> add authentication policy ldap3 -rule
aaa.LOGIN.VALUE("passwdreset").EQ("1") -action ldap3
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Create knowledge-based question and answer validation action

For knowledge-based question and answer validation in the self-service password reset flow, you need to configure the LDAP server with authentication disabled.

```
> add authentication ldapAction &lt;LDAP ACTION NAME> -serverIP &lt;SERVER
IP> -serverPort &lt;SERVER PORT> -ldapBase &lt;BASE> -ldapBindDn &lt;AD
USER> -ldapBindDnPassword &lt;PASSWORD> -ldapLoginName &lt;USER FORMAT>
-KBAttribute  &lt;LDAP ATTRIBUTE> - alternateEmailAttr &lt;LDAP ATTRIBUTE>
-authentication DISABLED
```

Example:

```
> add authentication ldapAction ldap2 -serverIP 1.2.3.4 -serverPort 636
-ldapBase "OU=Users,DC=server,DC=com" -ldapBindDn
administrator@ctxnsdev.com -ldapBindDnPassword PASSWORD -ldapLoginName
samAccountName -KBAttribute userParameters -alternateEmailAttr
userParameters -authentication disabled
```

To create an authentication policy for knowledge-based question and answer validation using CLI

```
add authentication policy kba_validation -rule true -action ldap2
```

Create an email validation action

LDAP must be a prior factor to the email validation factor because you need the user's email ID or alternate email ID as part of the self-service password reset registration.

NOTE:

For the Email OTP solution to work, ensure that the login-based authentication is enabled on the SMTP server.

To ensure that the login-based authentication is enabled, type the following command on the SMTP server. If the login-based authentication is enabled, you notice that the text **AUTH LOGIN** appears in bold in the output.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
root@ns# telnet &lt;IP address of the SMTP server>&lt;Port number of the
server>

ehlo
```

Example:

```
root@ns# telnet 10.106.3.66 25

Trying 10.106.3.66...

Connected to 10.106.3.66.

Escape character is '\^]'.

220 E2K13.NSGSanity.com Microsoft ESMTP MAIL Service ready at Fri, 22 Nov
2019 16:24:17 +0530

ehlo

250-E2K13.NSGSanity.com Hello [10.221.41.151]

250-SIZE 37748736

250-PIPELINING

250-DSN

250-ENHANCEDSTATUSCODES

250-STARTTLS

250-X-ANONYMOUSTLS

250-AUTH LOGIN

250-X-EXPS GSSAPI NTLM

250-8BITMIME

250-BINARYMIME

```
250-CHUNKING

250 XRDST
```

For information on how to enable login-based authentication, see `https://support.microfocus.com/kb/doc.php?id=7020367`.

To configure email action using the CLI

```
add authentication emailAction emailact -userName sender@example.com
-password &lt;Password> -serverURL "smtps://smtp.example.com:25" -content
"OTP is $code"
```

Example:

```
add authentication emailAction email -userName testmail@gmail.com
-password 298a34b1a1b7626cd5902bbb416d04076e5ac4f357532e949db94c0534832670
-encrypted -encryptmethod ENCMTHD_3 -serverURL "smtps://10.19.164.57:25"
-content "OTP is $code" -emailAddress
"aaa.user.attribute(\"alternate_mail\")"
```

NOTE

The "emailAddress" parameter in the configuration is a PI expression. Hence, this is configured to take either the default user email ID from the session or the already registered alternative email ID.

To configure email ID using the GUI

1. Navigate to **Security > AAA – Application Traffic > policies > Authentication > Advanced Policies > Actions > Authentication Email Action**. Click **Add**.
2. On the **Create Authentication Email Action** page, fill the details, and click **Create**.

To create an authentication policy for email validation by using CLI

```
add authentication policy email_validation -rule true -action email
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To create an authentication policy for password reset factor

```
add authentication policy ldap_pwd -rule true -action ldap_logon_action
```

Presenting UI through Login Schema

There are three LoginSchema's for self-service password reset to reset the password. Use the following CLI commands to view the three Login Schema:

```
root@ns# cd  /nsconfig/loginschema/LoginSchema/

root@ns# ls -ltr | grep -i password

-r--r--r--  1 nobody  wheel  2088 Nov 13 08:38
SingleAuthPasswordResetRem.xml

-r--r--r--  1 nobody  wheel  1541 Nov 13 08:38
OnlyUsernamePasswordReset.xml

-r--r--r--  1 nobody  wheel  1391 Nov 13 08:38 OnlyPassword.xml
```

To create single authentication password reset by using CLI

```
> add authentication loginSchema lschema_password_reset
-authenticationSchema "/nsconfig/loginschema/LoginSchema/
SingleAuthPasswordResetRem.xml"

> add authentication loginSchemaPolicy lpol_password_reset -rule true
-action lschema_password_reset
```

Create knowledge-based question and answer and email OTP validation factor through the policy label

If the first factor is LDAP logon, you can create a knowledge-based question and answer and email OTP policy labels for the next factor using the following commands.

```
> add authentication loginSchema lschema_noschema -authenticationSchema
noschema
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
> add authentication policylabel kba_validation -loginSchema
lschema_noschema

> add authentication policylabel email_validation -loginSchema
lschema_noschema
```

Create password reset factor through the policy label

You can create the password reset factor through the policy label by using the following commands.

```
> add authentication loginSchema lschema_noschema -authenticationSchema
noschema

> add authentication policylabel password_reset -loginSchema
lschema_noschema

> bind authentication policylabel password_reset -policyName ldap_pwd
-priority 10 -gotoPriorityExpression NEXT
```

Bind the knowledge-based question and answer and email policy to the previously created policies using the following commands.

```
> bind authentication policylabel email_validation -policyName
email_validation -nextfactor password_reset -priority 10
-gotoPriorityExpression NEXT

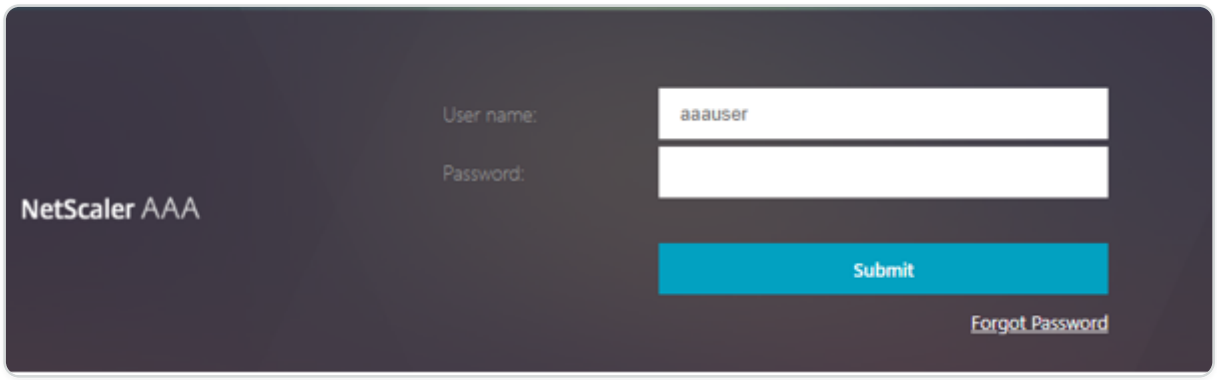
> bind authentication policylabel kba_validation -policyName
kba_validation -nextfactor email_validation -priority 10
-gotoPriorityExpression NEXT
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Bind the flow

You must have the LDAP logon flow created under the authentication policy for LDAP Logon. In this flow, the user clicks the forgot password link presented on the first LDAP logon page, then KBA validation followed by OTP validation and finally the password reset page.

```
bind authentication vserver authvs -policy ldap3 -nextfactor
kba_validation -priority 10 -gotoPriorityExpression NEXT
```



To bind all the UI flow

```
bind authentication vserver authvs -policy lpol_password_reset -priority
20 -gotoPriorityExpression END
```

User log on workflow to reset password

The following is a user logon workflow if the user needs to reset the password:

1. Enter the lb virtual server URL; for example, `<https://lb1.server.com>`. The logon screen is displayed.

2. Click **Forgot Password**. A validation screen displays two questions out of the maximum six questions and answers registered against an AD user.
3. Answer the questions, and click **Log on**. An email OTP Validation screen where you must enter the OTP received on the registered alternate email ID, is displayed.
4. Enter the email OTP. Once the email OTP validation is successful, the password reset page is displayed.
5. Enter a new password and confirm the new password. Click **Submit**. After the password reset is successful, the password reset successful screen is displayed.

You can now log on using the reset password.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Troubleshooting

NetScaler® provides an option to troubleshoot some of the basic issues that you might face while using self-service password reset. The following section helps you troubleshoot some of the issues that might occur in specific areas.

NS Log

Before analyzing the logs, we recommend you to set the log level to debug using the `set syslogparams -loglevel DEBUG` command. When this parameter is enabled, the logs are printed in the `ns.log` file.

Registration

The following message indicates a successful user registration.

```
"ns_aaa_insert_hash_keyValue_entry key:kba_registered value:1"

Nov 14 23:35:51 &lt;local0.debug> 10.102.229.76 11/14/2018:18:05:51 GMT
 0-PPE-1 : default SSLVPN Message 1588 0 :
 "ns_aaa_insert_hash_keyValue_entry key:alternate_mail

Nl9HQ00ifQ==.oKmvOalaOJ3a9z7BcGCSegNPMw=="
```

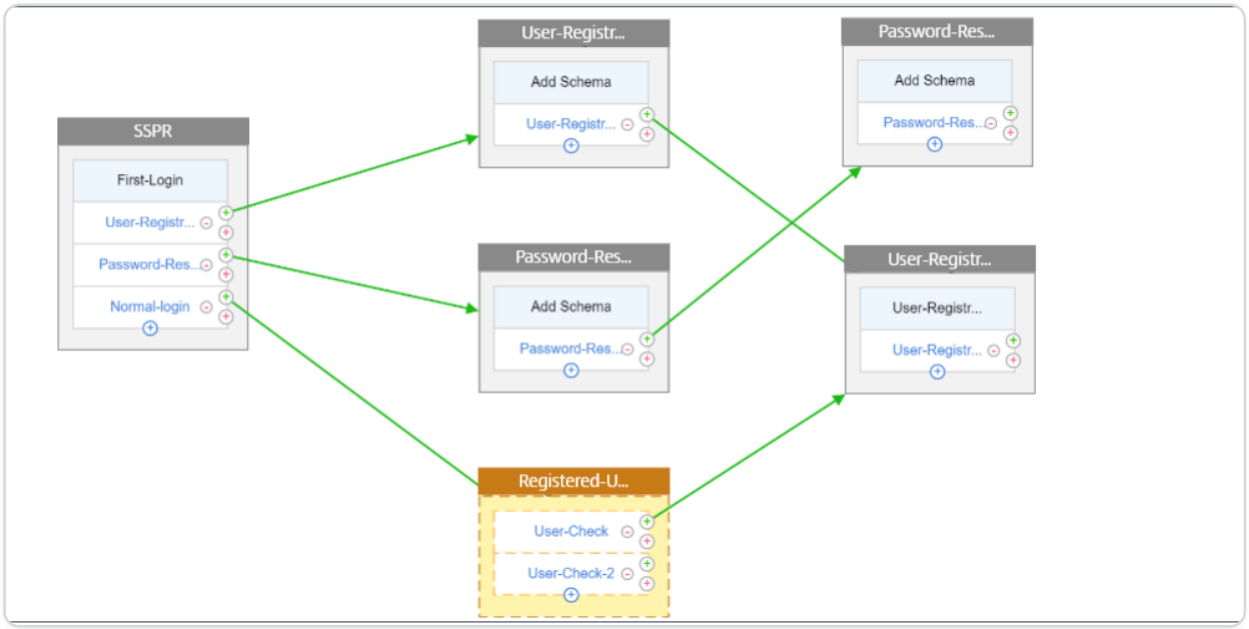
Knowledge-based question and answer validation

The following message indicates successful knowledge-based question and answer validation.

```
"NFactor: Successfully completed KBA Validation, nextfactor is email"
```

Email ID validation

The following message indicates successful password reset.



```
"NFactor: Successfully completed email auth, nextfactor is pwd_reset"
```

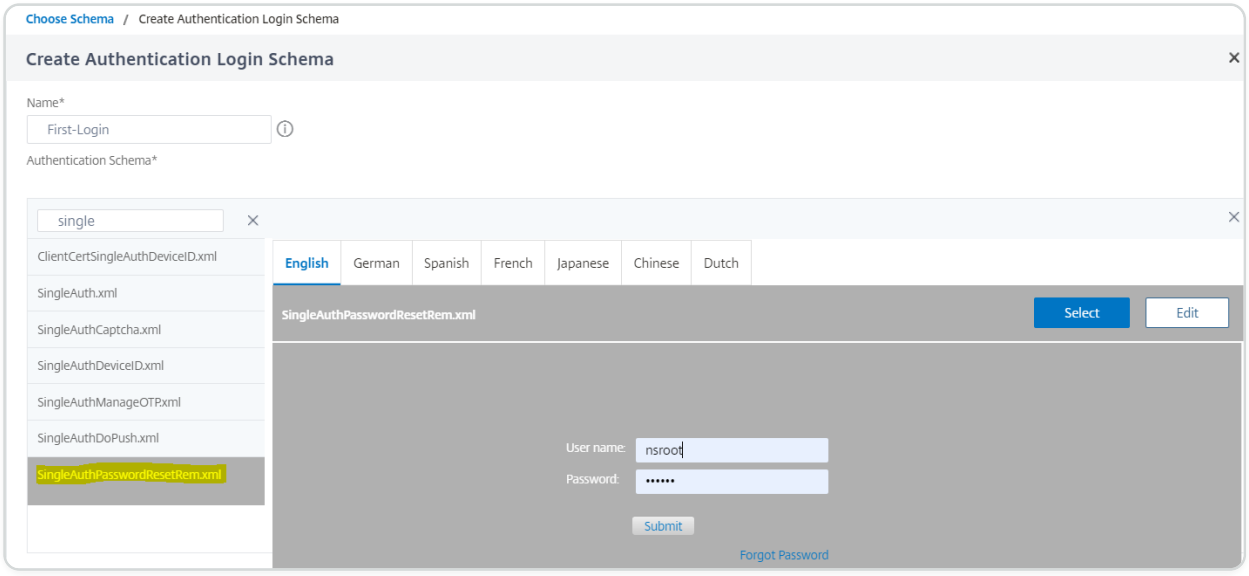
© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure SSPR using nFactor visualizer

Before we begin the SSPR configuration using the nFactor visualizer, we need to add the following LDAP servers:

1. Standard LDAP server with authentication enabled for user authentication and AD attribute specified.
2. LDAP server for user parameter extraction with no auth.
3. LDAP server for password reset on SSL with no auth. Also, the AD attribute to be used for storing the user details must be defined in this server.
4. LDAP server for user registration, with authentication enabled, and AD attribute specified.
5. The following figure displays the complete flow:

6. Bind the certificate globally using the following CLI command:



```
bind vpn global -userDataEncryptionKey Wildcard
```

Now that the LDAP servers are added, proceed with the nFactor configuration using the visualizer

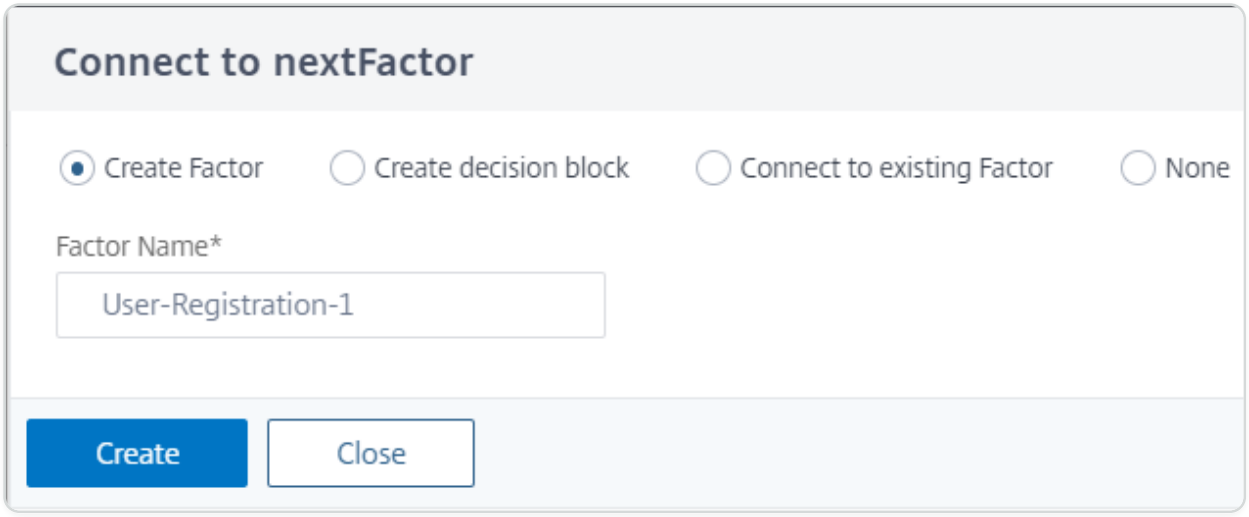
1. Navigate to, **Security > AAA > Application Traffic > nFactor Visualizer > nFactor Flows**, click **Add** and click the plus icon inside the box.
2. Give the flow a name.
3. Click **Add Schema** that serves as the default schema. Click **Add** on the login schema page.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. After giving the schema a name, select the schema. Click **Select** on the top right corner for the schema to be selected.

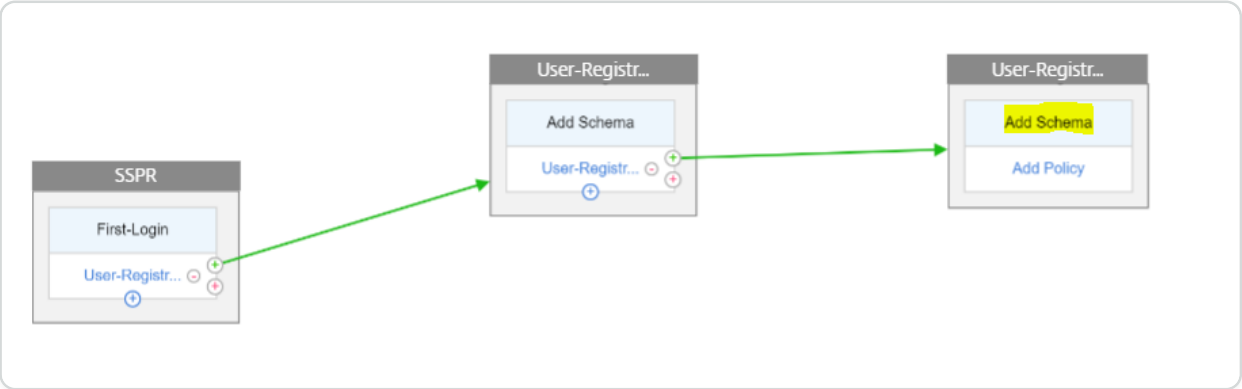
5. Click **Create** and click **OK**.

Once the default Schema is added, then we have to configure the following three flows:



- **User registration**: For explicit user registration
- **Password reset**: For password reset
- **Normal login + Registered user check**: In case the user is registered and enters the correct password, the user is logged in. In case the user is not registered it takes the user to the registration page.

User Registration

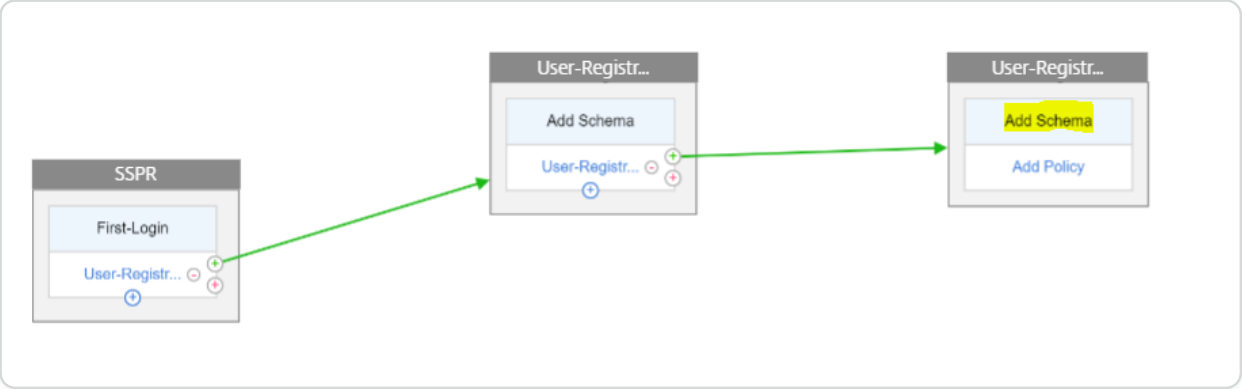


Let us continue from where we left after adding the schema.

1. Click **Add Policy**, this checks if the user is trying to explicitly register.
2. Click **Create** and then click **Add**.
3. Click the green '+' icon, to add the next authentication factor to the user-registration flow.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. Click **Create**.
5. Click **Add Policy** for User-Registration-1 factor.
6. Create the authentication policy. This policy extracts the user information and validates it before redirecting it to the registration page.
7. Click **Create** and then click **Add**.
8. Now click the green '+' icon to create another factor for the user registration and click **Create**. Click **Add Schema**.

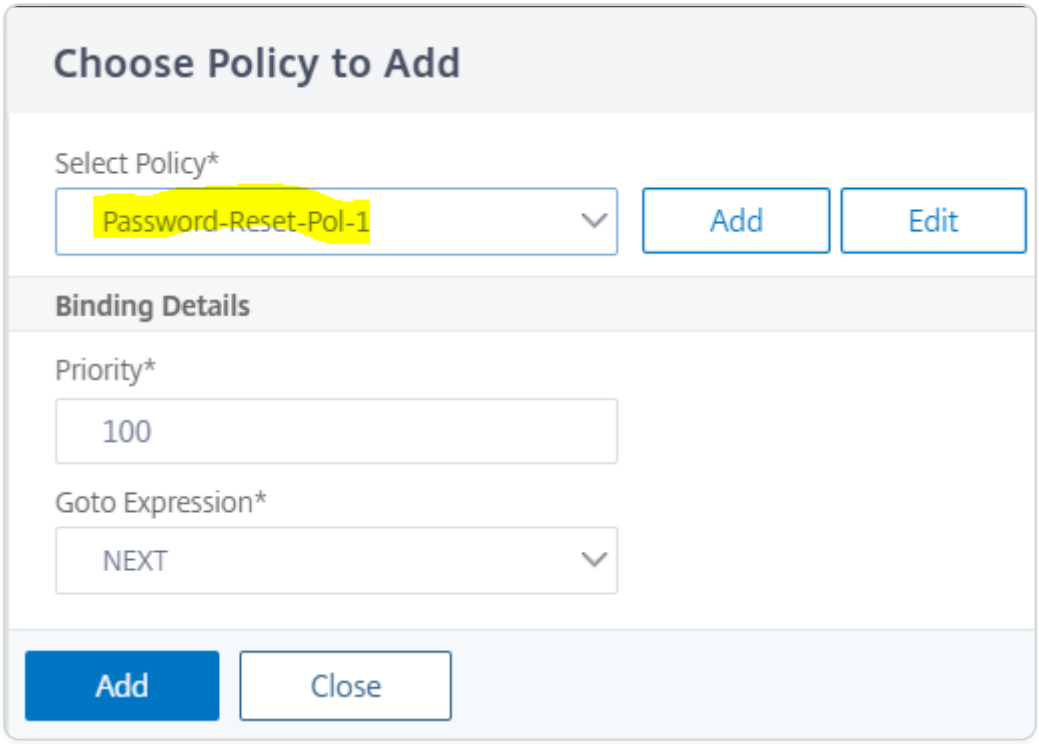


9. Create the authentication login schema for user registration.
10. Click **Add Policy** and create the authentication policy.
11. Click **Create** and click **Add**.

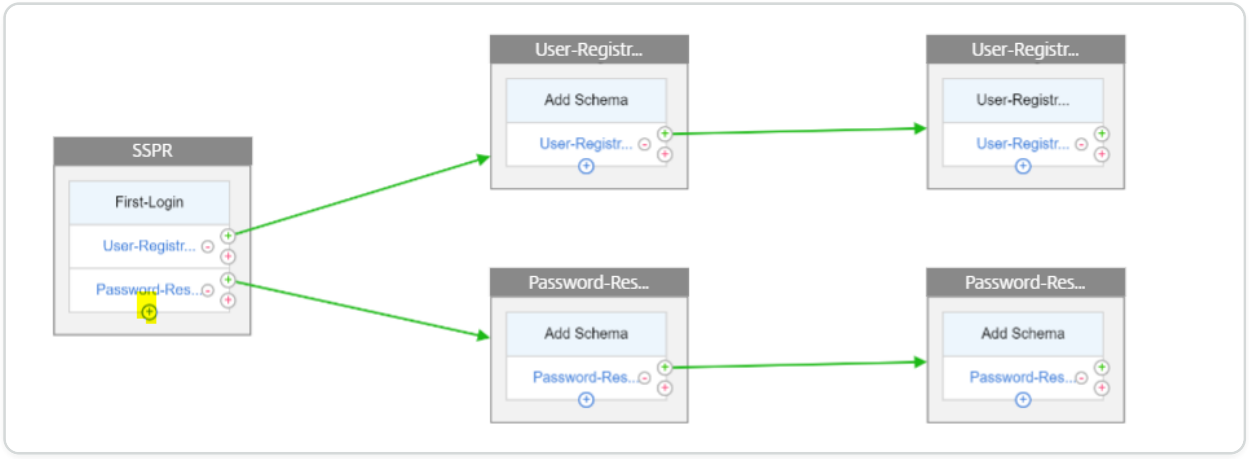
Password reset

1. Click the Blue '+' icon to add another policy (Password reset flow) for the parent SSPR factor.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



2. In the **Choose Authentication Policy** page, click **Add** to create an authentication policy or select an existing policy in the drop-down list. This policy is triggered if the user clicks "Forgot password" on the login page.
3. Click **Add**.
4. Click the green '+' icon for the password reset authentication policy to add the next factor.



5. Click **Create**.
6. Click **Add policy** to create an authentication policy for the earlier created factor. This factor is for validating the user.
7. Click **Add**.
8. Click the green '+' icon to add the next factor for the password factor flow. This validates the answers provided for resetting the password. Click **Create**.
9. Click **Add Policy** to add an authentication policy for the factor.
10. Select the same authentication policy from the drop-down list and click **Add**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Normal login + Registered user check

1. Click the blue '+' icon to add another authentication policy (Normal login flow) to the parent SSPR factor.

2. Click **Add**, to create an authentication policy for normal user login.
3. Click **Create** and then click **Add**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. Click the green '+' icon for the earlier created policy to add the next factor and select the **Create decision block** option and provide a name to the decision block.
5. Click **Create**.
6. Click **Add Policy** to create an authentication policy for this decision factor.
7. Click **Create** then click **Add**. This checks if the user is registered or not.
8. Click the green '+' icon on the decision block tile to point the user to the registration policy and select the **Connect to existing factor** option.

9. Select the registration factor from the **Connect to** drop-down list and click **Create**.
10. Now click the blue '+' icon on the decision block tile to add another policy to the decision block. This policy is for the registered user to complete the authentication.
11. Click **Add Policy** to create an authentication policy.
12. Click **Create** and click **Add**.

Polling during authentication

Starting from NetScaler release build 13.0.79.64, a NetScaler appliance can be configured for Polling mechanism during multifactor authentication.

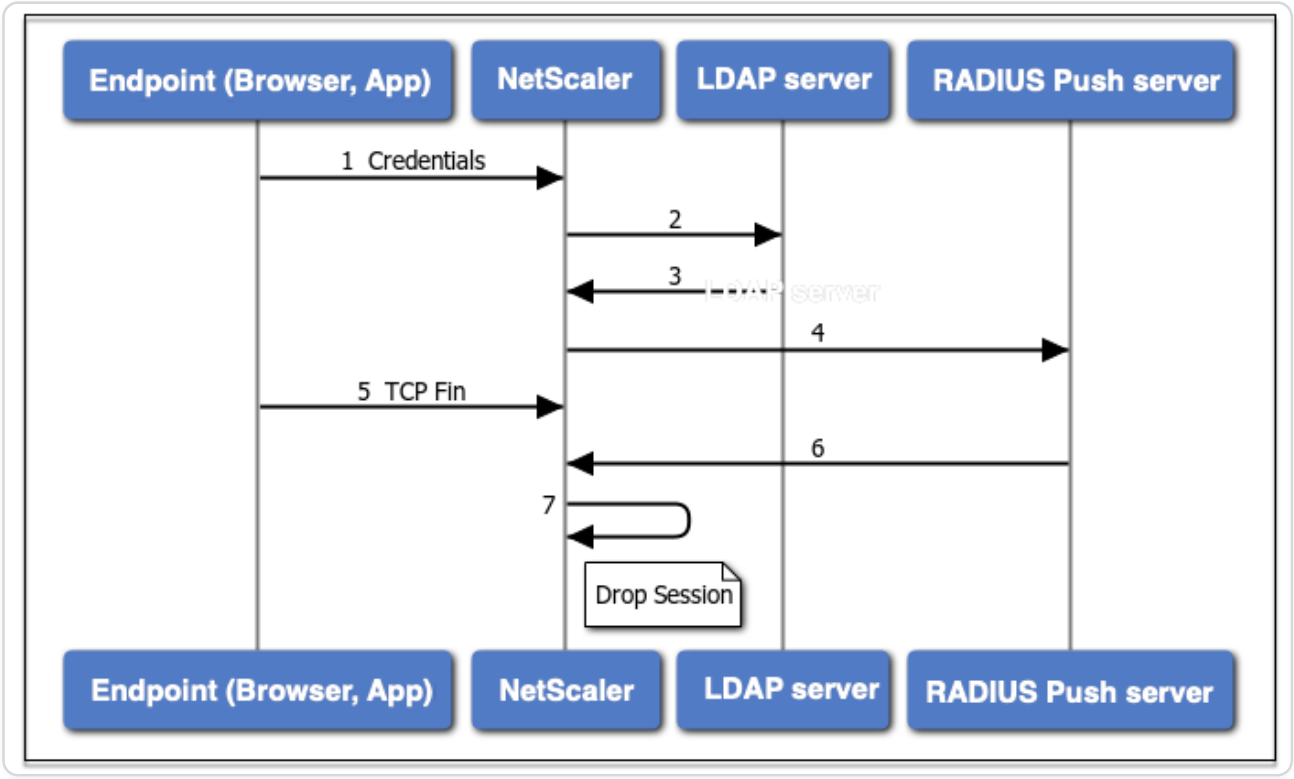
If Polling is configured on a NetScaler appliance, endpoints (like a web browser or an app) can poll (probe) the appliance during authentication at the configured intervals to get the status of the submitted authentication request.

Polling can be configured to handle authentications when an endpoint drops a TCP connection while authenticating with a NetScaler appliance.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Points to note

- The Polling configuration is supported for LDAP, RADIUS, and TACACS authentication methods.
- Client can probe authentication requests from second factor onwards.



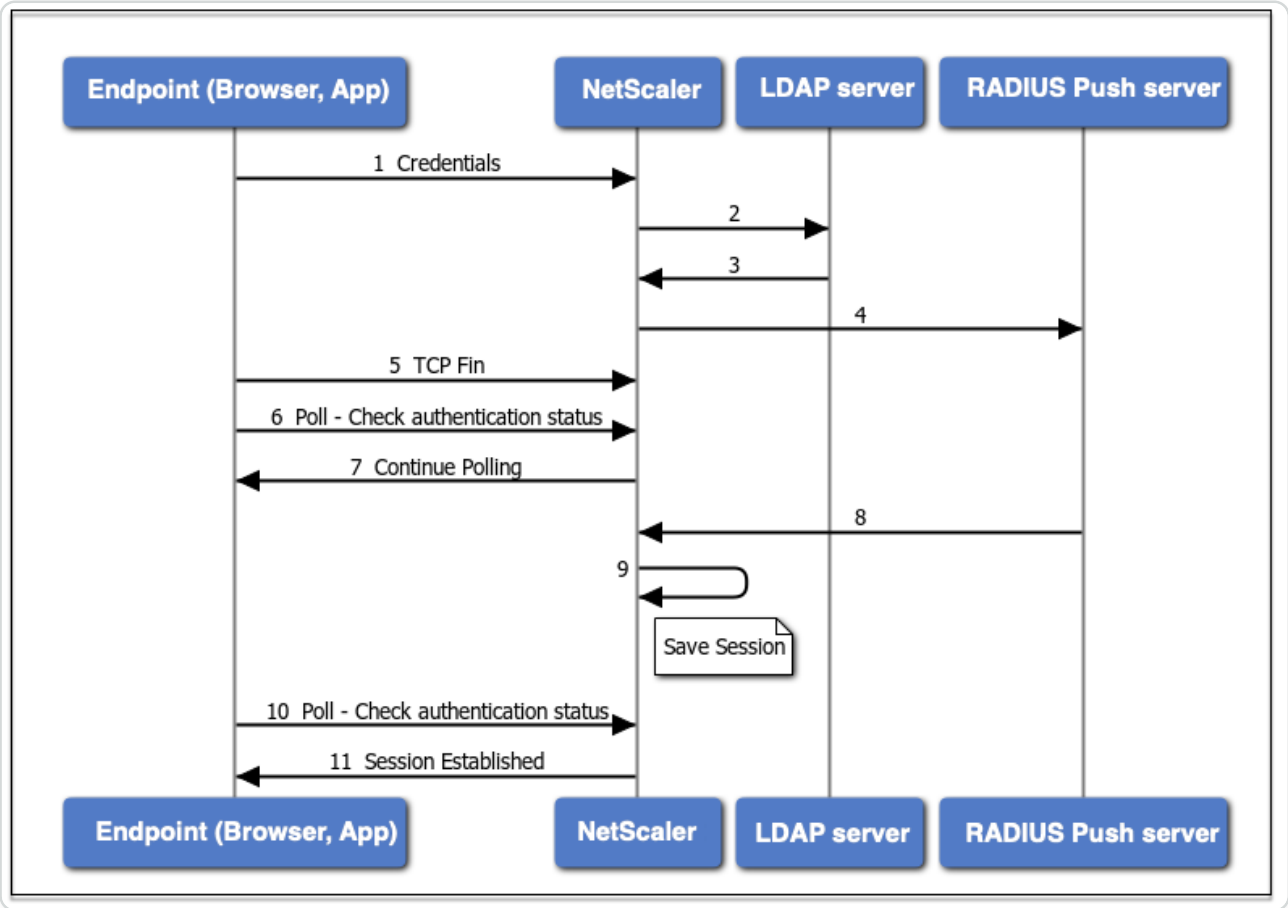
Why configure Polling?

Sometimes while authenticating, switching between the apps (for example a login app and an authenticator app) causes endpoints to lose connection with the NetScaler appliance leading to a break in the authentication flow. With Polling configured, this break in authentication can be avoided.

Understanding the Polling mechanism

The following is an example for the flow of events during authentication without Polling configured.

The Polling mechanism enables a NetScaler appliance to resume an ongoing authentication with the endpoint without having to restart the authentication process in a rare case of a TCP connection reset at the endpoint.



1. An endpoint (App or Web browser) authenticates with credentials.
2. The user name and password is verified against an existing first factor directory (LDAP/Active Directory).

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. If the correct credentials are supplied, the authentication moves to the next factor.
4. At this point, the NetScaler appliance sends request to the RADIUS Push server.
5. While the NetScaler appliance waits for a response from the RADIUS server, the endpoint drops TCP connection.
6. The NetScaler receives a response from the RADIUS Push server.
7. As no client TCP connection is found, the NetScaler appliance drops session and the login fails.

The following is an example for the flow of events during authentication with Polling configured.

1. An endpoint (App or Web browser) authenticates with credentials.
2. The user name and password is verified against an existing first factor directory (LDAP/Active Directory).
3. If the correct credentials are supplied, the authentication moves to the next factor.
4. At this point, the NetScaler appliance sends request to the RADIUS Push server.
5. While the NetScaler appliance waits for a response from the RADIUS server, the endpoint drops TCP connection.
6. Endpoint sends a poll (probe) to the NetScaler appliance to check for the authentication status.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

7. As the NetScaler appliance does not hear back from the RADIUS server, it requests the endpoint to continue polling.
8. The NetScaler appliance receives response from the RADIUS Push server.
9. As no client TCP connection is found, ADC saves the session state.
10. Endpoint again polls to check for the authentication status.
11. NetScaler appliance establishes the session and the login succeeds.

Configure Polling using CLI

The following is a sample CLI configuration.

Configure First factor

```
add authentication ldapAction ldap-new -serverIP 10.106.40.65 -serverPort
636 -ldapBase "dc=aaatm-test,dc=com" -ldapBindDn administrator@aaatm-
test.com -ldapBindDnPassword
2f63d3659103464a4fad0ade65e2ccfd4e8440e36ddff941d29796af03e01139
-encrypted -encryptmethod ENCMTHD_3 -ldapLoginName sAMAccountName
-groupAttrName memberof -subAttributeName CN -secType SSL
-alternateEmailAttr userParameters

add authentication Policy ldap-new -rule true -action ldap-new

bind authentication vserver avs -policy ldap-new -priority 1 -nextFactor
rad_factor
```

Configure Second factor

```
add authentication radiusAction rad1 -serverIP 10.102.229.120 -radKey
1b1613760143ce2371961e9a9eb5392c86a4954a62397f29a01b5d12b42ce232
-encrypted -encryptmethod ENCMTHD_3

add authentication Policy rad -rule true -action rad1
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure Poll.xml login schema

```
add authentication loginSchema polling_schema -authenticationSchema
LoginSchema/Poll.xml

add authentication policylabel rad_factor -loginSchema polling_schema

bind authentication policylabel rad_factor -policyName rad -priority 1
-gotoPriorityExpression NEXT
```

Configure Polling using GUI

For detailed steps on configuring multifactor authentication using GUI see, Configuring nFactor authentication

Following are the sample high level steps required for configuring NetScaler for Polling from second factor onwards.

1. Create a first factor for authentication, for example LDAP.
2. Create a second factor for authentication, for example RADIUS.
3. Add **Poll.xml** present in NetScaler (/nsconfig/loginschema/LoginSchema/) as login schema for the second factor.

Web App Firewall protection for VPN virtual servers and authentication virtual servers

Starting from NetScaler release 13.1 build 53.x, you can protect the NetScaler Gateway virtual servers, traffic management virtual servers, and authentication virtual servers against malicious attacks by applying Web App Firewall protection. This functionality provides an additional layer of security to your deployments as it filters incoming requests by validating them using the API schema and then authenticates users to access applications.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE:

The Web App firewall protection for authentication and Gateway endpoint is not supported on Linux based CPX and BLX deployments.

When Web App Firewall protection is enabled, NetScaler leverages the built-in Web App Firewall profiles `ns-aaatm-default-appfw-profile`, `ns-aaa-default-appfw-profile`, and `ns-vpn-default-appfw-profile`. The profiles contain the associated built-in API specification files `ns-aaatm-spec`, `ns-aaa-spec`, and `ns-vpn-spec` to ensure that network traffic is secure and compliant with the API specifications.

NOTE:

We recommend that you always upgrade to the latest software version as it contains the latest security fixes.

Licensing requirements

This feature is available with all the licenses (Standard, Enterprise, and Premium).

NOTE:

For the standard license, only the Web App Firewall protection for VPN virtual server and authentication virtual server features are applicable, not the entire Web App Firewall feature.

Configure Web App Firewall protection

On the GUI

To configure Web App Firewall protection to the virtual servers:

1. Navigate to **Security > AAA- Application Traffic > Change authentication AAA settings**.
2. On the **Configure AAA Parameter** page, configure **WAF Protection**.

   The following options are supported:

   - Disabled - When selected, Web App Firewall protection is not applied to any virtual server. By default, Web App Firewall protection is not set to any value.
   - AUTH – Protects the authentication virtual server.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- VPN – Protects the VPN virtual server.
- AUTH and VPN – Protects the authentication, traffic management, and VPN virtual servers.

3. Click **OK**.

On the CLI

Run the following command to enable Web App Firewall protection to the virtual servers:

```
set aaa parameter -wafProtection <DISABLED/AUTH/VPN>
```

Examples:

The following is an example of Web App Firewall protection for the authentication virtual servers:

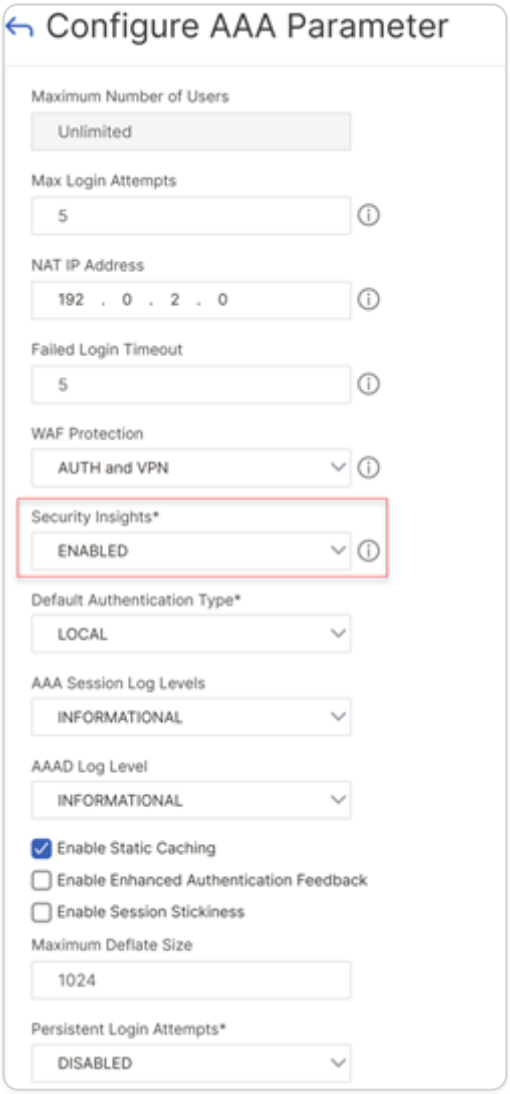
- The `set aaa parameter -wafProtection AUTH` command protects the authentication virtual servers.
- The `set aaa parameter -wafProtection VPN` command protects the VPN virtual servers.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- The `set aaa parameter -wafProtection AUTH VPN` command protects the authentication, VPN, and traffic management virtual servers.

Configure security insights

To view the violations detected by the built-in Web App Firewall profiles, configure security insights. When configured, NetScaler sends the insight records to the AppFlow collector (configured in the analytics profile) whenever a request is sent to a virtual server. The security insight records are sent to the AppFlow collector.



NOTES:

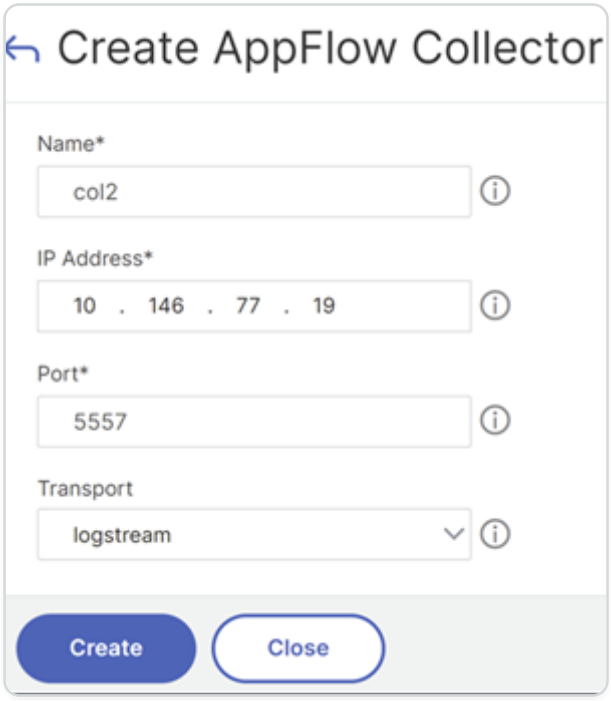
- Before you configure the security insights, as a pre-requisite, ensure that the ULFD mode and AppFlow feature are enabled. On the GUI, you can perform this step by navigating to **System > Settings > Modes and Features**. On the CLI, you can use the commands `en ns mode ULFD` and `en ns feature appflow`.
- Ensure that your NetScaler instances are added in NetScaler Console. For details, see Instance management.

On the GUI

On the **Configure AAA Parameter** page, enable the **Security Insights** option. This parameter is disabled, by default.

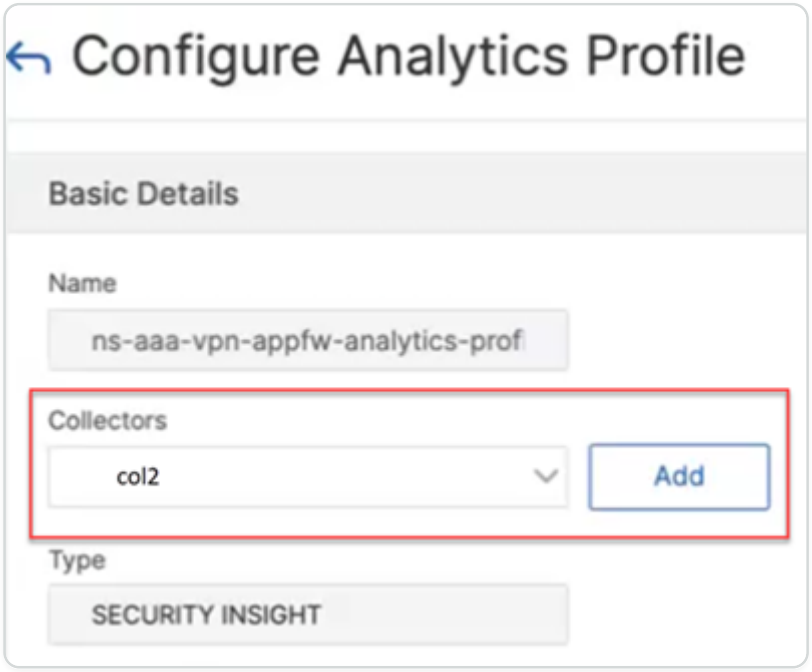
© 1997–2026 Citrix Systems, Inc. All rights reserved.

On the CLI



Run the following command to enable security insights for debug logging. This parameter is disabled, by default.

```
set aaa parameter -securityInsights <ENABLED/DISABLED>
```



Configure AppFlow® collector and analytics profile on the GUI

- Navigate to **System > Settings**. In the **Modes and Features** section and enable the ULFD mode and the AppFlow feature.
- Configure an AppFlow collector.
    - Navigate to **Configuration > System > AppFlow > AppFlow Collectors**. Configure the required parameters and click **Create**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

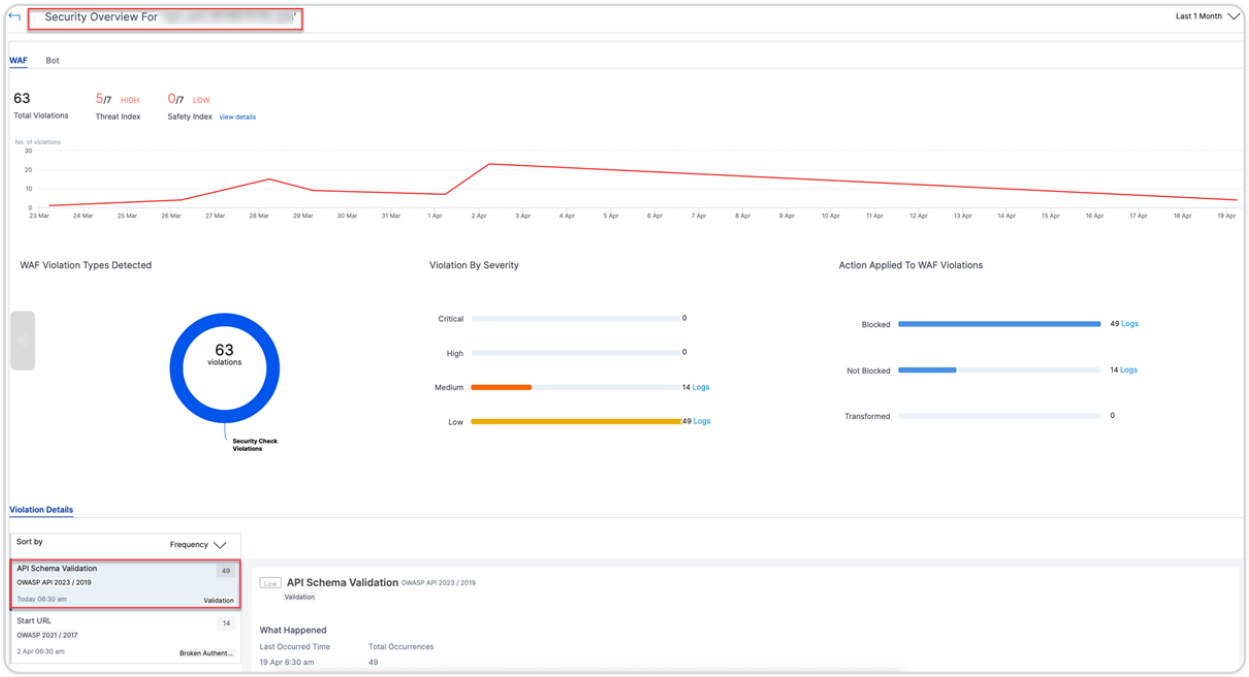
- Set the configured AppFlow collector to the analytics profile. In this example, the AppFlow collector is set to the built-in analytics profile `ns-aaa-vpn-appfw-analytics-profile`.
  - Navigate to **Configuration > System > Profiles > Analytics Profiles**. In the **Basic details** section, select the AppFlow collector on the **Collectors** field.

Configure AppFlow collector and analytics profile on the CLI

```
-  add appflow collector col2 -IPAddress 10.146.77.19 -port 5557
-Transport logstream
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

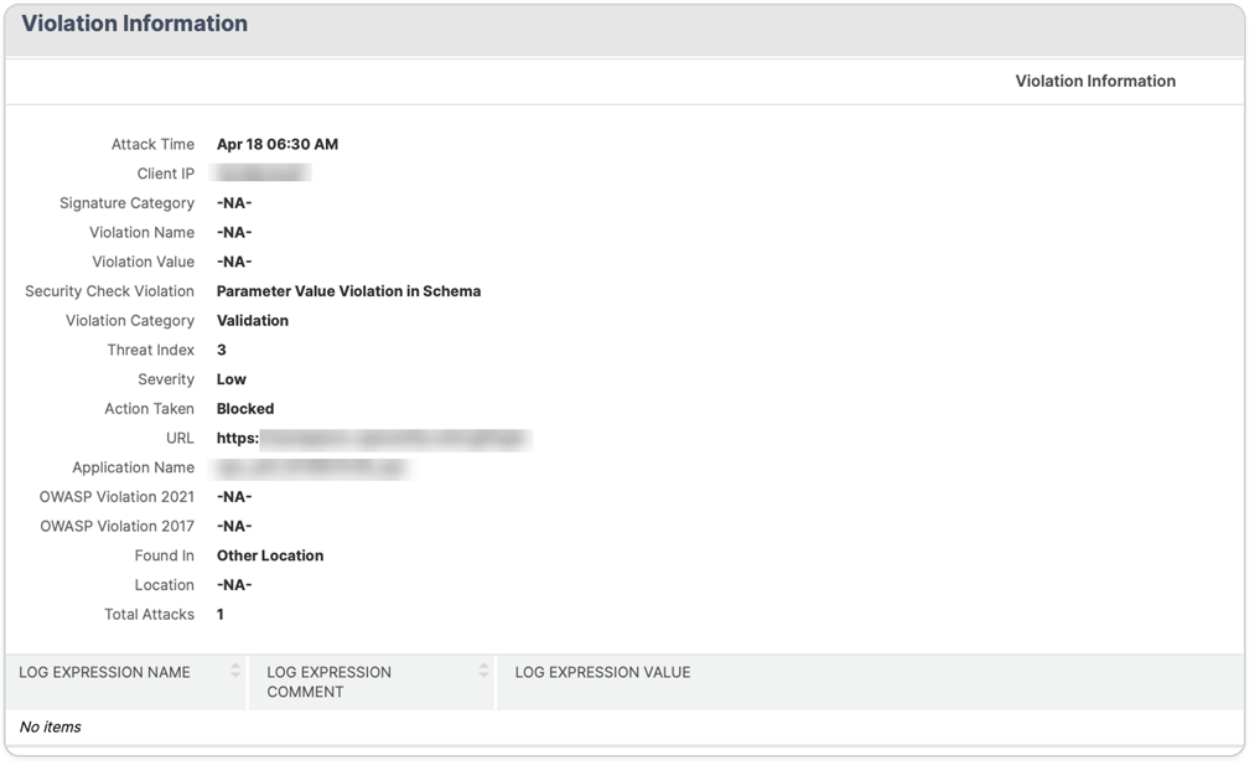
```
-  set analytics profile ns-aaa-vpn-appfw-analytics-profile -collectors
col2 -type securityinsight
```



For more information about the AppFlow configuration, see Configuring the AppFlow feature.

NOTE:

Security insights for this feature work only with Logstream messages. They do not work with IPFIX messages.



View the AppFlow records on NetScaler Console

1. On the NetScaler Console on-prem GUI, navigate to **Security > Security Violations**. In the **WAF** section, select the VPN or the authentication virtual server. For more details, see View application security violation details.

For a detailed view, select the URL in the **Request URL** field.

