and add an HSM key. You must specify the HSM Type as **SAFENET**.

3. Add a certificate-key pair on the ADC. First use a third party tool to generate a certificate associated with the key. Then, copy the certificate to the /nsconfig/ssl/ directory on the ADC.

   Note: The key must be an HSM key.

   To add a certkey pair on the ADC by using the CLI:

   At the command prompt, type:

   ```
   add ssl certkey <CertkeyName> -cert <cert name> -hsmkey <KeyName>
   ```

   To add a certkey pair on the ADC by using the GUI:

   a. Navigate to **Traffic Management** > **SSL**.
   b. In **Getting Started**, select **Install Certificate (HSM)** and create a certificate-key pair using an HSM key.

4. Create a virtual server and bind the certificate-key pair to this virtual server.

For information about creating a virtual server, click SSL virtual server configuration.

For information about adding a certificate-key pair, click Add or update a certificate-key pair.

For information about binding a certificate-key pair to an SSL virtual server, click Bind the certificate-key pair to the SSL virtual server.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NetScaler appliances in a high availability setup

You can configure a high availability (HA) setup on the NetScaler appliances with a Thales Luna HSM configuration in either of the following two ways:

- First, configure a Thales Luna HSM on the two nodes, using the same HSM and partition. Then create an HA pair. Finally, add the NetScaler configuration, such as keys, certificate-key pairs, and virtual servers, on the primary node.
- If a Thales Luna HSM is already configured on one node with the NetScaler configuration, add a similar configuration on the other node. Copy “/var/safenet/sfgw_ident_file” from the first node to the other and restart the safenet_gw binary. After the gateway is up and running, add the nodes in an HA setup.

Limitations

1. For any changes to the HSM-related configuration in an existing setup, such as adding or removing an HSM, or creating an HA setup, copy '/etc/Chrystoki.conf' to '/var/safenet/config'.
2. After adding, removing, or restarting an HSM, you must restart the '/var/safenet/gateway/safenet_gw' binary. If you don't restart the gateway binary, the HSM will not serve any traffic after it is added back or after it restarts.
3. To reboot or stop the current '/var/safenet/gateway/safenet_gw' binary, use

   ```
   kill –SIGTERM <PID>

   kill –SIGINT <PID>
   ```

   Important! Do not use `kill –9 <PID>` or `kill -6 <PID>`
4. Before removing an existing HSM from the ADC, remove, from the ADC, all the keys and certificate-key pairs that are associated with that HSM. You can't delete these files from the ADC after you remove the HSM.
5. On a standalone NetScaler appliance, Thales Luna HSMs in HA are supported for Luna version 6.2 and later.
6. EXPORT ciphers are not supported.
7. Update certificate-key pair operation is not supported.
8. When you generate an HSM key on a third-party tool, the private and public key names must be the same. When you add the HSM key on the appliance, provide this name as the key name.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

9. The `#` character is not supported in a key name and partition password.
10. Cluster and admin partitions are not supported.

Appendix

Sample commands with their outputs:

Run the script

```
 root@ns# pwd

/var/safenet/config

root@ns# sh safenet_config
```

Create a certificate

```
root@ns# cd /var/safenet/safenet/lunaclient/bin

root@ns# ./vtl createcert -n 10.102.59.175

Private Key created and written to: /var/safenet/safenet/lunaclient/cert/
client/10.102.59.175Key.pem

Certificate created and written to: /var/safenet/safenet/lunaclient/cert/
client/10.102.59.175.pem
```

Copy the certificate to the HSM

```
    root@ns# scp /var/safenet/safenet/lunaclient/cert/client/
10.102.59.175.pem admin@10.217.2.7:

    admin@10.217.2.7's password:

    10.102.59.175.pem          100%  818     0.8KB/s   00:00
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Copy the certificate and key from the HSM to the NetScaler appliance

```
    root@ns# scp admin@10.217.2.7:server.pem /var/Thales Luna/safenet/
lunaclient/server.2.7.pem

    admin@10.217.2.7's password:

    server.pem            100% 1164     1.1KB/s   00:01
```

Use SSH to connect to the Thales Luna HSM

```
    ssh admin@10.217.2.7

    Connecting to 10.217.2.7:22...

    Connection established.

    To escape to local shell, press 'Ctrl+Alt+]'.

    Last login: Thu Jun 23 02:20:29 2016 from 10.252.243.11

    Luna SA 5.2.3-1 Command Line Shell - Copyright (c) 2001-2014 SafeNet,
Inc. All rights reserved.

    [Safenet1] lunash:>hsm login

      Please enter the HSM Administrators' password:

      > *******
```

```
'hsm login' successful.

Command Result : 0 (Success)

[Safenet1] lunash:>
```

Register the NetScaler on the Thales Luna HSM

```
[Safenet1] lunash:>client register -client ns175 -ip 10.102.59.175

'client register' successful.

Command Result : 0 (Success)

[Safenet1] lunash:>
```

Assign the client a partition from the partition list

```
[Safenet1] lunash:>client assignPartition -client ns175 -partition p2

'client assignPartition' successful.

Command Result : 0 (Success)
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
    [Safenet1] lunash:>
```

Register the HSM with its certificate on the NetScaler

```
    root@ns# ./vtl addserver -n 10.217.2.7 -c /var/safenet/safenet/
lunaclient/server.2.7.pem

    New server 10.217.2.7 successfully added to server list.
```

Verify the network trust links (NTLs) connectivity between the ADC and HSM

```
    root@ns# ./vtl verify

    The following Luna SA Slots/Partitions were found:

    Slot        Serial #                  Label

    ====      ================          =====

       0              477877010          p2
```

Save the configuration

```
root@ns# cp /etc/Chrystoki.conf /var/safenet/config/
```

Configure automatic start of the gateway daemon at boot time

```
touch /var/safenet/safenet_is_enrolled
```

FAQ

- **How do I check that the Thales Luna process is running?**

  At the NetScaler shell prompt, type:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
ps –aux | grep safenet_gw
```

- **How do I verify the network trust links (NTLs) connectivity between the ADC and HSM?**

  After configuring Thales Luna, change the directory to “/var/safenet/safenet/lunaclient/bin” and type:

```
./vtl verify
```

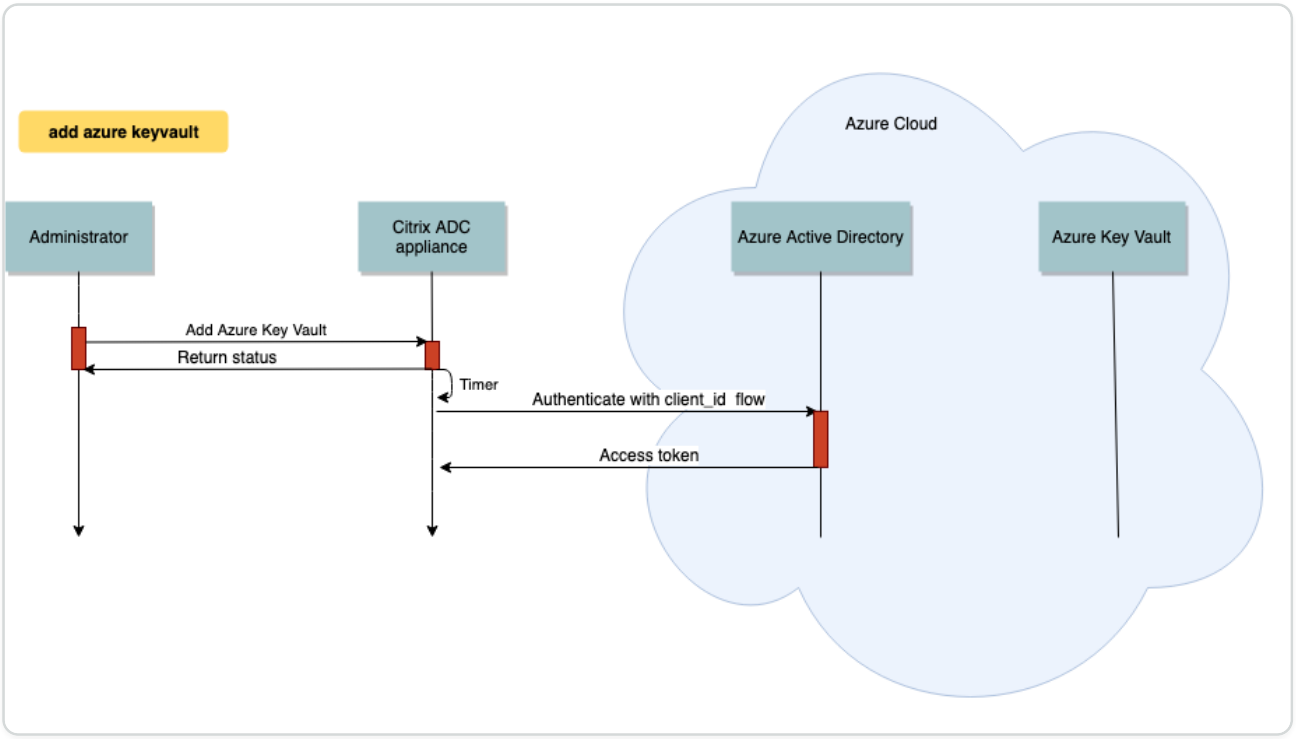
Support for Azure Key Vault

The NetScaler appliance integrates with external HSMs (SafeNet and Thales) for on-premises deployments. For cloud deployments, the ADC appliance integrates with Azure Key Vault. The appliance stores its private keys in the Key Vault for ease of management and security of the private key in the public cloud domain. You no longer have to store and manage keys in different locations for ADC appliances deployed across multiple data centers and cloud providers.

Using ADC with the Azure Key Vault Premium pricing tier, which provided HSM backed keys, provides FIPS 140-2 level 2 compliance.

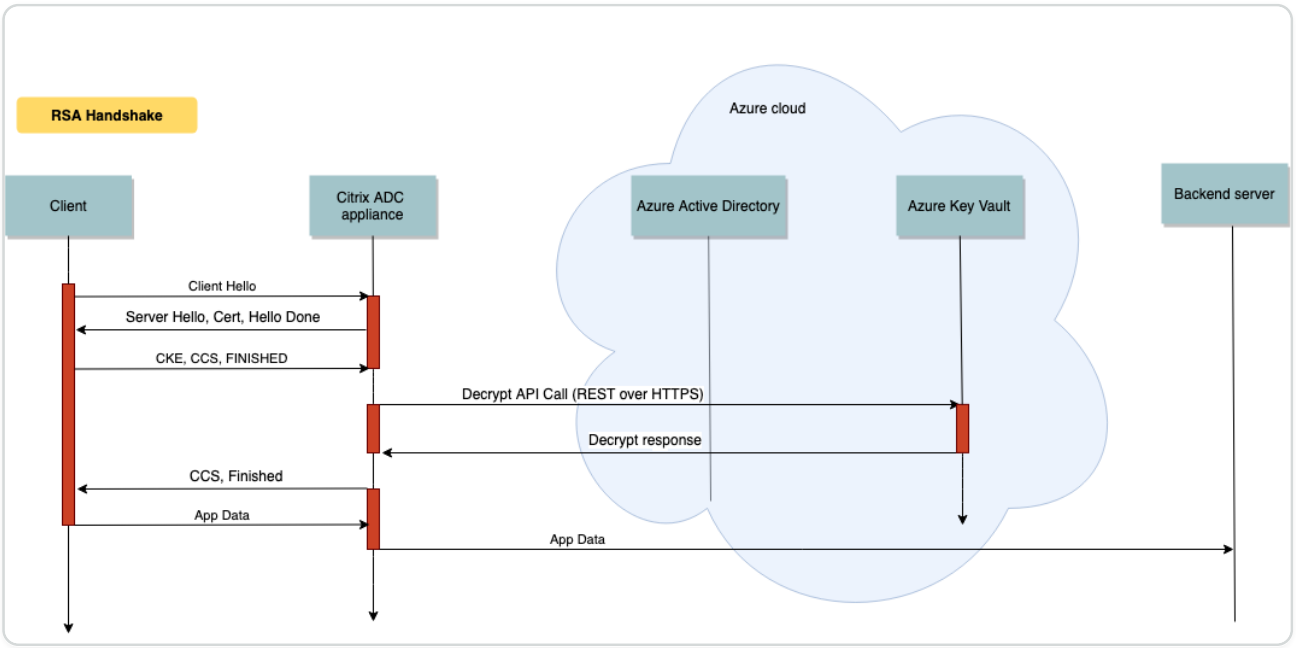
Azure Key Vault is a standard offering from Microsoft. For more information about Azure Key Vault, see the Microsoft Azure documentation.

NOTE:



The NetScaler integration with Azure Key Vault is supported with the TLS 1.3 protocol.

Architecture overview



Azure Key Vault is a service for storing secrets securely in the Azure cloud. By storing your keys in the Azure Key Vault, you reduce the chances of keys being stolen. Once the Key Vault is set up, you can store your keys in it. Configure virtual servers on the ADC appliance to perform private key operations in the Key Vault. The ADC appliance accesses the key for each SSL handshake.

The following diagram illustrates the process to get an access token from the Azure Active Directory after authentication. This token is used with REST API calls for crypto operations using private keys.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

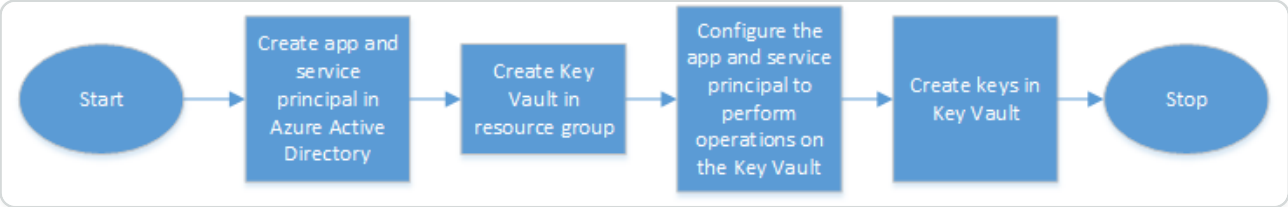
The following diagram shows a typical RSA handshake. The client key exchange (CKE) message that is encrypted using the public key is decrypted using the private key stored in the Key Vault.

In an ECDHE handshake, the server key exchange (SKE) message sent by the NetScaler appliance is signed by using the private key stored in the Key Vault.

Prerequisites

1. You must have an Azure subscription.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



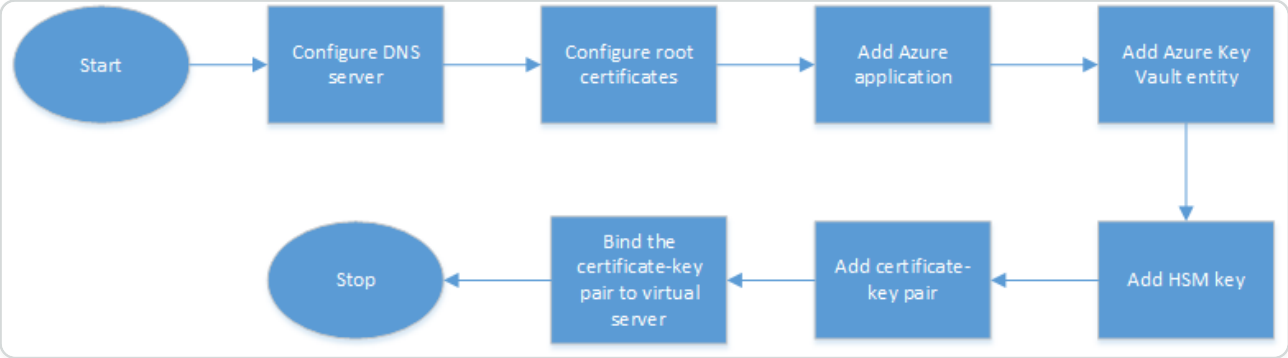
2. (Optional) Install Azure CLI on a Linux machine. For instructions, see the Azure documentation `<https://docs.microsoft.com/en-us/cli/azure/install-azure-cli-apt?view=azure-cli-latest>`.
3. Complete the configuration on the Azure portal before configuring entities on the ADC appliance.

Configure the ADC Azure Key Vault integration

First perform the configuration on the Azure portal followed by the configuration on the ADC appliance.

Perform the following steps on the Azure portal

The following flowchart shows the high-level flow for configuration required on the Azure portal.



1. Create app and service principal in Azure Active Directory.
2. Create Key Vault in a resource group.
3. Configure the app and service principal to perform sign and decrypt operations on the Key Vault.
4. Create keys in the Key Vault using one of the following ways:
    a. By importing a key file.
    b. By generating a certificate.

For information about the commands to configure the preceding steps, see the Azure documentation at `<https://docs.microsoft.com/en-us/azure/active-directory/develop/app-objects-and-service-principals>`.

Perform the following steps on the ADC appliance

The following flowchart shows the high-level flow for configuration required on the ADC appliance.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. Configure a DNS server.
2. Configure root certificates to verify the certificates presented by Azure.
3. Create an Azure application.
4. Create an Azure Key Vault entity.
5. Create an HSM key.
6. Create a certificate-key pair.
7. Bind the certificate-key pair to a virtual server.

Configure a DNS server

A DNS server is required for the name resolution of Key Vault host and Azure Active Directory end point.

To configure a DNS server by using the CLI

At the command prompt, type:

```
add dns nameserver <IP address>
```

Example:

```
add dns nameserver 192.0.2.150
```

To configure a DNS server by using the GUI

1. Navigate to **Traffic Management > DNS > Name Servers**. Click **Add**.
2. Enter values for the following parameters:
   - IP Address - IP address of an external name server or, if the Local parameter is set, IP address of a local DNS server (LDNS).

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Protocol - Protocol used by the name server. UDP_TCP is not valid if the name server is a DNS virtual server configured on the appliance.

3. Click **Create**.

Add and bind a root certificate

Download the root certificates of the certificate presented by Azure Key Vault `https://<vault_name>.vault.azure.net` and Azure Active Directory (AAD) `<https://login.microsoftonline.com>` and load it on the ADC appliance. These certificates are required to validate the certificate presented by Azure Key Vault and AAD. Bind one or more certificates to the CA certificate group `ns_callout_certs`.

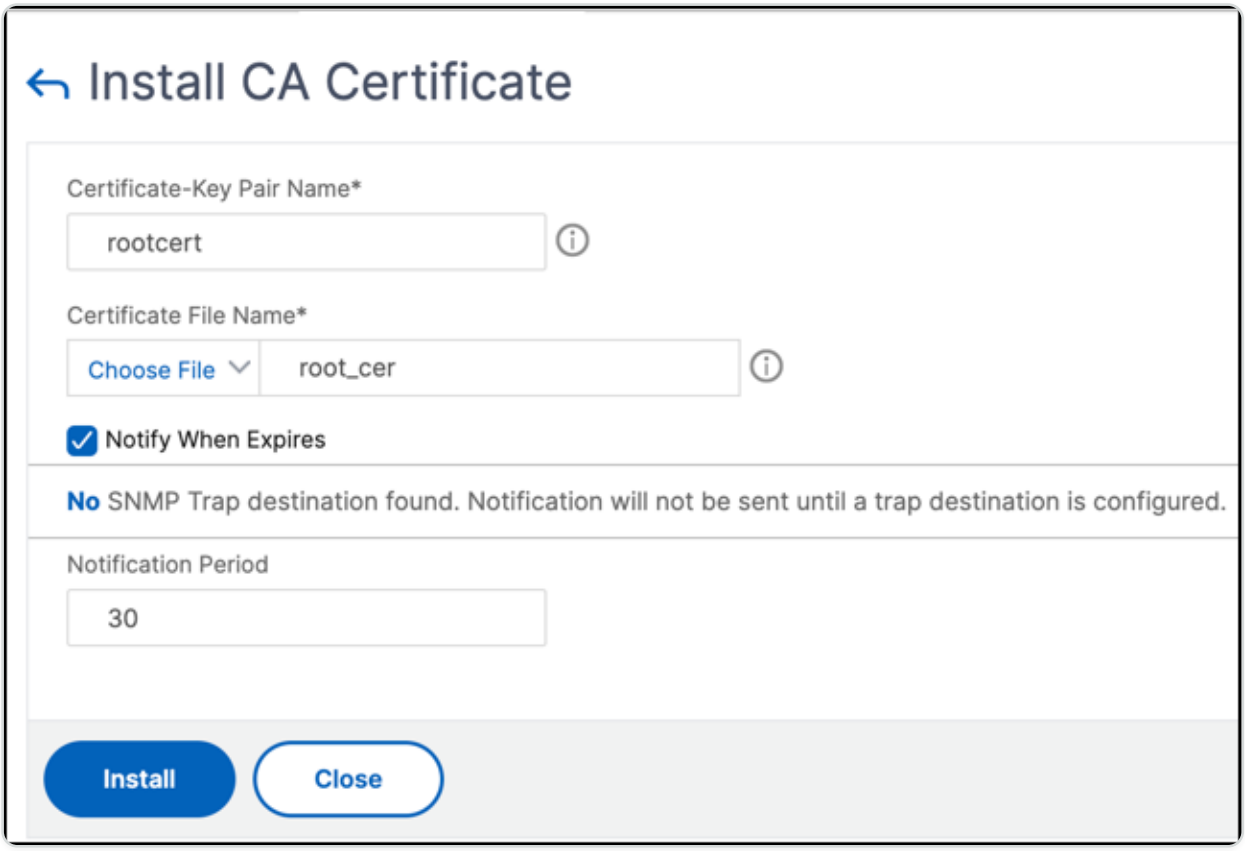
To add a root certificate by using the CLI

At the command prompt, type:

```
add ssl certkey <certkeyname> -cert <certname>

bind ssl caCertGroup <caCertGroupName> <certkeyName>
```

Example: In the following example, the root certificate presented by Azure Key Vault and AAD is the same.



```
add ssl certKey rootcert -cert RootCyberTrustRoot.crt

bind ssl cacertGroup ns_callout_certs  rootcert
```

To add a root certificate by using the GUI

1. Navigate to **Traffic Management > SSL > Certificates > CA Certificates**.
2. Enter values for the following parameters:
   - Certificate-key pair name
   - Certificate file name

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. Click **Install**.
4. Navigate to **Traffic Management > SSL > CA Certificates Group**.
5. Select **ns_callout_certs** and click **Show Bindings**.
6. Click **Bind**.
7. Select the CA certificate created earlier and click **Select**.
8. Click **Bind**, and then click **Close**.

Configure an Azure application

The Azure application entity contains the credentials required to authenticate to Azure Active Directory and obtain the access token. That is, to get authorization access to Key Vault resources and APIs, add the Azure Application ID, secret (password) and tenant ID on the ADC appliance.

When configuring the Azure Application entity using the CLI, you must enter the password. If you use the GUI, the Azure application entity contains the credentials required to authenticate to Azure Active Directory and obtain the access token.

To configure an Azure application by using the CLI

From release 13.0-61.x, a parameter, vaultResource, is added to the `add azure application` command to get the domain of the resource group before the access token is granted to the

© 1997–2026 Citrix Systems, Inc. All rights reserved.

application. This parameter is added because the domain name might be different for different regions. For example, the domain might be `vault.azure.net` or `vault.usgov.net`.

At the command prompt, type:

```
add azure application <name> -clientID <string> -clientSecret -tenantID
<string> -vaultResource <string> [-tokenEndpoint <URL>]

show azure application
```

Example:

```
add azure application app10 -clientiD 12345t23aaa5 -clientsecret
csHzOoEzmuY= -vaultResource example.vault.azure.net -tenantID 33583ee9ca5b

 Done

> sh azure application app10

1)  Name:  app10             ClientID:  12345t23aaa5

    TokenEndpoint:  "https://login.microsoftonline.com/33583ee9ca5b/"

    TenantID:  33583ee9ca5b  VaultResource:  example.vault.azure.net

 Done
```

To configure an Azure application by using the GUI

1. Navigate to **Traffic Management > SSL > Azure > Application**.
2. In the details pane, click **Add**.
3. Enter values for the following parameters:
    - Name – Name for the application object on the NetScaler appliance.
    - Client ID – Application ID that is generated when an application is created in Azure Active Directory using either the Azure CLI or the Azure portal (GUI).
    - Client Secret – Password for the application configured in Azure Active Directory. The password is specified in the Azure CLI or generated in the Azure portal (GUI).

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Tenant ID – ID of the directory inside Azure Active Directory in which the application was created.
- Vault Resource - Vault resource for which access token is granted. Example `vault.azure.net`.
- Token End point – URL from where the access token can be obtained. If the token end point is not specified, the default value is `https://login.microsoftonline.com/<tenant id>`.

Configure Azure Key Vault

Create an Azure Key Vault object on the ADC appliance.

To configure Azure Key Vault by using the CLI

At the command prompt, type:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add azure keyVault <name> -azureVaultName <string> -azureApplication

       <string>

show azure keyvault
```

Example:

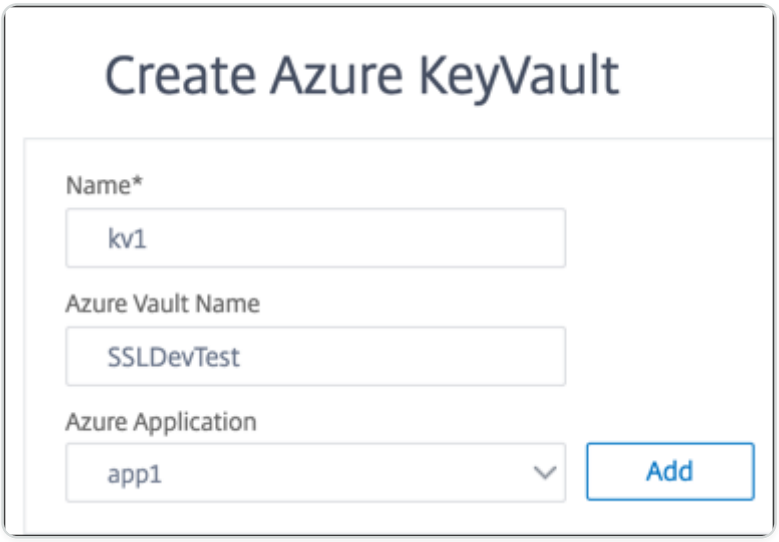
```
add azure keyvault kv1 -azureapplication app10 -azurevaultName
pctest.vault.azure.net

> sh azure keyVault

1)  Name:  kv1              AzureVaultName:  pctest.vault.azure.net

  AzureApplication:  app10  State:  "Access token obtained"

 Done
```



The following table lists the different values that the state of the Azure Key Vault can take along with a brief description about each state.

STATE	DESCRIPTION
`Created`	Initial state of the Key Vault object. Authentication has not been attempted.
`Could not reach token end point`	Indicates one of the following: DNS server not configured, issuer certificate not bound to a CA certificate group, or network issues.
`Authorization failed`	Incorrect application credentials.
`Token parse error`	Response from Azure Active Directory is not in the expected format.
`Access token obtained`	Successfully authenticated by Azure Active Directory.

To configure the Azure Key Vault by using the GUI

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. Navigate to **Traffic Management > SSL > Azure > Key Vault**.
2. Enter values for the following parameters:
   - Name - Name for the Key Vault.
   - Azure Key Vault Name - Name of the Key Vault configured in Azure cloud using either the Azure CLI or the Azure portal (GUI) with domain name.
   - Azure Application Name - Name of the Azure Application object created on the ADC appliance. The Azure Application object with this name is used for authentication with Azure Active Directory.

Add HSM key

Storing your private key in the HSM provides FIPS 140-2 level 2 compliance.

To add an HSM key by using the CLI

At the command prompt, type:

```
add ssl hsmKey <hsmKeyName> [-hsmType <hsmType>] [-key <string> |

       -serialNum <string>] {-password } [-keystore <string>]
```

Example:

```
add ssl hsmKey h1 -keystore kv1 -key san15key -hsmType KEYVAULT
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
> sh ssl hsmKey h1

    HSM Key Name: h1       Type: KEYVAULT

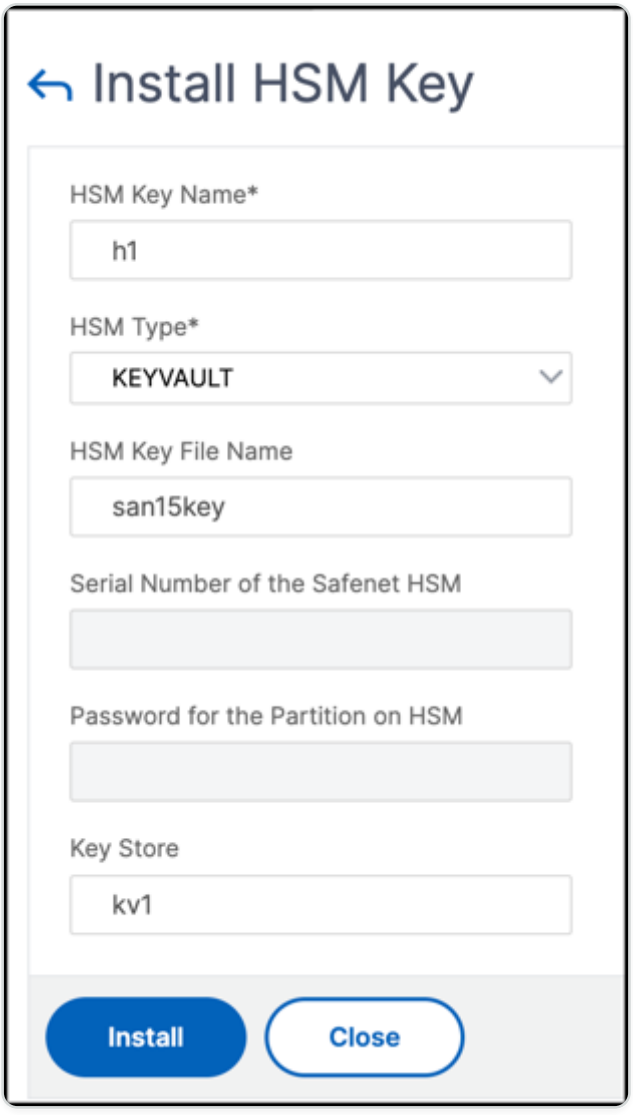
    Key: san15key

    Key store: kv1

    State: “Created”

 Done
```

The following table lists the different values that the state of an HSM key can take along with a brief description about each state.



STATE	DESCRIPTION
Created	The HSM key is added on the ADC appliance. A key operation is not yet attempted.
Access token unavailable	Access token not available when key operation was attempted.
Unauthorized	Configured Azure application does not have permission to perform the key operation.
Does not exist	The key does not exist in the Azure Key Vault.
Unreachable	The Key Vault host is not reachable on the network.
Marked down	The HSM key is marked DOWN on the ADC appliance due to threshold errors during key operation.
Key operations successful	Success response received from the Key Vault for key operation.
Key operations failed	Failure response received from Key Vault for key operation.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

STATE	DESCRIPTION
Key operation throttled	The key operation request is throttled by the Key Vault.

To add an HSM key by using the GUI

1. Navigate to **Traffic Management > SSL > HSM**.
2. Enter values for the following parameters.
   - HSM key name - Name of the key.
   - HSM type - Type of HSM.
   - Key store - Name of key store object representing HSM where the key is stored. For example, name of Key Vault object or Azure Key Vault authentication object. Applies only to `KEYVAULT` type HSM.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. Click **Add**

Add a certificate-key pair

Add a certificate-key pair using the HSM key created earlier.

To add a certificate-key pair by using the CLI

At the command prompt, type:

```
add ssl certKey <certkeyName> (-cert <string> [-password]) -hsmKey
<string>]

show ssl certkey
```

Example:

```
add ssl certKey serverrsa_2048 -cert /nsconfig/ssl/san_certs/san15.pem
-hsmKey h1

> sh ssl certkey serverrsa_2048

    Name: serverrsa_2048        Status: Valid,   Days to expiration:9483

    Version: 3

    Serial Number: F5CFF9EF1E246022

    Signature Algorithm: sha256WithRSAEncryption

    Issuer:  C=in,O=citrix,CN=ca

    Validity

        Not Before: Mar 20 05:42:57 2015 GMT

        Not After : Mar 12 05:42:57 2045 GMT

    Certificate Type:   "Server Certificate"

    Subject:  C=in,O=citrix

    Public Key Algorithm: rsaEncryption
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
    Public Key size: 2048

    Ocsp Response Status: NONE

 Done
```

To add a certificate-key pair by using the GUI

1. Navigate to **Traffic Management > SSL > Install Certificate (HSM)**.
2. Enter values for the following parameters:
   - Certificate-Key Pair Name
   - Certificate File Name
   - HSM Key

3. Click **Install**.

Bind the certificate-key pair to a virtual server

The certificate used for processing SSL transactions must be bound to the virtual server that receives the SSL data.

To bind the SSL certificate-key pair to a virtual server by using the CLI

At the command prompt, type:

```
bind ssl vserver <vServerName> -certkeyName <certificate-KeyPairName>

show ssl vserver <vServerName>
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Example:

```
bind ssl vserver v1 -certkeyName serverrsa_2048

sh ssl vserver v1

    Advanced SSL configuration for VServer v1:

    DH: DISABLED

    DH Private-Key Exponent Size Limit: DISABLED    Ephemeral RSA: ENABLED
     Refresh Count: 0

    Session Reuse: ENABLED      Timeout: 120 seconds

    Cipher Redirect: DISABLED

    ClearText Port: 0

    Client Auth: DISABLED

    SSL Redirect: DISABLED

    Non FIPS Ciphers: DISABLED

    SNI: DISABLED

    OCSP Stapling: DISABLED

    HSTS: DISABLED

    HSTS IncludeSubDomains: NO

    HSTS Max-Age: 0

    HSTS Preload: NO

    SSLv3: ENABLED  TLSv1.0: ENABLED  TLSv1.1: ENABLED  TLSv1.2: ENABLED
 TLSv1.3: DISABLED
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
    Push Encryption Trigger: Always

    Send Close-Notify: YES

    Strict Sig-Digest Check: DISABLED

    Zero RTT Early Data: DISABLED

    DHE Key Exchange With PSK: NO

    Tickets Per Authentication Context: 1

    ECC Curve: P_256, P_384, P_224, P_521

1)  CertKey Name: serverrsa_2048    Server Certificate

1)  Cipher Name: DEFAULT

    Description: Default cipher list with encryption strength >= 128bit

 Done
```

To bind an SSL certificate-key pair to a virtual server by using the GUI

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers** and open an SSL virtual server. Click inside the Certificate section.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. Click the arrow to select the certificate-key pair.
3. Select the certificate-key pair from the list.
4. Bind the certificate-key pair to the virtual server.

Limitations

- The number of concurrent calls to the Azure Key Vault for key operations is limited. Performance of the ADC appliance depends on the Key Vault limits. For more information see, Microsoft Azure Key Vault documentation.
- EC keys are not supported.
- EDT and DTLS protocols are not supported.
- ADC appliances with Intel Coleto SSL chips are not supported.
- Clustering and admin partitions are not supported.
- You cannot update the Azure Application entity, the Azure Key Vault object, and the HSM certificate-key pair after you have added them to the ADC appliance.
- A certificate bundle with HSM keys is not supported.
- An error does not appear if the HSM key and certificate do not match. While adding a certificate-key pair, ensure that the HSM key and certificate match.
- You cannot bind an HSM key to a DTLS virtual server.
- You cannot sign OCSP requests using a certificate-key pair that is created using an HSM key.
- You cannot bind a certificate-key pair to an SSL service if the certificate-key pair is created using an HSM key.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

FAQ

When integrated with Azure Key Vault, are private keys stored in the ADC appliance memory?

No, private keys are not be stored in ADC appliance memory. For each SSL transaction, the appliance sends a request to Key Vault.

Is the integration FIPS 140-2 level 2 compliant?

Yes, the integrated solution provides FIPS 140-2 Level 2 support.

Which key types are supported?

Only RSA key types are supported.

What key sizes are supported?

1024-bit, 2048-bit, and 4096-bit RSA keys are supported.

Which ciphers are supported?

All ciphers supported on the ADC appliance, including TLSv1.3 ciphers with ECDHE and SHA256 are supported.

Are transactions logged?

The ADC appliance logs each transaction it makes with the Key Vault. Details such as, time, vault IP address, port, success or failure of connection, and errors are logged. The following is a sample SSL log output.

```
Apr  9 16:35:30 &lt;local0.debug> 10.102.57.30 04/09/2019:16:35:30 GMT  0-

Dynamic client certificate generation

NOTE:

Dynamic client certificate generation feature is available only in NetScaler FIPS release from 13.1-37.255 version onwards.

The dynamic client certificate generation feature allows NetScaler to facilitate end-to-end mutual Transport Layer Security (mTLS) communication. NetScaler achieves this by generating a new client certificate for the backend server-side handshake, using the information extracted from the client certificate provided during the client-side SSL handshake.

Traditional certificate-based authentication protocols, such as smart card authentication, require a complete end-to-end TLS handshake for client verification. Dynamic client certificate generation feature overcomes this restriction, allowing security teams to inspect encrypted traffic (through decryption and re-encryption) while still satisfying smart card or certificate-based authentication requirements.

How it works

When dynamic client certificate generation is enabled, the NetScaler seamlessly manages both the client-side and server-side mTLS handshakes:

STEP	CLIENT-SIDE HANDSHAKE (CLIENT <-> NETSCALER)	SERVER-SIDE HANDSHAKE (NETSCALER <->> SERVER)
1	The client sends Client Hello.	NetScaler initiates a handshake with Client Hello to the backend server.
2	NetScaler responds with Server Hello and its configured certificate.	The server responds with Server Hello and its certificate.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

STEP	CLIENT-SIDE HANDSHAKE (CLIENT <-> NETSCALER)	SERVER-SIDE HANDSHAKE (NETSCALER <->> SERVER)
3	NetScaler sends Certificate Request to the client (Client Authentication must be enabled on the front-end).	The server sends a Client Certificate Request to NetScaler.
4	The client responds with its certificate, and NetScaler verifies it.	NetScaler generates a new client certificate using the configured CA and sends it to the server (if the Dynamic Client Certificate Generation feature is enabled).
5	The client-side SSL handshake completes.	The server-side SSL handshake completes.

Some of the benefits are:

- Customers can manage application availability using NetScaler while maintaining strong mutual TLS communication.
- NetScaler decrypts, inspects the content, and then re-encrypts the TLS communication, even when Smart Card or certificate-based authentication is used.
- By operating as a middleman, NetScaler enables content inspection combined with NetScaler Console SSL insights or any other third-party tool for enhanced observability.

Enable dynamic client certificate generation

Prerequisites

1. Ensure that the following is configured on the virtual server:
    - The server certificate is to be served to clients.
    - The CA certificate for verifying the client certificate such as the CA that issued the client's actual certificate.
2. Enable the client certificate authentication on the front-end enhanced SSL profile.
3. Enable client certificate authentication on the backend origin server. The origin server must trust the NetScaler CA certificate used for generating the client certificates.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. Ensure to migrate to the enhanced SSL profile. For more information, see Migrate the SSL configuration to the enhanced SSL profile.

To enable dynamic client certificate generation using CLI

1. Enable the feature on the SSL profile bound to the backend service.

   At the command prompt, type:

   ```
   set ssl profile <backend_profile_name> -dynamicClientCert ENABLED
   ```

2. Create a certificate key for the CA used to sign the generated dynamic client certificate.

   At the command prompt, type:

   ```
   add ssl certkey <certkey_name> -cert <cert_file> -key <key_file>
   ```

3. Bind the certificate key to the backend profile where the Dynamic Client Certificate Generation feature is enabled.

   At the command prompt, type:

   ```
   bind ssl profile <backend_profile_name> --certkeyName <certkey_name>
   -forgingCACertkey
   ```

NOTES:

- If the client certificate is configured as optional in the front end profile and the peer does not provide a certificate, NetScaler intentionally fails the handshake with the backend server.
- The Dynamic Client Certificate Generation feature works seamlessly with NetScaler SSL Orchestrator in the reverse proxy deployment. For more information, see ICAP for remote content inspection.

Limitations

The dynamic client certificate generation feature is not supported in the following scenarios:

- DTLS
- Admin partition environments

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NetScaler® FIPS FAQ

General Overview

What is the Federal Information Processing Standard (FIPS)?

FIPS is a standard and guideline for federal computer systems that are developed by the National Institute of Standards and Technology (NIST) in accordance with the Federal Information Security Management Act (FISMA) and approved by the Secretary of Commerce. These standards and guidelines are developed when there are no acceptable industry standards or solutions for a particular government requirement. Although FIPS is developed for use by the federal government, many organizations and companies voluntarily use these standards.

The Federal Information Processing Standard (140-2, 140-3) specifies the security requirements that will be satisfied by a cryptographic module, providing four increasing, qualitative levels intended to cover a wide range of potential applications and environments. The areas covered, related to the secure design and implementation of a cryptographic module, include specification, ports and interfaces, roles, services, and authentication, finite state model, physical security, operational environment, cryptographic key management, electromagnetic interference/ electromagnetic compatibility (EMI/EMC), self-tests, design assurance, and mitigation of other attacks.

For more information, see `<https://www.nist.gov/standardsgov/compliance-faqs-federal-information-processing-standards-fips>`.

What is the difference between compliant and validated?

A FIPS validated or certified solution is one that has undergone a thorough testing process conducted by one of a handful of independent laboratories to ensure that all pieces of the product meet FIPS requirements.

A FIPS compliant solution is one where likely only a portion of the product has been fully verified. In the case of the first two generations of NetScaler FIPS appliances, Citrix leveraged a Hardware Security Module that is fully validated as a way to provide the additional security requirements to meet FIPS level compliance. In the current generation of appliances, NetScaler has worked on getting the specific components validated directly, resulting in an ADC that is now fully validated to meet FIPS requirements.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Form factor and series options

What are the current FIPS options for NetScaler?

Currently, NetScaler appliances are available in validated and compliant versions against FIPS 140-2 and FIPS 140-3 (NetScaler MPX 8900 FIPS, NetScaler MPX 9100 FIPS, NetScaler MPX 15000-50G FIPS, and NetScaler VPX FIPS). For more information on this process, look for NetScaler in `<https://csrc.nist.gov/projects/cryptographic-module-validation-program/modules-in-process/modules-in-process-list>`.

The following table lists the available options for FIPS 140-3 appliances. For the latest information on FIPS certiifcation, see NetScaler product certifications.

FIPS CATEGORY	PLATFORM	SUPPORTED FIRMWARE	CPU	MEMORY	INTERFACES/ HYPERVISOR
140-3/ Level-2	NetScaler MPX 8900 FIPS	13.1-FIPS (Cert #4830)	8-core	32 GB	(8x10G; 4x40G)
	NetScaler MPX 15000-50G FIPS	13.1-FIPS (Cert #4830)	8-core	128 GB	(16x10G, 2*40G)
	NetScaler MPX 9100 FIPS	13.1-FIPS (Cert #4830)	10-Core	64 GB	8 x 25GE SFP28
					(8x10G, 4x40G)
140-3/ Level-1	VPX FIPS	13.1-FIPS (Cert #5111)	n-Core	From 4 GB	VMware vSphere, Microsoft Hyper-V, Citrix XenServer, ASW, GCP, Azure, KVM, Oracle

© 1997–2026 Citrix Systems, Inc. All rights reserved.

FIPS CATEGORY	PLATFORM	SUPPORTED FIRMWARE	CPU	MEMORY	INTERFACES/ HYPERVISOR
					Virtual Box, OpenStack

NOTES:

NetScaler MPX 14000 FIPS is not validated but a FIPS compliant platform.

See the NetScaler ADC Product Matrix for the updated list of platforms.

CONFORMANCE	SERIES	SUPPORTED OS	SUPPORTED PLATFORMS
NDcPP v2.2e	VPX FIPS	13.1-FIPS NDcPP Certified, Security Target	VMware VSphere, Microsoft Hyper-V, Citrix XenServer, Amazon Web Services, Google Cloud Platform, Microsoft Azure, KVM, Oracle Virtual Box, OpenStack **Tested:** Dell PowerEdge R630 VMware ESXi 6.5 U217, Dell PowerEdge R630/ R640, Lenovo SR630, Citrix XenServer 7.1 LTSR19, Microsoft Hyper-V, KVM with Ubuntu 16.04.05 LTS20, Citrix XenServer 8.2 LTSR
NDcPP v2.2e	NetScaler MPX 8900 Series FIPS, NetScaler MPX 9100	13.1-FIPS NDcPP Certified, Security Target	8905 FIPS, 8910 FIPS, 8920 FIPS, 9120 FIPS, 9130

© 1997–2026 Citrix Systems, Inc. All rights reserved.

CONFORMANCE	SERIES	SUPPORTED OS	SUPPORTED PLATFORMS
	Series FIPS, NetScaler MPX 15000-50G Series FIPS		FIPS, 9140 FIPS, 9160 FIPS, 9180 FIPS, 9195 FIPS, 15030-50G FIPS, 15040-50G FIPS, 15060-50G FIPS, 15080-50G FIPS, 15100-50G FIPS, 15120-50G FIPS

Which NetScaler appliances are FIPS validated?

The NetScaler NetScaler MPX 8900 FIPS, NetScaler MPX 9100 FIPS, and NetScaler MPX 15000-50G FIPS validated appliances (Cert #4830) have been tested by a third-party laboratory for the security requirements of FIPS 140-3 Level 2.

The module is available as a software package that includes both the application software and the operating system. After purchasing the NetScaler VPX FIPS license, get the latest NetScaler VPX FIPS 12.1/13.1 image from the Citrix website `<https://www.citrix.com/downloads/>` and deploy it to a host with appropriate hardware.

More information about the FIPS 140-2 standard and validation program is available on the National Institute of Standards and Technology (NIST) and the Canadian Center for Cyber Security (CCCS) Cryptographic Module Validation Program (CMVP) website at `<https://csrc.nist.gov/projects/cryptographic-module-validation-program>`.

Why did NetScaler develop its own cryptographic modules for FIPS validation?

NetScaler decided to discontinue using third-party Hardware Security Modules in the FIPS ADC appliances to have deeper control over the overall architecture of the appliances. The benefits of this change come in the following areas:

- Instead of only being able to offer FIPS ADC appliances in hardware form, the purpose-built firmware is now also packaged and licensed as a virtual appliance and this offers customers more flexibility in how they deploy ADCs.
- There is no longer a dependency on a third-party company to provide the add-on hardware or the firmware that it runs. This ensures better availability of components.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- By architecting and developing all of the software in-house, NetScaler is able to overcome performance limitations that existed due to the communication with the add-on hardware components. The result for customers is being able to deploy FIPS appliances that perform better.
- The most significant benefit may be that NetScaler customers are now able to deploy FIPS Validated appliances as opposed to FIPS compliant appliances.

Is FIPS 140-3 level 2 more secure than FIPS 140-2 Level 3?

Any level 3 device provides stronger physical security. Level 2 satisfies the tamper evident physical security. The primary distinction between them is the physical security requirement.

Is NetScaler trading off security over performance by having MPX 9100 at Level 2?

No, we are not trading off security over performance. Providing an additional layer of physical security is not the only way to protect sensitive data. NetScaler MPX 9100 FIPS leverages the latest version of 140-3 standards and processor technology with robust cryptographic capabilities. NetScaler MPX 9100 FIPS provides a stronger alternative to HSM. In fact, the software-based key management optimizes the performance without compromising the security needs.

FIPS Encryption/Ciphers

Which ciphers are supported on NetScaler MPX 8900/15000-50G/9100 FIPS and VPX FIPS?

For information on supported ciphers, see `<https://docs.netscaler.com/en-us/citrix-adc/downloads/cipher-support-on-netscaler-mpx-vpx-fips-certified-appliance.pdf>`

What key sizes are supported in the VPX FIPS and MPX 8900/15000-50G/9100 FIPS series?

Customers can use key sizes of 2048 bits, 3072 bits, and 4096 bits, although only key sizes of 2048 bits and 3072 bits can be generated directly on the FIPS appliances with `ssl-keygen`.

What happens if I try to add non-compliant ciphers to my virtual servers that are using a certificate to enable FIPS encryption?

An error message appears because non-compliant ciphers are not supported on NetScaler.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Features and Functions

Does NetScaler FIPS include all the standard NetScaler functionality?

Yes. However, the following limitations apply:

- For NetScaler MPX FIPS, TACACS authentication is not supported on the NetScaler MPX FIPS validated appliances. For more information, see Limitation.
- For NetScaler VPX FIPS, TACACS authentication is not supported on the VPX FIPS validated appliance. For more information, see VPX FIPS Limitations.

Upgrading NetScaler firmware

One of the most important aspects of running a NetScaler is ensuring that you keep the firmware up-to-date with a compatible version. The information in this section is intended to help you understand which firmware is compatible with the particular NetScaler FIPS appliance that you have so that you can select an appropriate firmware when upgrades are necessary.

How do I know which firmware is compatible with my NetScaler?

NetScaler appliances run either a general firmware or FIPS firmware depending on the specific model. The naming convention for firmware indicates whether it is a FIPS firmware by including FIPS in the name. Also, the naming convention always provides information on the version and the build numbers as well. The specific model of NetScaler determines which firmware type is used. Here are some naming examples:

- Example of naming of a general firmware, version 13.1, build 49.13:
  - NetScaler Release (Maintenance Phase) 13.1 Build 49.13
  - Citrix ADC Release (Maintenance Phase) 13.1 Build 49.13
- Example of naming of a FIPS firmware, version 13.1, build 37.159
  - NetScaler FIPS Release 13.1 Build 37.159
  - Citrix ADC FIPS Release 13.1 Build 37.159

NetScaler appliances can be upgraded to newer builds within a specific version. For example, upgrading from an older build of 12.1 FIPS to a newer build of 12.1 FIPS or 13.1 FIPS is supported. While it is also possible to move from a later build to an earlier build within a major version, or even move from a later version to an earlier version of compatible firmware, you must

© 1997–2026 Citrix Systems, Inc. All rights reserved.

understand the risks and implications of doing so as certain features in newer versions might not be available in older versions.

The following table can be used as a guide in determining which major firmware versions are compatible based on the NetScaler model.

NETSCALER MODELS	FIRMWARE TYPE	COMPATIBLE FIRMWARE
VPX FIPS	FIPS	13.1 FIPS
MPX8900 FIPS, MPX9100 FIPS, MPX15000-50G FIPS	FIPS	13.1 FIPS

For more information, see NetScaler MPX Hardware-Software Compatibility Matrix and SDX Hardware-Software Compatibility Matrix.

For more information about SDX Single Bundle Upgrade (including minimum 12.1 version requirements to upgrade to 13.0 and later), see SDX Single bundle upgrade.

Contact Citrix® Support for help with upgrading and unsupported software version.

Can I upgrade to a FIPS validated version firmware from a non-FIPS version of firmware?

No. FIPS validated firmware is a separate image. Software version upgrade from non-FIPS version to FIPS version is not supported. Also, the FIPS software version cannot be downgraded or upgraded to a non-FIPS software version. There is no option to “convert” between a FIPS and non-FIPS validated appliance through license or firmware changes. Any appliance that was not purchased as FIPS validated remains non-validated and must not be operated in a manner compliant with FIPS.

How do I upgrade firmware on my FIPS validated appliances?

The upgrade process is identical to that of the non-FIPS firmware appliances except that the FIPS-validated firmware is required (standard firmware cannot be used).

Can VPX FIPS be installed on NetScaler SDX or NetScaler SDX FIPS appliances?

No. VPX FIPS image is not supported on a NetScaler SDX or NetScaler SDX FIPS appliance.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Can we upgrade or downgrade VPX to VPX FIPS or vice versa?

No. VPX FIPS is a separate image and cannot be upgraded or downgraded to the VPX firmware. Also, we cannot upgrade or downgrade VPX to VPX FIPS firmware.

Firmware information and differences

Can the FIPS validated build be installed on the MPX series other than MPX 8900 FIPS, MPX 9100 FIPS, and MPX 15000-50G FIPS?

No. FIPS validated build is only qualified to run on NetScaler MPX 8900 series FIPS and NetScaler MPX 15000-50G series FIPS appliances.

Can I deploy NetScaler FIPS appliances in a high-availability deployment?

Yes. For FIPS validated NetScaler MPX and VPX appliances, the HA configuration steps are the same as for non-FIPS appliances.

Before getting started with HA configuration, for NetScaler MPX 8900 FIPS, NetScaler MPX 9100 FIPS, and NetScaler MPX 15000-50G FIPS series, see Configuration and for VPX FIPS, see VPX FIPS Configuration.

For the MPX/SDX 14000 series FIPS, see Configure FIPS on appliances in an HA setup.

Can I deploy a NetScaler FIPS Cluster

Yes. Configuration steps for NetScaler VPX FIPS, NetScaler MPX 8900 FIPS, NetScaler MPX 9100 FIPS, and NetScaler MPX 15000-50G FIPS are the same as for non-FIPS appliances. For more information, see `<https://docs.netscaler.com/en-us/citrix-adc/13-1/clustering.html>`.

Will the NetScaler MPX 14000 FIPS commands work on NetScaler MPX 8900/9100/15000-50G FIPS appliances?

No. The NetScaler MPX 14000 FIPS-specific commands will not work on the latest NetScaler MPX 8900/9100/15000-50G appliances. For more information, see `<https://docs.netscaler.com/en-us/citrix-adc/13-1/fips/mpx-fips-appliances>`.

Do VPX FIPS and MPX 8900/9100/15000-50G FIPS support Admin Partitions? Are there any differences from non-FIPS appliances?

Yes. The FIPS series support Admin Partitions.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Which NetScaler appliances require specific firmware, and why?

The NetScaler VPX FIPS and NetScaler MPX 8900/9100/15000-50G FIPS appliances use FIPS-validated firmware. These series meet specific design and build specifications to support the FIPS-validated firmware to achieve FIPS validated status. In the case of the NetScaler MPX FIPS appliances listed here, they must run the FIPS-validated firmware to achieve the FIPS-validated status as they do not use a Hardware Security Module as previous appliances had used.

All other appliances, including the MPX/SDX 14000 FIPS, use standard firmware.

Pooled Licensing

Is Pooled licensing supported on NetScaler MPX 8900/9100/15000-50G and NetScaler VPX FIPS appliances?

Yes. For NetScaler MPX FIPS, following the purchase of the Zero-capacity FIPS hardware model, the appliance bandwidth capacity can be configured.

For NetScaler VPX FIPS, the appliance needs a VPX FIPS instance license to be uploaded to NetScaler Console after which the instance capacity can be configured.

Can a common license pool be used for NetScaler FIPS and non-FIPS appliances?

Yes. A common bandwidth pool can be shared between FIPS and non-FIPS appliances.

For NetScaler MPX FIPS, a Zero-capacity FIPS hardware appliance is required.

For NetScaler VPX FIPS, the appliance needs a VPX FIPS instance license to be uploaded to NetScaler Console after which the instance capacity can be configured.

Contact your NetScaler Sales for detailed information around this topic.

Can an existing NetScaler FIPS appliance be transitioned from perpetual to pooled license?

Yes. NetScaler FIPS appliances can be migrated from perpetual to pooled licensing. See the following topics for details:

- Upgrade a perpetual license in NetScaler VPX to NetScaler pooled capacity
- Upgrading a perpetual license in NetScaler NetScaler MPX to NetScaler pooled capacity

© 1997–2026 Citrix Systems, Inc. All rights reserved.

VPX FIPS

Which hypervisors are supported for NetScaler VPX FIPS?

NetScaler VPX FIPS is a software appliance with an overall security level of FIPS 140-2 Level 1. It runs as a virtual appliance, and was tested and found compliant on the following platforms with Intel CPU supporting RDRAND and RDSEED instruction sets:

Hypervisor: VMware ESXi, KVM, Microsoft Hyper-V, Citrix Hypervisor™, Microsoft Azure, AWS, and GCP.

What are the prerequisites to run a NetScaler VPX FIPS appliance?

See the Prerequisites.

How is NetScaler VPX FIPS packaged?

The FIPS module is available as a software package that includes both the application software and the operating system. After purchasing the NetScaler VPX FIPS license, get the latest NetScaler VPX FIPS image from the Citrix website `<https://download.citrix.com>`.

Where can I find NetScaler FIPS documentation?

The following documents contain information about the supported NetScaler FIPS appliances:

FIPS Compliant Series

- NetScaler MPX 14000 FIPS appliances
- SDX 14000 FIPS appliances

FIPS Validated Series

- NetScaler VPX FIPS validated appliances
- NetScaler NetScaler MPX 8900 FIPS, NetScaler NetScaler MPX 8900 FIPS, and NetScaler MPX 15000-50G FIPS validated appliances

SDX FIPS (14000 family of appliances)

On a NetScaler SDX FIPS appliance, are all instances automatically FIPS compliant?

No. SDX 14000 FIPS is not fully FIPS complaint. Only the SVM is FIPS complaint. Running a VPX on top of the SDX 14000 FIPS will not make it FIPS Compliant.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Are there advantages to operating an instance in non-FIPS mode on a NetScaler SDX FIPS appliance?

Achieving FIPS encryption standards for specific traffic requires a more intensive encrypt/decrypt process to ensure that the keys are maintained at the correct level of security integrity. If an instance operates any of its virtual servers without leveraging the FIPS encryption process specifically, the SSL transactions per second that are achievable are higher.

Performance

Why are instances or appliances configured to use FIPS mode not able to achieve the same TPS rates for SSL traffic as the non-FIPS counterparts?

Achieving FIPS encryption standards for specific traffic requires a more intensive encrypt/decrypt process to ensure that the keys are maintained at the correct level of security integrity. When an instance or appliance is using the FIPS mode of encryption, it increases the amount of time required to run an encrypt or decrypt action and this reduces the total amount of TPS that can be achieved.

The more recent FIPS appliances (VPX FIPS and NetScaler MPX 8900/9100/15000-50G FIPS) are able to operate at throughput rates that are much closer to their non-FIPS counterparts due to the architecture that NetScaler chose when designing these appliances. NetScaler no longer uses a third-party Hardware Security Module and has been able to create an appliance that offers better FIPS-encrypted throughput as a result.

Cloud

How do I get FIPS compliance in the Azure cloud?

There are two ways to achieve FIPS compliance or validation when using NetScaler VPX on Azure. One way is to directly deploy a NetScaler VPX FIPS on Azure, and leverage its design and built-in ability to provide FIPS 140-2 Level 1 validation.

The second option available is to deploy a standard NetScaler VPX and connect it to the Azure Key Vault, allowing to achieve FIPS 140-2 Level 2 and Level 3 compliance.

NetScaler VPX is also supported on Azure Government and similar options are available.

How can I tell if my NetScaler appliance is operating in FIPS mode?

If you access the appliance via SSH, you can run the command `show fipsstatus` at the prompt. If the appliance is operating in FIPS mode, you receive the following response.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
FipsStatus: System is operating in FIPS mode

   Done
```