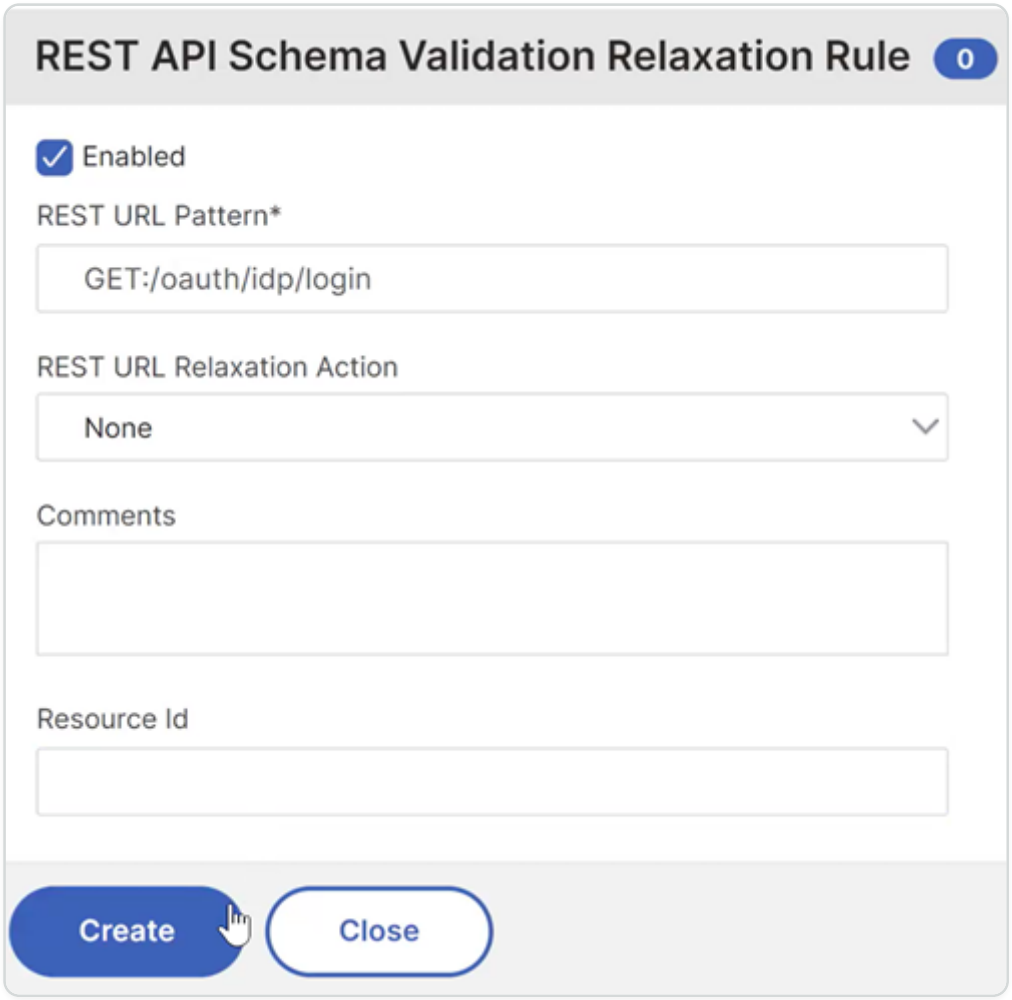
© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. Apply the appropriate licenses to your VPN or authentication virtual server.

   - Verify if your virtual server is licensed.
   - In **Settings > Analytics configuration** section of the NetScaler Console GUI, select your virtual server and apply the licenses. For more details, see Manage licensing and enable analytics on virtual servers.

Configure relaxation rules

You can configure a relaxation rule on the endpoint URLs or the virtual server IP addresses, to bypass certain traffic from being validated against the schema specified in the API specification file.

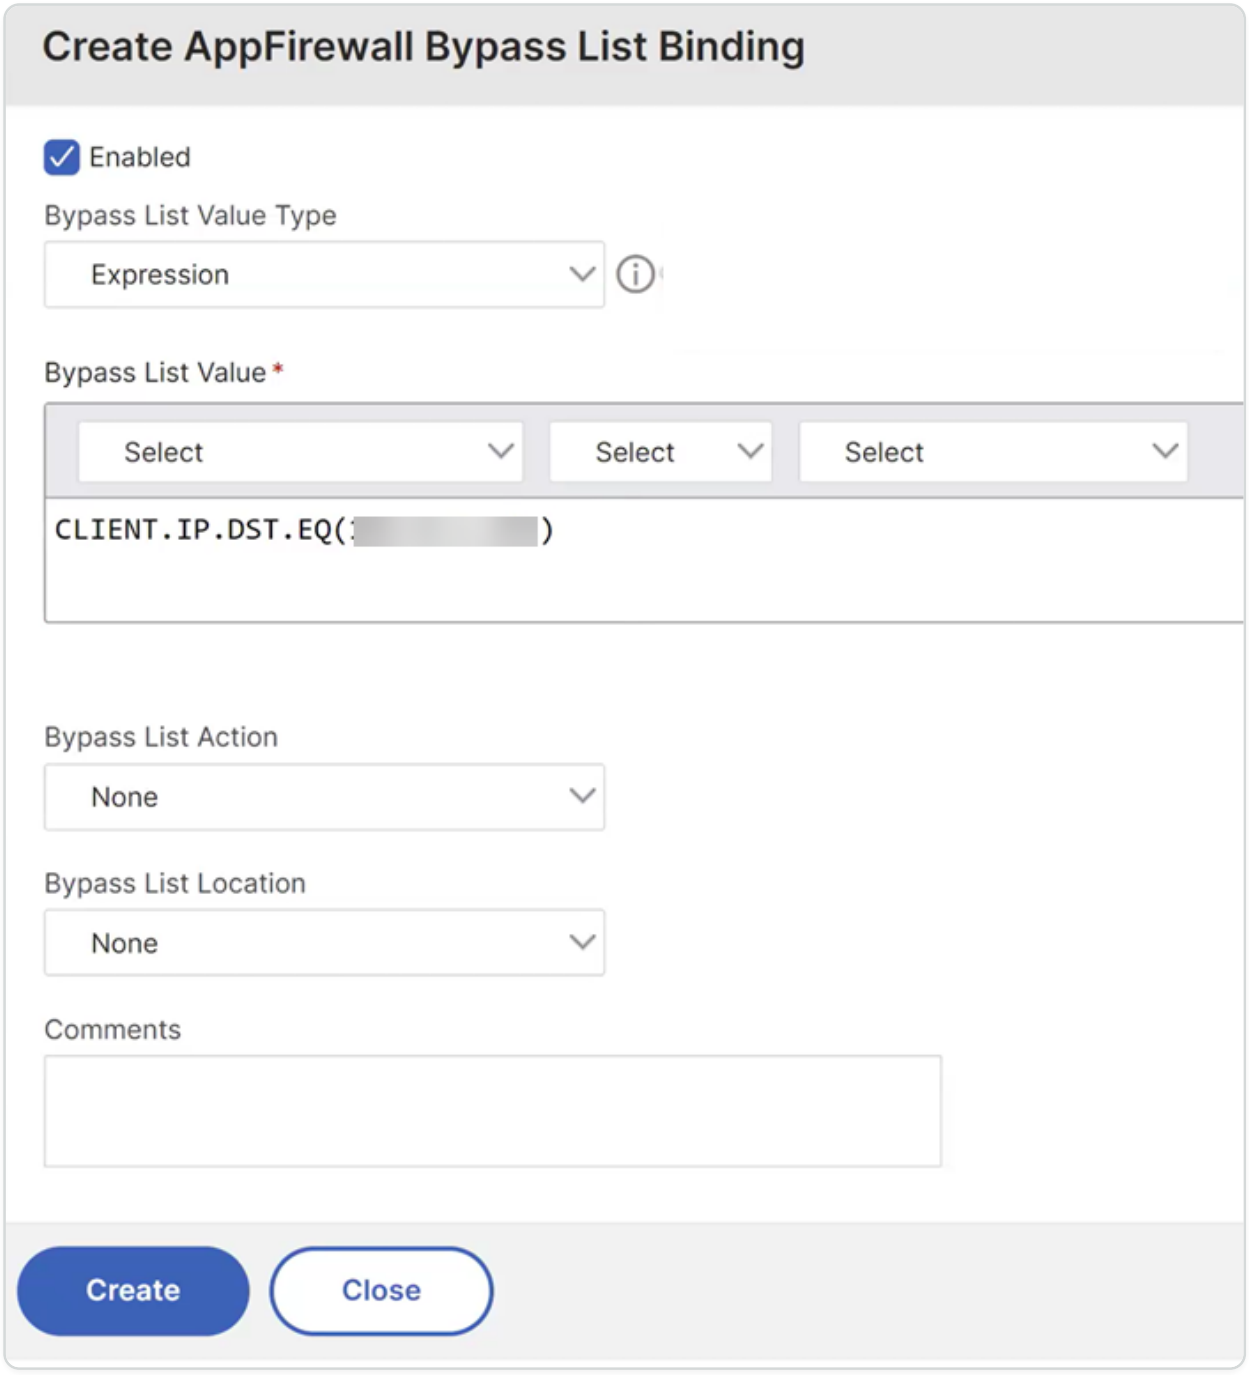


On the GUI

The following is an example of a REST validation relaxation that you can apply to the `"GET:/oauth/idp/login"` authentication endpoint URL:

- Navigate to **Security > NetScaler® Web App Firewall > Profiles**.
- Select the profile `ns-aaa-default-appfw-profile`.
- Under **Advanced Settings**, click **Relaxation Rules**.
- Select the **REST API schema validation** checkbox.
- Navigate to the beginning of the **Relaxation Rules** section and click **Edit**.
- Click **Add**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



- On the **REST API Schema Validation Relaxation Rule** page, update the required fields and click **Create**.

The following is an example of a relaxation that you can apply to a virtual server IP address:

- Under **Advanced Settings**, select **Profile Settings**.
- In the **Common Settings** section, select the **Enable Bypass List** checkbox.
- Go back to the **Advanced Settings** section and select **Global Bypass/Deny List**.
- In the **Global Bypass List** section, click **Add**.
- On the **Create AppFirewall Bypass List Binding** page, update the required fields and click **Create**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

On the CLI

The following is an example of a REST validation relaxation that you can apply to the `"GET:/oauth/idp/login"` authentication endpoint URL:

```
bind appfwprofile ns-aaa-default-appfw-profile -restValidation "GET:/
oauth/idp/login"
```

The following is an example of a relaxation that you can apply to a virtual server IP address:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
set appfwprofile ns-aaa-default-appfw-profile -bypasslist on

bind appfwprofile ns-aaa-default-appfw-profile -bypasslist
"CLIENT.IP.DST.EQ(192.0.2.255)" -valueType expression
```

Debug logging

The following is a sample error message that appears in the ns.log file for user requests that NetScaler Web App Firewall blocks:

```
Mar 22 07:04:26 <local0.info> 192.0.2.4 03/22/2024:07:04:26 GMT 0-PPE-0 :
default APPFW APPFW_SCHEMA_VALUE_INCORRECT 864 0 : 10.106.31.93 107-PPE0 - ns-
aaa-default-appfw-profile Parameter value incorrect as per API Spec: (ns-aaa-
spec) for Endpoint: (GET https://192.0.2.5/oauth/idp/login?
client_id=test&response_type=code&scope=openid%20profile&redirect_uri=https%3A%2F%2Foauthrp
<blocked>
```

In the preceding example, the profile name and endpoint URLs are specified to help users with the analysis and configure relaxation rules.

The following `stat` command displays the counters of the user requests blocked by the traffic management and authentication virtual servers:

```
stat aaa | grep -i blocked

Total AAA Waf blocked hits     0        15

Total AAATM Waf blocked hits   0         1
```

The following `stat` command displays the counters of API specification file:

```
stat apispec

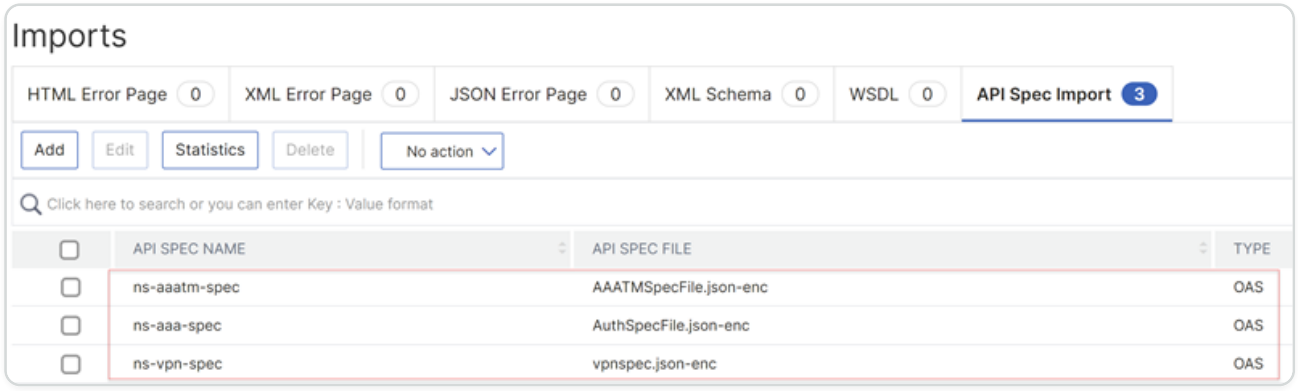
API spec(s) Summary hits validate unmatched

ns-a...-spec 0 0 0
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
ns-aaa-spec 15 12 0

ns-vpn-spec 4 4 0



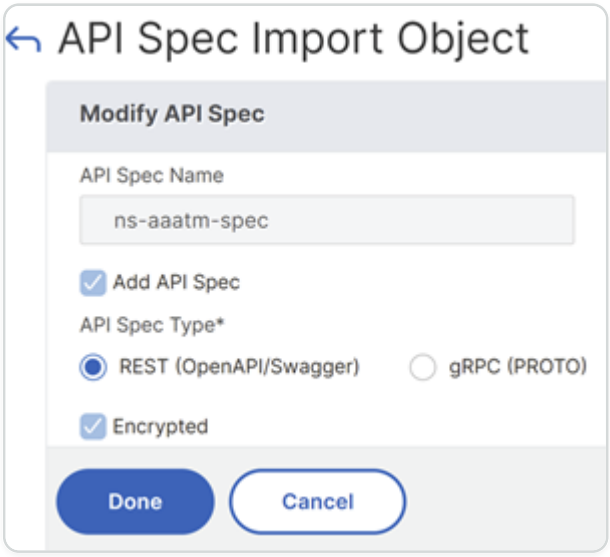
aaa 0 0 0
```

Dynamic update of the new API specification files provided by NetScaler

When the Web App Firewall protection parameter is enabled, NetScaler uses the following built-in API specification files for API schema validation.

- **ns-aaatm-spec**: This file performs API schema validation of the incoming requests to the traffic management virtual servers.
- **ns-aaa-spec**: This file performs API schema validation of the incoming requests to the authentication virtual servers.
- **ns-vpn-spec**: This file performs API schema validation of the incoming requests to the VPN virtual servers.

On the GUI, you can locate these files by navigating to **Security > NetScaler Web App Firewall > Imports > API Spec Import**.



You can dynamically update the built-in API specification files by using the API specification files that NetScaler provides. Perform the following steps on the GUI:

1. Navigate to **Security > NetScaler Web App Firewall > Imports > API Spec Import**.
2. Select the API specification file and click **Edit**.
3. On the API Spec Import Object page, click **File**.
4. Upload the new API schema file and click **Continue**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTES:

- Do not rename API specification files that NetScaler provides.
- Ensure that the **Encrypted** checkbox is selected.

5. Click **Done**.

For more details about importing files, see Imports.

Limitation

This feature is currently applicable to traffic in the default partition.

References

- For more information about the NetScaler Web App Firewall feature, see Introduction to NetScaler Web App Firewall.
- For more information about the AppFlow feature, see AppFlow.
- For FAQ details, see Authentication, Authorization, and Auditing.

Session and traffic management

Session settings

After you configure your authentication, authorization, and auditing profiles, you configure session settings to customize your user sessions. The session settings are:

- **The session timeout.**

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Controls the period after which the user is automatically disconnected and must authenticate again to access your intranet.

- **The default authorization setting.**

  Determines whether the NetScaler appliance will by default allow or deny access to content for which there is no specific authorization policy.

- **The single sign-on setting.**

  Determines whether the NetScaler appliance will log users on to all web applications automatically after they authenticate, or will pass users to the web application logon page to authenticate for each application.

- **The credential index setting.**

  Determines whether the NetScaler appliance uses the primary or the secondary authentication credentials for single sign-on.

To configure the session settings, you can take one of two approaches. If you want different settings for different user accounts or groups, you create a profile for each user account or group for which you want to configure custom sessions settings. You also create policies to select the connections to which to apply particular profiles, and you bind the policies to users or groups. You can also bind a policy to the authentication virtual server that handles the traffic to which you want to apply the profile.

If you want the same settings for all sessions, or if you want to customize the default settings for sessions that do not have specific profiles and policies configured, you can simply configure the global session settings.

Session profiles

To customize your user sessions, you first create a session profile. The session profile allows you to override global settings for any of the session parameters.

NOTE

The terms "session profile" and "session action" mean the same thing.

To create a session profile by using the command line interface

At the command prompt, type the following commands to create a session profile and verify the configuration:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add tm sessionAction <name> [-sessTimeout <mins>] [-
defaultAuthorizationAction ( ALLOW | DENY )][-SSO ( ON | OFF )][-
ssoCredential ( PRIMARY | SECONDARY )] [-ssoDomain <string>][-
httpOnlyCookie ( YES | NO )] [-persistentCookie ( ENABLED | DISABLED )] [-
persistentCookieValidity <minutes>]

show tm sessionAction <name>
```

Example

```
> add tm sessionAction session-profile -sessTimeout 30
-defaultAuthorization ALLOW

 Done

> show tm sessionAction session-profile

1)      Name: session-profile

        Authorization action : ALLOW

        Session timeout: 30 minutes

 Done
```

To modify a session profile by using the command line interface

At the command prompt, type the following commands to modify a session profile and verify the configuration:

```
set tm sessionAction <name> [-sessTimeout <mins>] [-
defaultAuthorizationAction ( ALLOW | DENY )][-SSO ( ON | OFF )][-
ssoCredential ( PRIMARY | SECONDARY )] [-ssoDomain <string>][-
httpOnlyCookie ( YES | NO )] [-persistentCookie ( ENABLED | DISABLED )] [-
persistentCookieValidity <minutes>]
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
show tm sessionAction
```

Example

```
> set tm sessionAction session-profile -sessTimeout 30
-defaultAuthorization ALLOW

 Done

> show tm sessionAction session-profile

1)      Name: session-profile

        Authorization action : ALLOW

        Session timeout: 30 minutes

 Done
```

To remove a session profile by using the command line interface

At the command prompt, type the following command to remove a session profile:

```
rm tm sessionAction <name>
```

To configure session profiles by using the configuration utility

1. Navigate to **Security > AAA - Application Traffic > Session.**
2. Navigate to **Security > AAA - Application Traffic > Policies > Session.**
3. In the details pane, click the **Profiles** tab.
4. On the **Profiles** tab, do one of the following:
   - To create a new session profile, click **Add.**
   - To modify an existing session profile, select the profile, and then click **Edit.**
5. In the Create TM Session Profile or Configure TM Session Profile dialog, type or select values for the parameters.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Name*—actionname (Cannot be changed for a previously configured session action.)
- Session Time-out—sesstimeout
- Single sign-on to Web Applications—sso
- Default Authorization Action—defaultAuthorizationAction
- Credential Index—ssocredential
- Single Sign-on Domain—ssoDomain
- HTTPOnly Cookie—httpOnlyCookie
- Enable Persistent Cookie—persistentCookie
- Persistent Cookie Validity—persistentCookieValidity

6. Click **Create** or **OK**. The session profile that you created appears in the Session Policies and Profiles pane.

Session policies

After you create one or more session profiles, you create session policies and then bind the policies globally or to an authentication virtual server to put them into effect.

To create a session policy by using the command line interface

At the command prompt, type the following commands to create a session policy and verify the configuration:

```
-  add tm sessionPolicy <name> <rule> <action>

-  show tm sessionPolicy <name>
```

Example

```
> add tm sessionPolicy session-pol "URL == /*.gif" session-profile

Done

> show tm sessionPolicy session-pol

1)      Name: session-pol       Rule: URL == '/*.gif'

        Action: session-profile
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
 Done
```

To modify a session policy by using the command line interface

At the command prompt, type the following commands to modify a session policy and verify the configuration:

```
-  set tm sessionPolicy <name> [-rule <expression>] [-action <action>]

-  show tm sessionPolicy <name>
```

Example

```
> set tm sessionPolicy session-pol "URL == /*.gif" session-profile

 Done

> show tm sessionPolicy session-pol

1)      Name: session-pol       Rule: URL == '/*.gif'

        Action: session-profile

 Done
```

To globally bind a session policy by using the command line interface

At the command prompt, type the following commands to globally bind a session policy and verify the configuration:

```
bind tm global -policyName <policyname> [-priority <priority>]
```

Example

```
> bind tm global -policyName session-pol

 Done
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
> show tm sessionPolicy session-pol

1)      Name: session-pol       Rule: URL == '/*.gif'

        Action: session-profile

        Policy is bound to following entities

        1) TM GLOBAL    PRIORITY : 0

 Done
```

To bind a session policy to an authentication virtual server by using the command line interface

At the command prompt, type the following command to bind a session policy to an authentication virtual and verify the configuration:

```
bind authentication vserver <name> -policy <policyname> [-priority
<priority>]
```

Example

```
bind authentication vserver auth-vserver-1 -policyName Session-Pol-1
-priority 1000

Done
```

To unbind a session policy from an authentication virtual server by using the command line interface

At the command prompt, type the following commands to unbind a session policy from an authentication virtual server and verify the configuration:

```
unbind authentication vserver <name> -policy <policyname>
```

Example

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
unbind authentication vserver auth-vserver-1 -policyName Session-Pol-1

Done
```

To unbind a globally bound session policy by using the command line interface

At the command prompt, type the following commands to unbind a globally bound session policy:

```
unbind tm global -policyName <policyname>
```

Example

```
unbind tm global -policyName Session-Pol-1

Done
```

To remove a session policy by using the command line interface

First unbind the session policy from global, and then, at the command prompt, type the following commands to remove a session policy and verify the configuration:

```
rm tm sessionPolicy <name>
```

Example

```

rm tm sessionPolicy Session-Pol-1

Done

```

To configure and bind session policies by using the configuration utility

1. Navigate to **Security > AAA - Application Traffic > Session**.
2. Navigate to **Security > AAA - Application Traffic > Policies > Session**.
3. In the details pane, on the **Policies** tab, do one of the following:
   - To create a new session policy, click **Add**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- To modify an existing session policy, select the policy, and then click **Edit**.

4. In the **Create Session Policy** or **Configure Session Policy** dialog, type or select the values for the parameters.
   - Name*—policyname (Cannot be changed for a previously configured session policy.)
   - Request Profile*—actionname
   - Expression*—rule (You enter expressions by first choosing the type of expression in the leftmost drop-down list beneath the Expression text area and then typing your expression directly into the expression text area, or by clicking **Add** to open the Add Expression dialog box and using the drop-down lists in it to construct your expression.)
5. Click **Create** or **OK**. The policy that you created appears in the details pane of the **Session Policies** and **Profiles** page.
6. To globally bind a session policy, in the details pane, select **Global Bindings** from the **Action** drop-down list, and fill in the dialog.
   - Select the name of the session policy you want to globally bind.
   - Click **OK**.
7. To bind a session policy to an authentication virtual server, in the navigation pane, click **Virtual Servers**, and add that policy to the policies list.
   - In the details pane, select the virtual server, and then click **Edit**.
   - In the **Advanced Selections** to the right of the detail area, click **Policies**.
   - Select a policy, or click the **plus** icon to add a policy.
   - In the **Priority** column to the left, modify the default priority to ensure that the policy is evaluated in the proper order.
   - Click **OK**. A message appears in the status bar, stating that the policy has been configured successfully.

Global session settings

In addition to or instead of creating session profiles and policies, you can configure global session settings. These settings control the session configuration when there is no explicit policy overriding them.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To configure the session settings by using the command line interface

At the command prompt, type the following commands to configure the global session settings and verify the configuration:

```
set tm sessionParameter [-sessTimeout <mins>][-defaultAuthorizationAction
( ALLOW | DENY )][-SSO ( ON | OFF )][-ssoCredential ( PRIMARY |
SECONDARY )][-ssoDomain <string>][-httpOnlyCookie ( YES | NO )][-
persistentCookie ( ENABLED | DISABLED )] [-persistentCookieValidity
<minutes>]
```

Example

```
> set tm sessionParameter -sessTimeout 30

  Done

> set tm sessionParameter -defaultAuthorizationAction DENY

  Done

> set tm sessionParameter -SSO ON

  Done

> set tm sessionParameter -ssoCredential PRIMARY

  Done
```

To configure the session settings by using the configuration utility

1. Navigate to **Security > AAA - Application Traffic**
2. In the details pane, under **Settings**, click Change global settings.
3. In the **Global Session Settings** dialog, type or select values for the parameters.
    - Session Time-out—sessTimeout
    - Default Authorization Action—defaultAuthorizationAction
    - Single Sign-on to Web Applications—sso
    - Credential Index—ssoCredential
    - Single Sign-on Domain—ssoDomain

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- HTTPOnly Cookie—httpOnlyCookie
- Enable Persistent Cookie—persistentCookie
- Persistent Cookie Validity (minutes)—persistentCookieValidity
- Home Page—home page

4. Click **OK**.

Traffic settings

If you use forms-based or SAML single sign-on (SSO) for your protected applications, you configure that feature in the Traffic settings. SSO enables your users to log on once to access all protected applications, rather than requiring them to log on separately to access each one.

Forms-based SSO allows you to use a web form of your own design as the sign-on method instead of a generic pop-up window. You can therefore put your company logo and other information you might want your users to see on the logon form. SAML SSO allows you to configure one NetScaler appliance or virtual appliance instance to authenticate to another NetScaler appliance on behalf of users who have authenticated with the first appliance.

To configure either type of SSO, you first create a forms or SAML SSO profile. Next, you create a traffic profile and link it to the SSO profile you created. Next, you create a policy, link it to the traffic profile. Finally, you bind the policy globally or to an authentication virtual server to put your configuration into effect.

Traffic profiles

After creating at least one forms or SAML sso profile, you must next create a traffic profile.

NOTE:

In this feature, the terms "profile" and "action" mean the same thing.

To create a traffic profile by using the command line interface

At the command prompt, type:

```
add tm trafficAction <name> [-appTimeout <mins>][-SSO ( ON | OFF ) [-
formSSOAction <string>]][-persistentCookie ( ENABLED | DISABLED )][-
InitiateLogout ( ON | OFF )]
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Example

```
add tm trafficAction Traffic-Prof-1 –appTimeout 10 -SSO ON -formSSOAction
SSO-Prof-1
```

To modify a session profile by using the command line interface

At the command prompt, type:

```
set tm trafficAction <name> [-appTimeout <mins>] [-SSO ( ON | OFF ) [-
formSSOAction <string>]] [-persistentCookie ( ENABLED | DISABLED )] [-
InitiateLogout ( ON | OFF )]
```

Example

```
set tm trafficAction Traffic-Prof-1 –appTimeout 10 -SSO ON -formSSOAction
SSO-Prof-1
```

To remove a session profile by using the command line interface

At the command prompt, type:

```
rm tm trafficAction <name>
```

Example

```
rm tm trafficAction Traffic-Prof-1
```

To configure traffic profiles by using the configuration utility

1. Navigate to **Security > AAA - Application Traffic > Traffic.**
2. Navigate to **Security > AAA - Application Traffic > Policies > Traffic.**
3. In the details pane, click the Profiles tab.
4. On the Profiles tab, do one of the following:
   - To create a new traffic profile, click **Add.**
   - To modify an existing traffic profile, select the profile, and then click **Edit.**

© 1997–2026 Citrix Systems, Inc. All rights reserved.

5. In the **Create Traffic Profile** or **Configure Traffic Profile** dialog box, specify values for the parameters.
   - Name*—name (Cannot be changed for a previously configured session action.)
   - AppTimeout—appTimeout
   - Single Sign-On—SSO
   - Form SSO Action—formSSOAction
   - SAML SSO Action—samlSSOAction
   - Enable Persistent Cookie—persistentCookie
   - Initiate Logout—InitiateLogout
6. Click **Create** or **OK**. The traffic profile that you created appears in the Traffic Policies, Profiles, and either the Form SSO Profiles or SAML SSO Profiles pane, as appropriate.

Support for AAA.USER and AAA.LOGIN expressions

The AAA.USER expression is now implemented to replace the existing HTTP.REQ.USER expressions. The AAA.USER expression is applicable to handle non-HTTP traffic, such as the Secure Web Gateway (SWG) and role-based access (RBA) mechanism. The AAA.USER expressions are equivalent to HTTP.REQ.USER expressions.

You can use the expression at various actions or profiles configuration.

At the command prompt, type:

```
add tm trafficAction <name> [SSO (ON|OFF)] [-userExpression <string>]

add tm trafficAction <name> [SSO (ON|OFF)] [-passwdExpression <string>]
```

Example

```
add tm trafficAction tm_act -SSO ON -userExpression "AAA.USER.NAME"

add tm trafficAction tm_act -SSO ON -userExpression "AAA.USER.PASSWD"
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add tm trafficPolicy tm_pol true tm_act

bind lb vserver lb1 -policyName tm_pol -priority 2
```

NOTE:

If you use HTTP.REQ.USER expression, a warning message “HTTP.REQ.USER has been deprecated. Use AAA.USER instead” appears on the command prompt.

- **AAA.LOGIN Expression.** The LOGIN expression represents pre-login, also known as the login request. The login request can be from NetScaler Gateway, SAML IdP, or from OAuth authentication. The NetScaler will abstract the required attributes from the policy configuration. The AAA.LOGIN expression contains the attributes, which can be fetched based on the following:
  - **AAA.LOGIN.USERNAME.** The user name (if found) is fetched from the current login request. The same expression applied to a non-login request (determined by an authentication, authorization, and auditing) results in an empty string.
  - **AAA.LOGIN.PASSWORD.** The user password (if found) is fetched from the current login request. The expression results in an empty string if the password is not found.
  - **AAA.LOGIN.PASSWORD2.** The second password (if found) is fetched from the login request.
  - **AAA.LOGIN.DOMAIN.** The domain information is fetched from the login request.
  - **AAA.LOGIN.VALUE("#").** The expression is used to retrieve information associated with your account when are you logged in. Here # is a string value. You can use these index values by using the expression AAA.LOGIN.VALUE("#"). The authentication, authorization, and auditing module looks up the login sessions value and `AAA.LOGIN.VALUE("#")` queries the hash table for that particular attribute. For example, if `Value("username")` is set, `AAA.LOGIN.VALUE("#")` queries the hash map and fetches the value corresponding to `username`.
- **AAA.USER.ATTRIBUTE("#").** The expression is used to store user attribute. Here # can either be an integer value (between 1 and 16) or a string value. You can use these index values by using the expression AAA.USER.ATTRIBUTE("#"). The authentication, authorization, and

© 1997–2026 Citrix Systems, Inc. All rights reserved.

auditing module looks up the user sessions attribute and `AAA.USER.ATTRIBUTE("#")` queries the hash table for that particular attribute. For example, if `Attributes("samaccountname")` is set, `AAA.USER.ATTRIBUTE("samaccountname")` queries the hash map and fetches the value corresponding to `samaccountname`.

Traffic policies

After you create one or more form SSO and traffic profiles, you create traffic policies and then bind the policies, either globally or to a traffic management virtual server, to put them into effect.

To create a traffic policy by using the command line interface

At the command prompt, type:

```
add tm trafficPolicy <name> <rule> <action>
```

Example

```
add tm trafficPolicy Traffic-Pol-1
"HTTP.REQ.HEADER("Cookie").CONTAINS("login=true")" Traffic-Prof-1
```

To modify a traffic policy by using the command line interface

At the command prompt, type:

```
set tm trafficPolicy <name> <rule> <action>
```

Example

```
set tm trafficPolicy Traffic-Pol-1
"HTTP.REQ.HEADER("Cookie").CONTAINS("login=true")" Traffic-Prof-1
```

To globally bind a traffic policy by using the command line interface

At the command prompt, type:

```
bind tm global -policyName <string> [-priority <priority>]
```

Example

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
bind tm global -policyName Traffic-Pol-1
```

To bind a traffic policy to a load balancing or content switching virtual server by using the command line interface

At the command prompt, type one of the following commands:

```
bind lb vserver <name> -policy <policyName> [-priority <priority>]

bind cs vserver <name> -policy <policyName> [-priority <priority>]
```

Example

```
bind authentication vserver auth-vserver-1 -policyName Traffic-Pol-1
-priority 1000
```

To unbind a globally bound traffic policy by using the command line interface

At the command prompt, type:

```
unbind tm global -policyName <policyname>
```

Example

```
unbind tm global -policyName Traffic-Pol-1
```

To unbind a traffic policy from a load balancing or content switching virtual server by using the command line interface

At the command prompt, type one of the following commands:

```
unbind lb vserver <name> -policy <policyname>

unbind cs vserver <name> -policy <policyname>
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Example

```
unbind authentication vserver auth-vserver-1 -policyName Traffic-Pol-1
```

To remove a traffic policy by using the command line interface

First unbind the session policy from global, and then, at the command prompt, type:

```
rm tm trafficPolicy <name>
```

Example

```
rm tm trafficPolicy Traffic-Pol-1
```

To configure and bind traffic policies by using the configuration utility

1. Navigate to **Security > AAA - Application Traffic > Traffic.**
2. Navigate to **Security > AAA - Application Traffic > Policies > Traffic.**
3. In the details pane, do one of the following:
   - To create a new session policy, click **Add.**
   - To modify an existing session policy, select the policy, and then click **Edit.**
4. In the **Create Traffic Policy** or **Configure Traffic Policy** dialog, specify values for the parameters.
   - Name*—policyName (Cannot be changed for a previously configured session policy.)
   - Profile*—actionName
   - Expression—rule (You enter expressions by first choosing the type of expression in the leftmost drop-down list beneath the Expression text area and then typing your expression directly into the expression text area, or by clicking Add to open the Add Expression dialog box and using the drop-down lists in it to construct your expression.)
5. Click **Create** or **OK**. The policy that you created appears in the details pane of the **Session Policies** and **Profiles** page.

Form SSO profiles

To enable and configure forms-based SSO, you first create an SSO profile.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE

- Forms-based single sign-on does not work if the form is customized to include Javascript.
- In this feature, the terms “profile” and “action” mean the same thing.

To create a form SSO profile by using the command line interface

At the command prompt, type:

```
add tm formSSOAction <name> -actionURL <URL> -userField <string>
-passwdField <string> -ssoSuccessRule <expression> [-nameValuePair
<string>] [-responsesize <positive_integer>][-nvtype ( STATIC | DYNAMIC )]
[-submitMethod ( GET | POST )]

show tm formSSOAction [<name>]
```

Example

```
add tm formSSOAction SSO-Prof-1 -actionURL "/logon.php"

-userField "loginID" -passwdField "passwd"

-nameValuePair "loginID passwd" -responsesize "9096"

-ssoSuccessRule "HTTP.RES.HEADER("Set-Cookie").CONTAINS("LogonID")"

-nvtype STATIC -submitMethod GET

–sessTimeout 10 -defaultAuthorizationAction ALLOW
```

To modify a form SSO by using the command line interface

At the command prompt, type:

```
set tm formSSOAction <name> -actionURL <URL> -userField <string>
-passwdField <string> -ssoSuccessRule <expression> [-nameValuePair
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
<string>] [-responsesize <positive_integer>][-nvtype ( STATIC | DYNAMIC )]
[-submitMethod ( GET | POST )]
```

Example

```
set tm formSSOAction SSO-Prof-1 -actionURL "/logon.php"

-userField "loginID" -passwdField "passwd"

-ssoSuccessRule "HTTP.RES.HEADER("Set-Cookie").CONTAINS("LogonID")"

-nameValuePair "loginID passwd" -responsesize "9096"

-nvtype STATIC -submitMethod GET

–sessTimeout 10 -defaultAuthorizationAction ALLOW
```

To remove a form SSO profile by using the command line interface

At the command prompt, type:

```
rm tm formSSOAction <name>
```

Example

```
rm tm sessionAction SSO-Prof-1
```

To configure form SSO profiles by using the configuration utility

1. Navigate to **Security > AAA - Application Traffic > Policies > Traffic**.
2. In the details pane, click the **Form SSO Profiles** tab.
3. On the Form SSO Profiles tab, do one of the following:
   - To create a new form SSO profile, click **Add**.
   - To modify an existing form SSO profile, select the profile, and then click Edit.
4. In the **Create Form SSO Profile** or **Configure Form SSO Profile** dialog, specify the values for the parameters:
   - Name*—name (Cannot be changed for a previously configured session action.)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Action URL*—actionURL
- User Name Field*—userField
- Password Field*—passField
- Expression*—ssoSuccessRule
- Name Value Pair—nameValuePair
- Response Size—responsesize
- Extraction—nvtype
- Submit Method—submitMethod

5. Click **Create** or **OK**, and then click **Close**. The form SSO profile that you created appears in the **Traffic Policies**, **Profiles**, and **Form SSO Profiles** pane.

SAML SSO profiles

To enable and configure SAML-based SSO, you first create a SAML SSO profile.

To create a SAML SSO profile by using the command line interface

At the command prompt, type:

```
add tm samlSSOProfile <name> -samlSigningCertName <string>
-assertionConsumerServiceURL <URL> -relaystateRule <expression>
-sendPassword (ON | OFF) [-samlIssuerName <string>]
```

Example

```
add tm samlSSOProfile saml-SSO-Prof-1 -samlSigningCertName "Example, Inc."
 -assertionConsumerServiceURL "https://service.example.com"
-relaystateRule "true"  -sendPassword "ON" -samlIssuerName "Example, Inc."
```

To modify a SAML SSO by using the command line interface

At the command prompt, type:

```
set tm samlSSOProfile <name> -samlSigningCertName <string>
-assertionConsumerServiceURL <URL> -relaystateRule <expression>
-sendPassword (ON | OFF) [-samlIssuerName <string>]
```

Example

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
set tm samlSSOProfile saml-SSO-Prof-1 -samlSigningCertName "Example, Inc."
 -assertionConsumerServiceURL "https://service.example.com"
-relaystateRule "true"  -sendPassword "ON" -samlIssuerName "Example, Inc."
```

To remove a SAML SSO profile by using the command line interface

At the command prompt, type:

```
rm tm samlSSOProfile <name>
```

Example

```
rm tm sessionAction saml-SSO-Prof-1
```

To configure a SAML SSO profile by using the configuration utility

1. Navigate to **Security > AAA - Application Traffic > Policies > Traffic.**
2. In the details pane, click the **SAML SSO Profiles** tab.
3. On the **SAML SSO Profiles** tab, do one of the following:
   - To create a new SAML SSO profile, click **Add.**
   - To modify an existing SAML SSO profile, select the profile, and then click **OpenEdit**.
4. In the **Create SAML SSO Profiles** or the **Configure SAML SSO Profiles** dialog box, set the following parameters:
   - Name*
   - Signing Certificate Name*
   - ACS URL*
   - Relay State Rule*
   - Send Password
   - Issuer Name
5. Click **Create** or **OK**, and then click **Close.** The SAML SSO profile that you created appears in the Traffic Policies, Profiles, and SAML SSO Profiles pane.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Session timeout for OWA 2010

You can now force OWA 2010 connections to time out after a specified period of inactivity. OWA sends repeated keepalive requests to the server to prevent timeouts. Keeping the connections open can interfere with single sign-on.

To force OWA 2010 to time out after a specified period by using the command line interface

At the command prompt, type the following commands:

```
add tm trafficAction <actname> [-forcedTimeout <forcedTimeout>
-forcedTimeoutVal <mins>]
```

For <actname\>, substitute a name for your traffic policy. For <mins\>, substitute the number of minutes after which to initiate a forced timeout. For <forcedTimeout\>, substitute one of the following values:

-**START** — Starts the timer for forced timeout if a timer has not already been started. If a running timer exists, has no effect. -**STOP** — Stops a running timer. If no running timer is found, has no effect. -**RESET** — Restarts a running timer. If no running timer is found, starts a timer as if the START option had been used.

```
add tm trafficPolicy <polname> <rule> <actname>
```

For <polname\>, substitute a name for your traffic policy. For <rule\>, substitute a rule in NetScaler Advanced policy.

```
bind lb vserver <vservername> –policyName <name> -priority <number>
```

For <vservername\>, substitute the name of the authentication, authorization, and auditing traffic management virtual server. For <priority\>, substitute an integer that designates the policy's priority.

Example

```
add tm trafficAction act-owa2010timeout -forcedTimeout RESET
-forcedTimeoutVal 10

add tm trafficPolicy pol-owa2010timeout true act-owa2010timeout
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
bind lb vserver vs-owa2010 -policyName pol-owa2010timeout -priority 10
```

Rate Limiting for NetScaler Gateway

The rate limiting feature for NetScaler Gateway enables you to define the maximum load for a given network entity or virtual entity on the NetScaler Gateway appliance. Since the NetScaler Gateway appliance consumes all the unauthenticated traffic, the appliance is often exposed to process requests at a high rate. The rate limiting feature enables you to configure the NetScaler Gateway appliance to monitor the rate of traffic associated with an entity and take preventive action, in real time, based on the traffic. For more information about how rate limiting works in a NetScaler appliance, see Rate limiting.

NetScaler has the rate limiting feature that provides protection to back-end servers for an unforeseen rate. Since the feature for NetScaler did not serve the unauthenticated traffic that NetScaler Gateway handles, NetScaler Gateway needed its own rate limiting functionality. This is needed to check an unforeseen rate of requests from various sources the NetScaler Gateway appliance is exposed to. For example, unauthenticated/login/control requests and certain APIs exposed for end user or device validations.

Common use-cases for Rate limiting

- Limit the number of requests per second from a URL.
- Drop a connection based on cookies received in request from a particular host if the request exceeds the rate limit.
- Limit the number of HTTP requests that arrive from the same host (with a particular subnet mask) and that have the same destination IP address.

Configure Rate Limiting for NetScaler Gateway

Prerequisites

A configured authentication virtual server.

Points to note

- In the configuration steps, a sample limit identifier is configured. The same can be configured with all the supported parameters like stream selector, mode. For an exhaustive description of the rate limiting capabilities, see Rate limiting.
- The policy can also be bound to a VPN virtual server as follows. You need a configured VPN virtual server to bind the policies using the following command.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
bind vpn vserver  -policy denylogin –pri 1 –type aaa_request
```

- AAA_REQUEST is a newly introduced bindpoint for responder policies. The policies configured at this bind point are applied to all the incoming request at the specified virtual server. The policies are processed for the unauthenticated/control traffic first before any other processing.
- Binding the policy to the NetScaler Gateway virtual server enables rate limiting at the AAA_REQUEST bindpoint for all the traffic consumed by NetScaler Gateway including unauthenticated requests.
- Binding the policy to an authentication virtual server rate limits the unauthenticated/control requests hitting the authentication virtual server.

To configure rate limiting by using the command line interface, at the command prompt, type the following commands:

```
add limitIdentifier <limitIdentifier name> -threshold <positive_integer>
-timeslice <positive_integer> -mode <mode type>
```

Example:

```
add limitIdentifier limit_one_login -threshold 3 -timeslice 6000 -mode
REQUEST_RATE
```

```
add responder action denylogin respondwith "\"HTTP/1.1 200
OK\r\n\r\nRequest is denied due to unusual rate\""
```

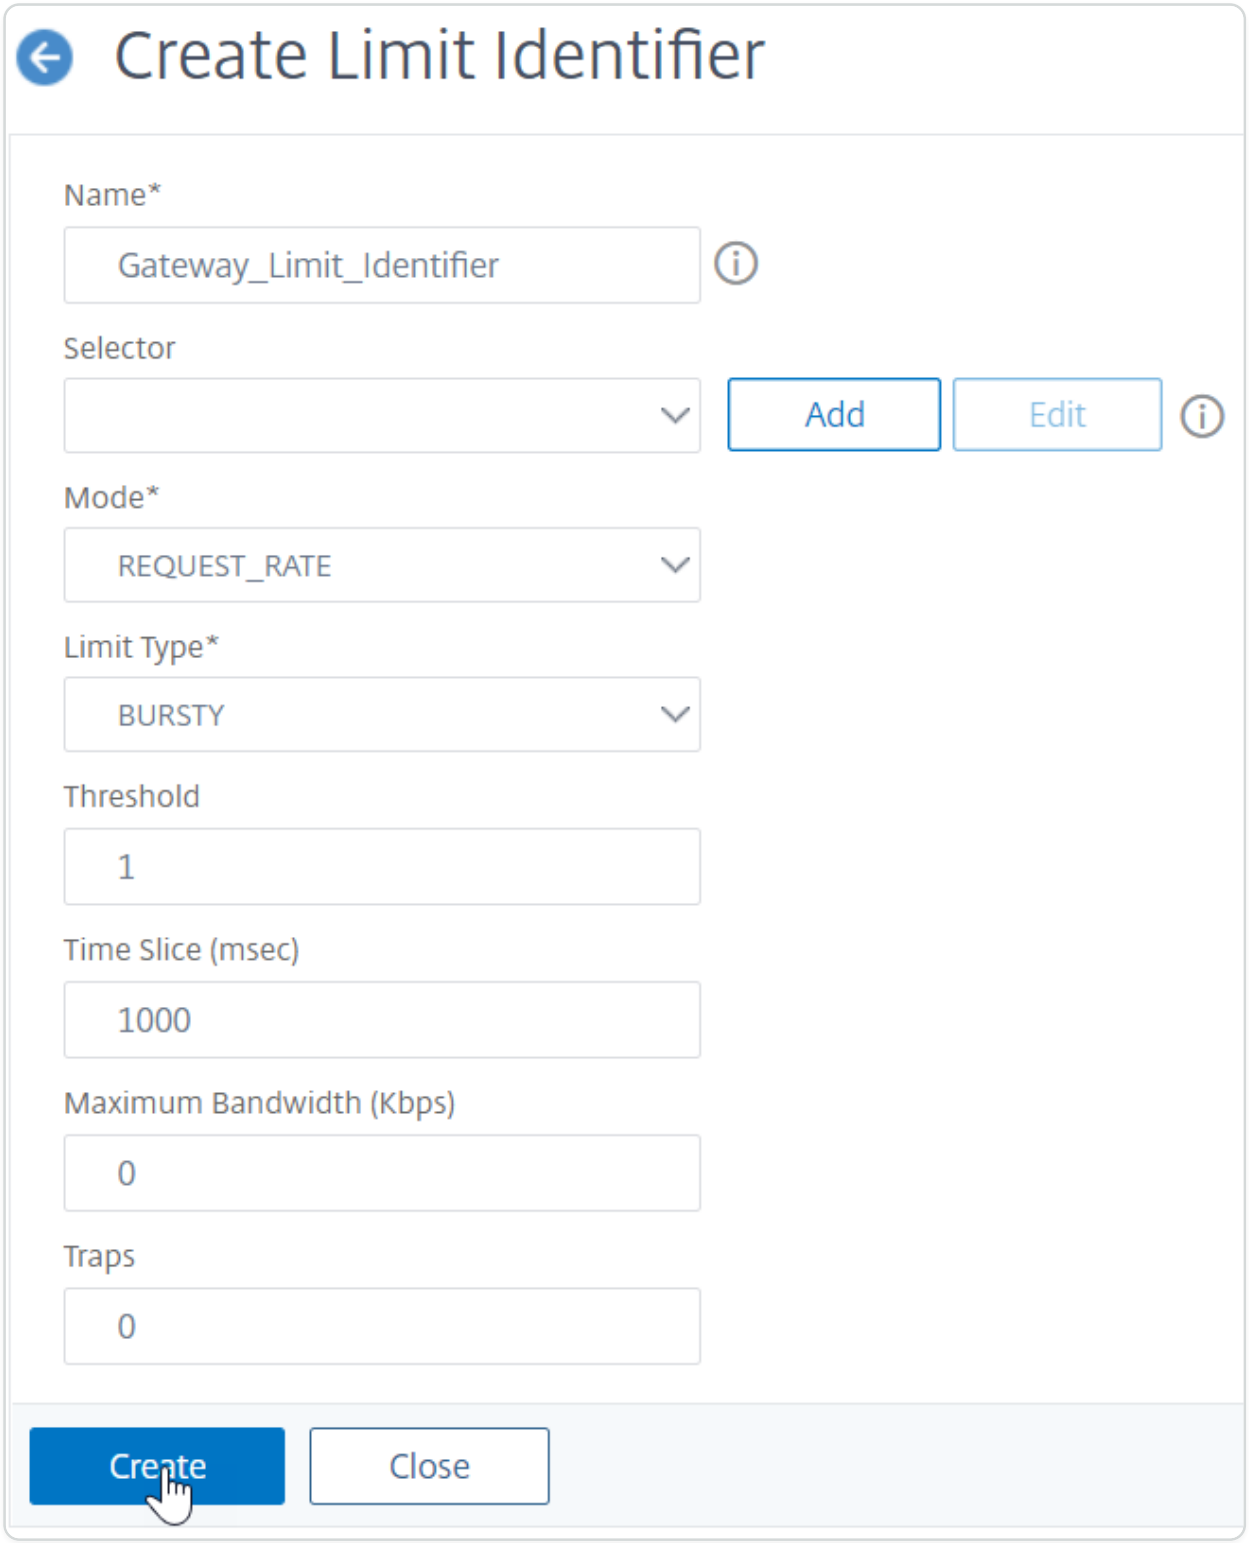
```
add responder policy denylogin 'sys.check_limit("limit_one_login")'
denylogin
```

```
bind authentication vserver <vserver name> -policy denylogin -priority 1 –
type aaa_request
```

Example:

```
bind authentication vserver authvserver -policy denylogin -priority 1
-type aaa_request
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.



Parameter description

- **limitIdentifier -** Name for a rate limit identifier. Must begin with an ASCII letter or underscore (_) character, and must consist only of ASCII alphanumeric or underscore characters. Reserved words must not be used. This is a mandatory argument. Maximum Length: 31
- **threshold -** A maximum number of requests that are allowed in the given timeslice when requests (mode is set as REQUEST_RATE) are tracked per timeslice. When connections (mode is set as CONNECTION) are tracked, it is the total number of connections that would be let through. Default value: 1 Minimum value: 1 Maximum Value: 4294967295
- **timeSlice -** Time interval, in milliseconds, specified in multiples of 10, during which requests are tracked to check if they cross the threshold. The argument is needed only when the mode is set to REQUEST_RATE. Default value: 1000 Minimum value: 10 Maximum Value: 4294967295
- **mode -** Defines the type of traffic to be tracked.
  - REQUEST_RATE - Tracks requests/timeslice.
  - CONNECTION - Tracks active transactions.

To configure Rate Limiting using the NetScaler GUI:

1. Navigate to **AppExpert > Rate Limiting > Limit Identifiers**, click **Add** and specify the relevant details as specified in the CLI section.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. Navigate to **AppExpert>Responder>Policies**. On the **Responder Policies** page, click **Add**.
3. On the **Create Responder Policy** page, create a responder policy with a responder action which has the limit identifier.
4. To create a responder action, Click **Add** next to **Action**.
5. On the **Create Responder Action** page, enter a name for responder action.
6. Select the type as **Respond with** from the drop-down menu.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

7. In the Expression editor, configure the response message. For example, `"HTTP/1.1 200 OK\r\n\r\n"+ "Request is denied due to unusual rate"`.
8. Click **Create**.
9. To create a responder policy, on the **Create Responder Policy** page, enter a name for the responder policy.
10. In the Expression editor, configure the condition for the responder policy. For example, `'sys.check_limit("limit_one_login")'`.
11. Click **Create**.
12. Bind the responder policy to the authentication virtual server.
    - Go to **Security>AAA-Application Traffic>Virtual server**.
    - Select the virtual server.
    - Add a policy.
    - Choose the responder policy that you want to bind to the server, set the priority.
    - Choose the type as **AAA-REQUEST** and click **Continue**.

NOTE:

You can also enable rate limiting at the AAA_REQUEST bind point for the VPN virtual server.

Configuration for the common use cases for applying rate limiting to NetScaler Gateway

The following are the examples of commands to configure common use cases.

- Limit the number of requests per second from a URL.

```
add stream selector ipStreamSelector http.req.url “client.ip.src”

add ns limitIdentifier ipLimitIdentifier –threshold 4 –timeslice 1000 –
mode request_rate –limitType smooth –selectorName ip StreamSelector

add responder policy ipLimitResponderPolicy
“http.req.url.contains(\”myasp.asp\”) &&
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
sys.check_limit(\”ipLimitIdentifier\”)” myWebSiteRedirectAction

bind authentication virtual server authvserver -policy denylogin –pri 1
–type aaa_request
```

- Drop a connection based on cookies received in request from `www.yourcompany.com` if the request exceeds the rate limit.

```
add stream selector cacheStreamSelector
“http.req.cookie.value(\”mycookie\”)” “client.ip.src.subnet(24)”

add ns limitIdentifier myLimitIdentifier –Threshold 2 –timeSlice 3000 –
selectorName reqCookieStreamSelector

add responder action sendRedirectURL redirect `"http://
www.mycompany.com\"` + http.req.url'

add responder policy rateLimitCookiePolicy

“http.req.url.contains(\www.yourcompany.com\) &&
sys.check_limit(\”myLimitIdentifier\”)” sendRedirectUrl
```

- Limit the number of HTTP requests that arrive from the same host (with a subnet mask of 32) and that have the same destination IP address.

```
add stream selector ipv6_sel
“CLIENT.IPv6.src.subnet(32)”CLIENT.IPv6.dst

add ns limitIdentifier ipv6_id –imeSlice 20000 –selectorName ipv6_sel
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add lb vserver ipv6_vip HTTP 3ffe:: 209 80 –persistenceType NONE –
cltTime

add responder action redirect_page redirect “\”`http://
redirectpage.com/\””`

add responder policy ipv6_resp_pol “SYS.CHECK_LIMIT(\”ipv6_id\”)”
redirect_page

bind responder global ipv6_resp_pol 5 END –type DEFAULT
```

- Limit the number of authentication attempts against an authentication, authorization, and auditing virtual server or Gateway virtual server

```
add stream selector URLStreamSelector HTTP.REQ.URL

add ns limitldentifier Request_limit -threshold 3 -timeSlice 1000
-selectorName URLStreamSelector -mode REQUEST_RATE -limitType BURSTY

add responder policy Rate_limit_pol
"HTTP.REQ.URL.CONTAINS(\"doAuthentication.do\")&&SYS.CHECK_LIMIT(\"Requ
est_limit\")" RESET

bind vpn vserver <vserver_names> -policy Rate_limit_pol -priority 100
-gotoPriorityExpression END -type AAA_REQUEST
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Bind responder policy for authentication, authorization, and auditing endpoints

To allow the packet engine to handle the requests, bind the responder policy to the authentication virtual server or the VPN virtual server by using the `AAA_REQUEST` bindpoint.