If you do not see this message, refer Troubleshooting.

NOTE:

- 13.1 VPX FIPS is currently Module in Process. It can be used in production if there is no requirement/dependency on Compliance or validation.
- NetScaler SDX 14000 FIPS appliances are compatible with only non-FIPS firmware, including VPX instances.

Firewall Load Balancing

Firewall load balancing distributes traffic across multiple firewalls, providing fault tolerance and increased throughput. Firewall load balancing protects your network by:

- Dividing the load between the firewalls, which eliminates a single point of failure and allows the network to scale.
- Increasing high availability.

Configuring a NetScaler appliance for firewall load balancing is similar to configuring load balancing, with the exception that the recommended service type is ANY, recommended monitor type is PING, and the load balancing virtual server mode is set to MAC.

You can set up firewall load balancing in a sandwich, an enterprise, or multiple-firewall environment configuration. The sandwich environment is used for load balancing traffic entering the network from outside and traffic leaving the network to the internet and involves configuring two NetScaler appliances, one on each side of a set of firewalls. You configure an enterprise environment for load balancing traffic leaving the network to the internet. The enterprise environment involves configuring a single NetScaler appliance between the internal network and the firewalls that provide access to the Internet. The multiple-firewall environment is used for load balance traffic coming from another firewall. Having firewall load balancing enabled on both the sides of NetScaler appliance improves the traffic flow in both the egress and ingress direction and ensures faster processing of the traffic. The multiple-firewall environment involves configuring a NetScaler appliance sandwiched between two firewalls.

Important: If you configure static routes on the NetScaler appliance for the destination IP address and enable L3 mode, the NetScaler appliance uses its routing table to route the traffic instead of sending the traffic to the load balancing vserver.

Note: For FTP to work, an additional virtual server or service should be configured on the NetScaler appliance with IP address and port as * and 21 respectively, and the service type specified as FTP. In this case, the NetScaler appliance manages the FTP protocol by accepting the FTP control connection, modifying the payload, and managing the data connection, all through the same firewall.

Firewall Load Balancing supports only some of the load balancing methods supported on the NetScaler appliance. Also, you can configure only a few types of persistence and monitors.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Firewall Load Balancing Methods

The following load balancing methods are supported for firewall load balancing.

- Least Connections
- Round Robin
- Least Packets
- Least Bandwidth
- Source IP Hash
- Destination IP Hash
- Source IP Destination IP Hash
- Source IP Source Port hash
- Least Response Time Method (LRTM)
- Custom Load

Firewall Persistence

Only SOURCEIP, DESTIP, and SOURCEIPDESTIP based persistence are supported for firewall load balancing.

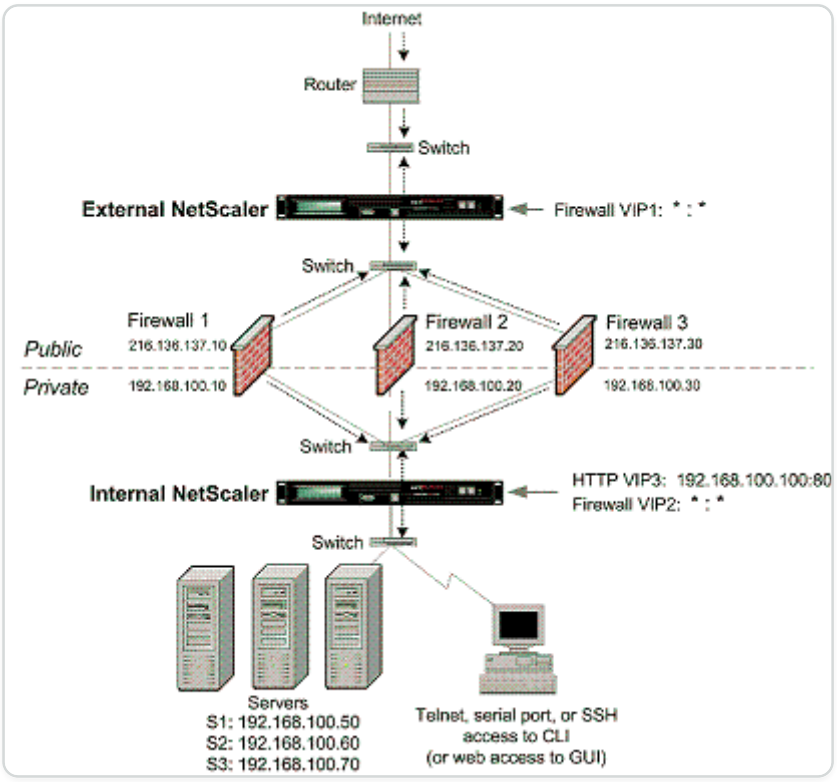
Firewall Server Monitoring

Only PING and transparent monitors are supported in firewall load balancing. You can bind a PING monitor (default) to the backend service that represents the firewall. If a firewall is configured not to respond to ping packets, you can configure transparent monitors to monitor hosts on the trusted side through individual firewalls.

Sandwich Environment

A NetScaler deployment in a sandwich mode can load balance network traffic through firewalls in both directions: ingress (traffic entering the network from the outside, such as the internet) and egress (traffic leaving the network to the internet).

In this setup, a NetScaler is located on each side of a set of firewalls. The NetScaler placed between the firewalls and the Internet, called the external NetScaler that handles ingress traffic selects the best firewall, based on the configured method. The NetScaler between the firewalls and the private network, called the internal NetScaler tracks the firewall from which the initial packet for



© 1997–2026 Citrix Systems, Inc. All rights reserved.

a session is received. It then makes sure that all subsequent packets for that session are sent to the same firewall.

The internal NetScaler can be configured as a regular traffic manager to load balance traffic across the private network servers. This configuration also allows traffic originating from the private network (egress) to be load balanced across the firewalls.

The following diagram shows the sandwich firewall load balancing environment.

Figure 1. Firewall Load Balancing (Sandwich)

The service type ANY configures the NetScaler to accept all traffic.

To avail benefits related to HTTP and TCP, configure the service and virtual server with type HTTP or TCP. For FTP to work, configure the service with type FTP.

Configuring the External NetScaler in a Sandwich Environment

Perform the following tasks to configure the external NetScaler in a sandwich environment

- Enable the load balancing feature.
- Configure a wildcard service for each firewall.
- Configure a monitor for each wildcard service.
- Configure a wildcard virtual server for traffic coming from the Internet.
- Configure the virtual server in MAC rewrite mode.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Bind services to the wildcard virtual server.
- Save and Verify the Configuration.

Enable the load balancing feature

To enable load balancing by using the command line interface

At the command prompt, type the following command to enable load balancing and verify the configuration:

```
enable ns feature LB

show ns feature
```

Example:

```
> enable ns feature LoadBalancing

 Done

> show ns feature

        Feature                       Acronym             Status

        -------                       -------             ------

 1)     Web Logging                   WL                  OFF

 2)     Surge Protection              SP                  ON

 3)     Load Balancing                LB                  ON

 .

 .

 .

 24)    NetScaler Push                push                OFF
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Done
```

To enable load balancing by using the configuration utility

Navigate to **System > Settings** and, in **Configure Basic Features**, select **Load Balancing**.

Configure a wildcard service for each firewall

To configure a wildcard service for each firewall by using the command line interface

At the command prompt, type:

```
add service <name> <serverName> ANY *
```

Example:

```
add service Service-HTTP-1 10.102.29.5 ANY *
```

To configure a wildcard service for each firewall by using the configuration utility

Navigate to **Traffic Management > Load Balancing > Services** and add a service. Specify **ANY** in the **Protocol** field and * in the Port field.

Configure a monitor for each wildcard service

A PING monitor is bound by default to the service. You need to configure a transparent monitor to monitor hosts on the trusted side through individual firewalls. You can then bind the transparent monitor to services. The default PING monitor monitors the connectivity only between the NetScaler appliance and the upstream device. The transparent monitor monitors all the devices existing in the path from the appliance to the device that owns the destination IP address specified in the monitor. If a transparent monitor is not configured and the status of the firewall is UP but one of the next hop devices from that firewall is down, the appliance includes the firewall while performing load balancing and forwards the packet to the firewall. However, the packet is not delivered to the final destination because one of the next hop devices is down. By binding a transparent monitor, if any of the devices (including the firewall) are down, the service is marked as DOWN and the firewall is not included when the appliance performs firewall load balancing.

Binding a transparent monitor overrides the PING monitor. To configure a PING monitor in addition to a transparent monitor, after you create and bind a transparent monitor, you need to bind a PING monitor to the service.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To configure a transparent monitor by using the command line interface

At the command prompt, type the following commands to configure a transparent monitor and verify the configuration:

```
add lb monitor <monitorName> <type> [-destIP <ip_addr|ipv6_addr|*>] [-
transparent (YES | NO )]

bind lb monitor <monitorName> <serviceName>
```

Example:

```
add monitor monitor-HTTP-1 HTTP -destip 10.10.10.11 -transparent YES

bind monitor monitor-HTTP-1 fw-svc1

To bind a PING monitor, type the following command:

bind monitor PING fw-svc1
```

To create and bind a transparent monitor by using the configuration utility

Navigate to **Traffic Management > Load Balancing > Monitors**, and then create and bind a transparent monitor.

Configure a wildcard virtual server for traffic coming from the Internet

To configure a wildcard virtual server for traffic coming from the Internet by using the command line interface

At the command prompt, type:

```
add lb vserver <name> ANY * *
```

Example:

```
add lb vserver Vserver-LB-1 ANY * *
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To configure a wildcard virtual server for traffic coming from the Internet by using the configuration utility

Navigate to **Traffic Management > Load Balancing > Virtual Servers** and create a wildcard virtual server. Specify **ANY** in the **Protocol** field and * in the Port field.

Configure the virtual server in MAC rewrite mode

To configure the virtual server in MAC rewrite mode by using the command line interface

At the command prompt, type:

```
set lb vserver <name>@ -m <RedirectionMode>
```

Example:

```
set lb vserver Vserver-LB-1 -m MAC
```

To configure the virtual server in MAC rewrite mode by using the configuration utility

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**, and select the virtual server for which you want to configure the redirection mode (for example, Vserver-LB-1).
2. Edit the **Basic Settings** section, and click **more**.
3. From the **Redirection Mode** drop-down list, select **MAC Based**.

Bind services to the wildcard virtual server

To bind a service to the wildcard virtual server by using the command line interface

At the command prompt, type:

```
bind lb vserver <name> <serviceName>
```

Example:

```
bind lb vserver Vserver-LB-1 Service-HTTP-1
```

To bind a service to the wildcard virtual server by using the configuration utility

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers** and select the virtual server for which you want to bind the service.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. Click in the **Services** section and select a service to bind.

Save and Verify the Configuration

When you've finished the configuration tasks, be sure to save the configuration. Ensure that the settings are correct.

To save and verify the configuration by using the command line interface

At the command prompt, type the following commands to configure a transparent monitor and verify the configuration:

```
save ns config

show vserver
```

Example:

```
save config

sh lb vserver FWLBVIP1

FWLBVIP1 (*:*) - ANY    Type: ADDRESS

        State: UP

        Last state change was at Mon Jun 14 06:40:14 2010

        Time since last state change: 0 days, 00:00:11.240

        Effective State: UP  ARP:DISABLED

2)      Monitor Name: ping

                State: UP       Weight: 1

                Probes: 3       Failed [Total: 0 Current: 0]

                Last response: Success - ICMP echo reply received.

                Response Time: 1.415 millisec

 Done
```

Configuring the Internal NetScaler in a Sandwich Environment

Perform the following tasks to configure the internal NetScaler in a sandwich environment

For traffic from the server (egress)

- Enable the load balancing feature.
- Configure a wildcard service for each firewall.
- Configure a monitor for each wildcard service.
- Configure a wildcard virtual server to load balance the traffic sent to the firewalls.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Configure the virtual server in MAC rewrite mode.
- Bind firewall services to the wildcard virtual server.

For traffic across private network servers

- Configure a service for each virtual server.
- Configure a monitor for each service.
- Configure an HTTP virtual server to balance traffic sent to the servers.
- Bind HTTP services to the HTTP virtual server.
- Save and Verify the Configuration.

Enable the load balancing feature

You can configure load balancing entities such as services and virtual servers when the load balancing feature is disabled. But they will not function until you enable the feature.

To enable load balancing by using the command line interface

At the command prompt, type the following command to enable load balancing and verify the configuration:

```
enable ns feature LB

show ns feature
```

Example:

```
> enable ns feature LoadBalancing

 Done

> show ns feature

        Feature                       Acronym             Status

        -------                       -------             ------

 1)     Web Logging                   WL                  OFF
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
2)     Surge Protection              SP                  ON

3)     Load Balancing                LB                  ON

.

.

.

24)    NetScaler Push                push                OFF

Done
```

To enable load balancing by using the configuration utility

Navigate to **System > Settings** and, in Configure Basic Features, select **Load Balancing**.

Configure a wildcard service for each firewall

To configure a wildcard service for each firewall by using the command line interface

At the command prompt, type:

```
add service <name> <serverName> ANY *
```

Example:

```
add service Service-HTTP-1 10.102.29.5 ANY *
```

To configure a wildcard service for each firewall by using the configuration utility

Navigate to **Traffic Management > Load Balancing > Services** and add a service. Specify **ANY** in the **Protocol** field and * in the Port field.

Configure a monitor for each wildcard service

A PING monitor is bound by default to the service. You need to configure a transparent monitor to monitor hosts on the trusted side through individual firewalls. You can then bind the transparent monitor to services. The default PING monitor monitors the connectivity only between the NetScaler appliance and the upstream device. The transparent monitor monitors all the devices existing in the path from the appliance to the device that owns the destination IP address specified

© 1997–2026 Citrix Systems, Inc. All rights reserved.

in the monitor. If a transparent monitor is not configured and the status of the firewall is UP but one of the next hop devices from that firewall is down, the appliance includes the firewall while performing load balancing and forwards the packet to the firewall. However, the packet is not delivered to the final destination because one of the next hop devices is down. By binding a transparent monitor, if any of the devices (including the firewall) are down, the service is marked as DOWN and the firewall is not included when the appliance performs firewall load balancing.

Binding a transparent monitor overrides the PING monitor. To configure a PING monitor in addition to a transparent monitor, after you create and bind a transparent monitor, you need to bind a PING monitor to the service.

To configure a transparent monitor by using the command line interface

At the command prompt, type the following commands to configure a transparent monitor and verify the configuration:

```
add lb monitor <monitorName> <type> [-destIP <ip_addr|ipv6_addr|*>] [-
transparent (YES | NO )]

bind lb monitor <monitorName> <serviceName>
```

Example:

```
add monitor monitor-HTTP-1 HTTP -destip 10.10.10.11 -transparent YES

bind monitor monitor-HTTP-1 fw-svc1
```

To create and bind a transparent monitor by using the configuration utility

1. Navigate to **Traffic Management > Load Balancing > Monitors** and create a monitor.
2. In the **Create Monitor** dialog box, enter the required parameters, and select **Transparent**.

Configure a wildcard virtual server to load balance the traffic sent to the firewalls

To configure a wildcard virtual server to load balance the traffic sent to the firewalls by using the command line interface

At the command prompt, type:

```
add lb vserver <name> ANY * *
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Example:

```
add lb vserver Vserver-LB-1 ANY * *
```

To configure a wildcard virtual server for traffic coming from the Internet by using the configuration utility

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers** and create a wildcard virtual server.
2. Specify **ANY** in the Protocol field and ***** in the Port field.

To configure a wildcard virtual server to load balance the traffic sent to the firewalls by using the configuration utility

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**.
2. In the details pane, click Add.
3. In the Create Virtual Server (Load Balancing) dialog box, specify values for the following parameters as shown:
   - Name—name
4. In Protocol, select ANY, and in IP Address and Port, select *.
5. Click Create, and then click Close. The virtual server you created appears in the Load Balancing Virtual Servers pane.

Configure the virtual server in MAC rewrite mode

To configure the virtual server in MAC rewrite mode by using the command line interface

At the command prompt, type:

```
set lb vserver <name>@ -m <RedirectionMode>
```

Example:

```
set lb vserver Vserver-LB-1 -m MAC
```

To configure the virtual server in MAC rewrite mode by using the configuration utility

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**, and select the virtual server for which you want to configure the redirection mode (for example, Vserver-LB-1).

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. Edit the **Basic Settings** section, and click **more**.
3. From the **Redirection Mode** drop-down list, select **MAC Based**.

Bind firewall services to the wildcard virtual server

To bind firewall services to the wildcard virtual server by using the command line interface

At the command prompt, type:

```
bind lb vserver <name> <serviceName>
```

Example:

```
bind lb vserver Vserver-LB-1 Service-HTTP-1
```

To bind firewall services to the wildcard virtual server by using the configuration utility

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**, and select a virtual server.
2. Click in the Service section, and select a service to bind.

Note: You can bind a service to multiple virtual servers.

Configure a service for each virtual server

To configure a service for each virtual server by using the command line interface

At the command prompt, type:

```
add service <name> <serverName> HTTP <port>
```

Example:

```
add service Service-HTTP-1 10.102.29.5 HTTP 80
```

To configure a service for each virtual server by using the configuration utility

1. Navigate to **Traffic Management > Load Balancing > Services**, and configure a service for each virtual server.
2. Specify **HTTP** in the **Protocol** field, and select **HTTP** under **Available Monitors**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To configure a service for each virtual server by using the configuration utility

1. Navigate to **Traffic Management > Load Balancing > Services**.
2. In the details pane, click Add.
3. In the Create Service dialog box, specify values for the following parameters as shown:
   - Service Name—name
   - Server—serverName
   - Port—port
4. In Protocol, specify HTTP. Under Available Monitors, select HTTP.
5. Click Create, and then click Close. The service you created appears in the Services pane.

Configure a monitor for each service

To bind a monitor to a service by using the command line interface

At the command prompt, type:

```
bind lb monitor <monitorName> <ServiceName>
```

Example:

```
bind mon monitor-HTTP-1 Service-HTTP-1
```

To bind a monitor to a service by using the configuration utility

Navigate to **Traffic Management > Load Balancing > Services**, double-click a service, and add a monitor.

Configure an HTTP virtual server to balance traffic sent to the servers

To configure an HTTP virtual server to balance traffic sent to the servers by using the command line interface

At the command prompt, type:

```
add lb vserver <name> HTTP <ip> <port>
```

Example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add lb vserver Vserver-LB-1 HTTP 10.102.29.60 80
```

To configure an HTTP virtual server to balance traffic sent to the servers by using the configuration utility

1. Navigate to **Traffic Management > Load Balancing > Virtual Services**, and configure an HTTP virtual server.
2. Specify **HTTP** in the **Protocol** field.

To configure an HTTP virtual server to balance traffic sent to the servers by using the configuration utility

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**.
2. In the details pane, click Add.
3. In the Create Virtual Server (Load Balancing) dialog box, specify values for the following parameters as shown:
   - Name—name
   - IP Address—IP Address Note: If the virtual server uses IPv6, select the IPv6 check box and enter the address in IPv6 format (for example, **1000:0000:0000:0000:0005:0600:700a:888b**).
   - Port—port
4. Under Protocol, select HTTP.
5. Click Create, and then click Close. The virtual server you created appears in the Load Balancing Virtual Servers pane.

Save and Verify the Configuration

When you've finished the configuration tasks, be sure to save the configuration. You should also check to make sure that the settings are correct.

To save and verify the configuration by using the command line interface

At the command prompt, type the following commands to configure a transparent monitor and verify the configuration:

- `save ns config`
- `show vserver`

Example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
save config

show lb vserver FWLBVIP2

        FWLBVIP2 (*:*) - ANY    Type: ADDRESS

        State: UP

        Last state change was at Mon Jun 14 07:22:54 2010

        Time since last state change: 0 days, 00:00:32.760

        Effective State: UP

        Client Idle Timeout: 120 sec

        Down state flush: ENABLED

        Disable Primary Vserver On Down : DISABLED

        No. of Bound Services :  2 (Total)       2 (Active)

        Configured Method: LEASTCONNECTION

        Current Method: Round Robin, Reason: A new service is bound

        Mode: MAC

        Persistence: NONE

        Connection Failover: DISABLED

1) fw-int-svc1 (10.102.29.5: *) - ANY State: UP Weight: 1

2) fw-int-svc2 (10.102.29.9: *) - ANY State: UP Weight: 1

 Done

show service fw-int-svc1

        fw-int-svc1 (10.102.29.5:*) - ANY
```

1)      Monitor Name: monitor-HTTP-1

                State: DOWN     Weight: 1

                Probes: 9       Failed [Total: 9 Current: 9]

                Last response: Failure - Time out during TCP connection
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
establishment stage

                Response Time: 2000.0 millisec

2)      Monitor Name: ping

                State: UP       Weight: 1

                Probes: 3       Failed [Total: 0 Current: 0]

                Last response: Success - ICMP echo reply received.

                Response Time: 1.275 millisec

 Done
```

To save and verify the configuration by using the configuration utility

1. In the **Details** pane, click **Save**.
2. In the **Save Config** dialog box, click **Yes**.
3. Navigate to **Traffic Management > Load Balancing > Virtual Servers**.
4. In the **Details** pane, select the virtual server that you created in step 5.
5. Verify that the settings displayed in the **Details** pane are correct.
6. Navigate to **Traffic Management > Load Balancing > Services**.
7. In the **Details** pane, select the services that you created in step 5.
8. Verify that the settings displayed in the **Details** pane are correct.

Monitoring a Firewall Load Balancing Set up in a Sandwich Environment

After the configuration is up and running, you should view the statistics for each service and virtual server to check for possible problems.

Viewing the Statistics of a Virtual Server

To evaluate the performance of virtual servers or to troubleshoot problems, you can display details of the virtual servers configured on the NetScaler appliance. You can display a summary of statistics for all the virtual servers, or you can specify the name of a virtual server to display the statistics only for that virtual server. You can display the following details:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Name
- IP address
- Port
- Protocol
- State of the virtual server
- Rate of requests received
- Rate of hits

To display virtual server statistics by using the command line interface

To display a summary of the statistics for all the virtual servers currently configured on the NetScaler, or for a single virtual server, at the command prompt, type:

```
stat lb vserver [-detail] [<name>]
```

Example:

```
>stat lb vserver -detail

Virtual Server(s) Summary

                      vsvrIP  port     Protocol        State    Req/s
Hits/s

One                        *    80         HTTP           UP      5/s
 0/s

Two                        *     0          TCP         DOWN      0/s
 0/s

Three                      *  2598          TCP         DOWN      0/s
 0/s

dnsVirtualNS    10.102.29.90    53          DNS         DOWN      0/s
 0/s

BRVSERV            10.10.1.1    80         HTTP         DOWN      0/s
 0/s

LBVIP           10.102.29.66    80         HTTP           UP      0/s
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
0/s

Done
```

To display virtual server statistics by using the configuration utility

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers > Statistics**.
2. If you want to display the statistics for only one virtual server, in the details pane, select the virtual server, and click **Statistics**.

Viewing the Statistics of a Service

You can view the rate of requests, responses, request bytes, response bytes, current client connections, requests in surge queue, current server connections, and so forth using the service statistics.

To view the statistics of a service by using the command line interface

At the command prompt, type:

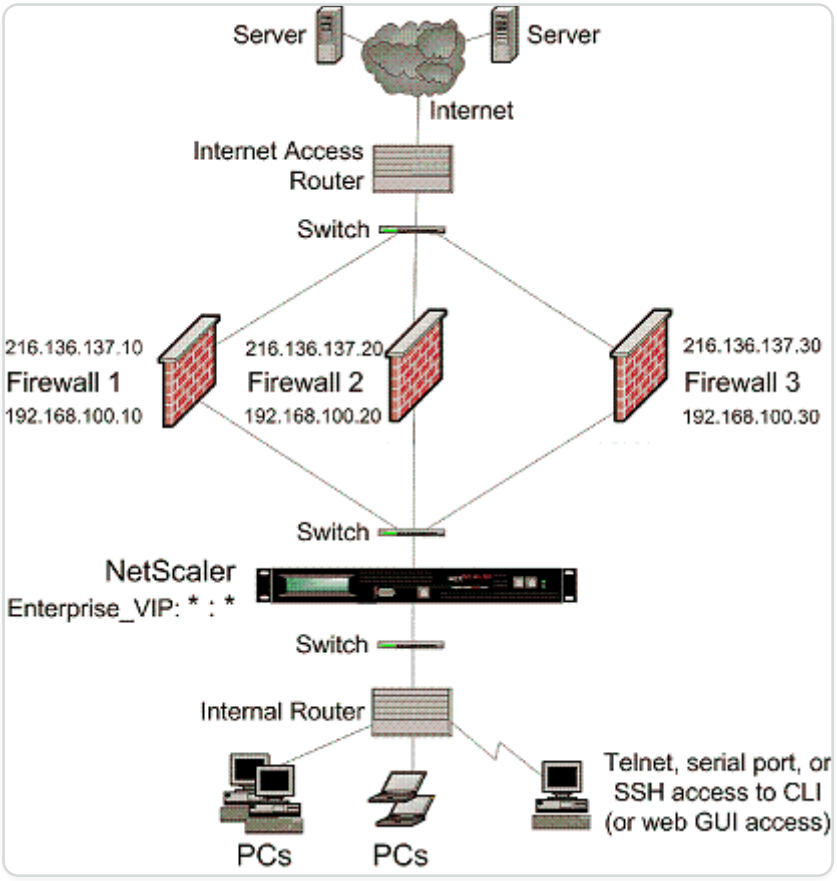
```
stat service <name>
```

Example:

```
stat service Service-HTTP-1
```

To view the statistics of a service by using the configuration utility

1. Navigate to **Traffic Management > Load Balancing > Services > Statistics**.
2. If you want to display the statistics for only one service, select the service, and click **Statistics**.



Enterprise Environment

In the enterprise setup, the NetScaler is placed between the firewalls connecting to the public Internet and the internal private network and handles egress traffic. The NetScaler selects the best firewall based on the configured load balancing policy.

The following diagram shows the enterprise firewall load balancing environment

Figure 1. Firewall Load Balancing (Enterprise)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The service type ANY configures the NetScaler to accept all traffic.

To avail benefits related to HTTP and TCP, configure the service and vserver with type HTTP or TCP. For FTP to work, configure the service with type FTP.

Configuring the NetScaler in an Enterprise Environment

Perform the following tasks to configure a NetScaler in an enterprise environment.

For traffic from the server (egress)

- Enable the load balancing feature.
- Configure a wildcard service for each firewall.
- Configure a monitor for each wildcard service.
- Configure a wildcard virtual server to load balance the traffic sent to the firewalls.
- Configure the virtual server in MAC rewrite mode.
- Bind firewall services to the wildcard virtual server.

For traffic across private network servers

- Configure a service for each virtual server.
- Configure a monitor for each service.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Configure an HTTP virtual server to balance traffic sent to the servers.
- Bind HTTP services to the HTTP virtual server.
- Save and Verify the Configuration.

In the below configuration example, one of the firewall servers is shown in the network topology diagram (Figure 1) is considered.

Enable the load balancing feature

You can configure load balancing entities such as services and virtual servers when the load balancing feature is disabled, but they will not function until you enable the feature.

To enable load balancing by using the command line interface

At the command prompt, type the following command to enable load balancing and verify the configuration:

- enable ns feature LB
- show ns feature

Example:

```
> enable ns feature LoadBalancing

 Done

> show ns feature

        Feature                         Acronym             Status

        -------                         -------             ------

 1)     Web Logging                     WL                  OFF

 2)     Surge Protection                SP                  ON

 3)     Load Balancing                  LB                  ON

 .

 .
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
.

24)    NetScaler Push                push                OFF

Done
```

To enable load balancing by using the configuration utility

Navigate to System > Settings and, in Configure Basic Features, select Load Balancing.

Configure a wildcard service for each firewall

To configure a wildcard service for each firewall by using the command line interface

At the command prompt, type:

```
add service <name> <serverName> ANY *
```

Example:

```
add service Service-HTTP-1 192.168.100.10 ANY *
```

To configure a wildcard service for each firewall by using the configuration utility

1. Navigate to Traffic Management > Load Balancing > Services.
2. In the details pane, click Add.
3. In the Create Service dialog box, specify values for the following parameters as shown:
   - Service Name—name
   - Server—serverName
4. In Protocol, select ANY, and in Port, select *.
5. Click Create, and then click Close. The service you created appears in the Services pane.

Configure a monitor for each wildcard service

A PING monitor is bound by default to the service. You will need to configure a transparent monitor to monitor hosts on the trusted side through individual firewalls. You can then bind the transparent monitor to services. The default PING monitor monitors the connectivity only between the NetScaler appliance and the upstream device. The transparent monitor monitors all the devices existing in the path from the appliance to the device that owns the destination IP address specified

© 1997–2026 Citrix Systems, Inc. All rights reserved.

in the monitor. If a transparent monitor is not configured and the status of the firewall is UP but one of the next hop devices from that firewall is down, the appliance includes the firewall while performing load balancing and forwards the packet to the firewall. However, the packet is not delivered to the final destination because one of the next hop devices is down. By binding a transparent monitor, if any of the devices (including the firewall) are down, the service is marked as DOWN and the firewall is not included when the appliance performs firewall load balancing.

Binding a transparent monitor will override the PING monitor. To configure a PING monitor in addition to a transparent monitor, after you create and bind a transparent monitor, you need to bind a PING monitor to the service.

To configure a transparent monitor by using the command line interface

At the command prompt, type the following commands to configure a transparent monitor and verify the configuration:

```
add lb monitor <monitorName> <type> [-destIP <ip_addr|ipv6_addr|*>] [-
transparent (YES | NO )]

bind lb monitor <monitorName> <serviceName>
```

Example:

```
add monitor monitor-HTTP-1 HTTP -destip 10.10.10.11 -destport 80
-transparent YES

bind monitor monitor-HTTP-1 fw-svc1
```

To create and bind a transparent monitor by using the configuration utility

1. Navigate to Traffic Management > Load Balancing > Monitors.
2. In the details pane, click Add.
3. In the Create Monitor dialog box, specify values as shown:
   - Name*
   - Type*—type
   - Destination IP
   - Transparent

   -* A required parameter

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. Click Create, and then click Close. In the Monitors pane, select the monitor that you just configured and verify that the settings displayed at the bottom of the screen are correct.

Configure a wildcard virtual server to load balance the traffic sent to the firewalls

The traffic passing through firewalls is meant for different proxies or servers that are placed behind the firewalls. These proxies or servers can have different IP addresses and ports. For the traffic to pass transparently through the firewalls, the IP address and port of the virtual server load balancing the firewalls must be set as * to accept traffic for any IP address and port.

To configure a wildcard virtual server to load balance the traffic sent to the firewalls by using the command line interface

At the command prompt, type:

```
add lb vserver <name> ANY * *
```

Example:

```
add lb vserver Vserver-LB-1 ANY * *
```

To configure a wildcard virtual server to load balance the traffic sent to the firewalls by using the configuration utility

1. Navigate to Traffic Management > Load Balancing > Virtual Servers.
2. In the details pane, click Add.
3. In the Create Virtual Server (Load Balancing) dialog box, specify values for the following parameters as shown:
   - Name—name
4. In Protocol, select ANY, and in IP Address and Port, select *.
5. Click Create, and then click Close. The virtual server you created appears in the Load Balancing Virtual Servers pane.

Configure the virtual server in MAC rewrite mode

To configure the virtual server in MAC rewrite mode by using the command line interface

At the command prompt, type:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
set lb vserver <name>@ -m <RedirectionMode>
```

Example:

```
set lb vserver Vserver-LB-1 -m MAC
```

To configure the virtual server in MAC rewrite mode by using the configuration utility

1. Navigate to Traffic Management > Load Balancing > Virtual Servers.
2. In the details pane, select the virtual server for which you want to configure the redirection mode (for example, Vserver-LB-1), and then click Open.
3. On the Advanced tab, under Redirection Mode, click MAC-Based.
4. Click OK.

Bind firewall services to the wildcard virtual server

To bind firewall services to the wildcard virtual server by using the command line interface

At the command prompt, type:

```
bind lb vserver <name> <serviceName>
```

Example:

```
bind lb vserver Vserver-LB-1 Service-HTTP-1
```

To bind firewall services to the wildcard virtual server by using the configuration utility

1. Navigate to Traffic Management > Load Balancing > Virtual Servers, and select a virtual server.
2. Click in the Service section, and select a service to bind.

Note: You can bind a service to multiple virtual servers.

Configure a service for each virtual server

To configure a service for each virtual server by using the command line interface

At the command prompt, type:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add service <name> <serverName> HTTP <port>
```

Example:

```
add service Service-HTTP-1 192.168.100.10 HTTP 80
```

To configure a service for each virtual server by using the configuration utility

1. Navigate to Traffic Management > Load Balancing > Services.
2. In the details pane, click Add.
3. In the Create Service dialog box, specify values for the following parameters as shown:
   - Service Name—name
   - Server—serverName
   - Port—port
4. In Protocol, specify HTTP. Under Available Monitors, select HTTP.
5. Click Create, and then click Close. The service you created appears in the Services pane.

Configure a monitor for each service

To bind a monitor to a service by using the command line interface

At the command prompt, type:

```
bind lb monitor <monitorName> <ServiceName>
```

Example:

```
bind mon monitor-HTTP-1 Service-HTTP-1
```

To bind a monitor to a service by using the configuration utility

1. Navigate to Traffic Management > Load Balancing > Services.
2. Open the service, and add a monitor.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure an HTTP virtual server to balance traffic sent to the servers

To configure an HTTP virtual server to balance traffic sent to the servers by using the command line interface

At the command prompt, type:

```
add lb vserver <name> HTTP <ip> <port>
```

Example:

```
add lb vserver Vserver-LB-1 HTTP 10.102.29.60 80
```

To configure an HTTP virtual server to balance traffic sent to the servers by using the configuration utility

1. Navigate to Traffic Management > Load Balancing > Virtual Servers.
2. In the details pane, click Add.
3. In the Create Virtual Server (Load Balancing) dialog box, specify values for the following parameters as shown:
   - Name—name
   - IP Address—IPAddress Note: If the virtual server uses IPv6, select the IPv6 check box and enter the address in IPv6 format (for example, **1000:0000:0000:0000:0005:0600:700a:888b**).
   - Port—port
4. Under Protocol, select HTTP.
5. Click Create, and then click Close. The virtual server you created appears in the Load Balancing Virtual Servers pane.

Bind HTTP services to the HTTP virtual server

To bind HTTP services to the wildcard virtual server by using the command line interface

At the command prompt, type:

```
bind lb vserver <name> <serviceName>
```

Example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
bind lb vserver Vserver-LB-1 Service-HTTP-1
```

To bind HTTP services to the wildcard virtual server by using the configuration utility

1. Navigate to Traffic Management > Load Balancing > Virtual Servers, and select a virtual server.
2. Click in the Service section, and select a service to bind.

Note: You can bind a service to multiple virtual servers.

Save and Verify the Configuration

When you've finished the configuration tasks, be sure to save the configuration. You should also check to make sure that the settings are correct.

To save and verify the configuration by using the command line interface

At the command prompt, type the following commands to configure a transparent monitor and verify the configuration:

- save ns config
- show vserver

Example:

```
save config

show lb vserver FWLBVIP2

        FWLBVIP2 (*:*) - ANY    Type: ADDRESS

        State: UP

        Last state change was at Mon Jun 14 07:22:54 2010

        Time since last state change: 0 days, 00:00:32.760

        Effective State: UP

        Client Idle Timeout: 120 sec

        Down state flush: ENABLED

        Disable Primary Vserver On Down : DISABLED
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```

                Probes: 9       Failed [Total: 0 Current: 0]

                Last response: Success - HTTP response code 200 received

                Response Time: 100.0 millisec

2)      Monitor Name: ping

                State: UP       Weight: 1

                Probes: 3       Failed [Total: 0 Current: 0]

                Last response: Success - ICMP echo reply received.

                Response Time: 1.275 millisec

 Done
```

To save and verify the configuration by using the configuration utility

1. In the details pane, click Save.
2. In the Save Config dialog box, click Yes.
3. Navigate to Traffic Management > Load Balancing > Virtual Servers.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. In the details pane, select the virtual server that you created in step 5 and verify that the settings displayed in the Details pane are correct.
5. Navigate to Traffic Management > Load Balancing > Services.
6. In the details pane, select the service that you created in step 5 and verify that the settings displayed in the Details pane are correct.

Monitoring a Firewall Load Balancing Setup in an Enterprise Environment

After the configuration is up and running, you should view the statistics for each service and virtual server to check for possible problems.

Viewing the Statistics of a Virtual Server

To evaluate the performance of virtual servers or to troubleshoot problems, you can display details of the virtual servers configured on the NetScaler appliance. You can display a summary of statistics for all the virtual servers, or you can specify the name of a virtual server to display the statistics only for that virtual server. You can display the following details:

- Name
- IP address
- Port
- Protocol
- State of the virtual server
- Rate of requests received
- Rate of hits

To display virtual server statistics by using the command line interface

To display a summary of the statistics for all the virtual servers currently configured on the NetScaler appliance, or for a single virtual server, at the command prompt, type:

```
stat lb vserver [-detail] [<name>]
```

Example:

```
>stat lb vserver -detail

Virtual Server(s) Summary
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
                      vsvrIP  port     Protocol        State    Req/s
Hits/s

 0/s

LBVIP           10.102.29.66    80         HTTP           UP      0/s
 0/s

 Done
```

To display virtual server statistics by using the configuration utility

1. Navigate to Traffic Management > Load Balancing > Virtual Servers > Statistics.
2. If you want to display the statistics for only one virtual server, in the details pane, select the virtual server, and click Statistics.

Viewing the Statistics of a Service

Updated: 2013-08-28

You can view the rate of requests, responses, request bytes, response bytes, current client connections, requests in surge queue, current server connections, and so forth using the service statistics.

To view the statistics of a service by using the command line interface

At the command prompt, type:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

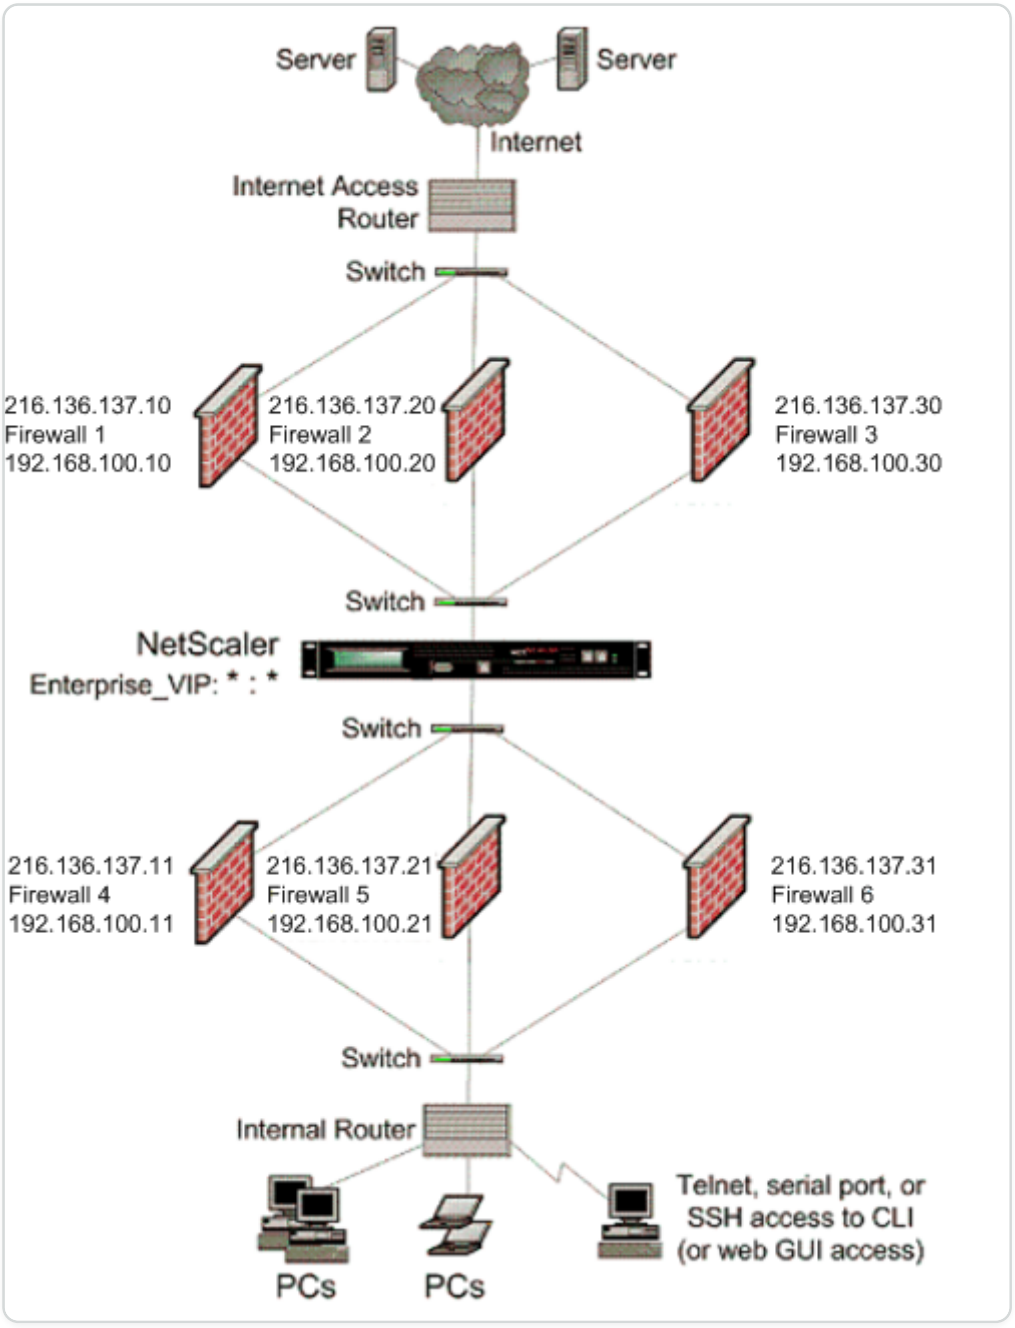
```
stat service <name>
```

Example:

```
stat service Service-HTTP-1
```

To view the statistics of a service by using the configuration utility

1. Navigate to Traffic Management > Load Balancing > Services > Statistics.
2. If you want to display the statistics for only one service, select the service, and click Statistics.



Multiple-Firewall Environment

In a multiple-firewall environment, the NetScaler appliance is placed between two sets of firewalls, the external set connecting to the public Internet, and the internal set connecting to the internal private network. The external set typically handles the egress traffic. These firewalls mainly implement access control lists to allow or deny access to external resources. The internal set typically handles the ingress traffic. These firewalls implement security to safeguard the intranet from malicious attacks apart from load-balancing the ingress traffic. The multiple-firewall environment allows you to load-balance traffic coming from another firewall. By default, the traffic coming from a firewall is not load balanced on the other firewall across a NetScaler appliance. Having firewall load balancing enabled on both the sides of NetScaler improves the traffic flow in both the egress and ingress direction and ensures faster processing of the traffic.

The following figure shows a multiple-firewall load balancing environment

Figure 1. Firewall Load Balancing (multiple-firewall)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

With a configuration like the one shown in Figure 1, you can configure the NetScaler to load balance the traffic through the an internal firewall even if it is load balanced by an external firewall. For example, with this feature configured, the traffic coming from the external firewalls (firewalls 1, 2, and 3) is load balanced on the internal firewalls (firewalls 4, 5, and 6) and vice versa.

Firewall load balancing is supported only for MAC mode LB virtual server.

The service type ANY configures the NetScaler to accept all traffic.

To avail benefits related to HTTP and TCP, configure the service and virtual server with type HTTP or TCP. For FTP to work, configure the service with type FTP.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configuring the NetScaler in a Multiple-Firewall Environment

To configure a NetScaler appliance in a multiple-firewall environment, you have to enable the load balancing feature, configure a virtual server to load balance the egress traffic across the external firewalls, configure a virtual server to load balance the ingress traffic across the internal firewalls, and enable firewall load balancing on the NetScaler appliance. To configure a virtual server to load balance traffic across a firewall in the multiple-firewall environment, you need to:

1. Configure a wildcard service for each firewall
2. Configure a monitor for each wildcard service
3. Configure a wildcard virtual server to load balance the traffic sent to the firewalls
4. Configure the virtual server in MAC rewrite mode
5. Bind firewall services to the wildcard virtual server

Enabling the load balancing feature

To configure and implement load balancing entities such as services and virtual servers, you need to enable the load balancing feature on the NetScaler device.

To enable load balancing by using the CLI:

At the command prompt, type the following command to enable load balancing and verify the configuration:

```
enable ns feature <featureName>

show ns feature
```

Example:

```
enable ns feature LoadBalancing

Done

show ns feature

Feature Acronym Status

------- ------- ------

1) Web Logging WL OFF
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
2) Surge Protection SP ON

3) Load Balancing LB ON

.

.

.

24) NetScaler Push push OFF

Done
```

To enable load balancing by using the GUI:

1. In the navigation pane, expand System, and then click Settings.
2. In the Settings pane, under Modes and Features, click Change basic features.
3. In the Configure Basic Features dialog box, select the Load Balancing check box, and then click Ok.

Configuring a wildcard service for each firewall

To accept traffic from all the protocols, you need to configure wildcard service for each firewall by specifying support for all the protocols and ports.

To configure a wildcard service for each firewall by using the CLI:

At the command prompt, type the following command to configure support for all the protocols and ports:

```
add service <name>@ <serverName> <serviceType> <port_number>
```

Example:

```
add service fw-svc1 10.102.29.5 ANY *
```

To configure a wildcard service for each firewall by using the GUI:

1. Navigate to Traffic Management > Load Balancing > Services.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. In the details pane, click Add.
3. In the Create Services dialog box, specify values for the following parameters as shown:

   - Service Name—name
   - Server—serverName

   -* A required parameter
4. In Protocol, select Any and in Port, select *.
5. Click Create, and then click Close. The service you created appears in the Services pane.

Configuring a monitor for each service

A PING monitor is bound by default to the service. You will need to configure a transparent monitor to monitor hosts on the trusted side through individual firewalls. You can then bind the transparent monitor to services. The default PING monitor monitors the connectivity only between the NetScaler appliance and the upstream device. The transparent monitor monitors all the devices existing in the path from the appliance to the device that owns the destination IP address specified in the monitor. If a transparent monitor is not configured and the status of the firewall is UP but one of the next hop devices from that firewall is down, the appliance includes the firewall while performing load balancing and forwards the packet to the firewall. However, the packet is not delivered to the final destination because one of the next hop devices is down. By binding a transparent monitor, if any of the devices (including the firewall) are down, the service is marked as DOWN and the firewall is not included when the appliance performs firewall load balancing.

Binding a transparent monitor will override the PING monitor. To configure a PING monitor in addition to a transparent monitor, after you create and bind a transparent monitor, you need to bind a PING monitor to the service.

To configure a transparent monitor by using the CLI:

At the command prompt, type the following commands to configure a transparent monitor and verify the configuration:

```
add lb monitor <monitorName> <type> [-destIP <ip_addr|ipv6_addr|*>] [-
transparent (YES | NO )]

bind lb monitor <monitorName> <serviceName>
```

Example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add monitor monitor-HTTP-1 HTTP -destip 10.10.10.11 -transparent YES

bind monitor monitor-HTTP-1 fw-svc1
```

The NetScaler appliance learns the server L2 parameters from the monitor that is bound to the service. For UDP-ECV monitors, configure a receive string to enable the appliance to learn the L2 parameters of the server. If the receive string is not configured and the server does not respond, then the appliance does not learn the L2 parameters but the service is set to UP. The traffic for this service is blackholed.

To configure a receive string by using the CLI:

At the command prompt, type the following command:

```
add lb monitor <monitorName> <type> [-destIP <ip_addr|ipv6_addr|*>] [-
transparent (YES | NO )] [-send <string>] [-recv <string>]
```

Example:

```
add lb monitor monitor-udp-1 udp-ecv -destip 10.10.10.11 -transparent YES
–send "test message" –recv "site_is_up"
```

To create and bind a transparent monitor by using the GUI:

1. Navigate to Traffic Management > Load Balancing > Monitors.
2. In the details pane, click Add.
3. In the Create Monitor dialog box, specify values for the following parameters as shown:
   - Name*
   - Type*—type
   - Destination IP
   - Transparent

   -* A required parameter
4. Click Create, and then click Close. In the Monitors pane, select the monitor that you just configured and verify that the settings displayed at the bottom of the screen are correct.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configuring a virtual server to load balance the traffic sent to the firewalls

To load balance any kind of traffic, you need to configure a wildcard virtual server specifying the protocol and port as any value.

To configure a virtual server to load balance the traffic sent to the firewalls by using the CLI:

At the command prompt, type the following command:

```
add lb vserver <name>@ <serviceType> <IPAddress> <port_number>
```

Example:

```
add lb vserver Vserver-LB-1 ANY * *
```

To configure a virtual server to load balance the traffic sent to the firewalls by using the GUI:

1. Navigate to Traffic Management > Load Balancing > Virtual Servers.
2. In the details pane, click Add.
3. In Protocol, select Any, and in IP Address and Port, select *.
4. Click Create, and then click Close. The virtual server you created appears in the Load Balancing Virtual Servers pane.

Configuring the virtual server to MAC rewrite mode

To configure the virtual server to use MAC address for forwarding the incoming traffic, you need to enable the MAC rewrite mode.

To configure the virtual server in MAC rewrite mode by using the CLI:

At the command prompt, type the following command:

```
set lb vserver <name>@ -m <RedirectionMode>
```

Example:

```
set lb vserver Vserver-LB-1 -m MAC
```

To configure the virtual server in MAC rewrite mode by using the GUI:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. Navigate to Traffic Management > Load Balancing > Virtual Servers.
2. In the details pane, select the virtual server for which you want to configure the redirection mode (for example, Vserver-LB1), and then click Open.
3. On the Advanced tab, under the Redirection Mode mode, click Open.
4. Click Ok.

Binding firewall services to the virtual server

To access a service on NetScaler appliance, you need to bind it to a wildcard virtual server.

To bind firewall services to the virtual server by using the CLI:

At the command prompt, type the following command:

```
bind lb vserver <name>@ <serviceName>
```

Example:

```
bind lb vserver Vserver-LB-1 Service-HTTP-1
```

To bind firewall services to the virtual server by using the GUI:

1. Navigate to Traffic Management > Load Balancing > Virtual Servers.
2. In the details pane, select the virtual server for which you want to configure the redirection mode (for example, Vserver-LB1), and then click Open.
3. In the Configure Virtual Server (Load Balancing) dialog box, on the Services tab, select the Active check box next to the service that you want to bind to the virtual server(for example, Service-HTTP-1).
4. Click Ok.

Configuring the multiple-firewall load balancing on the NetScaler appliance

To load balance traffic on both the sides of a NetScaler using firewall load balancing, you need to enable mulitpl-firewall load balancing by using the vServerSpecificMac parameter.

To configure multiple-firewall load balancing by using the CLI:

At the command prompt, type the following command:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
set lb parameter -vServerSpecificMac <status>
```

Example:

```
set lb parameter -vServerSpecificMac ENABLED
```

To configure multiple-firewall load balancing by using the GUI:

1. Navigate to Traffic Management > Load Balancing > Virtual Servers.
2. In the details pane, select the virtual server for which you want to configure the redirection mode (for example, Configure Load Balancing parameters).
3. In the Set Load Balancing Parameters dialog box, select the Virtual Server Specific MAC check box.
4. Click Ok.

Saving and Verifying the Configuration

When you've finished the configuration tasks, be sure to save the configuration. You should also check to make sure that the settings are correct.

To save and verify the configuration by using the CLI:

At the command prompt, type the following commands to configure a transparent monitor and verify the configuration:

- save ns config
- show vserver

Example:

```
save config

show lb vserver FWLBVIP2

        FWLBVIP2 (*:*) - ANY    Type: ADDRESS

        State: UP

        Last state change was at Mon Jun 14 07:22:54 2010
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
        Time since last state change: 0 days, 00:00:32.760

        Effective State: UP

        Client Idle Timeout: 120 sec

        Down state flush: ENABLED

        Disable Primary Vserver On Down : DISABLED

        No. of Bound Services :  2 (Total)       2 (Active)

        Configured Method: LEASTCONNECTION

        Current Method: Round Robin, Reason: A new service is bound

        Mode: MAC

        Persistence: NONE

        Connection Failover: DISABLED

1) fw-int-svc1 (10.102.29.5: *) - ANY State: UP Weight: 1

2) fw-int-svc2 (10.102.29.9: *) - ANY State: UP Weight: 1

 Done

show service fw-int-svc1

        fw-int-svc1 (10.102.29.5:*) - ANY

        State: DOWN

        Last state change was at Thu Jul  8 14:44:51 2010

        Time since last state change: 0 days, 00:01:50.240

        Server Name: 10.102.29.5

        Server ID : 0   Monitor Threshold : 0
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
        Max Conn: 0     Max Req: 0      Max Bandwidth: 0 kbits

        Use Source IP: NO

        Client Keepalive(CKA): NO

        TCP Buffering(TCPB): NO

        HTTP Compression(CMP): NO

        Idle timeout: Client: 120 sec   Server: 120 sec

        Client IP: DISABLED

        Cacheable: NO

        SC: OFF

        SP: OFF

        Down state flush: ENABLED

1)      Monitor Name: monitor-HTTP-1

                State: DOWN     Weight: 1

                Probes: 9       Failed [Total: 9 Current: 9]

                Last response: Failure - Time out during TCP connection
establishment stage

                Response Time: 2000.0 millisec

2)      Monitor Name: ping

                State: UP       Weight: 1

                Probes: 3       Failed [Total: 0 Current: 0]
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
                Last response: Success - ICMP echo reply received.

                Response Time: 1.275 millisec

Done
```

To save and verify the configuration by using the GUI:

1. In the details pane, click Save.
2. In the Save Config dialog box, click Yes.
3. Navigate to Traffic Management > Load Balancing > Virtual Servers.
4. In the details pane, select the virtual server that you created in step 5 and verify that the settings displayed in the Details pane are correct.
5. Navigate to Traffic Management > Load Balancing > Services.
6. In the details pane, select the service that you created in step 5 and verify that the settings displayed in the Details pane are correct.

Monitoring a Firewall Load Balancing Setup in a Multiple-Firewall Environment

After the configuration is up and running, you should view the statistics for each service and virtual server to check for possible problems.

Viewing the Statistics of a Virtual Server

To evaluate the performance of virtual servers or to troubleshoot problems, you can display details of the virtual servers configured on the NetScaler appliance. You can display a summary of statistics for all the virtual servers, or you can specify the name of a virtual server to display the statistics only for that virtual server. You can display the following details:

- Name
- IP address
- Port
- Protocol
- State of the virtual server
- Rate of requests received
- Rate of hits

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To display virtual server statistics by using the command line interface

To display a summary of the statistics for all the virtual servers currently configured on the NetScaler appliance, or for a single virtual server, at the command prompt, type:

```
stat lb vserver [-detail] [<name>]
```

Example:

```
>stat lb vserver -detail

Virtual Server(s) Summary

                      vsvrIP  port     Protocol        State    Req/s
Hits/s

One                        *    80         HTTP           UP      5/s
 0/s

Two                        *     0          TCP         DOWN      0/s
 0/s

Three                      *  2598          TCP         DOWN      0/s
 0/s

dnsVirtualNS    10.102.29.90    53          DNS         DOWN      0/s
 0/s

BRVSERV            10.10.1.1    80         HTTP         DOWN      0/s
 0/s

LBVIP           10.102.29.66    80         HTTP           UP      0/s
 0/s

 Done
```

To display virtual server statistics by using the GUI:

1. Navigate to Traffic Management > Load Balancing > Virtual Servers > Statistics.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. If you want to display the statistics for only one virtual server, in the details pane, select the virtual server, and click Statistics.

Viewing the Statistics of a Service

You can view the rate of requests, responses, request bytes, response bytes, current client connections, requests in surge queue, current server connections, and so forth using the service statistics.

To view the statistics of a service by using the CLI:

At the command prompt, type:

```
stat service <name>
```

Example:

```
stat service Service-HTTP-1
```

To view the statistics of a service by using the GUI:

1. Navigate to Traffic Management > Load Balancing > Services > Statistics.
2. If you want to display the statistics for only one service, select the service, and click Statistics.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Global Server Load Balancing

NOTES:

- From release 13.0 build 41.x, global server load balancing (GSLB) deployments using the NetScaler appliance are fully compliant with DNS flag day 2019.
- The GSLB feature is included with the NetScaler Advance and Premium edition licenses. The NetScaler option license is supported with the Standard edition.

NetScaler appliances configured for GSLB provide disaster recovery and ensure continuous availability of applications by protecting against points of failure in a WAN. GSLB balances the load across data centers by directing client requests to the closest or best performing data center, or to surviving data centers if there is an outage.

In a typical configuration, a local DNS server sends client requests to a GSLB virtual server, to which are bound GSLB services. A GSLB service identifies a load balancing or content switching virtual server, which can be at the local site or a remote site. If the GSLB virtual server selects a load balancing or content switching virtual server at a remote site, it sends the virtual server's IP address to the DNS server. The DNS server sends it to the client. The client then resends the request to the new virtual server at the new IP.

The GSLB entities that you must configure are the GSLB sites, the GSLB services, the GSLB virtual servers, load balancing or content switching virtual servers, and authoritative DNS (ADNS) services. You must also configure MEP. You can also configure DNS views to expose different parts of your network to clients accessing the network from different locations.

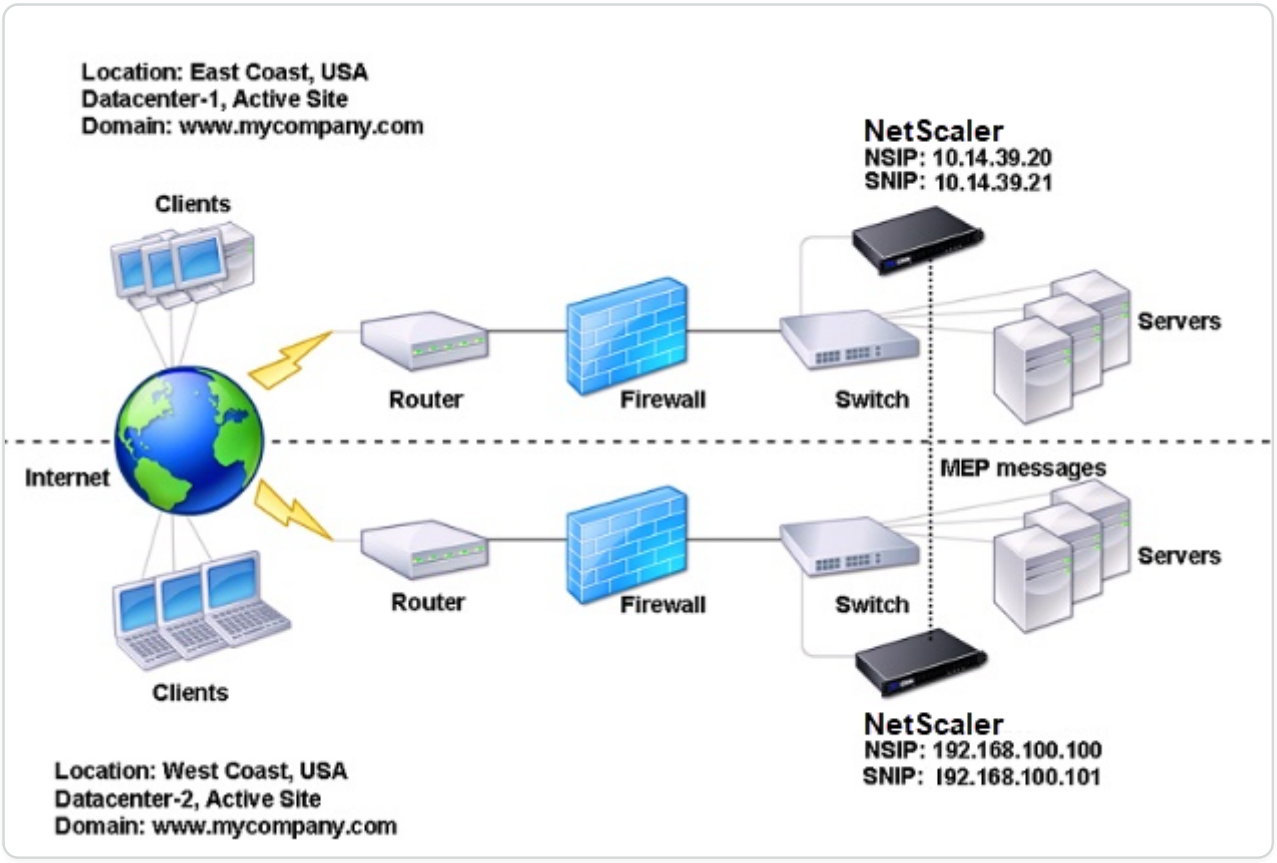
NOTE:

To take full advantage of GSLB features, use ADC appliances for load balancing or content switching at each data center, so that your GSLB configuration can use the proprietary MEP to exchange site metrics.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

How GSLB works

With ordinary DNS, when a client sends a domain name system (DNS) request, it receives a list of IP addresses of the domain or service. Generally, the client chooses the first IP address in the list and initiates a connection with that server. The DNS server uses a technique called DNS round robin to rotate through the IPs on the list. It sends the first IP address to the end of the list and promotes the others after it responds to each DNS request. This technique ensures equal distribution of the load, but it does not support disaster recovery, load balancing based on load or proximity of servers, or persistency.



When you configure GSLB on ADC appliances and enable MEP, the DNS infrastructure is used to connect the client to the data center that best meets the set criteria. The criteria can designate the following:

- Least loaded data center
- Closest data center
- Data center that responds most quickly to requests from the client's location
- A combination of those metrics and SNMP metrics.

An appliance tracks the location, performance, load, and availability of each data center. It uses these factors to select the data center to send the client request.

The following figure illustrates a basic GSLB topology.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

A GSLB configuration consists of a group of GSLB entities on each appliance in the configuration. These entities include GSLB sites, GSLB services, GSLB service groups, GSLB virtual servers, load balancing servers, content switching servers, and ADNS services.

GSLB deployment types

NetScaler appliances configured for global server load balancing (GSLB) provide for disaster recovery and ensure continuous availability of applications by protecting against points of failure in a wide area network (WAN). GSLB can balance the load across data centers by directing client requests to the closest or best performing data center, or to surviving data centers in the event of an outage.

The following are some of the typical GSLB deployment types:

- Active-active site deployment
- Active-passive site deployment
- Parent-child topology deployment

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Active-active site deployment

An active-active site consists of multiple active data centers. Client requests are load balanced across active data centers. This deployment type can be used when you have a need for global distribution of traffic in a distributed environment.

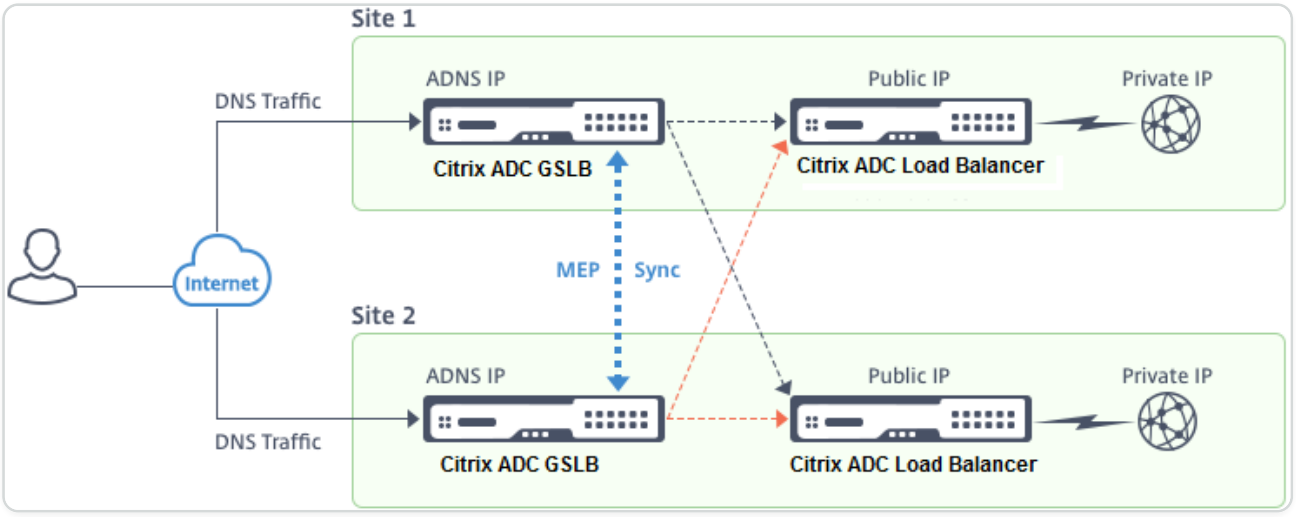
All the sites in an active-active deployment are active, and all the services for a particular application/domain are bound to the same GSLB virtual server. Sites exchange metrics through the Metrics Exchange Protocol (MEP). Site metrics exchanged between the sites include the status of each load balancing and content switching virtual server, current number of connections, current packet rate, and current bandwidth usage. The NetScaler appliance needs this information to perform load balancing across the sites.

An active-active deployment can include a maximum of 32 GSLB sites, because MEP cannot synchronize more than 32 sites. No backup sites are configured in this deployment type.

The NetScaler appliance sends client requests to the appropriate GSLB site as determined by the GSLB method specified in the GSLB configuration.

For an active-active deployment, you can configure the following GSLB methods.

- Round Robin
- Least Connections
- Least Response Time
- Least Bandwidth
- Least Packets
- Source IP Hash
- Custom Load
- Round Trip Time (RTT)
- Static Proximity



© 1997–2026 Citrix Systems, Inc. All rights reserved.

Note:

- If MEP is disabled, the following GSLB methods default to the Round Robin method.
  - RTT
  - Least Connections
  - Least Bandwidth
  - Least Packets
  - Least Response Time
- In the static proximity GLSB method, the appliance sends the request to the IP address of the site that best matches the proximity criteria.
- In the Round Trip Time method, the dynamic round trip time (RTT) values are to select the IP address of the best performing site. RTT is a measure of the delay in the network between the client's local DNS server and a data resource.

GSLB active-active data center topology

In the diagram, Site 1 and Site 2 are active GLSB sites.

When the client sends a DNS request, it lands in one of the active sites.

If Site 1 receives the client request, the GSLB virtual server in Site 1 selects a load balancing or content switching virtual server and sends the virtual server's IP address to the DNS server, which sends it to the client. The client then resends the request to the new virtual server at the new IP address.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

As both sites are active, the GSLB algorithm evaluates the services at both sites when making a selection as determined by the configured GSLB method.

Active-passive site deployment

An active-passive site consists of an active and a passive data center. This deployment type is ideal for disaster recovery.

In this type of deployment, some of the sites (remote sites) are reserved only for disaster recovery. These sites do not participate in any decision making until all the active sites are DOWN. A passive site does not become operational unless a disaster event triggers a failover.

Once you have configured the primary data center, replicate the configuration for the backup data center and designate it as the passive GSLB site by designating a GSLB virtual server at that site as the backup virtual server.

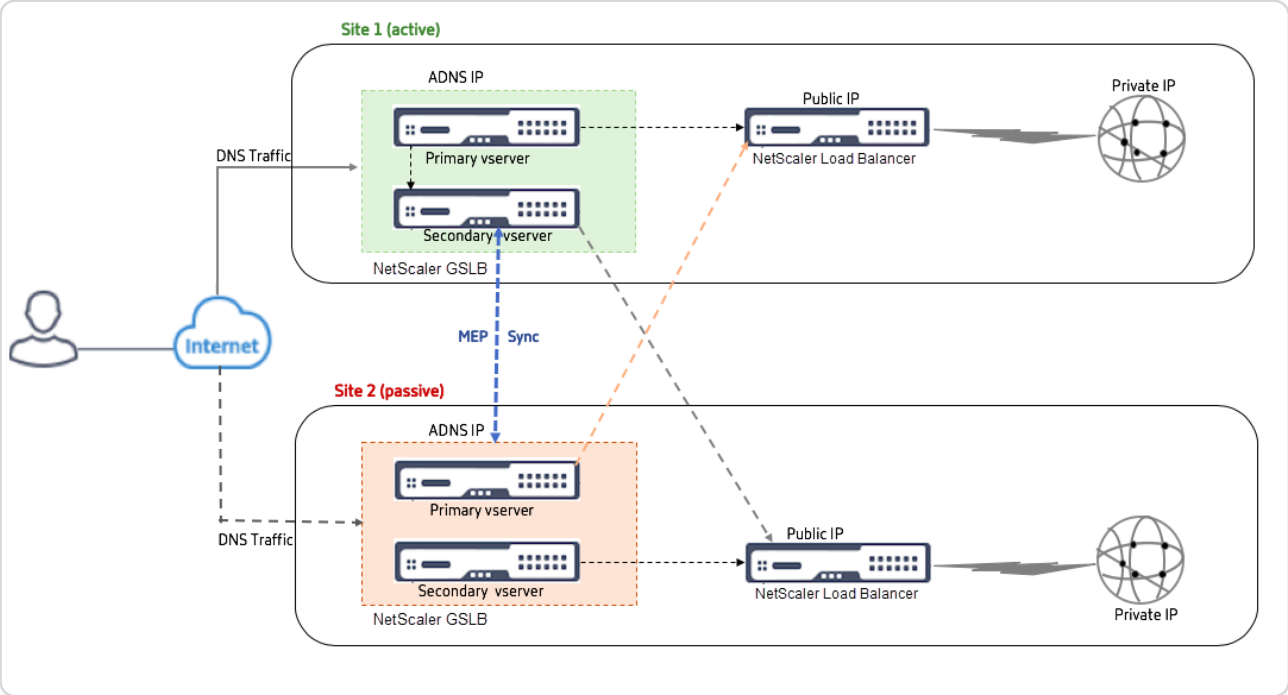
An active-passive deployment can include a maximum of 32 GSLB sites, because MEP cannot synchronize more than 32 sites.

For an active-passive deployment, you can configure the following GSLB methods.

- Round Robin
- Least Connections
- Least Response Time
- Least Bandwidth
- Least Packets
- Source IP Hash
- Custom Load
- Round Trip Time (RTT)
- Static Proximity

Note:

- If MEP is disabled, the following algorithm methods default to Round Robin.
    - RTT
    - Least Connections
    - Least Bandwidth
    - Least Packets



© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Least Response Time

- In the static proximity GLSB method, the appliance sends the request to the IP address of the site that best matches the proximity criteria.
- In the Round Trip Time method, the dynamic round trip time (RTT) values are to select the IP address of the best performing site. RTT is a measure of the delay in the network between the client's local DNS server and a data resource.

GSLB active-passive datacenter topology

In the diagram, Site 1 is an active site and Site 2 is a passive site, which has the same configuration as that of Site 1.

If Site 1 goes DOWN, Site 2 becomes operational.

When the client sends a DNS request, the request can land in any of the sites. However, the services are selected only from the active site (Site1) as long as it is UP.

Services from the passive site (Site 2) are selected only if the active site (Site 1) is DOWN.

Parent-child topology deployment using the MEP protocol

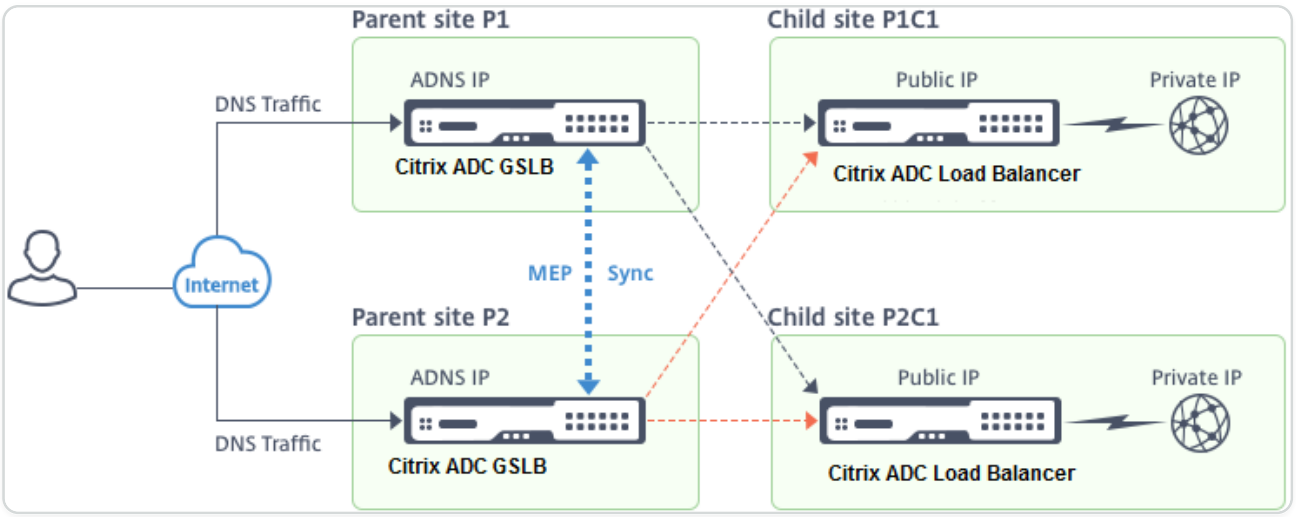
NetScaler GSLB provides global server load balancing and disaster recovery by creating mesh connections between all the involved sites and making intelligent load balancing decisions. Each site communicates with the others to exchange server and network metrics through the Metric Exchange Protocol (MEP), at regular intervals. However, with the increase in the number of peer sites, the volume of MEP traffic increases exponentially because of the mesh topology. To

© 1997–2026 Citrix Systems, Inc. All rights reserved.

overcome this, you can use a parent-child topology. The parent-child topology also supports larger deployments. In addition to the 32 parent sites, you can configure 1024 child sites.

The GSLB parent-child topology is a two-level hierarchical design with the following characteristics:

- At the top level are parent sites, which have peer relationships with other parents.
- Each parent can have multiple child sites.
- Each parent site exchanges health information with its child sites and with other parent sites.
- A child site communicates only with its parent site.
- In a parent-child relationship for GSLB, only the parent site responds to ADNS queries. The child sites act as normal load balancing sites.
- Configure an ADNS service or DNS load balancing virtual server only in the parent site.
- A parent site can have a normal GSLB configuration, that is, services from local and all remote sites, but a child site can have local services only. Also, only the parent sites have GSLB virtual servers configured.

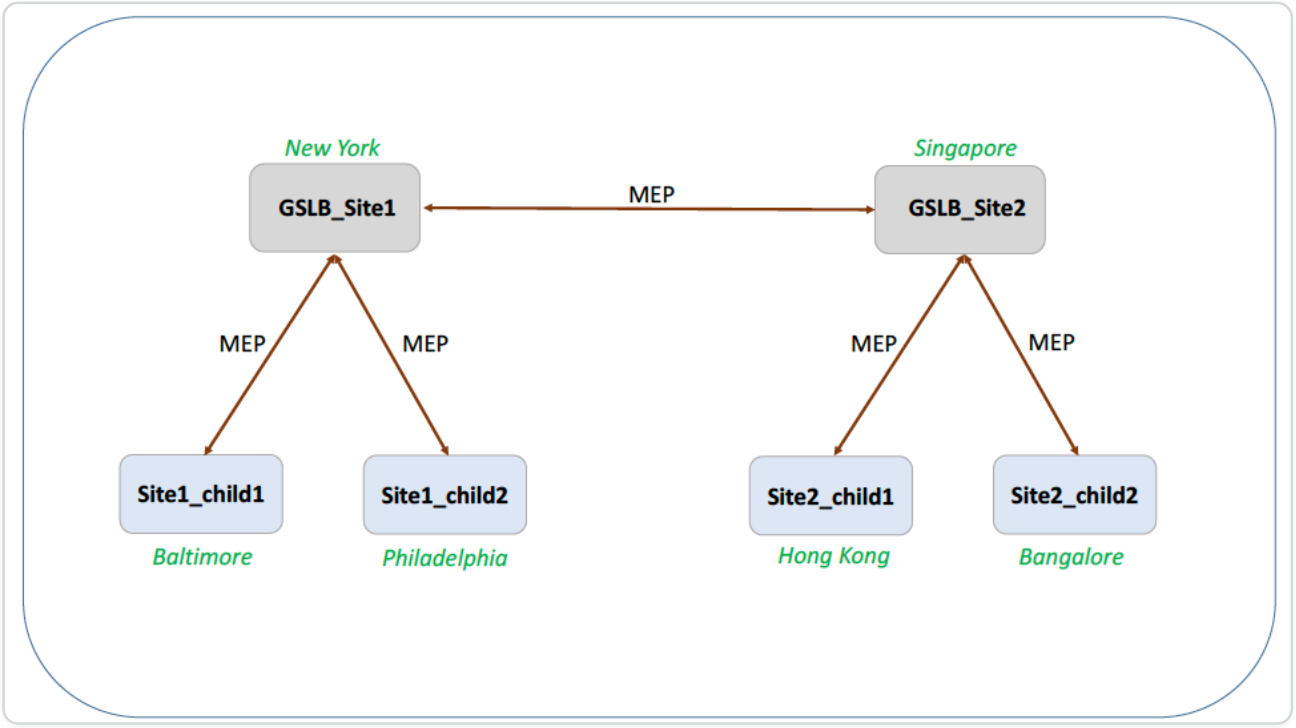


NOTE

- In a parent-child topology, the exchange of site metrics is initiated from the lower of two IP addresses. However, from NetScaler release 11.1 build 51.x, the parent sites initiate connections to the child sites, and not the opposite way. Because the parent sites have information about all the child sites in the GSLB setup.
- In a parent-parent connection, the exchange of site metrics is still initiated from the lower IP of two IP addresses.
- In a parent-child topology, GSLB services are not always required to be configured on a child site. However, if you have more configuration such as client authentication, client IP address insertion, or other SSL-specific requirement, you must add an explicit GSLB service on the child site and configure it accordingly.
- In a parent-child topology, the parent site and the child site can be on differentNetScaler software versions. However, to use the GSLB automaticConfigSync option to synchronize the configuration across the parent sites, all parent sites must be on the sameNetScaler software versions. If you are not using the automaticConfigSync option, then the parent site and the child site can be on differentNetScaler software versions but make sure that you are not using any of the new features in the latest release. This is also applicable, in general, to two NetScaler nodes participating in GSLB.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Basic parent-child topology



In the diagram, SiteP1 and SiteP2 are parent sites in a peer relationship. Site P1C1 and P2C1 are the child sites of P1 and P2 respectively.

Setting up a parent-child configuration for GSLB

If you have a firewall configured at a GSLB site, make sure that port 3011 is open.

The following diagram displays a sample parent-child configuration.

- The configuration of a child site includes the child site and its parent site, but no other parent or child sites.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Network metrics, such as RTT and persistence session information, are synchronized only across the parent sites. Therefore, parameters such as nwMetricExchange and sessionExchange are disabled by default on all the child sites.
- To verify the correct parent-child configuration, check the states of all the GSLB services bound to the parent sites.

To set up a parent-child configuration for GSLB by using the CLI:

1. On each parent site, configure all its child sites, its peer parent sites, and the child sites associated with the peer sites:

   Use the following command while adding a parent site:

   ```
   add gslb site <siteName> <siteIPAddress> [-publicIP <ip_addr|ipv6_addr|
   *>]
   ```

   Use the following command while adding a child site:

   ```
   add gslb site <siteName> <siteIPAddress> [-publicIP <ip_addr|ipv6_addr|
   *>] [-parentSite <string>]
   ```

2. On the child sites, configure the child site and also associate the child site with its parent:

   NOTE:

   Configure the parent site and child site association correctly. For example, you must configure Site1_child1 with GSLB_Site1. You cannot configure Site1_child1 with GSLB_Site2.

   Use the following command to configure the parent site with which the child site is associated:

   ```
   add gslb site <siteName> <siteIPAddress> [-publicIP <ip_addr|ipv6_addr|
   *>]
   ```

   Use the following command to add a child site and associate it with its parent site:

   ```
   add gslb site <siteName> <siteIPAddress> [-publicIP <ip_addr|ipv6_addr|
   *>] [-parentSite <string>]
   ```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

For a complete example of a parent-child configuration, using the command line interface, see Example of a Complete Parent-Child Configuration, Using the CLI.

NOTE

If the load balancing virtual server IP address is a private IP address and the public IP address is different from this IP address, you need to configure a GSLB service for the local load balancing virtual server on the child site. This is required for statistics collection between the parent and the child site.

On the child site, at the command prompt, type:

```
add gslb service <name> <private IP/lb vserver IP> http 80 –sitename <childsite name> -publicip <public IP of LB vserver>
```

Example:

```
add gslb service Service-GSLB 192.168.1.3 http 80 -GSLB_Site11 site 11_lb1 172.16.1.1
```

Where 192.168.1.3 is a private IP address of the load balancing virtual server and 172.16.1.1 is a public IP address of the load balancing virtual server.

Backing up a parent site

Note: This feature was introduced in NetScaler release 11.1 build 51.x. To use the backup parent site topology, make sure that the parent site and the child sites are on NetScaler 11.1 build 51.x and later.

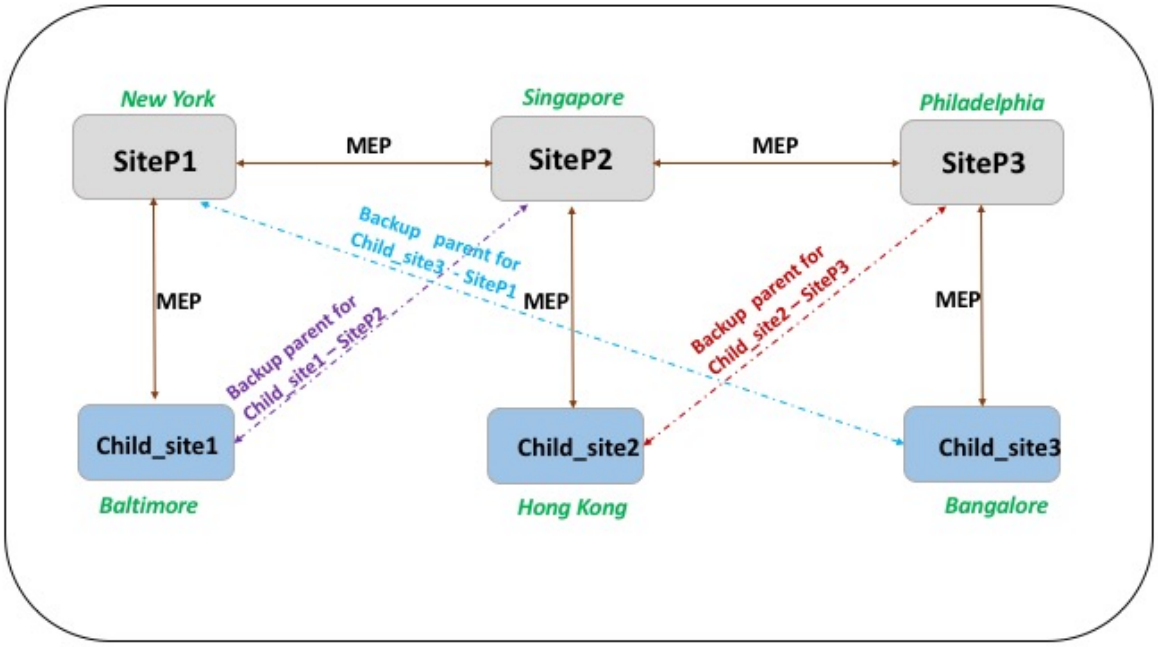
The backup parent site topology is useful in scenarios wherein many child sites are associated with a parent site. If this parent site goes DOWN, all of its child sites become unavailable. To prevent this, you can now configure a backup parent site to which the child sites can connect if the original parent site is DOWN. The parent site sends the backup parent list to the child sites through the MEP messages.

When a parent site is DOWN, the other parent sites in the GSLB get to know that a particular parent site is DOWN through MEP because MEP to that parent site is DOWN. The other parent sites in the GSLB setup look up the backup chain of the peer parent. The parent site with the highest preference adopts the child sites of the parent that went DOWN. The new parent then initiates a connection with the child site. A child site can accept or reject the connection after evaluating its existing connections and the information in the backup list. It takes a few seconds for the backup parent to adopt the child sites. When the original parent site is back UP, it tries to

© 1997–2026 Citrix Systems, Inc. All rights reserved.

establish connections with its child sites that have migrated to a different parent. When a connection attempt is successful, the child site is reassigned to its original parent site.

Note:



- Only parent sites can be configured as backups, and this configuration can only be done at the parent site.
- All child sites use the backup parent set.
- Synchronization is done only on the parent sites. GSLB child sites' configuration is not affected by synchronization. This is because the parent site and the child site configurations are not identical. The child sites configuration consists only of its own and its parent site's details. Also, GSLB services are not always required to be configured in the child sites.

Consider the configuration shown in the following figure, in which:

- SiteP1, SiteP2, and SiteP3 are the parent sites.
- Child_site1, Child_site2, and Child_site3 are the child sites of SiteP1, SiteP2, and SiteP3 respectively.
- Backup parent sites;
    - SiteP1 backup parents - SiteP2 (higher preference) and SiteP3
    - SiteP2 backup parents – SiteP3 (higher preference) and SiteP1
    - SiteP3 backup parents – SiteP1 (higher preference) and SiteP2

Note: For illustration purposes, the figure shows only one backup parent for each parent site.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The following list summarizes the behavior of the parent and child sites under various scenarios:

- Scenario 1: SiteP1 goes DOWN.
  - SiteP2 and SiteP3 detect that SiteP1's MEP connection is DOWN. SiteP2 is higher in the preference list of backup parents for SiteP1, so it tries to initiate a connection to Child_site1. SiteP3 assumes that Child_site1 is now the child site of parent SiteP2.
  - SiteP2 sends Child_Site1 the list of SiteP1's backup parents (SiteP2 and SiteP3) to Child_site1. Child_site1 uses the list to decide whether to accept or reject the connection from SiteP2. It accepts the connection and becomes a child of SiteP2.
  - When SiteP1 is back UP, it sends Child_site1 a connection request. The new request takes precedence and Child_site 1 migrates to SiteP1.
- Scenario 2: Only the MEP connection between SiteP1 and SiteP2 has gone DOWN. Child_site1 rejects SiteP2's connection request, because its parent, SiteP1, is still UP.
- Scenario 3: SiteP3 and Child_Site1 detect that SiteP1 is DOWN, and the MEP connection between SiteP3 and SiteP2 is also DOWN. However, SiteP2 detects that SiteP1 is UP, and the MEP connection between SiteP1 and SiteP2 is UP.
  - SiteP2 does not take any action.
  - SiteP3 checks SiteP1's backup list and finds that SiteP2 has a higher preference than SiteP3. But SiteP2 is DOWN, so SiteP3 tries to establish a connection with Child_site1. Child_site1 has detected that SiteP1 is DOWN, so it accepts SiteP3's connection request.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Now the connection between SiteP1 and SiteP2 goes DOWN. SiteP2 checks SiteP1's backup list and finds itself as the most preferred backup, so it tries to connect to Child_site1. Child_site1 evaluates the new connection request based on SiteP1's list and finds SiteP2 as the most preferred backup, so it migrates to SiteP2 from SiteP3.

To configure a backup parent site by using the command line interface

At the command prompt type:

```
set gslb site <sitename> -backupParentlist <bkp_site1> <bkp_site2> …
<bkp_site5>
```

`<sitename>` is the current parent site.

Example:

For the parent site (SiteP1), the sites (SiteP2 and SiteP3) are configured as the backup parent sites.

```
set gslb site SiteP1 -backupParentlist SiteP2 SiteP3
```

Note:

- You cannot add a new site as a backup parent. You must first add all the sites, and then configure the site as a backup parent.
- To remove a backup parent, you must use the unset command, which unsets all the sites that were previously configured as backup parent sites.

To configure a backup parent site by using the GUI

1. Navigate to **Configuration** > **Traffic Management** > **GSLB** > **Sites**.
2. Add a new site or select an existing site.
3. Choose the **Backup Parent Sites** option box while creating or configuring the GSLB site.

GSLB configuration entities

A GSLB configuration consists of a group of GSLB entities on each appliance in the configuration. These entities include the following:

- GSLB Sites

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- GSLB Services
- GSLB Virtual Servers
- Load Balancing or Content Switching Virtual Servers
- ADNS Services
- DNS VIPs

GSLB Sites

A typical GSLB setup consists of data centers, each of which has various network appliances that may or may not be NetScaler appliances. The data centers are called GSLB sites. Each GSLB site is managed by a NetScaler appliance that is local to that site. Each of these appliances treats its own site as the local site and all other sites, managed by other appliances, as remote sites.

If the appliance that manages a site is the only NetScaler appliance in that data center, the GSLB site hosted on that appliance acts as a bookkeeping placeholder for auditing purposes, because no metrics can be collected. Typically, this happens when the appliance is used only for GSLB, and other products in the data center are used for load balancing or content switching.

Relationships among GSLB Sites

The concept of sites is central to NetScaler GSLB implementations. Unless otherwise specified, sites form a peer relationship among themselves. This relationship is used first to exchange health information and then to distribute load as determined by the selected algorithm. In many situations, however, a peer relationship among all GSLB sites is not desirable. Reasons for not having an all-peer implementation could be;

- To clearly separate GSLB sites. For example, to separate sites that participate in resolving DNS queries from the traffic management sites.
- To reduce the volume of Metric Exchange Protocol (MEP) traffic, which increases exponentially with an increasing number of peer sites.

These goals can be achieved by using parent and child GSLB sites.

GSLB Services

A GSLB service is usually a representation of a load balancing or content switching virtual server, although it can represent any type of virtual server. The GSLB service identifies the virtual server’s IP address, port number, and service type. GSLB services are bound to GSLB virtual servers on the NetScaler appliances managing the GSLB sites. A GSLB service bound to a GSLB virtual

© 1997–2026 Citrix Systems, Inc. All rights reserved.

server in the same data center is local to the GSLB virtual server. A GSLB service bound to a GSLB virtual server in a different data center is remote from that GSLB virtual server.