- **Example for VPN virtual server:** `bind vpn vserver vpnVs -policy resp_pol -priority 6 -type AAA_REQUEST`
- **Example for authentication virtual server:** `bind authentication vserver av_vs -policy resp_pol -priority 6 -type AAA_REQUEST`

To allow the Apache HTTP server to handle the requests, bind the responder policy to the authentication virtual server or the VPN virtual server by using the `REQUEST` bindpoint.

For example,

- **Example for VPN virtual server:** `bind vpn vserver vpnVs -policy resp_pol -priority 6 -type REQUEST`
- **Example for authentication virtual server:** `bind authentication vserver av_vs -policy resp_pol -priority 6 -type REQUEST`

For details about binding responder policies, see Bind a responder policy.

Troubleshooting responder action configuration

When users exceed the rate limit, the customized rate-limit message might fail to display, and a spinning cursor appears on the login screen. This issue occurs due to improper configuration of the responder action.

To resolve the issue, modify the responder action to use an HTML page that displays the customized rate-limit message using the following steps:

1. Create an HTML page with the customized message.

```
<?xml version="1.0" encoding="UTF-8"?>

<AuthenticateResponse xmlns="http://citrix.com/authentication/response/
1">

<Status>success</Status>

<Result>more-info</Result>

<StateContext/>
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
<AuthenticationRequirements>
    <PostBack>/nf/auth/doAuthentication.do</PostBack>
    <CancelPostBack>/nf/auth/doLogoff.do</CancelPostBack>
    <CancelButtonText>Cancel</CancelButtonText>
    <Requirements>
    <Requirement>
        <Credential>
        <Type>none</Type>
        </Credential>
        <Label>
        <Text>Request is denied due to rate limit violation</Text>
        <Type>error</Type>
        </Label>
        <Input/>
    </Requirement>
    <Requirement>
        <Credential>
        <ID>error_okBtn</ID>
        <Type>error_okBtn</Type>
        </Credential>
        <Label>
        <Type>none</Type>
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
        </Label>

    </Requirement>

    </Requirements>

</AuthenticationRequirements>

</AuthenticateResponse>
```

2. Import the customized HTML page into NetScaler.

```
import responder htmlpage local:test.html test
```

3. Create or update the responder action to use the imported HTML page.

```
add responder action test123 respondwithhtmlpage test
```

4. Bind the updated responder action to the existing responder policy.

```
set responder policy resp_pol_rate_limit -action test123
```

5. Ensure that the responder policy is bound to the authentication virtual server.

```
bind authentication vserver aaa_idp -policy resp_pol_rate_limit
-priority 5 -gotoPriorityExpression END -type AAA_REQUEST
```

With the updated configuration, users can see the customized rate-limit message instead of a spinning cursor when the rate limit is exceeded.

Client source IP address tracking

NetScaler® supports validating the client IP address after validating the NSC_TMAS cookie to ensure that requests are generated from the same client IP address. If a client request comes from a different source IP, even with a valid session cookie, the session is discarded, and the user will be prompted to log in again. This adds an extra layer of security and verification to the authentication process.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure client source IP address tracking for sessions

To support this functionality, two new PI expressions AAA.USER.SOURCEIP and AAA.USER.SOURCEIPV6 is introduced. These expressions return the source IPV4/IPV6 address stored in the AAA-TM or AAA Session. You can create an authorization policy to validate the client's source IP address for each request that comes with a cookie by using these expressions.

NOTE:

The AAA.USER.SOURCEIP and AAA.USER.SOURCEIPV6 expressions are only available in NetScaler 14.1-25.x, 13.1- 53. x, 13.1-37 FIPS and later releases.

To configure authorization policy using PI expressions:

At the command prompt, type:

```
add authorization policy <policy_name> <expression> <action>
```

Example:

```
add lb vserver <LB_VS> HTTP <LB-VIP> <PORT> -AuthenticationHost <AUTH_VIP>
-Authentication ON

add authentication vserver <AUTH_VS> SSL <Auth-VIP> <PORT>

add authorization policy  validateClientIP
"AAA.USER.SOURCEIP.EQ(CLIENT.IP.SRC).NOT" DENY

bind lb vserver <LB_VS> -policy validateClientIP -priority 1
```

Client IP address validation using X-Forwarded-For (XFF) in AAA sessions

In NetScaler Authentication, Authorization, and Auditing (AAA) deployments, attackers might attempt to reuse stolen session cookies to hijack authenticated sessions. To mitigate this risk, NetScaler captures and associates a client's real IP address with their authenticated AAA session.

Earlier, NetScaler relied on the client’s source IP address to validate sessions. To better support modern network topologies, NetScaler now associates the IP address in the X-Forwarded-For header as a user attribute, along with the client IP address seen in the IP address header, to optimize proxy and NAT-based deployments.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Benefits

- **Stronger session integrity:** Enforces security even when traffic passes through intermediate devices.
- **Modern topology support:** Ideal for AAA deployments behind NAT or proxy devices.
- **Reduced attack surface:** Significantly lowers the risk of session hijacking by preventing session reuse from different client networks.

Prerequisites

Before implementing XFF-based validation, ensure that you have:

- Trusted proxy infrastructure.
- Proper responder or authorization policies configured on Gateway or AAA.

How it works

When a user authenticates, NetScaler extracts the first IP address from the XFF header and stores it within the AAA session. This stored IP address is then compared against the XFF IP address seen during subsequent resource access.

Key policy expressions

- `AAA.USER.XFFIP`: Exposes the stored XFF IP address.
- `AAA.USER.XFFIPV6`: Exposes the stored XFF IPv6 address.
- `AAA.USER.VALIDATE_CLIENTIP`: A boolean expression that compares the XFF IP address stored at authentication with the one seen during access. If no XFF information is available, it automatically falls back to a source IP address comparison.

Configuration examples

The following commands and expressions are used through the authorization policy infrastructure to protect the deployment:

- **SOURCE_IP based protection:**

Command:

```
add authorization policy session_hijack_Block
"AAA.USER.SOURCEIP.NE(CLIENT.IP.SOURCE)" DENY
```

Expression:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
AAA.USER.SOURCEIP.NE(CLIENT.IP.SOURCE)
```

- **XFF based protection:**

Command:

```
add authorization policy session_hijack_Block
"AAA.USER.XFFIP.NE(CLIENT.IP.SOURCE)" DENY
```

Expression:

```
AAA.USER.XFFIP.NE(CLIENT.IP.SOURCE)
```

- **Using the VALIDATE_CLIENTIP expression:**

This boolean expression compares the XFF IP stored at authentication with the one seen during access, falling back to source IP if no XFF info is available.

Command:

```
add authorization policy session_hijack_Block
"AAA.USER.VALIDATE_CLIENTIP.NOT" DENY
```

Expression:

```
AAA.USER.VALIDATE_CLIENTIP.NOT
```

Limitations

- Session cookie theft from the same client IP address cannot be detected.
- Replayed or forged XFF headers might bypass validation.
- XFF tampering can result in denial-of-service for valid users.
- This feature reduces risk but does not eliminate all hijacking scenarios.

Authorizing user access to application resources

You can control the resources that an authenticated user can access within an application.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To do this, associate an authorization policy to each of the users, either individually or by associating the policy to a group of users. The authorization policy must specify the following:

- **Rule.** The resource to which access must be authorized. This can be specified by using basic or advanced expressions.
- **Action.** Whether access to the resource must be allowed or denied.

By default, access to all resources within an application is **DENIED** to all users. However, you can change this default authorization action to **ALLOW** access to all users (by setting the session parameters in session profile or by setting the global session parameters).

WARNING

For optimum security, Citrix® recommends that you do not to change the default authorization action from DENY to ALLOW. Instead, it is advised to create specific authorization policies for users who need access to specific resources.

To configure authorization by using the CLI

1. Configure the authorization policy.

   ns-cli-prompt\> **add authorization policy \<name\> \<rule\> \<action\>**

2. Associate the policy with the appropriate user or group.

   - Bind the policy to a specific user.

     ns-cli-prompt\> **bind aaa user \<username\> -policy** \<policyname\>

   - Bind the policy to a specific group.

     ns-cli-prompt\> **bind aaa group \<groupName\> -policy** \<policyname\>

To configure authorization by using the GUI (Configuration tab)

1. Create the authorization policy.

   Navigate to **Security > AAA - Application Traffic > Policies > Authorization**, click **Add** and then define the policy as required.

2. Associate the policy with the appropriate user or group.

   Navigate to **Security > AAA - Application Traffic > Users** or **Groups**, and edit the relevant user or group to associate it with the authorization policy.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Sample authorization configurations

Here are some example configurations to authorize user access to some application resources. Note that these are CLI commands. You can do similar configurations using the GUI, although you must not enclose the expression within quotes (").

```
add authorization policy authzpol1 "HTTP.REQ.URL.SUFFIX.EQ(\"gif\")" ALLOW
```

```
bind aaa user user1 -policy authzpol1
```

```
add authorization policy authzpol2 "HTTP.REQ.URL.SUFFIX.EQ(\"png\")" DENY
```

```
bind aaa group group1 -policy authzpol2
```

Audit authenticated sessions

You can configure NetScaler to keep a log of all the events that are triggered in an authenticated session. Using the events log, you can audit state and status information, to see the history for users in chronological order.

To keep a log of all the events triggered in an authenticated session, define an audit policy that specifies the following:

- **Log type.** The logs can be stored remotely (syslog) or locally on NetScaler (nslog).
- **Rule.** The conditions on which the logs are stored.
- **Action.** Details of the log server and other details for creating the log entries.

This audit policy can be configured at different levels: user-level, group-level, authentication, authorization, and auditing virtual server, and global system level. The policies configured at the user-level have the highest priority.

NOTE

This topic details steps for using syslog. Make necessary changes to use nslog.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To configure syslog auditing by using the CLI

1. Configure the audit server with the relevant log settings.

   ns-cli-prompt\> **add audit syslogAction \<name\> \<serverIP\> ...**

2. Configure the audit policy by associating the audit server.

   ns-cli-prompt\> **add audit syslogPolicy \<name\> \<rule\> \<action\>**

3. Associate the audit policy with one of the following entities:

   - Bind the policy to a specific user.

     ns-cli-prompt\> **bind aaa user \<userName\>-policy** \<policyname\> ...

   - Bind the policy to a specific group.

     ns-cli-prompt\> **bind aaa group \<groupName\>-policy** \<policyname\> ...

   - Bind the policy to an authentication, authorization, and auditing virtual server.

     ns-cli-prompt\> **bind authentication vserver \<name\> -policy** \<policyname\> ...

   - Bind the policy globally to NetScaler.

     ns-cli-prompt\> **bind tm global -policyName** \<policyname\> ...

To configure syslog auditing by using the GUI

1. Configure the audit server and policy.

   Navigate to **Security > AAA - Application Traffic > Policies > Auditing > Syslog**, and configure the server and the policy in the relevant tabs.

2. Associate the audit policy with one of the following:

   - Bind the audit policy to a specific user.

     Navigate to **Security > AAA - Application Traffic > Users**, and associate the audit policy with the relevant user.

   - Bind the audit policy to a specific group.

     Navigate to **Security > AAA - Application Traffic > Groups**, and associate the audit policy with the relevant group.

   - Bind the audit policy to an authentication, authorization, and auditing virtual server.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Navigate to **Security > AAA - Application Traffic > Virtual Servers**, and associate the audit policy with the relevant virtual server.

- Bind the audit policy globally to NetScaler.

  Navigate to **Security > AAA - Application Traffic > Policies > Auditing > Syslog** or **Nslog**, select the audit policy, and click **Action > Global Bindings** to bind the policy globally.

NetScaler as an Active Directory Federation Services proxy

Active Directory Federation Services (ADFS) is a Microsoft service that enables single sign-on (SSO) experience for Active Directory-authenticated clients to resources outside the enterprise data center. An ADFS server farm allows internal users to access external cloud-hosted services. But the moment external users are brought into the mix, the external users must be given a way to connect remotely and access cloud-based services through federated identity. Most enterprises do not prefer keeping the ADFS server exposed in the DMZ. Therefore, ADFS proxy plays a critical role in remote user connectivity and application access.

For more than a decade, NetScaler appliance is playing similar roles of remote user connectivity, and application access. NetScaler appliance becomes the preferred solution to be used as ADFS proxy for supporting a new ADFS implementation to enable the following services:

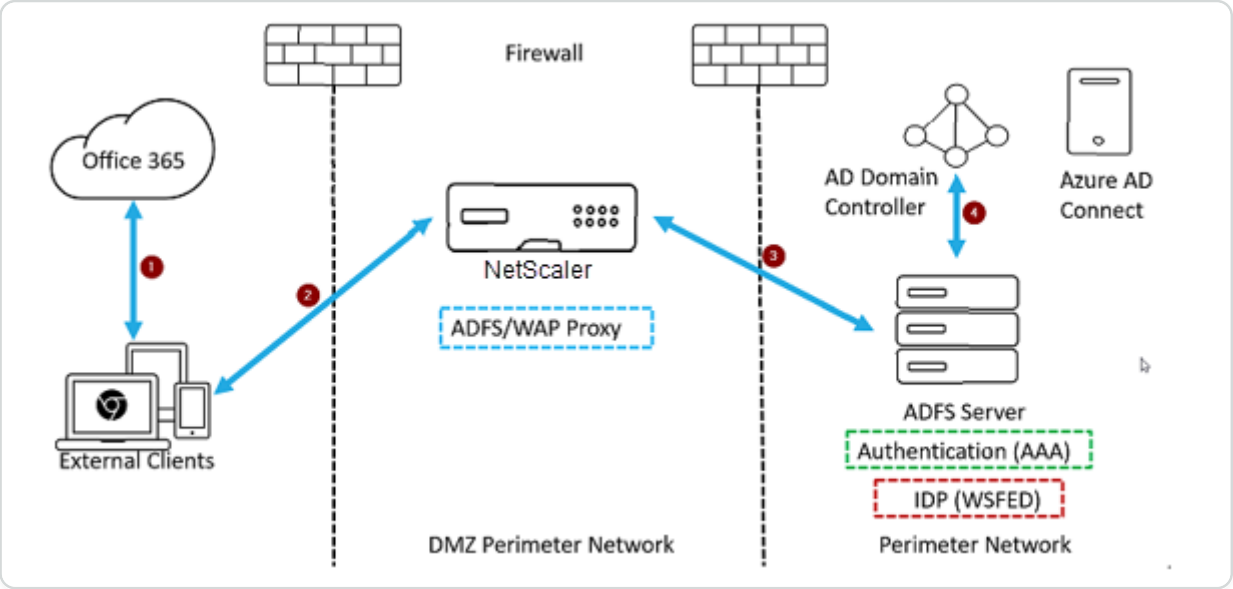
- Secure connectivity.
- Authentication and handling of federated identity.

For more information about NetScaler as a SAML IdP, see NetScaler as a SAML IdP.

Advantages of ADFS proxy

- Reduces the footprint in DMZ to cater the need for most of the enterprises.
- Provides an SSO experience for end users.
- Supports rich methods for pre-authentication and enables multifactor authentication.
- Supports both active and passive clients.

Prerequisites for using NetScaler as ADFS proxy



Before you configure the NetScaler appliance as an ADFS proxy, make sure that the following prerequisites are met:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- A NetScaler appliance with 12.1 build or later.
- Domain ADFS server.
- Domain SSL certificate.
- Virtual IP for Content Switching virtual server.
- Enable Load Balancing, SSL Offload, Content Switching, Rewrite, and authentication, authorization, and auditing traffic management features on NetScaler appliance.

Configure NetScaler appliance as ADFS proxy

To achieve this use case, configure NetScaler as an ADFS proxy in a DMZ zone. The ADFS server is configured along with the AD domain controller in the back-end.

1. A client request to access Microsoft Office365 gets redirected to NetScaler deployed as ADFS proxy.
2. User’s credentials are passed to the ADFS server.
3. ADFS server authenticates the credentials with on-premises AD of the domain.
4. ADFS server upon successful validation of credentials with AD, generates a token which is passed to Microsoft Office365 for session establishment.

The following are the high-level steps involved in configuring NetScaler appliance before you configure as ADFS proxy.

At the NetScaler command prompt, type the following commands:

1. Create an SSL profile for the back-end and enable SNI in the SSL profile. Disable SSLv3/TLS1.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add ssl profile <new SSL profile> -sslprofileType backEnd -sniEnable ENABLED
-ssl3 DISABLED -tls1 DISABLED -commonName <FQDN of ADFS>
```

2. Disable SSLv3/TLS1 for the service.

```
set ssl service <adfs service name> -sslProfile <SSL profile created in the
above step>
```

3. Enable SNI extension for back-end server handshakes.

   - `set vpn parameter –backendServerSni ENABLED`
   - `set ssl parameter -denySSLReneg NONSECURE`

Configure NetScaler appliance as ADFS proxy using the CLI

The following sections are categorized based on the requirement to complete the configuration steps.

To configure ADFS service

1. Configure ADFS service on NetScaler for ADFS server.

```
add service <Domain_ADFS_Service> <ADFS Server IP> SSL 443 -gslb NONE
-maxClient 0 -maxReq 0 -cip DISABLED -usip NO -useproxyport YES -sp OFF
-cltTimeout 180 -svrTimeout 360 -CKA NO -TCPB NO -CMP NO
```

   Example

   add service CTXTEST_ADFS_Service 1.1.1.1 SSL 443 -gslb NONE -maxClient 0 -maxReq 0 -cip DISABLED -usip NO -useproxyport YES -sp OFF -cltTimeout 180 -svrTimeout 360 -CKA NO -TCPB NO -CMP NO

2. Configure FQDN for content switching virtual server and enable SNI.

```
set ssl service <Domain_ADFS_Service> -SNIEnable ENABLED -commonName
<sts.domain.com>
```

   Example

   set ssl service CTXTEST_ADFS_Service -SNIEnable ENABLED -commonName sts.ctxtest.com

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To configure ADFS load balancing virtual server

IMPORTANT

Domain SSL certificate (SSL_CERT) is required for secure traffic.

1. Configure ADFS load balancing virtual server.

   ```
   add lb vserver <Domain_ADFS_LBVS> SSL <IP_address> -persistenceType NONE
   -cltTimeout 180
   ```

   Example

   ```
   add lb vserver CTXTEST_ADFS_LBVS SSL 192.168.1.0 -persistenceType NONE
   -cltTimeout 180
   ```

2. Bind ADFS load balancing virtual server to ADFS service.

   ```
   bind lb vserver <Domain_ADFS_LBVS> <Domain_ADFS_Service>
   ```

   Example

   ```
   bind lb vserver CTXTEST_ADFS_LBVS CTXTEST_ADFS_Service
   ```

3. Bind an SSL virtual server certificate-key pair.

   ```
   bind ssl vserver <Domain_ADFS_LBVS> -certkeyName <SSL_CERT>
   ```

   Example

   ```
   bind ssl vserver CTXTEST_ADFS_LBVS -certkeyName ctxtest_newcert_2019
   ```

To configure content switching virtual server for domain

NOTE

One free virtual IP (for example, 2.2.2.2), which is NATed to public IP is required for a content switching virtual server. It must be reachable for both external and internal traffic.

1. Create a content switching virtual server with free VIP.

   ```
   add cs vserver <Domain_CSVS> SSL <FREE VIP> 443 -cltTimeout 180
   -persistenceType NONE
   ```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Example

```
add cs vserver CTXTEST_CSVS SSL 2.2.2.2 443 -cltTimeout 180 -persistenceType NONE
```

2. Bind content switching virtual server to load balancing virtual server.

```
bind cs vserver <Domain_CSVS> -lbvserver <Domain_ADFS_LBVS>
```

Example

- `bind cs vserver CTXTEST_CSVS -lbvserver CTXTEST_ADFS_LBVS`
- `set ssl vserver CTXTEST_CSVS -sessReuse DISABLED`

3. Bind an SSL virtual server certificate-key pair.

```
bind ssl vserver <Domain_CSVS> -certkeyName <SSL_CERT>
```

Example

```
bind ssl vserver CTXTEST_CSVS -certkeyName ctxtest_newcert_2019
```

Supported protocols

The Microsoft provided protocols plays a vital role in integrating with the NetScaler appliance. NetScaler as ADFS proxy supports the following protocols:

- **WS-Federation**. For details, see Web Services Federation protocol.
- **ADFSPIP**. For details, see Active Directory Federation Service Proxy Integration Protocol compliance.

NOTE

NetScaler appliance does not support device certificate authentication when deployed as an ADFS proxy.

Web Services Federation protocol

Web Services Federation (WS-Federation) is an identity protocol that allows a Security Token Service (STS) in one trust domain to provide authentication information to an STS in another trust domain when there is a trust relationship between the two domains.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Advantages of WS-Federation

WS-Federation supports both active and passive clients whereas SAML IdP supports only passive clients.

- Active clients are Microsoft native clients such as, Outlook, and Office clients (Word, PowerPoint, Excel, and OneNote).
- Passive clients are browser-based clients such as, Google Chrome, Mozilla Firefox, and Internet Explorer.

Prerequisites for using NetScaler as WS-Federation

Before you configure the NetScaler appliance as the ADFS proxy, review the following:

- Active Directory.
- Domain SSL certificate.
- NetScaler SSL certificate and ADFS token signing certificate on ADFS server must be the same.

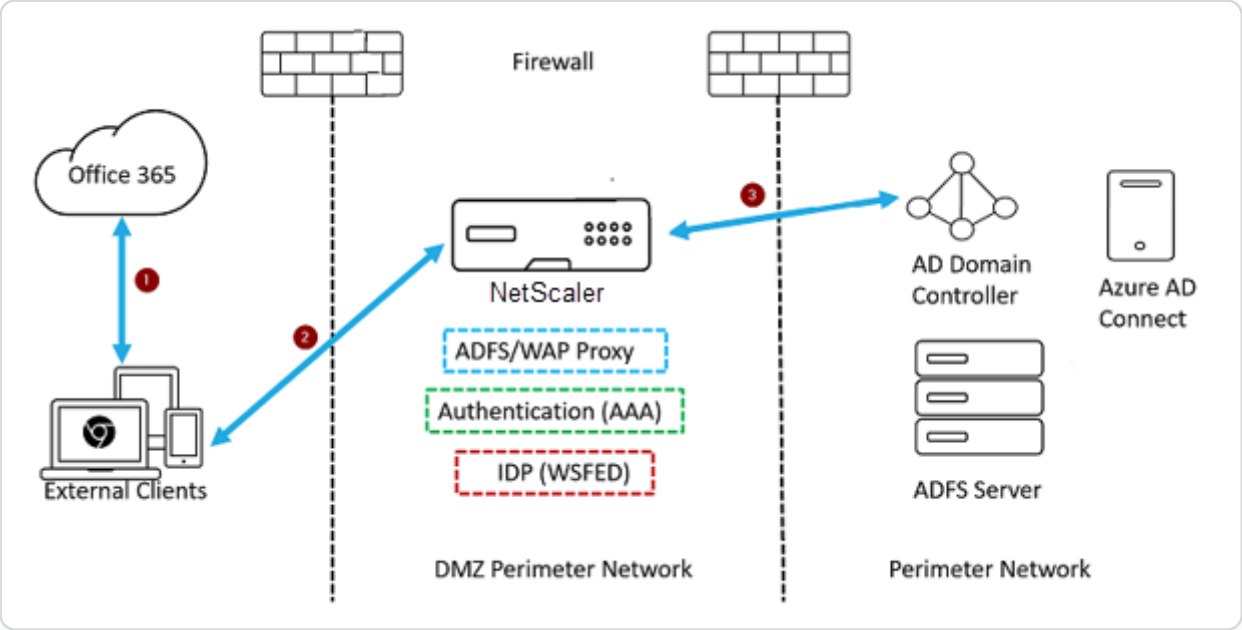
IMPORTANT

SAML IdP is now capable of handling the WS-Federation protocol. Therefore, to configure the WS-Federation IdP, you must actually configure the SAML IdP. You do not see any user interface explicitly mentioning WS-Federation.

Features supported by NetScaler when configured as ADFS proxy and WS-Federation IdP

The following table lists the features supported by the NetScaler appliance when configured as an ADFS proxy and WS-Federation IdP.

FEATURES	CONFIGURE NETSCALER APPLIANCE AS ADFS PROXY	NETSCALER AS WS-FEDERATION IDP	NETSCALER AS ADFSPIP
Load Balancing	Yes	Yes	Yes
SSL Termination	Yes	Yes	Yes
Rate Limiting	Yes	Yes	Yes



© 1997–2026 Citrix Systems, Inc. All rights reserved.

FEATURES	CONFIGURE NETSCALER APPLIANCE AS ADFS PROXY	NETSCALER AS WS-FEDERATION IDP	NETSCALER AS ADFSPIP
Consolidation (reduces DMZ server footprint and saves public IP)	Yes	Yes	Yes
Web Application Firewall (WAF)	Yes	Yes	Yes
Authentication Offload to NetScaler appliance	Yes	Yes (Active and Passive clients)	Yes
Single sign-on (SSO)	Yes	Yes (Active and Passive clients)	Yes
Multi-Factor (nFactor) authentication	No	Yes (Active and Passive clients)	Yes
Azure multifactor authentication	No	Yes (Active and Passive clients)	Yes
ADFS server farm can be avoided	No	Yes	Yes

Configure NetScaler appliance as WS-Federation IdP

Configure NetScaler as WS-Federation IdP (SAML IdP) in a DMZ zone. The ADFS server is configured along with the AD domain controller in the back-end.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. The client request to Microsoft Office365 gets redirected to the NetScaler appliance.
2. The user enters the credentials for multifactor authentication.
3. NetScaler validates the credentials with AD and generates a token natively on the NetScaler appliance. The credentials are passed to Office365 for access.

NOTE

WS-Federation IdP support is done natively through the NetScaler appliance when compared to the F5 Networks load balancer.

Configure NetScaler appliance as WS-Federation IdP (SAML IdP) using the CLI

The following sections are categorized based on the requirement to complete the configuration steps.

To configure LDAP authentication and add policy

IMPORTANT

For domain users, to log on to the NetScaler appliance by using their corporate email addresses, you must configure the following:

- Configure LDAP authentication server and policy on the NetScaler appliance.
- Bind it to your authentication, authorization, and auditing virtual IP address (use of an existing LDAP configuration is also supported).

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add authentication ldapAction <Domain_LDAP_Action> -serverIP <Active
Directory IP> -serverPort 636 -ldapBase "cn=Users,dc=domain,dc=com"
-ldapBindDn "cn=administrator,cn=Users,dc=domain,dc=com"
-ldapBindDnPassword <administrator password> -encrypted -encryptmethod
ENCMTHD_3 -ldapLoginName sAMAccountName -groupAttrName memberOf
-subAttributeName cn -secType SSL -ssoNameAttribute UserPrincipalName
-followReferrals ON -Attribute1 mail -Attribute2 objectGUID

add authentication Policy <Domain_LDAP_Policy> -rule true -action
<Domain_LDAP_Action>
```

Example

```
add authentication ldapAction CTXTEST_LDAP_Action -serverIP 3.3.3.3
-serverPort 636 -ldapBase "cn=Users,dc=ctxtest,dc=com" -ldapBindDn
"cn=administrator,cn=Users,dc=ctxtest,dc=com" -ldapBindDnPassword
xxxxxxxxxxx -encrypted -encryptmethod ENCMTHD_3 -ldapLoginName
sAMAccountName -groupAttrName memberOf -subAttributeName cn -secType SSL
-ssoNameAttribute UserPrincipalName -followReferrals ON -Attribute1 mail
-Attribute2 objectGUID

add authentication Policy CTXTEST_LDAP_Policy -rule true -action
CTXTEST_LDAP_Action
```

To configure NetScaler as WS-Federation IdP or SAML IdP

Create WS-Federation IdP (SAML IdP) action and policy for token generation. Bind it to the authentication, authorization, and auditing virtual server later.

```
add authentication samlIdPProfile <Domain_SAMLIDP_Profile>
-samlIdPCertName <SSL_CERT> -assertionConsumerServiceURL "https://
login.microsoftonline.com/login.srf" -samlIssuerName <Issuer Name for
Office 365 in ADFS Server> -rejectUnsignedRequests OFF -audience
urn:federation:MicrosoftOnline -NameIDFormat persistent -NameIDExpr
"HTTP.REQ.USER.ATTRIBUTE(2).B64ENCODE" -Attribute1 IDPEmail
-Attribute1Expr "HTTP.REQ.USER.ATTRIBUTE(1)"
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add authentication samlIdPPolicy <Domain_SAMLIDP_Policy> -rule
"HTTP.REQ.HEADER(\"referer\").CONTAINS(\"microsoft\") || true" -action
<Domain_SAMLIDP_Profile>
```

Example

```
add authentication samlIdPProfile CTXTEST_SAMLIDP_Profile -samlIdPCertName
ctxtest_newcert_2019 -assertionConsumerServiceURL "https://
login.microsoftonline.com/login.srf" -samlIssuerName "http://ctxtest.com/
adfs/services/trust/" -rejectUnsignedRequests OFF -audience
urn:federation:MicrosoftOnline -NameIDFormat persistent -NameIDExpr
"HTTP.REQ.USER.ATTRIBUTE(2).B64ENCODE" -Attribute1 IDPEmail
-Attribute1Expr "HTTP.REQ.USER.ATTRIBUTE(1)"

add authentication samlIdPPolicy CTXTEST_SAMLIDP_Policy -rule
"HTTP.REQ.HEADER(\"referer\").CONTAINS(\"microsoft\") || true" -action
CTXTEST_SAMLIDP_Profile
```

To configure an authentication, authorization, and auditing virtual server to authenticate the employees who log on to Office365 using corporate credentials

```
add authentication vserver <Domain_AAA_VS> SSL <IP_address>`
```

Example

```
add authentication vserver CTXTEST_AAA_VS SSL 192.168.1.0

bind authentication vserver CTXTEST_AAA_VS -portaltheme RfWebUI
```

To bind authentication virtual server and policy

```
bind authentication vserver <Domain_AAA_VS> -policy
<Domain_SAMLIDP_Policy> -priority 100 -gotoPriorityExpression NEXT
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
bind authentication vserver <Domain_AAA_VS> -policy <Domain_LDAP_Policy>
-priority 100 -gotoPriorityExpression NEXT
```

Example

```
bind authentication vserver CTXTEST_AAA_VS -policy CTXTEST_SAMLIDP_Policy
-priority 100 -gotoPriorityExpression NEXT

bind authentication vserver CTXTEST_AAA_VS -policy CTXTEST_LDAP_Policy
-priority 100 -gotoPriorityExpression NEXT

bind ssl vserver CTXTEST_AAA_VS -certkeyName ctxtest_newcert_2019
```

To configure content switching

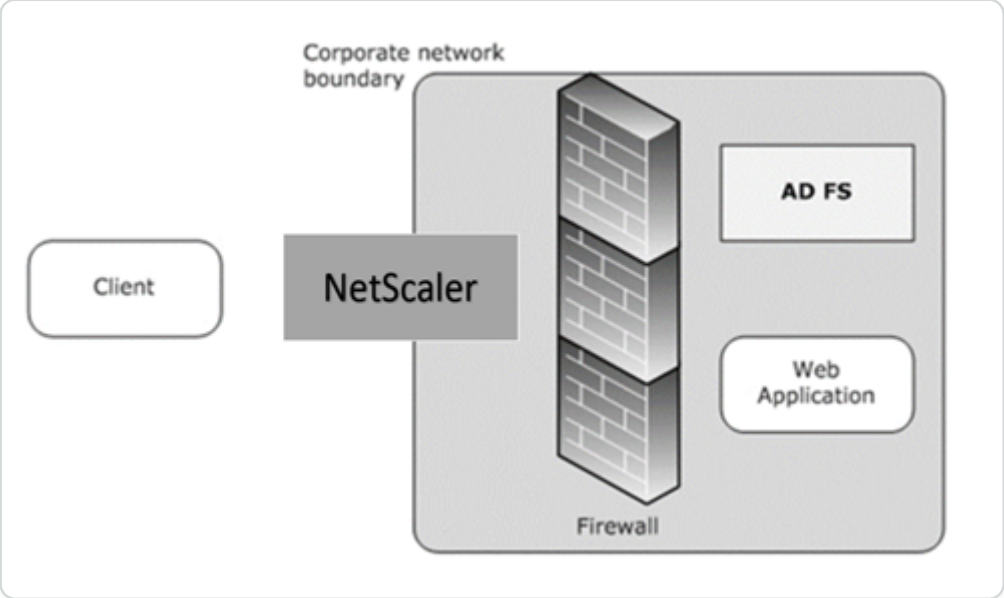
```
add cs action <Domain_CS_Action> -targetVserver <Domain_AAA_VS>

add cs policy <Domain_CS_Policy> -rule "is_vpn_url ||
http.req.url.contains(\"/adfs/ls\") || http.req.url.contains(\"/adfs/
services/trust\") || -action <Domain_CS_Action>
```

Example

```
add cs action CTXTEST_CS_Action -targetVserver CTXTEST_AAA_VS

add cs policy CTXTEST_CS_Policy -rule "is_vpn_url ||
http.req.url.contains(\"/adfs/ls\") || http.req.url.contains(\"/adfs/
services/trust\") || -action CTXTEST_CS_Action
```



To bind content switching virtual server to policy

```
bind cs vserver CTXTEST_CSVS -policyName CTXTEST_CS_Policy -priority 100
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Active Directory Federation Service Proxy Integration Protocol compliance

If third-party proxies are to be used in place of the Web Application Proxy, they must support the MS-ADFSPIP protocol which specifies the ADFS and WAP integration rules. ADFSPIP integrates Active Directory Federation Services with an authentication and application proxy to enable access to services located inside the boundaries of the corporate network for clients that are located outside of that boundary.

Prerequisites

To successfully establish Trust between the proxy server and the ADFS farm, review the following configuration in the NetScaler appliance:

- Create an SSL profile for the back end and enable SNI in the SSL profile. Disable SSLv3/TLS1. At the command prompt, type the following command:

```
add ssl profile <new SSL profile> -sniEnable ENABLED -ssl3 DISABLED
-tls1 DISABLED -commonName <FQDN of ADFS>
```

- Disable SSLv3/TLS1 for the service. At the command prompt, type the following command:

```
set ssl profile <adfs service name> -sessReuse <ENABLED|DISABLED> -tls1
<ENABLED|DISABLED> -SNIEnable <ENABLED|DISABLED> -commonName <name>
-denySSLReneg <YES|NO>
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

IMPORTANT

For Home Realm Discovery (HRD) scenarios where authentication must be offloaded to the ADFS server, Citrix recommends you disable both authentication and SSO on the NetScaler appliance.

Authentication mechanism

The following are the high-level flow of events for the authentication.

1. **Establish Trust with ADFS server** – The NetScaler server establishes Trust with the ADFS server by registering a client certificate. Once the Trust is established, the NetScaler appliance re-establishes the trust after reboot without user intervention.

   Upon certificate expiry, you must reestablish the trust by removing and adding the ADFS proxy profile again.
2. **Published endpoints** - The NetScaler appliance automatically fetches the list of published endpoints on the ADFS server post trust establishment. These published endpoints filter the requests forwarded to the ADFS server.
3. **Insert headers to client requests** – When the NetScaler appliance tunnels client requests, the HTTP headers related to ADFSPIP are added in the packet while sending them to the ADFS server. You can implement access control at the ADFS server based on these header values. The following headers are supported.

   - X-MS-Proxy
   - X-MS-Endpoint-Absolute-Path
   - X-MS-Forwarded-Client-IP
   - X-MS-Proxy
   - X-MS-Target-Role
   - X-MS-ADFS-Proxy-Client-IP
4. **Manage end-user traffic** – End-user traffic is routed securely to the desired resources.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTES:

- NetScaler uses form based authentication.
- NetScaler does not support publishing of an application using the Active Directory Federation Service Proxy Integration Protocol compliance.

Configure NetScaler to support ADFS server

Prerequisites

- Configure Context Switching (CS) server as front-end with authentication, authorization, and auditing server behind CS. At the command prompt, type:

```
add cs vserver cs_adfs_proxy SSL a.b.c.d 443 -cltTimeout 180
-AuthenticationHost adfs.ns.com
```

```
add cs action adfs_proxy_cs_act -targetVserver avs_adfs_proxy
```

```
add cs policy adfs_proxy_policy -rule is_vpn_url -action
adfs_proxy_cs_act
```

```
bind cs vserver cs_adfs_proxy -policyName adfs_proxy_policy -priority
100
```

```
bind cs vserver cs_adfs_proxy -lbvserver lb_adfs_proxy
```

- Add an ADFS service. At the command prompt, type:

```
add service adfs_service adfs_server SSL 443

set ssl service adfs_service -sslProfile ns_default_ssl_profile_backend
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
bind ssl service adfs_service -certkeyName adfs_trust_cert
```

```
set ssl profile ns_default_ssl_profile_backend -sessReuse ENABLED -tls1
DISABLED -SNIEnable ENABLED -commonName www.server.com -denySSLReneg NO
```

- Add a load balancing virtual server. At the command prompt, type:

```
add lb vserver lb_adfs_proxy SSL 0.0.0.0 0 -AuthenticationHost
adfs.ns.com -Authentication ON -adfsProxyProfile adfs_proxy_profile
```

- Bind the ADFS traffic policy and the ADFS service to the load balancing virtual server. At the command prompt, type:

```
bind lb vserver lb_adfs_proxy adfs_service

bind lb vserver lb_adfs_proxy -policyName adfs_traffic_pol -priority 1
-type REQUEST
```

- Configure an SNIP address:

```
add ns ip p.q.r.s 255.255.255.0 -type SNIP
```

- Configure traffic actions and policies:

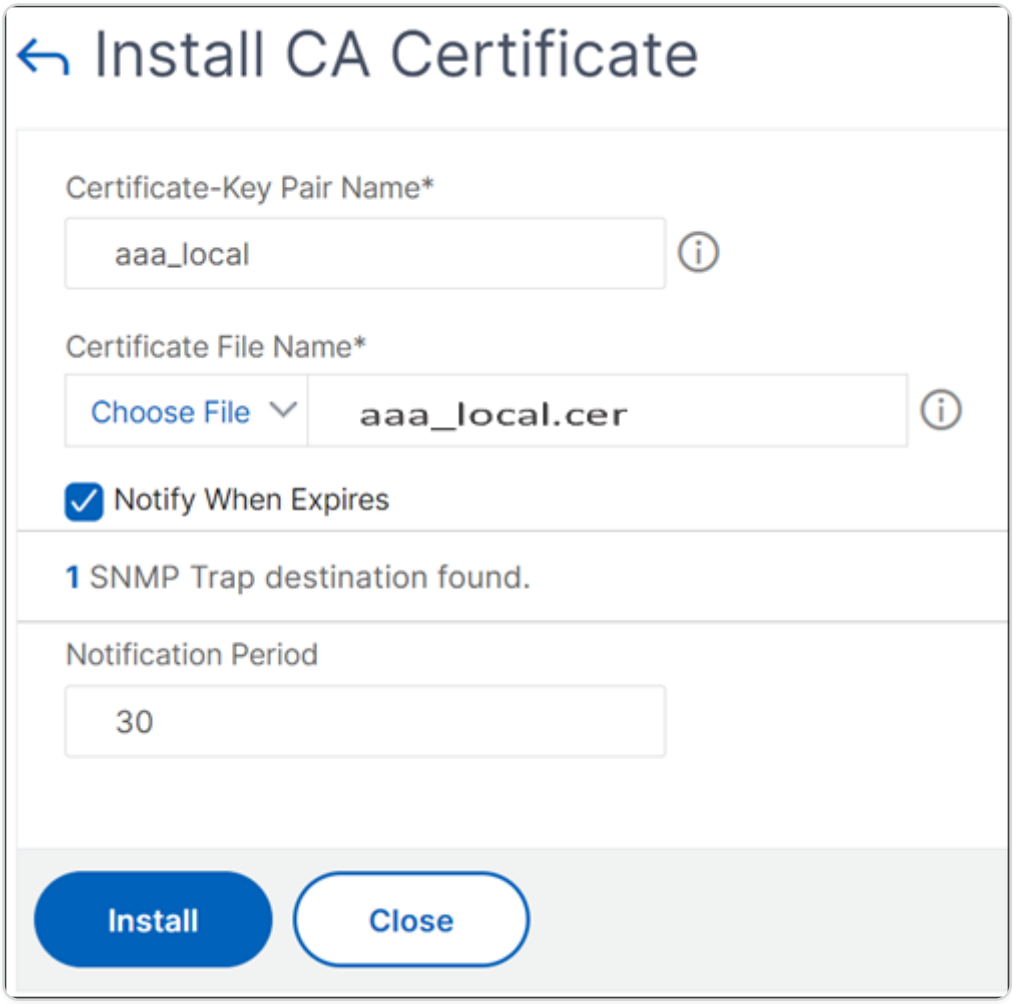
```
add tm trafficAction adfs_traffic_action -SSO ON -formSSOAction
adfs_form_action

add tm formSSOAction adfs_form_action -actionURL "/adfs/ls" -userField
UserName -passwdField Password -ssoSuccessRule
"HTTP.RES.SET_COOKIE.EQ(\"MSISAuth\")" -nameValuePair
AuthMethod=FormsAuthentication -submitMethod POST
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add tm trafficAction adfs_traffic_action -SSO ON -formSSOAction
adfs_form_action

add tm trafficPolicy adfs_traffic_pol "HTTP.REQ.URL.EQ(\"/adfs/ls/\")"
adfs_traffic_action
```



To configure NetScaler to work with ADFS server, you need to do the following:

1. Create an SSL CertKey profile key to use with ADFS proxy profile
2. Create an ADFS proxy profile
3. Associate the ADFS proxy profile to the load balancing virtual server

Create an SSL certificate with private key to use with ADFS proxy profile by using the GUI

1. Navigate to **Traffic Management > SSL > Certificates > CA Certificates**.
2. In the details pane, click **Install**. In the **Install Certificate** dialog box, type the details, such as the certificate and key file name, and then select **Certificate Bundle**.
3. Click **Install**, and then click **Close**.

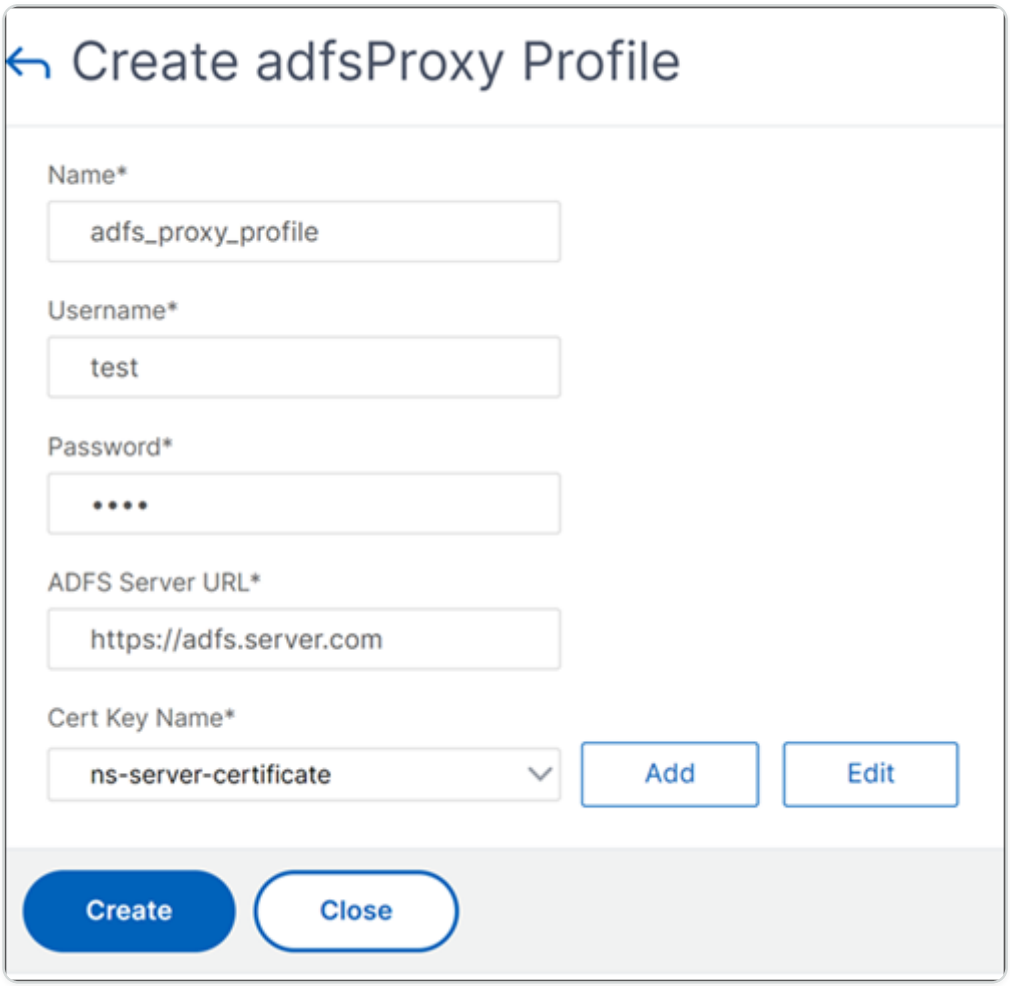
© 1997–2026 Citrix Systems, Inc. All rights reserved.

Create an SSL certificate with private key to use with ADFS proxy profile by using the CLI

At the command prompt, type:

```
add ssl certKey aaa_local -cert aaa_local.cer -key aaa_local.key
```

Note: The Certificate file and the key file must be present in the NetScaler appliance.



Create an ADFS proxy profile using the GUI

1. Navigate to **Configuration > Security > AAA-Application Traffic > adfsProxy Profile**.
2. Click **Add** on the **adfsProxy Profile** page.
3. On the **Create adfsProxy Profile** page, configure the following parameters:
   - Name: Assign a name to the ADFS proxy profile.
   - User name: This is the name of an account in the directory that would be used to authenticate the trust request from NetScaler acting as a proxy.
   - Password: This is the password of the account.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Server URL: FQDN of the ADFS server.
- Cert Key Name: SSL certificate of the proxy that is registered at the ADFS server.

4. Click **Create**.

Create an ADFS proxy profile using the CLI

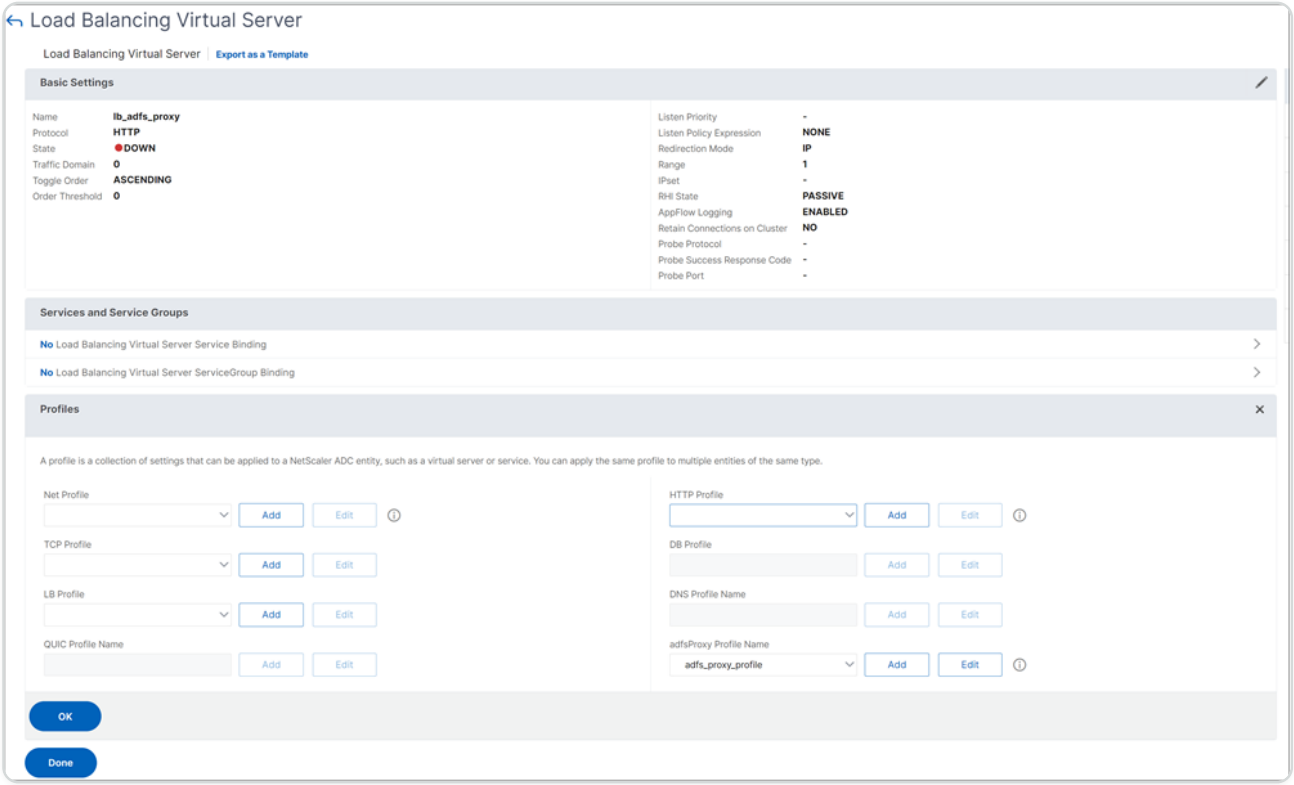
At the command prompt, type:

```
add authentication adfsProxyProfile &lt;profile name> -serverUrl <https://
&lt;server FQDN or IP address>/> -username &lt;adfs admin user name>
-password &lt;password for admin user> -certKeyName &lt;name of the
CertKey profile created above>

add dns addRec adfs.server.com 10.106.30.151
```

Example,

© 1997–2026 Citrix Systems, Inc. All rights reserved.



```
add authentication adfsProxyProfile adfs_proxy_profile -userName test
-password test -serverURL "https://adfs.server.com" -CertKeyName
adfs_trust_cert
```

NOTE:

The ADFS proxy and the ADFS server can establish trust only if the certificate is signed by the Certificate Authority of the ADFS server.

Associate the ADFS proxy profile to the load balancing virtual server using the GUI

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**, and select an SSL virtual server.
2. Click **Edit**.
3. In **Advanced Settings**, click **Profiles**.
4. Select the ADFS profile created earlier.
5. Click **OK** and then click **Done**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Associate the ADFS proxy profile to the load balancing virtual server using the CLI

In the ADFS deployment, two virtual severs are used, one for the client traffic and the other one for metadata exchange. The ADFS proxy profile must be associated with the load balancing virtual server that is front-ending the ADFS server.

At the command prompt, type:

```
set ssl vserver lb_adfs_proxy -sslProfile ns_default_ssl_profile_frontend
```

Trust renewal support for ADFSPIP

You can renew the trust of the existing certificates that are nearing to expiry or if the existing certificate is not valid. The trust renewal of certificates is done only when the trust is established between NetScaler appliance and ADFS server. To renew the trust of the certificate, you must provide the new certificate.

IMPORTANT:

Manual intervention is required for trust renewal of new certificates.

The following example lists the steps involved in the certificate trust renewal:

1. The NetScaler appliance sends both old (SerializedTrustCertificate) and new (SerializedReplacementCertificate) certificates in POST request to the ADFS server for trust renewal.
2. The ADFS server responds with 200 OK success if trust is renewed successfully.
3. The NetScaler appliance updates the state as "ESTABLISHED_RENEW_SUCCESS" if the trust renewal is successful. If the trust renewal fails, the state is updated as "ESTABLISHED_RENEW_FAILED" and the NetScaler appliance keeps using the old certificate.

NOTE:

You cannot update the certificate key if it is already bound to an ADFS proxy profile.

To configure the trust renewal of certificates by using the CLI

At the command prompt, type:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add ssl certKey &lt;name> -cert &lt;certificate file> -key &lt;key file>
```

```
add authentication vserver &lt;name> SSL &lt;ipaddress> &lt;port>
```

```
bind ssl vserver &lt;virtual server name> -certkeyName &lt;string>
```

Example:

```
add ssl certKey adfs_trust_cert -cert "client/client_rsa_2048.pem" -key
"client/client_rsa_2048.ky"
```

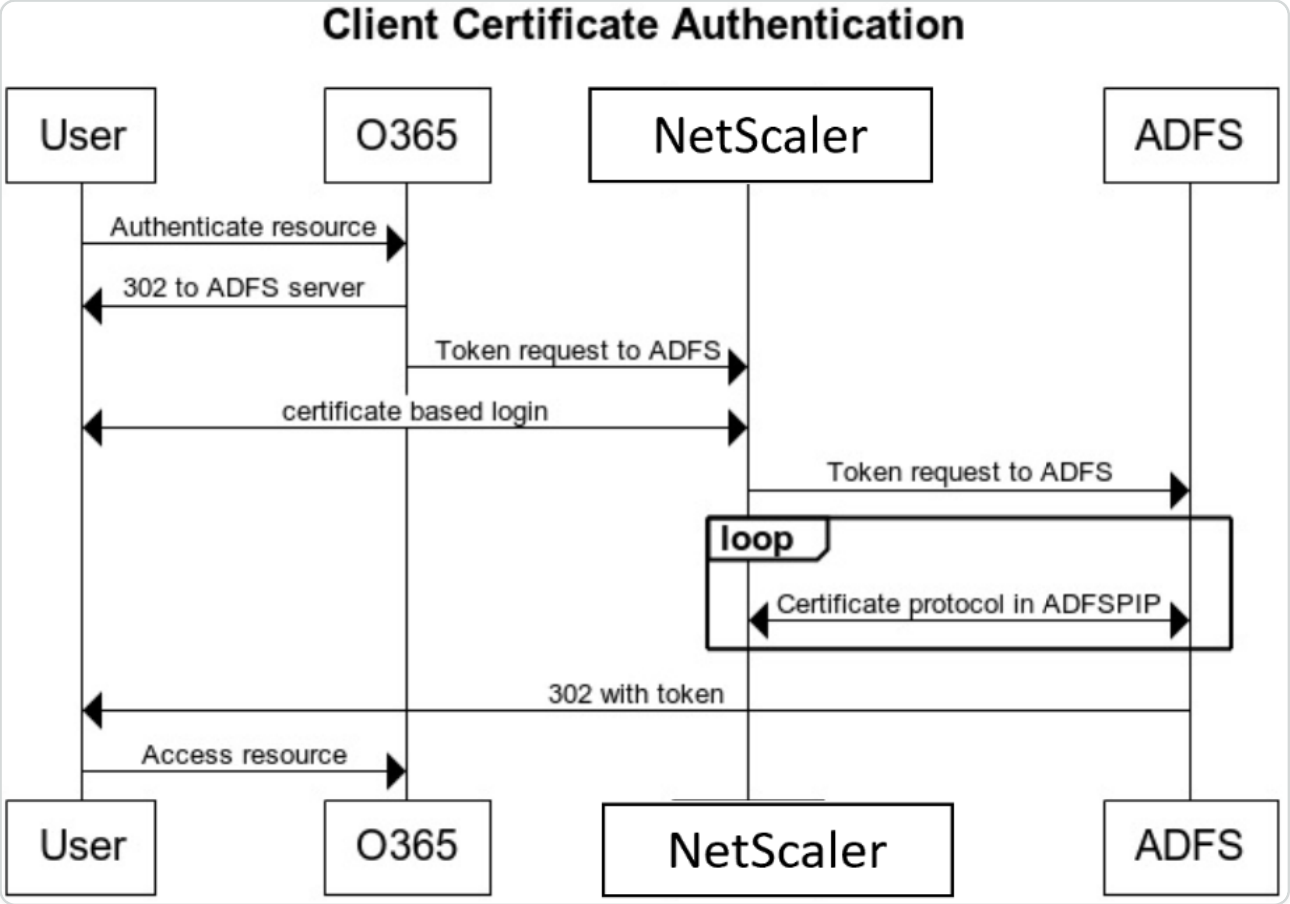
NOTE:

The certificate must be issued by the Certificate Authority of the ADFS server.

```
add authentication vserver avs_adfs_proxy SSL 0.0.0.0
```

```
bind ssl vserver avs_adfs_proxy -certkeyName aaa_local
```

Client certificate based authentication on ADFS server



Starting with Windows server 2016, Microsoft introduced a new way of authenticating users when ADFS is accessed through proxy servers. Now, end users can log in with their certificates thereby avoiding the use of a password.