NOTE

Sites and services are inherently linked to indicate proximity between the two. That is, all services must belong to a site, and are assumed to be in the same location as the GSLB site for proximity purposes. Likewise, services and virtual servers are linked, so that the logic is linked to the resources that are available.

GSLB Virtual Servers

A GSLB virtual server has one or more GSLB services bound to it, and load balances traffic among those services. It evaluates the configured GSLB methods (algorithms) to select the appropriate service to which to send a client request. Because the GSLB services can represent either local or remote servers, selecting the optimal GSLB service for a request has the effect of selecting the data center that should serve the client request.

The domain for which global server load balancing is configured must be bound to the GSLB virtual server, because one or more services bound to the virtual server will serve requests made for that domain.

Unlike other virtual servers configured on a NetScaler appliance, a GSLB virtual server does not have its own virtual IP address (VIP).

Load Balancing or Content Switching Virtual Servers

A load balancing or content switching virtual server represents one or many physical servers on the local network. Clients send their requests to the load balancing or content switching virtual server's virtual IP (VIP) address, and the virtual server balances the load across the physical servers. After a GSLB virtual server selects a GSLB service representing either a local or a remote load balancing or content switching virtual server, the client sends the request to that virtual server's VIP address.

For more information about load balancing or content switching virtual servers and services, see Load Balancing or Content Switching.

ADNS Services

An ADNS service is a special kind of service that responds only to DNS requests for domains for which the NetScaler appliance is authoritative. When an ADNS service is configured, the appliance

© 1997–2026 Citrix Systems, Inc. All rights reserved.

owns the ADNS service IP address and advertises it. Upon reception of a DNS request by an ADNS service, the appliance checks for a GSLB virtual server bound to that domain. If a GSLB virtual server is bound to the domain, it is queried for the best IP address to which to send the DNS response.

DNS VIPs

A DNS virtual IP is a virtual IP (VIP) address that represents a load balancing DNS virtual server on the NetScaler appliance. DNS requests for domains for which the NetScaler appliance is authoritative can be sent to a DNS VIP.

GSLB methods

Unlike traditional DNS servers that simply respond with the IP addresses of the configured servers, a NetScaler appliance configured for GSLB responds with the IP addresses of the services, as determined by the configured GSLB method. By default, the GSLB virtual server is set to the least connection method. If all GSLB services are down, the appliance responds with the IP addresses of all the configured GSLB services.

GSLB methods are algorithms that the GSLB virtual server uses to select the best-performing GSLB service. After the host name in the Web address is resolved, the client sends traffic directly to the resolved service IP address.

The NetScaler appliance provides the following GSLB methods:

- Round Robin
- Least Connections
- Least Response Time
- Least Bandwidth
- Least Packets
- Source IP Hash
- Custom Load
- Round Trip Time (RTT)
- Static Proximity

For GSLB methods to work with a remote site, either MEP must be enabled or explicit monitors must be bound to the remote services. If MEP is disabled, RTT, Least Connections, Least Bandwidth, Least Packets and Least Response Time methods default to Round Robin.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The Static Proximity and RTT load balancing methods are specific to GSLB.

Specifying a GSLB method other than static proximity or dynamic RTT

For information about the Round Robin, Least Connections, Least Response Time, Least Bandwidth, Least Packets, Source IP Hash, or Custom Load method, see Load Balancing.

To change the GSLB method by using the CLI

At the command prompt, type:

```
set gslb vserver <name> -lbMethod GSLBMethod
```

Example:

```
set gslb vserver Vserver-GSLB-1 -lbMethod ROUNDROBIN
```

To change the GSLB method by using the GUI

1. Navigate to **Traffic Management** > **GSLB** > **Virtual Servers**.
2. In the details pane, select a GSLB virtual server and click **Open**.
3. In the Configure GSLB Virtual Server dialog box, on the Method and Persistence tab, under Method, select a method from the Choose Method list.
4. Click **OK**, and verify that the method you selected appears under Details at the bottom of the screen.

GSLB algorithms

The following algorithms are supported for GSLB.

- **Round Robin**: When a GSLB virtual server is configured to use the round robin method, it continuously rotates a list of the services that are bound to it. When the virtual server receives a request, it assigns the connection to the first service in the list, and then moves that service to the bottom of the list.
- **Least Response Time**: When the GSLB virtual server is configured to use the least response time method, it selects the service with the lowest value. Where, lowest value = current active connections X average response time.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

You can configure this method for HTTP and Secure Sockets Layer (SSL) services only. The response time (also called Time to First Byte, or TTFB) is the time interval between sending a request packet to a service and receiving the first response packet from the service. The NetScaler® appliance uses response code 200 to calculate TTFB.

- **Least Connections**: When a GSLB virtual server is configured to use the least connection GSLB algorithm (or method), it selects the service with the fewest active connections. This is the default method, because, in most circumstances, it provides the best performance.
- **Least Bandwidth**: A GSLB virtual server configured to use the least bandwidth method selects the service that is currently serving the least amount of traffic, measured in megabits per second (Mbps).
- **Least Packets**: A GSLB virtual server configured to use the least packets method selects the service that has received the fewest packets in the last 14 seconds.
- **Source IP Hash**: A GSLB virtual server configured to use the source IP hash method uses the hashed value of the client IPv4 or IPv6 address to select a service. To direct all requests from source IP addresses that belong to a particular network to a specific destination server, you must mask the source IP address. For IPv4 addresses, use the netMask parameter. For IPv6 addresses, use the v6NetMaskLength parameter.
- **Custom Load**: Custom load balancing is performed on server parameters such as CPU usage, memory, and response time. When using the custom load method, the NetScaler appliance usually selects a service that is not handling any active transactions. If all of the services in the GSLB setup are handling active transactions, the appliance selects the service with the smallest load. A special type of monitor, known as a load monitor, calculates the load on each service in the network. The load monitors do not mark the state of a service, but they do take services out of the GSLB decision when those services are not UP.
- **Static Proximity**: GSLB uses an IP-address based static proximity database to determine the proximity between the client's local DNS server and the GSLB sites. The NetScaler appliance responds with the IP address of a site that best matches the proximity criteria.
- **Round Trip Time**: RTT is a measure of time or delay in the network between the client's local DNS server and a data resource. The NetScaler appliance probes the client's local DNS server and gathers RTT metric information. The appliance then uses this metric to make its load balancing decision. Global server load balancing monitors the real-time status of the network and dynamically directs the client request to the data center with the lowest RTT value.
- **API Method**: GSLB uses a REST API to determine the best performing GSLB service. In the API method, when GSLB receives a DNS request from a client, it evaluates the request against the specified rule.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

For more details, see Load Balancing.

Static proximity

The static proximity method for GSLB uses an IP-address based static proximity database to determine the proximity between the client's local DNS server and the GSLB sites. The NetScaler appliance responds with the IP address of a site that best matches the proximity criteria.

If two or more GSLB sites at different geographic locations serve the same content, the NetScaler appliance maintains a database of IP address ranges and uses the database for decisions about the GSLB sites to which to direct incoming client requests.

For the static proximity method to work, you must either configure the NetScaler appliance to use an existing static proximity database populated through a location file or add custom entries to the static proximity database. After adding custom entries, you can set their location qualifiers. After configuring the database, you are ready to specify static proximity as the GSLB method.

For details about configuring static proximity, see Configuring Static Proximity.

Dynamic round trip time method

Dynamic round trip time (RTT) is a measure of time or delay in the network between the client's local DNS server and a data resource. To measure dynamic RTT, the NetScaler appliance probes the client's local DNS server and gathers RTT metric information. The appliance then uses this metric to make its load balancing decision. Global server load balancing monitors the real-time status of the network and dynamically directs the client request to the data center with the lowest RTT value.

When a client's DNS request for a domain comes to the NetScaler appliance configured as the authoritative DNS for that domain, the appliance uses the RTT value to select the IP address of the best performing site to send it as a response to the DNS request.

The NetScaler appliance uses different mechanisms, such as ICMP echo request or reply (PING), UDP, and TCP to gather the RTT metrics for connections between the local DNS server and participating sites. The appliance first sends a ping probe to determine the RTT. If the ping probe fails, a DNS UDP probe is used. If that probe also fails, the appliance uses a DNS TCP probe.

These mechanisms are represented on the NetScaler appliance as Load Balancing Monitors and are easily identified due to their use of the "ldns" prefix. The three monitors, in their default order, are:

- `ldns-ping`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- `ldns-dns`
- `ldns-tcp`

These monitors are built into the appliance and are set to safe defaults. But they are customizable like any other monitor on the appliance.

You can change the default order by setting it explicitly as a GSLB parameter. For example, to set the order to be the DNS UDP query followed by the PING and then TCP, type the following command:

```
set gslb parameter -ldnsprobeOrder DNS PING TCP
```

Unless they have been customized, the NetScaler appliance performs UDP and TCP probing on port 53, however unlike regular load balancing monitors the probes need not be successful to provide valid RTT information. ICMP port unavailable messages, TCP Resets and DNS error responses, which would usually constitute a failure are all acceptable for calculating the RTT value.

Once the RTT data has been compiled, the appliance uses the proprietary metrics exchange protocol (MEP) to exchange RTT values between participating sites. After calculating RTT metrics, the appliance sorts the RTT values to identify the data center with the best (smallest) RTT metric."

If RTT information is not available (for example, when a client's local DNS server accesses the site for the first time), the NetScaler appliance selects a site by using the round robin method and directs the client to the site.

To configure the dynamic method, you configure the site's GSLB virtual server for dynamic RTT. You can also set the interval at which local DNS servers are probed to a value other than the default.

Configure a GSLB virtual server for dynamic RTT

To configure a GSLB virtual server for dynamic RTT, you specify the RTT load balancing method.

The NetScaler appliance regularly validates the timing information for a given local server. If a change in latency exceeds the configured tolerance factor, the appliance updates its database with the new timing information and sends the new value to other GSLB sites by performing a MEP exchange. The default tolerance factor is 5 milliseconds (ms).

The RTT tolerance factor must be the same throughout the GSLB domain. If you change it for a site, you must configure identical RTT tolerance factors on all NetScaler appliances deployed in the GSLB domain.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To configure a GSLB virtual server for dynamic RTT by using the command line interface

At the command prompt, type:

```
set gslb vserver <name> -lbMethod RTT -tolerance <value>
```

Example:

```
set gslb vserver Vserver-GSLB-1 -lbMethod RTT -tolerance 10
```

To configure a GSLB virtual server for dynamic RTT by using the configuration utility

Navigate to **Traffic Management** > **GSLB** > **Virtual Servers** and double-click the virtual server.

Set the probing interval of local DNS servers

The NetScaler appliance uses different mechanisms, such as ICMP echo request or reply (PING), TCP, and UDP to obtain RTT metrics for connections between the local DNS server and participating GSLB sites. By default, the appliance uses a ping monitor and probes the local DNS server every 5 seconds. The appliance then waits 2 seconds for the response. If a response is not received in that time, it uses the TCP DNS monitor for probing.

However, you can modify the time interval for probing the local DNS server to accommodate your configuration.

To modify the probing interval by using the command line interface

At the command prompt, type:

```
set lb monitor <monitorName> <type> -interval <integer> <units>
-resptimeout <integer> <units>
```

Example:

```
set lb monitor ldns-tcp LDNS-TCP -interval 10 sec -resptimeout 5 sec
```

To modify the probing interval by using the configuration utility

Navigate to **Traffic Management** > **Load Balancing** > **Monitors**, and double-click the monitor that you want to modify (for example, ping).

© 1997–2026 Citrix Systems, Inc. All rights reserved.

API method

You can use the API method to determine the best performing GSLB service. The API method for GSLB uses a REST API to determine the best performing GSLB service.

In the API method, when GSLB receives a DNS request from a client, it evaluates the request against the specified rule. If GSLB encounters the HTTP callout expression, SYS.HTTP_CALLOUT(`<name>`), it invokes a REST API request to an HTTP callout agent. GSLB uses the response from the HTTP callout agent to decide the best performing service. In the DNS response, GSLB returns the IP address of the best performing service, back to the client.

To configure a GSLB API method by using the CLI

Perform the following to configure the GSLB API method:

1. Configure an HTTP callout.

   For more information, see Configuring an HTTP callout.

   At the command prompt, type:

   ```
   add policy httpCallout <name> [-IPAddress <ip_addr|ipv6_addr>] [-port
   <port>] [-vServer <string>] [-returnType <returnType>] [-httpMethod
   (GET | POST)] [-hostExpr <string>] [-urlStemExpr <string>] [-headers
   <name(value)> ...] [-parameters <name(value)> ...] [-bodyExpr <string>]
   [-fullReqExpr <string>] [-scheme (http | https)] [-resultExpr <string>]
   [-cacheForSecs <secs>] [-comment <string>]
   ```

   Example:

   ```
   add policy httpCallout GSLB_Method_API -IPAddress 208.111.39.237 -port
   443 -returnType TEXT -hostExpr “\”hopx.gslb.com\”” -urlStemExpr “\”/
   zones/1/customers/92395/apps/6/decision\”” -headers
   Authorization(“Basic 19fbe6db-4332-4e3f-a8bc-ee47bdc726f8") -parameters
   ip(DNS.REQ.OPT.ECS.IP.TYPECAST_TEXT_T ALT
   CLIENT.IP.SRC.TYPECAST_TEXT_T) -scheme https -resultExpr
   “HTTP.RES.BODY(HTTP.RES.CONTENT_LENGTH).XPATH_JSON(xp%/providers/
   Val[1]/provider%)” -cacheForSecs 30
   ```

2. Specify the API method for load balancing. GSLB evaluates the DNS request against the specified rule.

   At the command prompt, type:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add gslb vserver <name> <serviceType>  [-lbMethod <lbMethod>] [-
backupLBMethod <backupLBMethod>] -rule <expression>
```

Example:

```
add gslb vserver vs1 HTTP -lbMethod API -backupLBMethod ROUNDROBIN
-rule “sys.http_callout(GSLB_Method_API)”
```

Configure static proximity

For the static proximity method to work, you must either configure the NetScaler appliance to use an existing static proximity database populated through a location file or add custom entries to the static proximity database. After adding custom entries, you can set their location qualifiers. After configuring the database, you are ready to specify static proximity as the GSLB method.

This document includes the following information:

- Adding a Location File to Create a Static Proximity Database
- Adding Custom Entries to a Static Proximity Database
- Setting the Location Qualifiers
- Specifying the Proximity Method
- Synchronizing GSLB Static Proximity Database

Add a location file to create a static proximity database

A static proximity database is a UNIX-based ASCII file. Entries added to this database from a location file are called static entries. Only one location file can be loaded on a NetScaler appliance. Adding a new location file overrides the existing file. The number of entries in the static proximity database is limited by the configured memory in the NetScaler appliance.

The static proximity database can be created in the default format or in a format derived from commercially configured third party databases (such as `www.maxmind.com` and `www.ip2location.com`).

The NetScaler appliance includes the following two IP geolocation database files. These are GeoLite2 files, published by MaxMind.

- Citrix®_Netscaler_InBuilt_GeoIP_DB_IPv4

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Citrix_Netscaler_InBuilt_GeoIP_DB_IPv6

These database files are available in a format supported by the NetScaler appliance in the directory /var/netscaler/inbuilt_db.

You can use these IP geolocation databases as the location file for the static proximity based GSLB method, or in location based policies.

These databases vary in the details that they provide. There is no strict enforcement of the database file format, except that the default file has format tags. The database files are ASCII files that use a comma as the field delimiter. There are differences in the structure of fields and the representation of IP addresses in the locations.

The format parameter describes the structure of the file to the NetScaler appliance. Specifying an incorrect value for the format option can corrupt the internal data.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTES:

- After an upgrade, if the /var/netscaler/inbuilt_db/ directory contains the database file (Citrix_Netscaler_InBuilt_GeoIP_DB.csv) from the earlier NetScaler software versions, the file is retained.
- The default location of the database file is /var/netscaler/locdb, and on a high availability (HA) setup, an identical copy of the file must be present in the same location on both NetScaler appliances.
- If the location file is stored in a location other than the default location, then specify the path of location database file including the directory name. For example, `var/netscaler/inbuilt_db/Citrix_Netscaler_InBuilt_GeoIP_DB_IPv6`.
- For admin partitions, the default path is: `/var/partitions/<partitionName>/netscaler/locdb`.
- Some databases provide short country names according to ISO-3166 and long country names as well. The NetScaler uses short names when storing and matching qualifiers.
- To create a static proximity database, log on to the UNIX shell of the NetScaler appliance and use an editor to create a file with the location details in one of the NetScaler supported formats.
- NetScaler appliance is shipped with the GeoLite2 database (IPv4 and IPv6) but NetScaler does not maintain or update the MaxMind GeoLite2 database regularly. If necessary, you can get the GeoLite2 database from `<https://www.maxmind.com>` and convert it to NetScaler database format. For more information, see Script to convert MaxMind GeoLite2 database format to NetScaler database format.

To add a static location file by using the CLI

At the command prompt, type:

```
add locationFile <locationFile> [-format <format>]

-  show locationFile
```

Example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add locationFile /var/netscaler/locdb/nsgeo1.0 -format netscaler

Done

show locationFile

Location File: /var/netscaler/locdb/nsgeo1.0

Format: netscaler

 Done

>
```

Example:

```
add locationFile /var/netscaler/inbuilt_db/
Citrix_Netscaler_InBuilt_GeoIP_DB_IPv4 -format netscaler

add locationFile6 /var/netscaler/inbuilt_db/
Citrix_Netscaler_InBuilt_GeoIP_DB_IPv6 -format netscaler
```

To add a static location file by using the GUI:

1. Navigate to **AppExpert** > **Location**, click the **Static Database** tab.
2. Click **Add** to add a static location file.

You can view an imported location file database by using the **View Database** dialog box in the configuration utility. There is no CLI equivalent.

To view a static location file by using the GUI:

1. Navigate to **AppExpert** > **Location**, click the **Static Database** tab.
2. Select a static location file, and from the **Action** list, click **View Database**.

To convert a location file into the NetScaler format:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

By default, when you add a location file, it is saved in the NetScaler format. You can convert a location file of other formats into the NetScaler format.

NOTE:

The `nsmap` option can be accessed only from the command line interface. The conversion is possible only into the NetScaler format.

To convert the static database format, at the CLI prompt, type the following command:

```
nsmap -f <inputFileFormat> -o <outputFileName> <inputFileName>
```

Example:

```
nsmap -f ip-country-region-city -o nsfile.ns ip-country-region-city.csv
```

Script to convert MaxMind GeoLite2 database format to NetScaler database format

MaxMind GeoIP database cannot be used directly in NetScaler. The MaxMind GeoIP database must be converted into NetScaler format and then loaded for IP location detection in the GSLB static proximity method and other features like policies. You can use a script to convert the GeoLite2 database format to NetScaler database format. This script can be used to convert both IPv4 and IPv6 files. The script is available in the location: `<https://github.com/citrix/MaxMind-GeoIP-Database-Conversion-Citrix-ADC-Format>`

Steps to convert GeoIP2 database to NetScaler format

1. Download the GeoLite2 City or GeoLite2 Country database in .csv format from `<https://dev.maxmind.com/geoip/geoip2/geolite2/>`.
2. Copy the file in a NetScaler directory (say /var). Unzip the file using the following shell command, which would create a directory with the same name.

   `tar -xf <filename>`
3. Download the script Convert_GeoIPDB_To_Netscaler_Format.pl from `<https://github.com/citrix/MaxMind-GeoIP-Database-Conversion-Citrix-ADC-Format>` and copy it to the directory created in step #2.
4. To check the acceptable options for the script execution, run the following command:

   `perl Convert_GeoIPDB_To_Netscaler_Format.pl –help`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Various options available are:

- `<filename>` IPv4 output file. Default output file name: Netscaler_Maxmind_GeoIP_DB_IPv4.csv
- `-p <filename>` IPv6 output file. Default output file name: Netscaler_Maxmind_GeoIP_DB_IPv6.csv
- `-logfile <filename>` File containing list of events/messages
- `-debug` Prints all the messages to STDOUT

5. Run the following command to convert the GeoLite2 database format to NetScaler database format.

   `perl Convert_GeoIPDB_To_Netscaler_Format.pl`

   NOTE:

   The operation can take up to 5 minutes.

   The default file names used in the script are that of the MaxMind GeoLite2 City based database. If you have downloaded the GeoLite2 Country database, you must provide the input file names accordingly as listed.

   - `-b <filename>` name of IPv4 block file to be converted. Default file name: GeoLite2-City-Blocks-IPv4.csv
   - `-i <filename>` name of IPv6 block file to be converted. Default file name: GeoLite2-City-Blocks-IPv6.csv
   - `-l <filename>` name of location file to be converted. Default file name: GeoLite2-City-Locations-en.csv

   Example:

   ```
   perl Convert_GeoIPDB_To_Netscaler_Format.pl -b GeoLite2-City-Blocks-IPv4.csv -i GeoLite2-City-Blocks-IPv6.csv -l  GeoLite2-City-Locations-en.csv
   ```

   The following are the output files generated after running the script.

   - Netscaler_Maxmind_GeoIP_DB_IPv4.csv
   - Netscaler_Maxmind_GeoIP_DB_IPv6.csv

© 1997–2026 Citrix Systems, Inc. All rights reserved.

6. Once the conversion of the database into NetScaler format is complete, use the following command to start using it.

   ```
   add locationFile <locationFile>
   ```

Add a third-party static database file on a NetScaler appliance

Perform the following steps to add a third-party static database file on a NetScaler appliance.

1. Obtain the location database file from a third-party vendor, such as `www.maxmind.com`.

   NOTE:

   If you download the location database file from `www.maxmind.com`, you can use the readily available script to convert it into NetScaler database format. For information on using the script, see Script to convert MaxMind GeoLite2 database format to NetScaler database format.

   For location databases downloaded from other third-party vendors, you must convert them to NetScaler database format before adding them to a NetScaler appliance.

2. Run the following command to add a static location file:

   ```
   add location file <locationfile Name>
   ```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE:

- If the location database file is not placed in the default **/var/netscaler/locdb** location, then the `<locationfile Name>` must contain the location of the file along with the file name.
- Before you run the `add location file <locationfile Name>` command:
  - Make sure that the location database file is present in one of the directories of the NetScaler appliance.
  - Run the `sync HA files` command on the high availability setup and the `sync cluster files` command in a cluster setup. These commands ensure that the location database file is copied to the secondary appliance of the high availability pair and peer nodes of the cluster.

3. Run the following command to ensure that the location database is loaded:

```
show locationParameter
```

   This command displays location parameters related to static proximity-based load balancing. A maximum of 10M entries can be loaded. When the database loading is in progress, the command displays `Loading: In progress`. After the loading is completed, the command displays `Loading: Idle`.

4. Run the following command to view the location of the GSLB site:

```
show gslb service
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTES

- If the database is loaded correctly, the location of the GSLB sites is automatically populated in the database.
- You can specify only one location file in the configuration on the appliance.
- If no match is found for an incoming IP address, the request is processed using the method that is configured as the backup method.
- If the two services are from the same location, the request is processed using the round robin method.

5. Run the following command to configure the GSLB method on the appliance:

```
set gslb vserver GSLBVserverName -lbMethod MethodType
```

6. Run the following command to get location of the IP address:

```
nsmap -d -t <IP address>
```

Add custom entries to a static proximity database

Custom entries take precedence over static entries in the proximity database. You can add a maximum of 3000 custom entries. For a custom entry, denote all omitted qualifiers with an asterisk (*) and, if qualifiers have a period or space in the name, enclose the parameter in double quotation marks. The first 31 characters are evaluated for each qualifier. You can also provide the longitude and latitude of the geographical location of the IP address-range for selecting a service with the static proximity GSLB method.

To add custom entries by using the command line interface

At the command prompt, type the following commands to add a custom entry to the static proximity database and verify the configuration.

```
add location < IPfrom> < IPto> <preferredLocation> [-longitude <integer>[-
latitude <integer>]]

show location
```

Example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
> add location 192.168.100.1 192.168.100.100 *.us.ca.mycity

Done
```

```
> show location

1) IP from 192.168.100.1    IP to 192.168.100.100

Continent.Country.REgion.City.ISP.Organization =

North America.us.ca.mycity.*.

Coordinated: Not specified

Done
```

Parameters for adding custom entries

- **From IP Address**: First IP address in the range that is in dotted decimal notation.

  This is a mandatory argument.

- **To IP Address**: Last IP address in the range that is in dotted decimal notation.

  This is a mandatory argument.

- **Location Name**: String of qualifiers that is in dotted notation describes the geographical location of the IP address range. Each qualifier is more specific than the one that precedes it, as in continent.country.region.city.isp.organization. For example,"NA.US.CA.San Jose.ATT.citrix".

  This is a mandatory argument. Maximum Length: 197

  NOTE:

  A qualifier that includes a dot (.) or space ( ) must be enclosed in double quotation marks.

- **longitude**: Numerical value that is in degrees specifies the longitude of the geographical location of the IP address-range. Maximum value: 180
- **latitude**: Numerical value that is in degrees specifies the latitude of the geographical location of the IP address-range. Maximum value: 180

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE:

Longitude and latitude parameters are used for selecting a service with the static proximity GSLB method. If they are not specified, selection is based on the qualifiers specified for the location.

To add custom entries by using the configuration utility

Navigate to **AppExpert** > **Location**, click the **Custom Entries** tab, and add the custom entries.

Set location qualifiers

The database used to implement static proximity has the location of the GSLB sites. Each location has an IP address range and up to six qualifiers for that range. The qualifiers are literal strings and are compared in a prescribed order at run time. Every location must have at least one qualifier. The qualifier labels define the meaning of the qualifiers (context), which are user defined. NetScaler has two built-in contexts:

Geographic context, which has the following qualifier labels:

- Qualifier 1 – “Continent”
- Qualifier 2 – “Country”
- Qualifier 3 – “State”
- Qualifier 4 – “City”
- Qualifier 5 – “ISP”
- Qualifier 6 – “Organization”

Custom entries, which have the following qualifier labels:

- Qualifier 1 – “Qualifier 1”
- Qualifier 2 – “Qualifier 2”
- Qualifier 3 – “Qualifier 3”
- Qualifier 4 – “Qualifier 4”
- Qualifier 5 – “Qualifier 5”
- Qualifier 6 – “Qualifier 6”

If the geographic context is set with no Continent qualifier, Continent is derived from Country. Even the built-in qualifier labels are based on the context, and the labels can be changed. These

© 1997–2026 Citrix Systems, Inc. All rights reserved.

qualifier labels specify the locations mapped with the IP addresses used to make static proximity decisions.

To perform a static proximity-based decision, the NetScaler appliance compares the location attributes (qualifiers) derived from the IP address of the local DNS server resolver with the location attributes of the participating sites. If only one site matches, the appliance returns the IP address of that site. If there are multiple matches, the site selected is the result of a round robin on the matching GSLB sites. If there is no match, the site selected is a result of a round robin on all configured sites. A site that does not have any qualifiers is considered a match.

The GEO rules for location-based policy expression allow you to check wildcard matches. This feature checks whether wildcard qualifiers match any other qualifier including non-wildcard or not. The wildcard match is done by using the `matchWildcardtoany` attribute that is added to the `set locationParameter` command.

The `matchWildcardtoany` attribute can be set to the following values:

- **Yes:** Wildcard qualifiers match any other qualifiers.
- **No:** Wildcard qualifiers do not match non-wildcard qualifiers but match other wildcard qualifiers. The default option is **No**.
- **Expression:** Wildcard qualifiers in an expression match any qualifier in an LDNS location but wildcard qualifiers in the LDNS location do not match non-wildcard qualifiers in an expression.

Example:

```
add dns policy1 "CLIENT.IP.SRC.MATCHES_LOCATION(\"Continent.country
*.*.*.* \“)” <action>
```

To set the location parameters by using the CLI

At the command prompt, type:

```
set locationparameter -context <context> -q1label <string> [-q2label
<string>] [-q3label <string>] [-q4label <string>] [-q5label <string>] [-
q6label <string>] -matchWildcardtoany [Yes | No | Expression]
```

Example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
set locationparameter -context custom -q1label asia -matchWildcardtoany
Yes
```

To set the location parameters by using the GUI

1. Navigate to **Traffic Management > GSLB > Database and Entries**.
2. Under **Settings**, click **Change Location Parameters**.
3. In the **Configure Location Parameters** page, set the location parameters.

Configuration example (using CLI)

Consider the following network setup:

- GSLB virtual server name: gv1
- GSLB virtual server IP address: 1.1.1.2
- GSLB Service: gsvc1 bound to gv1
- Location DB file name: sample.csv
- Geolocation qualifiers: Qualifiers 1 and 2 are configured. Rest is set to match the wildcard.
    - Qualifier 1–Asia
    - Qualifier 2–IR
    - Qualifier 3-*
    - Qualifier 4-*
    - Qualifier 5-*
    - Qualifier 6-*
- DNS Policy-The policy, pol1, is set to drop the packets in if there is a match.

Set the location parameter and configure the DNS policy as follows:

```
set locationParameter -q2label Country_Code -q3label Subdivision_1_Name
-q4label Subdivision_2_Name -q5label City

add locationFile "/var/netscaler/inbuilt_db/sample.csv"
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add gslb vserver gv1 HTTP -backupLBMethod ROUNDROBIN -tolerance 0

add dns policy pol1 "CLIENT.IP.SRC.MATCHES_LOCATION(\"Asia.IR.*.*.*.*\")||
CLIENT.IP.SRC.MATCHES_LOCATION(\"Asia.SY.*.*.*.*\")||
CLIENT.IP.SRC.MATCHES_LOCATION(\"Asia.SD.*.*.*.*\")||
CLIENT.IP.SRC.MATCHES_LOCATION(\"Asia.KP.*.*.*.*\")||
CLIENT.IP.SRC.MATCHES_LOCATION(\"North America.CU.*.*.*.*\")||
CLIENT.IP.SRC.MATCHES_LOCATION(\"Europe.UA.Crimea.*.*.*.*\")"
dns_default_act_Drop

bind dns global pol1 1 -gotoPriorityExpression 65535 -type REQ_DEFAULT

add gslb service gsvc1 1.1.1.2 HTTP 80 -publicIP 1.1.1.2 -publicPort 80
-maxClient 0 -healthMonitor NO -siteName s1 -cltTimeout 180 -svrTimeout
360 -downStateFlush ENABLED

bind gslb vserver gv1 -serviceName gsvc1

bind gslb vserver gv1 -domainName www.gslbnew.com -TTL 5
```

Add the following client entries in the location DB file. In this example, the location DB file name is sample.csv:

```
10.106.24.170,10.106.24.190,,,,,,,8.0000,47.0000

10.102.82.170,10.102.82.190,Asia,,,,,,-73.9924,40.7553
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
10.106.24.140,10.106.24.150,,IR,,,,,51.4231,35.6961
```

According to the preceding configuration, the clients between 10.106.24.170 and 10.106.24.190 do not have any wildcard qualifiers defined. The clients between 10.106.24.140 and 10.106.24.150, have qualifier 2 as IR.

Set the match wildcard qualifier to NO:

```
set locationparameter -matchWildcardtoany no
```

When the match wildcard qualifier is set to NO, the wildcard qualifiers match only the defined wildcard qualifiers. It does not match any other non-wildcard qualifier.

- The DNS queries coming 10.106.24.147 match the defined wildcard qualifier (qualifier 2 = IR). Therefore, the DNS policy comes into effect and drops the queries.

  When you run the `dig @10.102.82.13 www.gslbnew.com` command on the 10.106.24.147 client, the output shows that servers were not reachable.

  ```
  root@ns#  dig @10.102.82.13 www.gslbnew.com

  ; <<>> DiG 9.11.23 <<>> @10.102.82.13 www.gslbnew.com

  ; (1 server found)

  ;; global options: +cmd

  ;; connection timed out; no servers could be reached
  ```

- The DNS queries coming from 10.106.24.180, do not match the defined qualifiers. The DNS policy does not come into effect and the queries are processed.

  Run the `dig @10.102.82.13 www.gslbnew.com` command on the 10.106.24.180 client. The output shows the GSLB virtual server's IP address.

  ```
  root@ns# dig @10.102.82.13 www.gslbnew.com
  ```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
; <<>> DiG 9.11.23 <<>> @10.102.82.13 www.gslbnew.com

```

Set the match wildcard qualifier to Yes:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
set locationparameter -matchWildcardtoany yes
```

When the match wildcard qualifier is set to yes, the wildcard qualifiers match any wildcard qualifier (defined and non-wildcard qualifier).

- The DNS queries coming 10.106.24.147 match the defined qualifier (qualifier 2 = IR). Therefore, the DNS policy comes into effect and drops the queries.

  Run the `dig @10.102.82.13 www.gslbnew.com` command on the 10.106.24.147 client. The output shows that servers were not reachable.

  ```
  root@ns#  dig @10.102.82.13 www.gslbnew.com

  ; <<>> DiG 9.11.23 <<>> @10.102.82.13 www.gslbnew.com

  ; (1 server found)

  ;; global options: +cmd

  ;; connection timed out; no servers could be reached
  ```

- The queries coming from 10.106.24.180, match the non-wildcard qualifiers. Therefore the DNS policy comes into effect and drops the queries.

  Run the `dig @10.102.82.13 www.gslbnew.com` command on the 10.106.24.180 client. The output shows that servers were not reachable.

  ```
  root@ns# dig @10.102.82.13 www.gslbnew.com

  ; <<>> DiG 9.11.23 <<>> @10.102.82.13 www.gslbnew.com

  ; (1 server found)

  ;; global options: +cmd

  ;; connection timed out; no servers could be reached
  ```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Set the match wildcard qualifier to Expression:

```
set locationparameter -matchWildcardtoany expression
```

When the match wildcard qualifier is set to expression, the wildcard qualifiers match either the qualifier available in the DNS policy or the qualifiers available in the location DB file.

- The DNS queries coming 10.106.24.147 match the defined wildcard qualifiers in the DNS policy. Therefore, the DNS policy comes into effect and drops the queries.

  Run the `dig @10.102.82.13 www.gslbnew.com` command on the 10.106.24.147 client. The output shows that servers were not reachable.

  ```
  root@ns#  dig @10.102.82.13 www.gslbnew.com

  ; <<>> DiG 9.11.23 <<>> @10.102.82.13 www.gslbnew.com

  ; (1 server found)

  ;; global options: +cmd

  ;; connection timed out; no servers could be reached
  ```

- The queries coming from 10.106.24.180 do not match the qualifiers in the DNS policy. Therefore, the DNS policy does not come into effect and the queries are processed.

  Run the `dig @10.102.82.13 www.gslbnew.com` command on the 10.106.24.180 client. The output shows the GSLB virtual server's IP address.

  ```
  root@ns# dig @10.102.82.13 www.gslbnew.com

  ; <<>> DiG 9.11.23 <<>> @10.102.82.13 www.gslbnew.com

  ; (1 server found)

  ;; global options: +cmd
  ```

Specify proximity method

When you have configured the static proximity database, you are ready to specify static proximity as the GLSB method.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To specify static proximity by using the command line interface

At the command prompt, type the following commands to configure static proximity and verify the configuration:

```
set gslb vserver <name> -lbMethod STATICPROXIMITY

show gslb vserver <name>
```

Example:

```
set gslb vserver Vserver-GSLB-1 -lbMethod STATICPROXIMITY

show gslb vserver
```

To specify static proximity by using the configuration utility

1. Navigate to Traffic Management > GSLB > Virtual Servers and double-click the virtual server.
2. Click the **Method** section and from the **Choose Method** drop-down list, select **STATICPROXIMITY**.

Synchronize GSLB static proximity database

Synchronizing a global server load balancing (GSLB) static proximity database requires that one of the sites be identified as the parent GSLB node. Any site in the topology can be designated as the parent node. The rest of the GSLB nodes are automatically designated as child nodes.

Synchronizing GSLB static proximity databases synchronizes the files in the /var/netscaler/locdb directory across the child nodes. During the synchronization process, the parent node fetches the running configuration from each of the child nodes and compares it to the configuration on the parent node. The parent GSLB node uses the rsync program to synchronize the static proximity database across the child nodes. To speed up the synchronization process, the rsync program makes only enough changes to eliminate the differences between the two files. The synchronization process cannot be rolled back.

The following example synchronizes Site2, which is a child site, to parent site Site1. The administrator enters the **sync gslb config** command on Site1:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
sync gslb config -nowarn

Sync Time: Feb 24 2014 14:56:16

Retrieving local site info: ok

Retrieving all participating gslb sites info:

0 bytes in 0 blocks

ok

site1[Master]:

        Getting Config: ok

site2[Slave]:

        Syncing gslb static proximity database: ok

        Getting Config: ok

        Comparing config: ok

        Applying changes: ok

 Done
```

Configure site-to-site communication

GSLB site-to-site communication is between the remote procedure call (RPC) nodes that are associated with the communicating sites. A parent GSLB site establishes connections with child sites to synchronize GSLB configuration information and to exchange site metrics.

An RPC node is created automatically when a GSLB site is created, and is assigned an internally generated user name and password. The NetScaler appliance uses this user name and password to authenticate itself to remote GSLB sites during connection establishment. No configuration steps are necessary for an RPC node, but you can specify a password of your choice, enhance security by encrypting the information that GSLB sites exchange, and specify a source IP address for the RPC node.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The appliance needs a NetScaler owned IP address to use as the source IP address when communicating with other GSLB sites. By default, the RPC nodes use either a subnet IP (SNIP) address, but you might want to specify an IP address of your choice.

The following topics describe the behavior and configuration of RPC nodes on the NetScaler appliance:

Changing the password of an RPC node

Citrix® recommends you to secure the communication between sites in your GSLB setup by changing the password of each RPC node. After you change the password for the RPC node of the local site, you must manually propagate the change to the RPC node at each of the remote sites.

The password is stored in encrypted form. You can verify that the password has changed by using the show rpcNode command to compare the encrypted form of the password before and after the change.

NOTE:

GSLB uses internal user account. For enhanced security, Citrix recommends that you change the internal user account password as well. Internal user account password is changed through RPC node password.

To change the password of an RPC node by using the command line interface

At the command line, type the following commands to change the password of an RPC node:

```
set ns rpcNode <IPAddress> {-password}

show ns rpcNode
```

Example:

```
> set rpcNode 192.0.2.4 -password mypassword

 Done

> show rpcNode

.

.
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
.

2)  IPAddress:  192.0.2.4 Password:  d336004164d4352ce39e

    SrcIP:  *               Secure:  OFF

Done

>
```

To unset the password of an RPC node by using the command line interface

To unset the password of an RPC node by using the CLI, type the unset rpcNode command, the IP address of the RPC node, and the password parameter, without a value.

To change the password of an RPC node by using the configuration utility

Navigate to System > Network > RPC, select the RPC node, and change the password.

Encrypt the exchange of site metrics

You can secure the information that is exchanged between GSLB sites by setting the secure option for the RPC nodes in the GSLB setup. With the secure option set, the NetScaler appliance encrypts all communication sent from the node to other RPC nodes.

To encrypt the exchange of site metrics by using the command line interface

At the command prompt, type the following commands to encrypt the exchange of site metrics and verify the configuration:

```
set ns rpcNode <IPAddress> [-secure ( YES | NO )]

show rpcNode
```

Example:

```
> set rpcNode 192.0.2.4 -secure YES

 Done

>
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
> show rpcNode

.

.

.

3)  IPAddress:  192.0.2.4 Password:  d336004164d4352ce39e SrcIP:
 192.0.2.3     Secure:  ON

 Done

>
```

To unset the secure parameter by using the command line interface

To unset the secure parameter by using the CLI, type the unset rpcNode command, the IP address of the RPC node, and the secure parameter, without a value.

To encrypt the exchange of site metrics by using the NetScaler configuration utility

1. Navigate to System > Network > RPC and double-click a RPC node.
2. Select the **Secure** option, and click **OK**.

Configure source IP address for an RPC node

By default, the NetScaler appliance uses a NetScaler owned subnet IP (SNIP) address as the source IP address for an RPC node, but you can configure the appliance to use a specific SNIP address. If a SNIP address is not available, the GSLB site cannot communicate with other sites. In such a scenario, you must configure either the NSIP address or a virtual IP (VIP) address as the source IP address for an RPC node. A VIP address can be used as the source IP address of an RPC node only if the RPC node is a remote node. If you configure a VIP address as the source IP address and remove the VIP address, the appliance uses a SNIP address.

NOTE

From NetScaler 11.0.64.x release onwards, you can configure the appliance to use GSLB Site IP address as the source IP address for an RPC node.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To specify a source IP address for an RPC node by using the command line interface

At the command prompt, type the following commands to change the source IP address for an RPC node and verify the configuration:

```
set ns rpcNode <IPAddress> [-srcIP <ip_addr|ipv6_addr|*>]

show ns rpcNode
```

Example:

```
set rpcNode 192.0.2.4 -srcIP 192.0.2.3

Done

show rpcNode
```

```
IPAddress: 192.0.2.4 Password: d336004164d4352ce39e SrcIP: 192.0.2.3
Secure: OFF

Done
```

To unset the source IP address parameter by using the command line interface

To unset the source IP address parameter by using the CLI, type the unset rpcNodecommand, the IP address of the RPC node, and the srcIP parameter, without a value.

To specify a source IP address for an RPC node by using the NetScaler configuration utility

1. Navigate to System > Network > RPC and double-click a RPC node.
2. In the Source IP Address field, enter the IP address that you want the RPC node to use as the source IP address and click OK.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

IMPORTANT

The source IP address cannot be synchronized across the sites participating in GSLB because the source IP address for a RPC node is specific to each NetScaler appliance. Therefore, after you force a synchronization (using the sync gslb config –forceSync command or by selecting the ForceSync option in the GUI), you have to manually change the source IP addresses on the other NetScaler appliances.

Configure metrics exchange protocol

The data centers in a GSLB setup exchange metric with each other through the metrics exchange protocol (MEP), which is a proprietary protocol for NetScaler appliance. The exchange of the metric information begins when you create a GSLB site. These metrics comprise load, network, and persistence information.

MEP is required for health checking of data centers to ensure their availability. A connection for exchanging network metric (round-trip time) can be initiated by either of the data centers involved in the exchange, but a connection for exchanging site metrics is always initiated by the data center with the lower IP address. By default, the data center uses a subnet IP address (SNIP) to establish a connection to the IP address of a different data center. However, you can configure a specific SNIP, virtual IP (VIP) address, or the NSIP address, as the source IP address for metrics exchange. The communication process between GSLB sites uses TCP port 3011 or 3009, so this port must be open on firewalls that are between the NetScaler appliances.

Note: You can configure a SNIP or a GSLB site IP address as the source IP address for metrics exchange. For more information, see Configure source IP address for an RPC node.

If the source and target sites (the site that initiates a MEP connection and the site that receives the connection request, respectively) have both private and public IP addresses configured, the sites exchange MEP information by using the public IP addresses.

You can also bind monitors to check the health of remote services as described in "Monitoring GSLB Services." When monitors are bound, metric exchange does not control the state of the remote service. If a monitor is bound to a remote service and metric exchange is enabled, the monitor controls the health status. Binding the monitors to the remote service enables the NetScaler appliance to interact with a non-NetScaler load balancing device. The NetScaler appliance can monitor non-NetScaler devices but cannot perform load balancing on them unless

© 1997–2026 Citrix Systems, Inc. All rights reserved.

monitors are bound to all GSLB services and only static load balancing methods (such as the round robin, static proximity, or hash-based methods) are used.

With NetScaler release 11.1.51.x or later, to avoid unnecessary disruption of services, you can set a time delay for marking GSLB services as DOWN when a MEP connection goes DOWN.

MEP state in a high availability setup

In a high availability setup, the primary node establishes connections with the remote sites and the MEP state is not synchronized from the primary node to secondary nodes. Therefore, the MEP state in secondary node remains DOWN. When the secondary node becomes primary, it establishes MEP connections with the new GSLB site and updates the MEP state accordingly.

Enable site metrics exchange

Site metrics exchanged between the GSLB sites include the status of each load balancing, or content switching virtual server, the current number of connections, the current packet rate, and current bandwidth usage information.

The NetScaler appliance needs this information to perform load balancing between the sites. The site metric exchange interval is 1 second. A remote GSLB service must be bound to a local GSLB virtual server to enable the exchange of site metrics with the remote service.

To enable or disable site metrics exchange by using the command line interface

At a command prompt, type the following commands to enable or disable site metric exchange and verify the configuration:

```
set gslb site <siteName> -metricExchange (ENABLED|DISABLED)

show gslb site** <siteName>
```

Example:

```
set gslb site Site-GSLB-East-Coast -metricExchange ENABLED

set gslb site Site-GSLB-East-Coast -metricExchange DISABLED

show gslb site Site-GSLB-East-Coast
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To enable or disable site metric exchange by using the GUI

1. Navigate to **Traffic Management** > **GSLB** > **Sites**, and select the site.
2. In the **Configure GSLB Site** dialog box, select the **Metric Exchange** option.

Enable network metric exchange

If your GSLB sites use the round-trip time (RTT) load balancing method, you can enable or disable the exchange of RTT information about the client's local DNS service. This information is exchanged every 5 seconds.

For details about changing the GSLB method to a method based on RTT, see GSLB Methods.

To enable or disable network metric information exchange by using the command line interface

At the command prompt, type the following commands to enable or disable network metric information exchange and verify the configuration:

```
set gslb site <siteName> -nwmetricExchange (ENABLED|DISABLED)

show gslb site <<siteName>
```

Example:

```
set gslb site Site-GSLB-East-Coast -nwmetricExchange ENABLED

set gslb site Site-GSLB-East-Coast -nwmetricExchange DISABLED

show gslb site Site-GSLB-East-Coast
```

To enable or disable network metric information exchange by using the GUI

1. Navigate to **Traffic Management** > **GSLB** > **Sites**.
2. In the **Configure GSLB Site** dialog box, select the **Network Metric Exchange** option.

Configuring a time delay for the GSLB services to be marked as DOWN when a MEP connection goes DOWN

If the status of a MEP connection to a remote site changes to DOWN, the status of every GSLB service on that remote site is marked as DOWN, although the site might not actually be DOWN.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

You can now set a delay to allow some time for reestablishment of the MEP connection before the site is marked as DOWN. If the MEP connection is back UP before the delay expires, the services are not affected.

For example, if you set the delay 10, the GSLB services are marked as DOWN until the MEP connection has been DOWN for 10 seconds. If the MEP connection is back UP within 10 seconds, the GSLB services remain in the UP state.

Note: This delay is applicable only to services not bound to a monitor. The delay does not affect the trigger monitors.

To set a time delay by using the command line interface

At the command prompt, type the following command:

```
set gslb parameter** - GSLBSvcStateDelayTime <sec>
```

Example:

set gslb parameter - GSLBSvcStateDelayTime 10

NOTE

In a hierarchical deployment (parent-child topology), if you configure the GSLB service on both the parent and child sites, set the GSLB parameter on both the parent and child sites. If you do not configure the GSLB service on the child site, set the GSLB parameter only on the parent site.

To set a time delay by using the GUI

1. Navigate to **Configuration** > **Traffic Management** > **GSLB** > **Change GSLB Settings**.
2. In the **GSLB Service State Delay Time (secs)** box, type the time delay in seconds.

Configure a learning time for GSLB services when MEP connection status comes up to avoid flaps on GSLB services

When a node reboots or during HA failover, the system is initialized. Then, the node must learn current information about the configured local and child services to communicate the service state to remote nodes through MEP. The node takes some time to learn the correct information. Meanwhile, if a peer node connects to this node and requests for an update, the node might send an incorrect service state and statistics. This incorrect information might cause service flap and

© 1997–2026 Citrix Systems, Inc. All rights reserved.

other functionality related issues on the remote peer nodes. To avoid this scenario, you can now set a learning time for the local and child GSLB service.

When a learning timeout is configured, the GSLB site gets some buffer time (learning timeout) to learn the correct statistics about its local and child services. When a service is in a learning phase, the remote GSLB site gets this information in MEP update, and does not honor the primary site state and statistics received through MEP for that service.

GSLB services enter the learning phase in any of the following scenarios.

- NetScaler appliance is rebooted
- High availability failover has occurred
- Owner node in a cluster GSLB setup is changed
- MEP is enabled on a local node
- GSLB site comes out of island scenario. A GSLB Site becomes island when it is not connected to any other site.

In a parent-child deployment, the backup parent (if configured) selectively moves the adopted child site's GSLB services to the learning phase when the primary parent goes DOWN.

To set a service state learning time by using the CLI

At the command prompt, type the following command:

```
set gslb parameter – SvcStateLearningTime <sec>
```

You can set "SvcStateLearningTime" in seconds. Default value is 0 and maximum value is 3600. This parameter is applicable only if monitors are not bound to GSLB services.

Example:

```
set gslb parameter – SvcStateLearningTime 10
```

To set a service state learning time by using the GUI

1. Navigate to **Configuration > Traffic Management > GSLB > Dashboard > Change GSLB Settings**.

   The **Set GSLB Parameters** page appears.
2. In the **GSLB Service State Learning Time (secs)** field, type the learning time in seconds.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Enable persistence information exchange

You can configure NetScaler appliance to provide persistent connections, so that a client transmission to any virtual server in a group can be directed to a server that has received previous transmissions from the same client.

You can enable or disable the exchange of persistence information at each site. This information is exchanged once every 5 seconds between NetScaler appliances participating in GSLB.

For details about configuring persistence, see Configuring Persistent Connections.

To enable or disable persistence information exchange by using the command line interface

At the command prompt, type the following commands to enable or disable persistence-information exchange and verify the configuration:

```
set gslb site <siteName> -sessionExchange (ENABLED|DISABLED)

show gslb site** <siteName>
```

Example:

```
set gslb site Site-GSLB-East-Coast -sessionExchange  ENABLED

set gslb site Site-GSLB-East-Coast -sessionExchange  DISABLED

show gslb site Site-GSLB-East-Coast
```

To enable or disable persistence information exchange by using the GUI

1. Navigate to **Traffic Management** > **GSLB** > **Sites**, and double-click the site.
2. In the **Configure GSLB Site** dialog box, select, or clear the **Persistence Session Entry Exchange** check box.

Configure GSLB by using a wizard

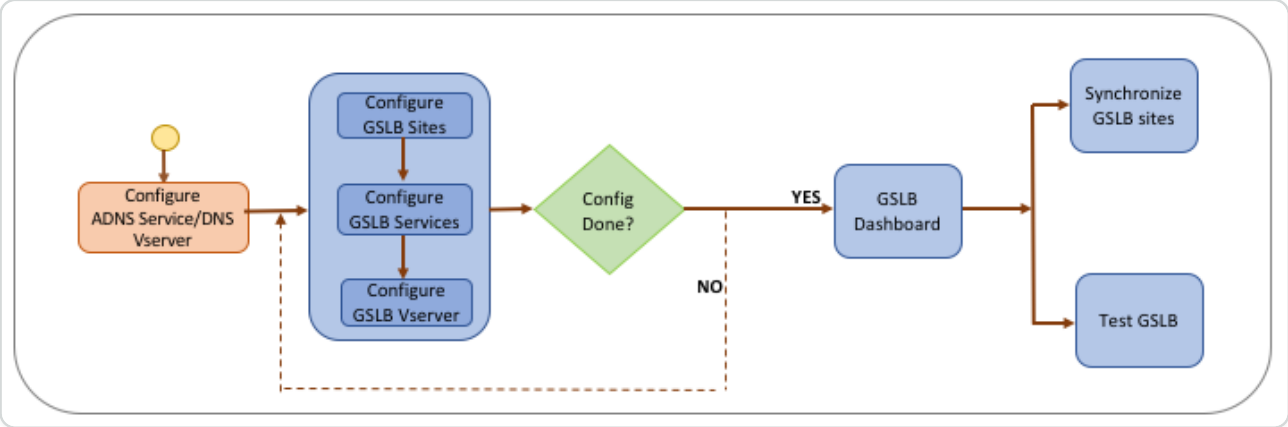
You can now use a wizard to configure the GSLB deployment types: active-active, active-passive, and parent-child.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

This wizard is available in the GUI. To access the wizard, navigate to **Configuration** > **Traffic Management** > **GSLB** and click **Get Started**.

You can also access this wizard from the GSLB dashboard. Navigate to **Configuration** > **Traffic Management** > **GSLB** > **Dashboard** and click **Configure GSLB**.

Note: You can also configure the GSLB entities individually.



- Active-Active Site Configuration
- Active-Passive Site Configuraiton
- Parent-Child Topology Configuration

IMPORTANT

This feature is supported in High Availability deployment and not in Admin Partition and Cluster deployments.

Configure active-active site

The following figure shows the workflow involved in a GSLB active-active site configuration.

Before you begin configuring an active-active site, make sure you have configured a standard load balancing setup for each server farm or data center.

Also, for synchronizing the GSLB configuration across the GSLB sites in the deployment, make sure that:

- Local GLSB Sites are configured on all the appliances in the GSLB configuration.
- You have enabled management access on all the GSLB Sites in the configuration.
- You have configured the firewall to accept the auto synchronization and MEP connections.
- The master and slave NetScaler appliances are running the same NetScaler software versions.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- All the NetScaler appliances participating as sites should have the same NetScaler software version (the sites are not in a master-slave relationship).
- The RPC node password is same across all the GSLB sites in the GSLB configuration.

To configure an active-active site by using the wizard

On the Configuration tab, do the following:

1. Navigate to **Traffic Management** > **GSLB**, and then click **Get Started**.
2. If you have not configured an ADNS service or a DNS virtual server for the site, you can do it now.
    a. Click **View** and then click **Add**.
    b. Enter the service name, IP address and select the protocol (ADNS/ADNS_TCP) through which the data is exchanged with the service.
3. Select **Active-Active Site**.
4. Enter the fully qualified domain name and specify the time period for which the record must be cached by DNS proxies.
5. Configure the GSLB sites. Each site must be configured with a local GSLB site, and each site's configuration must include all the other sites as remote GSLB sites. There can be only one local site and all other sites are remote sites.
    a. Enter the site details, such as the site name and site IP address.
    b. Select either REMOTE or LOCAL site type.
    c. Optionally, change the RPC password and, if necessary, secure it.
    d. If a monitor is to be bound to the GSLB service, select the condition under which the monitor is to monitor the service. This will be effective only after a monitor is bound to the services. The possible conditions are:
        - **ALWAYS**. Monitor the GSLB service at all times.
        - **MEP Fails**. Monitor the GSLB service only when the exchange of metrics through MEP fails.
        - **MEP Fails and Service ID Down**. Exchange of metrics through MEP is enabled but the status of the service, updated through metrics exchange, is DOWN.
6. Configure the GSLB services. To create an active-active site you must add at least two GSLB services.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

a. Enter the service details, such as service name, service type, and port number.
b. Associate the service with a site (local or remote) by selecting the GSLB site where the GSLB service belongs.
c. Select the monitor that must be bound to the service when MEP fails, if required. The service can be an existing server, or you can create a new server or a virtual server.
d. To associate an existing server, select the server name. The service IP address is automatically populated.

   - If the public IP address is different from the server IP, which can happen in a NAT environment, enter the public IP address and the port number of the public port.
   - To associate a new server, create a server by entering the server IP details and its public IP address and the public port number.
   - To associate a virtual server, select an already existing virtual server, or click + and add a new virtual server. This vserver is the load balancing vserver with which this GSLB service will be associated.

7. Configure the GSLB virtual servers.

   a. Enter the name of the GSLB virtual server name and select the DNS record type.
   b. Click **>** in the **Select Service** box and choose the GSLB services to be bound to the GSLB virtual server.
   c. Click **>** in the **Domain Binding** box to select the domain to be bound to this GSLB virtual server.
   d. Choose the GSLB method for selecting the best-performing GSLB service. The default values for GSLB method, backup method, and dynamic weight are auto-populated, by default. You can change them if required.

      - If you choose the **Algorithm based** method, select the primary and backup methods and also specify the dynamic weight option.
      - If you choose the **Static Proximity** method, select the backup method and the dynamic weight method. Also, provide the location of the database file by clicking the > icon or add a new location by clicking **+** in the Select a location database box.
      - If you choose the **Dynamic Proximity (RTT)** method, select the backup method and specify the dynamic weight option and the round-trip time value based on which the best-performing service is to be selected.

8. Click **Done** if the configuration is complete. The GSLB dashboard appears.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

9. If you have modified the GSLB site configuration, click **Auto Synchronize GSLB** in the dashboard to synchronize the configuration to other sites in the GSLB setup.

    - Before synchronization, make sure that the local site's configuration includes information about the remote sites. Also, for the synchronization to be successful, the local site must be configured on the other NetScaler appliances.
    - If real-time synchronization is enabled, you do not have to click **Auto Synchronize GSLB**. The synchronization happens automatically. To enable real time synchronization, do the following:

        a. Navigate to **Traffic Management** > **GSLB** > **Dashboard** and click **Change GSLB Settings**.

        b. Select the **Automatic Config Sync** check box.

10. Click **Test GSLB Setup** to make sure that the ADNS services or the DNS servers are responding with the correct IP address for the domain name that is configured in the GSLB setup.

Configure active-passive site

The following figure shows the workflow involved in the active-passive site configuration.

Before you begin configuring an active-passive site, make sure you have configured a standard load balancing setup for each server farm or data center.

Also, for synchronizing the GSLB configuration across the GSLB sites in the deployment, make sure that:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Local GLSB Sites are configured on all the appliances in the GSLB configuration.
- You have enabled management access on all the GSLB Sites in the configuration.
- You have configured the firewall to accept the auto synchronization and MEP connections.
- The master and slave NetScaler appliances are running the same NetScaler software versions.
- All the NetScaler appliances participating as sites should have the same NetScaler software version (the sites are not in a master-slave relationship).
- The RPC node password is same across all the GSLB sites in the GSLB configuration.

To configure an active-passive site by using the wizard

On the Configuration tab, do the following:

1. Navigate to **Traffic Management** > **GSLB**, and then click **Get Started**.
2. If you have not configured an ADNS service or a DNS virtual server for the site, you can do it now.
    a. Click **View** and then click **Add**.
    b. Enter the service name, IP address and select the protocol (ADNS/ADNS_TCP) through which the data is exchanged with the service.
3. Select **Active-Passive Site**.
4. Enter the fully qualified domain name and specify the time period for which the record must be cached by DNS proxies.
5. Configure the GSLB sites. Each site must be configured with a local GSLB site, and each site's configuration must include all the other sites as remote GSLB sites. There can be only one local site and all other sites are remote sites.
    a. Enter the site details, such as the site name and site IP address.
    b. Select either REMOTE or LOCAL site type.
    c. Optionally, change the RPC password and, if necessary, secure it.
    d. If a monitor is to be bound to the GSLB service, select the condition under which the monitor is to monitor the service. This will be effective only after a monitor is bound to the services. The possible conditions are:
        - **ALWAYS**. Monitor the GSLB service at all times.
        - **MEP Fails**. Monitor the GSLB service only when the exchange of metrics through MEP fails.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **MEP Fails and Service ID Down**. Exchange of metrics through MEP is enabled but the status of the service, updated through metrics exchange, is DOWN.

6. Configure the GSLB services.

   a. Enter the service details, such as service name, service type, and port number.

   b. Associate the service with a site (local or remote) by selecting the GSLB site where the GSLB service belongs.

   c. Select the monitor that must be bound to the service when MEP fails, if required. The service can be an existing server, or you can create a new server or a virtual server.

   d. To associate an existing server, select the server name. The service IP address is automatically populated.

      - If the public IP address is different from the server IP, which can happen in a NAT environment, enter the public IP address and the port number of the public port.
      - To associate a new server, create a server by entering the server IP details and its public IP address and the public port number.
      - To associate a virtual server, select an already existing virtual server, or click **+** and add a new virtual server. This vserver is the load balancing vserver with which this GSLB service will be associated.

7. Configure the GSLB backup virtual servers. The GSLB backup virtual servers become operational only when the primary GSLB virtual servers is inaccessible or it is marked DOWN for any reason.

   a. Enter the name of the GSLB virtual server name and select the DNS record type.

   b. Click **>** in **Service Binding**, and choose the GSLB services that must be bound to the GSLB virtual server.

   c. Choose the GSLB method for selecting the best-performing GSLB service. The default values for GSLB method, backup method, and dynamic weight are auto-populated, by default. You can change them if required.

      - If you choose the **Algorithm based** method, select the primary and backup methods.
      - If you choose the **Static Proximity** method, select the backup method and provide the location of the database file.
      - If you choose the **Dynamic Proximity (RTT)** method, select the backup method and specify the service weight and the RTT value based on which the best-performing service is to be selected.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

8. Configure the GSLB virtual servers.

    a. Enter the name of the GSLB virtual server name and select the DNS record type.

    b. Click **>** in the **Select Service** box and choose the GSLB services to be bound to the GSLB virtual server.

    c. Click **>** in the **Domain Binding** box to select the domain to be bound to this GSLB virtual server.

    d. Choose the GSLB method for selecting the best-performing GSLB service. The default values for GSLB method, backup method, and dynamic weight are auto-populated, by default. You can change them if required.

        - If you choose the **Algorithm based** method, select the primary and backup methods and also specify the dynamic weight option.
        - If you choose the **Static Proximity** method, select the backup method and the dynamic weight method. Also, provide the location of the database file by clicking the **>** icon or add a new location by clicking **+** in the Select a location database box.
        - If you choose the **Dynamic Proximity (RTT)** method, select the backup method and specify the dynamic weight option and the round-trip time value based on which the best-performing service is to be selected.

9. Click **Done** if the configuration is complete. The GSLB dashboard appears.

10. If you have modified the GSLB site configuration, click **Auto Synchronize GSLB** in the dashboard to synchronize the configuration to other sites in the GSLB setup.

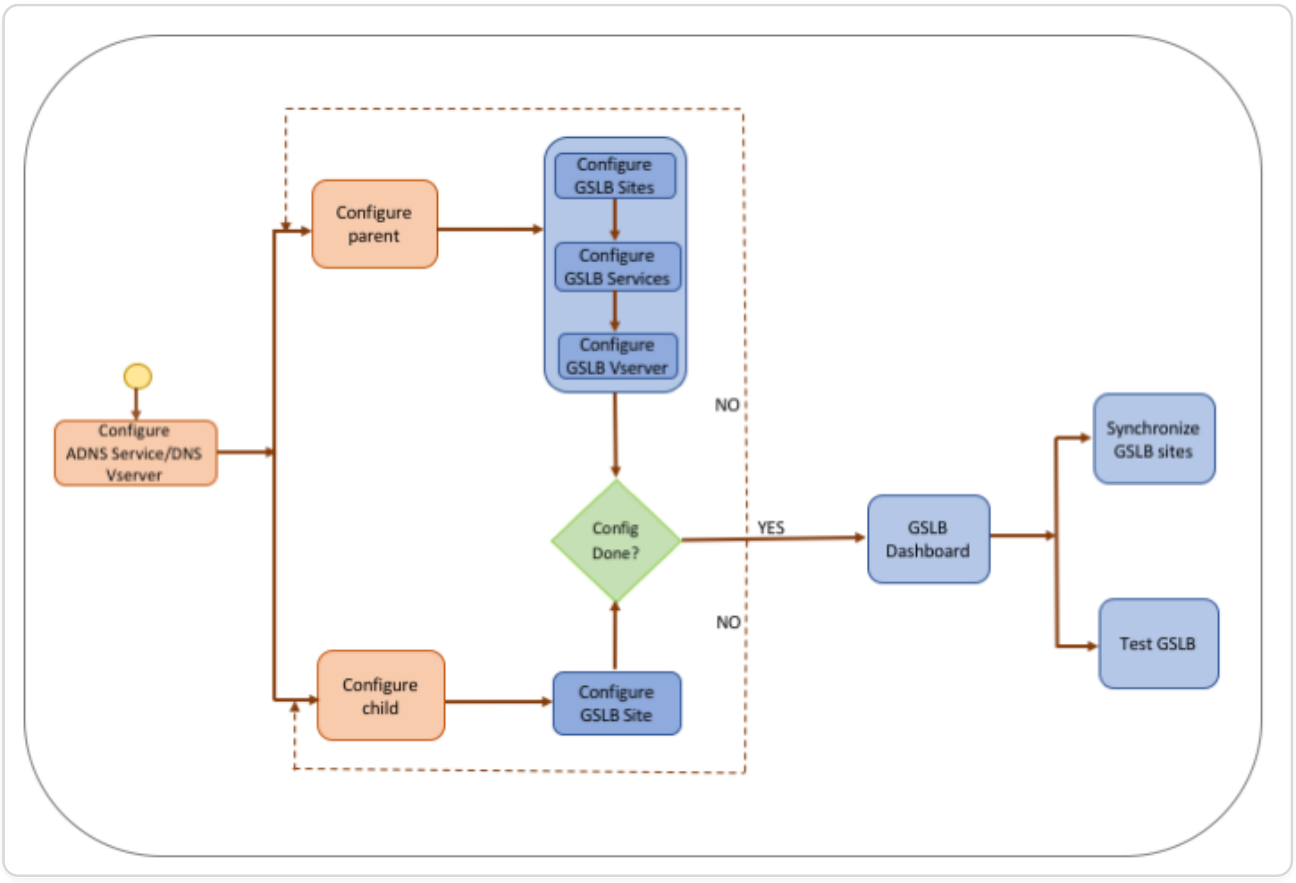
    - Before synchronization, make sure that the local site's configuration includes information about the remote sites. Also, for the synchronization to be successful, the local site must be configured on the other NetScaler appliances.
    - If real-time synchronization is enabled, you do not have to click **Auto Synchronize GSLB**. The synchronization happens automatically. To enable real time synchronization, do the following:

        a. Navigate to **Traffic Management** > **GSLB** > **Dashboard** and click **Change GSLB Settings**.

        b. Select the **Automatic Config Sync** check box.

11. Click **Test GSLB Setup** to make sure that the ADNS services or the DNS servers are responding with the correct IP address for the domain name that is configured in the GSLB setup.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



NOTE

For details about configuring GSLB entities of an active-passive GSLB setup for disaster recovery, see Configuring GSLB for Disaster Recovery.

Configure parent-child topology

In a parent-child topology, at the top level are parent sites, which have peer relationships with other parents. Each parent can have multiple child sites, and each parent site exchanges health information with its child sites and with other parent sites. However, a child site communicates only with its parent site.

The following figure shows the workflow involved in a GSLB parent-child topology configuration.

Before you begin configuring the parent-child topology deployment, make sure you have configured a standard load balancing setup for each server farm or data center.

Also, for synchronizing the GSLB configuration across the GSLB sites in the deployment, make sure that:

- Local GLSB Sites are configured on all the appliances in the GSLB configuration.
- You have enabled management access on all the GSLB Sites in the configuration.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- You have configured the firewall to accept the auto synchronization and MEP connections.
- All the NetScaler appliances participating as sites should have the sameNetScaler software version (the sites are not in a master-slave relationship).
- The RPC node password is same across all the GSLB sites in the GSLB configuration.

To configure a parent-child deployment by using the wizard

On the Configuration tab, do the following:

1. Navigate to **Traffic Management** > **GSLB**, and then click **Get Started**.
2. If you have not configured an ADNS server or a DNS virtual server for the site, you can do it now.
    a. Click **View** and then click **Add**.
    b. Enter the service name, IP address and select the protocol (ADNS/ADNS_TCP) through which the data is exchanged with the service.
3. Select **Parent-Child Topology**.
4. In the Select the site type field, choose;
    - **Parent** – When configuring the parent site, you must configure its associated child sites and also configure the other parent sites in the GSLB setup.
    - **Child** – When configuring the child site, you must configure only the child site and its parent site.

To configure a parent site

1. Enter the fully qualified domain name and specify the time period for which the record must be cached by DNS proxies.
2. Configure the GSLB sites. Each site must be configured with a local GSLB site, and each site's configuration must include all the other sites as remote GSLB sites. There can be only one local site. All other sites are remote sites. If the specified site IP address is owned by the appliance (for example, a MIP address or SNIP address), the site is a local site. Otherwise, it is a remote site.
3. Enter the site details, such as the site name and site IP address.
    a. Select the site type.
    b. Optionally, change the RPC password and, if necessary, secure it.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

c. If a monitor is to be bound to the GSLB service, select the condition under which the monitor is to monitor the service. This will be effective only after a monitor is bound to the services. The possible conditions are:

- **Always**. Monitor the GSLB service at all times.
- **MEP Fails**. Monitor the GSLB service only when the exchange of metrics through MEP fails.
- **MEP Fails and Service is DOWN**. Exchange of metrics through MEP is enabled but the status of the service, updated through metrics exchange, is DOWN.

4. Configure the GSLB services.

a. Enter the service details such as service name, service type, and port number.

b. Associate the service with a site (local or remote) by selecting the GSLB site to which the GSLB service belongs.

c. Select the monitor that must be bound to the service when MEP fails, if required. The service can be an existing server, or you can create a new server or a virtual server.

- To associate an existing server, select the server name. The service IP address is auto-populated.
- To associate a new server, create a server by entering the server IP details and its public IP address and the public port number.
- To associate a virtual server, select an already existing virtual server or click **+** and add a new virtual server. This vserver is the load balancing vserver to which this GSLB service will be associated. If the public IP address is different from the server IP, which can happen in a NAT environment, enter the public IP address and the public port number.

5. Configure the GSLB virtual servers.

a. Enter the name of the GSLB virtual server name and select the DNS record type.

b. Click **>** in the **Select Service** box and choose the GSLB services to be bound to the GSLB virtual server.

c. Click **>** in the **Domain Binding** box to view the domain name that is bound to the GSLB virtual server.

d. Choose the GSLB method for selecting the best-performing GSLB service. The default values for GSLB method, backup method, and dynamic weight are automatically populated by default. You can change them if required.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

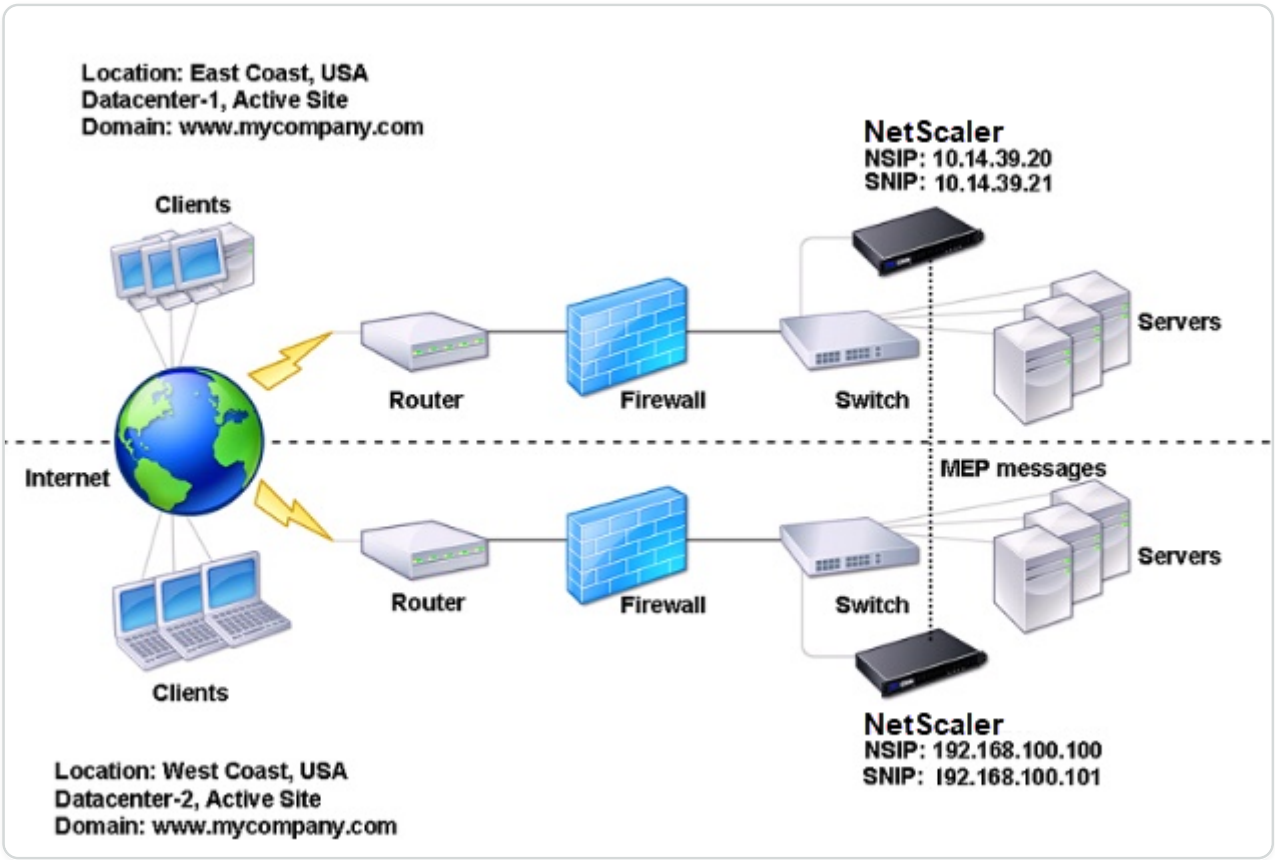
- If you choose the **Algorithm based** method, select the primary and backup methods and also specify the dynamic weight option.
- If you choose the **Static Proximity** method, select the backup method and the dynamic weight method. Also, provide the location of the database file by clicking the **>** icon or add a new location by clicking **+** in the Select a location database box.
- If you choose the **Dynamic Proximity (RTT)** method, select the backup method and specify the service weight and the RTT value based on which the best-performing service is to be selected.

6. Click **Done** if the configuration is complete. The GSLB dashboard appears.
7. If you have modified the GSLB parent-site configuration, click **Auto Synchronize GSLB** to synchronize the configuration to the other parent sites in the GSLB setup. In a parent-child topology, synchronization for the child sites is skipped.
   - Before synchronization, make sure that the local site's configuration includes information about the remote sites.
   - If real-time synchronization is enabled, you do not have to click **Auto Synchronize GSLB**. The synchronization happens automatically. To enable real time synchronization, do the following:
     a. Navigate to **Traffic Management** > **GSLB** > **Dashboard** and click **Change GSLB Settings**.
     b. Select the **Automatic Config Sync** check box.
8. Click **Test GSLB Setup** to make sure that the ADNS services or the DNS servers are responding with the correct IP address for the domain name that is configured in the GSLB setup.

TO CONFIGURE A CHILD SITE

1. Configure the GSLB sites.
   a. Enter the site details, such as the site name and site IP address.
   b. Select the site type.
   c. Optionally, change the RPC password and, if necessary, secure it. 4. If a monitor is bound to the GSLB service, select the condition under which the monitor is to monitor the service. The possible conditions are:
      - **Always**. Monitor the GSLB service at all times.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



- **MEP Fails**. Monitor the GSLB service only when the exchange of metrics through MEP fails.
- **MEP Fails and Service is DOWN**. Exchange of metrics through MEP is enabled but the status of the service, updated through metrics exchange, is DOWN.

2. Click **Done** if the configuration is complete. The GSLB dashboard appears.
3. Click **Test GSLB Setup** to make sure that the ADNS services or the DNS servers are responding with the correct IP address for the domain name that is configured in the GSLB setup.

Configure GSLB entities individually

Global server load balancing is used to manage traffic flow to a web site hosted on two separate server farms that ideally are in different geographic locations. For example, consider a Web site, www.mycompany.com, which is hosted on two geographically separated server farms or data centers. Both server farms use NetScaler appliances. The NetScaler appliances in these server farms are set up in one-arm mode and function as authoritative DNS servers for the www.mycompany.com domain. The following figure illustrates this configuration.

Figure 1. Basic GSLB Topology

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To configure such a GSLB setup, you must first configure a standard load balancing setup for each server farm or data center. This enables you to balance load across the different servers in each server farm. Then, configure both NetScaler appliances as authoritative DNS (ADNS) servers. Next, create a GSLB site for each server farm, configure GSLB virtual servers for each site, create GLSB services, and bind the GSLB services to the GSLB virtual servers. Finally, bind the domain to the GSLB virtual servers. The GSLB configurations on the two appliances at the two different sites are identical, although the load-balancing configurations for each site is specific to that site.

Note: To configure a GSLB site in a NetScaler cluster setup, see Setting Up GSLB in a Cluster.

Configuring a Standard Load Balancing Setup

A load balancing virtual server balances the load across different physical servers in the data center. These servers are represented as services on the NetScaler appliance, and the services are bound to the load balancing virtual server.

For details on configuring a basic load balancing setup, see Load Balancing.

Configure an authoritative DNS service

When you configure the NetScaler appliance as an authoritative DNS server, it accepts DNS requests from the client and responds with the IP address of the data center to which the client should send requests.

Note: For the NetScaler appliance to be authoritative, you must also create SOA and NS records. For more information about SOA and NS records, see Domain Name System.

To create an ADNS service by using the command line interface

At the command prompt, type the following commands to create an ADNS service and verify the configuration:

```
add service <name> <IP>@ ADNS <port>

show service <name>
```

Example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add service Service-ADNS-1 10.14.39.21 ADNS 53

show service Service-ADNS-1
```

To modify an ADNS service by using the command line interface

At the command prompt, type the following command:

```
set service <name> <IPAddress>
```

Example:

```
set service Service-ADNS-1 10.14.39.21
```

To remove an ADNS service by using the command line interface

At the command prompt, type the following command:

```
rm service <name>
```

Example:

```
rm service Service-ADNS-1
```

To configure an ADNS service by using the configuration utility

1. Navigate to **Traffic Management** > **Load Balancing** > **Services**.
2. Add a new ADNS service, or select an existing service and edit its settings.

Configure a basic GSLB site

A GSLB site is a representation of a data center in your network and is a logical grouping of GSLB virtual servers, services, and other network entities. Typically, in a GSLB set up, there are many GSLB sites that are equipped to serve the same content to a client. These are usually geographically separated to ensure that the domain is active even if one site goes down completely. All of the sites in the GSLB configuration must be configured on every NetScaler

© 1997–2026 Citrix Systems, Inc. All rights reserved.

appliance hosting a GSLB site. In other words, at each site, you configure the local GSLB site and each remote GSLB site.

Once GSLB sites are created for a domain, the NetScaler appliance sends client requests to the appropriate GSLB site as determined by the GSLB algorithms configured.

Staring from release 13.1 build 57.x, you can configure a password using the `sitePassword` parameter that replaces the RPC node password. If the GSLB synchronisation is enabled, this password is updated for all the GSLB sites. For existing GSLB deployments, configure the password of an RPC node to continue using the GSLB configuration synchronization functionality. To configure the RPC password, see Configure site-to-site communication.

NOTE:

It is mandatory to create a password while creating a GSLB site.

To create a GSLB site by using the command line interface

At the command prompt, type the following commands to create a GSLB site and verify the configuration:

```
add gslb site <siteName> <siteIPAddress>

show gslb site <siteName>
```

Example:

```
add gslb site Site-GSLB-East-Coast 10.14.39.21

show glsb site Site-GSLB-East-Coast
```

To modify or remove a GSLB Site by using the command line interface

- To modify a GSLB site, use the set gslb site command, which is just like using the add gslb site command, except that you enter the name of an existing GSLB Site.
- To unset a site parameter, use the unset gslb site command, followed by the siteName value and the name of the parameter to be reset to its default value.
- To remove a GSLB site, use the rm gslb site command, which accepts only the `<name>` argument.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To configure a basic GSLB site by using the configuration utility

1. Navigate to **Traffic Management** > **GSLB** > **Sites**.
2. Add a new GSLB site, or select an existing GSLB site and edit its settings.

To view the statistics of a GSLB site by using the command line interface

At the command prompt, type:

```
stat gslb site <siteName>
```

Example:

```
stat gslb site Site-GSLB-East-Coast
```

To view the statistics of a GSLB site by using the configuration utility

1. Navigate to **Traffic Management** > **GSLB** > **Sites**.
2. Select the GSLB site and click **Statistics**.

Configure a GSLB service

A GSLB service is a representation of a load balancing or content switching virtual server. A local GSLB service represents a local load balancing or content switching virtual server. A remote GSLB service represents a load balancing or content switching virtual server configured at one of the other sites in the GSLB setup. At each site in the GSLB setup, you can create one local GSLB service and any number of remote GSLB services.

IMPORTANT

If the load balancing virtual server is either in a GSLB node itself or is in a child node (in parent-child deployment) and no monitors are bound to the GSLB service, then make sure the following:

The GLSB service IP address, port number, and protocol match the virtual server that the service is representing. Else, the service state is marked as DOWN.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To create a GSLB service by using the command line interface

At the command prompt, type the following commands to create a GSLB service and verify the configuration:

```
add gslb service <serviceName> <serverName | IP> <serviceType> <port>-
siteName <string>

show gslb service <serviceName>
```

Example:

```
add gslb service Service-GSLB-1 10.14.39.14 HTTP 80 –siteName Site-GSLB-
East-Coast

show gslb service Service-GSLB-1
```

To modify or remove a GSLB service by using the command line interface

- To modify a GSLB service, use the set gslb service `<serviceName>` command. For this command, specify the name of the GSLB service whose configuration you want to modify. You can change the existing values of the parameters either specified by you or set by default. You can change the value of more than one parameter in the same command. Refer to the add gslb service command for details about the parameters. Example

  ```
  > set gslb service SKP_GSLB_NOTCNAME_SVC2 -maxBandWidth 25 -maxClient 8

  Done

  > sh gslb service SKP_GSLB_NOTCNAME_SVC2

  SKP_GSLB_NOTCNAME_SVC2 (21.211.21.21: 80)- HTTP

  ...

  Max Conn: 8  Max Bandwidth: 25 kbits
  ```

- To reset a parameter to its default value, you can use the unset gslb service `<serviceName>` command and the parameters to be unset. Example

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
> unset gslb service SKP_GSLB_NOTCNAME_SVC2 maxBandWidth

Done

> sh gslb service SKP_GSLB_NOTCNAME_SVC2

SKP_GSLB_NOTCNAME_SVC2 (21.211.21.21: 80)- HTTP

...

Max Conn: 8  Max Bandwidth: 0 kbits
```

- To remove a GSLB service, use the rm gslb service `<serviceName>` command.

To create a GSLB service by using the configuration utility

1. Navigate to **Traffic Management** > **GSLB** > **Services**.
2. Add a new GSLB service, or select an existing service and edit its settings.

To view the statistics of a GSLB service by using the command line interface

At the command prompt, type:

```
stat gslb service <serviceName>
```

Example:

```
stat gslb service Service-GSLB-1
```

To view the statistics of a GSLB service by using the configuration utility

1. Navigate to **Traffic Management** > **GSLB** > **Services**.
2. Select the GSLB Service and click **Statistics**.

Configure a GSLB service group

Service group enables you to manage a group of services as easily as a single service. If you enable or disable any option for a service group, the option gets enabled or disabled for all the members of the service group. For example, you can apply this feature to options such as Compression, Health monitoring, and Graceful shutdown.

After creating a service group, you can do any of the following:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Bind the service group to a virtual server.
- Add services to the service group.
- Bind monitors to the service groups.

IMPORTANT

If the load balancing virtual server is either in a GSLB node itself or is in a child node (in parent-child deployment) and no monitors are bound to the GSLB service, then make sure the following:

The GLSB service group IP address, port number, and protocol match the virtual server that the service is representing. Else, the service state is marked as DOWN.
The NetScaler supports the following types of GSLB service groups.

- IP address based service groups
- Domain name based service groups
- Domain name based autoscale™ service groups

GSLB domain name based autoscale service groups

The NetScaler hybrid and multi-cloud global server load balancing (GSLB) solution enables customers to distribute application traffic across multiple data centers in hybrid clouds, multiple clouds, and on-premises. The NetScaler GSLB solution supports various load balancing solutions, such as the NetScaler load balancer, Elastic Load Balancing (ELB) for AWS, and other third-party load balancers. Also, the GSLB solution performs global load balancing even if the GSLB and load balancing layers are independently managed.

In cloud deployments, users are given a domain name as a reference when accessing the load balancing solution for management purposes. It is recommended that external entities do not use the IP addresses that these domain names resolve to. Also, the load balancing layers scale up or down based on the load, and the IP addresses are not guaranteed to be static. Therefore, it is recommended to use the domain name to refer to the load balancing endpoints instead of IP addresses. This requires the GSLB services to be referred using the domain name instead of IP addresses and it must consume all the IP addresses returned for the load balancing layer domain name and have a representation for the same in GSLB.

To use domain names instead of IP addresses when referring to the load balancing endpoints, you can use the domain name based service groups for GSLB.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Monitor GSLB domain name based service groups

The NetScaler appliance has two built-in monitors that monitor TCP-based applications; `tcp-default` and `ping-default`. The `tcp-default` monitor is bound to all TCP services and the `ping-default` monitor is bound to all non-TCP services. The built-in monitors are bound by default to the GSLB service groups. However, it is recommended to bind an application specific monitor to the GSLB service groups.

RECOMMENDATION FOR SETTING THE TRIGGER MONITORS OPTION TO MEPDOWN

The Trigger Monitors option can be used to indicate if the GSLB site must use the monitors always, or use monitors when metrics exchange protocol (MEP) is DOWN.

The Trigger Monitors option is set to ALWAYS by default.

When the Trigger Monitors option is set to ALWAYS, each GSLB node triggers the monitors independently. If each GSLB node triggers the monitors independently, then each GSLB node might operate on different set of GSLB services. This might result in discrepancies in the DNS responses for the DNS requests landing on these GSLB nodes. Also, if each GSLB node is monitoring independently, then the number of monitor probes reaching the load balancer entity increases. The persistence entries also become incompatible across the GSLB nodes.

Therefore, it is recommended that the Trigger Monitors option on the GSLB site entity is set to MEPDOWN. When the Trigger Monitors option is set to MEPDOWN, the load balancing domain resolution and monitoring ownership lies with the local GSLB node. When the Trigger Monitors option is set to MEPDOWN, the load balancing domain resolution and subsequent monitoring is done by the local GSLB node of a GSLB service group. The results are then propagated to all other nodes participating in GSLB by using the metrics exchange protocol (MEP).

Also, whenever the set of IP addresses associated with a load balancing domain are updated, it is notified through MEP.

Limitations of GSLB service groups

- For a load balancing domain, the IP address that is returned in the DNS response is generally the public IP address. The private IP address cannot be applied dynamically when the load balancing domain is resolved. Therefore, public IP port and private IP port for the GSLB domain name based autoscale service groups IP port bindings are the same. These parameters cannot be set explicitly for the domain name based autoscale service groups.
- Site persistence, DNS views, and clustering are not supported for GSLB service groups.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure and manage GSLB service groups by using the CLI

To add a GSLB service group:

```
add gslb serviceGroup <serviceGroupName>@ <serviceType> [-autoScale
( DISABLED | DNS )] -siteName <string>
```

Example:

```
add gslb serviceGroup Service-Group-1 http -autoScale DNS -siteName Site1
```

To bind a GSLB service group to a virtual server:

```
bind gslb serviceGroup <serviceGroupName> ((<IP>@ <port>) | <serverName>@
| (-monitorName <string>@))
```

Example:

```
bind gslb serviceGroup Service-Group-1 203.0.113.2

bind gslb serviceGroup Service-Group-1 S1 80

bind gslb serviceGroup** Service-Group-1 -monitorName Mon1
```

To unbind a GSLB service group to a virtual server:

```
unbind gslb serviceGroup <serviceGroupName> ((<IP>@ <port>) |
<serverName>@ | -monitorName <string>@)
```

Example:

```
unbind gslb serviceGroup Service-Group-1 -monitorName Mon1
```

To set parameters for a GSLB service group:

```
set gslb serviceGroup <serviceGroupName>@ [(<serverName>@ <port> [-weight
<positive_integer>] [-hashId <positive_integer>] [-publicIP <ip_addr|
ipv6_addr|*>] [-publicPort <port>]) | -maxClient <positive_integer> | -cip
( ENABLED | DISABLED ) | <cipHeader> | -cltTimeout <secs> | -svrTimeout
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
<secs> | -maxBandwidth <positive_integer> | -monThreshold
<positive_integer> | -downStateFlush ( ENABLED | DISABLED )] [-monitorName
<string> -weight <positive_integer>] [-healthMonitor ( YES | NO )] [-
comment <string>] [-appflowLog ( ENABLED | DISABLED )]
```

To unset parameters from a GSLB service group:

```
unset gslb serviceGroup <serviceGroupName>@ [<serverName>@ <port> [-
weight] [-hashId] [-publicIP] [-publicPort]] [-maxClient] [-cip] [-
cltTimeout] [-svrTimeout] [-maxBandwidth] [-monThreshold] [-appflowLog] [-
monitorName] [-weight] [-healthMonitor] [-cipHeader] [-downStateFlush] [-
comment]
```

To enable a GSLB service group

```
enable gslb serviceGroup <serviceGroupName>@ [<serverName>@ <port>]
```

Example:

```
enable gslb serviceGroup SG1 S1 80
```

To disable a GSLB service group

```
disable gslb serviceGroup <serviceGroupName>@ [<serverName>@ <port>] [-
delay <secs>] [-graceFul ( YES /| NO )]
```

Example:

```
disable gslb serviceGroup SRG2 S1 80
```

NOTE

The service group that has to be disabled must be a DBS service group and not an autoscale service group.

To remove a GSLB service group:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
rm gslb serviceGroup <serviceGroupName>
```

Example:

```
rm gslb serviceGroup Service-Group-1
```

To view the statistics of a GSLB service group:

```
stat gslb serviceGroup [<serviceGroupName>]
```

Example:

```
stat gslb serviceGroup Service-Group-1
```

To view the properties of a GSLB service group:

```
show gslb serviceGroup [<serviceGroupName>  -includeMembers]
```

Example:

```
show gslb serviceGroup SG1

show gslb serviceGroup -includeMembers
```

Enable or disable GSLB service group members

You can selectively enable or disable an individual member of a GSLB (DNS-based) service group instead of enabling or disabling the entire service group. This feature is available in both autoscale service groups and non-autoscale service groups. Therefore, managing a GSLB service group is made easier.

For example, you have a requirement to avoid traffic to a particular server on a GSLB site. Let's say, 10 GSLB services or servers (S1 to S10) are bound to a service group (SG1). You want to disable only service 5 (S5), that is avoid traffic to server 5. Without this feature, you have to separately bind services S1 to S4 and services S6 to S10. This process becomes tedious in a large GSLB service group where you have to disable or enable large number of services. With this

© 1997–2026 Citrix Systems, Inc. All rights reserved.

feature, you can directly disable service 5 (S5) without impacting other services in the service group.

To enable a GSLB service group member by using CLI:

```
enable gslb serviceGroup <serviceGroupName>@ [<serverName>@ <port>]
```

NOTE:

To enable a GSLB service group, provide only the service group name. To enable a member of a service group, in addition to the GSLB service group name, provide the name of the server that hosts the service, and the port number of the service.

Example:

```
enable gslb serviceGroup http_svc_group 10.102.27.153 80
```

To disable a GSLB service group or a member of the GSLB service group by using CLI:

```
disable gslb serviceGroup <serviceGroupName>@ [<serverName>@ <port>]
```

Example:

```
disable gslb serviceGroup http_svc_group 10.102.27.153 80
```

NOTE:

To disable a GSLB service group, provide only the service group name. To disable a member of a service group, in addition to the GSLB service group name, provide the name of the server that hosts the service, and the port number of the service.

Changes to the existing GSLB CLI commands

The following are the changes that are done to the existing GSLB commands after the introduction of the GSLB service groups:

- `bind gslb vserver` - The service group name is added to the bind command.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Example:

```
bind gslb vserver <name> ((-serviceName <string> [-weight
<positive_integer>] ) | <serviceGroupName>@ | | (-domainName <string>
[-TTL <secs>] [-backupIP<ip_addr|ipv6_addr|*>] [-cookieDomain <string>]
[-cookieTimeout <mins>][-sitedomainTTL <secs>]) | (-policyName
<string>@ [-priority<positive_integer>] [-gotoPriorityExpression
<expression>] [-type REQUEST | RESPONSE )]))
```

- `unbind gslb vserver` - The service group is added to the unbind command.

  Example:

  ```
  unbind gslb vserver <name> (-serviceName <string> <serviceGroupName>
  @ /(-domainName <string> [-backupIP] [-cookieDomain]) | -policyName
  <string>@)
  ```

- `show gslb site` - When this command is run, the GSLB service groups are also displayed.
- `show gslb vs` - When this command is run, the GSLB service groups are displayed.
- `stat gslb vs` - When this command is run, the GSLB service groups statistics are also displayed.
- `show lb monitor bindings` - When this command is run, the GSLB service group bindings are also displayed.

Configure GSLB service groups by using the GUI

1. Navigate to **Traffic Management** > **GSLB** > **Service Groups**.
2. Create a service group and set the AutoScale mode to DNS.

Configure site persistence for the GSLB service groups

You can configure site persistence for the IP address based and domain name based service groups. Site persistence is not supported for domain name based autoscale service groups.

TO SET SITE PERSISTENCE BASED ON HTTP COOKIES BY USING THE CLI

- For connection proxy persistence, you do not have to set the site prefix.

  At the command prompt, type:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
set gslb service group <serviceGroupName> [-sitePersistence
<sitePersistence>]
```

- For HTTP redirect persistence, you must first set the site prefix for a member of the service group and then set the `HTTPRedirect` persistence parameter for the service group.

  At the command prompt, type:

```
set gslb servicegroup <serviceGroupName>  <serviceGroup member name|Ip>
<port>  [-sitePrefix <string>]

set gslb servicegroup <serviceGroupName> [-sitePersistence
<sitePersistence>]
```

Examples:

- Connection proxy persistence

```
set gslbservicegroup sg1 -sitePersistence connectionProxy
```

- HTTP Redirect persistence

```
set gslb servicegroup sg2 test1 80 -sitePrefix vserver-GSLB-1

set gslb servicegroup sg2 -sitePersistence HTTPRedirect
```

TO SET SITE PERSISTENCE BASED ON COOKIES BY USING THE GUI

1. Navigate to **Traffic Management** > **GSLB** > **Services Groups** and select the service group that you want to configure for site persistence (for example, servicegroup-GSLB-1).
2. Click the **Site Persistence** section and set the persistence that meets your requirement.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

TIP

For deployment scenario and example configuration of GSLB service groups, see the following topics:

- Use Case: Deployment of Domain Name Based Autoscale Service Group
- Use Case: Deployment of IP Address Based Autoscale Service Group

Configure a GSLB virtual server

A GSLB virtual server is an entity that represents one or more GSLB services and balances traffic between them. It evaluates the configured GSLB methods or algorithms to select a GSLB service to which to send the client request.

NOTE

A GSLB virtual server protocol requirement is mainly to create a relation between the virtual server and the services that are bound to the virtual server. This also keeps CLI/APIs consistent for other types of virtual servers. The Service Type parameter on a service or a virtual server is not used while serving the DNS requests. It is instead referenced during site persistence, monitoring, and for doing lookups via MEP.

To create a GSLB virtual server by using the command line interface

At the command prompt, type the following commands to add a GSLB virtual server and verify the configuration:

```
-  add gslb vserver <name> <serviceType> -ipType (IPv4 | IPv6)

-  show gslb vserver <name>
```

Example:

```
add gslb vserver Vserver-GSLB-1 HTTP -ipType IPv4

add gslb vserver Vserver-GSLB-2 HTTP -ipType IPv6

show gslb vserver Vserver-GSLB-1
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
show gslb vserver Vserver-GSLB-2
```

To modify or remove a GSLB virtual server by using the command line interface

- To modify a GSLB virtual server, use the `set gslb vserver` command. This command works similar to the `add gslb vserver` command, except that you enter the name of an existing GSLB virtual server.
- To reset a parameter to its default value, you can use the `unset gslb vserver` command followed by the vserverName value and the name of the parameter to be unset.
- To remove a GSLB virtual server, use the `rm gslb vserver` command, which accepts only the name argument.

To configure a GSLB virtual server by using the configuration utility

1. Navigate to **Traffic Management** > **GSLB** > **Virtual Servers**.
2. Add a new GSLB virtual server, or select an existing GSLB virtual server and edit its settings.

To view the statistics of a GSLB virtual server by using the command line interface

At the command prompt, type:

```
stat gslb vserver <name>
```

Example:

```
stat gslb vserver Vserver-GSLB-1
```

To view the statistics of a GSLB virtual server by using the configuration utility

Navigate to **Traffic Management** > **GSLB** > **Virtual Servers**, select the virtual server and click **Statistics**.

GSLB virtual server statistics

Starting from NetScaler version 12.1 build 51.xx and later, the GSLB virtual server statistics also display the following information in addition to details such as; virtual server hits, current persistence session, request bytes, response bytes, spillover threshold, spillover hits, current client established connections, and virtual server down backup hits.

- **Primary LB method failures**: Number of times the primary GSLB method has failed.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Backup LB method failures**: Number of times the backup GSLB method has failed.
- **Vserver persistence hits**: The number of times the request is served through the persistence sessions.

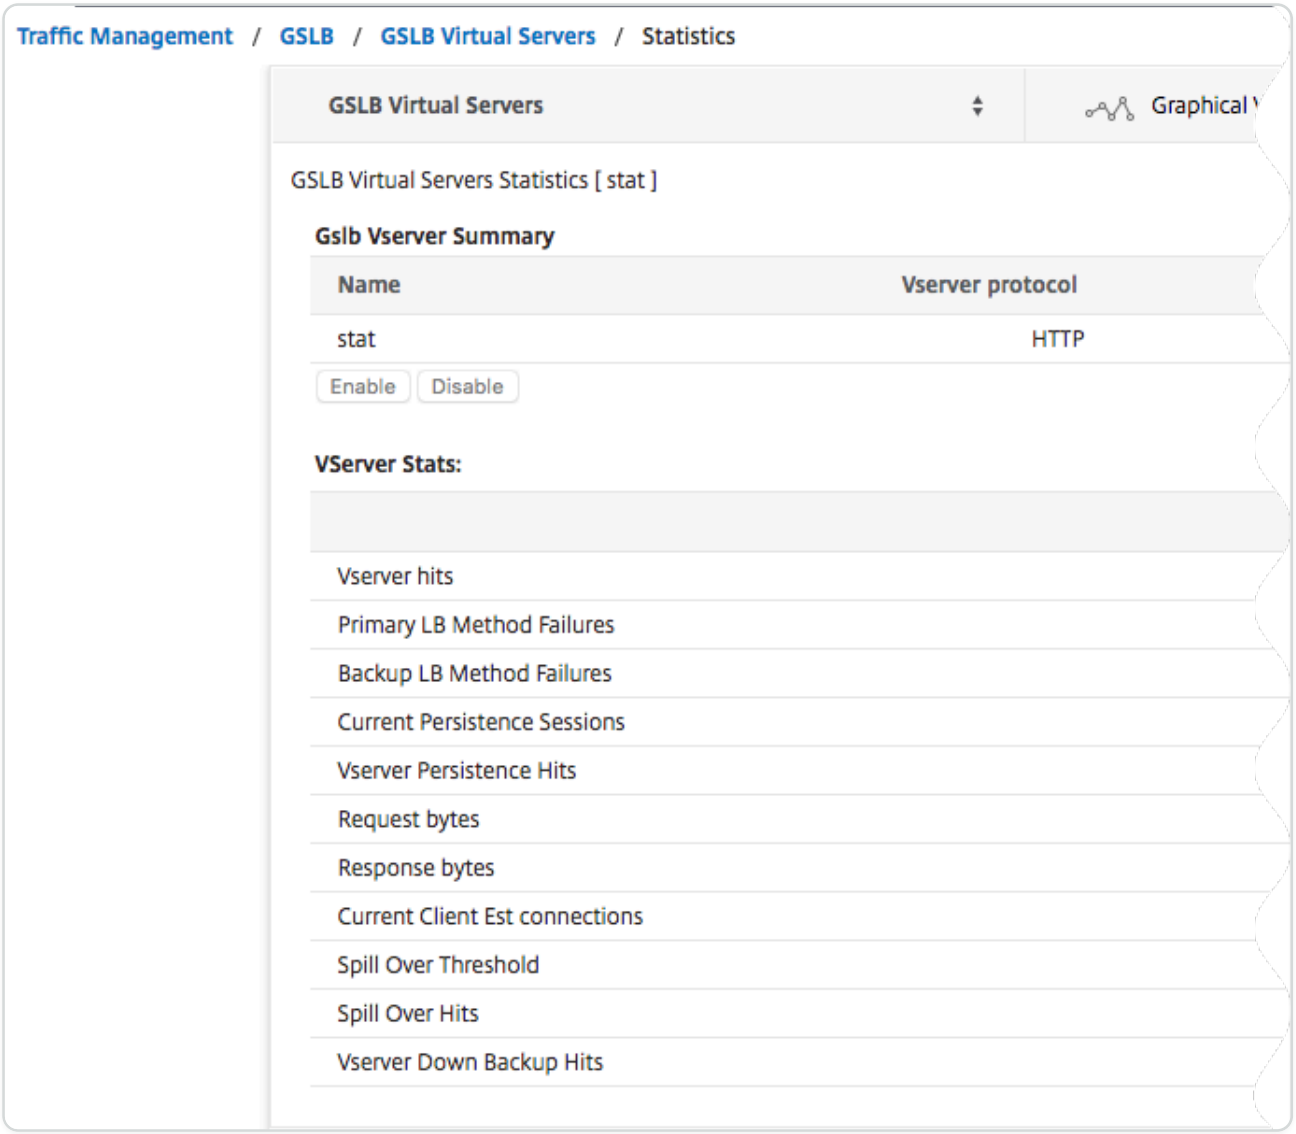
The GSLB virtual server statistics also display the statistics of the service group members bound to the virtual server.

NOTE:

The primary or the backup method can fail when the primary method is static proximity and the backup method is RTT. In this scenario, if there is no location corresponding to LDNS IP, the static proximity fails and the backup method is attempted. The statistics are updated based on the following:

- If the backup method is successful, only primary method failure statistics are incremented.
- If the RTT calculation is not successful, then the backup method also fails. In this case, both primary and backup method failure statistics are incremented.

When the backup method fails, the last resort method of round robin is used.
The following image is a sample of GSLB virtual server statistics from the CLI.