End users often access ADFS through a proxy, especially when they are not in the premises. Therefore, ADFS proxy servers are required to support client certificate authentication through the ADFSPIP protocol.

When ADFS is load balanced using a NetScaler appliance, to support certificate-based authentication at the ADFS server, users need to log in to the NetScaler appliance using the certificate as well. This allows NetScaler to pass the user certificate to ADFS to provide SSO to the ADFS server.

The following diagram represents the client-certificate authentication flow.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure SSO for ADFS server using client certificate

To configure SSO for the ADFS server using the client certificate, you must first configure the client certificate authentication on the NetScaler appliance. You must then bind the certificate authentication policy to the authentication, authorization, and auditing virtual server.

In addition, you must perform the following steps.

- An extra context switching virtual server with port 49443 must be configured and this context switching virtual server must point to the same load balancing virtual server which is open for all ports, which you have created earlier.
- The port 49443 must be opened on the NetScaler appliance for authentication.
- The context switching policy must be bound the same load balancing virtual server with port 443 open that you have created earlier.
- You must bind the same SSL service that you have created earlier to the load balancing virtual server.
- If you have already created an SSL profile for the back end, you must use that profile.

At the command prompt, type;

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
bind ssl vserver &lt;name> -certkeyName &lt;string>

bind ssl vserver &lt;vServerName> -certkeyName &lt;string>

add authentication Policy &lt;policy name> -rule &lt;expression> -action
&lt;action name>

bind authentication vserver &lt;name> -policy &lt;name of the policy>
-priority &lt;integer>
```

Example:

```
bind ssl vserver lb_adfs_proxy -certkeyName aaa_local

set ssl profile ns_default_ssl_profile_frontend -eRSA ENABLED -sessReuse
ENABLED -denySSLReneg NONSECURE

bind ssl vserver cs_adfs_proxy -certkeyName aaa_local

add authentication Policy local_pol -rule true -action LOCAL

bind authentication vserver avs_adfs_proxy -policy local_pol -priority 1
```

For information on configuring client certificate on the NetScaler appliance, see Configure client certificate authentication using advanced policies.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Use an on-premises NetScaler Gateway as the identity provider for Citrix Cloud

Citrix Cloud supports using an on-premises NetScaler Gateway as an identity provider to authenticate subscribers signing in to their workspaces.

By using NetScaler Gateway authentication, you can:

- Continue authenticating users through your existing NetScaler Gateway so they can access the resources in your on-premises Virtual Apps and Desktops deployment through Citrix Workspace.
- Use the NetScaler Gateway authentication, authorization, and auditing functions with Citrix Workspace.
- Provide your users access to the resources that they need through Citrix Workspace using features such as pass-through authentication, smart cards, secure tokens, conditional access policies, federation.

NetScaler Gateway authentication is supported for use with the following product versions:

- NetScaler Gateway 13.0 41.20 Advanced edition or later
- NetScaler Gateway 12.1 54.13 Advanced edition or later

Prerequisites

- Cloud Connectors - You need at least two servers on which to install the Citrix Cloud Connector software.
- Active Directory - Perform the necessary checks.
- NetScaler Gateway requirements
    - Use advanced policies on the on-premises gateway due to deprecation of classic policies.
    - When configuring the Gateway for authenticating subscribers to Citrix Workspace, the gateway acts as an OpenID Connect provider. Messages between Citrix Cloud and Gateway conform to the OIDC protocol, which involves digitally signing tokens. Therefore, you must configure a certificate for signing these tokens.
    - Clock synchronization - The Gateway must be synchronized to NTP time.

For details, see Prerequisites.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Create an OAuth IdP policy on the on-premises NetScaler Gateway

IMPORTANT:

You must have generated the client ID, secret, and redirect URL in the **Citrix Cloud > Identity and Access Management > Authentication** tab. For details, see Connect an on-premises NetScaler Gateway to Citrix Cloud.

Creating an OAuth IdP authentication policy involves the following tasks:

1. Create an OAuth IdP profile.
2. Add an OAuth IdP policy.
3. Bind the OAuth IdP policy to an authentication virtual server.
4. Bind the SSL cert key to VPN Global for signing token.

NOTE:

Only the RSA cert key can be used as the SSL cert key. The maximum length is 127.

Creating an OAuth IdP profile by using the CLI

At the command prompt, type;

```
add authentication OAuthIDPProfile <name> [-clientID <string>][-
clientSecret ][-redirectURL <URL>][-issuer <string>][-audience <string>][-
skewTime <mins>] [-defaultAuthenticationGroup <string>]

add authentication OAuthIdPPolicy <name> -rule <expression> [-action
<string>] [-undefAction <string>] [-comment <string>][-logAction <string>]

add authentication ldapAction <name> -serverIP <IP> -ldapBase
"dc=aaa,dc=local"

ldapBindDn <administrator@aaa.local> -ldapBindDnPassword <password>
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
-ldapLoginName sAMAccountName

add authentication policy <name> -rule <expression> -action <string>

bind authentication vserver auth_vs -policy <ldap_policy_name> -priority
<integer> -gotoPriorityExpression NEXT

bind authentication vserver auth_vs -policy <OAuthIDPPolicyName> -priority
<integer> -gotoPriorityExpression END

bind vpn global -certkeyName <SSL_cert_key>
```

Creating an OAuth IdP profile by using the GUI

1. Navigate to **Security > AAA – Application Traffic > Policies > Authentication > Advanced Policies > OAuth IDP**.
2. In the **OAuth IDP** page, select the **Profiles** tab and click **Add**.
3. Configure the OAuth IdP profile.

NOTE:

- Copy and paste the client ID, secret, and Redirect URL values from the **Citrix Cloud™ > Identity and Access Management > Authentication** tab to establish the connection to Citrix Cloud.
- Enter the Gateway URL correctly in the **Issuer Name** Example: `<https://GatewayFQDN.com>`
- Also copy and paste the client ID in the **Audience** field as well.
- **Send Password**: Enable this option for single sign-on support. This option is disabled by default.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. On the **Create Authentication OAuth IDP Profile** screen, set values for the following parameters and click **Create**.

   - **Name** – Name of the authentication profile. Must begin with a letter, number, or the underscore character (_). Name must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after the profile is created.
   - **Client ID** – Unique string that identifies SP. The authorization server infers client configuration using this ID. Maximum Length: 127.
   - **Client Secret** – Secret string established by user and authorization server. Maximum Length: 239.
   - **Redirect URL** – Endpoint on SP to which code/token has to be posted.
   - **Issuer Name** – Identity of the server whose tokens are to be accepted. Maximum Length: 127. Example: `<https://GatewayFQDN.com>`
   - **Audience** – Target recipient for the token sent by IdP. This token is checked by the recipient.
   - **Skew Time** – This option specifies the allowed clock skew (in minutes) that NetScaler allows on an incoming token. For example, if skewTime is 10, then the token would be valid from (current time - 10) min to (current time + 10) min that is 20 min in all. Default value: 5.
   - **Default Authentication Group** – A group added to the session internal group list when this profile is chosen by IdP, which can be used in nFactor flow. It can be used in the expression (AAA.USER.IS_MEMBER_OF("xxx")) for authentication policies to identify relying party related nFactor flow. Maximum Length: 63

   A group is added to the session for this profile to simplify policy evaluation and help in customizing policies. This group is the default group that is chosen when the authentication succeeds in addition to the extracted groups.

   - **Relying Party Metadata URL**: Endpoint at which the NetScaler IdP can get details about the relying party being configured. The metadata response must include endpoints for the jwks_uri for RP public keys. The maximum length is 255.
   - **Refresh Interval**: The interval at which the relying party metadata is refreshed. The default interval is 50.
   - **Encrypt Token**: When you select this option, the token sent by NetScaler is encrypted.
   - **Signature Service**: The name of the cloud service that is used to sign the data. This is applicable only if the signature is offloaded to cloud.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Attributes**: Name-Value pairs of the attributes to be inserted in the ID token. The maximum length is 1047 characters.
- **Send Password**: Select this option to send the encrypted password in the ID token.

5. Click **Policies** and click **Add.**
6. On the **Create Authentication OAuth IDP Policy** screen, set values for the following parameters and click **Create**.

   - **Name** – The name of the authentication policy.
   - **Action** – Name of profile created earlier.
   - **Log Action** – Name of the message log action to use when a request matches this policy. Not a mandatory field.
   - **Undefined-Result Action** – Action to perform if the result of policy evaluation is undenfined(UNDEF). Not a mandatory field.
   - **Expression** – Default syntax expression that the policy uses to respond to a specific request. For example, true.
   - **Comments** – Any comments about the policy.

NOTE:

When **sendPassword** is set to ON (OFF by default), user credentials are encrypted and passed through a secure channel to Citrix Cloud. Passing user credentials through a secure channel allows you to enable SSO to Citrix Virtual Apps and Desktops upon launch.

Binding the OAuthIDP policy and LDAP policy to the authentication virtual server

1. Navigate to **Configuration > Security > AAA-Application Traffic > Policies >Authentication > Advanced Policies > Actions > LDAP**.
2. On the **LDAP Actions** screen, click **Add**.
3. On the **Create Authentication LDAP Server** screen, set the values for the following parameters, and click **Create**.

   - **Name –** The name of the LDAP action
   - **ServerName/ServerIP –** Provide FQDN or IP of the LDAP server
   - Choose appropriate values **for Security Type, Port, Server Type, Time-Out**
   - Make sure **Authentication** is checked

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Base DN –** Base from which to start LDAP search. For example, `dc=aaa,dc=local`.
- **Administrator Bind DN:** User name of the bind to LDAP server. For example, `admin@aaa.local`.
- **Administrator Password/Confirm Password: Password to bind LDAP**
- Click **Test Connection** to test your settings.
- **Server Logon Name Attribute:** Choose **“sAMAccountName”**
- Other fields are not mandatory and hence can be configured as required.

4. Navigate to **Configuration > Security > AAA-Application Traffic > Policies >Authentication > Advanced Policies > Policy.**
5. On the **Authentication Policies** screen, click **Add**.
6. On the **Create Authentication Policy** page, set the values for the following parameters, and click **Create.**

   - **Name –** Name of the LDAP Authentication Policy.
   - **Action Type –** Choose **LDAP.**
   - **Action –** Choose the LDAP action.
   - **Expression –** Default syntax expression that the policy uses to respond to specific request. For example, true**.

Support for active-active GSLB deployments on NetScaler Gateway

NetScaler Gateway configured as an Identity Provider (IdP) using the OIDC protocol can support active-active GSLB deployments.

For more information on configuring a GSLB setup, see Example of a GSLB setup and configuration.

IMPORTANT:

Active-active GSLB with NetScaler Gateway as an OAuth IdP is not supported for Citrix Cloud.

GSLB active-active support for multifactor authentication using connection proxy

Starting from NetScaler release 13.1 build 12.x, support is added for GSLB active-active deployment for multifactor authentication using connection proxy. This support is applicable for

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NetScaler Gateway and NetScaler authentication, authorization, and auditing scenarios. Connection proxy is used to route requests to the correct GSLB sites once the authentication succeeds. For details on connection proxy persistence, see Connection Proxy.

How it works

The GSLB site persistence cookie is inserted in the authentication response. Using this cookie, the NetScaler or the NetScaler Gateway appliance identifies whether the request is for a local site or a remote site. The requests are then routed accordingly.

IMPORTANT:

- Only GSLB active-active type deployment is supported.
- Parent-child topology is not supported.
- The persistence type in the GSLB deployment must be configured as "ConnectionProxy".

Configuration support for SameSite cookie attribute

The SameSite attribute indicates the browser whether the cookie can be used for cross-site context or only for same-site context. Also, if an application intends to be accessed in a cross-site context then it can do so only via the HTTPS connection. For details, see RFC6265.

Until Feb 2020, the SameSite attribute was not explicitly set in NetScaler. The browser took the default value (None). Not setting the SameSite attribute did not impact the NetScaler Gateway and authentication, authorization, and auditing deployments.

With certain browsers upgrade, such as Google Chrome 80, there is a change in the default cross-domain behavior of cookies. The SameSite attribute can be set to one of the following values. Default value for Google Chrome is set to Lax. For certain version of other browsers, the default value for the SameSite attribute might still be set to None.

- **None**: Indicates the browser to use a cookie in cross-site context only on secure connections.
- **Lax**: Indicates the browser to use a cookie for requests on the same domain and for cross-sites. For cross-site, only safe HTTP methods like GET request can use the cookie. For example, a GET request of a one subdomain abc.example.com can read the cookie of another subdomain xyz.example.com using a GET. For cross site, only safe HTTP methods are used because Safe HTTP methods do not alter the server state. For more details, see `<https://developer.mozilla.org/en-US/docs/Web/HTTP/Headers/Set-Cookie/SameSite#lax>`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Strict**: Use the cookie only in the same site context.

If there is no SameSite attribute in the cookie, the Google Chrome assumes the functionality of SameSite = Lax. As a result, for deployments within an iframe with cross-site context that require cookies to be inserted by the browser, Google Chrome does not share cross-site cookies. As a result, the iframe within the website might not load.

Configure SameSite cookie attribute

A new cookie attribute named SameSite is added to the VPN and authentication, authorization, and auditing virtual servers. This attribute can be set at the global level and at the virtual server level.

To configure the SameSite attribute, you must do the following:

1. Set the SameSite attribute for the virtual server
2. Bind cookies to the patset (if the browser drops cross-site cookies)

Setting the SameSite attribute by using the CLI

To set the SameSite attribute at the virtual server level, use the following commands.

```
set vpn vserver VP1 -SameSite [STRICT | LAX | None]

set authentication vserver AV1 -SameSite [STRICT | LAX | None]
```

To set the SameSite attribute at the global level, use the following commands.

```
set aaa parameter -SameSite [STRICT | LAX | None]

set vpn parameter -SameSite [STRICT | LAX | None]
```

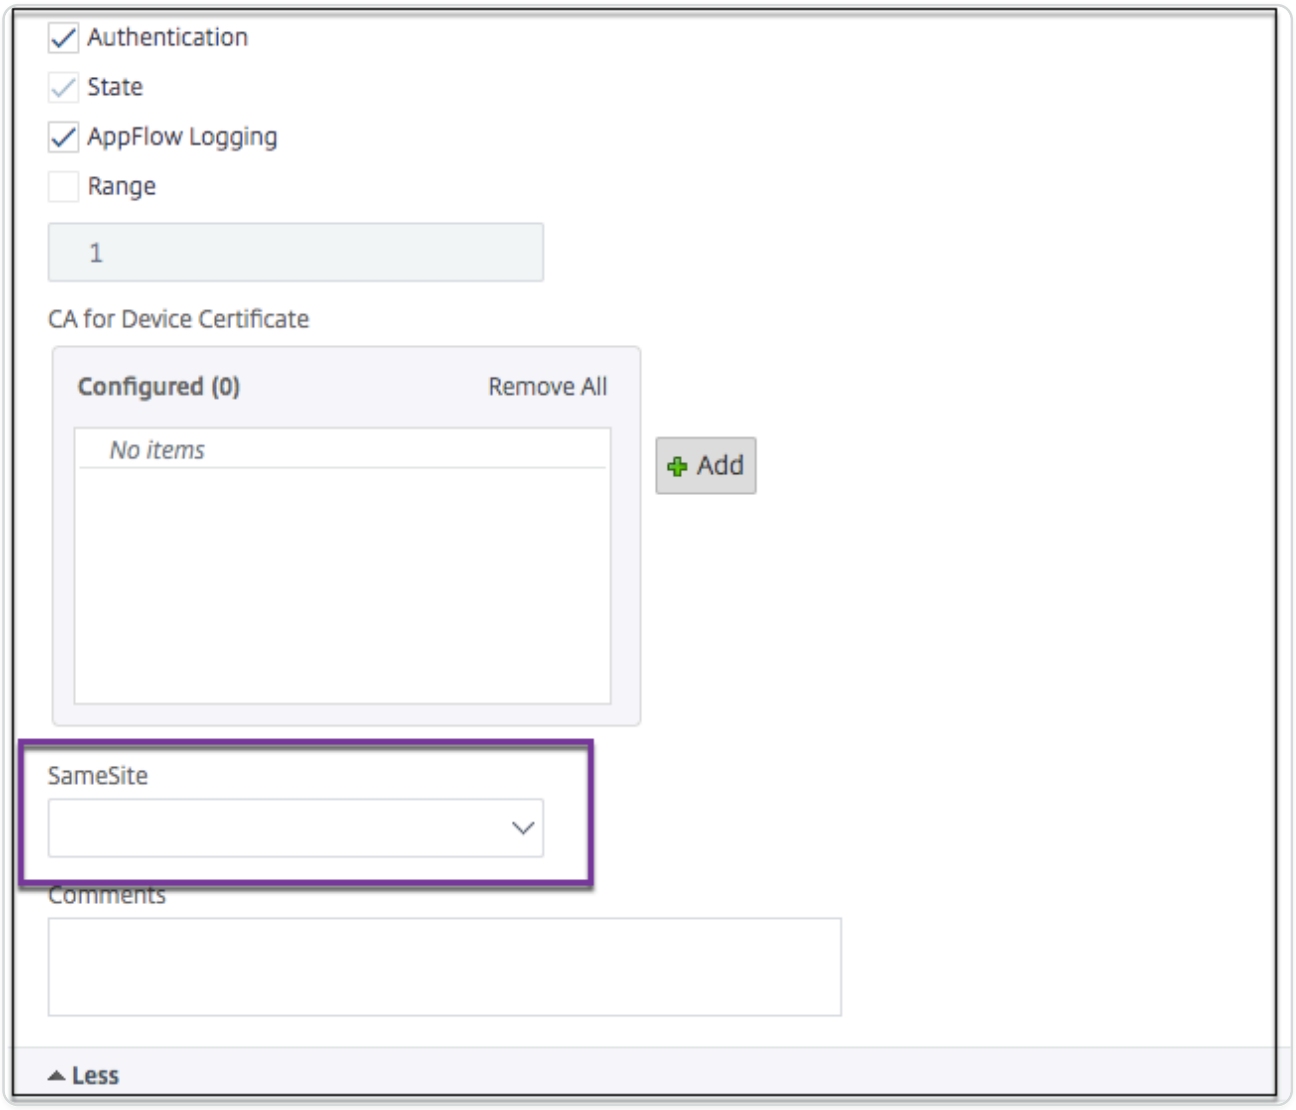
Note: The virtual server level setting takes preference over the global level setting. Citrix® recommends setting the SameSite cookie attribute at the virtual server level.

Binding cookies to the patset by using the CLI

If the browser drops cross-site cookies, you can bind that cookie string to the existing ns_cookies_SameSite patset so that the SameSite attribute is added to the cookie.

Example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.



```
bind patset ns_cookies_SameSite "NSC_TASS"

bind patset ns_cookies_SameSite "NSC_TMAS"
```

Setting the SameSite attribute by using the GUI

To set the SameSite attribute at the virtual server level:

1. Navigate to **Security > AAA – Application Traffic > Virtual Servers.**
2. Select a virtual server and click **Edit**.
3. Click the edit icon in the **Basic Setting**s section and click **More**.
4. In **SameSite**, select the option as required.

To set the SameSite attribute at the global level:

1. Navigate to **Security > AAA – Application Traffic > Change Authentication Settings.**

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. In the **Configure AAA Parameter** page, click the **SameSite** list, and select the option as required.

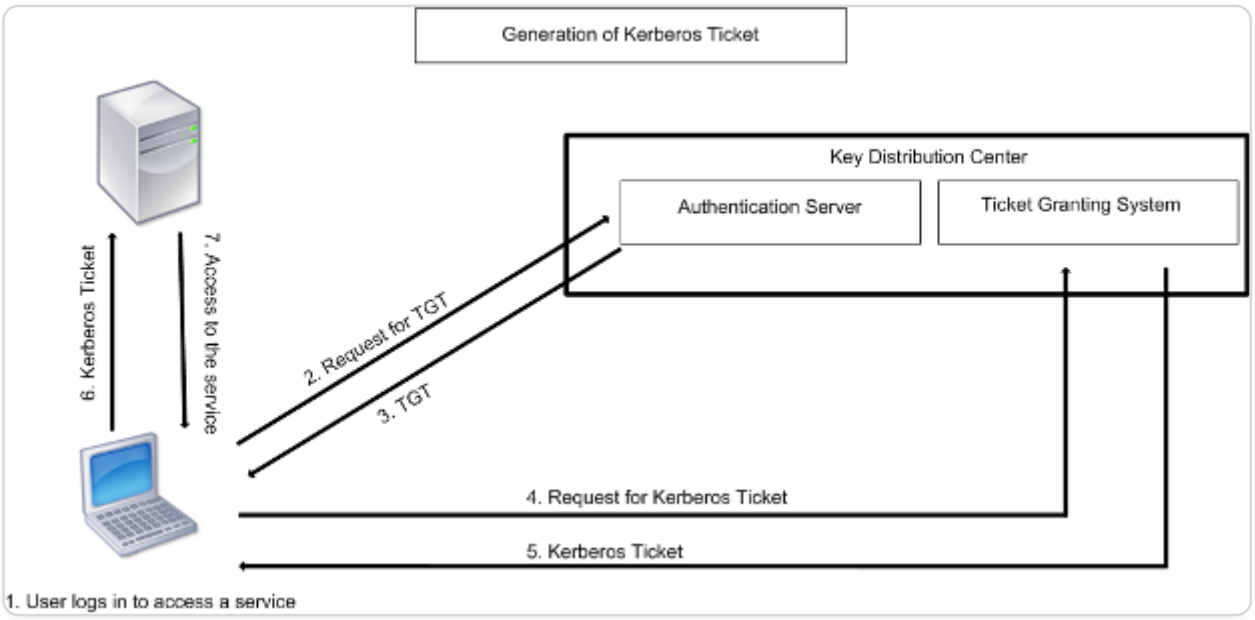
Authentication, authorization, and auditing configuration for commonly used protocols

Configuring the NetScaler appliance for authentication, authorization, and auditing needs a specific setup on the NetScaler appliance and clients' browsers. The configuration varies with the protocol used for authentication, authorization, and auditing.

For more information about configuring the NetScaler appliance for Kerberos authentication, see Handling Authentication, Authorization and Auditing with Kerberos/NTLM.

Handling authentication, authorization and auditing with Kerberos/ NTLM

Kerberos, a computer network authentication protocol, provides secure communication over the Internet. Designed primarily for client-server applications, it provides for mutual authentication by which the client and server can each ensure the other's authenticity. Kerberos uses a trusted third party, referred to as Key Distribution Center (KDC). A KDC consists of an Authentication Server (AS), which authenticates a user, and a Ticket Granting Server (TGS).



Each entity on the network (client or server) has a secret key that is known only to itself and the KDC. The knowledge of this key implies authenticity of the entity. For communication between two entities on the network, the KDC generates a session key, referred to as the Kerberos ticket or service ticket. The client makes a request to the AS for credentials for a specific server. The client then receives a ticket, referred to as Ticket Granting Ticket (TGT). The client then contacts the TGS, using the TGT it received from the AS to prove its identity, and asks for a service. If the client is eligible for the service, the TGS issues a Kerberos ticket to the client. The client then contacts the server hosting the service (referred to as the service server), using the Kerberos ticket to prove that it is authorized to receive the service. The Kerberos ticket has a configurable lifetime. The

© 1997–2026 Citrix Systems, Inc. All rights reserved.

client authenticates itself with the AS only once. If it contacts the physical server multiple times, it reuses the AS ticket.

The following figure shows the basic functioning of the Kerberos protocol.

Figure 1. **Functioning of Kerberos**

Kerberos authentication has the following advantages:

- Faster authentication. When a physical server gets a Kerberos ticket from a client, the server has enough information to authenticate the client directly. It does not have to contact a domain controller for client authentication, and therefore the authentication process is faster.
- Mutual authentication. When the KDC issues a Kerberos ticket to a client and the client uses the ticket to access a service, only authenticated servers can decrypt the Kerberos ticket. If the virtual server on the NetScaler appliance is able to decrypt the Kerberos ticket, you can conclude that both the virtual server and client are authenticated. Thus, the authentication of the server happens along with the authentication of the client.
- Single sign-on between Windows and other operating systems that support Kerberos.

Kerberos authentication may have the following disadvantages:

- Kerberos has strict time requirements; the clocks of the involved hosts must be synchronized with the Kerberos server clock to ensure that the authentication does not fail. You can mitigate this disadvantage by using the Network Time Protocol daemons to keep the host clocks synchronized. Kerberos tickets have an availability period, which you can configure.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Kerberos needs the central server to be available continuously. When the Kerberos server is down, no one can log on. You can mitigate this risk by using multiple Kerberos servers and fallback authentication mechanisms.
- Because all the authentication is controlled by a centralized KDC, any compromise in this infrastructure, such as the user's password for a local workstation being stolen, can allow an attacker to impersonate any user. You can mitigate this risk to some extent by using only a desktop machine or laptop that you trust, or by enforcing preauthentication by means of a hardware-token.

To use Kerberos authentication, you must configure it on the NetScaler appliance and on each client.

Optimizing Kerberos authentication on authentication, authorization, and auditing

The NetScaler appliance now optimizes and improves the system performance while Kerberos authentication. The authentication, authorization, and auditing daemon remembers the outstanding Kerberos request for the same user to avoid load on Key Distribution Center (KDC), which will avoid duplicate requests.

How NetScaler implements Kerberos for client authentication

IMPORTANT

Kerberos/NTLM authentication is supported only in the NetScaler 9.3 nCore release or later, and it can be used only for authentication, authorization, and auditing traffic management virtual servers.

NetScaler handles the components involved in Kerberos authentication in the following way:

Key Distribution Center (KDC)

In the Windows 2000 Server or later versions, the Domain Controller and KDC are part of the Windows Server. If the Windows Server is UP and running, it indicates that the Domain Controller and KDC are configured. The KDC is also the Active Directory server.

NOTE

All Kerberos interactions are validated with the Windows Kerberos Domain Controller.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Authentication service and protocol negotiation

A NetScaler appliance supports Kerberos authentication on the authentication, authorization, and auditing traffic management authentication virtual servers. If the Kerberos authentication fails, the NetScaler uses the NTLM authentication.

By default, Windows 2000 Server and later Windows Server versions use Kerberos for authentication, authorization, and auditing. If you create an authentication policy with NEGOTIATE as the authentication type, the NetScaler attempts to use the Kerberos protocol for authentication, authorization, and auditing and if the client's browser fails to receive a Kerberos ticket, the NetScaler uses the NTLM authentication. This process is referred to as negotiation.

The client may fail to receive a Kerberos ticket in any of the following cases:

- Kerberos is not supported on the client.
- Kerberos is not enabled on the client.
- The client is in a domain other than that of the KDC.
- The Access Directory on the KDC is not accessible to the client.

For Kerberos/NTLM authentication, the NetScaler does not use the data that is present locally on the NetScaler appliance.

AUTHORIZATION

The traffic management virtual server can be a load balancing virtual server or a content switching virtual server.

AUDITING

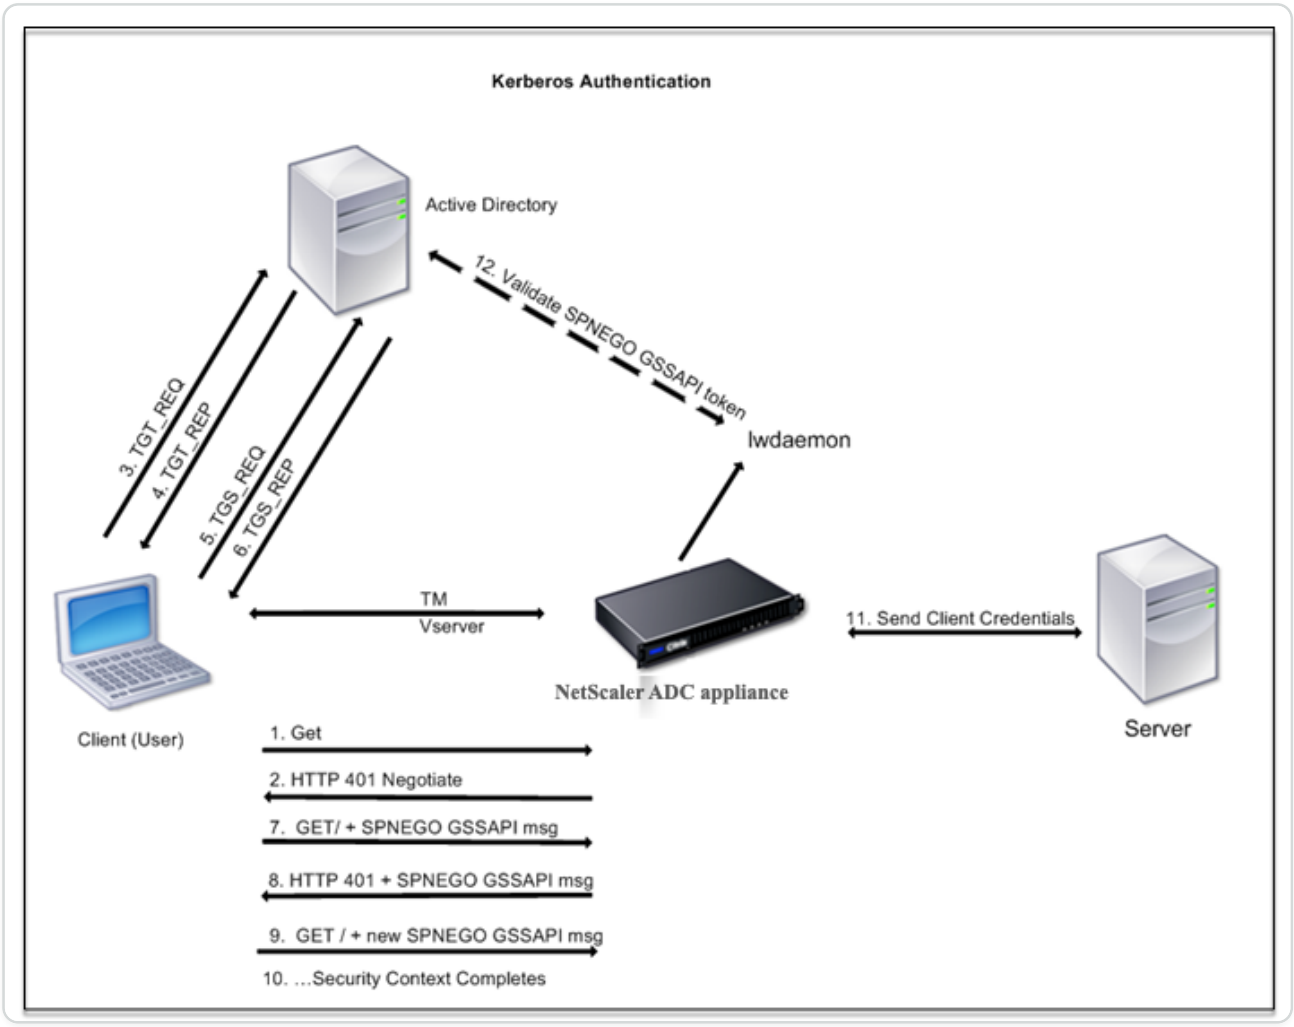
The NetScaler appliance supports auditing of Kerberos authentication with the following audit logging:

- Complete audit trail of the traffic management end-user activity
- SYSLOG and high performance TCP logging
- Complete audit trail of system administrators
- All system events
- Scriptable log format

SUPPORTED ENVIRONMENT

Kerberos authentication does not need any specific environment on the NetScaler. The client (browser) must provide support for Kerberos authentication.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



HIGH AVAILABILITY

In a high availability setup, only the active NetScaler joins the domain. In case of a failover, the NetScaler lwagent daemon joins the secondary NetScaler appliance to the domain. No specific configuration is required for this functionality.

KERBEROS AUTHENTICATION PROCESS

The following figure shows a typical process for Kerberos authentication in the NetScaler environment.

Figure 1. Kerberos Authentication Process on NetScaler

The Kerberos authentication occurs in the following stages:

CLIENT AUTHENTICATES ITSELF TO THE KDC

1. The NetScaler appliance receives a request from a client.
2. The traffic management (load balancing or content switching) virtual server on the NetScaler appliance sends a challenge to the client.
3. To respond to the challenge, the client gets a Kerberos ticket.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- The client sends the Authentication Server of the KDC a request for a ticket-granting ticket (TGT) and receives the TGT. (See 3, 4 in the figure, Kerberos Authentication Process.)
- The client sends the TGT to the Ticket Granting Server of the KDC and receives a Kerberos ticket. (See 5, 6 in the figure, Kerberos Authentication Process.)

NOTE

The above authentication process is not necessary if the client already has a Kerberos ticket whose lifetime has not expired. In addition, clients such as Web Services, .NET, or J2EE, which support SPNEGO, get a Kerberos ticket for the target server, create an SPNEGO token, and insert the token in the HTTP header when they send an HTTP request. They do not go through the client authentication process.

Client requests a service.

1. The client sends the Kerberos ticket containing the SPNEGO token and the HTTP request to the traffic management virtual server on the NetScaler. The SPNEGO token has the necessary GSSAPI data.
2. The NetScaler appliance establishes a security context between the client and the NetScaler. If the NetScaler cannot accept the data provided in the Kerberos ticket, the client is asked to get a different ticket. This cycle repeats till the GSSAPI data is acceptable and the security context is established. The traffic management virtual server on the NetScaler acts as an HTTP proxy between the client and the physical server.

NetScaler appliance completes the authentication.

1. After the security context is complete, the traffic management virtual server validates the SPNEGO token.
2. From the valid SPNEGO token, the virtual server extracts the user ID and GSS credentials, and passes them to the authentication daemon.
3. A successful authentication completes the Kerberos authentication.

Configuring kerberos authentication on the NetScaler appliance

This topic provides the detailed steps to configure Kerberos authentication on the NetScaler appliance by using the CLI and the GUI.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configuring Kerberos authentication on the CLI

1. Enable the authentication, authorization, and auditing feature to ensure the authentication of traffic on the appliance.

   ns-cli-prompt\> **enable ns feature** AAA

2. Add the keytab file to the NetScaler appliance. A keytab file is necessary for decrypting the secret received from the client during Kerberos authentication. A single keytab file contains authentication details for all the services that are bound to the traffic management virtual server on the NetScaler appliance.

   First generate the keytab file on the Active Directory server and then transfer it to the NetScaler appliance.

   - Log on to the Active Directory server and add a user for Kerberos authentication using the following command.

     ```
     net user <username> <password> /add
     ```

     NOTE

     In the **User Properties** section, ensure that the "Change password at next logon option" is not selected and the "Password does not expire" option is selected.

   - Map the HTTP service to the above user and export the keytab file. For example, run the following command on the Active Directory server:

     ```
     ktpass /out keytabfile /princ HTTP/owa.newacp.com@NEWACP.COM /pass
     <user password> /mapuser newacp\\dummy /ptype KRB5\_NT\_PRINCIPAL
     ```

     NOTE

     You can map more than one service if authentication is required for more than one service. If you want to map more services, repeat the above command for every service. You can give the same name or different names for the output file.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Transfer the keytab file to the NetScaler appliance by using the unix **ftp** command or any other file transfer utility of your choice. Upload the keytab file to the /nsconfig/krb/ directory on the NetScaler appliance.

3. The NetScaler appliance must obtain the IP address of the domain controller from the fully qualified domain name (FQDN). Therefore, Citrix recommends configuring the NetScaler with a DNS server.

   ns-cli-prompt\> **add dns nameserver** \<ip-address\>

   NOTE

   Alternatively, you can add static host entries or use any other means so that the NetScaler appliance can resolve the FQDN name of the domain controller to an IP address.

4. Configure the authentication action and then associate it to an authentication policy.

   - Configure the negotiate action. This configuration creates an action (profile) for an Active Directory server that is used as a Kerberos Key Distribution Center (KDC).The profile contains all the configuration data necessary to communicate with that AD KDC server.

     ns-cli-prompt\> **add authentication negotiateAction** \<name\> -domain \<domain name\> -domainUser \<domain user name\> -domainUserPasswd \<domain user password\> -defaultAuthenticationGroup \<default authentication group> -keytab \<string> -NTLMPath \<string>

     Note: For domain user and domain name configuration, go to client and use the klist command as shown in the following example:

     Client: username @ AAA.LOCAL

     Server: HTTP/onprem_idp.aaa.local @ AAA.LOCAL

     add authentication negotiateAction \<name> -domain <AAA.LOCAL> -domainUser <HTTP/onprem_idp.aaa.local>

   - Configure the negotiate policy and associate the negotiate action to this policy.

     ns-cli-prompt\> **add authentication negotiatePolicy** \<name\> \<rule\> \<reqAction\>

5. Create an authentication virtual server and associate the negotiate policy with it.

   - Create an authentication virtual server.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

ns-cli-prompt\> **add authentication vserver** \<name\> SSL \<ipAuthVserver\> 443 -authenticationDomain \<domainName\>

- Bind the negotiate policy to the authentication virtual server.

  ns-cli-prompt\> **bind authentication vserver** \<name\> -policy \<negotiatePolicyName\>

6. Associate the authentication virtual server with the traffic management (load balancing or content switching) virtual server.

   ns-cli-prompt\> **set lb vserver** \<name\> -authn401 ON -authnVsName \<string\>

   NOTE

   Similar configurations can also be done on the content switching virtual server.

7. Verify the configurations by doing the following:

   - Access the traffic management virtual server, using the FQDN. For example, Sample
   - View the details of the session on the CLI.

     ns-cli-prompt\> **show aaa session**

Configuring Kerberos authentication on the GUI

1. Enable the authentication, authorization, and auditing feature.

   Navigate to **System** > **Settings**, click **Configure Basic Features** and enable the authentication, authorization, and auditing feature.

2. Add the keytab file as detailed in step 2 of the CLI procedure mentioned above.
3. Add a DNS server.

   Navigate to **Traffic Management > DNS > Name Servers**, and specify the IP address for the DNS server.

4. Configure the **Negotiate** action and policy.

   Navigate to **Security > AAA - Application Traffic > Policies > Authentication > Advanced Policies > Policy**, and create a policy with **Negotiate** as the action type. Click **ADD** to create a new authentication negotiate server or click **Edit** to configure the existing details.

5. Bind the negotiate policy to the authentication virtual server.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Navigate to **Security > AAA - Application Traffic > Virtual Servers**, and associate the **Negotiate** policy with the authentication virtual server.

6. Associate the authentication virtual server with the traffic management (load balancing or content switching) virtual server.

   Navigate to **Traffic Management > Load Balancing > Virtual Servers**, and specify the relevant authentication settings.

   NOTE

   Similar configurations can also be done on the content switching virtual server.

7. Verify the configurations as detailed in step 7 of the CLI procedure mentioned above.

Configure kerberos authentication on a client

Kerberos support must be configured on the browser to use Kerberos for authentication. You can use any Kerberos-compliant browser. Instructions for configuring Kerberos support on Internet Explorer and Mozilla Firefox follow. For other browsers, see the documentation of the browser.

To configure Internet Explorer for Kerberos authentication

1. In the **Tools** menu select **Internet Options**.
2. On the **Security** tab, click **Local Intranet**, and then click **Sites**.
3. In the **Local Intranet** dialog box, make sure that the Automatically detect intranet network option is selected, and then click **Advanced**.
4. In the **Local Intranet** dialog box, add the web sites of the domains of the traffic management virtual server on the NetScaler appliance. The specified sites become local intranet sites.
5. Click **Close** or **OK** to close the dialog boxes.

To configure Mozilla Firefox for Kerberos authentication

1. Make sure that you have Kerberos properly configured on your computer.
2. Type about:config in the URL bar.
3. In the filter text box, type network.negotiate.
4. Change network.negotiate-auth.delegation-uris to the domain that you want to add.
5. Change network.negotiate-auth.trusted-uris to the domain that you want to add.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE:

If you are running Windows, you also need to enter sspi in the filter text box and change the network.auth.use-sspi option to False.

Offload Kerberos authentication from physical servers

The NetScaler appliance can offload authentication tasks from servers. Instead of the physical servers authenticating the requests from clients, the NetScaler authenticates all the client requests before it forwards them to any of the physical servers bound to it. The user authentication is based on Active Directory tokens.

There is no authentication between the NetScaler and the physical server, and the authentication offload is transparent to the end users. After the initial logon to a Windows computer, the end user does not have to enter any additional authentication information in a pop-up or on a logon page.

In the current NetScaler appliance release, Kerberos authentication is available only for authentication, authorization, and auditing traffic management virtual servers. Kerberos authentication is not supported for SSL VPN in the NetScaler Gateway Advanced Edition appliance or for NetScaler appliance management.

Kerberos authentication requires configuration on the NetScaler appliance and on client browsers.

To configure Kerberos authentication on the NetScaler appliance

NOTE

The passwords used in the following sample configuration are only examples and not the actual configuration passwords.

1. Create a user account on Active Directory. When creating a user account, verify the following options in the User Properties section:
   - Make sure that you do not select the Change password at next logon option.
   - Be sure to select the Password does not expire option.
2. On the AD server, at the CLI command prompt, type:
   - ktpass -princ HTTP/kerberos.crete.lab.net@crete.lab.net -ptype KRB5_NT_PRINCIPAL -mapuser kerbuser@crete.lab.net -mapop set -pass Citrix1 -out C:\\kerbtabfile.txt

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE

Be sure to type the above command on a single line. The output of the above command is written into the C:\\kerbtabfile.txt file.

3. Upload the kerbtabfile.txt file to the /etc directory of the NetScaler appliance by using a Secure Copy (SCP) client.
4. Run the following command to add a DNS server to the NetScaler appliance.

   - add dns nameserver 1.2.3.4

   The NetScaler appliance cannot process Kerberos requests without the DNS server. Be sure to use the same DNS server that is used in the Microsoft Windows domain.
5. Switch to the command line interface of NetScaler.
6. Run the following command to create a Kerberos authentication server:

   - add authentication negotiateAction KerberosServer -domain "crete.lab.net" -domainUser kerbuser -domainUserPasswd Citrix1 -keytab /var/mykcd.keytab

NOTE

If keytab is not available, you can specify the parameters: domain, domainUser, and -domainUserPasswd.

7. Run the following command to create a negotiation policy:

   - `add authentication negotiatePolicy Kerberos-Policy "REQ.IP.DESTIP == 192.168.17.200" KerberosServer`
8. Run the following command to create an authentication virtual server.

   - `add authentication vserver Kerb-Auth SSL 192.168.17.201 443 -AuthenticationDomain crete.lab.net`
9. Run the following command to bind the Kerberos policy to the authentication virtual server:

   - `bind authentication vserver Kerb-Auth -policy Kerberos-Policy -priority 100`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

10. Run the following command to bind an SSL certificate to the authentication virtual server. You can use one of the test certificates, which you can install from the GUI NetScaler appliance. Run the following command to use the ServerTestCert sample certificate.

    - `bind ssl vserver Kerb-Auth -certkeyName ServerTestCert`

11. Create an HTTP load balancing virtual server with the IP address, 192.168.17.200.

    Ensure that you create a virtual server from the command line interface for NetScaler 9.3 releases if they are older than 9.3.47.8.

12. Run the following command to configure an authentication virtual server:

    - `set lb vserver <name>-authn401 ON -authnVsName Kerb-Auth`

13. Enter the host name Example in the address bar of the Web browser.

    The Web browser displays an authentication dialog box because the Kerberos authentication is not set up in the browser.

    NOTE

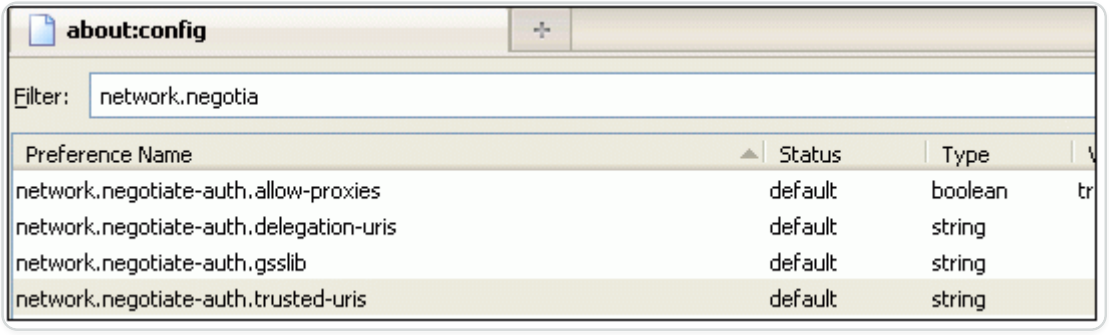
    Kerberos authentication requires a specific configuration on the client. Ensure that the client can resolve the hostname, which results in the Web browser connecting to an HTTP virtual server.

14. Configure Kerberos on the Web browser of the client computer.

    - For configuring on Internet Explorer, see Configuring Internet Explorer for Kerberos authentication.
    - For configuring on Mozilla Firefox, see Configuring Internet Explorer for Kerberos authentication.

15. Verify whether you can access the backend physical server without authentication.

To configure Internet Explorer for Kerberos authentication



1. Select **Internet Options** from the **Tools** menu.
2. Activate the **Security** tab.
3. Select **Local Intranet** from the Select a zone to view change security settings section.
4. Click **Sites**.
5. Click **Advanced**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

6. Specify the URL, Example and click **Add**.
7. Restart **Internet Explorer**.

To configure Mozilla Firefox for Kerberos authentication

1. Enter about:config in the address bar of the browser.
2. Click the warning disclaimer.
3. Type **Network.Negotiate-auth.trusted-uris** in the **Filter** box.
4. Double click **Network.Negotiate-auth.trusted-uris.** A sample screen is shown below.

5. In the Enter String Value dialog box, specify www.crete.lab.net.
6. Restart Firefox.

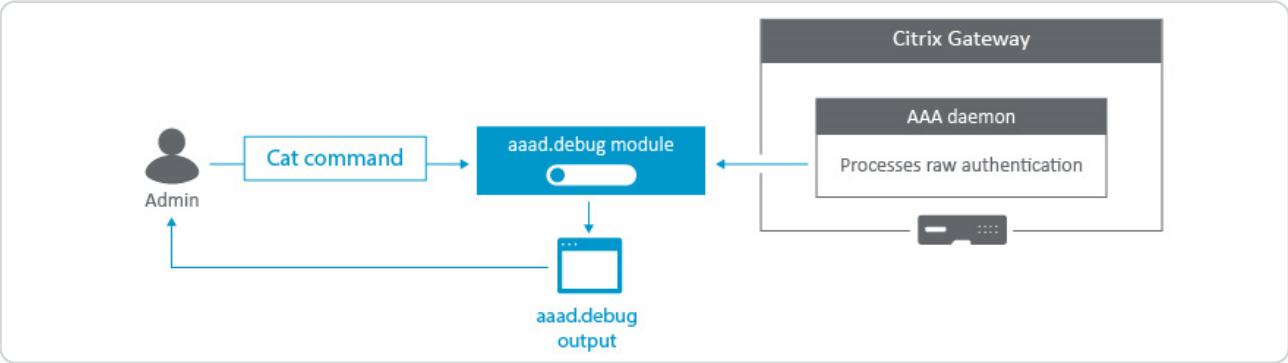
Troubleshoot authentication and authorization-related issues

Localize error messages

Localize error messages generated by NetScaler nFactor system

Troubleshoot authentication issues with aaad.debug module

Troubleshoot authentication issues in NetScaler and NetScaler Gateway with aaad.debug module



Troubleshoot authentication, authorization and auditing issues

Troubleshoot authentication issues in NetScaler and NetScaler Gateway with aaad.debug module

Authentication in NetScaler Gateway is handled by the Authentication, authorization, and auditing (AAA) daemon. The raw authentication events that AAA daemon processes can be monitored by

© 1997–2026 Citrix Systems, Inc. All rights reserved.

viewing the output of the **aaad.debug** module and serves as a valuable troubleshooting tool. The aaad.debug is a pipe as opposed to a flat file and does not display the results or log them. Therefore, the cat command can be used to view the output of aaad.debug. The process of using nsaaad.debug to troubleshoot an authentication problem is typically referred to as "debugging aaad".

This process is useful for troubleshooting authentication issues such as:

- General authentication errors
- Username/password failures
- Authentication policy configuration errors
- Group extraction discrepancies

NOTE:

This process applies to NetScaler Gateway and NetScaler appliance.

Troubleshooting authentication issues

To troubleshoot authentication with aaad.debug module, complete the following procedure:

1. Connect to the NetScaler Gateway command line interface with a Secure Shell (SSH) client such as PuTTY.
2. Run the following command to switch to the shell prompt: `shell`
3. Run the following command to change to the /tmp directory: `cd /tmp`
4. Run the following command to start the debugging process: `cat aaad.debug`
5. Perform the authentication process that requires troubleshooting, such as a user logon attempt.
6. Monitor the output of the cat aaad.debug command to interpret and troubleshoot the authentication process.
7. Stop the debugging process by pressing Ctrl+Z.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

8. Run the following command to record the output of `aaad.debug` to a file: `cat aaad.debug | tee /var/tmp/<debuglogname>`, where `/var/tmp` is the required directory path and `<debuglogname.log>` is the required log name.

The following section provides examples of how aaad.debug module can be used to troubleshoot and interpret an authentication error.

Incorrect password

In the following example, the user enters an incorrect RADIUS password.

```
process_radius Got RADIUS event

process_radius Received BAD_ACCESS_REJECT for: <username>

process_radius Sending reject.

send_reject_with_code Rejecting with error code 4001
```

Invalid username

In the following example, the user enters an incorrect LDAP username.

```
/home/build/rs_121/usr.src/netscaler/aaad/ldap_drv.c[450]:
receive_ldap_user_search_event 1-140: Admin authentication(Bind)
succeeded, now attempting to search the user testusernew

/home/build/rs_121/usr.src/netscaler/aaad/ldap_drv.c[453]:
receive_ldap_user_search_event 1-140: Number of entires in LDAP server
response = 0

/home/build/rs_121/usr.src/netscaler/aaad/ldap_drv.c[459]:
receive_ldap_user_search_event 1-140: ldap_first_entry returned null, user
testusernew not found

/home/build/rs_121/usr.src/netscaler/aaad/naaad.c[4781]:

```

Determining group extraction results

In the following example, the group extraction results can be determined. Many issues with AAA group access involve the user not picking up the correct session policies for their assigned group in a NetScaler Gateway appliance. Some common reasons for this include an incorrect spelling of AD or the Radius group name in the appliance and users not being a member of the security group in AD or the Radius server.