```
Gslb Vserver Summary
                Protocol        State   Health  actSvcs inactSvc
gslbvip             HTTP         DOWN        0        0        0

VServer Stats:
                                        Rate (/s)                Total
Vserver hits                                    0                    0
Primary LB Method Failures                     --                    0

Request bytes                                   0                    0
Response bytes                                  0                    0
Current Client Est connections                 --                    0
Spill Over Threshold                           --                    0
Spill Over Hits                                --                    0
Vserver Down Backup Hits                       --                    0

Note: The above counters are the sum of all bound GSLB services
 Done
```

The following image is a sample of GSLB virtual server statistics from the GUI.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

GSLB service statistics

When you run the `stat gslb service` command from the command line or click the **Statistics link** from the configuration utility, the following details of the service are displayed:

- **Request bytes.** Total number of request bytes received on this service or virtual server.
- **Response bytes.** Number of response bytes received by this service or virtual server.
- **Current client established connections.** Number of client connections in ESTABLISHED state.
- **Current load on the service.** Load on the service (Calculated from the load monitor bound to the service).

The data of the number of requests and responses, and the number of current client and server connections may not be displayed or may not be synchronized with the data of the corresponding load balancing virtual server.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Clearing the GSLB virtual server or service statistics

Note: This feature is available in NetScaler release 10.5.e.

You can now clear the statistics of a GSLB virtual server and service. NetScaler provides the following two options to clear the statistics:

- **Basic**: Clears the statistics that are specific to the virtual server but retains the statistics that are contributed by the bound GLSB service.
- **Full**: Clears both the virtual server and the bound GSLB service statistics.

To clear the statistics of a GSLB virtual server by using the command line interface

At the command prompt, type:

```
stat gslb vserver <name> -clearstats <basic | full>
```

Example:

```
stat gslb vserver Vserver-GSLB-1 –clearstats basic
```

To clear the statistics of a GSLB service by using the command line interface

At the command prompt, type:

```
stat gslb service <name> -clearstats <basic | full>
```

Example:

```
stat gslb service service-GSLB-1 –clearstats basic
```

To clear the statistics of a GSLB virtual server by using the configuration utility

1. Navigate to **Traffic Management** > **GSLB** > **Virtual Servers**.
2. Select the GSLB virtual server and, click **Statistics**, and then click **Clear**.
3. From the **Clear** drop-down list, select **Basic** or **Full**, and then click **OK**.

To clear the statistics of a GSLB service by using the configuration utility

1. Navigate to **Traffic Management** > **GSLB** > **Services**.
2. Select the GSLB service and, click **Statistics**, and then click **Clear**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. From the **Clear** drop-down list, select **Basic** or **Full**, and then click **OK**.

Enabling and Disabling GSLB Virtual Servers

When you create a GSLB virtual server, it is enabled by default. If you disable the GSLB virtual server, upon receiving a DNS request, the NetScaler appliance does not make any GSLB decision based on the GSLB method that is configured. Instead, the response to the DNS query contains the IP addresses of all the services bound to the virtual server.

To enable or disable a GSLB virtual server by using the command line interface

At the command prompt, type one of the following commands:

```
enable gslb vserver <name>@

disable gslb vserver <name>@
```

Example:

```
enable gslb vserver Vserver-GSLB-1

disable gslb vserver Vserver-GSLB-1
```

To enable or disable a GSLB virtual server by using the configuration utility

1. Navigate to **Traffic Management** > **GSLB** > **Virtual Servers**.
2. Select a virtual server and, from the **Action** list, select **enable** or **disable**.

Use cases - GSLB virtual server

The following are some of the use cases where you can configure GSLB virtual servers:

- Configure GSLB virtual server to protect the GSLB setup against failure
- Configure persistence in GSLB
- Configure GSLB API method

Bind GSLB services to a GSLB virtual server

Once the GSLB services and virtual server are configured, relevant GSLB services must be bound to the GSLB virtual server to activate the configuration.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To bind a GSLB service to a GSLB virtual server by using the command line interface

At the command prompt, type the following commands to bind a GSLB service to a GSLB virtual server and verify the configuration:

```
bind gslb vserver <name> -serviceName <string>

show gslb vserver <name>
```

Example:

```
bind gslb vserver Vserver-GSLB-1 -serviceName Service-GSLB-1

show gslb vserver Vserver-GSLB-1
```

To unbind a GSLB service from a GSLB virtual server by using the command line interface

At the command prompt, type:

```
unbind gslb vserver <name> -serviceName <string>
```

To bind GSLB services by using the configuration utility

1. Navigate to **Traffic Management** > **GSLB** > **Virtual Servers** and double-click a virtual server.
2. Click in the **Domains** section, and configure a domain and bind the domain.

Bind a domain to a GSLB virtual server

To make a NetScaler appliance the authoritative DNS server for a domain, you must bind the domain to the GSLB virtual server. When you bind a domain to a GSLB virtual server, the NetScaler appliance adds an address record for the domain, containing the name of the GSLB virtual server. The start of authority (SOA) and name server (NS) records for the GSLB domain must be added manually.

For details on configuring SOA and NS records, see Domain Name System.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To bind a domain to a GSLB virtual server by using the command line interface

At the command prompt, type the following commands to bind a domain to a GSLB virtual server and verify the configuration:

```
bind gslb vserver <name> -domainName <string>

show gslb vserver <name>
```

Example:

```
bind gslb vserver Vserver-GSLB-1 -domainName www.mycompany.com

show gslb vserver Vserver-GSLB-1
```

To unbind a GSLB domain from a GSLB virtual server by using the command line interface

At the command prompt, type:

```
unbind gslb vserver <name> -domainName <string>
```

To bind a domain to a GSLB virtual server by using the configuration utility

1. Navigate to **Traffic Management** > **GSLB** > **Virtual Servers**.
2. In GSLB Virtual Servers pane, select the GSLB Virtual Server to which you want to bind the domain (for example, Vserver-GSLB-1) and click Open.
3. In the Configure GSLB Virtual Server dialog box, on the Domains tab, do one of the following:
   - To create a new Domain, click **Add**.
   - To modify an existing Domain, select the domain, and then click **Open**.
4. In the Create GSLB Domain or Configure GSLB Domain dialog box, specify values for the following parameters as shown:
   - Domain Name*—domainName (for example, www.mycompany.com)

   * A required parameter
5. Click Create.
6. Click OK.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To view the statistics of a domain by using the command line interface

At the command prompt, type:

```
stat gslb domain <name>
```

Example:

```
stat gslb domain www.mycompany.com
```

Note: To view statistics for a particular GSLB domain, enter the name of the domain exactly as it was added to the NetScaler appliance. If you do not specify the domain name, or if you specify an incorrect domain name, statistics for all configured GSLB domains are displayed.

To view the statistics of a domain by using the configuration utility

1. Navigate to **Traffic Management** > **GSLB** > **Virtual Servers**.
2. In GSLB Virtual Servers pane, select the GSLB Virtual Server (for example, Vserver-GSLB-1) and click Open.
3. In the Configure GSLB Virtual Server dialog box, on the Domains tab, select the domain, and then click **Statistic**s.

To view the configuration details of the entities bound to a GSLB domain using the command line

Note: This feature is available in NetScaler release 10.5.e.

At the command prompt, type:

```
show gslb domain <name>
```

Example:

```
show gslb domain gslb1.com

       gslb1.com

       gvs1 - HTTP    state: DOWN

       DNS Record Type: A

```

To view the configuration details of the entities bound to a GSLB domain by using the configuration utility

Note: This feature is available in NetScaler release 10.5.e.

1. Navigate to **Traffic Management** > **GSLB** > **Virtual Servers** and double-click a virtual server.
2. Click the field below the **Domains** pane.
3. In the **GSLB Virtual Server Domain Binding** dialog box, select a domain, and then click **Show Bindings**.

Example of a GSLB setup and configuration

An organization has a geographically dispersed network and has three data centers located in the United States, Mexico, and Colombia. In the configuration related to these locations, these are referred to as US, MX, and CO respectively. At each location, the company has a server farm, which provides the same content and the setup is working as expected. The NetScaler appliance at each location is configured through a virtual server with the HTTP protocol on port 80.

The organization has implemented the GSLB setup by adding a site identifier at each site. The site identifier includes a site name and an IP address that is owned by the NetScaler appliance and is used for the GSLB communications. Each site has a site local to the appliance. Also, each site has two sites remote to the local appliance. On each site, a GSLB virtual server is created with the same name. This virtual server identifies the website of the organization globally and does not

© 1997–2026 Citrix Systems, Inc. All rights reserved.

have any IP address associated with it. The setup also has GSLB services configured that point to the load balancing virtual servers configured on each GSLB site by specifying the IP address, protocol, and port number of the respective virtual server. These services are bound to the GSLB virtual server.

NOTE

.

In the procedure, private IP addresses are used for the GSLB sites. For public sites and GSLB services, ensure that you use public IP addresses.

The following table lists the IP addresses and locations used in the example:

IP ADDRESS	LOCATION
10.3.1.101	Site IP of local NetScaler.
172.16.1.101	Site IP of remote location site-MX.
192.168.1.101	Site IP of remote location site-CO.
172.16.1.100	Service IP of remote location site-MX.
10.3.1.100	Service IP of local NetScaler.
192.168.1.100	Service IP of remote location site-CO.

When adding a GSLB site, if the site communicates over the internet only then use the "Public IP" field. For example, when there is no site to site VPN connectivity between the GSLB sites.

To configure the GSLB setup with NetScaler appliances by using the CLI commands

1. Enable the GSLB feature, if not already done.

```
enable ns feature gslb
```

2. Identify a SNIP that for adding local GSLB site.
3. Add the GSLB site for the local NetScaler appliance.

```
add gslb site site-US 10.3.1.101
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. Add the GSLB sites for the remote NetScaler appliances.

```
add gslb site site-MX 172.16.1.101

add gslb site site-CO 192.168.1.101
```

5. Add the GSLB virtual server that references a service being used in the GSLB setup:

```
add gslb vserver gslb-lb HTTP
```

6. Add the GSLB services for each site participating in the GSLB setup:

```
add gslb service gslb_SVC30 172.16.1.100 HTTP 80 -siteName site-MX

add gslb service gslb_SVC10 10.3.1.100 HTTP 80 -siteName site-US

add gslb service gslb_SVC20 192.168.1.100 HTTP 80 -siteName site-CO
```

7. Bind the GSLB services to the GSLB virtual server:

```
bind gslb vserver gslb-lb -serviceName gslb_SVC10

bind gslb vserver gslb-lb -serviceName gslb_SVC20

bind gslb vserver gslb-lb -serviceName gslb_SVC30
```

8. Bind the domain to the GSLB virtual server.

```
bind gslb vserver gslb-lb -domainName www.mycompany.com -TTL 30
```

9. Add an ADNS service that listens to the DNS queries.

```
add service Service-ADNS-1 10.14.39.21 ADNS 53
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Synchronize the configuration in a GSLB setup

Typically, a GSLB setup has a few data centers with a GSLB site configured for each data center. In each NetScaler, participating in GSLB, configure one GSLB site as a local site and the others as remote sites. When you add another GSLB site at a later point, you must ensure that the configuration across all GSLB sites is identical. You can use the NetScaler's GSLB configuration synchronization option to synchronize the configuration across the GSLB sites.

The NetScaler appliance from which you use the synchronization option is referred to as the 'main site' and the GSLB sites on which the configuration is copied as the 'subordinate sites'. When you synchronize a GSLB configuration, the configurations on all the GSLB sites participating in the GSLB setup are made similar to the configuration on the main site.

Synchronization is done only on the parent sites. Synchronization does not affect GSLB child sites' configuration. This is because the parent site and the child site configurations are not identical. The child sites configuration consists only of its own and its parent site's details. Also, GSLB services are not always required to be configured in the child sites.

- The main node finds the differences between the configuration of the main node and subordinate node, and changes the configuration of the subordinate node to make it similar to the main node.

  If you force a synchronization (use the 'force sync' option), the appliance deletes the GSLB configuration from the subordinate node and then configures the subordinate to make it similar to the main node.
- During synchronization, if a command fails, synchronization is not aborted and the error message are logged into a **.err** file in the **/var/netscaler/gslb** directory.
- Synchronization is done only on the parent sites. Synchronization does not affect the GSLB child sites' configuration. This is because the parent site and the child site configurations are not identical. The child sites configuration consists only of its own and its parent site's details. Also, GSLB services are not always required to be configured in the child sites.
- If you disable the internal user login, the GSLB auto sync uses the SSH keys to synchronize the configuration. But, to use GSLB auto sync in the partition environment, you must enable the internal user login and make sure that the partition user name in the local and remote GSLB sites is the same.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE

- On the remote GSLB site RPC node, configure the firewall to accept auto-sync connections by specifying the remote site IP (cluster IP address for cluster setup) and port (3010 for RPC and 3008 for secure RPC). If the default route to reach the remote sites is in the management subnet, as in most cases, then NSIP is used as the source IP address.

To configure a different source IP address, you must have the GSLB site IP address and the SNIP in a different subnet. Also, you must have an explicit route defined to the remote site IP address through a GSLB site IP subnet.
For enhanced security, Citrix recommends that you change the internal user account and RPC node passwords. Internal user account password is changed through RPC node password. For details, see Change an RPC node password.
If you use the saveconfig option, the sites that participate in the synchronization process automatically save their configuration, in the following way:

On the remote GSLB site RPC node, configure the firewall to accept auto-sync connections by specifying the remote site IP (cluster IP address for cluster setup) and port (3010 for RPC and 3008 for secure RPC). If the default route to reach the remote sites is in a management subnet, as in most cases, then NSIP is used as the source IP address.

To configure a different source IP address, you must have the GSLB site IP address and the SNIP in a different subnet. Also, you must have an explicit route defined to the remote site IP address through the GSLB site IP subnet. The source IP address cannot be synchronized across the sites participating in GSLB because the source IP address for an RPC node is specific to each NetScaler appliance. Therefore, after you force a synchronization (using the sync gslb config -forceSync command or by selecting the ForceSync option in the GUI), you have to manually change the source IP addresses on the other NetScaler appliances. Port 22 is also required for synchronizing the database files to the remote site.

To improve the time taken for configuration synchronization on all GSLB sites

Configure the TCP profile settings at the command prompt as follows:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
set tcpprofile nstcp_internal_apps -bufferSize 4194304 -sendBuffsize
4194304 -tcpmode ENDPOINT
```

Limitations of synchronization

- On the main site, the names of the remote GSLB sites must be identical to the names of sites configured on the NetScaler appliances hosting those sites.
- During the synchronization, traffic disruptions may occur.
- NetScaler is tested to synchronize up to 200,000 lines of the configuration.
- Synchronization may fail:
  - If the spill over method is changed from CONNECTION to DYNAMIC CONNECTION.
  - If you interchange the site prefix of the GSLB services bound to a GSLB virtual server on the main node and then try to synchronize.
  - If the RPC node passwords are different for NSIP and loopback IP address.
  - If you perform synchronization on GSLB sites that are configured in different partitions of the same NetScaler appliance.
- If you have configured the GSLB sites as High Availability (HA) pairs, the RPC node passwords of primary and secondary nodes must be the same.
- If you rename any GLSB entity that is part of your GSLB configuration (use the "show gslb runningConfig" command to display the GSLB configuration). You must use the force sync option to synchronize the configuration to other GSLB sites.

NOTE:

- In incremental synchronization, you don't have to use the force sync option to synchronize the configuration to other GSLB sites. This is applicable starting NetScaler release 13.0 build 79.x onwards.

Note: To overcome the limitations due to some settings in the GSLB configuration, you can use the force sync option. But, if you use the force sync option the GSLB entities are removed and readded to the configuration and the GSLB statistics are reset to zero. Hence the traffic is disrupted during the configuration change.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Points to note before starting the synchronization of a GSLB setup

Before you start the synchronization of a GSLB setup, make sure that:

- On all the GSLB sites including the main site, management access and SSH must be enabled for the IP address of the corresponding GSLB site. The IP address of a GSLB site must be an IP address owned by the NetScaler appliance. For more information about adding the GSLB site IP addresses and enabling Management Access, see "Configuring a Basic GSLB Site".
- The GSLB configuration on the NetScaler appliance that is considered as the main site is complete and appropriate to be copied on all the sites.
- If you are synchronizing the GSLB configuration for the first time, all the sites participating in GSLB must have the GSLB site entity of their respective local sites.
- You are not synchronizing sites that, by design, do not have the same configuration.
- The main site and the subordinate sites run the same NetScaler versions. Starting from release 12.1, build 50.x, the appliance checks for the firmware version on main and subordinate sites before initiating synchronization. If the main and the subordinate sites run different versions, the synchronization is aborted for that remote site to avoid pushing any incompatible changes across the versions. Also, an error message displaying the site details on which the synchronization aborted appears.

  The following figures display sample error messages from the CLI and the GUI.

```
> sh gslb syncStatus -summary
Displaying the status summary of the manual GSLB configuration synchronization:

-------------------------------------------------------------------------------------------------------------
        Site Name                Status        Reason
-------------------------------------------------------------------------------------------------------------
        s2                       Failure       Error: Different netscaler release on the remote site. Local Site: 13.0, Remote Site: 12.1
        s1                       Success       All Done
        s3                       Success       All Done
Done
>
```

```
> sh gslb syncStatus -summary
Displaying the status summary of the manual GSLB configuration synchronization:

IMPORTANT

The following directories are synchronized as part of the GSLB configuration synchronization.

- /var/netscaler/locdb/
- /var/netscaler/ssl/
- /var/netscaler/inbuilt_db/

Manual synchronization between sites participating in GSLB

The manual synchronization of GSLB configuration across the master site and the slave sites is performed in the following manner:

- The master site detects the differences between the configuration of its own site and the slave site.
- The master site applies the difference in configuration to the slave site.
- The master site performs the configuration synchronization with all the slave sites in the GSLB setup, and completes the synchronization process.

Important: After a GSLB configuration is synchronized, the configuration cannot be rolled back on any of the GSLB sites. Perform the synchronization only if you are sure that the synchronization process does not overwrite the configuration on the remote site. Site synchronization is undesirable when the local and remote sites have different configurations by design, which leads to site outage. If some commands fail and some commands succeed, the successful commands are not rolled back.

Points to note

- If you force a synchronization (use the ‘force sync’ option), the NetScaler appliance deletes the GSLB configuration from the slave site. Then, master site configures the slave site to make it similar to its own site.
- During synchronization, if a command fails, synchronization is not aborted. The error messages are logged into an .err file in the /var/netscaler/gslb directory.
- If you use the `saveconfig` option, the sites participating in the synchronization process automatically save their configuration, in the following way:
    - The master site saves its configuration immediately before it initiates the synchronization process.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- The slave sites save their configuration after the process of synchronization is complete. A slave site saves its configuration only if the configuration difference was applied successfully on it. If synchronization fails on a slave site, you must manually investigate the cause of the failure and take corrective actions.

To synchronize a GSLB configuration by using the CLI:

At the command prompt, type the following commands to synchronize GSLB sites and verify the configuration:

```
sync gslb config [-preview | -forceSync <string> | -nowarn | -saveconfig]
[-debug]

show gslb syncStatus
```

Example:

```
sync gslb config

[WARNING]: Syncing config may cause configuration loss on other site.

Please confirm whether you want to sync-config (Y/N)? [N]:y

Sync Time: Dec 9 2011 10:56:9

Retrieving local site info: ok

Retrieving all participating gslb sites info: ok

Gslb_site1[Master]:
```

Done
```

To synchronize a GSLB configuration by using the GUI:

1. Navigate to **Traffic Management > GSLB > Dashboard**.
2. Click **Auto Synchronization GSLB** and select **ForceSyn**.
3. In **GSLB Site Name**, select the GSLB sites that are to be synchronized with the master node configuration.

Previewing GSLB synchronization

By previewing the GSLB synchronization operation, you can see the differences between the master node and each slave node. If there are any discrepancies, you can troubleshoot before synchronizing the GSLB configuration.

To preview the GSLB synchronization output by using the CLI:

At the command prompt, type the following command:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
sync gslb config -preview
```

To preview the GSLB synchronization output by using the GUI:

1. Navigate to **Configuration** > **Traffic Management** > **GSLB** > **Dashboard**.
2. Click **Auto Synchronization GSLB** and select **Preview**.
3. Click **Run**. A progress window displays any discrepancies in the configuration.

Debugging the commands triggered during synchronization process

You can view the status (success or failure) of each command triggered during the synchronization process and troubleshoot accordingly.

To debug the GSLB synchronization commands by using the CLI:

At the command prompt, type the following command:

```
sync gslb config -debug
```

To debug the GSLB synchronization commands by using the GUI:

1. Navigate to **Configuration** > **Traffic Management** > **GSLB** > **Dashboard.**
2. Click **Auto Synchronization GSLB** and select **Debug**.
3. Click **Run**. A progress window displays the status of each command triggered during synchronization.

Real-time synchronization between sites participating in GSLB

You can use the `AutomaticConfigSync` parameter to automatically synchronize the real-time GSLB configuration of the main site to all the subordinate sites. You do not have to manually trigger the AutoSync option to synchronize the configuration.

You can automatically synchronize GSLB configuration of the main site to all the subordinate sites by using incremental synchronization or full synchronization. The `GSLBSyncMode` parameter allows you to choose the synchronization mode.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Note:

> Starting from NetScaler release 13.0 build 79.x, incremental synchronization of GSLB synchronization is supported. By default, the synchronization is performed using incremental synchronization. Incremental synchronization can be performed by enabling the `IncrementalSync` parameter. For details, see Incremental synchronization of GSLB configuration.

Best practices for using the real-time synchronization feature

- It is recommended that all the NetScaler appliances participating as sites have the sameNetScaler software version.
- To change the RPC node password, first change the password on the subordinate site and then on the main site.
- Configure local GSLB sites on each site participating in GSLB.
- Enable automaticConfigSync on one of the sites where the configuration is performed. This site eventually gets synchronized to other GSLB sites.
- If there is a new configuration or changes are made to the existing configuration, make sure to check the status using the `show gslb syncStatus` command to confirm if the changes are synchronized across all sites or if there was any error.
- RSYNC port monitoring must be enabled.

To enable real-time synchronization by using the CLI

At the command prompt, type:

```
set gslb parameter [–automaticConfigSync (ENABLED | DISABLED)] [-
MEPKeepAliveTimeout <secs>]  [-GSLBSyncMode ( IncrementalSync |
FullSync )] [-GSLBSyncLocFiles ( ENABLED | DISABLED)] [-
GslbConfigSyncMonitor ( ENABLED | DISABLED )] [-GSLBSyncInterval <secs>]
[-GSLBSyncSaveConfigCommand ( ENABLED | DISABLED )]
```

Example:

```
set gslb parameter –automaticConfigSync ENABLED
```

The real-time synchronization provides the following configurable parameters:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **GSLBSyncMode**-Mode in which configuration is synchronized from main site to remote sites.
  - Possible values: IncrementalSync, FullSync
  - Default value: IncrementalSync
- **GSLBSyncLocFiles**—During GSLB config synchronization, by default, the changes in the location DB files are detected and automatically synchronized. Because the location DB directories do not change often, admins can disable automatically synchronizing the location DB files. Instead, admins must manually copy the location DB files to the GSLB subordinate sites. Synchronizing location DB files takes much time. Thus, avoiding it reduces the overall synchronization time.

  Example to disable automatically synchronizing the location DB files:

  ```
  set gslb parameter -GSLBSyncMode IncrementalSync -GSLBSyncLocFiles
  DISABLED
  ```

- **GslbConfigSyncMonitor**—Enable the GSLB Config Sync Monitor parameter to monitor the state of the subordinate sites' RSYNC port which is the SSH port 22 on remote GSLB site IP address. If the monitor shows the subordinate site state as DOWN, the RSYNC operation to that site is skipped. This reduces the synchronization delays caused by attempting to connect to the remote sites that are DOWN.

  Example to enable RSYNC port monitoring in CLI:

  ```
  set gslb parameter -GSLBSyncMode IncrementalSync -GslbConfigSyncMonitor
  ENABLED
  ```

- **GSLBSyncInterval**—Set the time interval (in seconds) at which the GSLB configuration synchronization occurs. By default, the automatic GSLB configuration sync feature synchronizes the GSLB configuration automatically at every 10 seconds. You can change the time interval to any desired value. Refrain from setting this to a lower value, for example, not lesser than 5 seconds. Because synchronizing frequently might increase the management CPU consumption.

  Note:

  > In an admin partition setup, the time interval can be set only in the default partition because it is a global parameter.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Example to set the sync interval:

```
set gslb parameter -AutomaticConfigSync ENABLED -GSLBSyncMode
IncrementalSync -GSLBSyncInterval 7
```

- **GSLBSyncSaveConfigCommand**—Enable this parameter to synchronize the `save ns config` command to subordinate sites, if the `AutomaticConfigSync` option is enabled.

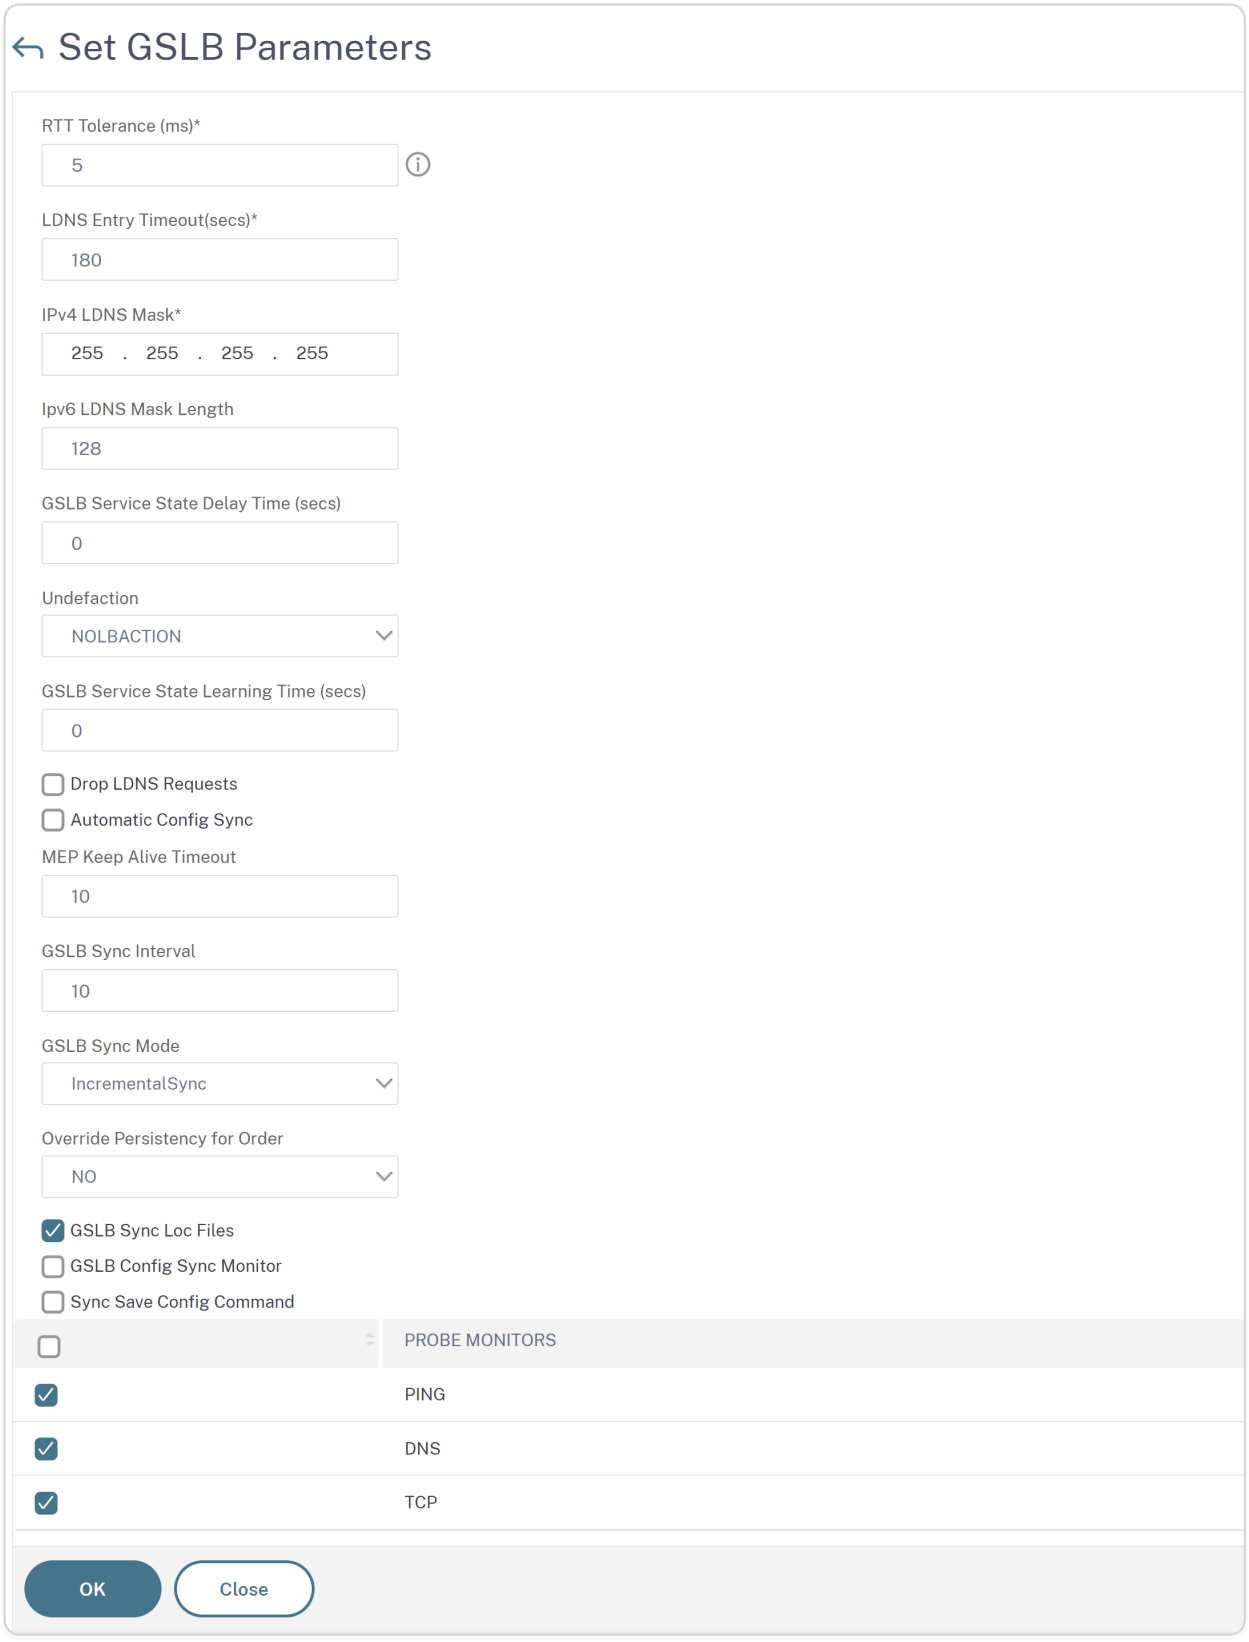
  Example to enable the synchronization of 'Save Config' Command:

  ```
  set gslb parameter -AutomaticConfigSync ENABLED
  -GSLBSyncSaveConfigCommand ENABLED
  ```

  The `save ns config` command isn't synchronized to subordinate sites in certain scenarios as follows:

  - Subordinate site is down or unreachable when config is saved on main site.
  - Configuration has failed on a subordinate site.

To enable real-time synchronization by using the GUI



1. Navigate to **Configuration** > **Traffic Management** > **GSLB** > **Change GSLB Settings**.
2. In the **Set GSLB Parameters** page, you can perform the following:

   - To automatically synchronize the real-time GSLB configuration, select **Automatic ConfigSync**.

   Note: This option must be enabled only in the site where the configuration is performed.

   - To set the Automatic GSLB config sync interval, enter the time in seconds in the **GSLB Sync Interval** field.
   - To enable RSYNC port monitoring, select the **GSLB Config Sync Monitor** check box.
   - To disable automatically synchronizing the location DB files, clear the **GSLB Sync Loc Files** check box.
   - To enable synchronizing of the `save ns config` command to the subordinate sites, select **Sync Save Config Command** check box.

Points to note

- The consolidated log file related to the real-time synchronization is stored in the /var/netscaler/gslb/periodic_sync.log directory.
- The default configuration file is stored in the /var/netscaler/gslb_sync/ directory.
- The main site uses the following directory structure:
  - The main site stores all its files in the /var/netscaler/gslb_sync/master directory.
  - The main site stores its configuration file that must be synced to the subordinate sites, in the /var/netscaler/gslb_sync/master/gslbconf/ directory.
  - The status files pulled from all the subordinate sites are stored in the /var/netscaler/gslb_sync/master/slavestatus/ directory.
- The subordinate site uses the following directory structure:
  - The subordinate site picks up the latest configuration file to be applied from the /var/netscaler/gslb_sync/slave/gslbconf directory.
  - The subordinate site stores its status file in the /var/netscaler/gslb_sync/slave/gslbstatus directory.
- In an admin partition setup, the same directory structure is maintained in the location: /var/partitions/`partition name`/netscaler/gslb_sync.
- The clocks on all the sites must be set accurately to a real-time standard like Coordinated Universal Time (UTC).

Incremental synchronization of GSLB configuration

The automatic GSLB configuration synchronization feature checks for the configuration changes on the main site at the interval of every 10 seconds, and performs a synchronization. This sync interval value is configurable.

In incremental synchronization, only the configurations that have changed on the main site between the last synchronization and the subsequent sync interval (10 secs) is synchronized across all the subordinate sites. Incremental synchronization is the default behavior. Pushing only the incremental configurations considerably reduces the configuration file size, and thus the synchronization time. If an incremental synchronization fails, the system automatically performs a full configuration synchronization.

Incremental synchronization is performed in the following manner:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- The main site pushes the configuration file comprising of only its latest changes to all the subordinate sites. The latest change refers to the configurations that has changed between the last synchronization and the subsequent sync interval (10 secs).
- Each subordinate site applies the latest change to its own site.
- Incremental synchronization in not attempted on the subordinate sites, which are in DOWN state. When the site comes back UP, again synchronization is performed.
- The subordinate site generates status logs at each step and copies them to a file at a specific location.
- The main site pulls the status log files from the specified location.
- The main site prepares a log file with logs combined from all the subordinate sites.
- This combined log file is stored in the "/var/netscaler/gslb/periodic_sync.log" file.

For more information on the directories where the configuration files are stored, see Points to note section.

To enable GSLB configuration incremental synchronization by using the CLI

```
set gslb parameter -AutomaticConfigSync (ENABLED | DISABLED) -GSLBSyncMode
(IncrementalSync | FullSync) -GslbConfigSyncMonitor (ENABLED | DISABLED)
-GSLBSyncInterval <secs> -GSLBSyncLocFiles (ENABLED | DISABLED)
```

Example:

```
set gslb parameter -AutomaticConfigSync ENABLED -GSLBSyncMode
IncrementalSync
```

To enable GSLB incremental synchronization by using the GUI

1. Navigate to **Traffic Management > GSLB > Dashboard > Change GSLB settings**.
2. In the **Set GSLB Parameters** page, choose **IncrementalSync** from the **GSLB Sync Mode** drop-down menu.

Full synchronization of GSLB configuration

Whenever there is a configuration change in the main site, the complete GSLB running configuration on the main site is pushed to all the subordinate sites. Even if incremental synchronization is configured, a full synchronization is performed when the main site does not know the configuration status of the subordinate site. Some of such scenarios are as follows:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Enable the automatic GSLB configuration synchronization feature for the first time.
- Reboot the NetScaler appliance.
- GSLB deployment has multiple main sites, and another main site becomes the active main site.
- Add a new subordinate site to the GSLB deployment.

GSLB configuration full synchronization is performed in the following manner:

- The main site pushes its latest configuration file to all the subordinate sites.
- Each subordinate site compares its own configuration with the latest configuration file sent by the main site. The subordinate site identifies the difference in configuration, and applies the delta configuration for its own site.
- The subordinate site generates status logs at each step and copies them to a file at a specific location.
- The main site pulls the status log files from the specified location.
- The main site prepares a log file with logs combined from all the subordinate sites.
- This combined log file is stored in the "/var/netscaler/gslb/periodic_sync.log" file.

If you attempt to manually synchronize (with the `sync gslb config` command) a site while it is being autosynchronized, a "Sync in progress" error message appears. Autosynchronization cannot be triggered for a site that is in the process of being synchronized manually.

NOTE:

Starting with NetScaler 12.1 build 49.37, SNMP traps are generated when you synchronize the GSLB configuration. In real-time synchronization, the synchronization status in the first SNMP trap is captured as failure. You can ignore this status because a second SNMP trap is automatically generated immediately after the first trap with the actual synchronization status. However, if the synchronization failed in the second attempt also, SNMP trap is not generated because the synchronization status has not changed from the previous synchronization status.

For details on configuring NetScaler appliance to generate traps, see Configuring the NetScaler to generate SNMP traps.

To enable GSLB full synchronization by using the CLI

```
set gslb parameter -GSLBSyncMode (IncrementalSync | FullSync)
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Example:

```
set gslb parameter -GSLBSyncMode FullSync
```

To enable GSLB incremental synchronization by using the GUI:

1. Navigate to **Traffic Management > GSLB > Dashboard > Change GSLB settings**.
2. In the **Set GSLB Parameters** page, choose **FullSync** from the **GSLB Sync Mode** drop-down menu.

Multiple main sites in a GSLB deployment

The NetScaler appliance supports multiple main sites in an active-passive deployment. It is recommended to have two main sites in a GSLB deployment to cope against GSLB main site failure. Having two main sites can avoid single point of failure of GSLB configuration synchronization. At any time, only one main site can actively process the GSLB configuration from the user. If the configuration changes are performed simultaneously in more than one main site, it might lead to configuration inconsistency or configuration losses. Hence, it is recommended to perform configuration changes from only one main site at a time, and use the other main site as a backup when the active main site fails.

**Note:

> When multiple main sites are used in a GSLB deployment, RSYNC monitoring must be enabled.

To make a GSLB node as one of the main sites for GSLB configuration synchronization, run the following command:

```
set gslb parameter -automaticConfigSync Enabled
```

View GSLB synchronization status and summary

After the GSLB configuration is synchronized across the GSLB sites, you can view the detailed status and the summary of the last GSLB sync operation. This is applicable to both manual and real-time GSLB synchronization.

To view the GSLB synchronization status or summary by using the CLI

At the command prompt, type:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
show gslb sync status
```

or

```
show gslb syncStatus -summary
```

Sample configuration output for GSLB manual synchronization

The following output displays the status of the manual GSLB configuration synchronization.

```
> sh gslb syncStatus
Displaying the status of the manual GSLB configuration synchronization:

gslb_site1[Master]:
        Getting Config:  ok
gslb_site2[Slave]:
        Syncing gslb static proximity database:  ok
        Syncing inbuilt gslb static proximity database : ok
        Getting Config:  ok
        Comparing config:  ok
        Applying changes:  ok
gslb_natsite1[Slave]:
        Syncing gslb static proximity database:  ok
        Syncing inbuilt gslb static proximity database : ok
        Getting Config:  ok
        Comparing config:  ok
        Applying changes:  ok
 Done
> 
```

The following output displays the status summary of the manual GSLB configuration synchronization.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
> sh gslb syncStatus -summary
Displaying the status summary of the manual GSLB configuration synchronization:

-------------------------------------------------------------------------------------------------------------
        Site Name                Status          Reason
-------------------------------------------------------------------------------------------------------------
        gslb_site1               Success         All Done
        gslb_site2               Failure         Error executing command on gslb site...ERROR: Connection failed
        gslb_natsite1            Success         All Done
Done
>
```

Sample configuration output for GSLB real-time synchronization

The following output displays the status of the real-time GSLB configuration synchronization for the master site:

```
> sh gslb syncStatus

Displaying the status of the real time GSLB configuration synchronization
as master node:

site2[Master]:

                New GSLB configuration detected at Fri Jan 23 20:54:24
2020

                Fetching current configuration: Done

                Updating default.conf file: Done

site1[Slave]:

                Syncing gslb static proximity database to node site1: Done

                Syncing inbuilt GSLB static proximity database to node
site1: Done

                Syncing ssl certificates, keys and CRLS to node site1:
Done

                Syncing current configuration to site1: Done
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
                Pulling status files from site1: Status file not available
yet(Sync in progress)

                Pulling status files from site1: Done

                site1 received new configuration from 10.102.217.205 in
file 2JNSzClRHK5+pdek6szQ3g-default-10.102.217.210.conf

                Firing set gslb parameter -startConfigSync ENABLED
command: Done

                Fetching running GSLB Config: Done

                Comparing config: Done

                Applying changes: Done

                Firing set gslb parameter -startConfigSync DISABLED
command: Done

                Updating default.conf file: Done

Done
```

The following output displays the status of the real-time GSLB configuration synchronization for the slave site:

```
> sh gslb syncStatus

Displaying the status of the real time GSLB configuration synchronization
as slave node:

                site1 received new configuration from 10.102.217.205 in
file 2JNSzClRHK5+pdek6szQ3g-default-10.102.217.210.conf

                Firing set gslb parameter -startConfigSync ENABLED
command: Done

                Fetching running GSLB Config: Done
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
                Comparing config: Done

                Applying changes: Done

                Firing set gslb parameter -startConfigSync DISABLED
command: Done

                Updating default.conf file: Done

Done
```

The following output displays the status summary of the real-time GSLB configuration synchronization for the master site:

```
> sh gslb syncStatus -summary

Displaying the status summary of the real time GSLB configuration
synchronization as master node:

------------------------------------------------------------------------
----------------------------

                Site Name                                   Status
  Reason

------------------------------------------------------------------------
----------------------------

                site2                                       Success
 All Done

                site1                                       Success
 All Done

Done
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The following output displays the status summary of the real-time GSLB configuration synchronization for slave site:

```
> sh gslb syncStatus –summary

Displaying the status summary of the real time GSLB configuration
synchronization as slave node:

--------------------------------------------------------------------------
--------------------------------

                Site Name                                   Status
  Reason

--------------------------------------------------------------------------
--------------------------------

                site1                                       Success
 All Done

Done
```

To view the GSLB synchronization status or summary by using the GUI

1. Navigate to **Configuration** > **Traffic Management** > **GSLB** > **Dashboard**.
2. Click **View Synchronization Summary** or **View Synchronization Status**, as required.

SNMP traps for GSLB configuration synchronization

Starting with NetScaler 12.1 build 49.xx, the NetScaler appliance generates SNMP traps for both local and remote sites when you synchronize the GSLB configuration. SNMP traps are generated for both manual synchronization and real-time synchronization.

When you synchronize the GSLB configuration for the first time, SNMP traps are generated. In the subsequent synchronization attempts, the SNMP traps are generated only if there is a change in the synchronization status from the previous synchronization status. Also, the SNMP traps are generated only for sites for which the synchronization status changed from the previous state.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

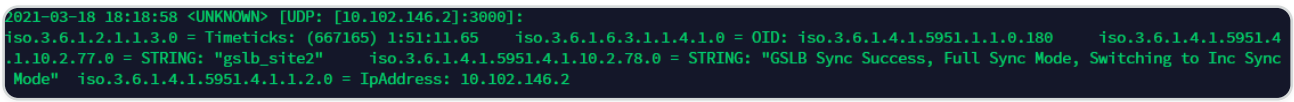
For example, consider that the first GSLB configuration synchronization is successful. When you synchronize the configuration for the second time and if the synchronization is successful again, then SNMP traps are not generated because the status is not changed. However, in the third attempt, if the synchronization fails for one of the sites, then SNMP trap is generated for that site alone.

In a high availability and a cluster setup, the appliance generates the SNMP traps when you synchronize the GSLB configuration from the new node irrespective of the previous synchronization status. Also, if SNMP trap option was previously disabled and then enabled, SNMP traps are generated from that point onwards irrespective of previous synchronization status.

The SNMP traps of GSLB configuration synchronization provide the following details:

- Name of the GSLB site for which the SNMP trap is sent.
- GSLB configuration synchronization status: Success or Failure.
- GSLB configuration synchronization mode: Incremental sync or Full sync.
- (Optional) Detailed information about the SNMP traps.

The SNMP traps are generated in the following scenarios:



- GSLB synchronization status for a GSLB site flips from Success to Failure, and conversely.
- GSLB synchronization mode changes from incremental synchronization to full synchronization, and conversely.

Note:

> Even when incremental synchronization is enabled, if full synchronization is performed on a GSLB site for some reason, the reason for Full sync is mentioned in the "Detailed information" section of the trap message. For example, when a new GSLB site is added to the GSLB configuration.

Sample SNMP trap messages

The following figure displays a sample SNMP trap for gslb_site2, where the GSLB configuration synchronization is successful using the Full sync mode.

The following figure displays a sample SNMP trap for gslb_site2, where the GSLB configuration synchronization is successful using the incremental sync mode.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
2021-03-18 18:24:18 <UNKNOWN> [UDP: [10.102.146.2]:3000]:

uration to gslb_site2: Skipped, Site Monitor is down"   iso.3.6.1.4.1.5951.4.1.1.2.0 = IpAddress: 10.102.146.2
```

GSLB dashboard

You can view the overall status of the GSLB sites participating in GSLB on the GSLB dashboard.

You can access the GSLB settings from the dashboard. You can also start the GSLB configuration wizard from the dashboard. Additionally, you can perform the synchronization and test the GSLB setup from the dashboard.

To access the GSLB dashboard, navigate to **Configuration** > **Traffic Management** > **GSLB** > **Dashboard**.

Monitor GSLB services

When you bind a remote service to a GSLB virtual server, the GSLB sites exchange metric information, including network metric Information, which is the round-trip-time and persistence Information.

If a metric exchange connection is momentarily lost between any of the participating sites, the remote site is marked as DOWN and load balancing is performed on the remaining sites that are UP. When metric exchange for a site is DOWN, the remote services belonging to the site are marked DOWN as well.

The NetScaler appliance periodically evaluates the state of the remote GSLB services by using either MEP or monitors that are explicitly bound to the remote services. Binding explicit monitors to local services is not required, because the state of the local GSLB service is updated by default

© 1997–2026 Citrix Systems, Inc. All rights reserved.

using the MEP. However, you can bind explicit monitors to a remote service. When monitors are explicitly bound, the state of the remote service is not controlled by the metric exchange.

By default, when you bind a monitor to a remote GSLB service, the NetScaler appliance uses the state of the service reported by the monitor. However, you can configure the NetScaler appliance to use monitors to evaluate services in the following situations:

- Always use monitors (default setting).
- Use monitors when MEP is DOWN.
- Use monitors when remote services and MEP are DOWN.

The second and third of the above settings enable the appliance to stop monitoring when MEP is UP. For example, in a hierarchical GSLB setup, a GSLB site provides the MEP information about its child sites to its parent site. Such an intermediate site may evaluate the state of the child site as DOWN because of network issues, though the actual state of the site is UP. In this case, you can bind monitors to the services of the parent site and disable MEP to determine the actual state of the remote service. This option enables you to control the manner in which the states of the remote services are determined.

To use monitors, first create them, and then bind them to GSLB services.

Configure monitor trigger

You can configure a GSLB site to always use monitors (the default), use monitors when MEP is down, or use monitors when both the remote service and MEP are down. In the latter two cases, the NetScaler appliance stops monitoring when MEP returns to the UP state.

To configure monitor triggering by using the command line interface

At the command prompt, type:

```
set gslb site <siteName> –triggerMonitor (ALWAYS | MEPDOWN |
MEPDOWN_SVCDOWN)
```

Example:

```
set gslb site Site-GSLB-North-America –triggerMonitor Always
```

To configure monitor triggering by using the configuration utility

1. Navigate to **Traffic Management** > **GSLB** > **Sites**, and double-click the site.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. In the **Trigger Monitors** drop-down list, select an option for when to trigger monitoring.

Add or remove monitors

To add a monitor, you specify the type and the port. You cannot remove a monitor that is bound to a service. You must first unbind the monitor from the service.

To add a monitor by using the command line interface

At the command prompt, type the following commands to create a monitor and verify the configuration:

```
add lb monitor <monitorName> -type <monitorType> -destPort <portNumber>

show lb monitor <monitorName>
```

Example:

```
add lb monitor monitor-HTTP-1 -type HTTP -destPort 80

show lb monitor monitor-HTTP-1
```

To remove a monitor by using the command line interface

At the command prompt, type:

```
rm lb monitor <monitorName>
```

To add a monitor by using the configuration utility

Navigate to Traffic Management > Load Balancing > Monitors, and add or delete a monitor.

Bind monitors to a GSLB service

Once you create monitors, you must bind them to GSLB services. When binding monitors to the services, you can specify a weight for the monitor. After binding one or more weighted monitors, you can configure a monitor threshold for the service. This threshold takes the service down if the sum of the bound monitor weights falls below the threshold value.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Note: In the configuration utility, you can set both the weight and the monitoring threshold at the same time that you bind the monitor. When using the command line, you must issue a separate command to set the service's monitoring threshold.

To bind the monitor to the GSLB service by using the command line interface

At the command prompt, type:

```
bind monitor <name> <serviceName> [ -state (Enabled | Disabled) ] -weight
<positiveInteger>
```

Example:

```
bind monitor monitor-HTTP-1 service-GSLB-1 -state enabled -weight 2
```

To set the monitoring threshold for a GSLB service by using the command line interface

At the command prompt, type:

```
set gslb service <ServiceName> -monThreshold <PositiveInteger>
```

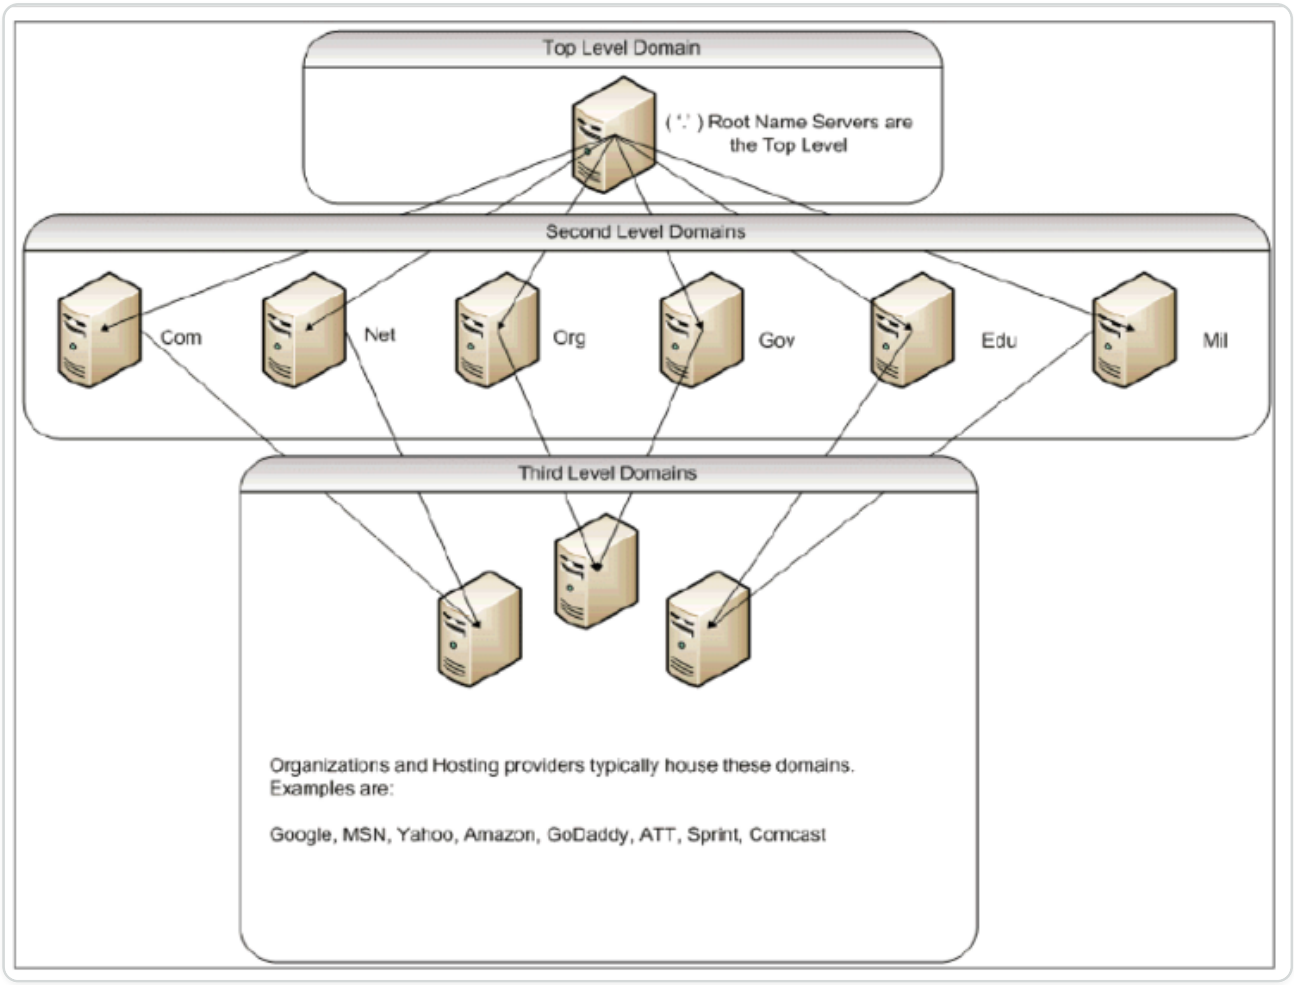
Example:

```
set gslb service service-GSLB-1 -monThreshold 9
```

To bind the monitor to the GSLB service by using the configuration utility

1. Navigate to Traffic Management > GSLB > Services.
2. Click the **Monitor** section and bind the monitor to the GSLB service.

To set the monitoring threshold for a GSLB service by using the configuration utility



1. Navigate to Traffic Management > GSLB > Services.
2. Click the **Monitor Threshold** section and enter a threshold value.

How domain name system supports GSLB

The domain name system (DNS) is considered as a distributed database, which uses the Client/Server architecture. Name Servers are the servers in the architecture, and the resolvers are the clients that are library routines installed on an operating system that create and send queries across the network.

The logical hierarchy of the DNS is shown in the following diagram:

Note:

The second-level root servers are responsible for maintaining Name server to Address mappings for Name server delegations within the .com, .net, .org, .gov domains, and so on. Each domain within the second-level domains is responsible for maintaining Name Server to Address mappings for the lower-level organizational domains. At the organization level, the individual host addresses are resolved for www, FTP, and other service providing hosts.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Delegation

The main purpose of the current DNS topology is to ease the burden of maintaining all address records on one authority. This allows for delegation of an organization name space to that particular organization. The organization can then further delegate its space to subdomains within the organization. For example, under citrix.com you can create subdomains called `sales.citrix.com`, `education.citrix.com`, and `support.citrix.com`. The corresponding departments can maintain their own set of Name servers that are authoritative for their subdomain, and then maintain their own set of host name to address mappings. No single department is responsible for maintaining all of Citrix address records. Each department can change addresses and modify topologies, and not impose more work at the higher-level domain or organization.

Benefits of the hierarchical topology

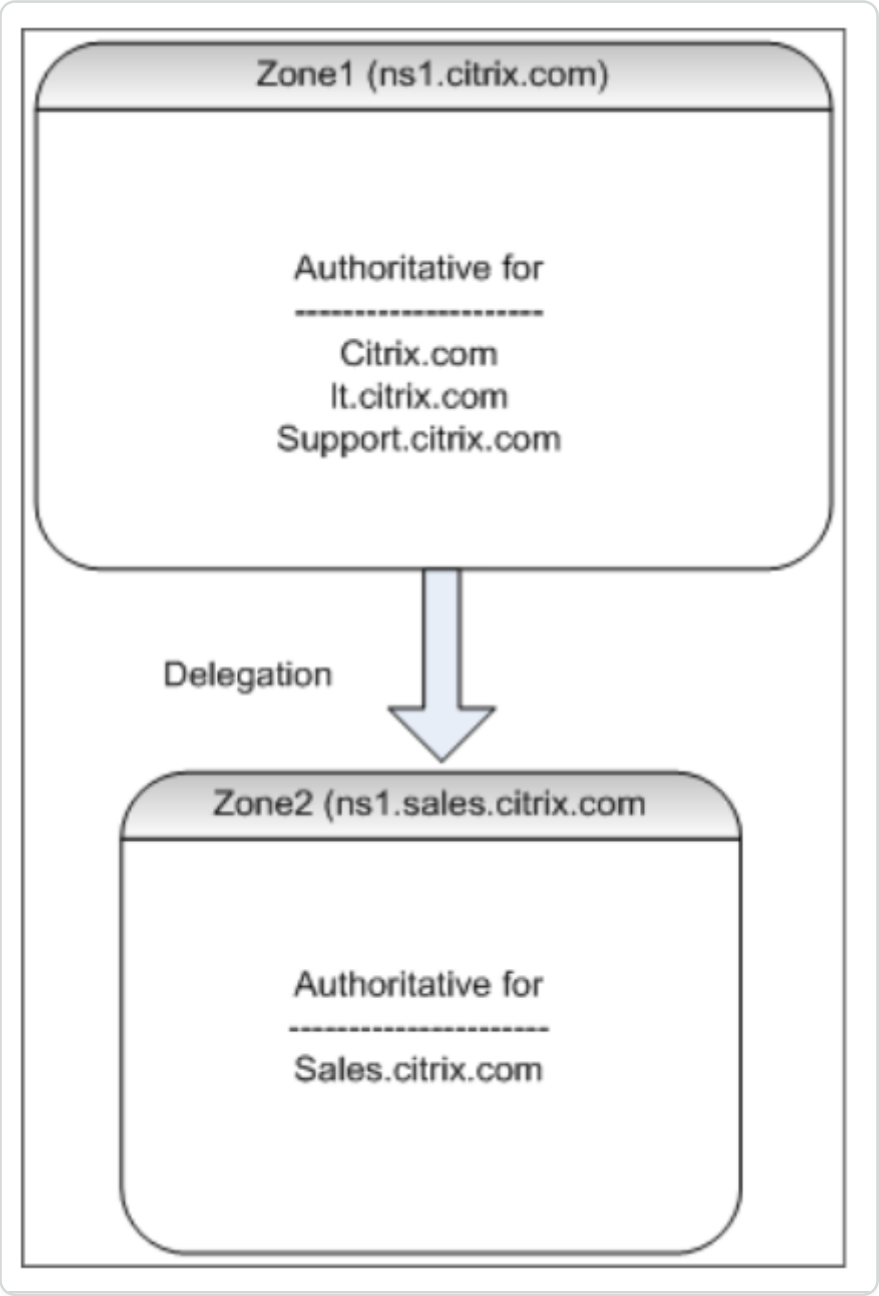
Some of the benefits of the hierarchical topology include:

- Scalability
- Adding caching functionality into Name servers at each level, where a DNS request is served by a host that is not authoritative for a particular domain but can contribute the answer to the query, and cut down on congestion and response time.
- Caching also creates redundancy and resiliency to server failure. If one name server fails, it is still possible that records can be served from other servers that have recent cached copies of the same records.

Resolvers

Resolvers are the client component in the DNS system. Programs that are running on a host that need information from the domain name space use the resolver. The resolver handles:

- Querying a name server.
- Interpreting responses (which might be resource records or an error).
- Returning the information to the programs that requested it.



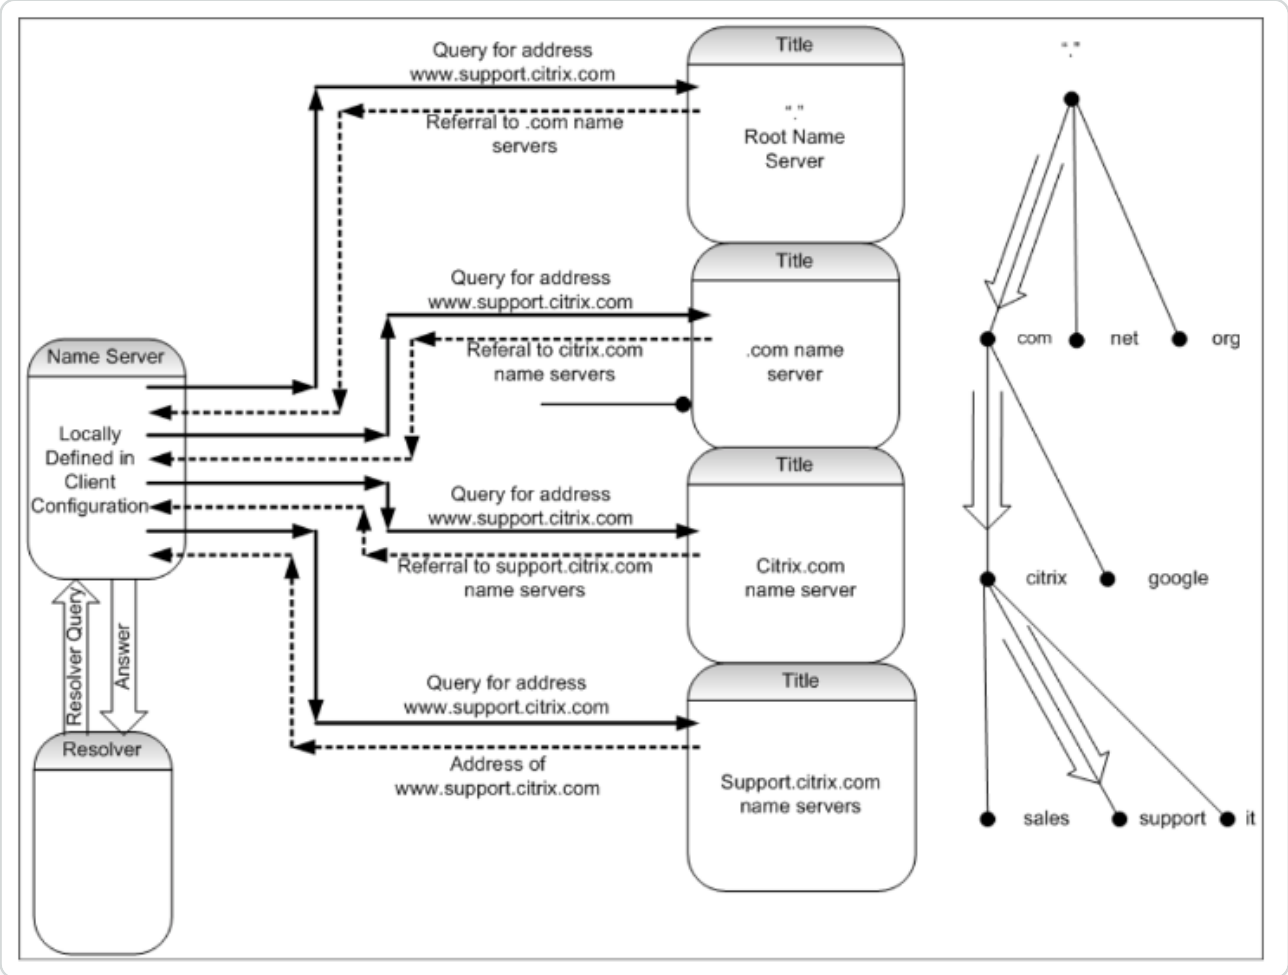
The resolver is a set of library routines that are compiled into programs like telnet, FTP, and ping. They are not separate processes. The resolvers can put together a query, send it, and wait for an answer. And, send it again (possibly to a secondary Name Server) if it is not answered within a certain time. These types of resolvers are known as stub resolvers. Some resolvers have the added functionality to cache records, and honor time to live (TTL). In Windows, this functionality is available through the DNS Client service; viewable through the "services.msc" console.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Name Servers

Name Servers generally store complete information about a particular part of a domain name space (called a zone). The Name Server is then said to have authority for that zone. They can also be authoritative for multiple zones.

The difference between a domain and a zone is subtle. A domain is the full set of entities including its subdomains while a zone is only the information within a domain that is not delegated to another Name Server. An example of a zone is `citrix.com`, while `sales.citrix.com` is a separate zone if that zone is delegated to another Name Server within the subdomain. In this case, the primary Citrix zone can include `citrix.com`, `it.citrix.com`, and `support.citrix.com`. Because the `sales.citrix.com` is delegated, it is not part of the zone that the `citrix.com` Name Server is authoritative over. The following diagram shows the two zones.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

To properly delegate a subdomain, you must assign authority for the subdomain to different Name Servers. In the preceding example, the `ns1.citrix.com` does not contain information about the `sales.citrix.com` subdomain. Instead, it contains pointers to the Name servers that are authoritative for the `ns1.sales.citrix.com` subdomain.

Root name servers and query resolution

Root Name servers know the IP addresses of all the Name servers authoritative for the second-level domains. If a Name Server does not have information about a given domain in its own data files, then it only needs to contact a root server to begin traversing the proper branch of the **DNS** tree structure to eventually get to the given domain. This involves a series of requests to multiple Name servers to help with the tree traversal to find the next authoritative Name server, which needs to be contacted for further resolution.

The following diagram shows a typical DNS request, assuming that there is no cached record for the requested name during the traversal. The following example uses a mock up of the Citrix® domain.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Recursive and non-recursive queries

The preceding example demonstrates the two types of queries that can occur.

- Recursive query: The query between the resolver and the locally configured Name server is recursive. This means that the Name server receives the query and does not respond to the resolver until the query is fully answered, or an error is returned. If the Name Server receives a referral to the query, then the Name server follows the referral until the Name server finally receives the answer (IP address) returned.
- Non-recursive query: The query that the locally configured Name server makes to the subsequent authoritative domain-level Name server is non-recursive (or iterative). Each request is immediately responded with either a referral to a lower-level authoritative server or the answer to the query, if the queried Name server contains the answer in its data files or its cache.

Caching

Although the resolution process is involved, and might potentially require small requests to several hosts, it is fast. One of the factors that increases the speed of DNS resolution is caching. Each time a Name server receives a recursive query, it might have to communicate to other servers to eventually get to the proper authoritative server for the specific request. It stores all of the information that it receives for future reference. When the next client makes a similar request, such as a different host but in the same domain, it already knows the Name server that is authoritative for that domain, and can send a request directly there instead of starting at the root Name server.

Caching can occur for negative responses also, such as the queries for hosts that do not exist. In this case, the server must not query the authoritative Name server for the requested domain to figure out that the host does not exist. To save time, the Name server simply checks the cache and responds back with the negative record.

Name servers do not cache records indefinitely, or else you can never update the IP addresses. To avoid synchronization problems, DNS responses contain a time to live (TTL). This field describes the time interval for which the cache can store a record before it must discard it and check with the authoritative Name server for any updated records. If the records have not changed, the use of TTL also allows rapid dynamic responses from devices performing GSLB.

Resource record types

Various RFCs provide a comprehensive list of DNS resource record types and its description. The following table lists the common resource record types.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

RESOURCE RECORD TYPE	DESCRIPTION	RFC
A	A host address	RFC 1035
NS	An authoritative name server	RFC 1035
MD	A mail destination (Obsolete - use MX)	RFC 1035
MF	A mail forwarder (Obsolete - use MX)	RFC 1035
CNAME	The canonical name for an alias	RFC 1035
SOA	Marks the start of a zone of authority	RFC 1035
WKS	A well known service description	RFC 1035
PTR	A domain name pointer	RFC 1035
HINFO	Host information	RFC 1035
MINFO	Mailbox or mail list information	RFC 1035
MX	Mail exchange	RFC 1035
TXT	Text strings	RFC 1035
AAAA	IP6 Address	RFC 3596
SRV	Server selection	RFC 2782]

How GSLB supports DNS

GSLB uses algorithms and protocols that decide which IP address must be sent for a DNS query. GSLB sites are geographically distributed and there is a DNS authoritative Name server at each site running as a service on the NetScaler appliance. All Name servers at the various sites involved are authoritative for the same domain. Each of the GSLB domains is a subdomain for which a

© 1997–2026 Citrix Systems, Inc. All rights reserved.

delegation is configured. Therefore, the GSLB Name servers are authoritative and can use one of the various load balancing algorithms to decide which IP address to return.

A delegation is created by adding a Name server record for the GSLB domain in the parent domain database files and a subsequent address record for the Name servers that are used for the delegation. For example, if you want to use GSLB for `www.citrix.com`, then the following Bind SOA file can be used to delegate requests to `www.citrix.com` to Name Servers: Netscaler1 and Netscaler2.

```

Understanding BIND is not a requirement for configuring DNS. All compliant DNS server implementations have a method of creating the equivalent delegation. Microsoft DNS servers can be configured for delegation using the instructions at Create a zone delegation.

What makes GSLB on NetScaler appliance different from using the standard DNS service for distributing traffic is that the NetScaler GSLB sites exchange data using a proprietary protocol called Metric Exchange Protocol (MEP). With MEP, the GSLB sites are able to maintain information about all other sites. When a DNS request is received, the MEP considers the GSLB metrics to determine information such as the following:

- Site with the least number of current connections
- Site that is closest to the LDNS server, which sent the request based on round trip times (RTT).

There are several load balancing algorithms that can be used, but GSLB is a DNS with the brain underneath telling the Name Server (hosted on the NetScaler appliance) which address must be sent based on metrics of the participating sites.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Other benefits that GSLB provides are the ability to maintain persistence (or site affinity). Responses to the incoming DNS queries can be compared with the source IP address to determine if that address was directed to a particular site in the recent past. If so, then the same address is sent in the DNS response to ensure that the client session is maintained.

Another form of persistence is obtained at the site level by using HTTP redirects, or HTTP proxying. These forms of persistence occur after the DNS response occurs. Therefore, if you get an HTTP request at a site that contains a cookie to direct the request to a different participating site, then you can either respond with a redirect or proxy the request to the appropriate site.

Metric exchange protocol

Metric Exchange Protocol (MEP) is used to share the data used in GSLB calculations across sites. Using MEP connections, you exchange three types of data. These connections need not be secure over TCP port 3011 or can be secure using SSL over TCP port 3009.

The following three types of data are exchanged, and have their own intervals and exchange methods.

- **Site metric exchange:** This is a polling exchange model. For example, if site1 has a configuration for site2 services, then every second site1 asks site2 for the status of the GSLB services. Site2 responds with the state and other load details.
- **Network metric exchange:** This is the LDNS RTT information exchange, which is used in the dynamic proximity load balancing algorithm. This is a push exchange model. Every five seconds, each site pushes its data to other participating sites.
- **Persistency exchange:** This is for SOURCEIP persistency exchange. This is also a push exchange model. Every five seconds, each site pushes its data to other participating sites.

By default, site services are monitored over MEP based on polling information only. If you bind monitors based on monitor interval, the state is updated and you can control the frequency of the updates by setting the monitoring interval accordingly.

Priority order for GSLB services

The priority order for services feature enables you to prioritize the order for services or service groups based on the load balancing selection preferences. You can configure the priority order when you do the following:

- Bind a service to a GSLB virtual server.
- Bind a service group to a GSLB virtual server.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Bind a service group member to the GSLB service group.

Currently, you can configure the priority order for services using the following approaches. However, these approaches have the following limitations:

- Configuring a backup virtual server chain: The number of configuration lines is high, and you must run the `show` command several times to know the state of all the GSLB services for each virtual server.
- Configuring the preferred location: You must create location entries for all your application endpoints.

The priority order for services feature addresses the preceding limitations with fewer configuration commands, and helps you to accomplish the preferred location configuration without the need of location representation of all GSLB services' IP addresses.

Configure priority order for GSLB services

To configure the priority order for GSLB services, the `-order <number>` parameter is added to the bind commands.

NOTE:

The lowest order number has the highest priority.

Command:

```
bind gslb vserver <vservername> -servicename/servicegroupname<servicename/servicegroupname> -order <number>
```

For example, consider a set of services that are bound to a GSLB virtual server (gv1). Using the `-order <number>` parameter, you can prioritize the order of selection of services as follows:

- Set 1 (s1, s2) bound to gv1 – order 1
- Set 2 (s3, s4) bound to gv1 – order 2
- Set 3 (s5, s6) bound to gv1 – order 3

After you bind the services to gv1, and when gv1 receives the client traffic, the order of selection of services is as follows:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- The virtual server (gv1) selects the services in set 1 (s1 and s2) with order number 1, because this set is assigned the lowest order number. By default, the lowest order number has the highest priority.
- If all the services in set 1 are DOWN, gv1 selects set 2 (s3 and s4) with order number 2.
- If all the services in set 1 and set 2 are down, gv1 selects set 3 (s5 and s6) with order number 3.

Configure priority order for GSLB services using the CLI

To configure the priority order for the GSLB services, type the following commands at the command prompt:

1. Add GSLB sites.

   ```
   add gslb site site1 1.1.1.1
   ```

   ```
   add gslb site site2 1.1.1.2
   ```

2. Add a GSLB virtual server.

   ```
   add gslb vserver gv1 HTTP
   ```

3. Add GSLB services.

   ```
   add gslb service gsvc1 1.1.1.3 http 80 -sitename site1
   ```

   ```
   add gslb service gsvc2 1.1.1.4 http 80 -sitename site2
   ```

   ```
   add gslb service gsvc3 1.1.1.5 http 80 -sitename site1
   ```

   ```
   add gslb service gsvc4 1.1.1.6 http 80 -sitename site2
   ```

   ```
   add gslb service gsvc5 1.1.1.7 http 80 -sitename site1
   ```

   ```
   add gslb service gsvc6 1.1.1.8 http 80 -sitename site2
   ```

4. Set the order number and bind the services to the GSLB virtual server.

   ```
   bind gslb vserver gv1 gsvc1 -order 1
   ```

   ```
   bind gslb vserver gv1 gsvc2 -order 1
   ```

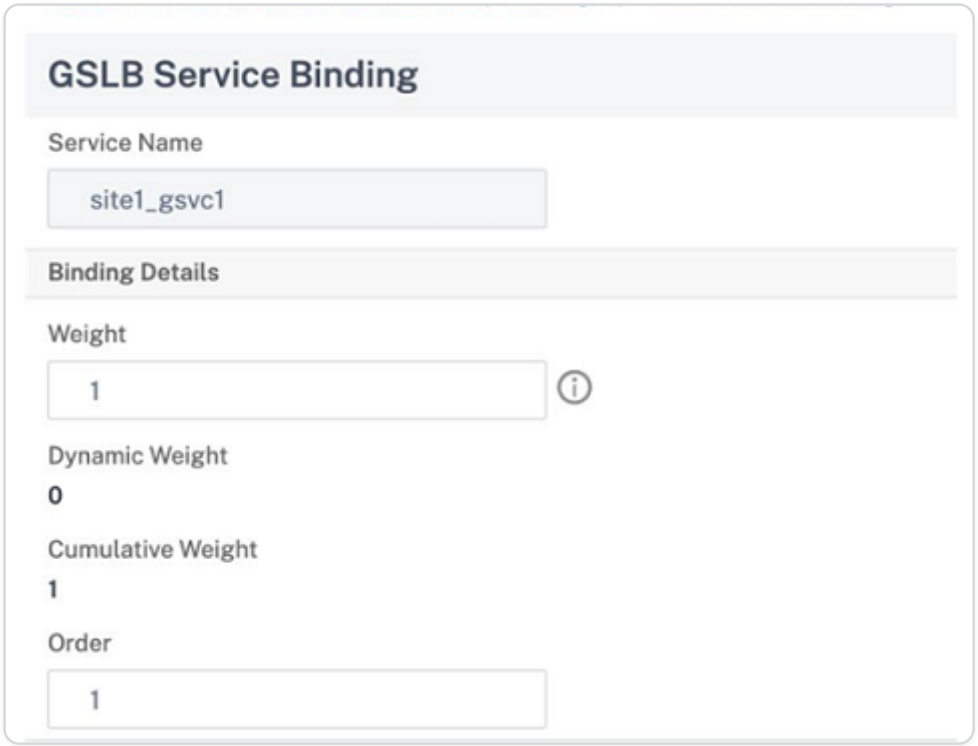
   ```
   bind gslb vserver gv1 gsvc3 -order 2
   ```

   ```
   bind gslb vserver gv1 gsvc4 -order 2
   ```

   ```
   bind gslb vserver gv1 gsvc5 -order 3
   ```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
bind gslb vserver gv1 gsvc6 -order 3
```



Configure priority order for GSLB services using the GUI

Prerequisites:

- You have created GSLB sites.
- You have created a GSLB virtual server.
- You have created GSLB services.

To configure the priority order for GSLB services and bind them to the GSLB virtual server, do the following:

1. Navigate to **Traffic Management > GSLB > Virtual Servers** and double-click the GSLB virtual server.
2. In **GSLB Virtual Server**, under the **GSLB Services and GSLB Service Group Binding** section, click **GSLB Virtual Server to GSLB Service Bindings**.
3. In the **GSLB Services and GSLB Service Group Binding** dialog, click **Add Binding**.
4. In the **GSLB Service Binding** dialog box, select a service.
5. Type a number in the **Order** field to set the priority order for the service.

6. Click **Bind**.
7. Repeat steps 1–6 to configure different priority order number for different services.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure priority order for GSLB services using LB policy commands

By default, the lowest order number has the highest priority. However, you can defer this default behavior using the new LB action and policy commands. You can configure the service selection order based on the incoming client traffic or client data.

For example, consider a set of services that are bound to a GSLB virtual server (gv1). Using the `-order <number>` parameter, you have configured the priority order for services as follows:

- Set 1 (s1, s2) bound to gv1 – order 1
- Set 2 (s3, s4) bound to gv1 – order 2
- Set 3 (s5, s6) bound to gv1 – order 3

By default, the lowest order number has the highest priority. Therefore, the default priority order of preference is 1, 2, and 3 for services in set 1, set2, and set3, respectively. However, for a specific client traffic, you want to change the priority order to 3, 1, and 2. To achieve this, you can add an LB policy and bind it to gv1.

An LB policy command consists of two elements: a rule, and an action. The rule is associated with an action, which is performed if a request matches the rule.

NOTE:

The LB policy commands are common for both LB and GSLB configuration and are applicable for the requests handled by the NetScaler appliance.

LB action

Expression:

```
add lb action <name> <type> <string>
```

Example:

```
add lb action act1 -type SELECTIONORDER -value 3 2 1
```

Parameters:

- `name`: Name of the action.
- `type`: Type of action.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- `string`: Value for the specified action.

LB policy

Expression:

```
add lb policy <name> <rule> <action><undefaction>
```

Example:

```
add lb policy pol1 -rule CLIENT.IP.SRC.EQ(8.8.8.8) -action act1
```

Parameters:

- `name`: Name of the policy.
- `rule`: A rule consists of one or more expressions. The rule is associated with an action, which is performed if the request matches the rule.
- `action`: DROP, NOLBACTION, and RESET are supported.
- `undefaction`: The NetScaler appliance generates an undefined event (UNDEF event) when a request does not match a policy. You can use the `set lb param -undefAction <action>` command to set the undefined action. You can assign these actions to an undefined event: DROP, NOLBACTION, and RESET.

Let's consider an example where you add an LB action, LB policy, and bind the policy to a GSLB virtual server (gv1) as follows:

```
add lb action act1 -type SELECTIONORDER -value 3 1 2
```

```
add lb policy pol1 -rule CLIENT.IP.SRC.EQ(8.8.8.8) -action act1
```

```
bind gslb vserver gv1 -policyName pol1 -priority 20 - gotoPriorityExpression END -type REQUEST
```

The rule selects the client traffic that matches the IP address, `8.8.8.8`, and sends that traffic to gv1. The LB action type (`SELECTIONORDER`) defines the service selection order. After you bind the LB policy to gv1, and when gv1 receives the client traffic from the IP address `8.8.8.8`, the services are selected in the following order:

1. The virtual server (gv1) selects services in set 3 (s5 and s6) with priority order 3.
2. If all the services in set 3 are DOWN, gv1 selects set 1 (s1 and s2) with priority order 2.
3. If all the services in set 3 and set 2 are down, the gv1 selects set 1 (s1 and s2) with order 1.

Configure priority order for GSLB services with LB policy commands using the CLI

To configure priority order for GSLB services using LB policy commands, type the following commands at the command prompt:

1. Add an LB action.

   ```
   add lb action act1 -type SELECTIONORDER -value 3 1 2
   ```

2. Add an LB policy.

   ```
   add lb policy pol1 -rule CLIENT.IP.SRC.EQ(8.8.8.8) -action act1
   ```

3. Add GSLB sites.

   ```
   add gslb site site1 1.1.1.1
   ```

   ```
   add gslb site site2 1.1.1.2
   ```

4. Add a GSLB virtual server.

   ```
   add gslb vserver gv1 HTTP
   ```

5. Bind the LB policy to the GSLB virtual server.

   ```
   bind gslb vserver gv1 -policyName pol1 -priority 20 - gotoPriorityExpression END -type REQUEST
   ```

6. Add GSLB services.

   ```
   add gslb service gsvc1 1.1.1.3 http 80 -sitename site1
   ```

   ```
   add gslb service gsvc2 1.1.1.4 http 80 -sitename site2
   ```

   ```
   add gslb service gsvc3 1.1.1.5 http 80 -sitename site1
   ```

   ```
   add gslb service gsvc4 1.1.1.6 http 80 -sitename site2
   ```

   ```
   add gslb service gsvc5 1.1.1.7 http 80 -sitename site1
   ```

   ```
   add gslb service gsvc6 1.1.1.8 http 80 -sitename site2
   ```

7. Set the order and bind the services to the GSLB virtual server.

   ```
   bind gslb vserver gv1 gsvc1 -order 1
   ```

   ```
   bind gslb vserver gv1 gsvc2 -order 1
   ```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
bind gslb vserver gv1 gsvc3 -order 2
```

```
bind gslb vserver gv1 gsvc4 -order 2
```

```
bind gslb vserver gv1 gsvc5 -order 3
```

```
bind gslb vserver gv1 gsvc6 -order 3
```

Configure priority order for GSLB services with the LB policy commands using the GUI

Prerequisites:

- You have created GSLB sites.
- You have created a GSLB virtual server.
- You have created services.

Step 1 - Create an LB Action:

1. Navigate to **AppExpert > LB > Actions**.
2. In **LB Actions**, click **Add**.
3. In the **Create LB Actions** dialog box, specify values for the following parameters:
   - **Action Name**
   - **Type**
   - **Value**

   NOTE:

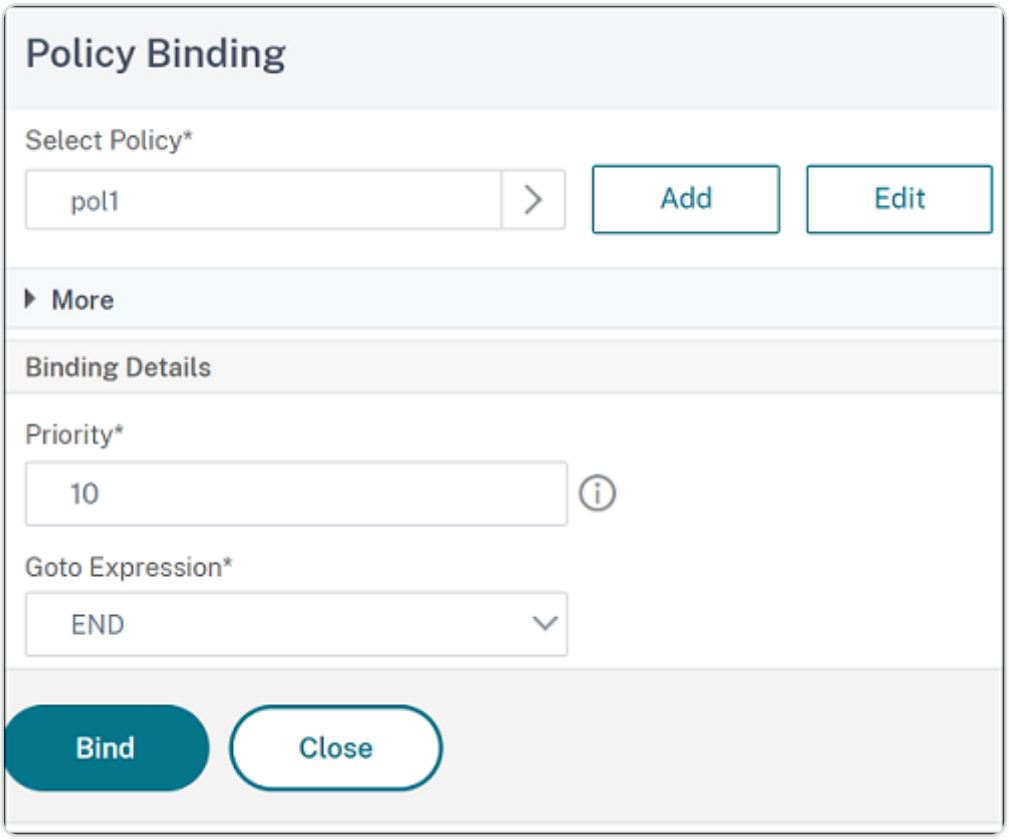
   The numbers in the **Value** field are separated by a space.
4. Click **Create**.

Step 2 - Create an LB Policy:

1. Navigate to **AppExpert > LB > Policies**.
2. In **LB Policies**, click **Add**.
3. In the **Create LB Policies** dialog box, specify values for the following parameters:
   - **Name**: pol1

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Action**: act1
- **Undefined-Result Action**: NOLBACTION
- **Expression**: CLIENT.IP.SRC.EQ(8.8.8.8)



4. Click **Create**.

Step 3 - Bind the LB policy to the GSLB virtual server:

1. Navigate to **Traffic Management >GSLB > Virtual Servers** and double-click the GSLB virtual server.
2. In **GSLB Virtual Server**, under the **Advanced Settings** section, click **Policies**.
3. In the **Policies** section, click **GSLB Virtual Server LB Policy Binding**.
4. In the **Policy Binding** dialog box, specify values for the following parameters:
   - **Select Policy**: pol 1
   - **Priority**: 10
   - **Goto Expression**: END

© 1997–2026 Citrix Systems, Inc. All rights reserved.

5. Click **Bind**.

Step 4 - Configure priority order for GSLB services:

To configure priority order for GSLB, see the **Configure priority order for GSLB services using the GUI** procedure.

Persistence settings for services

If persistence is configured for a service, then the preference is always given to persistence, by default.

For example, consider a service with persistence configured and priority order 1. If a service with priority order 0 is UP, then preference is always given to the service with priority order 1.

However, you can override this default behavior with the following CLI command:

```
set gslb param -overridePersistencyforOrder<YES/NO>
```

Let's consider the following example:

A set of services is bound to a GSLB virtual server (gv1) with the following priority order:

- Set 1 (s1, s2) bound to gv1 – order 1
- Set 2 (s3, s4) bound to gv1 – order 2

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Type the following command at the command prompt to override persistency:

```
set gslb parameter -overridePersistencyforOrder YES
```

If set 1 (services with persistence is configured) is DOWN, then set 2 services handle all the requests until set 1 services are UP. A persistence entry for priority 2 is created.

Let's assume that after some time, the set 1 services are UP. Now, both set 1 and set 2 services are UP to handle the requests. In this scenario, new load balancing decisions are made as higher order services are UP. The persistence entry is overridden with a new load balancing entry.

Priority toggle

With the priority toggle feature, you can toggle all the traffic to a low-priority service during version upgrade for a service with a higher priority order. You can use the following commands to toggle priority:

- `set gslb vserver –toggleorder <Ascending/Descending>`
- `set gslb vserver v1 -orderthreshold 80`

For example, let's consider that there are two services with the following priorities:

- Service 1- order 0
- Service 2 – order 1

By default, service 1 handles all the traffic. If service 1 needs to be upgraded, then the traffic needs to be rerouted to service 2.

At the command prompt, type the following commands to toggle priority:

```
set gslb vserver –toggleorder Descending
```

By default, 0 has higher priority. However, after priority toggling, 1 is considered as a higher priority. If persistence entry is present for the service, the persistence preference behavior is as explained in the **Persistence settings for services** section.

Upgrade recommendations for GSLB deployment

This section provides recommendations on the sequence in which GSLB nodes need to be upgraded in various GSLB setups. It also addresses a few FAQs.

Note: The NetScaler appliance from which the GSLB synchronization is started is referred to as the 'main site' and the GSLB sites on which the configuration is copied as the 'subordinate sites'.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Before you start the upgrade process, read the prerequisites mentioned in the following topics:

- Before you begin
- Upgrade a high availability pair.
- Upgrade a cluster.

Points to note when upgrading GSLB setups

- In an HA setup, first upgrade the subordinate sites and then the main site.
- In an HA setup, service states might not propagate from an older build primary node to a newer build secondary node. However, if the builds are of different versions, but have the same HA version, the service state might still propagate.
- If GSLB is configured within a cluster, first upgrade the non-owner nodes, and then upgrade the owner node. If there is one site or multiple sites in a cluster, follow the same upgrade sequence in each of the site.
- Enable new GSLB features only after you upgrade all nodes to a newer build.
- Upgrade all GSLB nodes to the latest build. There is no functional impact on the available features when some of the GSLB nodes are using an older version and some of the GSLB nodes are upgraded to a newer version.

FAQs

- **Are GSLB service states propagated when instances run different software versions?**

  GSLB MEP is functional when instances run on different versions and GSLB service states are propagated across GSLB sites. There is no impact on the MEP communication when instances run different versions after an upgrade.

- **Is it recommended to do configuration changes during an upgrade?**

  In a GSLB setup, when a main site is being upgraded, it is not recommended to do configuration changes on any other GSLB nodes.

Use case: Deployment of domain name based autoscale™ service group

TIP

For information about the GSLB service groups, see Configuring a GSLB Service Group

Deployment scenario

Two datacenters are deployed in two AWS regions, one in Sydney and one in North Virginia. Another datacenter is deployed in Azure. An AWS ELB in each AWS region is used to load balance the application servers. ALB is used for Azure to load balancing the application server. The NetScaler appliances are configured for GSLB for the ELBs and ALB using GSLB domain name based autoscale service group.

IMPORTANT

You must configure the required security groups in AWS and attach it to the GSLB instance. Port 53 must be allowed in the security group inbound and outbound rules. Also, ports (3009 or 3011 depending on secure MEP configuration) for MEP communication must be open. For application monitoring, the corresponding ports must be allowed in the security group outbound rules.

The configuration steps for the above deployment scenario and the corresponding CLI commands are as follows:

1. Create datacenters (represented by GSLB sites).

   ```
   add gslb site aws-sydney 192.0.2.2
   ```

   ```
   add gslb site aws-nvirginia 198.51.100.111
   ```

   ```
   add gslb site alb-southindia 203.0.113.6
   ```

2. Add a name server with the DNS gateway IP address where the GSLB node is added. This must be done in all datacenters.

   ```
   add dns nameServer 8.8.8.8
   ```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. Add servers for ELB and ALB.

```
add server aws-sydney_server lb-sydney-1052691850.ap-southeast-2.elb.amazonaws.com
```

```
add server aws-nvirginia_server LB-nvirginia-860559595.us-east-1.elb.amazonaws.com
```

```
add server alb-southindia_server alb.southindia.cloudapp.azure.com
```

4. Add GSLB autoscale service groups for each ELB and ALB and bind each server to the respective service group.

```
add gslb serviceGroup aws-nvirginia_sg HTTP -autoScale DNS -siteName aws-nvirginia
```

```
add gslb serviceGroup aws-sydney_sg HTTP -autoScale DNS -siteName aws-sydney
```

```
add gslb serviceGroup alb-southindia_sg HTTP -autoScale DNS -siteName alb-southindia
```

```
bind gslb serviceGroup aws-nvirginia_sg aws-nvirginia_server 80
```

```
bind gslb serviceGroup aws-sydney_sg aws-sydney_server 80
```

```
bind gslb serviceGroup alb-southindia_sg alb-southindia_server 80
```

5. Add a GSLB virtual server and bind the application domain and the service groups to this virtual server.

```
add gslb vserver gv1 HTTP
```

```
bind gslb vserver gv1 -serviceGroupName aws-nvirginia_sg
```

```
bind gslb vserver gv1 -serviceGroupName aws-sydney_sg
```

```
bind gslb vserver gv1 -serviceGroupName alb-southindia_sg
```

Use case: Deployment of IP address based GSLB service group

TIP

For information about the GSLB service groups, see Configuring a GSLB Service Group.

Deployment scenario

If there are multiple applications hosted on the same application server, the GSLB should probe these applications to see if the applications are responding or not. If an application is not responding, the user must be directed to the server on which the application is UP. Also, if one of the applications is DOWN, then the server should not be marked DOWN, because the other applications are UP.

In the following example, multiple applications (HTTPS) are hosted on one server in each GSLB site and hence all these applications resolve to one IP address of the respective site.

Using the GSLB service groups, you can have the same server with an IP address and port bound to multiple service groups where each service group represents a different application.

An application specific monitor is bound to the service groups that marks the service group as DOWN if the application is DOWN. Thus, whenever an application is DOWN, only that application is taken out from the setup and not the server.

```
```

```
add gslb serviceGroup app1_site1 HTTP -maxClient 0 -cip DISABLED
-cltTimeout 180 -svrTimeout 360 -siteName s1

add gslb serviceGroup app2_site1 HTTP -maxClient 0 -cip DISABLED
-cltTimeout 180 -svrTimeout 360 -siteName s1

add gslb serviceGroup app1_site2 HTTP -maxClient 0 -cip DISABLED
-cltTimeout 180 -svrTimeout 360 -siteName s2
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add gslb serviceGroup app2_site2 HTTP -maxClient 0 -cip DISABLED
-cltTimeout 180 -svrTimeout 360 -siteName s2

add lb monitor http_app2 HTTP -respCode 200 -httpRequest "GET /testsite/
app2.html"

add lb monitor http_app1 HTTP -respCode 200 -httpRequest "GET /testsite/
app1.html"

bind gslb serviceGroup app1_site1 192.0.2.140 80

bind gslb serviceGroup app1_site1 -monitorName http_app1

bind gslb serviceGroup app2_site1 192.0.2.140 80

bind gslb serviceGroup app2_site1 -monitorName http_app2

bind gslb serviceGroup app1_site2 192.0.2.142 80

bind gslb serviceGroup app1_site2 -monitorName http_app1

bind gslb serviceGroup app2_site2 192.0.2.142 80
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
bind gslb serviceGroup app2_site2 -monitorName http_app2

```
```

How-to articles

The GSLB how-to articles contain information about some of the important GSLB configurations such as customizing GSLB configuration, configuring persistent connections, disaster recovery, and so on.

Customizing Your GSLB Configuration

Configuring Persistent Connections

Managing Client Connections

Configuring GSLB for Proximity

Protecting the GSLB Setup Against Failure

Configuring GSLB for Disaster Recovery

Overriding Static Proximity Behavior by Configuring Preferred Locations

Configuring GSLB Service Selection Using Content Switching

Configuring Global Server Load Balancing for DNS Queries with NAPTR records

Using the EDNS0 Client Subnet Option for Global Server Load Balancing

Example of a Complete Parent-Child Configuration Using the Metrics Exchange Protocol

Customize your GSLB configuration

Once your basic GSLB configuration is operational, you can customize it by modifying the bandwidth of a GSLB service, configuring CNAME based GSLB services, static proximity, dynamic RTT, persistent connections, or dynamic weights for services, or changing the GSLB Method.

You can also configure monitoring for GSLB services to determine their states.

These settings depend on your network deployment and the types of clients you expect to connect to your servers.