```
/usr/home/build/rs_80_48/usr.src/usr.bin/nsaaad/../../netscaler/aaad/
ldap_drv.c[40]:

start_ldap_auth attempting to auth scottli @ 10.12.33.216

/usr/home/build/rs_80_48/usr.src/usr.bin/nsaaad/../../netscaler/aaad/
ldap_drv.c[291]:

/usr/home/build/rs_80_48/usr.src/usr.bin/nsaaad/../../netscaler/aaad/
ldap_drv.c[551]: recieve_ldap_user_search_event built group string for
scottli of:Domain Admins
```

aaad.debug module error codes

The following table lists the various **aaad.debug** module error codes, cause for the error, and the resolution.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

AAAD.DEBUG MODULE ERROR CODES	ERROR MESSAGE	CAUSE OF ERROR	RESOLUTION
4001	Incorrect credentials/ Password. Try again.	Incorrect credentials are supplied	Enter the correct credentials
4002	Not Permitted	This is a catch all error. Occurs when ldapbind operation fails for reasons other than incorrect user credentials.	Make sure bind operation is permitted
4003	Cannot connect to server. Try connecting again in a few minutes.	Server times out	Increase the LDAP/ Radius server timeout value on NetScaler (Authentication > LDAP/Radius > Server > Timeout value). Default timeout value is 3 secs.
4004	System Error	NetScaler/NetScaler Gateway internal error or a runtime error in the appliance library	Check for the cause of the system error and reslove the same
4005	Socket Error	Socket error while talking to the authentication server	Make sure that LDAP/RADIUS server or any other authentication servers can listen on the ports mentioned in the authentication action configured on NetScaler. For example, a common error scenario can be that an ldapprofile on

© 1997–2026 Citrix Systems, Inc. All rights reserved.

AAAD.DEBUG MODULE ERROR CODES	ERROR MESSAGE	CAUSE OF ERROR	RESOLUTION
			NetScaler is configured to use port 636 /SSL, however the same port is not open on the AD.
4006	Incorrect username	Bad (format) username passed to nsaaad, like empty username	Enter the correct username
4007	Incorrect password	Bad (format) password passed to nsaaad	Enter the correct password
4008	Passwords do not match	Password mismatch	Enter the correct password
4009	User not found	No such user	Login using a valid user present in AD
4010	You do not have permission to log on at this time	Restricted log on hours	Log on outside the restricted hours
4011	Your AD account is disabled	Account disabled	Get your AD account enabled
4012	Your password has expired	Password expired	Reset your password
4013	You do not have permission to log on	No dial-in permission (RADIUS specific). This usually happens if a user is not authorized to authenticate at a server.	Network access permission setting needs to be changed

© 1997–2026 Citrix Systems, Inc. All rights reserved.

AAAD.DEBUG MODULE ERROR CODES	ERROR MESSAGE	CAUSE OF ERROR	RESOLUTION
4014	Could not change your password	Error in changing password. This can happen due to many reasons. One such reason could be trying to change the password using the non-ssl port provided in ldapprofile on NetScaler.	Ensure secure port and sec type is used for changing password
4015	Your account is temporarily locked	User AD account is locked	Get your AD account unlocked
4016	Could not update your password. The password must meet the length, complexity, and history requirements of the domain.	User password requirements not met while changing the password	Meet the needed requirements while changing the password
4017	NAC process	Microsoft Intune Specific. NetScaler Gateway is unable to verify device, either due to API failure or connectivity failure.	Ensure Microsoft Intune managed devices are reachable to NetScaler Gateway
4018	NAC Noncompliance	Microsoft Intune returns a status saying that this device is not compliant device	Ensure Microsoft Intune managed devices are compliant with NetScaler Gateway
4019	NAC Unmanaged	Microsoft Intune returns a status saying that this is not a managed device	Ensure Microsoft Intune specific configurations are in place

© 1997–2026 Citrix Systems, Inc. All rights reserved.

AAAD.DEBUG MODULE ERROR CODES	ERROR MESSAGE	CAUSE OF ERROR	RESOLUTION
4020	Authentication not Supported	This error is seen in case of misconfiguration. For example, auth type is not supported by NetScaler or if the Authentciationprofile config is incorrect on NetScaler appliance or if accounting action (radius) is attempted for authentication.	Check the Authentication checkbox for the Authentication server on NetScaler if its unchecked. Use appropriate Authentication action on NetScaler.
4021	User Account Expired	The user account has expired	Get your user account renewed
4022	User account is locked by NetScaler	The user account is locked by NetScaler	Unlock the account using unlock aaa user <> command
4023	Max OTP Device limit reached	Device limit for receiving OTP reached	Either try unregistering the non-required OTP devices or continue with the ones already registered

Localize error messages generated by NetScaler nFactor system

This topic captures information on localizing error messages generated by NetScaler nFactor system. These messages include the extended authentication error strings that are obtained as part of enhanced authentication feedback.

The default error strings that are sent by nFactor subsystem are described in /var/netscaler/logon/LogonPoint/receiver/js/localization/en/ctxs.strings.js for English language. Error strings for other languages are found in corresponding directories in /var/netscaler/logon/LogonPoint/receiver/js/localization/.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

You must create a portal theme based on RfWeb UI for localizing error messages.

At the command prompt, type:

```
add portaltheme custom_error_theme -basetheme RfWebUI

bind authentication vserver av1  -portaltheme custom_error_theme
```

After these commands are executed, a new directory is created in /var/netscaler/logon/themes/ `<name>`. This directory contains a file named “strings.en.json.” This file is an empty json file to begin with. Administrator can add name-value pairs comprising of old and new error strings.

For example, { "No active policy during authentication": "No active policy during authentication, Please contact administrator" }

In the preceding example, text on the left side is the existing error message that is sent by nFactor. The text on the right side is the replacement for that. Administrator can add more messages as required.

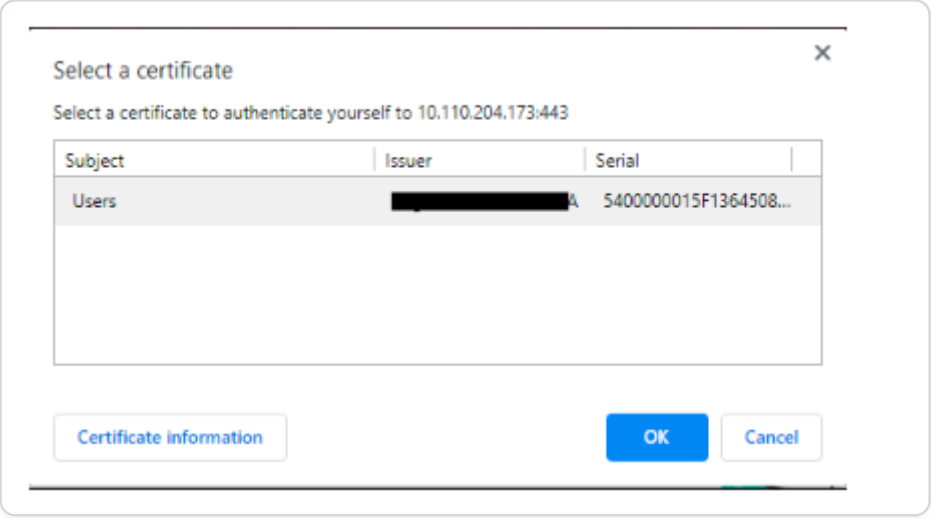
Enhanced authentication feedback

For obtaining extended error messages during authentication process, enhancedAuthenticationFeedback feature must be enabled.

At the command prompt, type:

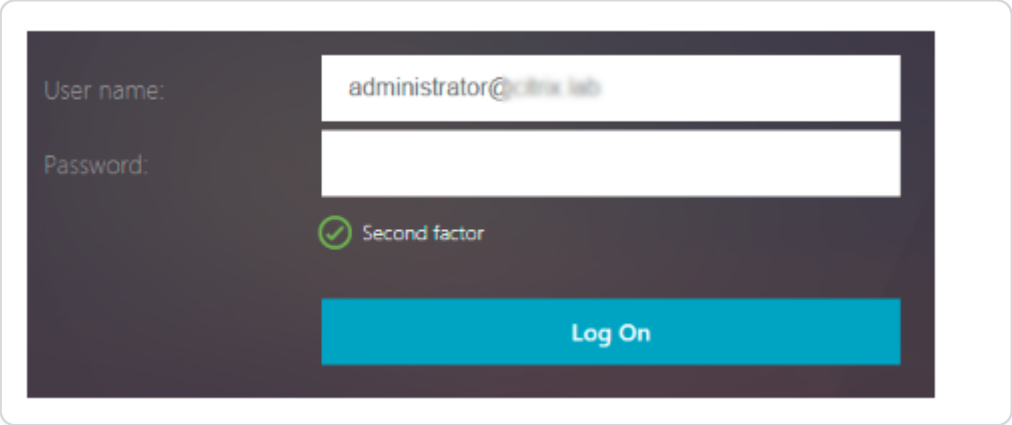
```
set aaa parameter –enableEnhancedAuthFeedback YES
```

Configure certificate authentication as the first factor and LDAP as the second factor in NetScaler nFactor authentication



The following section describes the use case of certificate authentication in the first factor followed by LDAP in the second factor. Else, the LDAP and OTP, if a user certificate is not present in the first factor.

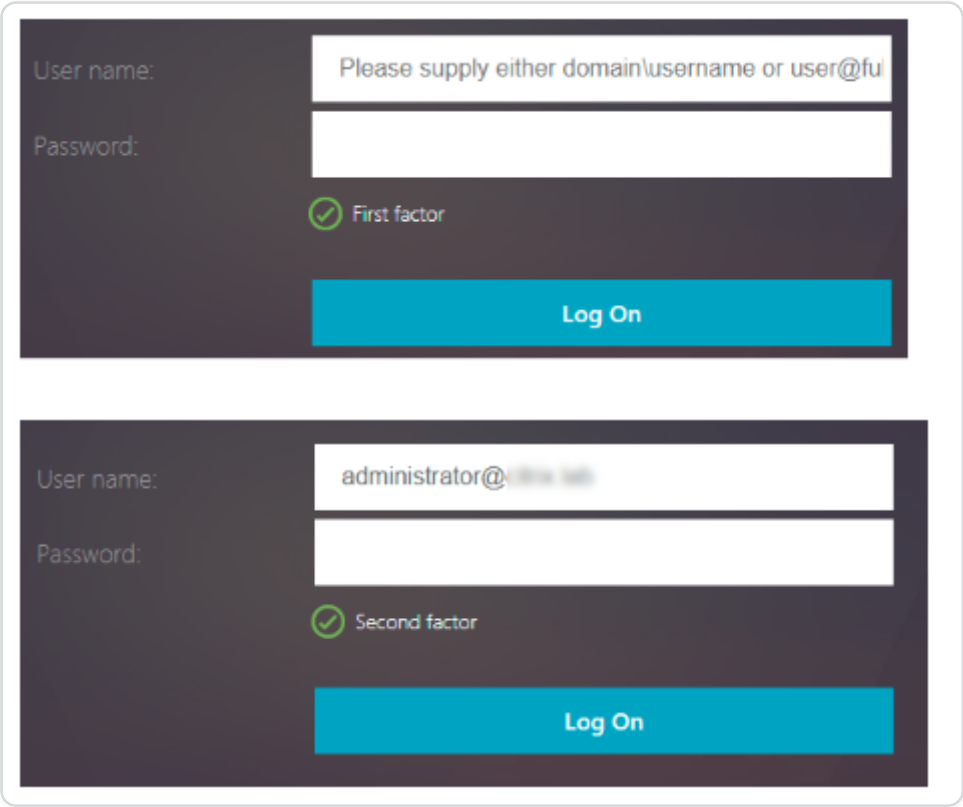
© 1997–2026 Citrix Systems, Inc. All rights reserved.



Use Case: Certificate authentication as the first factor followed by LDAP as the next factor

Assume a use case where, admins configure certificate authentication in the first factor. And if the certificate is present, then configure LDAP authentication in the next factor. If the user certificate is not present, configure LDAP and OTP.

1. Once you access the traffic management virtual server, you are redirected to the login page.
2. If the user certificate is present in the client device, you are displayed with the following screen.



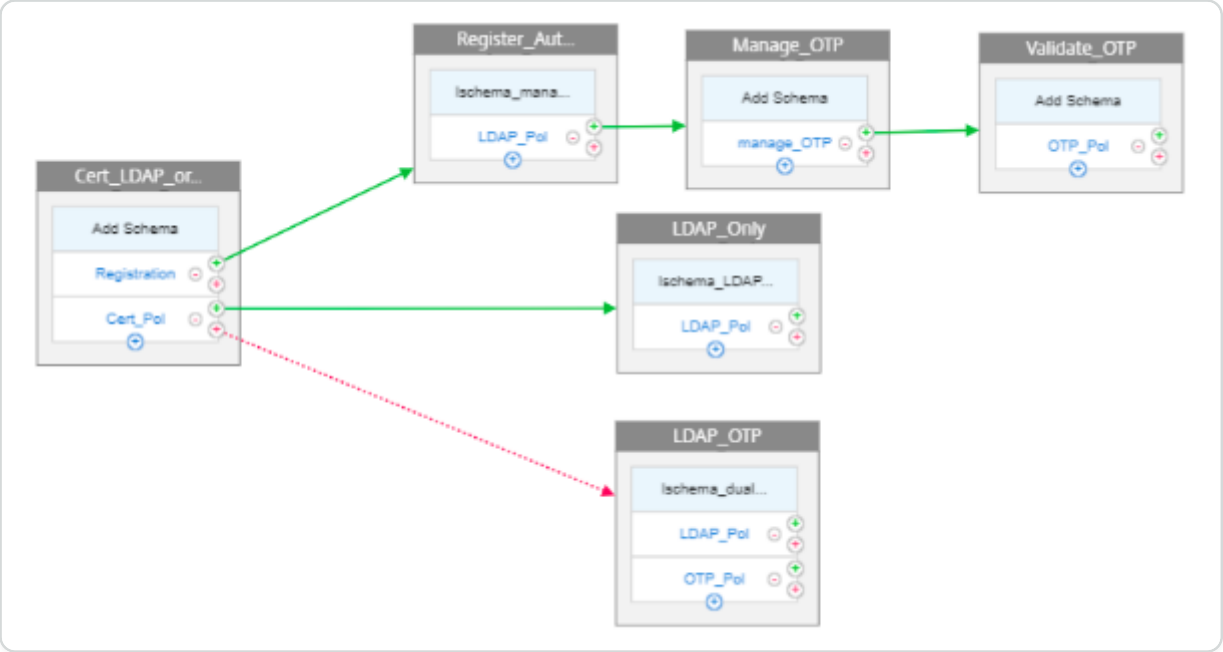
3. After the user certificate is submitted, authentication proceeds to the next factor. This factor is configured as LDAP.

4. If a user certificate is not present in the first factor, then proceed to LDAP and OTP. You have two options to achieve.

    - LDAP and OTP as separate login pages with user name prefilled from LDAP factor.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The user name value is prefilled using the expression ${http.req.user.name}, which extracts the user name from the first factor. Other fields such as, labels for user name and password can also be customized.



- Dual authentication page containing two password fields. The example used for this specific representation is displayed.

NOTE

The setup can also be created through the nFactor Visualizer available in NetScaler version 13.0 and later.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Perform the following by using the CLI

1. Configure authentication virtual server.

```
add authentication vserver auth_vserver SSL 10.217.28.152 443

add lb vserver lbvs1 HTTP 10.217.28.152 80 -AuthenticationHost
auth1.nsi-test.com -Authentication ON

bind ssl vserver auth_vserver -certkeyName gateway.angiras.lab
```

2. Bind the root certificate to the virtual server and enable Client Auth.

```
bind ssl vserver auth_vserver -certkeyName Root_Cert -CA -ocspCheck
Optional

set ssl vserver auth_vserver -clientAuth ENABLED -clientCert Optional
```

3. Configure authentication action and policies.

    - LDAP authentication

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add authentication ldapAction LDAP_Action -serverIP XX.XX.XX.XX
-ldapBase "dc=citrix,dc=lab" -ldapBindDn administrator@citrix.lab
-ldapBindDnPassword
97526a31c6e2e380f7b3a7e5aa53dc498c5b25e9b84e856b438b1c61624b5aad
-encrypted -encryptmethod ENCMTHD_3 -ldapLoginName sAMAccountName
-groupAttrName memberOf -subAttributeName cn`

add authentication Policy LDAP_Pol -rule true -action LDAP_Action`
```

- Device management

```
add authentication ldapAction OTP_manage_Act -serverIP XX.XX.XX.XX
-ldapBase "dc=citrix,dc=lab" -ldapBindDn administrator@citrix.lab
-ldapBindDnPassword
3e10c1df11a9cab239cff2c9305743da76068600a0c4359603abde04f28676ae
-encrypted -encryptmethod ENCMTHD_3 -ldapLoginName sAMAccountName
-groupAttrName memberOf -subAttributeName cn -authentication DISABLED
-OTPSecret userParameters

add authentication Policy manage_OTP -rule TRUE -action OTP_manage_Act
```

- OTP validation

```
add authentication ldapAction LDAP_OTP_Act -serverIP XX.XX.XX.XX
-ldapBase "dc=citrix,dc=lab" -ldapBindDn administrator@citrix.lab
-ldapBindDnPassword
e79a8ebf93fdb7e7438f44c076350c6ec9ad1269ef0528d55640c7c86d3490dc
-encrypted -encryptmethod ENCMTHD_3 -ldapLoginName sAMAccountName
-searchFilter "userParameters>=#@" -groupAttrName memberOf
-subAttributeName cn -authentication DISABLED -OTPSecret userParameters

add authentication Policy OTP_Pol -rule true -action LDAP_OTP_Act
```

- Certificate authentication

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add authentication certAction Certificate_Profile -twoFactor ON
-userNameField SubjectAltName:PrincipalName

add authentication policy Cert_Pol -rule true -action
 Certificate_Profile`
```

- Policy without authentication for dual authentication when a certificate authentication fails or certificate does not exist.

```
add authentication Policy Cert_Pol_NOAUTH_ -rule true -action NO_AUTHN
```

4. Configure the policy label and schema for the second factor.

   - Device management

```
add authentication policylabel manage_otp_label -loginSchema
LSCHEMA_INT

bind authentication policylabel manage_otp_label -policyName manage_OTP
-priority 100 -gotoPriorityExpression END
```

   - LDAP authentication after successful certificate authentication

```
add authentication loginSchema lschema_LDAP_Only -authenticationSchema
"/nsconfig/loginschema/LoginSchema/PrefilUserFromExpr.xml"

add authentication policylabel LDAP_Only -loginSchema lschema_LDAP_Only

bind authentication policylabel LDAP_Only -policyName LDAP_Pol
-priority 100 -gotoPriorityExpression END
```

   - Dual authentication when certification is not present or certificate authentication fails

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add authentication loginSchema lschema_dual_auth -authenticationSchema
"/nsconfig/loginschema/LoginSchema/DualAuth.xml"

add authentication policylabel Dual_Auth_Label -loginSchema
lschema_dual_auth

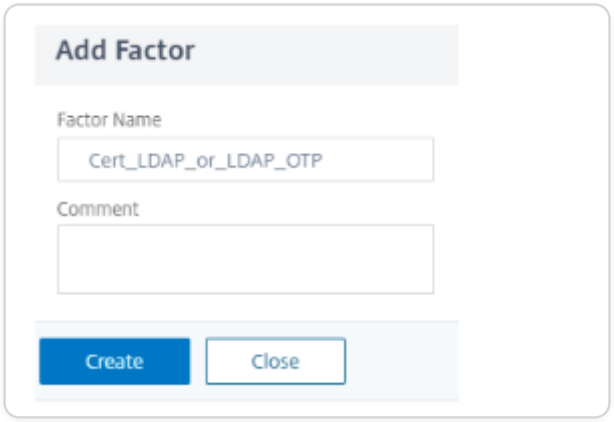
bind authentication policylabel Dual_Auth_Label -policyName LDAP_Pol
-priority 100 -gotoPriorityExpression END

bind authentication policylabel Dual_Auth_Label -policyName OTP_Pol
-priority 110 -gotoPriorityExpression END
```

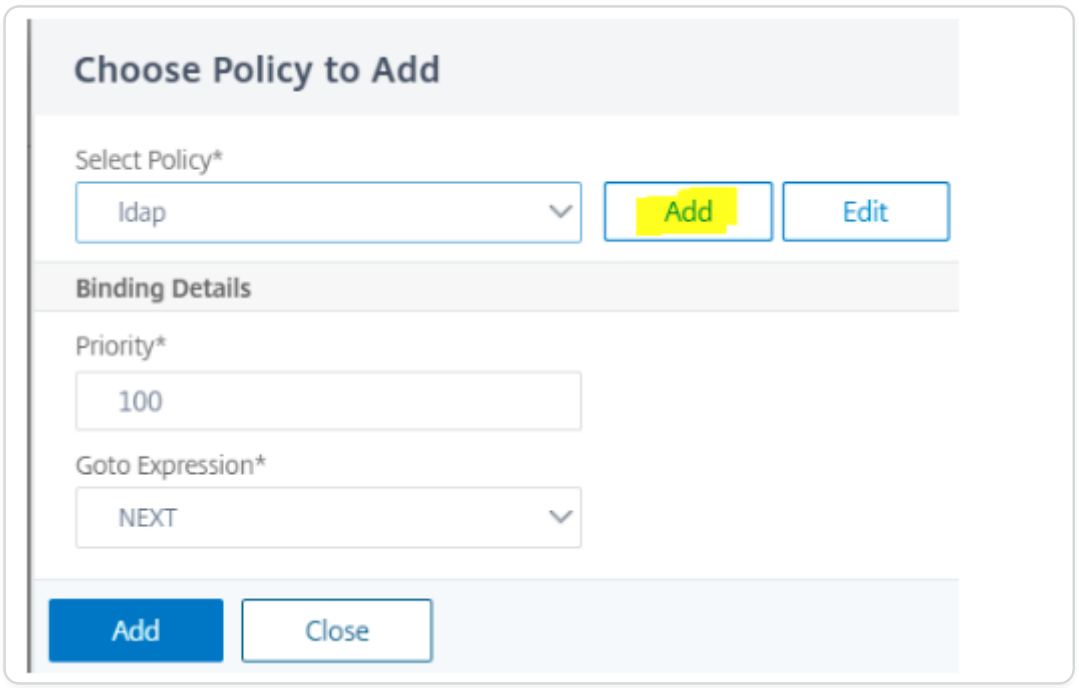
5. Bind the policies created in the preceding steps.

```
bind authentication vserver auth_vserver -policy Manage_OTP -priority
100 -nextFactor manage_otp_label -gotoPriorityExpression NEXT

bind authentication vserver auth_vserver -policy Cert_Pol -priority 110
-nextFactor LDAP_Only -gotoPriorityExpression NEXT



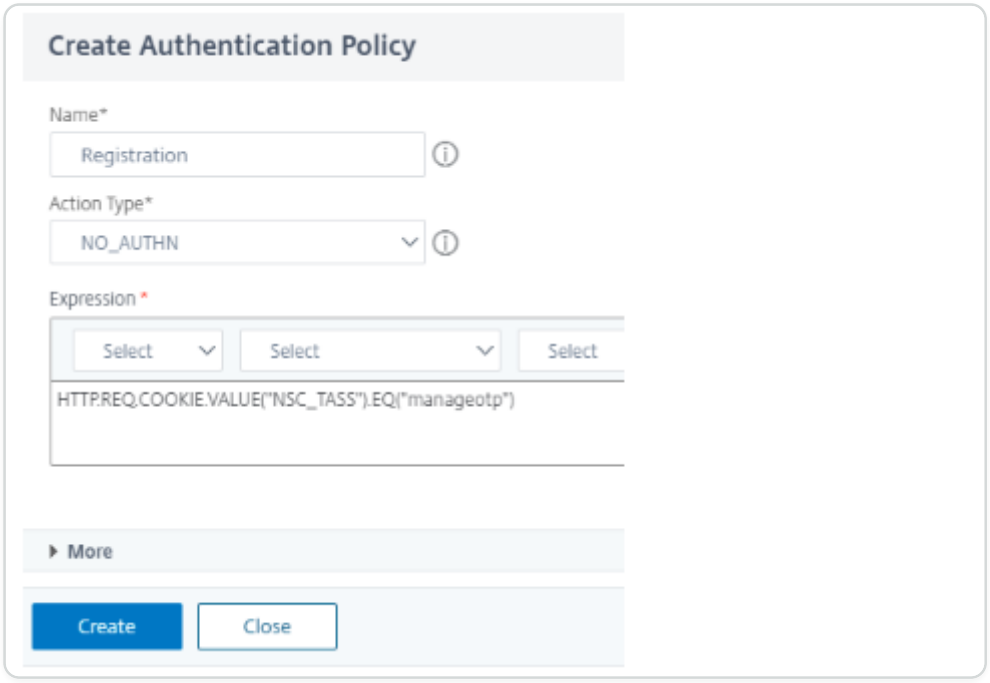
bind authentication vserver auth_vserver -policy Cert_Pol_NOAUTH_
-priority 120 -nextFactor Dual_Auth_Label -gotoPriorityExpression NEXT
```



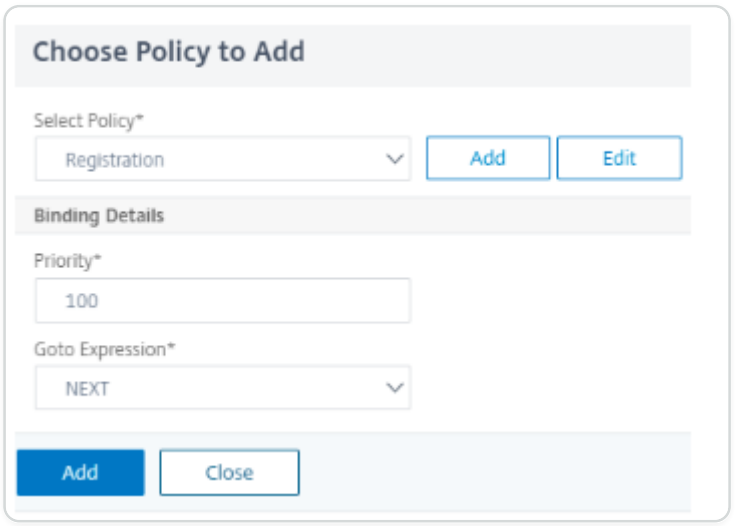
Configuring by using the nFactor Visualizer

1. Navigate to **Security > AAA-Application Traffic > nFactor Visualizer > nFactor Flows** and click **Add**.
2. Click **+** to add the nFactor flow.
3. Add a factor. The name that you enter is the name of the nFactor flow. Click **Create**.

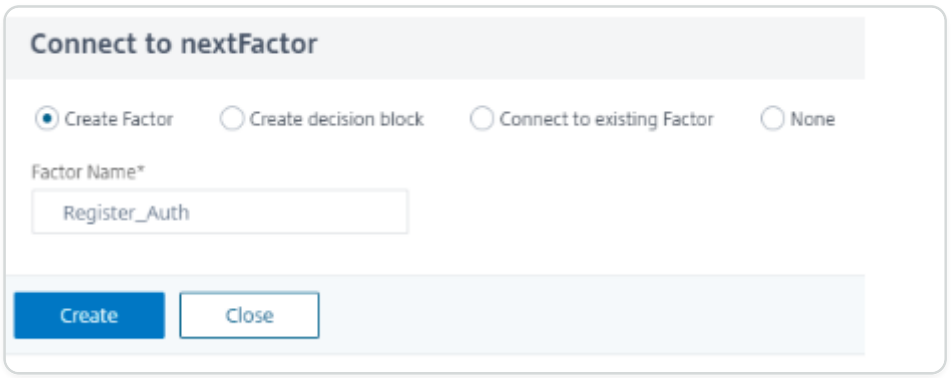
© 1997–2026 Citrix Systems, Inc. All rights reserved.



4. Click **Add Policy** to add the first factor authentication policy. You can create an authentication policy or select an existing authentication policy from the list.

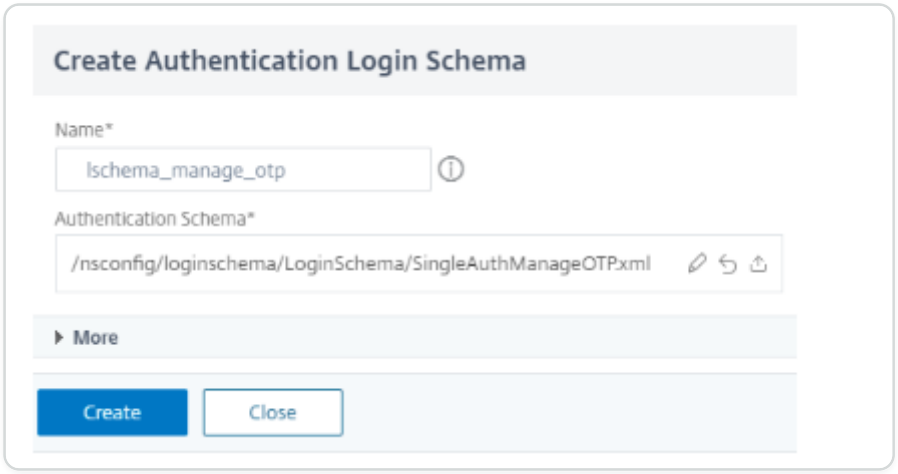


5. Add a policy for registration check. Action in this case would be NO_AUTHN.
6. In the **Expression Field**, type `HTTP.REQ.COOKIE.VALUE("NSC_TASS").EQ("manageotp")` and click **Create**.

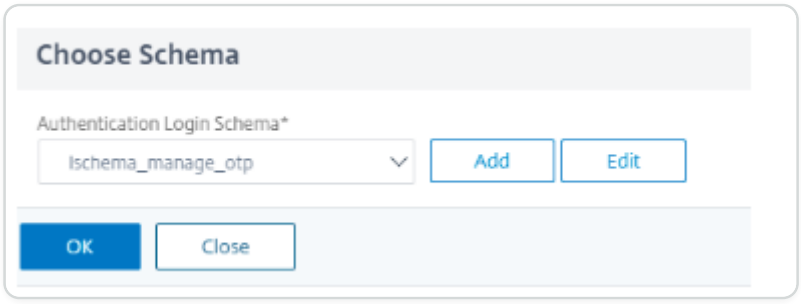


© 1997–2026 Citrix Systems, Inc. All rights reserved.

7. Click **Add Policy** to create a policy. Click **Create** and click **Add**.



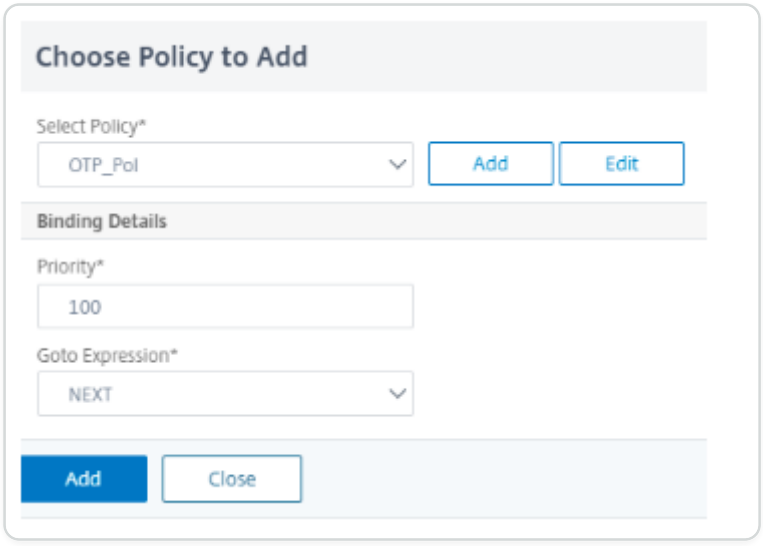
8. Click green **+** to add the next factor for LDAP authentication before managing the devices.
9. Select **Create Factor** and type in a name for this factor and click **Create**.



10. Click **Add Schema** and then add to create a schema to manage devices.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

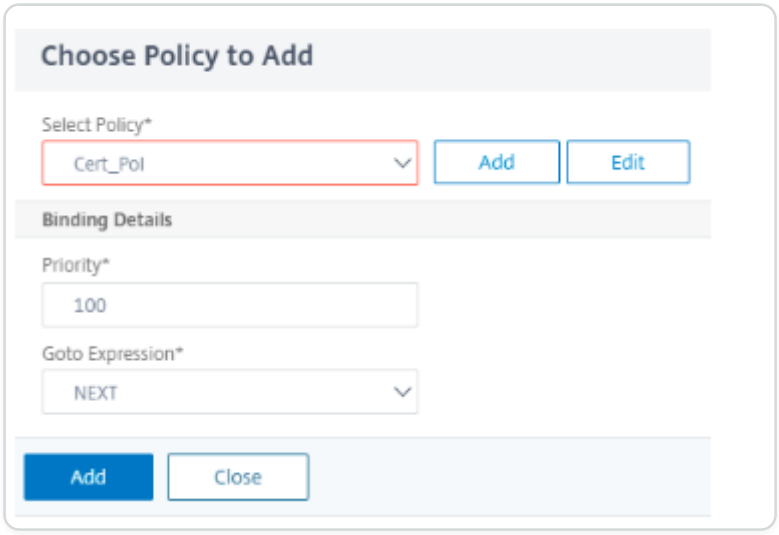
11. Choose the schema that is created in the preceding step and click **Add** to create it.



12. Click **Add Policy** and select LDAP Authentication Policy for initial LDAP authentication.

> **NOTE**
>
> For more information, see To configure LDAP authentication by using the configuration utility.

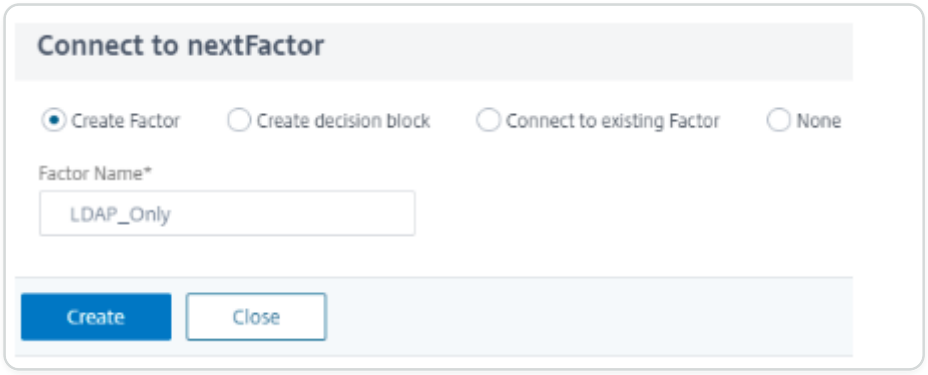
13. Follow steps 9 and 10 to create another factor to register the device.
14. No schema is needed in this factor. Click **Add Policy** to add the policy for device registration. (Policy created in CLI Configuration step 4 point b).
15. Create another factor following step 9 and 10 to test the registered devices.
16. Click **Add Policy** to add Authentication Policy (Policy created in CLI Configuration step 4 point c).



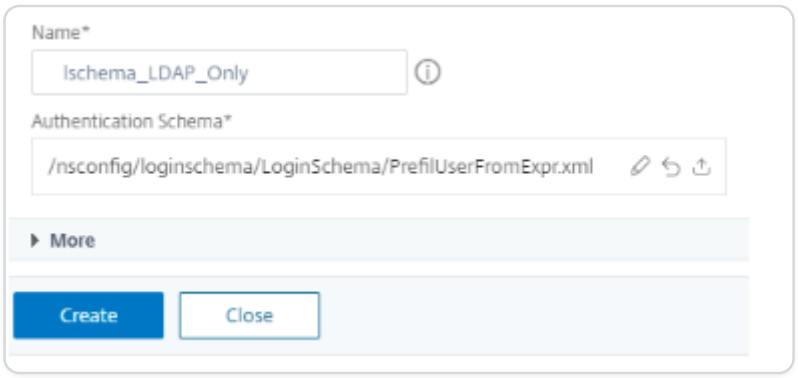
© 1997–2026 Citrix Systems, Inc. All rights reserved.

17. Click green **+** under the Registration Policy to add a Policy for certificate authentication.

18. Click **Add** to add the Cert Policy.

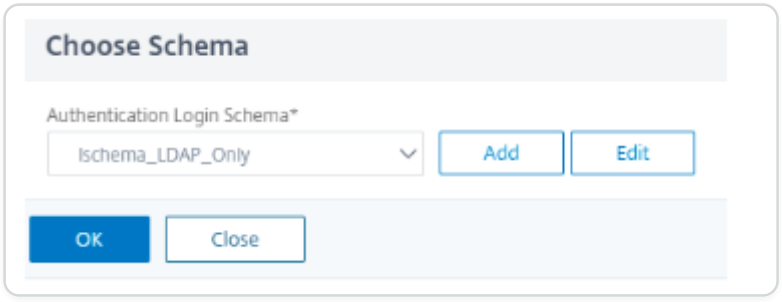


NOTE

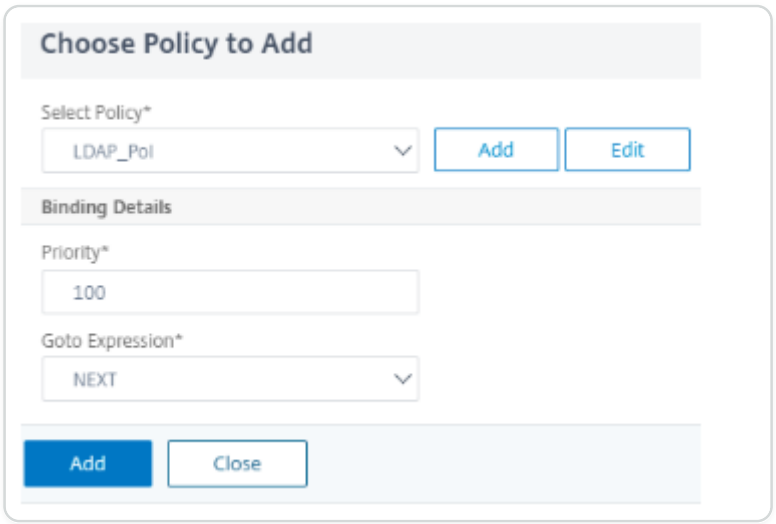


For more information on client certificate authentication, see How Do I Enable SSL Client Certificate Authentication on NetScaler.

19. Click the green sign next to the Cert Policy to create the next factor for LDAP authentication.

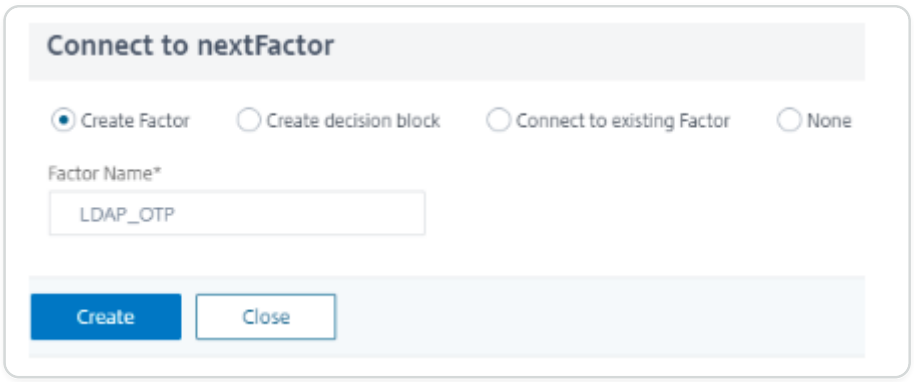


© 1997–2026 Citrix Systems, Inc. All rights reserved.

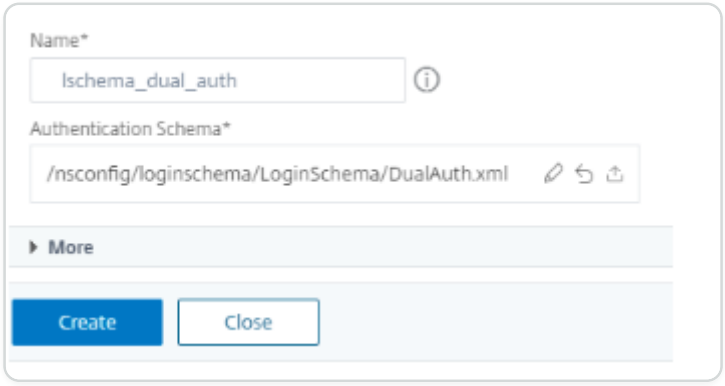


20. Click **Add Schema** to add the login schema for prefilled user name, single authentication.

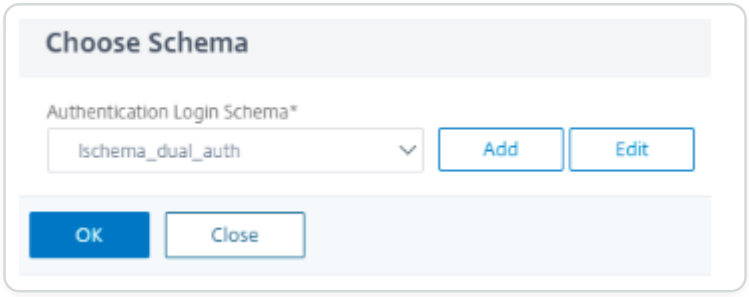
21. Choose the schema created and click **OK**.



22. Click **Add Policy** and add LDAP authentication.

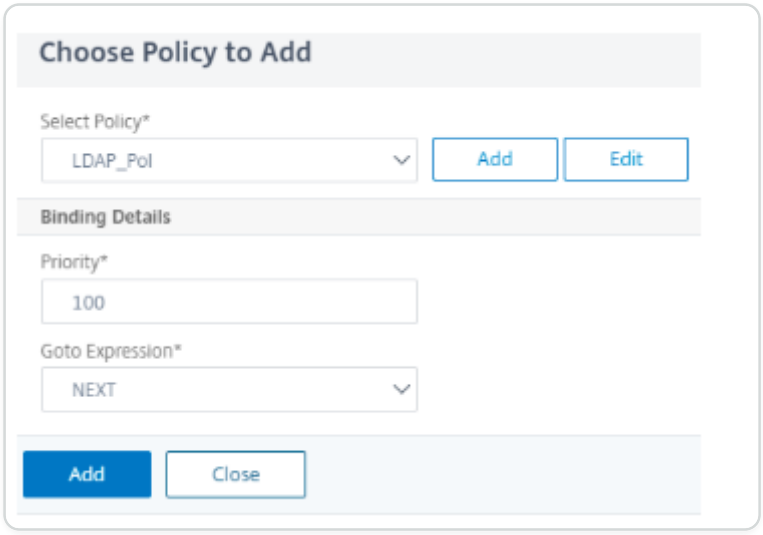


© 1997–2026 Citrix Systems, Inc. All rights reserved.

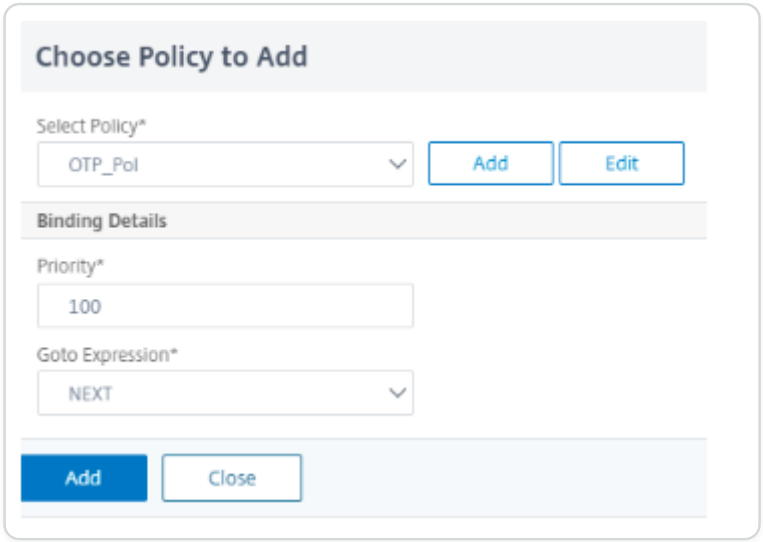


23. Click red **+** next to Certificate Policy to add the next factor for the failure case. The failure case is for when the certificate authentication fails or if there is no certificate on the device.
24. Select **Create Factor** and type a **Factor Name**.

25. Click **Add Schema** to add a dual authentication schema.

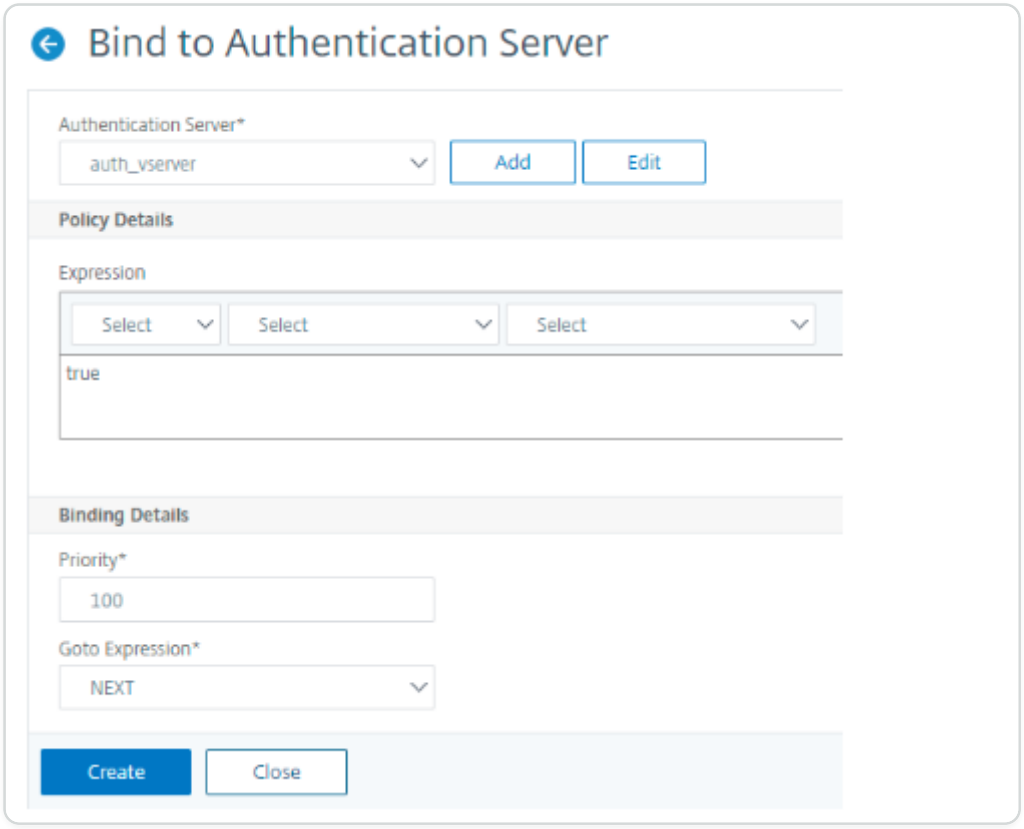


26. Choose the created schema and click **OK**.



27. Click **Add Policy** and add LDAP authentication.

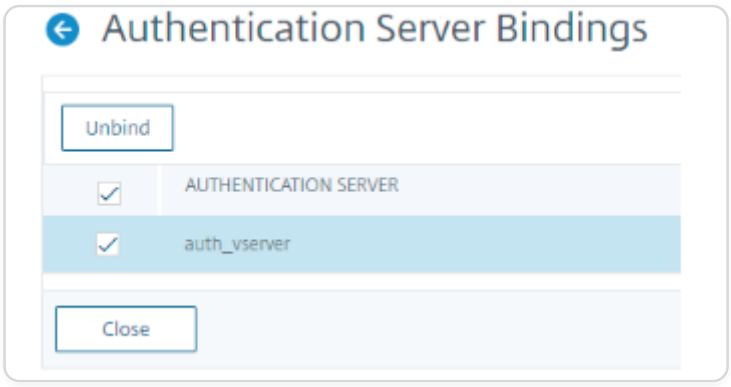
© 1997–2026 Citrix Systems, Inc. All rights reserved.



28. Select the authentication policy to validate OTP and click **OK**

29. Click **Done** to save the configuration.
30. Select the nFactor Flow created and bind it to an authentication, authorization, and auditing virtual server. Click **Bind to Authentication Server** and Click **Create**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

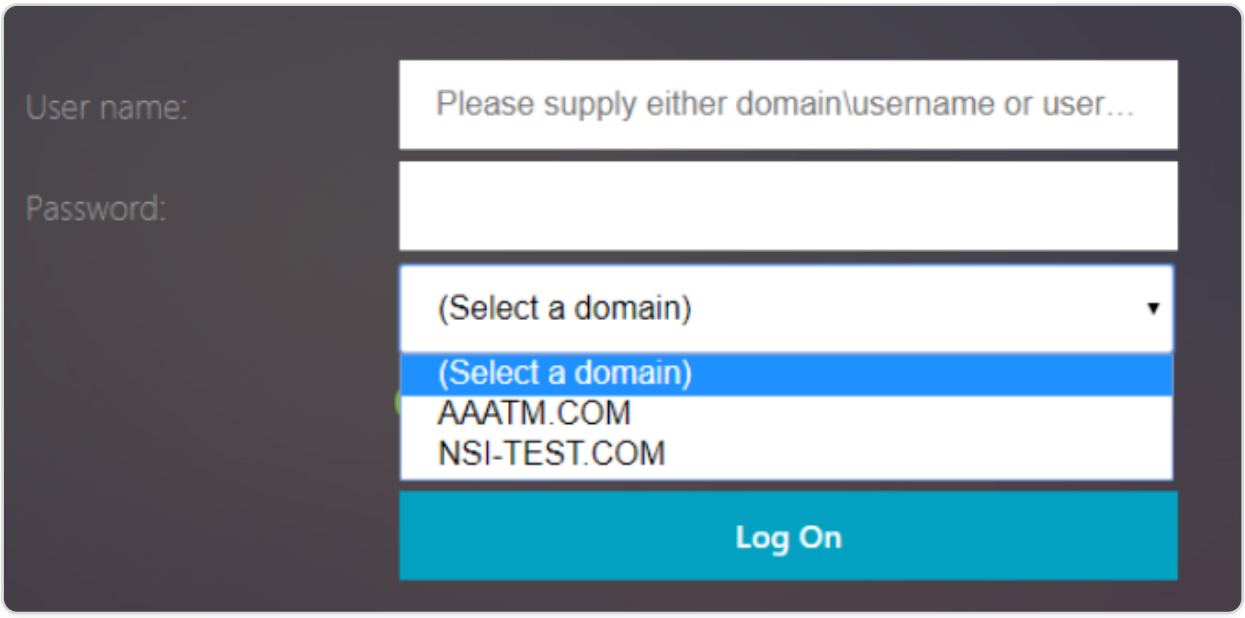


NOTE

You can bind and unbind the nFactor using the nFactor Flows page through **Show Bindings** option only.

Unbind the nFactor flow

1. On the nFactor Flows page, click Show Bindings from the hamburger icon.
2. On the Authentication Server Bindings page, select the authentication server to unbind and click Unbind. Click Close.

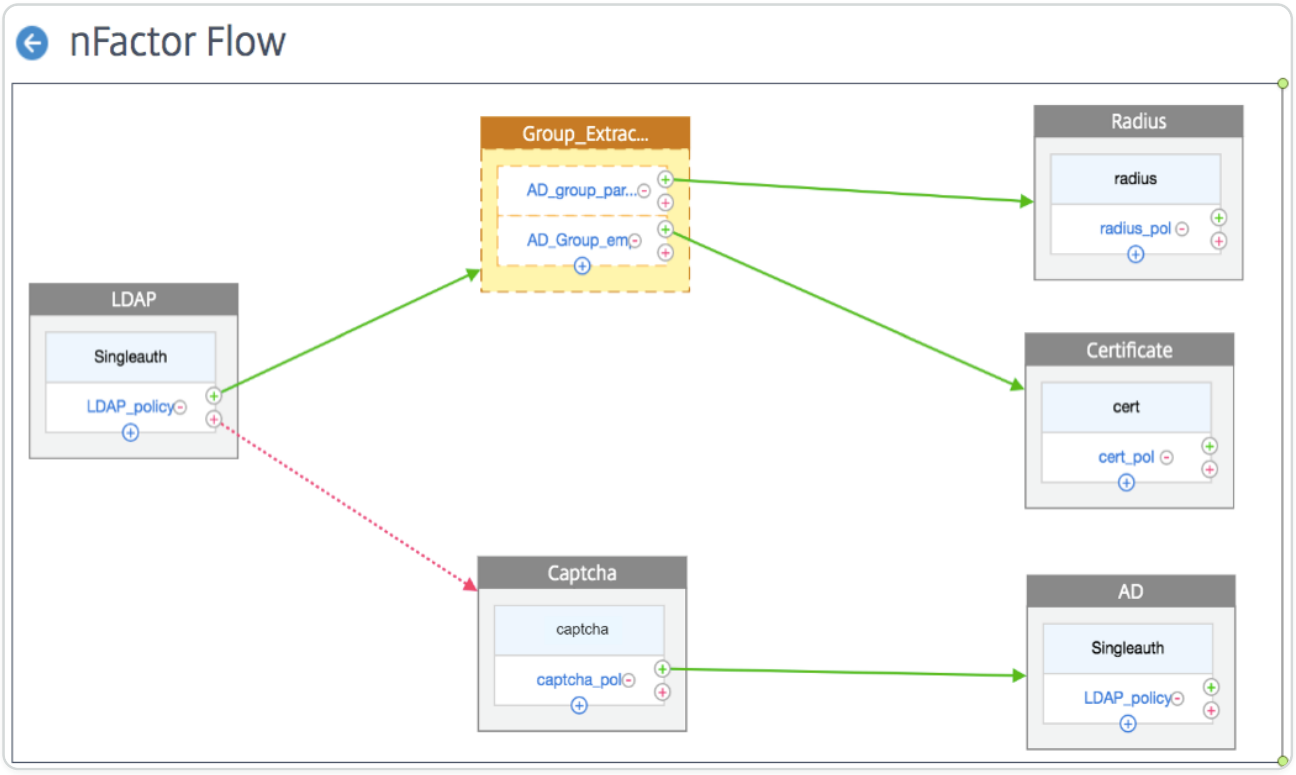


© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure domain drop-down, username, and password field in the first factor and policy evaluation based on groups in the next factor

The following section describes the use case of configuring domain drop-down, username, and password field in the first factor and policy evaluation based on groups in the next factor.

Use Case: Configure domain drop-down, username, and password field in the first factor and policy evaluation based on groups in the next factor.



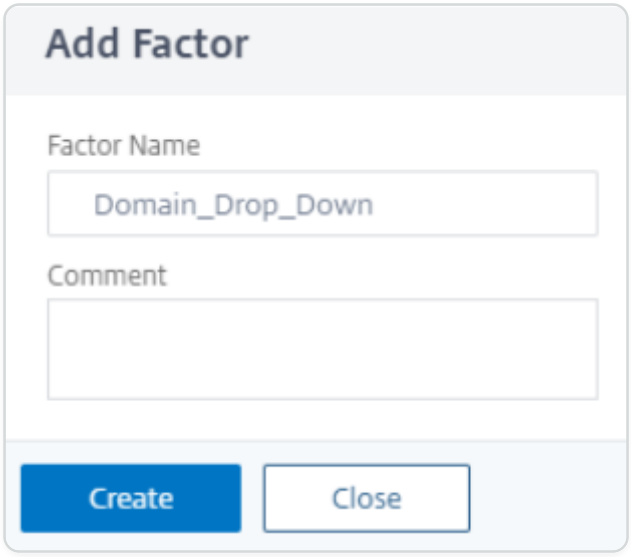
1. User logs in to Citrix Workspace and gets redirected to authentication virtual server.
2. NetScaler presents a logon form with a domain drop-down list, username, and password field.

3. User selects a value from the domain drop-down list and enters credentials.
4. NetScaler presents a logon form based on the user input.

The following diagram shows a sample nFactor visualizer flow.

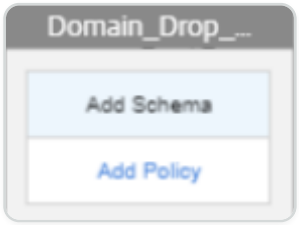
© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure domain drop-down, username, and password field in the first factor and policy evaluation based on groups in the next factor using nFactor visualizer

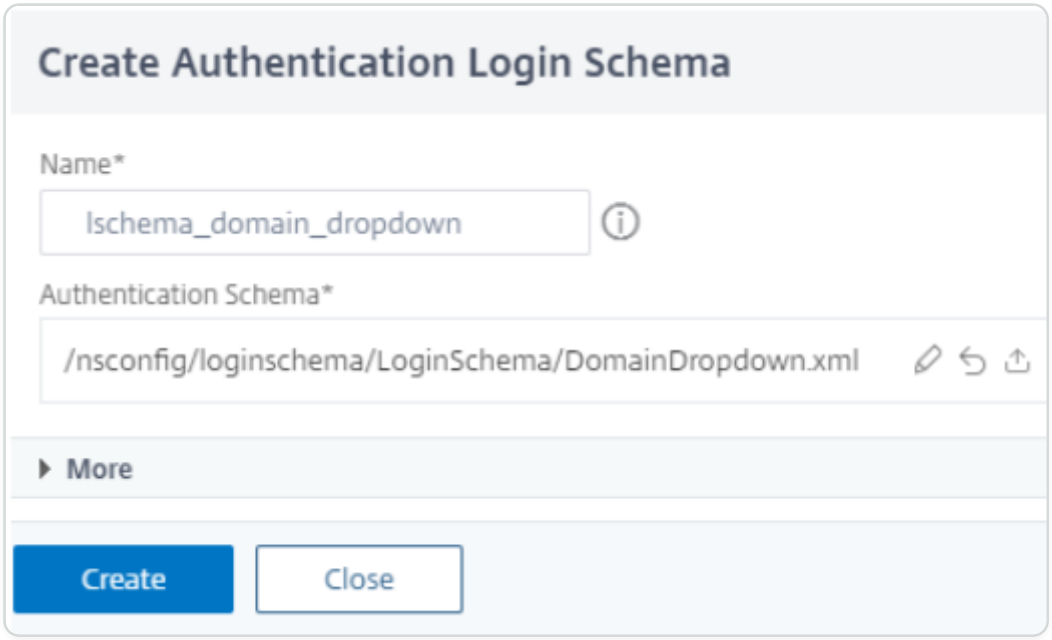


Following are the steps to configure.

1. Navigate to **Security > AAA-Application Traffic > nFactor Visualizer > nFactor Flow** and click **Add**.
2. Click the plus icon to add a factor in the nFactor Flow.

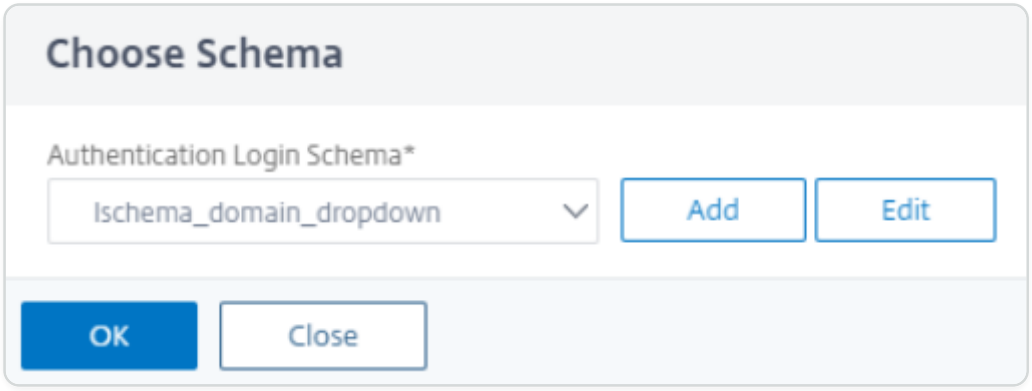


3. Enter a name for the Factor.

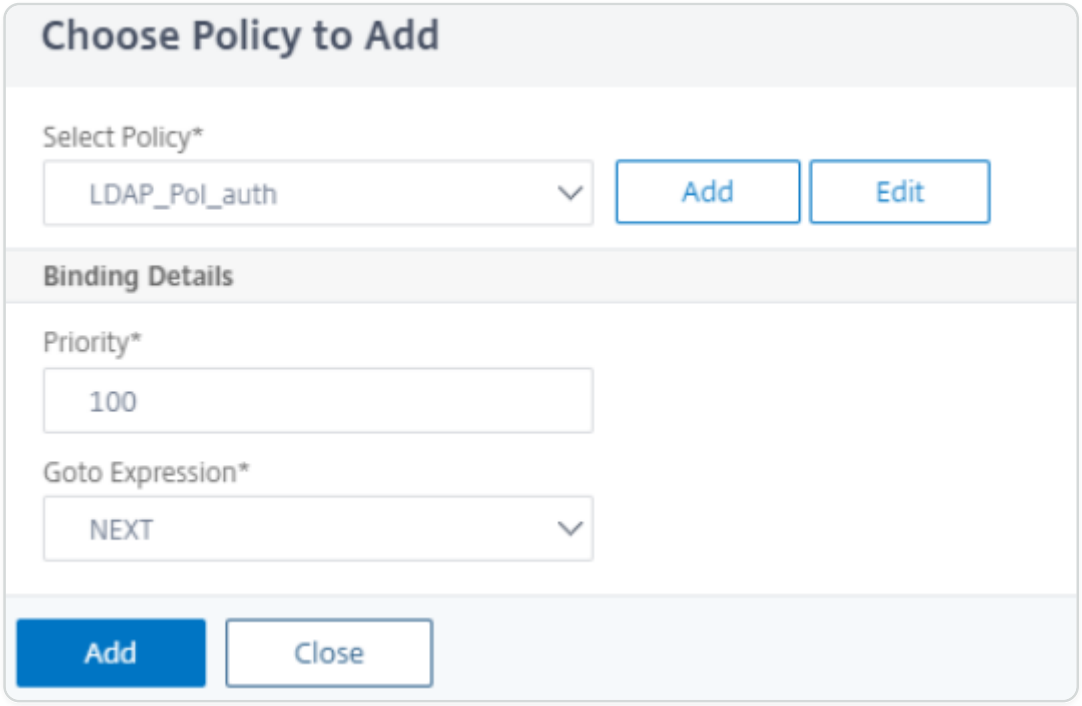


© 1997–2026 Citrix Systems, Inc. All rights reserved.

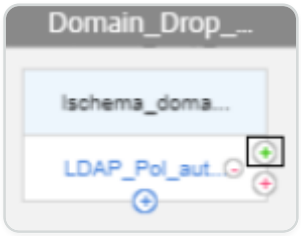
4. Add the schema for the First Factor by clicking on **Add Schema**.



5. Create a EULA_Schema by selecting the **DomainDropdown.xml** login schema.

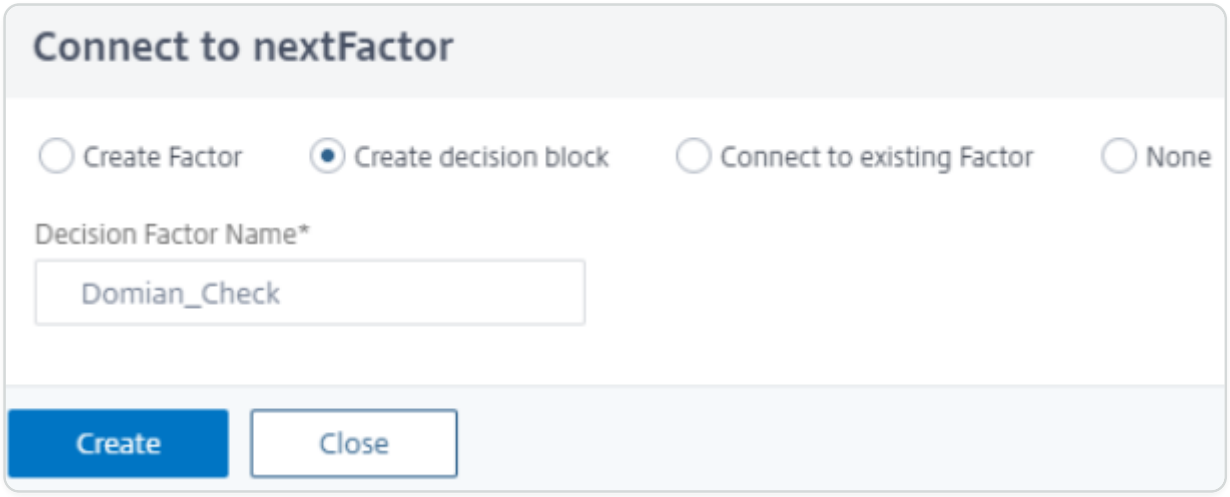


6. Choose the schema for the first factor created in step 5.

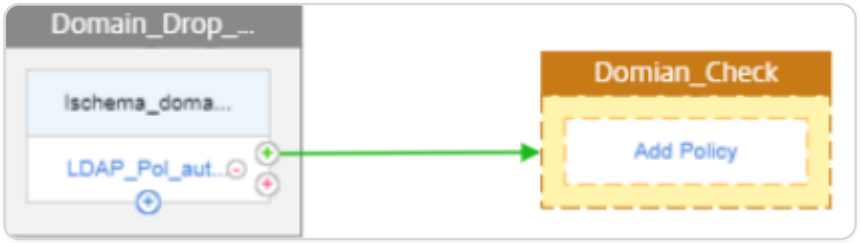


© 1997–2026 Citrix Systems, Inc. All rights reserved.

7. Click **Add Policy** and choose the LDAP Policy for first authentication.

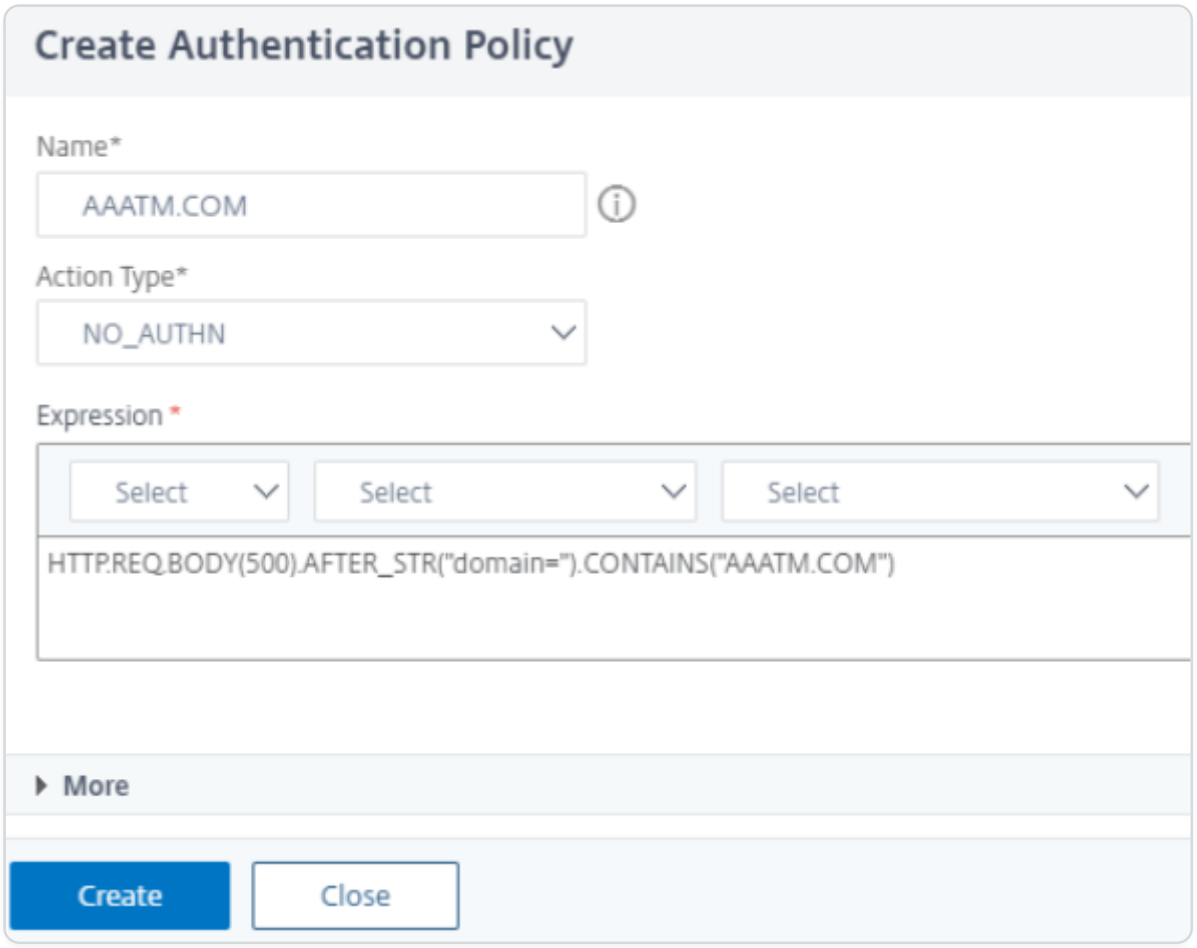


8. Click the plus icon to create a decision block.



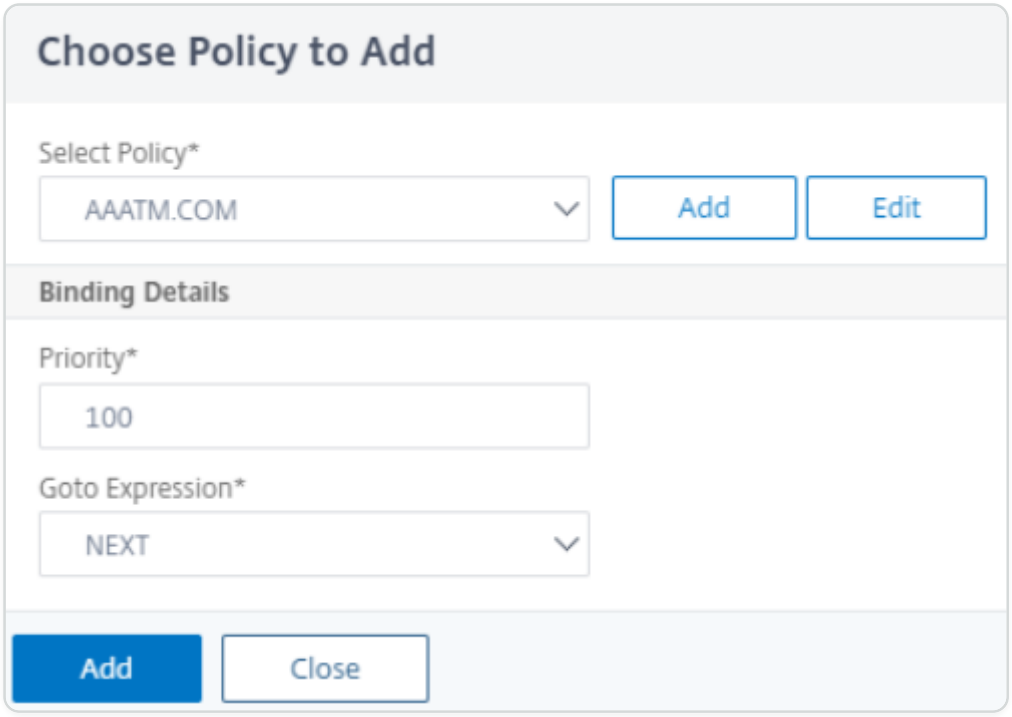
For more information on creating LDAP Authentication see, Configuring LDAP Authentication

9. Select **Create decision block** and enter a name in **Decision Factor Name** field.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

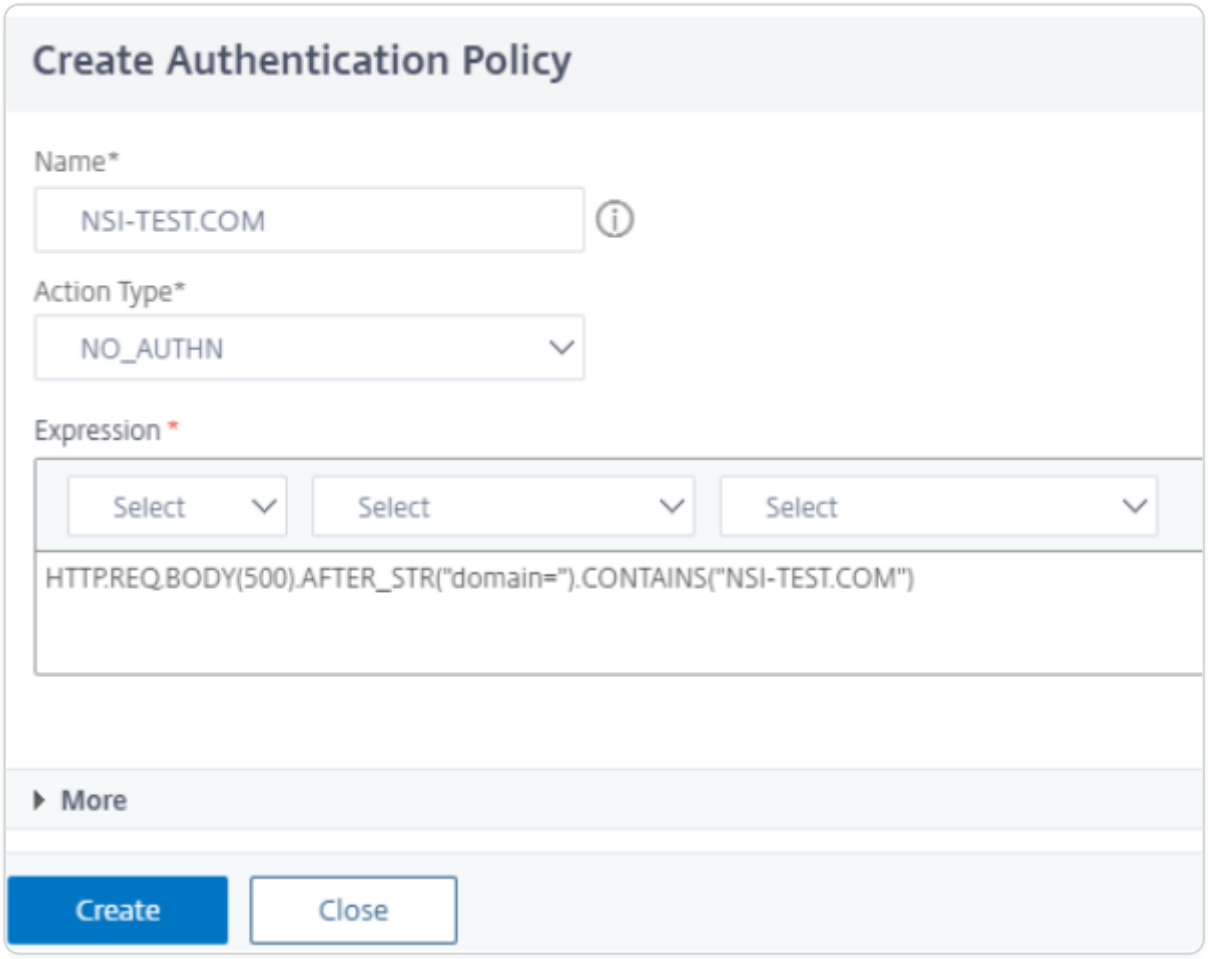
10. Click **Add Policy** to create a policy for the domain check.



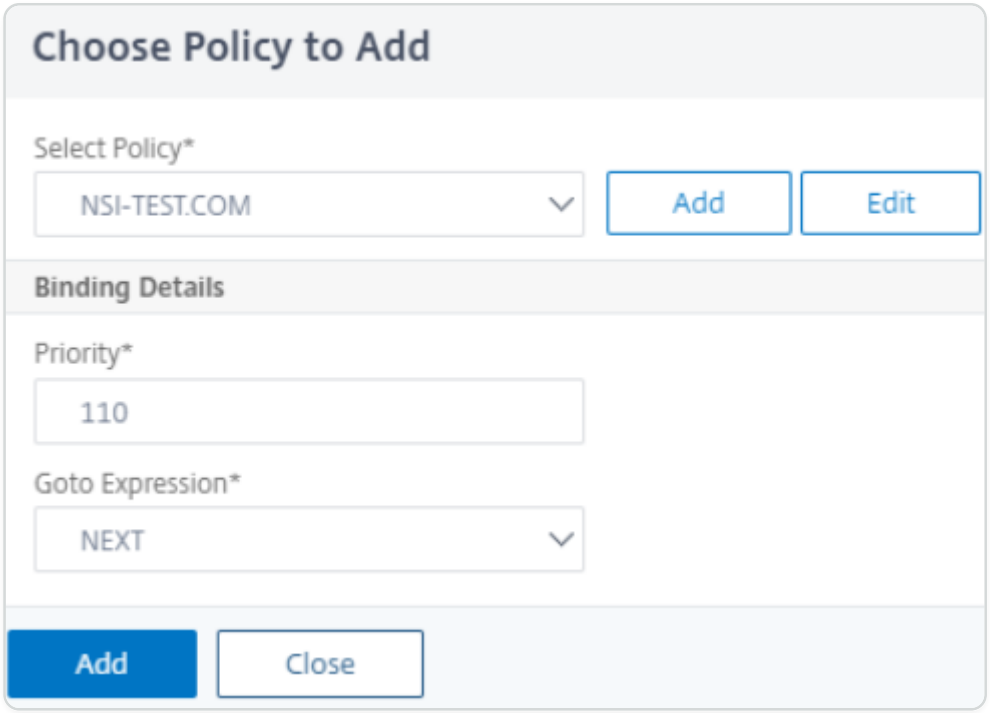
11. To create a policy to check for domain, select **NO_AUTHN** under **Action Type**.

12. Choose the previously created policy to add in decision block.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

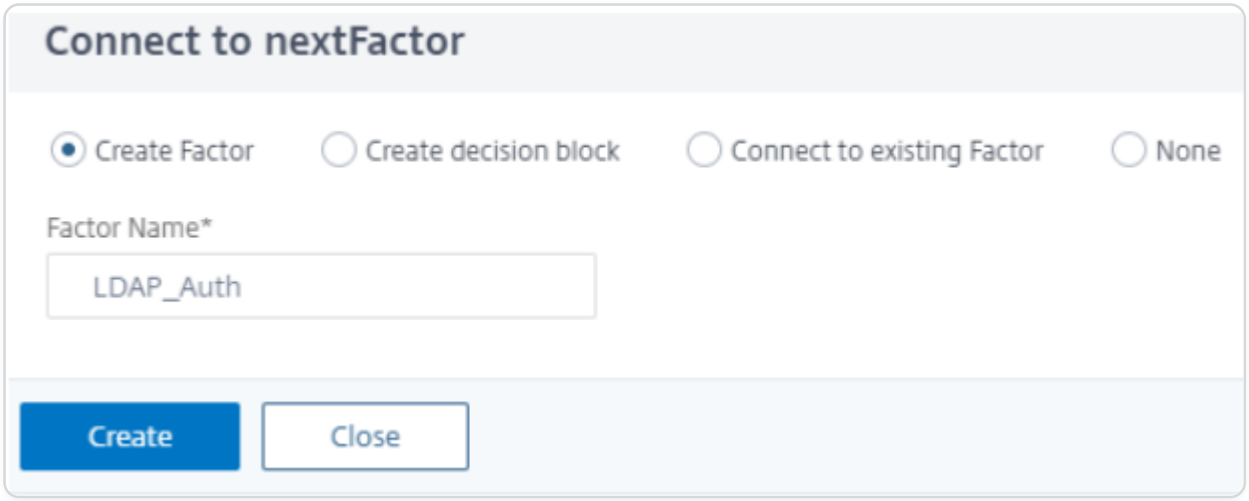


13. Click the plus icon below the newly created policy to add another policy for checking `AAATM.COM`.

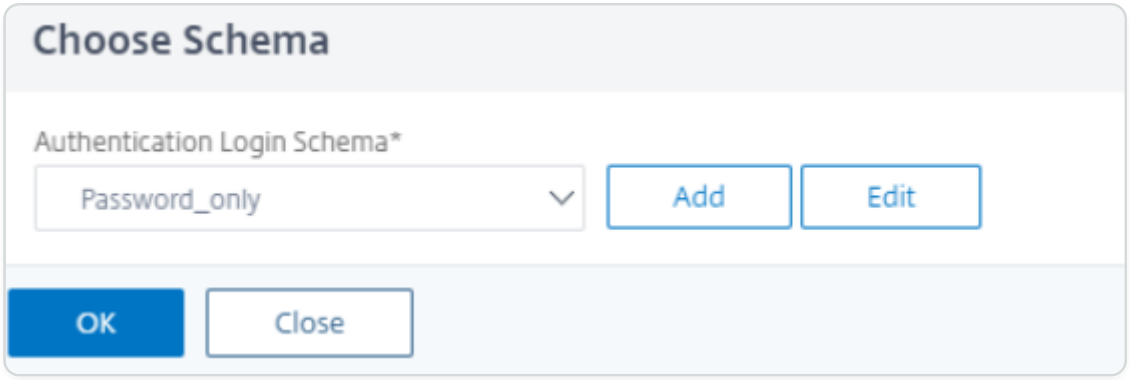


14. Create another policy to check for the second domain.

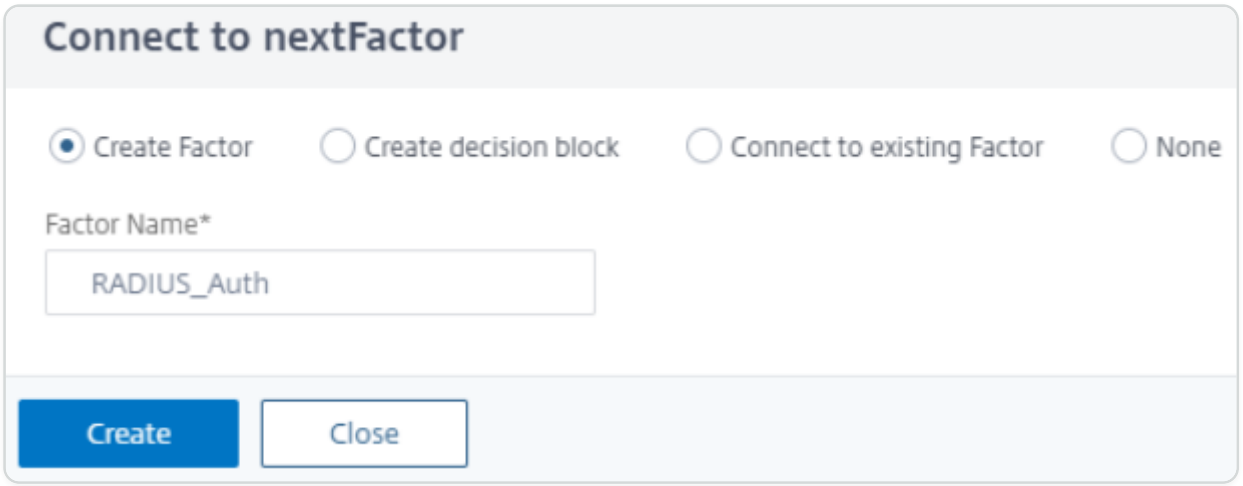
© 1997–2026 Citrix Systems, Inc. All rights reserved.



15. Choose the policy created in the previous step to add in decision block.

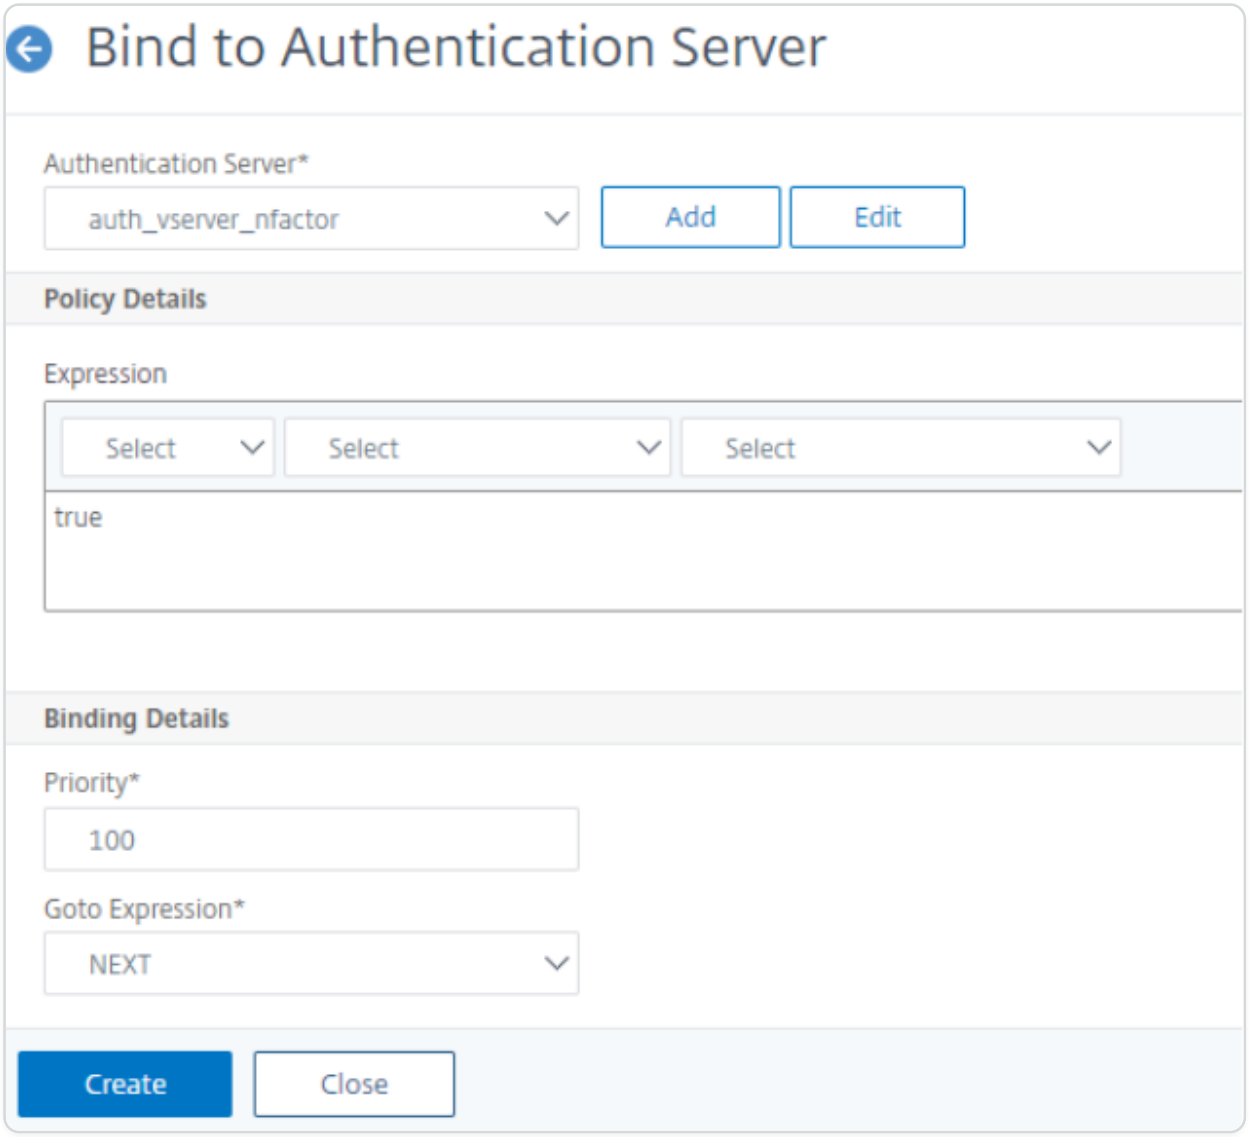


16. Select the + sign next to `AAATM.COM` to add factor that is evaluated if user is a part of `AAATM.COM`. In this case, add an LDAP Policy.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

17. Choose a schema for domain `AAATM.COM` users. In this example, password only schema is used that gives user a text field to enter the Password.



18. Follow step 7 add the policy for authenticating users of `AAATM.COM` domain
19. Select the + sign next to `NSI-TEST.COM` to add factor that will be evaluated if user is a part of `NSI-TEST.COM`. In this example RADIUS authentication menthod is used.

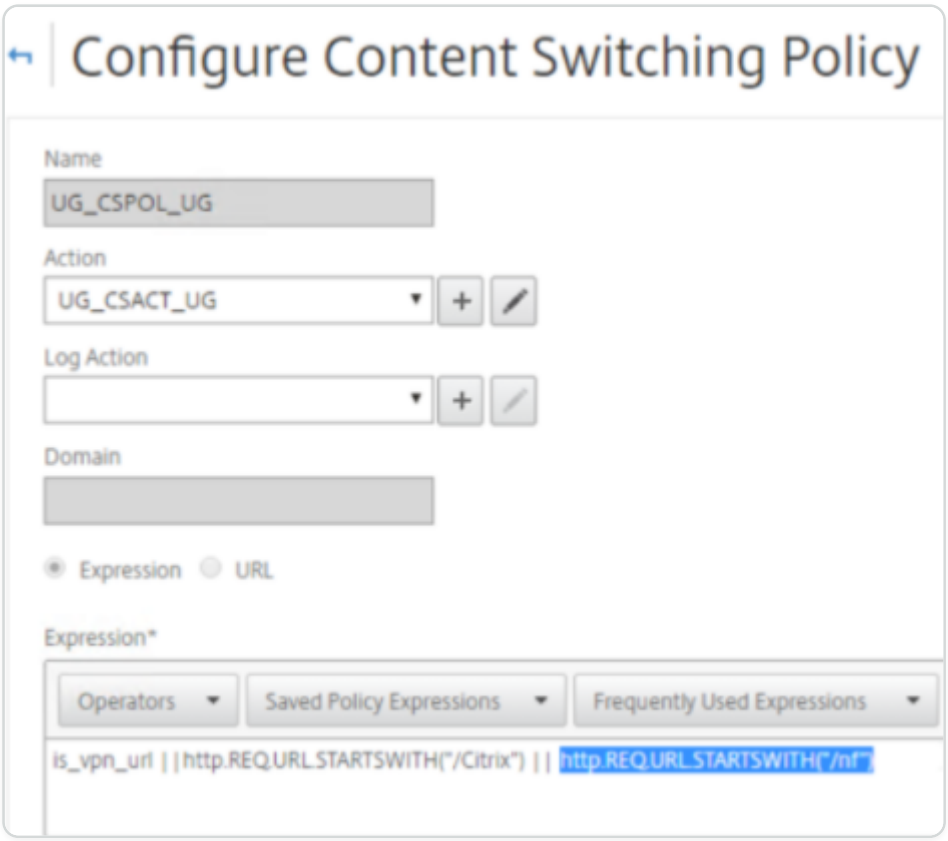
20. Follow step 17 to add a schema password only and then add the policy for RADIUS as shown in step 7.
21. Click **Done**. The configuration is saved automatically.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

22. Select the nFactor Flow just created and bind it to a AAA Virtual Server by clicking **Bind to Authentication Server** and clicking **Create**

NOTE

Bind and Unbind the nFactor Flow through the option given in nFactor Flow under Show Bindings only.



To unbind the nFactor Flow, do the following.

1. Select the nFactor Flow and click **Show Bindings**.
2. Select the Authentication VServer and click **Unbind**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE

For Login Schema to work, "/nf" is added to the Content Switching policy expression, when using Unified Gateway.

Configure domain drop-down, username, and password field in the first factor and policy evaluation based on groups in the next factor using CLI

The following configuration describes adding a TM virtual server for resource access, adding authentication virtual server for securing TM virtual server, and relevant policies for this use-case.

```
add lb vserver lbn HTTP 10.217.28.166 80 -persistenceType NONE -cltTimeout
180 -AuthenticationHost auth.nsi-test.com -Authentication ON -authnVsName
avn

add authentication vserver avn SSL 10.217.28.167 443 -AuthenticationDomain
nsi-test.com

add authentication login Schema nfactor-domain -authenticationSchema
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
domain-dropdown.xml

add authentication policylabel nfactor-domain-pol -loginSchema nfactor-
domain

add authentication Policy radius-auth -rule
"HTTP.REQ.BODY(500).AFTER_STR(\"domain=\").CONTAINS(\"NSI-TEST.COM\")"
-action &lt;RADIUS-ACTION>

add authentication Policy next_ldap -rule
"HTTP.REQ.BODY(500).AFTER_STR(\"domain=\").CONTAINS(\"AAATM.COM\")"
-action &lt;LDAP-ACTION>

bind authentication vserver avn -policy radius-auth -priority 10
-gotoPriorityExpression NEXT

bind authentication vserver avn -policy next_ldap -priority 20
-gotoPriorityExpression END
```

The following is an example used for this specific representation of logon form.

NOTE

This login Schema need not be separately configured on latest builds of NetScaler and is present as DomainDropdown.xml

```
<?xml version="1.0" encoding="UTF-8"?>
<AuthenticateResponse xmlns="http://citrix.com/authentication/response/1">

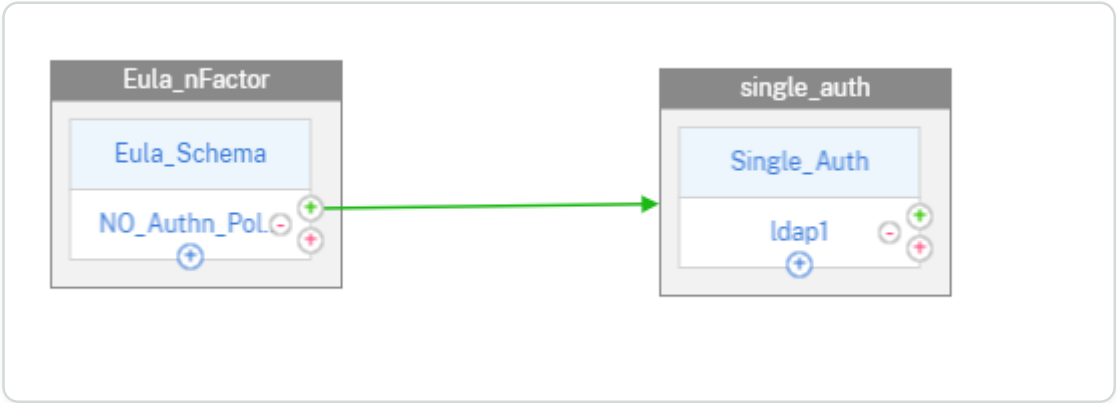
Configure EULA as an authentication factor in NetScaler nFactor system

The following figure displays an end-user logon flow with EULA. In this flow, existing first factor is moved to after the EULA. EULA becomes a first/vserver profile with previous first factor becoming a second factor.



NOTE:

This feature is available with the NetScaler Enterprise and Premium edition licenses.

nFactor flow presentation

The setup can also be created through nFactor Visualizer present in ADC version 13.0 and above.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configuration by using the CLI

1. Copy eula.xml to /nsconfig/loginschema on your NetScaler. The login schema used in this example is present in NetScaler version 13.0 and need not be created separately. For more information on the login schema, see the last section of this page.
2. Add a login schema for EULA.

```
add authentication loginSchema eulaschema -authenticationSchema
eula.xml

add authentication loginSchemaPolicy eula_schema -rule true -action
eulaschema

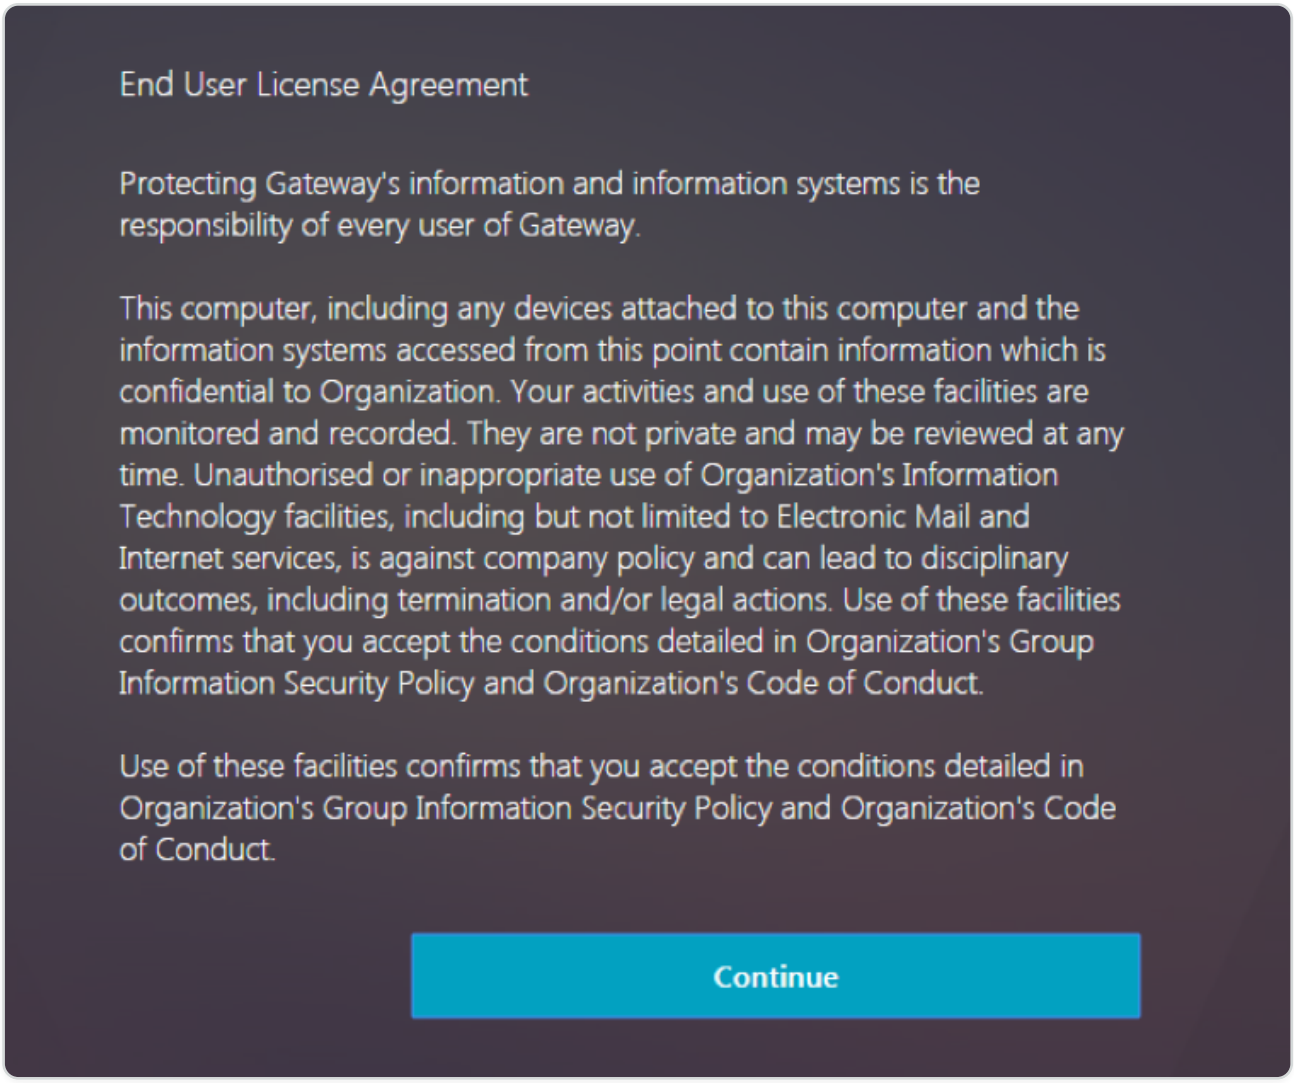
bind authentication vserver auth -policy eula_schema -priority 5
```

3. Add authentication factor as a secondary factor.

```
add authentication loginSchema single_auth -authenticationSchema
"LoginSchema/SingleAuth.xml"

add authentication policylabel single_factor -loginSchema single_auth

bind authentication policylabel single_factor -policyName ldap-adv
-priority 5
```



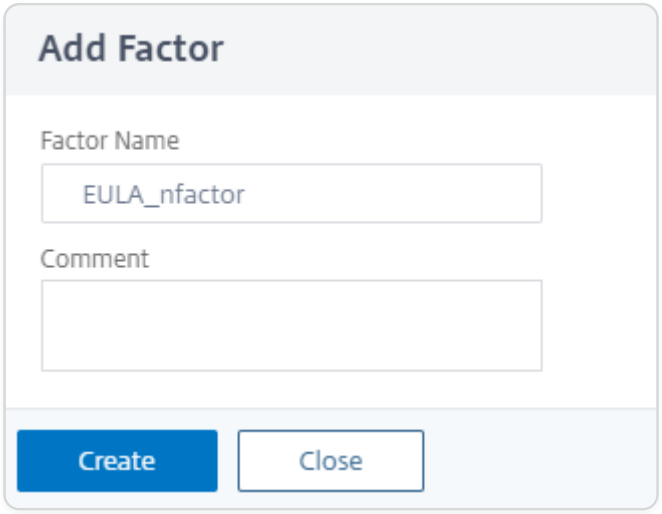
4. Add no-auth policy at the virtual server cascade.

```
add authentication Policy noauth_pol -rule "http.req.url.contains(\"/
nf/auth/doAuthentication.do\")" -action NO_AUTHN
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

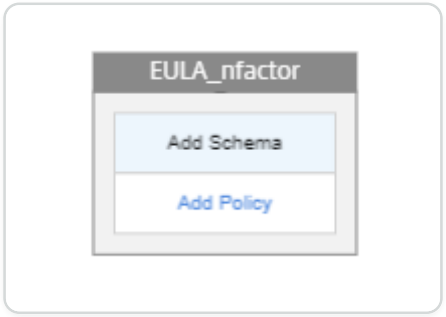
```
bind authentication vserver auth -policy noauth_pol -priority 1
-nextFactor single_factor -gotoPriorityExpression NEXT
```

The following screen capture is of the EULA that is configured at virtual server as a factor.

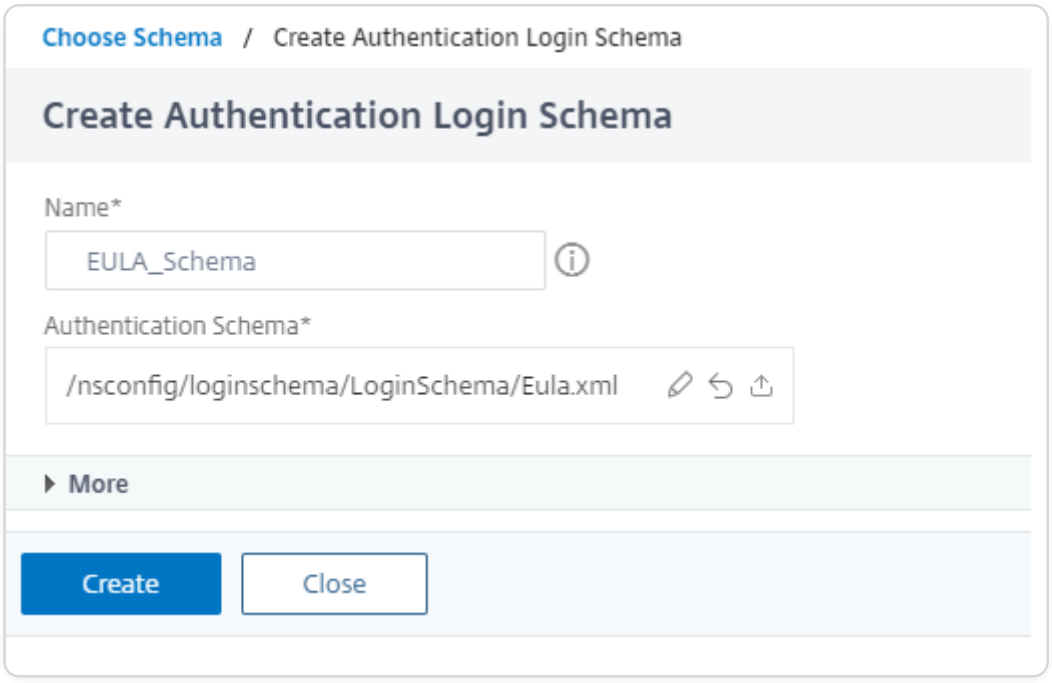


Configuration by using the nFactor Visualizer

1. Navigate to **Security** > **AAA-Application Traffic** > **nFactor Visualizer** > **nFactor Flow** and click **Add.**
2. Click the **+** sign to add the nFactor flow.

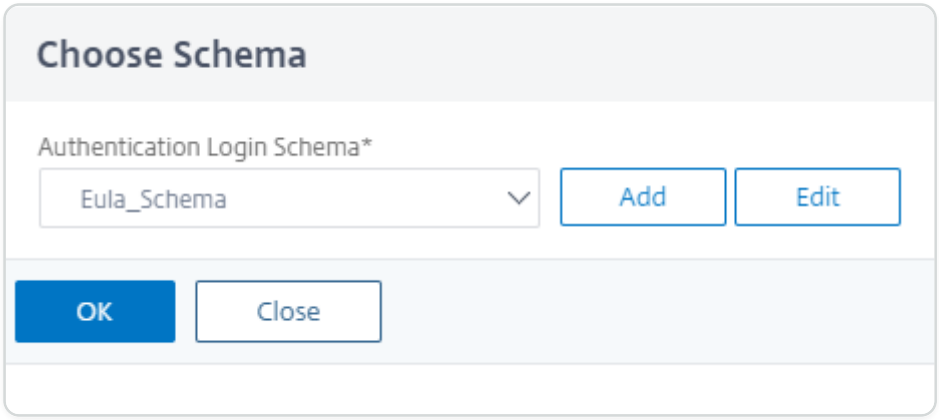


© 1997–2026 Citrix Systems, Inc. All rights reserved.