© 1997–2026 Citrix Systems, Inc. All rights reserved.
```

Modify maximum connections or maximum bandwidth for a GSLB service

You can restrict the number of new clients that can simultaneously connect to a load balancing or content switching virtual server by configuring the maximum number of clients and/or the maximum bandwidth for the GSLB service that represents the virtual server.

To modify the maximum clients or bandwidth of a GSLB service by using the command line interface

At the command prompt, type the following command to modify the maximum number of client connections or the maximum bandwidth of a GSLB service and verify the configuration:

```
set gslb service <serviceName> [-maxClients <positive_integer>] [-
maxBandwidth <positive_integer>]

show gslb service <serviceName>
```

Example:

```
set glsb service Service-GSLB-1 –maxBandwidth 100 –maxClients 100

show gslb service Service-GSLB-1
```

To modify the maximum clients or bandwidth of a GSLB service by using the configuration utility

1. Navigate to **Traffic Management** > **GSLB** > **Services**, and double-click a service.
2. Click in the **Other Settings** section and set the following parameters:
   - Max Clients—maxClients
   - Max Bandwidth—maxBandwidth

Create CNAME-based GSLB services

To configure a GSLB service, you can use the IP address of the server or a canonical name of the server. If you want to run multiple services (like an FTP and a Web server, each running on different ports) from a single IP address or run multiple HTTP services on the same port, with different names, on the same physical host, you can use canonical names (CNAMES) for the services.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

For example, you can have two entries in DNS as ftp.example.com and www.example.com for FTP services and HTTP services on the same domain, example.com. CNAME-based GSLB services are useful in a multilevel domain resolver configuration or in multilevel domain load balancing. Configuring a CNAME-based GSLB service can also help if the IP address of the physical server is likely to change.

If you configure CNAME-based GSLB services for a GSLB domain, when a query is sent for the GSLB domain, the NetScaler appliance provides a CNAME instead of an IP address. If the A record for this CNAME record is not configured, the client must query the CNAME domain for the IP address. If the A record for this CNAME record is configured, the NetScaler appliance provides the CNAME with the corresponding A record (IP address). The NetScaler appliance handles the final resolution of the DNS query, as determined by the GSLB method. The CNAME records can be maintained on a different NetScaler appliance or on a third-party system.

In an IP-address-based GSLB service, the state of a service is determined by the state of the server that it represents. However, a CNAME-based GSLB service has its state set to UP by default; the virtual server IP (VIP) address or metric exchange protocol (MEP) are not used for determining its state. If a desktop-based monitor is bound to a CNAME-based GSLB service, the state of the service is determined according to the result of the monitor probes.

You can bind a CNAME-based GSLB service only to a GSLB virtual server that has the DNS Record Type as CNAME. Also, a NetScaler appliance can contain at most one GSLB service with a given CNAME entry.

The following are some of the features supported for a CNAME-based GSLB service:

- GSLB-policy based site affinity is supported, with the CNAME as the preferred location.
- Source IP persistence is supported. The persistency entry contains the CNAME information instead of the IP address and port of the selected service.

The following are the limitations of CNAME-based GSLB services:

- Site persistence is not supported, because the service referenced by a CNAME can be present at any third-party location.
- Multiple-IP-address response is not supported because one domain cannot have multiple CNAME entries.
- Source IP Hash and Round Robin are the only load balancing methods supported. The Static Proximity method is not supported because a CNAME is not associated with an IP address and static proximity can be maintained only according to the IP addresses.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Note: The Empty-Down-Response feature should be enabled on the GSLB virtual server to which you bind the CNAME-based GSLB service. If you enable the Empty-Down-Response feature, when a GSLB virtual server is DOWN or disabled, the response to a DNS query, for the domains bound to this virtual server, contains an empty record without any IP addresses, instead of an error code.

To create a CNAME-based GSLB service by using the command line interface

At the command prompt, type:

```
add gslb service <serviceName> -cnameEntry <string> -siteName <string>
```

Example:

```
add gslb service Service-GSLB-1 -cnameEntry transport.mycompany.com
-siteName Site-GSLB-East-Coast

add gslb service Service-GSLB-2 -cnameEntry finance.mycompany.com
-siteName Site-GSLB-West-Coast
```

To create a CNAME-based GSLB service by using the configuration utility

1. Navigate to **Traffic Management** > **GSLB** > **Services**.
2. Create a service, and set the **Type to Canonical Name Based**.

Configure transition Out-Of-Service State (TROFS) in GSLB

When you configure persistence on a GSLB virtual server to which a service is bound, the service continues to serve requests from the client even after it is disabled, accepting new requests or connections only to honor persistence. After a configured period of time, known as the graceful shutdown period, no new requests or connections are directed to the service, and all of the existing connections are closed.

When disabling a service, you can specify a graceful shutdown period, in seconds, by using the delay argument. During the graceful shutdown period, if the service is bound to a virtual server, its state appears as Out of Service.

Configure dynamic weights for services

In a typical network, there are servers that have a higher capacity for traffic than others. However, with a regular load balancing configuration, the load is evenly distributed across all services even though different services represent servers with different capacities.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To optimize your GSLB resources, you can configure dynamic weights on a GSLB virtual server. The dynamic weights can be based on either the total number of services bound to the virtual server or the sum of the weights of the individual services bound to the virtual server. Traffic distribution is then based on the weights configured for the services.

When dynamic weights are configured on the GSLB virtual server, requests are distributed according to the load balancing method, the weight of the GSLB service, and the dynamic weight. The product of the weight of the GSLB service and the dynamic weight is known as the cumulative weight. Therefore, when dynamic weight is configured on the GSLB virtual server, requests are distributed on the basis of the load balancing method and the cumulative weight.

When dynamic weight for a virtual server is disabled, the numerical value is set to 1. This ensures that the cumulative weight is a non-zero integer at all times.

Dynamic weight can be based on the total number of active services bound to load balancing virtual servers or on the weights assigned to the services.

Consider a configuration with two GSLB sites configured for a domain and each site has two services that can serve the client. If a service at either site goes down, the other server in that site has to handle twice as much traffic as a service at the other site. If dynamic weight is based on the number of active services, the site with both services active has twice the weight of the site with one service down and therefore receives twice as much traffic.

Alternatively, consider a configuration in which the services at the first site represent servers that are twice as powerful as servers at the second site. If dynamic weight is based on the weights assigned to the services, twice as much traffic can be sent to the first site as to the second.

Note: For details on assigning weights to load balancing services, see Assigning Weights to Services.

As an illustration of how dynamic weight is calculated, consider a GSLB virtual server that has a GSLB service bound to it. The GSLB service represents a load balancing virtual server that in turn has two services bound to it. The weight assigned to the GSLB service is 3. The weights assigned to the two services are 1 and 2 respectively. In this example, when dynamic weight is set to:

- **Disabled**:The cumulative weight of the GSLB virtual server is the product of the dynamic weight (disabled = 1) and the weight of the GSLB service (3), so the cumulative weight is 3.
- **SERVICECOUNT**: The count is the sum of the number of services bound to the load balancing virtual servers corresponding to the GSLB service (2), and the cumulative weight is the product of the dynamic weight (2) and the weight of the GSLB service (3), which is 6.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **SERVICEWEIGHT**: The dynamic weight is the sum of the weights of services bound to the load balancing virtual servers corresponding to the GSLB service (3), and the cumulative weight is the product of the dynamic weight (3) and the weight of the GSLB service (3), which is 9.

Note: Dynamic weights are not applicable when content switching virtual servers are configured.

To configure a GSLB virtual server to use dynamic weights by using the command line interface

At the command prompt, type:

```
set gslb vserver <name> -dynamicWeight SERVICECOUNT | SERVICEWEIGHT
```

Example:

```
set gslb vserver vserver-GSLB-1 -dynamicWeight SERVICECOUNT
```

To set GSLB virtual server to use dynamic weights by using the configuration utility

1. Navigate to Traffic Management > GSLB > Virtual Servers, double-click the GSLB virtual server whose method you want to change (for example, vserver-GSLB-1).
2. Click the **Method** section and, from the **Dynamic Weight** drop-down list, select **SERVICECOUNT** or **SERVICEWEIGHT**.

How to configure persistence in GSLB

Persistence ensures that a series of client requests for a particular domain name is sent to the same data center instead of being load balanced. If persistence is configured for a particular domain, it takes precedence over the configured GSLB method. You can use persistence for deployments where an information related to a client transaction is stored locally on an instance, which has served the initial requests. For example, the deployments for e-commerce that uses a shopping cart, where the server needs to maintain the state of the connection to track the transaction. The NetScaler appliance selects a data center to process a client request. With persistence enabled, it forwards the same IP address of the selected data center for all subsequent Domain Name System (DNS) requests. If a persistence session points to a data center that is DOWN, the NetScaler appliance uses the configured GSLB method to select a new data center. It then becomes persistent for subsequent requests from the client. For persistence in GSLB, the same set of persistence identifiers (persistID) must be configured on the GSLB virtual servers in all data centers. The GSLB module uses the persistence identifier to uniquely identify a GSLB virtual server. When Source IP persistence is enabled on the GSLB virtual server, the persistence

© 1997–2026 Citrix Systems, Inc. All rights reserved.

sessions are also exchanged as part of the metrics exchange. For the NetScaler appliance to support persistence across sites, persistence related configuration must be done on all the participating GSLB sites. Citrix recommends persistence in GSLB for stateful applications, which requires clients to reconnect to the same application instance for the subsequent requests.

You can achieve persistence in GSLB by the following ways:

- Persistence on GSLB virtual server
- Site persistence on GSLB services

Persistence on GSLB virtual server

Persistence on GSLB virtual server is used during the DNS requests. The Source IP address of the DNS request is used to create persistence session between the client and the data center. DNS clients are generally the Local DNS (LDNS) or DNS gateways proxying a set of clients sitting behind them (in ISPs). Persistence on a GSLB virtual server is application protocol agnostic. In general, multiple DNS gateways or Local Domain Name Servers (LDNS) are configured in the client network. Citrix® recommends you to configure an appropriate persistence mask because for the subsequent DNS requests, irrespective of the upstream LDNS devices used to connect to the ADC appliance, the client is able to persist to the same data center, which had served the earlier requests. After the persistence session is created for an LDNS IP address, all the end clients connecting using that LDNS are given the same data center IP address.

Site persistence on GSLB services

Site persistence becomes effective while processing the application requests. Site persistence works only for HTTP and HTTPS traffic because the persistency is achieved using HTTP cookie. As cookies are maintained on HTTP clients (browsers), it gives visibility into the clients sitting behind the DNS gateways. When you use cookies to achieve persistency for clients, no resources are consumed on the ADC appliance for each incoming client. When you bring a GSLB service DOWN with a delay time, the service goes into the transition to out of service (TROFS) state. Persistence is supported as long as the service is in the UP or TROFS state. That is, if the same client sends a request for the same service within the specified delay time after a service is marked TROFS, the same GSLB site (data center) services the request.

If you access an application through an alias, ensure that the CNAME record is also configured on the NetScaler appliance. In a parent-child topology, site persistence does not work when you access an application through an alias.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Note

If the connection proxy is specified as the site persistence method and you also want to configure persistence on LB virtual servers, source IP persistence is not recommended. When the connection is proxied, an IP address owned by the ADC appliance is used, and not the actual IP address of the client. Configure an appropriate persistence, which does not use source IP of the HTTP(S) request to identify the client, for example, cookie persistence or rule-based persistence.

Configure persistence based on source IP address

If source IP persistence is configured on GSLB virtual server, persistence sessions are created for the source IP address of the DNS request. Depending on the Extended Client Subnet (ECS) feature, the source IP address of the DNS request is taken from any of the following:

- The source IP in the IP header of the incoming DNS request packet
- The ECS option in the DNS request For more information on ECS, see Use the EDNS0 client subnet option for Global Server Load Balancing.

Persistence sessions for a client last until the persistence timeout. After the timeout period expires, existing persistence sessions are cleared. For subsequent requests, a new GSLB decision is made and a different GSLB service IP address might be selected. The source IP persistence on GSLB virtual server and site persistence on GSLB service complements each other. If source IP persistence is disabled on GSLB virtual server, the GSLB virtual server chooses a different GSLB service each time the DNS tries to do the resolution. The client also connects to a different GSLB service and the data center which receives the application request proxy the connection to the data center which served the client first. This might add some latency. So by enabling source IP persistence on GSLB virtual server can avoid frequent such multiple hops for application requests. If the source IP persistence session has expired and the client reconnects after that, the site persistence connects the client back to the data center, which had served the client initially. Also, if the client connects back through a DNS gateway, which does not fall within the persistence mask range configured, then as well site persistence helps clients stick to the data center that served the first request.

To configure persistence based on source IP address by using the CLI

At the command prompt, type:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
set gslb vserver <name> -persistenceType (SOURCEIP|NONE) -persistenceId
<positive_integer> [-persistMask <netmask>] –[timeout <mins>]
```

Example:

```
set gslb vserver vserver-GSLB-1 -persistenceType SOURCEIP -persistenceId
23 -persistMask 255.255.255.255 –timeout 2
```

To configure persistence based on source IP address by using the GUI

1. Navigate to **Traffic Management** > **GSLB** > **Virtual Servers** and double-click the GSLB virtual server whose method you want to change (for example, vserver-GSLB-1).
2. Click the **Persistence** section and, from the **Persistence** drop-down list, select **SOURCEIP** and set the following parameters:
   - Persistence Id—persistenceID
   - Time-out—timeout
   - IPv4 Netmask or IPv6 Mask length—persistMask

Configure site persistence based on HTTP cookies

Site persistence is achieved using HTTP cookies (known as a “site cookie”) to reconnect the client to the same server. When the GSLB appliance responds to a client DNS request by sending the IP address of the selected GSLB site, the client sends an HTTP request to that GSLB site. Application endpoint in that GSLB site adds a site cookie to the HTTP header, and site persistence is in effect. If the client sends a DNS query after the client cache is expired, the DNS request might be directed to a different GSLB site. The new GSLB site uses the site cookie present in the client request header to implement persistence. Site persistence feature becomes active under the following conditions:

- When the domain name in the host header matches one of the GSLB domains
- When site persistence is enabled on the GSLB service that represents the virtual server receiving the application traffic.

The site cookie contains information about the selected GSLB service on which the client has a persistent connection. If the GSLB service pointed by the cookie is DOWN or removed from the GLSB configuration, then the virtual server that receives the traffic continues to process the traffic. The cookie expiration is based on the cookie timeout configured on the NetScaler appliance. If the

© 1997–2026 Citrix Systems, Inc. All rights reserved.

virtual server names are not identical on all the sites, you must use the persistence identifier. Cookies inserted are compliant with RFC 2109.

NetScaler supports two types of site persistence:

- Connection Proxy
- HTTP redirect

Connection Proxy

In the Connection Proxy mode of site persistence, the data center that receives the subsequent application request performs the following tasks to establish a connection:

1. Creates a connection to the GSLB site that inserted the site cookie.
2. Proxies the client request to the original site.

   NOTE:

   The proxy server establishes connection with the original site using the following details:

   - The SNIP of the new site is the source IP address.
   - The GSLB service public IP address of the original site is the destination IP address.
   - An ephemeral port is the source port and GSLB service port is the destination port.
   - Uses either HTTP or HTTPS protocols depending on the GSLB service type.
3. Receives a response from the original GSLB site.
4. Relays that response back to the client.
5. Closes the connection.

HTTP redirect

If the GSLB configuration uses HTTP redirect persistence, the new site redirects the request to the site that originally inserted the cookie. Domain name in the redirect URL is the site domain. Ensure that both cookies and SSL certificates are applicable to both GSLB domain and site domain. To apply cookies for both GSLB and site domain, the cookie domain must be the site to GSLB domain. To apply SSL certificates to both GSLB and site domain, certificate bound to the SSL virtual server must be a wildcard certificate.

Connection proxy occurs when the following conditions are satisfied:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Requests are sent for a domain participating in GSLB. The domain is obtained from the URL/ Host header.
- The local GSLB service has connection proxy enabled.
- The request includes a valid cookie that contains the IP address of an active remote GSLB service.

NOTE

In a GSLB parent-child configuration, the connection proxy works as intended even when a GSLB service is not configured on a child site. However, if you have extra configuration such as client authentication, client IP address insertion, or other SSL-specific requirement, you must add an explicit GSLB service on the site and configure it accordingly.

For more information about parent-child topology, see Parent-Child Topology Deployment Using the MEP Protocol.

To set persistence based on HTTP cookies by using the CLI

At the command prompt, type:

```
set gslb service <serviceName> -sitePersistence (ConnectionProxy [-
sitePrefix <prefix>] | HTTPredirect -sitePrefix <prefix>)
```

Example:

```
set gslb service service-GSLB-1 -sitePersistence ConnectionProxy

set gslb service service-GSLB-1 -sitePersistence HTTPRedirect -sitePrefix
vserver-GSLB-1
```

To set persistence based on cookies by using the GUI

1. Navigate to **Traffic Management** > **GSLB** > **Services** and select the service that you want to configure for site persistence (for example, service-GSLB-1).
2. Click the **Site Persistence** section and set persistence based on cookies.

Manage client connections

To facilitate management of client connections, you can enable delayed cleanup of connections to the virtual server. You can then manage local DNS traffic by configuring DNS policies.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Enable delayed cleanup of virtual server connections

The state of a virtual server depends on the states of the services bound to it, and the state of each service depends on the monitors bound to it. If a server is slow or down, the monitoring probes time out and the service that represents the server is marked as DOWN. A virtual server is marked as DOWN only when all services bound to it are marked as DOWN. You can configure services and virtual servers to either terminate all connections when they go down, or allow the connections to go through. The latter setting is for situations in which a service is marked as DOWN because of a slow server.

When you configure the down state flush option, the NetScaler appliance performs a delayed cleanup of connections to a GSLB service that is down.

To enable delayed cleanup of virtual server connections by using the command line interface

At the command prompt, type the following commands to configure delayed connection cleanup and verify the configuration:

```
set gslb service <name> -downStateFlush (ENABLED | DISABLED)

show gslb service <name>
```

Example:

```
set gslb service Service-GSLB-1 -downStateFlush ENABLED

Done

show gslb service Service-GSLB-1

Done
```

To enable delayed cleanup of virtual server connections by using the configuration utility

1. Navigate to **Traffic Management** > **GSLB** > **Services** and double-click the service.
2. Click the **Other Settings** section and select the **Down State Flush** option.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Manage local DNS traffic by using DNS policies

You can use DNS policies to implement site affinity by directing traffic from the IP address of a local DNS resolver or network to a predefined target GSLB site. This is configured by creating DNS policies with DNS expressions and binding the policies globally on the NetScaler appliance.

DNS expressions

The NetScaler appliance provides certain predefined DNS expressions that can be used for configuring actions specific to a domain. Such actions can, for example, drop certain requests, select a specific view for a specific domain, or redirect certain requests to a specific location.

These DNS expressions (also called *rules*) are combined to create DNS policies that are then bound globally on the NetScaler appliance.

Following is the list of predefined DNS qualifiers available on the NetScaler appliance:

- CLIENT.UDP.DNS.DOMAIN.EQ(“domainname”)
- CLIENT.UDP.DNS.IS_AREC
- CLIENT.UDP.DNS.IS_AAAAREC
- CLIENT.UDP.DNS.IS_SRVREC
- CLIENT.UDP.DNS.IS_MXREC
- CLIENT.UDP.DNS.IS_SOAREC
- CLIENT.UDP.DNS.IS_PTRREC
- CLIENT.UDP.DNS.IS_CNAME
- CLIENT.UDP.DNS.IS_NSREC
- CLIENT.UDP.DNS.IS_ANYREC

The CLIENT.UDP.DNS.DOMAIN DNS expression can be used with string expressions. If you are using domain names as part of the expression, they must end with a period (.). For example, CLIENT.UDP.DNS.DOMAIN.ENDSWITH(“abc.com.”)

TO CREATE AN EXPRESSION BY USING THE CONFIGURATION UTILITY

1. Click the icon next to the Expression text box. Click Add. (Leave the Flow Type and Protocol drop-down list boxes empty.) Follow these steps to create a rule.
2. In the Qualifier box, select a qualifier (for example, LOCATION).
3. In the Operator box, select an operator (for example, ==).
4. In the Value box, type a value (for example, Asia, Japan....).

© 1997–2026 Citrix Systems, Inc. All rights reserved.

5. Click OK. Click Create and click Close. The rule is created.
6. Click OK.

Configure DNS actions

A DNS policy includes the name of a DNS action to be performed when the policy rule evaluates to TRUE. A DNS action can do one of the following:

- Send the client an IP address for which you have configured a DNS view. For more information about DNS views, see Adding DNS Views.
- Send the client the IP address of a GSLB service after referring to a list of preferred locations that overrides static proximity behavior. For more information about preferred locations, see Overriding Static Proximity Behavior by Configuring Preferred Locations.
- Send the client a specific IP address as determined by the evaluation of the DNS query or response (DNS response rewrite).
- Forward a request to the name server without performing a lookup in the appliance's DNS cache.
- Drop a request.

You cannot create a DNS action for dropping a DNS request or for bypassing the DNS cache on the appliance. If you want to drop a DNS request, use the built-in action, dns_default_act_Drop. If you want to bypass the DNS cache, use the built-in action, dns_default_act_Cachebypass. Both actions are available along with custom actions in the Create DNS Policy and the Configure DNS Policy dialog boxes. These built-in actions cannot be modified or removed.

TO CONFIGURE A DNS ACTION BY USING THE COMMAND LINE INTERFACE

At the command prompt, type the following commands to configure a DNS action and verify the configuration:

```
add dns action <actionName> <actionType> (-IPAddress <ip_addr |
ipv6_addr> ... | -viewName <string> | -preferredLocList <string> ...) [-
TTL <secs>]

show dns action [<actionName>]
```

Examples

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Example 1: Configuring DNS Response Rewrite. The following DNS action sends the client a preconfigured IP address when the policy to which the action is bound evaluates to true:

```
add dns action dns_act_response_rewrite Rewrite_Response -IPAddress
192.0.2.20 192.0.2.56 198.51.100.10

 Done

show dns action dns_act_response_rewrite

1)  ActionName:  dns_act_response_rewrite ActionType:  Rewrite_Response
TTL:  3600              IPAddress:  192.0.2.20 192.0.2.56 198.51.100.10

 Done
```

Example 2: Configuring a DNS-View Based Response. The following DNS action sends the client an IP address for which you have configured a DNS view:

```
add dns action send_ip_from_view_internal_ip ViewName -viewName
view_internal_ip

Done

show dns action send_ip_from_view_internal_ip

1)  ActionName:  send_ip_from_view_internal_ip ActionType:  ViewName
 ViewName:  view_internal_ip

 Done
```

Example 3: Configuring a Response Based on a Preferred Location List. The following DNS action sends the client the IP address that corresponds to the preferred location that it selects from the specified list of locations:

```
add dns action send_preferred_location GslbPrefLoc -preferredLocList
NA.tx.ns1.*.*.* NA.tx.ns2.*.*.* NA.tx.ns3.*.*.*
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Done

show dns action  send_preferred_location

1)  ActionName:  send_preferred_location ActionType:  GslbPrefLoc
PreferredLocList:  "NA.tx.ns1.*.*.*" "NA.tx.ns2.*.*.*" "NA.tx.ns3.*.*.*"

 Done
```

TO CONFIGURE A DNS ACTION BY USING THE NETSCALER CONFIGURATION UTILITY

1. Navigate to Traffic Management > DNS > Actions, create or edit a DNS action.
2. In the Create DNS Action or Configure DNS Action dialog box, set the following parameters:
   - Action Name (cannot be changed for an existing DNS action)
   - Type (cannot be changed for an existing DNS action) To set the Type parameter, do one of the following:
     - To create a DNS action that is associated with a DNS view, select View Name. Then, from the View Name list, select the DNS view that you want to use in the action.
     - To create a DNS action with a preferred location list, select Preferred Location List. In Preferred Location, enter a location, and then click Add. Add as many DNS locations as you want.
     - To configure a DNS action for rewriting a DNS response on the basis of policy evaluation, select Rewrite Response. In IP Address, enter an IP address, and then click Add. Add as many IP addresses as you want.
   - TTL (applicable only to the Rewrite Response action type)

Configure DNS policies

DNS policies operate on a location database that uses static and custom IP addresses. The attributes of the incoming local DNS request are defined as part of an expression, and the target site is defined as part of a DNS policy. While defining actions and expressions, you can use a pair of single quotation marks (‘’) as a wildcard qualifier to specify more than one location. When a DNS policy is configured and a GSLB request is received, the custom IP address database is first queried for an entry that defines the location attributes for the source:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- When a DNS query comes from an LDNS, the characteristics of the LDNS are evaluated against the configured policies. If they match, an appropriate action (site affinity) is executed. If the LDNS characteristics match more than one site, the request is load balanced between the sites that match the LDNS characteristics.
- If the entry is not found in the custom database, the static IP address database is queried for an entry, and if there is a match, the above policy evaluation is repeated.
- If the entry is not found in either the custom or static databases, the best site is selected and sent in the DNS response on the basis of the configured load balancing method.

The following restrictions apply to DNS policies created on the NetScaler appliance.

- A maximum of 64 policies are supported.
- DNS policies are global to the NetScaler appliance and cannot be applied to a specific virtual server or domain.
- Domain or virtual server specific binding of policy is not supported.

You can use DNS policies to direct clients that match a certain IP address range to a specific site. For example, if you have a GSLB setup with multiple GSLB sites that are separated geographically, you can direct all clients whose IP address is within a specific range to a particular data center.

Both TCP-based and UDP-based DNS traffic can be evaluated. Policy expressions are available for UDP-based DNS traffic on the server and for both UDP-based DNS traffic and TCP-based DNS traffic on the client side. Additionally, you can configure expressions to evaluate queries and responses that involve only the following DNS question types (or QTYPE values):

- A
- AAAA
- NS
- SRV
- PTR
- CNAME
- SOA
- MX
- ANY

The following response codes (RCODE values) are also supported:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- NOERROR - No error
- FORMERR - Format error
- SERVFAIL - Server failure
- NXDOMAIN - Non-existent domain
- NOTIMP - Query type not implemented
- REFUSED - Query refused

You can configure expressions to evaluate DNS traffic. A DNS expression begins with the DNS.REQ or DNS.RES prefixes. Functions are available for evaluating the queried domain, the query type, and the carrier protocol. For more information about DNS expressions, see "Expressions for Evaluating a DNS Message and Identifying Its Carrier Protocol" in "Policy Configuration and Reference".

TO ADD A DNS POLICY BY USING THE COMMAND LINE INTERFACE

At the command prompt, type the following commands to create a DNS policy and verify the configuration:

```
add dns policy <name> <rule> <actionName>

show dns policy <name>
```

Example:

```
> add dns policy-GSLB-1 'CLIENT.UDP.DNS.DOMAIN.EQ("domainname")'
my_dns_action

 Done

> show dns policy-GSLB-1

    Name: policy-GSLB-1

    Rule: CLIENT.UDP.DNS.DOMAIN.EQ("domainname")

    Action Name: my_dns_action

    Hits: 0

    Undef Hits: 0
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Done
```

TO REMOVE A CONFIGURED DNS POLICY BY USING THE COMMAND LINE INTERFACE

At the command prompt, type:

```
rm dns policy <name>
```

TO CONFIGURE A DNS POLICY BY USING THE NETSCALER CONFIGURATION UTILITY

1. Navigate to Traffic Management > DNS > Policies and create a DNS policy.
2. In the Create DNS Policy or Configure DNS Policy dialog box, set the following parameters:
   - Policy Name (cannot be changed for an existing policy)
   - Action
   - Expression To specify an expression, do the following:
     a. Click Add, and then, in the drop-down box that appears, select the expression element with which you want to begin the expression. A second list appears. The list contains a set of expression elements that you can use immediately after the firs expression element.
     b. In the second list, select the expression element that you want, and then enter a period.
     c. After each selection, if you enter a period, the next set of valid expression elements appear in a list. Select expression elements and fill in arguments to functions until you have the expression you want.
3. Click Create or OK, and then click Close.

Bind DNS policies

DNS policies are bound globally on the NetScaler appliance and are available for all configured GSLB virtual servers. Even though DNS policies are globally bound, policy execution can be limited to a specific GSLB virtual server by specifying the domain in the expression.

Note: Even though the bind dns global command accepts REQ_OVERRIDE and RES_OVERRIDE as valid bind points, those bind points are redundant, because DNS policies can be bound only globally. Bind your DNS policies only to the REQ_DEFAULT and RES_DEFAULT bind points.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

TO BIND A DNS POLICY GLOBALLY BY USING THE COMMAND LINE INTERFACE

At the command prompt, type the following commands to bind a DNS policy globally and verify the configuration:

```
bind dns global <policyName> <priority> [-gotoPriorityExpression <string>]
[-type <type>]

show dns global -type <type>
```

Example:

```
bind dns global policy-GSLB-1 10 -gotoPriorityExpression END

 Done

show dns global -type REQ_DEFAULT

1)  Policy Name: policy-GSLB-1

    Priority: 10

    GotoPriorityExpression: END

 Done
```

TO BIND A DNS POLICY GLOBALLY BY USING THE CONFIGURATION UTILITY

1. Navigate to Traffic Management > DNS > Policies.
2. In the details pane, click Global Bindings.
3. In the Bind/Unbind DNS Policy(s) to Global dialog box, click Insert Policy.
4. In the Policy Name column, select, from the list, the policy that you want to bind. Alternatively, in the list, click New Policy, and then create a DNS policy by setting parameters in the Create DNS Policy dialog box.
5. To modify a policy that is already bound globally, click the name of the policy, and then click Modify Policy. Then, in the Configure DNS Policy dialog box, modify the policy, and then click OK.
6. To unbind a policy, click the name of the policy, and then click Unbind Policy.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

7. To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
8. To regenerate assigned priorities, click Regenerate Priorities. The priority values are modified to begin at 100, with increments of 10, without affecting the order of evaluation.
9. Click OK.

TO VIEW THE GLOBAL BINDINGS OF A DNS POLICY BY USING THE COMMAND LINE INTERFACE

At the command prompt, type:

```
show dns global
```

TO VIEW THE GLOBAL BINDINGS OF A DNS POLICY BY USING THE CONFIGURATION UTILITY

1. Navigate to **Traffic Management** > **DNS** > **Policies**.
2. In the details pane, click **Global Bindings**. The global bindings of all DNS policies appear in this dialog box.

Adding DNS Views

You can configure DNS views to identify various types of clients and provide an appropriate IP address to a group of clients who query for the same GSLB domain. DNS views are configured by using DNS policies that select the IP addresses sent back to the client.

For example, if you have configured GSLB for your company's domain and have the server hosted in your company's network, clients querying for the domain from within your company's internal network can be provided with the server's internal IP address instead of the public IP address. Clients that query DNS for the domain from the Internet, on the other hand, can be provided the domain's public IP address.

To add a DNS view, you assign it a name of up to 31 characters. The leading character must be a number or letter. The following characters are also allowed: @ _ - . (period) : (colon) # and space ( ). After adding the view, you configure a policy to associate it with clients and a part of the network, and you bind the policy globally. To configure and bind a DNS policy, see **Managing Local DNS Traffic by Using DNS Policies**.

To add a DNS view by using the command line interface

At the command prompt, type the following commands to create a DNS view and verify the configuration:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add dns view <viewName>

show dns view <viewName>
```

Example:

```
add dns view PrivateSubnet

show dns view PrivateSubnet
```

To remove a DNS view by using the command line interface

At the command prompt, type:

```
rm dns view <viewName>
```

To add a DNS view by using the configuration utility

Navigate to Traffic Management > DNS > Views and add a DNS view.

For details on how to create a DNS policy and how to bind DNS policies globally, see **Managing Local DNS Traffic by Using DNS Policies**.

Configure GSLB for proximity

When you configure GSLB for proximity, client requests are forwarded to the closest data center. The main benefit of the proximity-based GSLB method is faster response times resulting from the selection of the closest available data center. Such a deployment is critical for applications that require fast access to large volumes of data.

You can configure GSLB for proximity based on the round trip time (RTT), static proximity, or a combination of the two.

Configure dynamic round trip time (RTT) method

Dynamic round trip time (RTT) is a measure of time or delay in the network between the client's local DNS server and a data resource. To measure dynamic RTT, the NetScaler appliance probes the client's local DNS server and gathers RTT metric information. The appliance then uses this metric to make its load balancing decision. Global server load balancing monitors the real-time status of the network and dynamically directs the client request to the data center with the lowest RTT value

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To configure GSLB for proximity with dynamic method, you must first configure the basic GSLB set up and then configure dynamic RTT.

First create two GSLB sites, local and remote. Then, for the local site, create a GSLB virtual server and GSLB services and bind the services to the virtual server. Then create ADNS services and bind the domain for which you are configuring GSLB to the GSLB virtual server at the local site. Finally, create a load balancing virtual server with the same virtual server IP address as the GSLB service.

For details on how to configure a basic GSLB setup, see Configuring GSLB Entities Individually.

Once you have configured a basic GSLB setup, configure the dynamic RTT method.

For details on how to configure the GSLB virtual server to use the dynamic RTT method for load balancing, see Configuring Dynamic RTT.

Configure static proximity

The static proximity method for GSLB uses an IP address-based static proximity database to determine the proximity between the client's local DNS server and the GSLB sites. The NetScaler appliance responds with the IP address of a site that best matches the proximity criteria.

If two or more GSLB sites at different geographic locations serve the same content, the NetScaler appliance maintains a database of IP address ranges and uses the database for decisions about the GSLB sites to which to direct incoming client requests.

To configure GSLB for proximity with static proximity, you must first configure the basic GSLB set up and then configure static proximity.

First create two GSLB sites, local and remote. Then, for the local site, create a GSLB virtual server and GSLB services and bind the services to the virtual server. Then create ADNS services and bind the domain for which you are configuring GSLB to the GSLB virtual server at the local site. Finally, create a load balancing virtual server with the same virtual server IP address as the GSLB service.

For details on how to configure a basic GSLB setup, see Configuring GSLB Entities Individually.

Once you have configured a basic GSLB setup, configure static proximity.

For details on how to configure the GSLB virtual server to use static proximity for load balancing, see Configuring Static Proximity.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure static proximity and dynamic RTT

You can configure the GSLB virtual server to use a combination of static proximity and dynamic RTT when you have some clients coming from an internal network like a branch office. You can configure GSLB such that the clients coming from the branch office or any other internal network are directed to a particular GSLB site that is geographically close to the client network. For all other requests, you can use dynamic RTT.

First create two GSLB sites, local and remote. Then, for the local site, create a GSLB virtual server and GSLB services and bind the services to the virtual server. Then create ADNS services and bind the domain for which you are configuring GSLB to the GSLB virtual server at the local site. Finally, create a load balancing virtual server with the same virtual server IP address as the GSLB service.

For details on how to configure a basic GSLB setup, see Configuring GSLB Entities Individually.

Once you have configured a basic GSLB setup, configure the GSLB virtual server to use static proximity for all traffic originating from an internal network and then use dynamic RTT for all other traffic.

For details on how to configure static proximity, see Configuring Static Proximity and for details on how to configure dynamic RTT, see Configuring Dynamic RTT.

Protect the GSLB setup against failure

You can protect your GSLB setup against failure of a GSLB site or a GSLB virtual server by configuring the following:

- A backup GSLB virtual server
- A NetScaler appliance to respond with multiple IP addresses
- A backup IP address for a GSLB domain

You can also divert excess traffic to a backup virtual server by using spillover.

Configure a backup GSLB virtual server

Configuring a backup entity for a GSLB virtual server ensures that DNS traffic to a site is not interrupted if the GSLB virtual server goes down. The backup entity can be another GSLB virtual server, or it can be a backup IP address. With a backup entity configured, if the primary GSLB virtual server goes down, the backup entity handles DNS requests. To specify what must happen when the primary GSLB virtual server comes back up again, you can configure the backup entity to

© 1997–2026 Citrix Systems, Inc. All rights reserved.

continue handling traffic until you manually enable the primary virtual server to take over (using the disablePrimaryOnDown option).

Note: You can configure a single backup entity as backup for multiple GSLB virtual servers.

To configure a backup GSLB virtual server by using the command line interface

At the command prompt, type the following commands to configure a GSLB virtual server as backup virtual server and verify the configuration:

```
set gslb vserver <name> -backupVServer <name> [-disablePrimaryOnDown
(ENABLED | DISABLED)]

show gslb vserver <name>
```

Example:

```
set gslb vserver vserver-GSLB-1 -backupVServer vserver-GSLB-2
-disablePrimaryOnDown ENABLED

show gslb vserver vserver-GSLB-1
```

To set GSLB virtual server as a backup virtual server by using the configuration utility

1. Navigate to **Traffic Management** > **GSLB** > **Virtual Servers**, and double-click the GSLB virtual server.
2. Select the **Backup Virtual Server** section and choose the backup virtual server.

Configure a GSLB setup to respond with multiple IP addresses

A typical DNS response contains the IP address of the best performing GSLB service. However, if you enable multiple IP responses (MIR), the NetScaler appliance sends the best GSLB service as the first record in the response and adds the remaining active services as extra records. If MIR is disabled (the default), the NetScaler appliance sends the best service as the only record in response.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To configure a GSLB virtual server for multiple IP responses by using the command line interface

At the command prompt, type the following commands to configure a GSLB virtual server for multiple IP responses and verify the configuration:

```
set gslb vserver<name> -MIR (ENABLED | DISABLED)

-  show gslb vserver <name>
```

Example:

```
set gslb vserver vserver-GSLB-1 -MIR ENABLED

 show gslb vserver <vserverName>
```

To set a GSLB virtual server for multiple IP responses by using the configuration utility

1. Navigate to **Traffic Management** > **GSLB** > **Virtual Servers** and double-click the GSLB virtual server for which you want to configure a backup virtual server (for example, vserver-GSLB-1).
2. On the **Advanced** tab, under When this virtual server is “UP,” select the Send all "active" service IP in response (MIR) check box, and select **OK**.

Configuring a GSLB Virtual Server to Respond with an Empty Address Record When DOWN

A DNS response can contain either the IP address of the requested domain or an answer stating that the IP address for the domain is not known by the DNS server, in which case the query is forwarded to another name server. These are the only possible responses to a DNS query.

When a GSLB virtual server is disabled or in a DOWN state, the response to a DNS query for the GSLB domain bound to that virtual server contains the IP addresses of all the services bound to the virtual server. However, you can configure the GSLB virtual server to in this case send an empty down response (EDR). When this option is set, a DNS response from a GSLB virtual server that is in a DOWN state does not contain IP address records, but the response code is successful. This prevents clients from attempting to connect to GSLB sites that are down.

Note: You must configure this setting for each virtual server to which you want it to apply.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To configure a GSLB virtual server for empty down responses by using the command line interface

At the command prompt, type:

```
set gslb vserver<name> -EDR (ENABLED | DISABLED)
```

Example:

```
> set gslb vserver vserver-GSLB-1 -EDR ENABLED

 Done
```

To set a GSLB virtual server for empty down responses by using the configuration utility

1. Navigate to **Traffic Management** > **GSLB** > **Virtual Servers** and double-click the GSLB virtual server for which you want to configure a backup virtual server (for example, vserver-GSLB-1).
2. On the Advanced tab, under When this virtual server is "Down," select the Do not send any service's IP address in response (EDR) check box.
3. Click **OK**.

Configure a backup IP address for a GSLB domain

You can configure a backup site for your GSLB configuration. With this configuration in place, if all the primary sites go DOWN, the IP address of the backup site is provided in the DNS response.

Typically, if a GSLB virtual server is active, that virtual server sends a DNS response with one of the active site IP addresses as selected by the configured GSLB method. If all the configured primary sites in the GSLB virtual server are inactive (in the DOWN state), the authoritative domain name system (ADNS) server or DNS server sends a DNS response with the backup site's IP address.

Note: When a backup IP address is sent, persistence is not honored.

To set a backup IP address for a domain by using the command line interface

At the command prompt, type the following commands to set a backup IP address and verify the configuration:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
set gslb vserver <name> -domainName <string> -backupIP <IPAddress>

show gslb vserver <name>
```

Example:

```
set gslb vserver vserver-GSLB-1 -domainName www.abc.com -backupIP
10.102.29.66

show gslb vserver vserver-GSLB-1
```

To set a backup IP address for a domain by using the configuration utility

1. Navigate to **Traffic Management** > **GSLB** > **Virtual Servers** and double-click the GSLB virtual server to which you want to bind the backup domain (for example, vserver-GSLB-1).
2. Click the **Domains** section, configure the GSLB domain and specify the IP address of the backup domain in the **Backup IP** field.

Divert excess traffic to a backup virtual server

Once the number of connections to a primary GSLB virtual server exceeds the configured threshold value, you can use the spillover option to divert new connections to a backup GSLB virtual server. This threshold value can be calculated dynamically or set manually. Once the number of connections to the primary virtual server drops below the threshold, the primary GSLB virtual server resumes serving client requests.

You can configure persistence with spillover. When persistence is configured, new clients are diverted to the backup virtual server if that client is not already connected to a primary virtual server. When persistence is configured, connections that were diverted to the backup virtual server are not moved back to the primary virtual server after the number of connections to the primary virtual server drops below the threshold. Instead, the backup virtual server continues to process those connections until they are terminated by the user. Meanwhile, the primary virtual server accepts new clients.

The threshold can be measured by the number of connections, bandwidth, and health of the services.

If the backup virtual server reaches the configured threshold and is unable to take any additional load, the primary virtual server diverts all requests to the designated redirect URL. If a redirect URL is not configured on the primary virtual server, subsequent requests are dropped.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The spillover feature prevents the remote backup GSLB service (backup GSLB site) from getting flooded with client requests when the primary GSLB virtual server fails. This occurs when a monitor is bound to a remote GSLB service, and the service experiences a failure that causes its state to go DOWN. The monitor, however, continues to keep the state of the remote GSLB service UP because of the spillover feature that ensures that the backup GSLB service is not overload.

As part of the resolution to this problem, two states are maintained for a GSLB service, the primary state and effective state. The primary state is the state of the primary virtual server and the effective state is the cumulative state of the virtual servers (primary and backup chain). The effective state is set to UP if any of the virtual servers in the chain of virtual servers is UP. A flag that indicates that the primary VIP has reached the threshold is also provided. The threshold can be measured by either the number of connections or the bandwidth.

A service is considered for GSLB only if its primary state is UP. Traffic is directed to the backup GSLB service only when all the primary virtual servers are DOWN. Typically, such deployments have only one backup GSLB service.

Adding primary and effective states to a GSLB service has the following effects:

- When source IP persistence is configured, the local DNS is directed to the previously selected site only if the primary virtual server on the selected site is UP and below threshold. Persistence can be ignored in the round robin mode.
- If cookie-based persistence is configured, client requests are redirected only when the primary virtual server on the selected site is UP.
- If the primary virtual server has reached its saturation and the backup VIPs is absent or down, the effective state is set to DOWN.
- If external monitors are bound to an HTTP-HTTPS virtual server, the monitor decides the primary state.
- If there is no backup virtual server to the primary virtual server and the primary virtual server has reached its threshold, the effective state is set to DOWN.

To configure backup GSLB virtual server by using the command line interface

At the command prompt, type the following commands to configure backup GSLB virtual server and verify the configuration:

```
set gslb vserver <name> -soMethod <method> -soThreshold <threshold>
-soPersistence ( **ENABLED** | **DISABLED** ) -soPersistenceTimeout
<timeout>
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
show gslb vserver <name>
```

Example:

```
set gslb vserver Vserver-GSLB-1 -soMethod CONNECTION -soThreshold 1000
-soPersistence ENABLED -soPersistenceTimeout 2

show gslb vserver Vserver-GSLB-1
```

To configure backup GSLB virtual server by using the configuration utility

1. Navigate to **Traffic Management** > **GSLB** > **Virtual Servers** and double-click the virtual server that you want to configure as backup (for example, Vserver-LB-1).
2. Click the **SpillOver** section and set the following parameters:
   - Method— soMethod
   - Threshold— soThreshold
   - Persistence Time-out (min) — soPersistenceTimeout
3. Select the Persistence option and click **OK**.

Configure GSLB for disaster recovery

Disaster recovery capability is critical, because downtime is costly. A NetScaler appliance configured for GSLB forwards traffic to the least-loaded or the best-performing data center. This configuration, referred to as an active-active setup, not only improves performance, but also provides immediate disaster recovery by routing traffic to other data centers if a data center that is part of the setup goes down. Alternatively, you can configure an active-standby GSLB setup for disaster recovery only.

Configure GSLB for disaster recovery in an active-standby data center setup

A conventional disaster recovery setup includes an active data center and a standby data center. The standby data center is a remote site. When a failover occurs as a result of a disaster event that causes the primary active data center to be inactive, the standby data center becomes operational.

Configuring disaster recovery in an active-standby data-center setup consists of the following tasks.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Create the active data center.
  - Add a local GSLB site.
  - Add a GSLB vserver, which represents the active data center.
  - Bind the domain to the GSLB virtual server.
  - Add gslb services and bind the services to active GSLB virtual server.
- Create the standby data center.
  - Add a remote gslb site.
  - Add a gslb vserver, which represents standby data center.
  - Add gslb services which represents standby data center and bind the services to the standby gslb vserver.
  - Designate the standby data center by configuring the standby GSLB virtual server as the backup virtual server for the active GSLB virtual server.

Once you have configured the primary data center, replicate the configuration for the backup data center and designate it as the standby GSLB site by designating a GSLB virtual server at that site as the backup virtual server.

For details on how to configure a basic GSLB setup, see Configuring GSLB Entities Individually.

To designate the standby GSLB site by using the command line interface

At both the active site and the remote site, at the command prompt, type:

```
set gslb vserver <name> -backupVserver <string>
```

Example:

```
set gslb vserver vserver-GSLB-1 -backupVServer vserver-GSLB-2
```

To configure the standby site by using the configuration utility

1. Navigate to Traffic Management > GSLB > Virtual Servers and double-click the GSLB virtual server for the primary site.
2. Click the **Backup Virtual Server** section and select a backup virtual server.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

By default, once the primary virtual server becomes active, it starts receiving traffic. However, if you want the traffic to be directed to the backup virtual server even after the primary virtual server becomes active, use the ‘disable primary on down’ option.

Configure for disaster recovery in an active-active data center setup

An active-active GSLB deployment, in which both GSLB sites are active, removes any risk that may arise in having a standby data center. With such a setup, web or application content can be mirrored in geographically separate locations. This ensures that data is consistently available at each distributed data center.

To configure GSLB for disaster recovery in an active-active data center set up, you must first configure the basic GSLB setup on the first data center and then configure all other data centers.

First create at least two GSLB sites. Then, for the local site, create a GSLB virtual server and GSLB services and bind the services to the virtual server. Then create ADNS services and bind the domain for which you are configuring GSLB to the GSLB virtual server in the local site. Finally, at the local site, create a load balancing virtual server with the same virtual server IP address as the GSLB service.

Once you have configured the first data center, replicate the configuration for other data centers part of the setup.

For details on how to configure a basic GSLB setup, see Configuring GSLB Entities Individually.

Configuring for Disaster Recovery with Weighted Round Robin

When you configure GSLB to use the weighted round robin method, weights are added to the GSLB services and the configured percentage of incoming traffic is sent to each GSLB site. For example, you can configure your GSLB setup to forward 80 percent of the traffic to one site and 20 percent of the traffic to another. After you do this, the NetScaler appliance will send four requests to the first site for each request that it sends to the second.

To set up the weighted round robin method, first create two GSLB sites, local and remote. Next, for the local site create a GSLB virtual server and GSLB services, and bind the services to the virtual server. Configure the GSLB method as round robin. Next, create ADNS services and bind the domain for which you are configuring GSLB to the GSLB virtual server. Finally, create a load balancing virtual server with the same virtual server IP address as the GSLB service.

Each service that represents a physical server in the network has weights associated with it. Therefore the GSLB service is assigned a dynamic weight that is the sum of weights of all services bound to it. Traffic is then split between the GSLB services based on the ratio of the dynamic

© 1997–2026 Citrix Systems, Inc. All rights reserved.

weight of the particular service to the total weight. You can also configure individual weights for each GSLB service instead of the dynamic weight.

If the services do not have weights associated with them, you can configure the GSLB virtual server to use the number of services bound to it to calculate the weight dynamically.

For details on how to configure a basic GSLB setup, see Configuring GSLB Entities Individually.

Once you configure a basic GSLB setup, you must configure the weighted round robin method such that the traffic is split between the configured GSLB sites according to the weights configured for the individual services.

To configure a virtual server to assign weights to services by using the command line interface

At the command prompt, type one of the following commands, depending upon whether you want to create a new load balancing virtual server or configure an existing one:

```
add lb vserver <name>@ -weight <WeightValue> <ServiceName>

set lb vserver <name>@ -weight <WeightValue> <ServiceName>
```

Example:

```
add lb vserver Vserver-LB-1 -weight 4 Service-HTTP-1

set lb vserver Vserver-LB-1 -weight 4 Service-HTTP-1
```

To set dynamic weight by using the command line interface

At the command prompt, type:

```
set gslb vserver <name> -dynamicWeight DynamicWeightType
```

Example:

```
set gslb vserver Vserver-GSLB-1 -dynamicWeight ServiceWeight
```

To add weights to the GSLB services by using the command line interface

At the command prompt, type:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
set gslb vserver <name> -serviceName GSLBServiceName -weight WeightValue
```

Example:

```
set gslb vserver Vserver-GSLB-1 -serviceName Service-GSLB-1 -weight 1
```

To configure a virtual server to assign weights to services by using the configuration utility

1. Navigate to Traffic Management > Load Balancing > Virtual Servers and double-click the virtual server (for example, Vserver-LB-1).
2. Click the Services section and set the weight of a service.

To add weights to the GSLB services by using the configuration utility

1. Navigate to Traffic Management > GSLB > Virtual Servers and double-click the virtual server (for example, vserver-GSLB-1)
2. Click the Services section and set the weight of the service in the Weight field.

To set dynamic weight by using the configuration utility

1. Navigate to Traffic Management > GSLB > Virtual Servers and double-click the virtual server (for example, vserver-GSLB-1).
2. Click the **Method** section and, from the **Dynamic Weight** drop-down list select **SERVICEWEIGHT**.

Configuring for Disaster Recovery with Data Center Persistence

Data center persistence is required for web applications that require maintaining a connection with the same server instead of having the requests load balanced. For example, in an e-commerce portal, maintaining a connection between the client and the same server is critical. For such applications, HTTP redirect persistence can be configured in an active-active setup.

To configure GSLB for disaster recovery with data center persistence, you must first configure the basic GSLB set up and then configure HTTP redirect persistence.