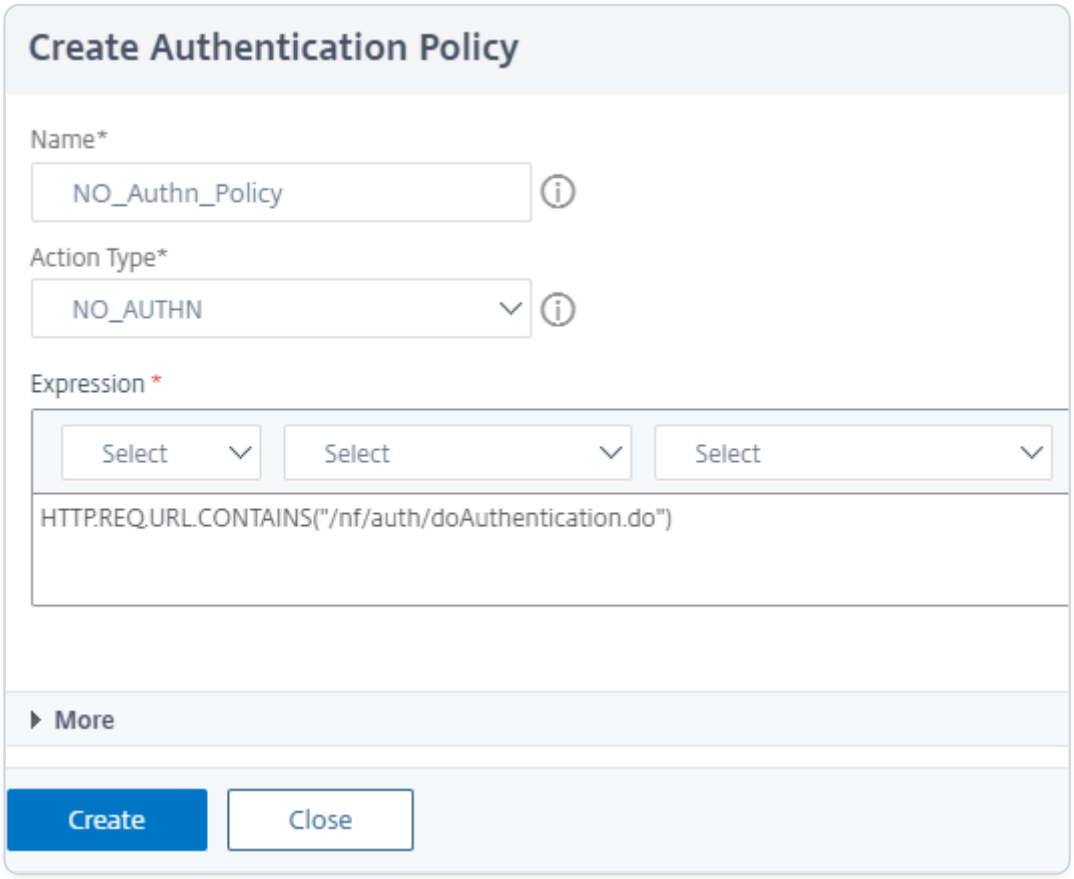


3. Add a factor. The name that you enter is the name of the nFactor flow.

4. Click **Add Schema** to add a schema for the first factor and then click **Add**.

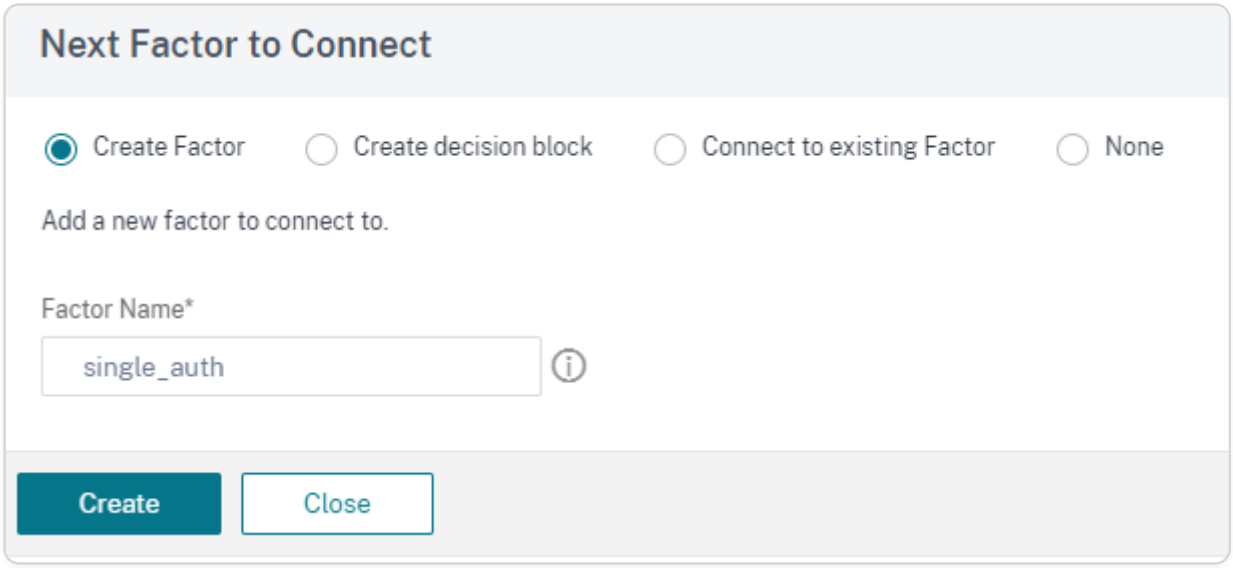


5. Create a EULA_Schema by selecting the eula.xml login schema.

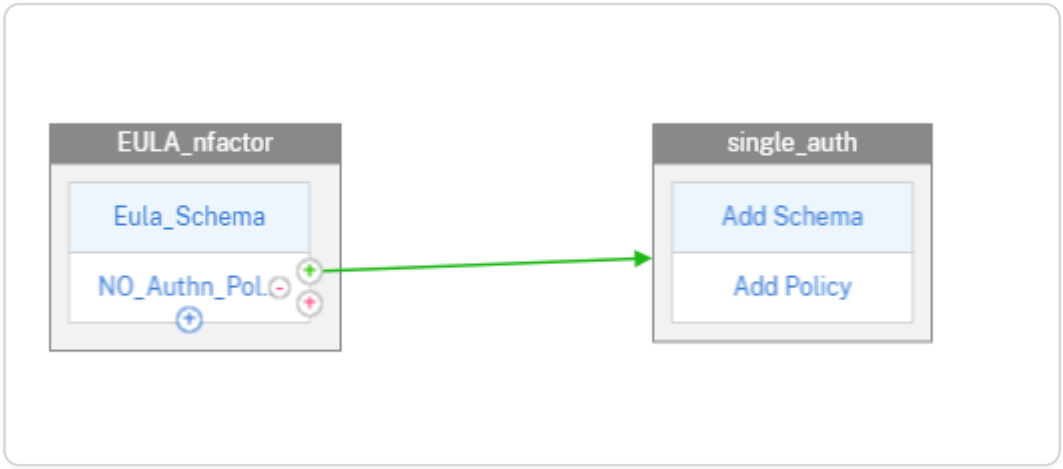


6. Choose the schema for first factor, that is the EULA.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

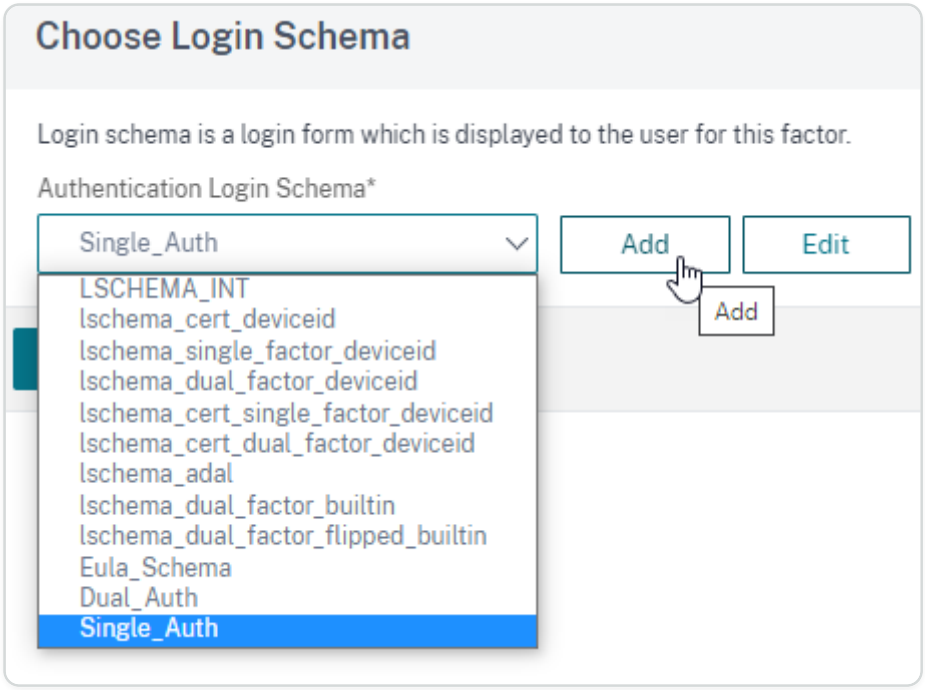


7. Click **Add Policy** to create an authentication Policy for NO_AUTHN and then click **Add**.

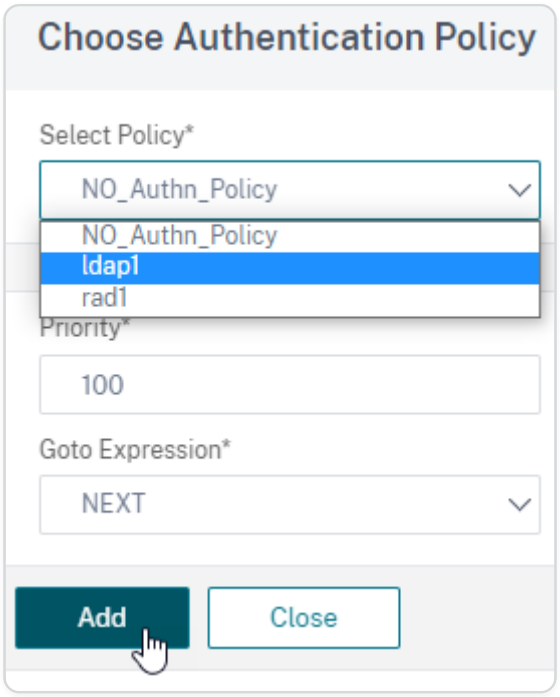


8. Click the green **+** sign add the next factor, that is single_auth.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

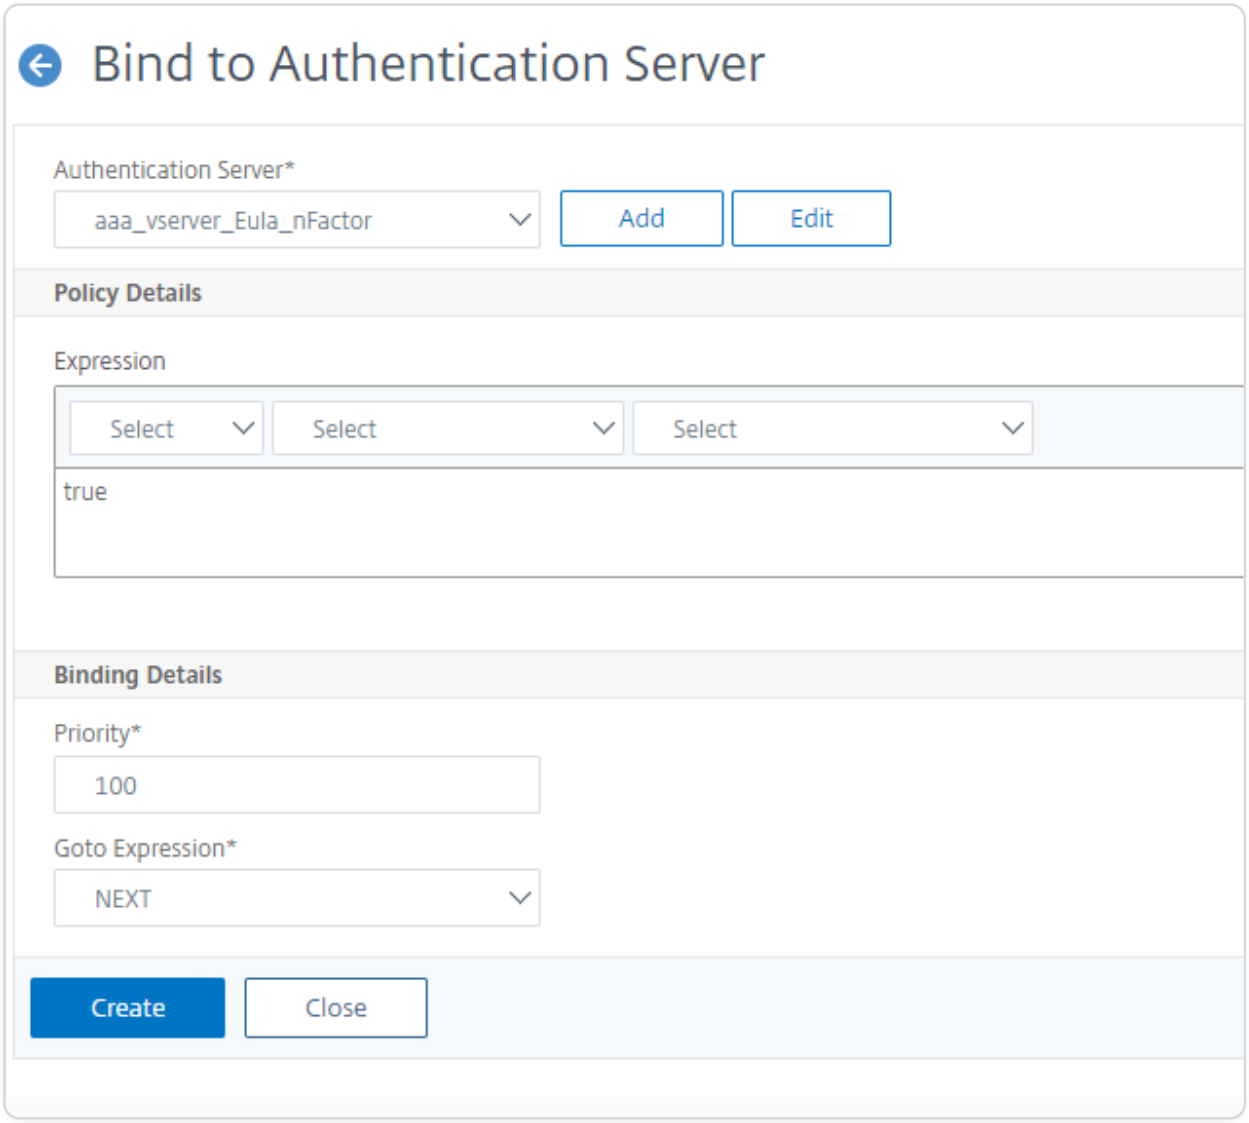


9. Click **Add Schema** again to add a schema for the second factor and then click **Add**.



10. Create a single_auth schema by selecting the Single_Auth.xml login schema and then click **Create.**

© 1997–2026 Citrix Systems, Inc. All rights reserved.

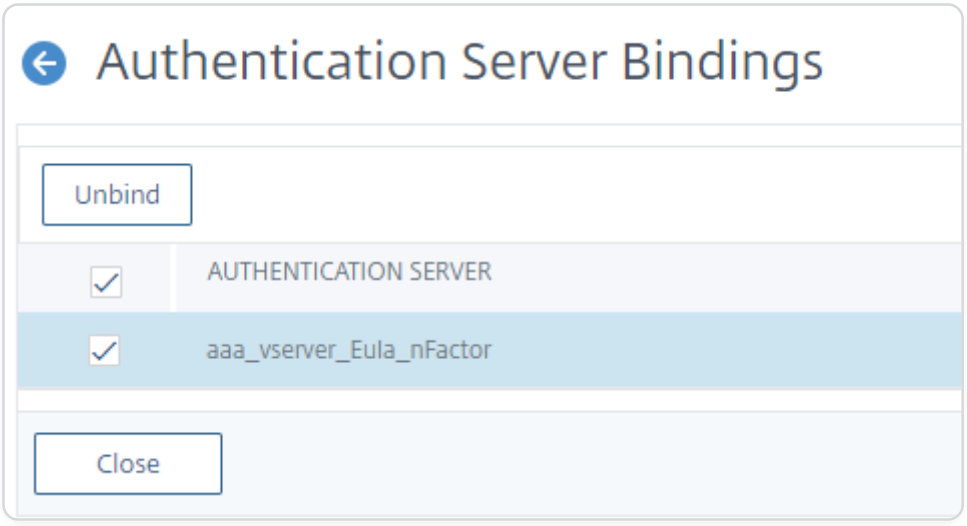


11. Click **Add Policy** to select a policy for LDAP authentication and then click **Add**.

For details about creating LDAP authentication see, Configuring LDAP Authentication.

12. Click **Done** The configuration is saved.
13. Click **Bind to Authentication Server**, select the nFactor flow just created to bind the flow to an authentication, authorization, and auditing virtual server and then click **Create.**

© 1997–2026 Citrix Systems, Inc. All rights reserved.



Note: Bind and Unbind the nFactor flow through the option given in nFactor flow under **Show Bindings** only.

To unbind the nFactor flow

1. Select the nFactor flow and click **Show Bindings**.
2. Select the authentication virtual server to which the nFactor flow is bound and click **Unbind**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Login schema used in this example

When copying text from web browser, certain quotes are rendered differently. It is recommended that you copy the schema in a text editor to normalize quotes.

Note: This login Schema is present in NetScaler version 13.0 and need not be created separately.

```
<?xml version="1.0" encoding="UTF-8"?>

Configure nFactor for applications with different login site requirements including step-up authentication

Usually, a NetScaler Gateway allows access to multiple applications. Depending on the security requirements, they can have different authentication mechanism. Some applications might only need a single factor like a common intranet. Other applications like; SAP or HR tools with more

© 1997–2026 Citrix Systems, Inc. All rights reserved.

critical data must have at least a multifactor authentication. However, the most users access only intranet, so multi-factor for all applications is not the right choice.

This topic describes how to change login mechanism dynamically based on the needs of the user who wants to access the application. Also, describe the steps to set up authentication.

Prerequisites

Before you configure the NetScaler Gateway, review the following prerequisites.

- NetScaler Advanced license edition.
- NetScaler feature release version is 11.1 and later.
- LDAP server.
- RADIUS server.
- Public IP address.

In the configuration example, you use two applications with the following authentication requirements.

- Web application green
  - Requirement - user name + LDAP password
- Web application red
  - Requirement - user name + LDAP password + RADIUS pin

NOTE

Next to LDAP and RADIUS, you can use other authentication methods like, user certificates, TACACS, or SAML is possible.

Basic setup

1. Add none addressable load balancing virtual servers and services for both web applications.
   - Load balancing virtual servers

Name	State	Effective State	IP Address	Port	Protocol
lbv-lin-web-green	UP	UP	0.0.0.0	0	HTTP
lbv-lin-web-red	UP	UP	0.0.0.0	0	HTTP

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Services

Name	State	IP Address/Domain Name	Port	Protocol
lbs-lin-web-green	UP	10.	80	HTTP
lbs-lin-web-red	UP	10.	80	HTTP

2. Add basic none addressable authentication, authorization, and auditing virtual server for logon. No need of more configuration at this moment.

Name	State	IP Address	Port	Protocol
aaa-stepUp	UP	0.0.0.0	0	SSL

3. Add Content Switching virtual server of type SSL with public IP. On this IP address, you need DNS records for each application that you want to access and for authentication, authorization, and auditing virtual server as well. In this example, you use the following DNS names:

   - green.lab.local - Application Green
   - red.lab.local -> Application Red
   - aaa.lab.local -> authentication, authorization, and auditing virtual server

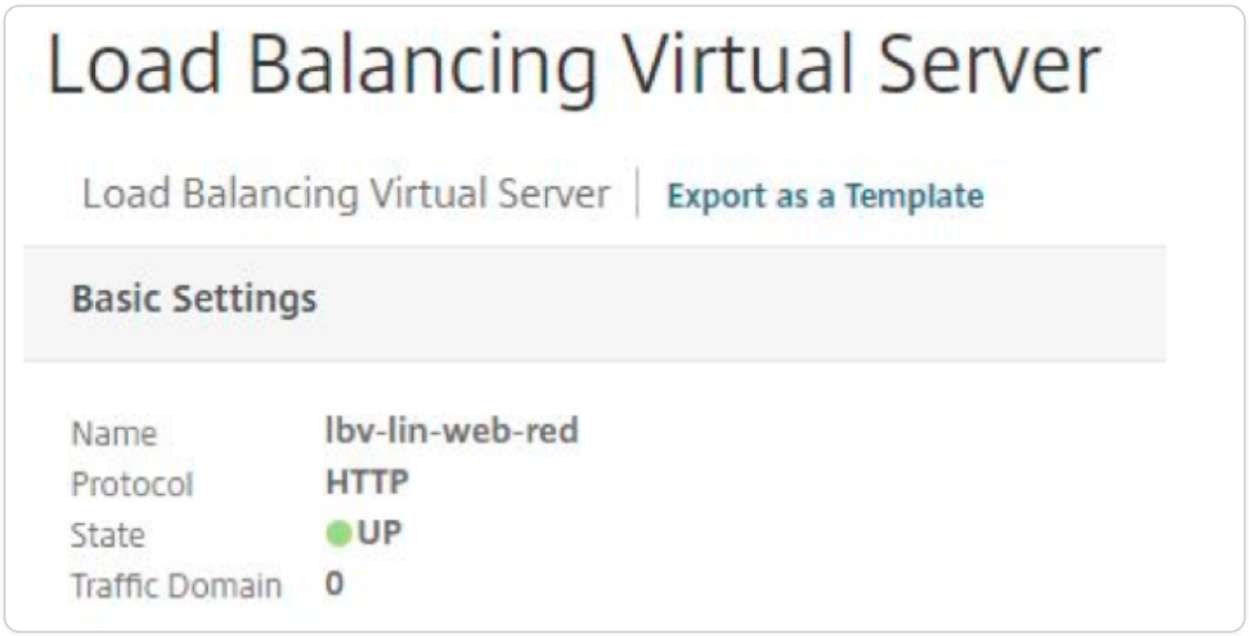
NAME	STATE	IP ADDRESS	PORT	PROTOCOL
csv-stepUp	UP	10.106.	443	SSL

   - Bind an SSL certificate with matching CN or SAN for all DNS records.

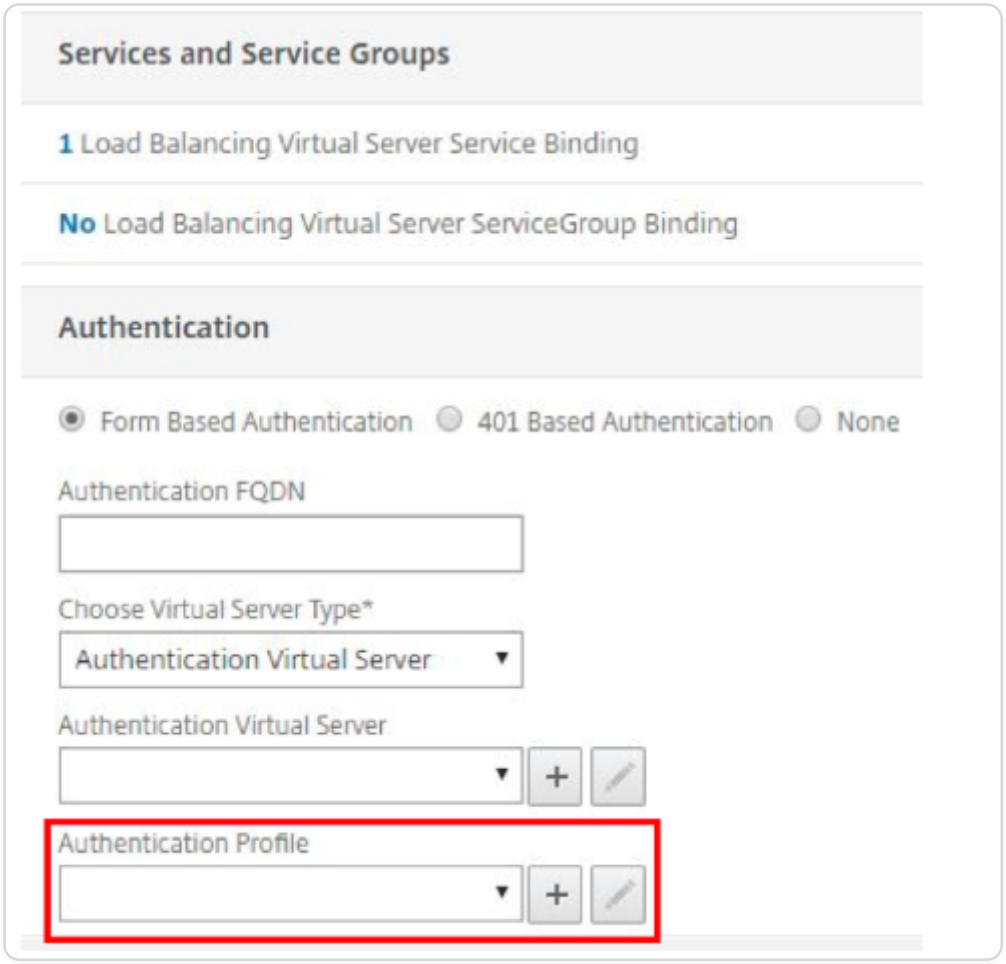
4. Add content switch policies to the virtual server. One for each application, which must match the individual host name. This is how the NetScaler determines which application the user wants to access. In addition, add another policy for authentication, authorization, and auditing with expression "true".

Name	Action	Log Action	URL	Expression
csp-green	csa-green			HTTP.REQ.HOSTNAME.CONTAINS("green")
csp-red	csa-red			HTTP.REQ.HOSTNAME.CONTAINS("red")
csp-aaa	csa-aaa			true

5. Ensure the authentication, authorization, and auditing policy has the highest priority. Otherwise, it would not be possible to access the applications.
6. Add content switch actions for each policy pointing on the matching virtual server. In this example on each load balancing virtual server and one authentication virtual server.



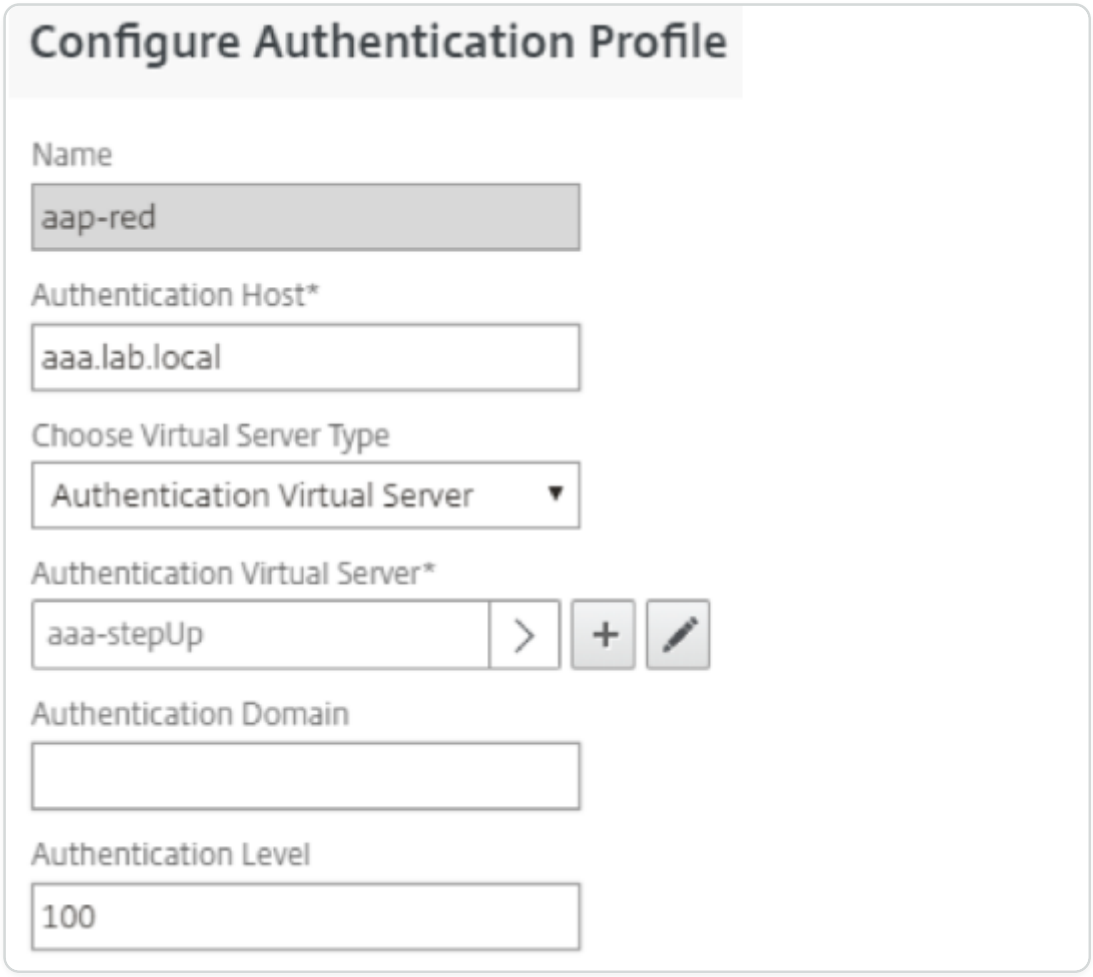
© 1997–2026 Citrix Systems, Inc. All rights reserved.



Authentication level configuration

After completing the basic virtual servers and content switching setup, you enable the authentication and doing the strong or weak definition for your applications.

1. Navigate to **Load Balancing Virtual Server** for application Red and enable "Form Based Authentication". And add an authentication profile.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

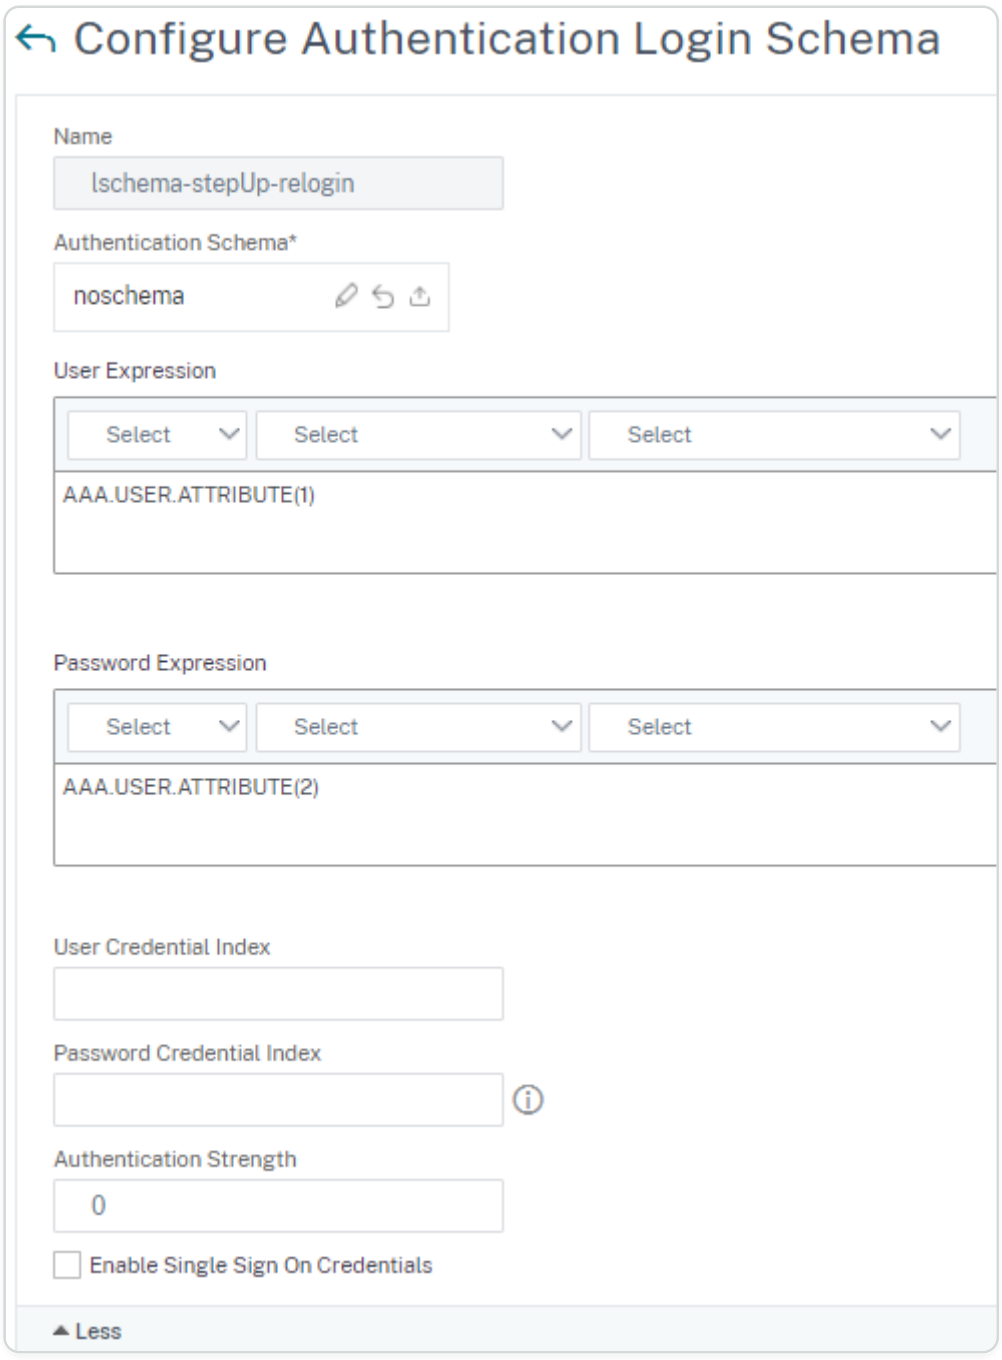
2. Enter the defined authentication, authorization, and auditing virtual server host name for redirection when a user wants to access the application, and has no existing session.
3. Choose authentication virtual server as type and bind authentication, authorization, and auditing virtual server.
4. Define an authentication level to configure whether an application is stronger or weaker than another. A session at the given level of 100 can access virtual servers with a lower level without reauthenticating. On the other hand, this session is forced to authenticate once again if the user tries to access a virtual server with a higher level.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

5. Repeat step 1–4 with application Green.
6. Navigate to **Security > AAA - Application Traffic > Authentication Profiles** to add Authentication Profile.

Name	State	Effective State	IP Address	Port	Protocol
lbv-lin-web-green	UP	UP	0.0.0.0	0	HTTP
lbv-lin-web-red	UP	UP	0.0.0.0	0	HTTP

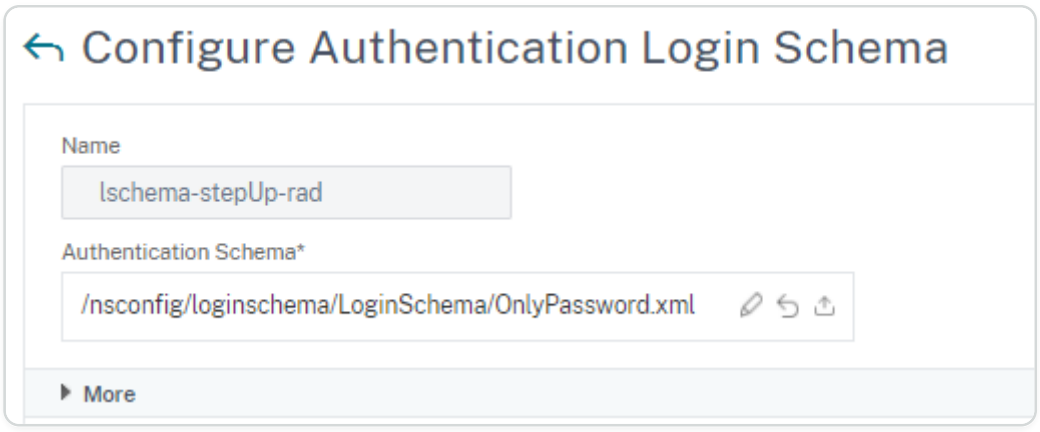
One profile for each application, both pointing on the authentication, authorization, and auditing virtual server host name. In the example, application Red is stronger (Level 100) than application Green (Level 90). Means a user with an existing session for Red can access Green without reauthentication. The other way around a user who accessed Green at first must reauthenticate for application Red.



nFactor configuration for multifactor authentication

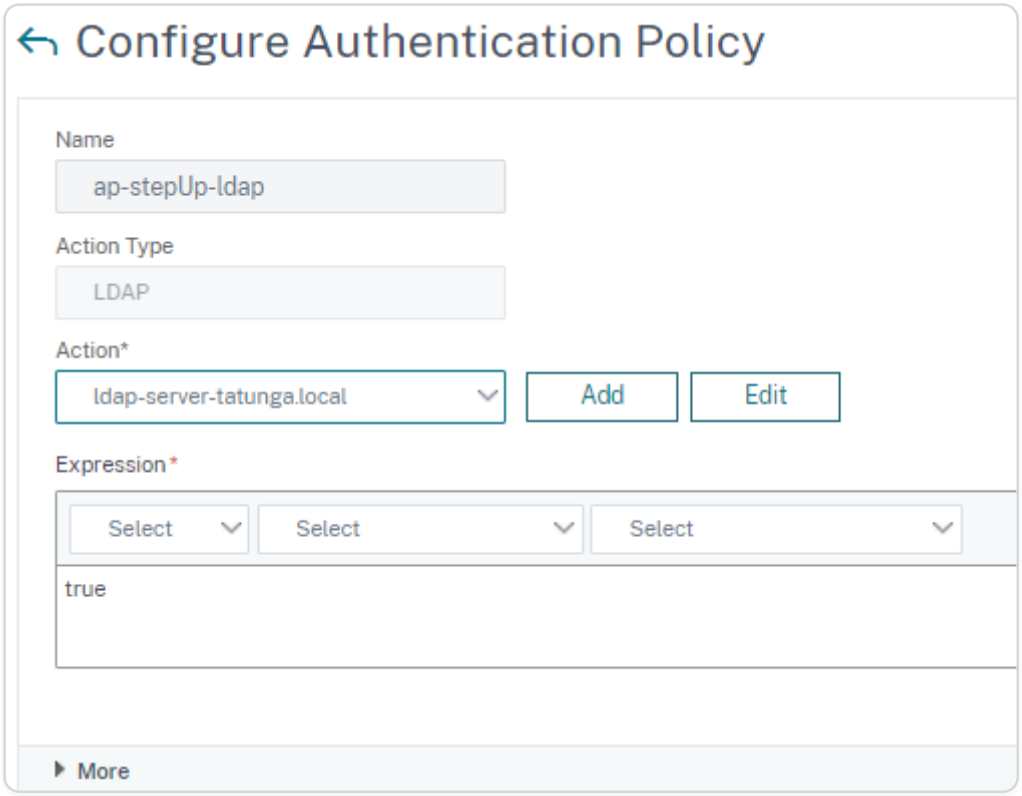
1. Navigate to **Security > AAA - Application Traffic > Login Schema > Profiles** to add three login schemas and to achieve the needed NetScaler logon page.
   - Schema for normal LDAP authentication

© 1997–2026 Citrix Systems, Inc. All rights reserved.



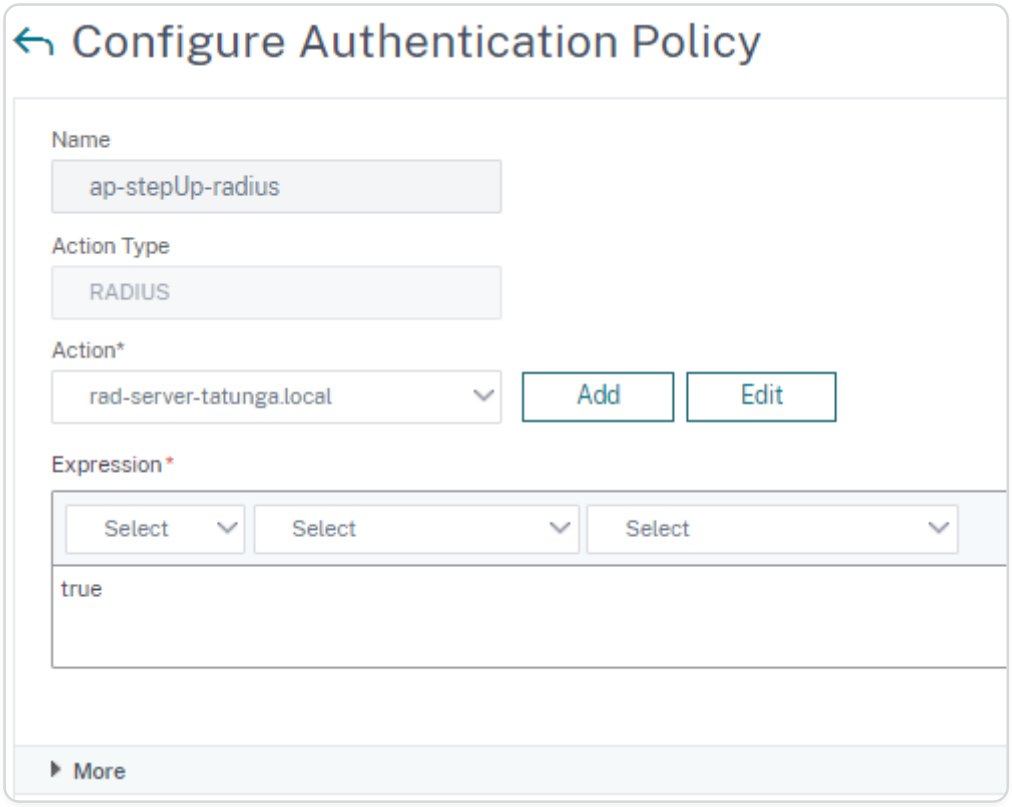
- Select SingleAuth XML to present the two fields. One for user name and the second for LDAP password.
- Ensure to save user name at index 1 and password at index 2. This is important for doing LDAP reauth, when a user is accessing application Red after application Green.

- Schema for LDAP reauthentication
  - Select "noschema" because the user does not see the process of LDAP reauthentication.
  - Populate User and Password expression with the attribute fields that you defined in the first schema.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

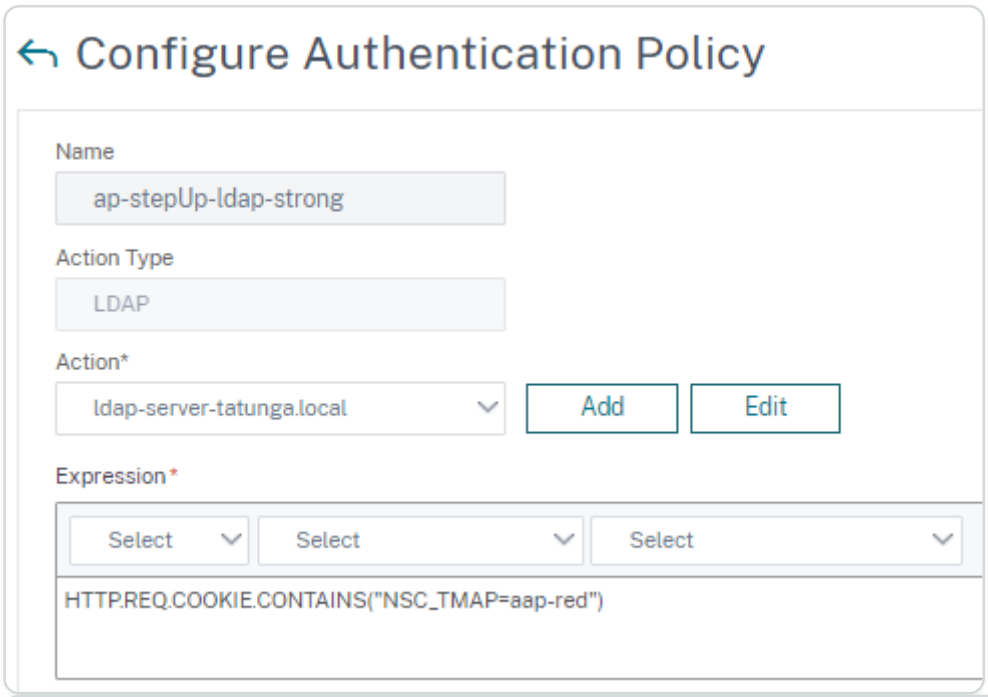
- Schema for RADIUS authentication
  - Select "OnlyPassword XML" to present only one field for RADIUS pin. User name is not necessary due to first LDAP login.



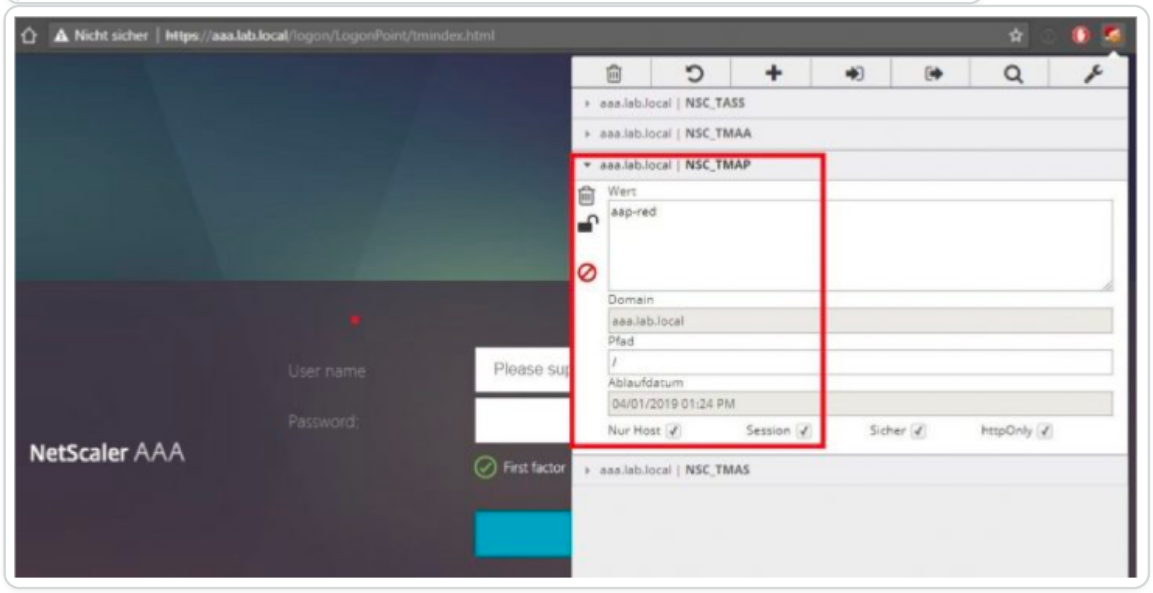
2. The next step is to add all needed Authentication Policies to control the behavior of our login mechanism. Navigate to **Security > AAA - Application Traffic > Policies > Authentication > Policy**.
   - Add default LDAP policy with required LDAP server.

   - Add default RADIUS policy with required RADIUS server.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

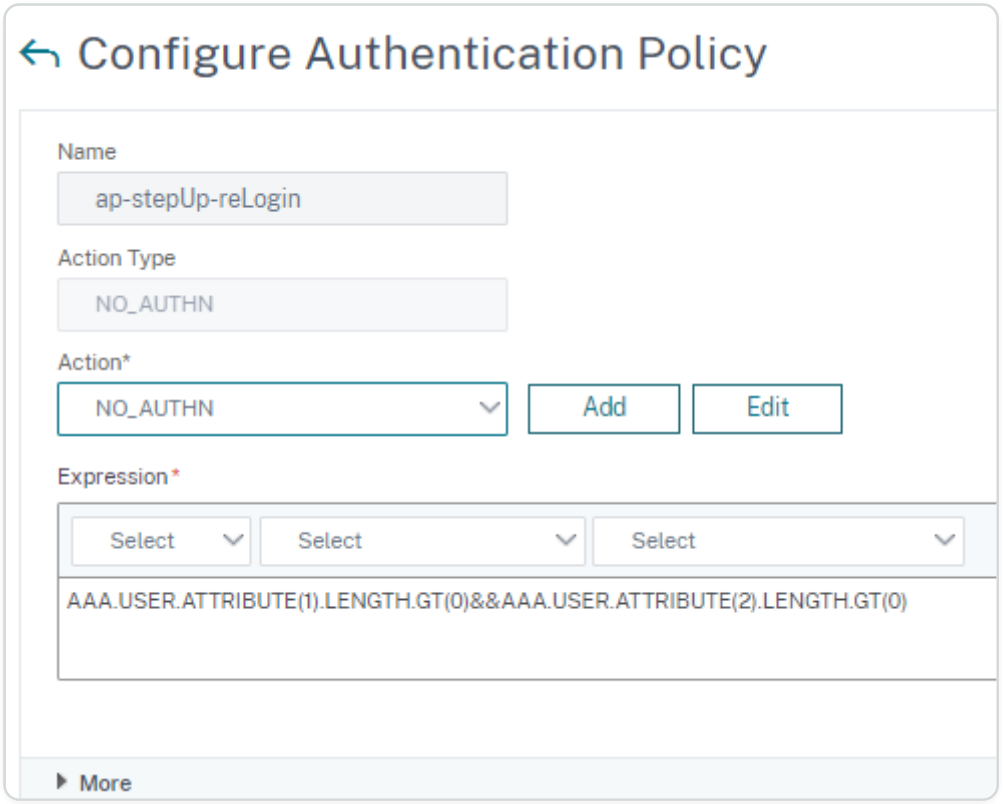


- Add a third authentication policy with action type "NO_AUTH" and expression "true". This policy will have no effect than bridging to the next factor.



- Fourth policy evaluates whether a user wants to access the stronger application Red or not. This is important to do a multifactor authentication for Red.
    - Select "LDAP" as action type and choose your LDAP server.

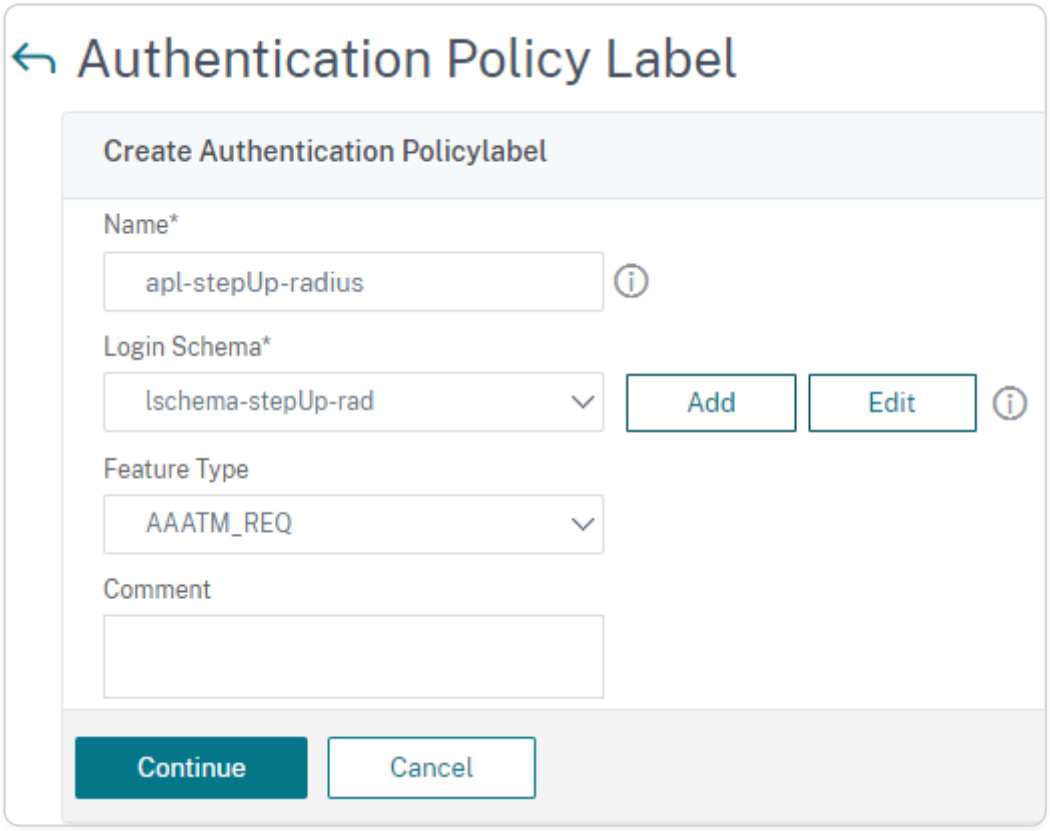
© 1997–2026 Citrix Systems, Inc. All rights reserved.



- The expression evaluates whether it is application Red by checking the cookie NSC_TMAP. The user issues this cookie by accessing the NetScaler logon site and contains the name of the authentication profile bound to the accessed load balancing virtual server.

- Last policy checks whether the user has saved credentials from a first weaker login. This is important for automatic LDAP relogin when a user at first accessed the weaker application and now wants to start the stronger one.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

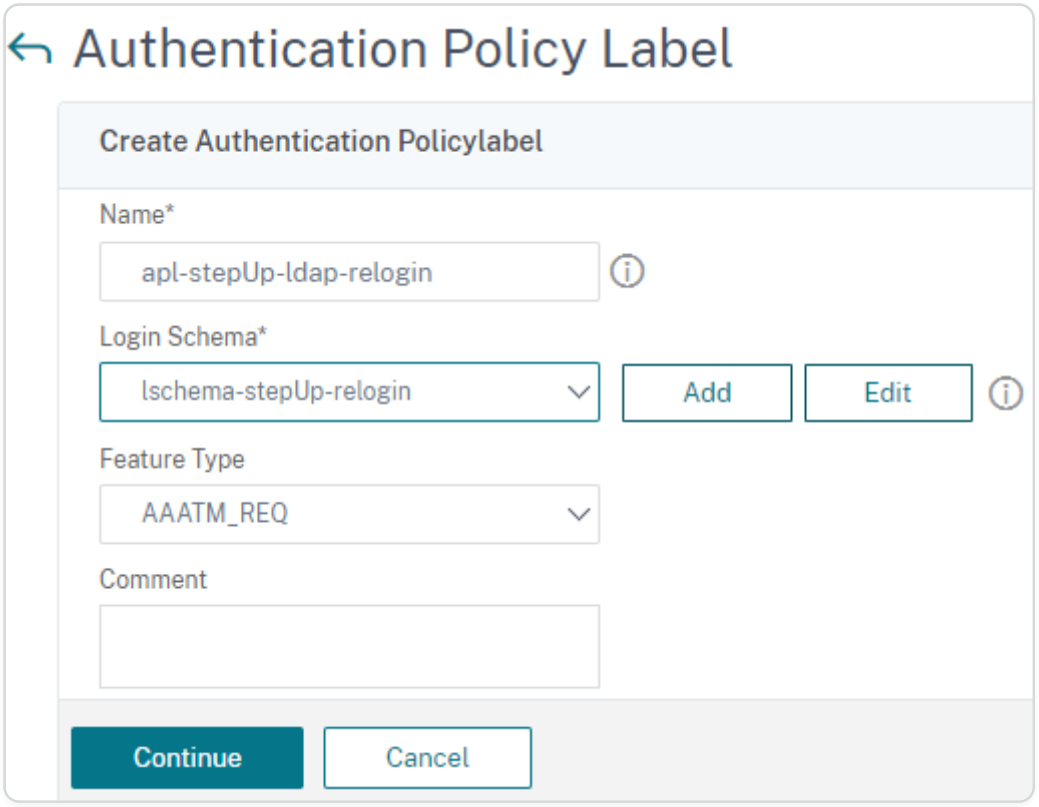


3. You add some policy labels for binding all the preceding Authentication Policies and Login Schemas. Navigate to **Security > AAA - Application Traffic > Policies > Authentication > PolicyLabel**.

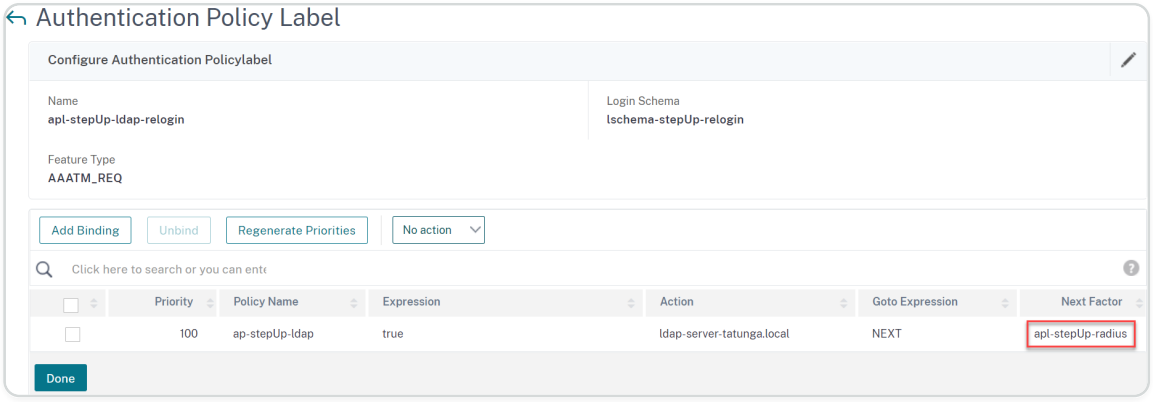
    - At first, start with the label for RADIUS authentication.

        - Give an appropriate name for the label, and select the earlier schema for RADIUS and click **Continue**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

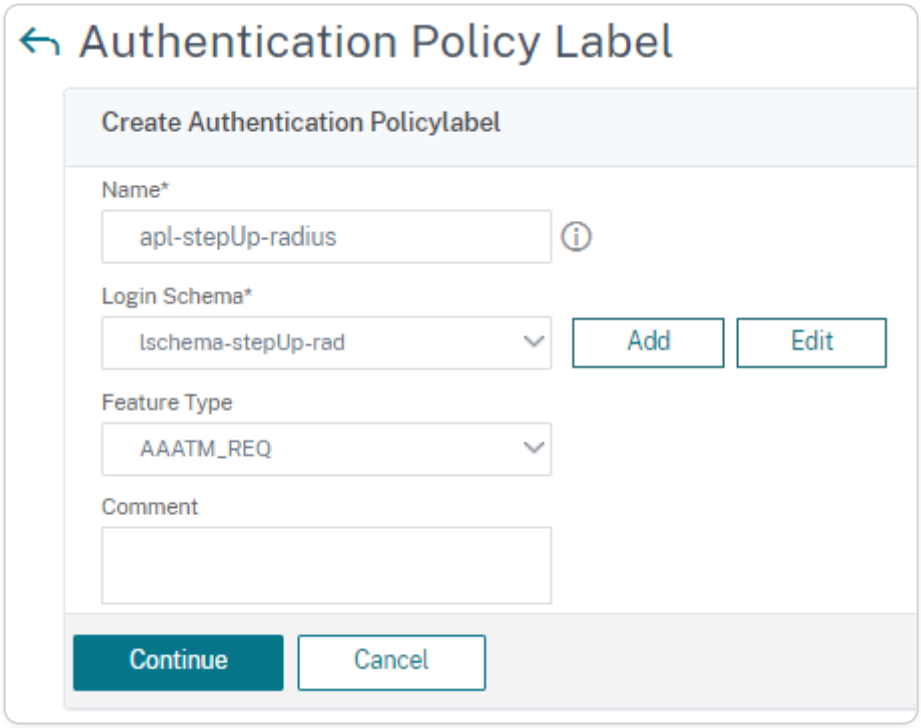


- Last step for this label is to bind the default RADIUS authentication policy.



- The second label does the LDAP relogin.
  - Add the label and bind the relogin schema.

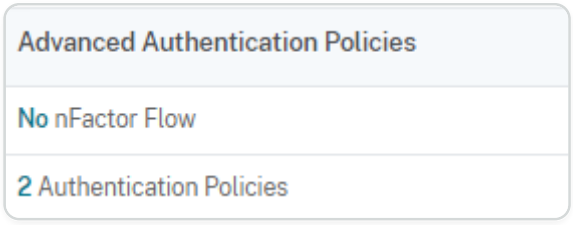
© 1997–2026 Citrix Systems, Inc. All rights reserved.



- Bind the LDAP authentication policy and set the RADIUS Policy Label as next factor.

- Add the last label for first LDAP authentication.
  - Select the appropriate schema and click **Continue**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



- Bind the first policy for strong authentication and set Goto Expression to "End". Select the RADIUS policy label as next factor.
- Second policy is for weak Green authentication without RADIUS.
- Ensure the priority of the binding.

- Configure authentication, authentication, and auditing. Navigate to **Security > AAA - Application Traffic > Virtual Servers**.
  - Open the previously added virtual server and set the favored **Portal Theme**.

  - Bind the last two remaining authentication policies directly at the virtual server.

  - Bind relogin policy with "NO_AUTH" and LDAP relogin policy label as next factor. This is for doing the automatic LDAP reauth with an existing session.
  - Set second policy to bridge directly to next factor LDAP when no session is existed before.

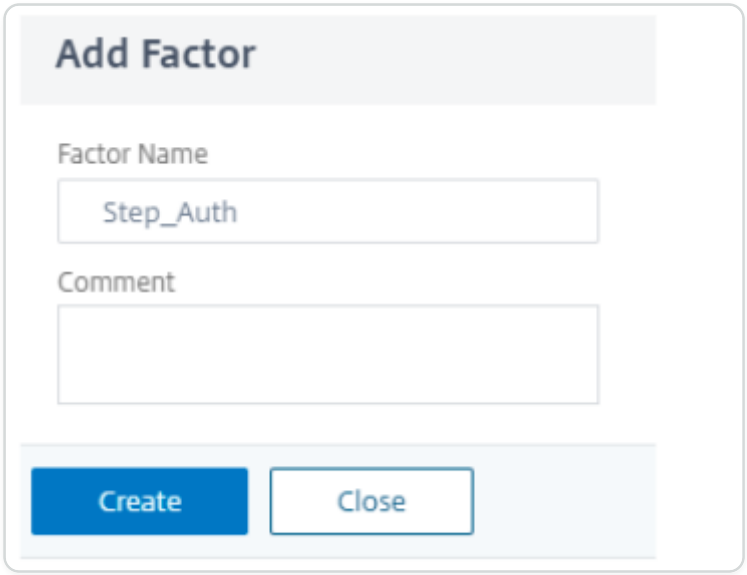
© 1997–2026 Citrix Systems, Inc. All rights reserved.

- As always, set the right priorities.

NOTE

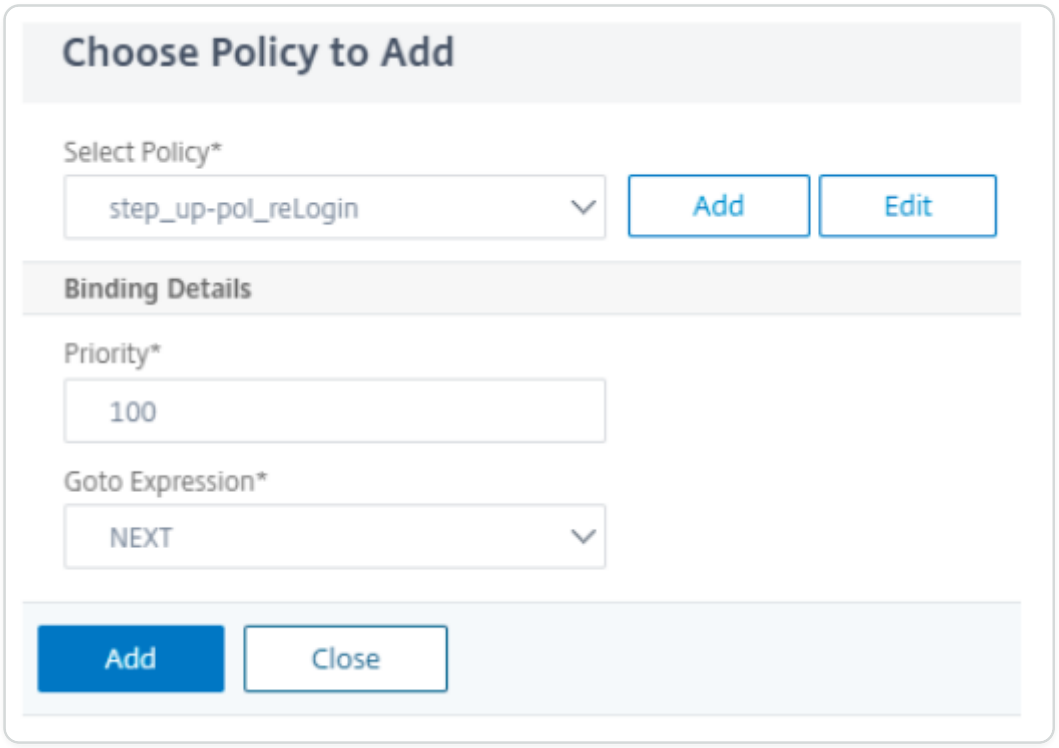
The step-up can also be created through the nFactor Visualizer available in NetScaler version 13.0 and later.

Name	State	Effective State	IP Address	Port	Protocol
lbv-lin-web-green	UP	UP	0.0.0.0	0	HTTP
lbv-lin-web-red	UP	UP	0.0.0.0	0	HTTP



Multifactor authentication configuration through nFactor Visualizer

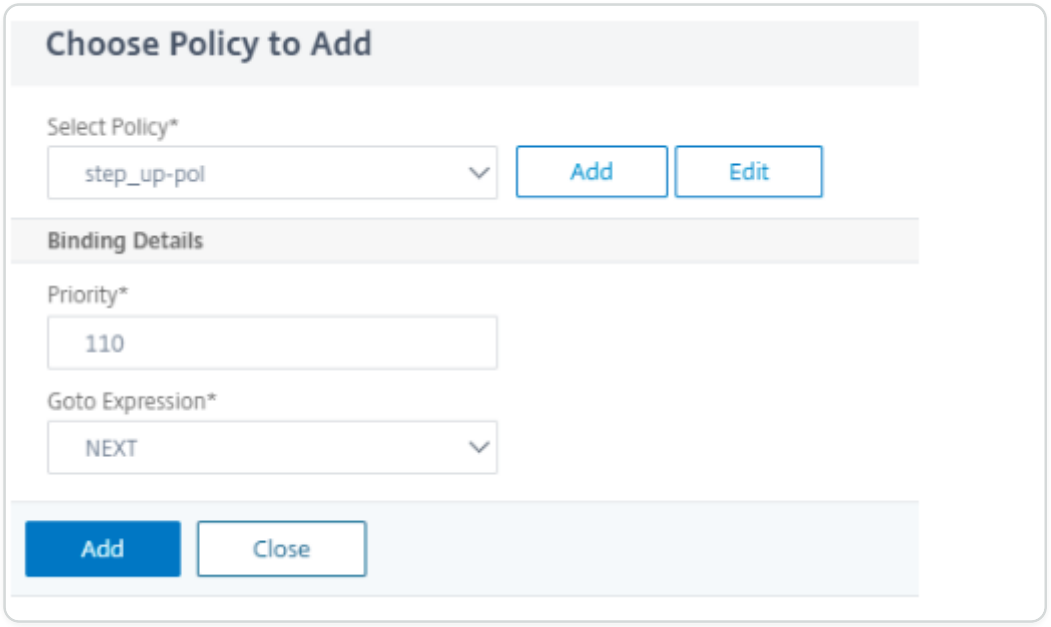
1. Navigate to **Security > AAA-Application Traffic > nFactor Visualizer > nFactor Flow** and click **Add**.
2. Click **+** sign to add the nFactor Flow.



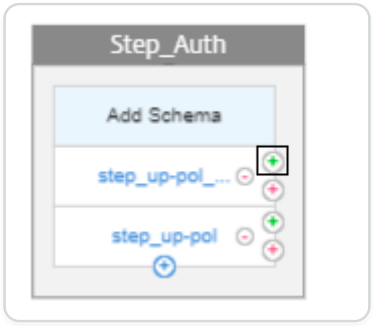
3. Enter the first factor name and click **Create**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

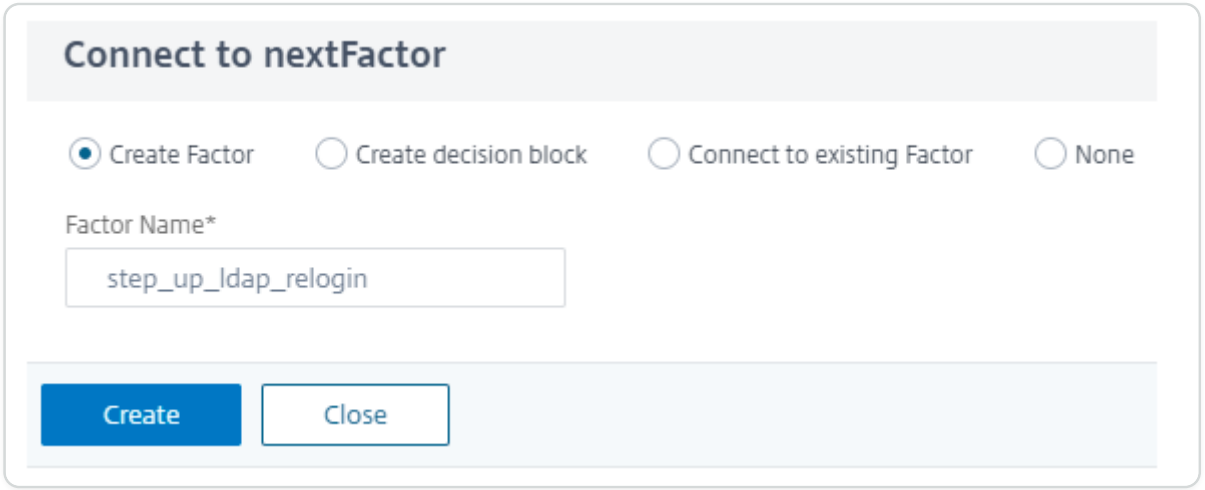
4. No Schema is needed for the first factor. Click **Add Policy** to add NO_AUTH policy as shown in step 2 of the multifactor authentication configuration.



5. Click blue **+** to add second authentication.

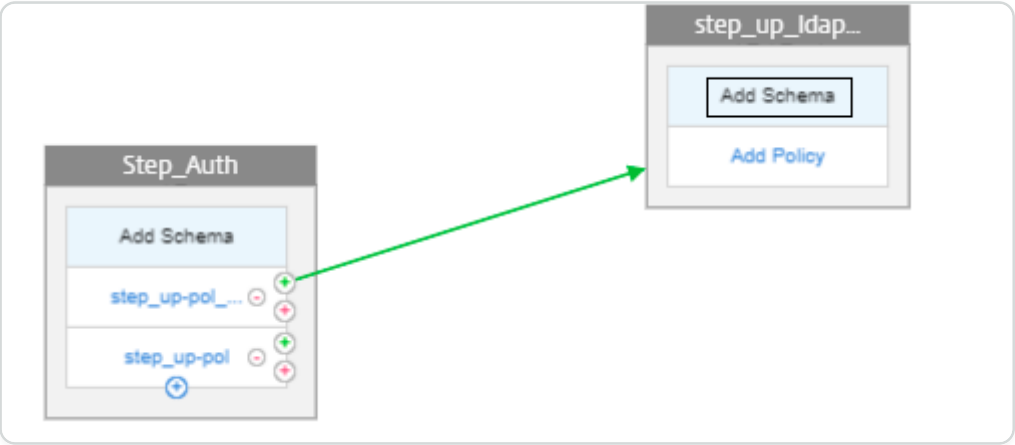


6. Choose authentication policy created and click **Add**.

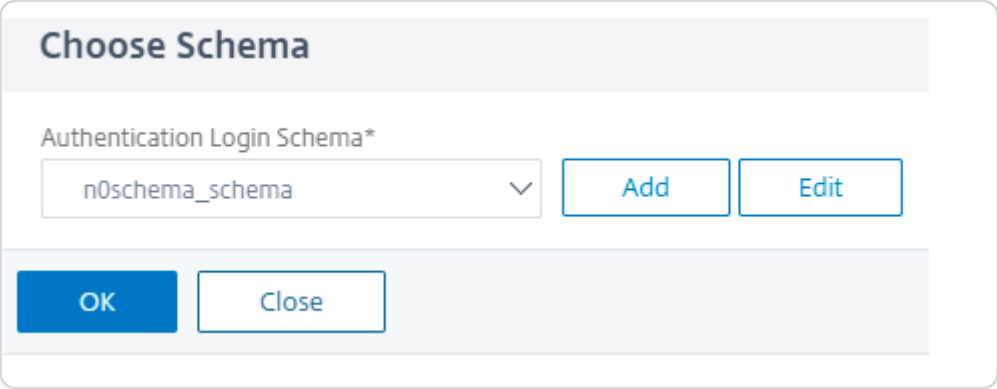


© 1997–2026 Citrix Systems, Inc. All rights reserved.

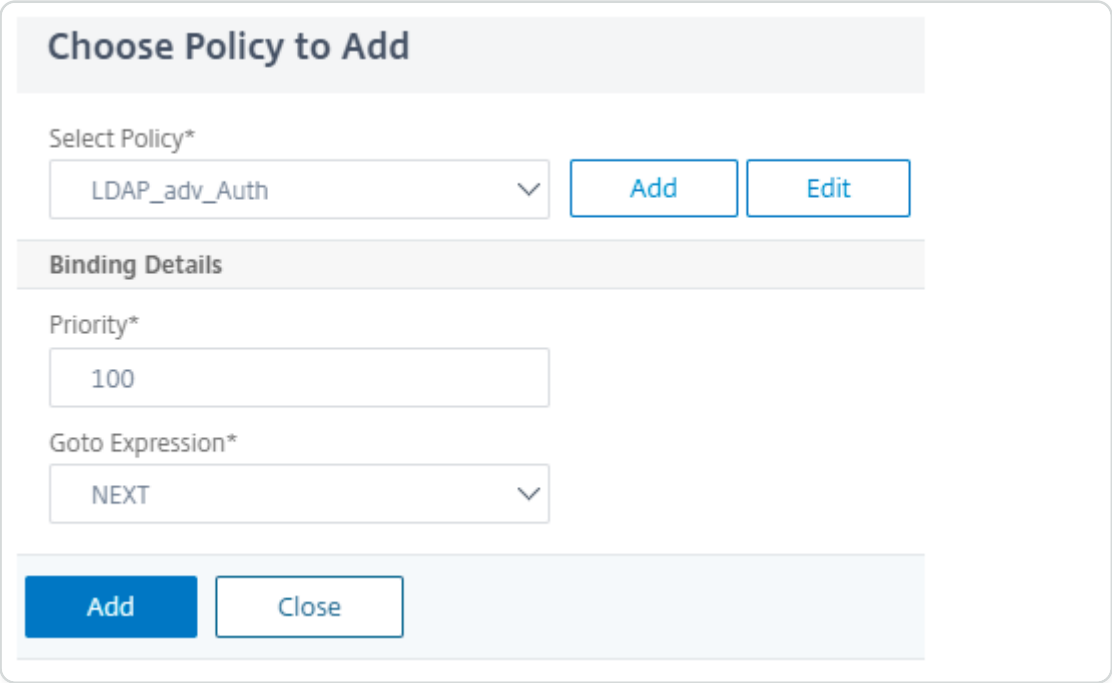
7. Click green **+** to add a next factor.



8. To add next authentication factor, select **Create Factor** enter the **Factor Name** and click **Create**.

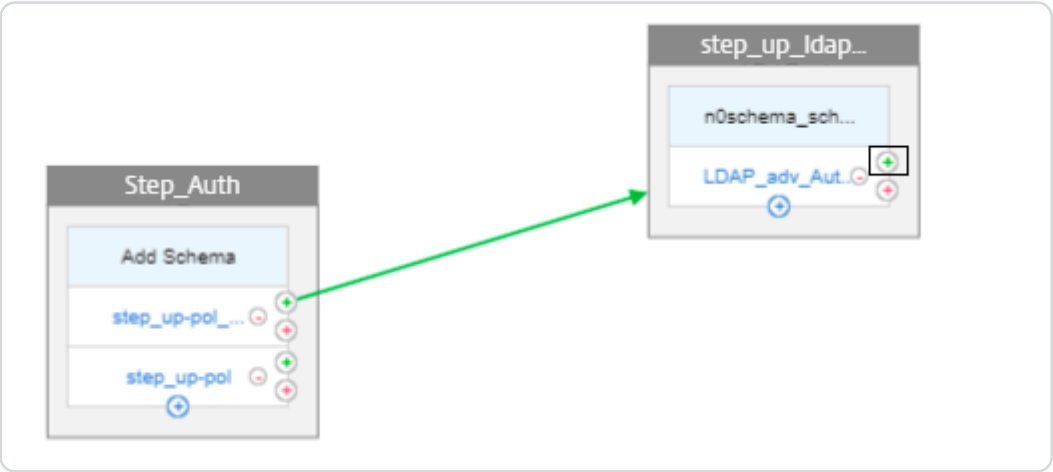


9. To add a schema, click **Add Schema**.

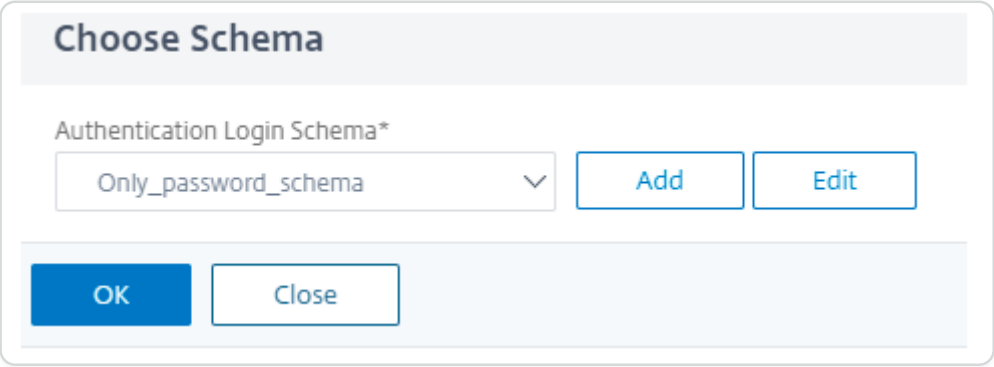


© 1997–2026 Citrix Systems, Inc. All rights reserved.

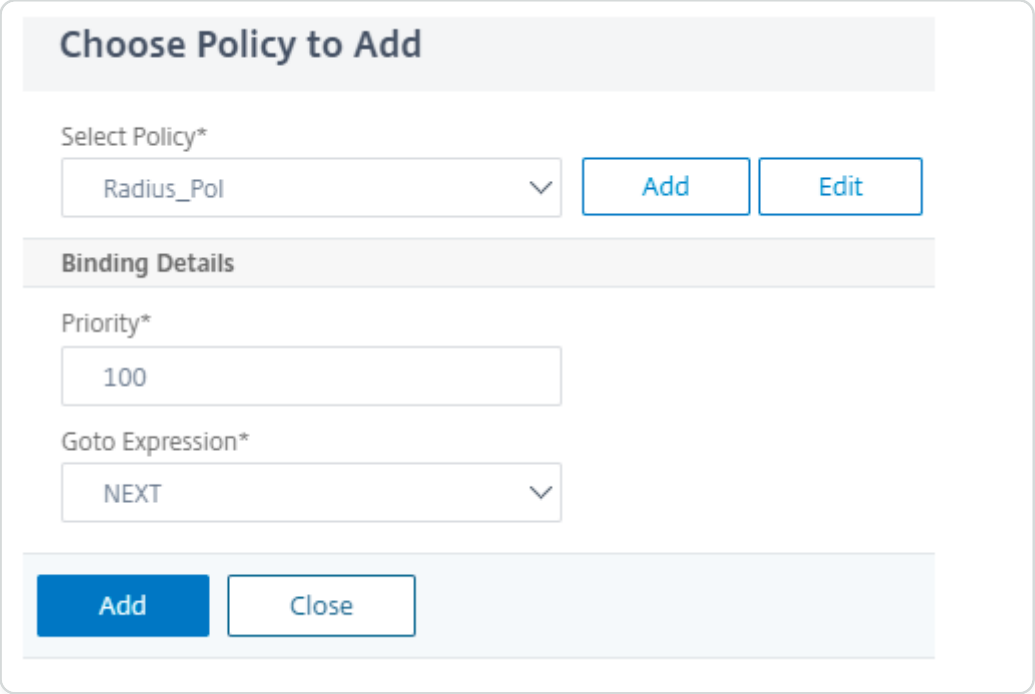
10. Choose the created schema in (multifactor authentication configuration), and click **OK**.



11. Click **Add Policy** and choose the authentication policy.

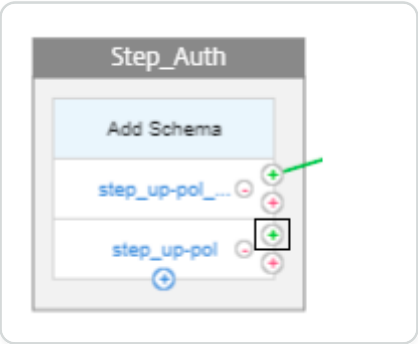


12. Click green **+** to add another factor for RADIUS authentication.

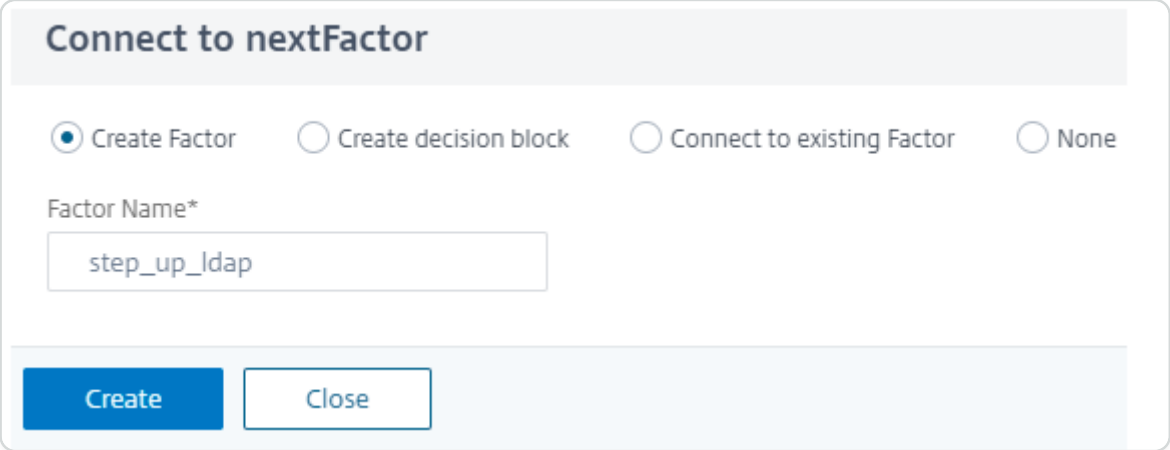


© 1997–2026 Citrix Systems, Inc. All rights reserved.

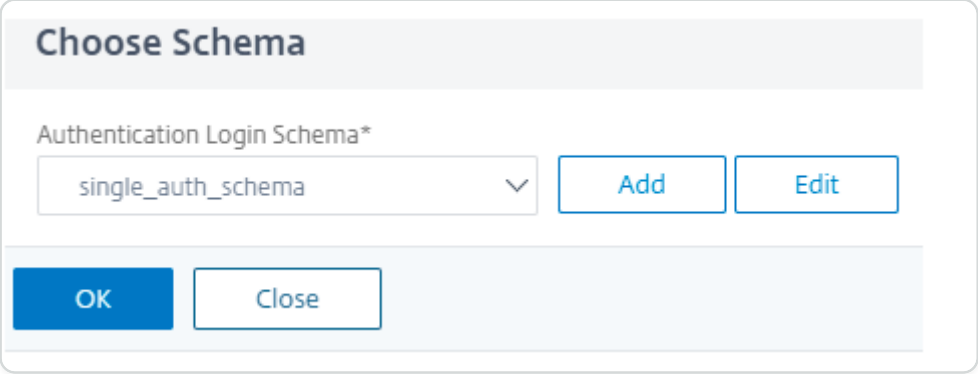
13. Create another factor by following step 8.
14. Click **Add Schema** and choose schema for the password only from the list.



15. Click **Add Policy** to choose RADIUS authentication and click **Add**.

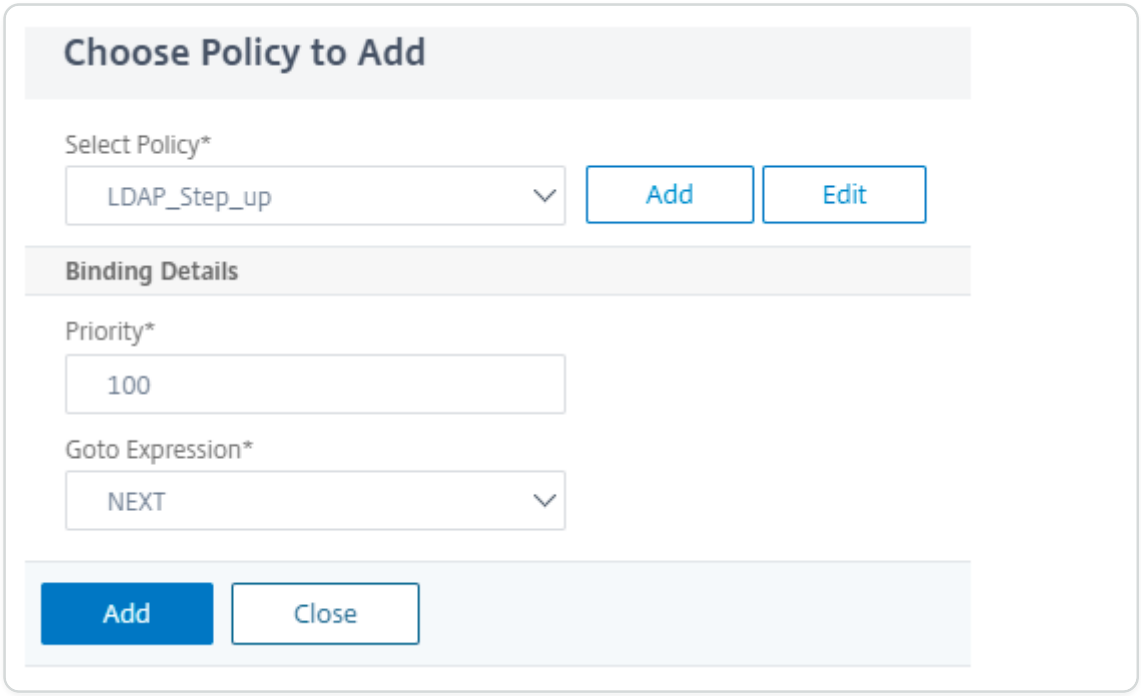


16. Click green **+** in first factor, next to step_up-pol.

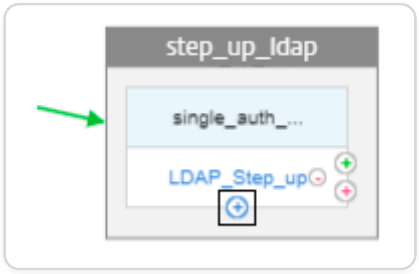


© 1997–2026 Citrix Systems, Inc. All rights reserved.

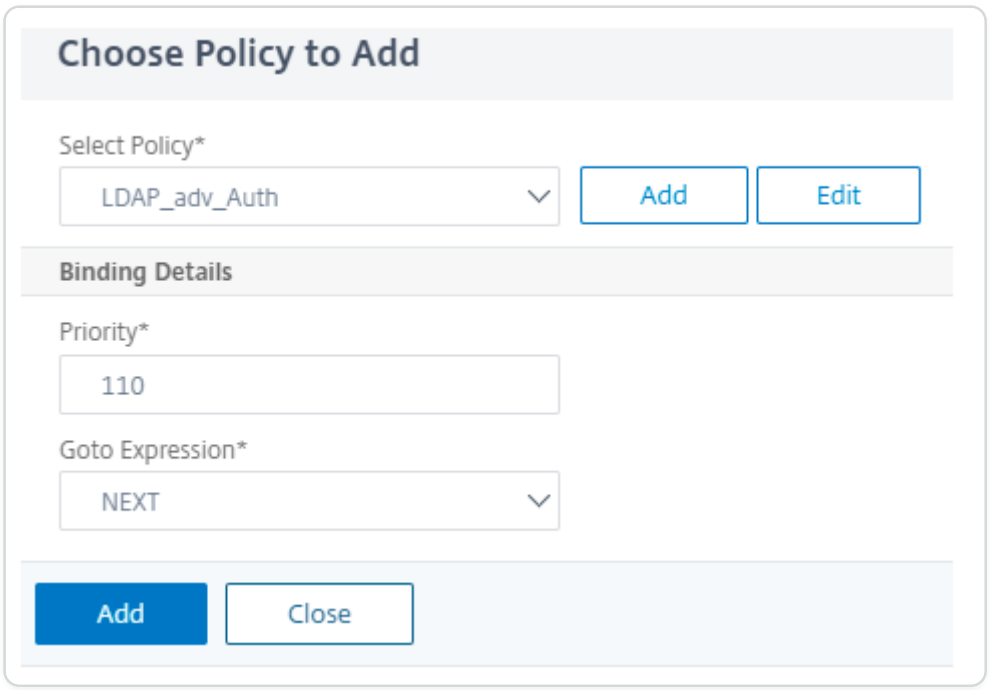
17. Create another factor by following step 8.



18. Click **Add Schema** and choose the schema.

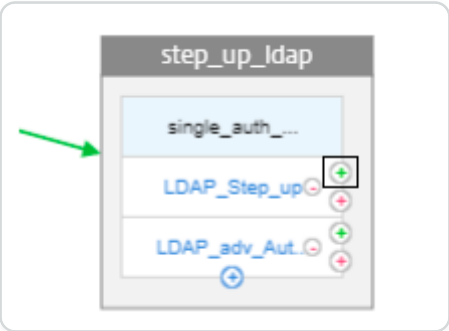


19. Click **Add Policy** to choose authentication policy.

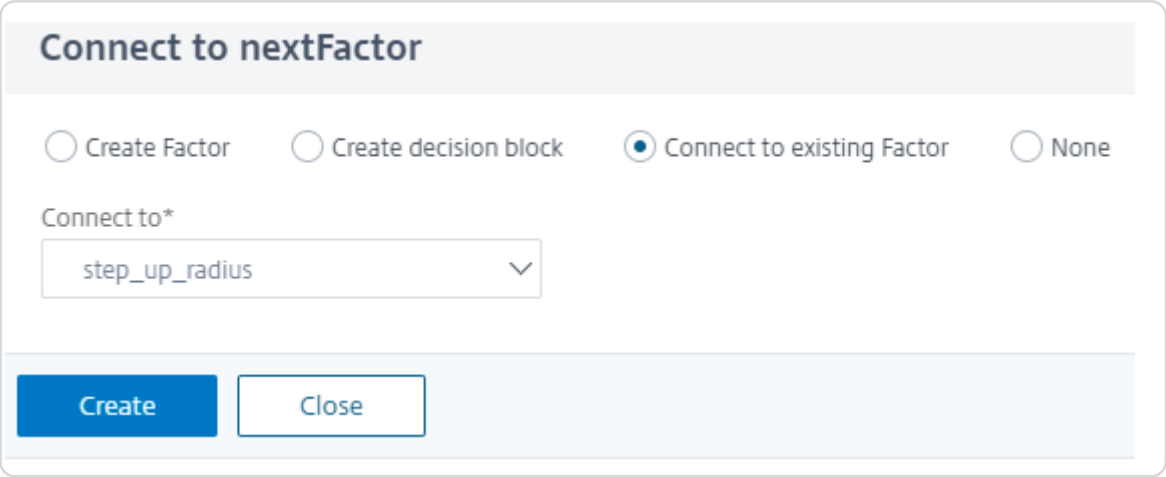


© 1997–2026 Citrix Systems, Inc. All rights reserved.

20. Click blue **+** to add another authentication policy for LDAP authentication.

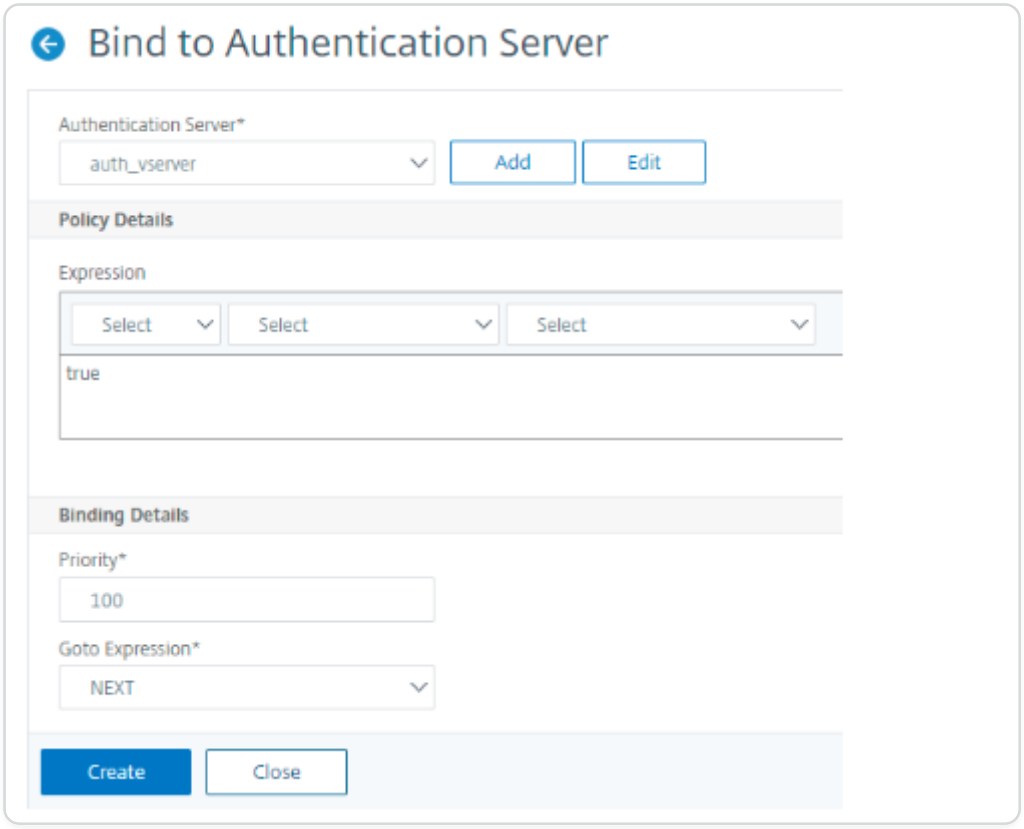


21. Choose LDAP authentication policy and click **Add**.



22. Click green **+** next to LDAP_Step_up to add the RADIUS authentication.

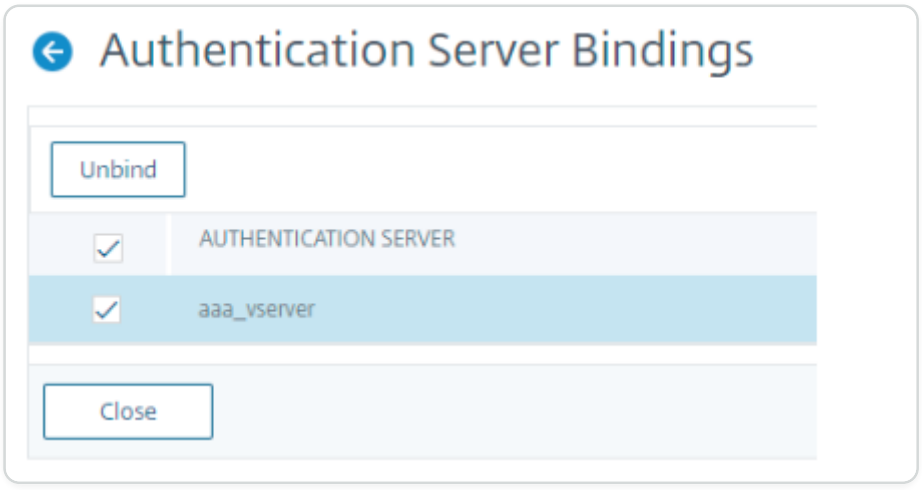
© 1997–2026 Citrix Systems, Inc. All rights reserved.



23. As the RADIUS authentication is already present, select **Connect to existing Factor**, and select step_up-radius from the list.

24. Click **Done** to save the configuration.
25. To bind the created nFactor Flow to an authentication, authorization, and auditing virtual server, click **Bind to Authentication Server** and click **Create**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

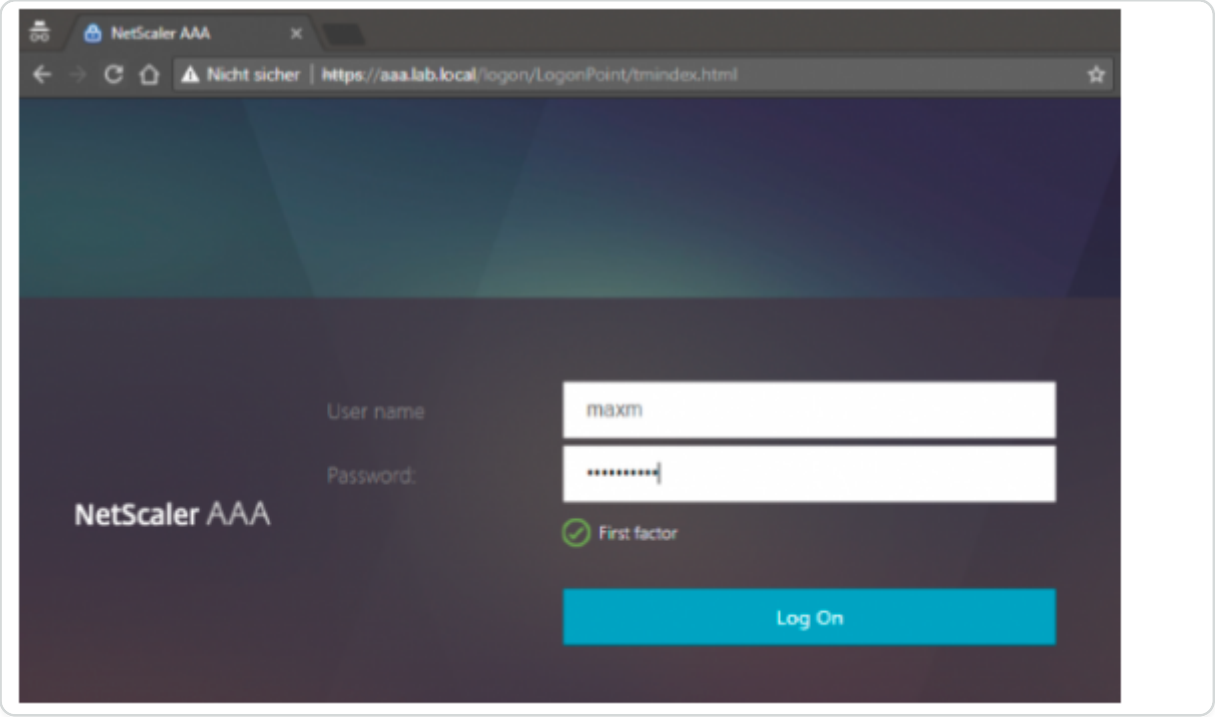


NOTE

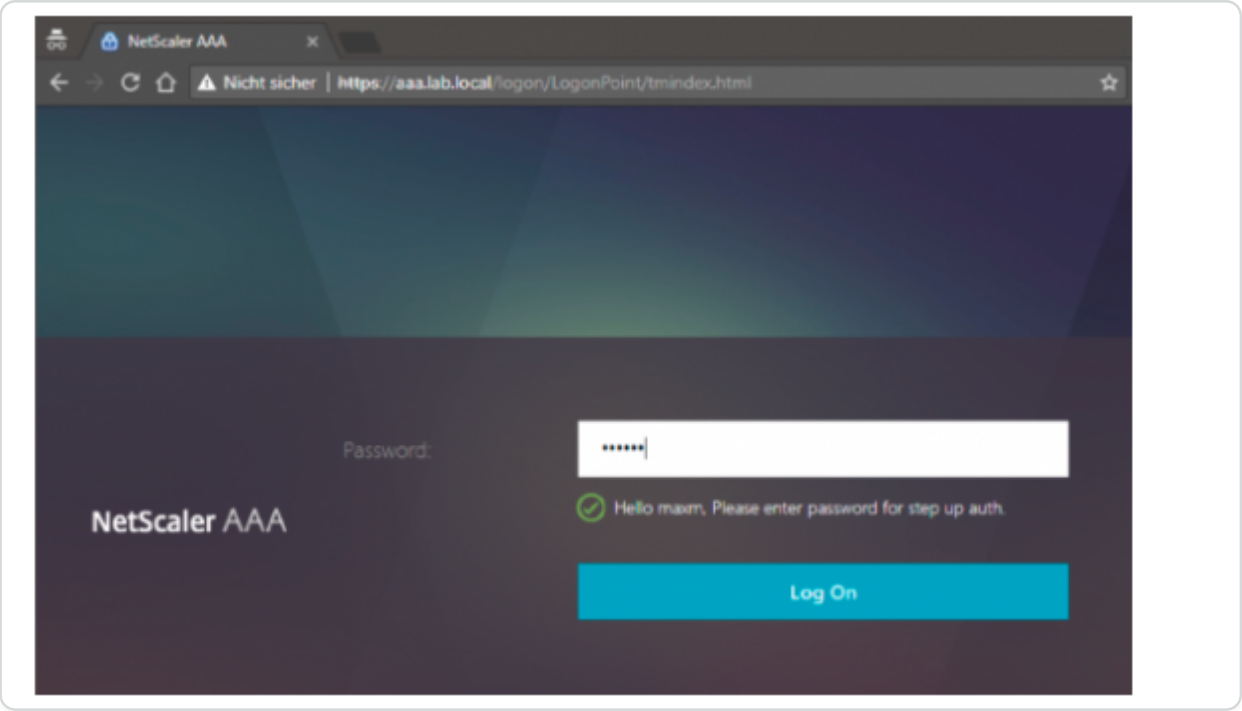
Bind and unbind the nFactor flow through the option given in nFactor Flow under Show Bindings only.

Unbind the nFactor Flow

1. Select the nFactor flow and click **Show Bindings**.
2. Select the authentication virtual server and click **Unbind**.



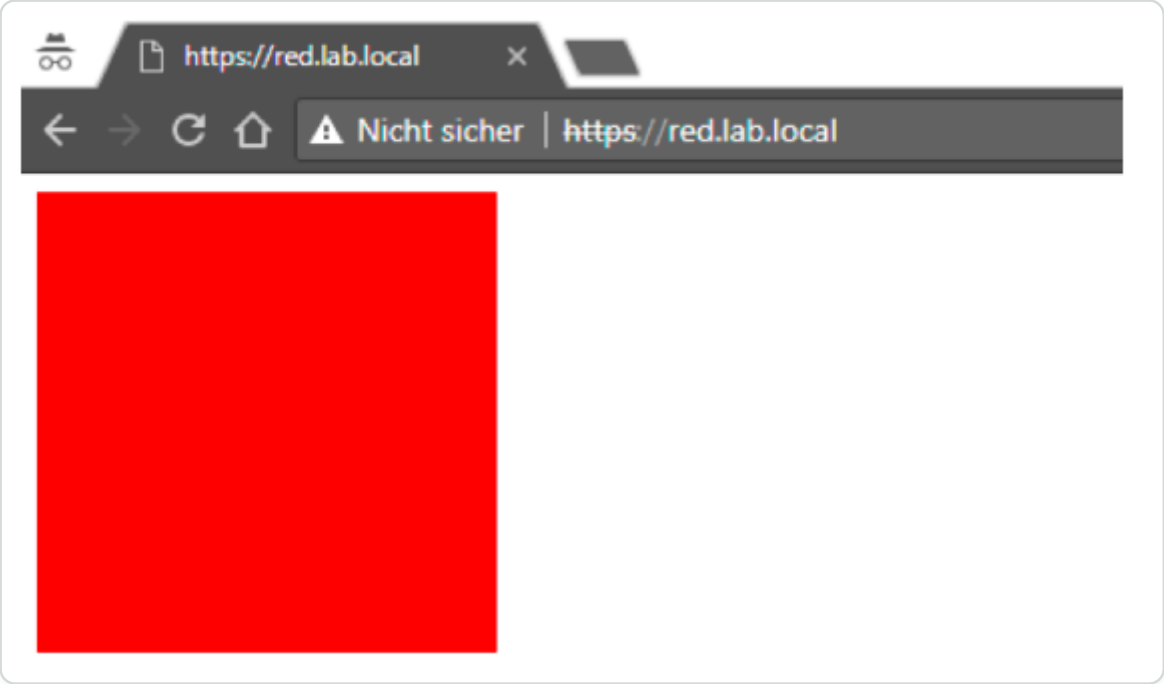
© 1997–2026 Citrix Systems, Inc. All rights reserved.



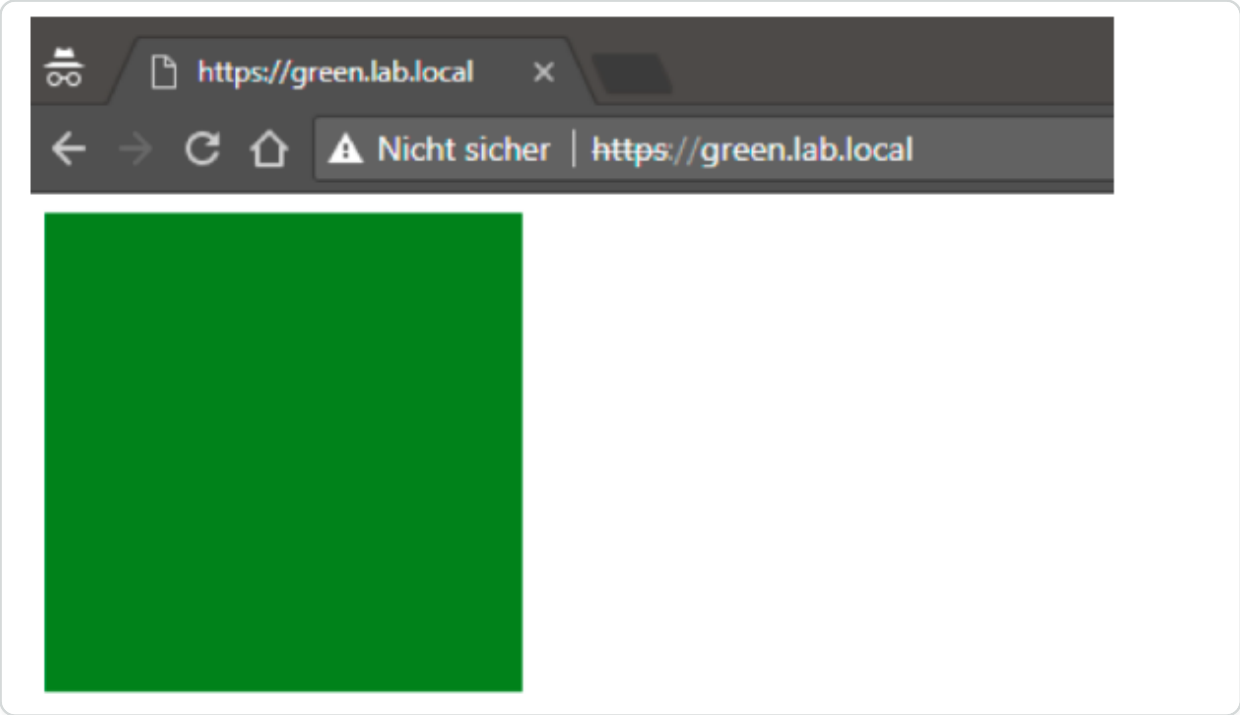
Result

The following steps help you to access the application Red as first.

1. Redirecting to authentication, authorization, and auditing virtual server login page with a first factor as LDAP, after you access "red.lab.local".

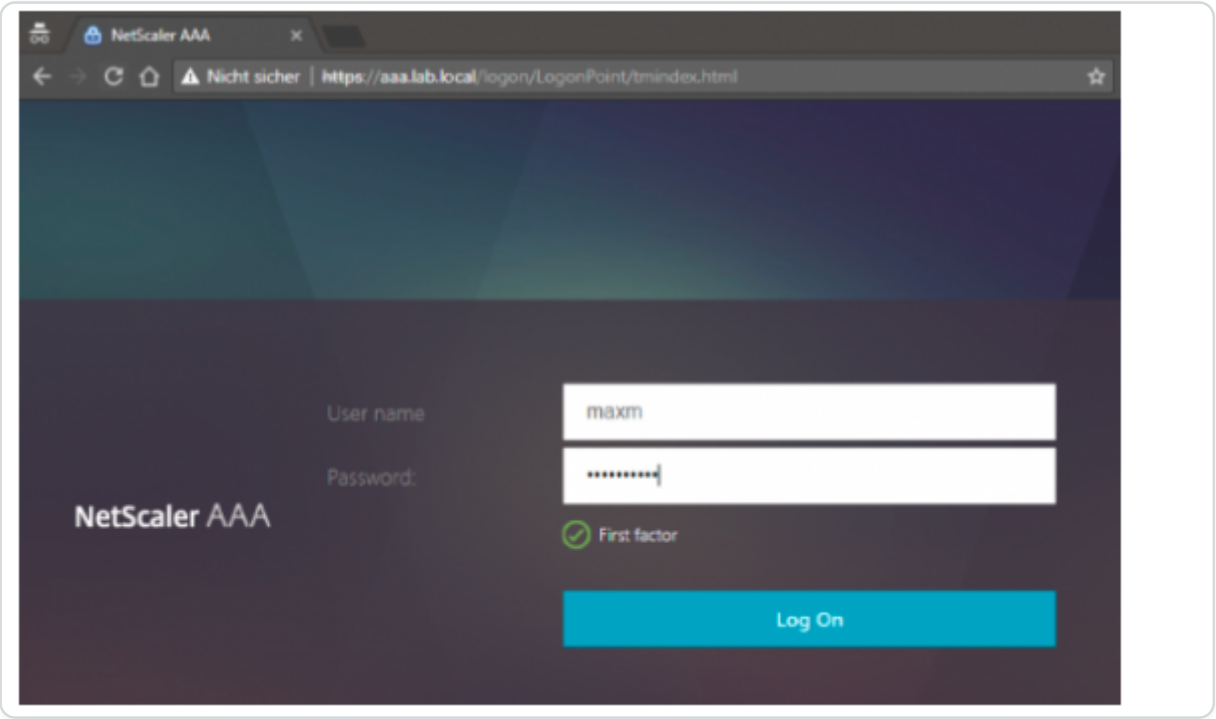


2. nFactor evaluates that user wants to access application Red and displays second factor RADIUS.

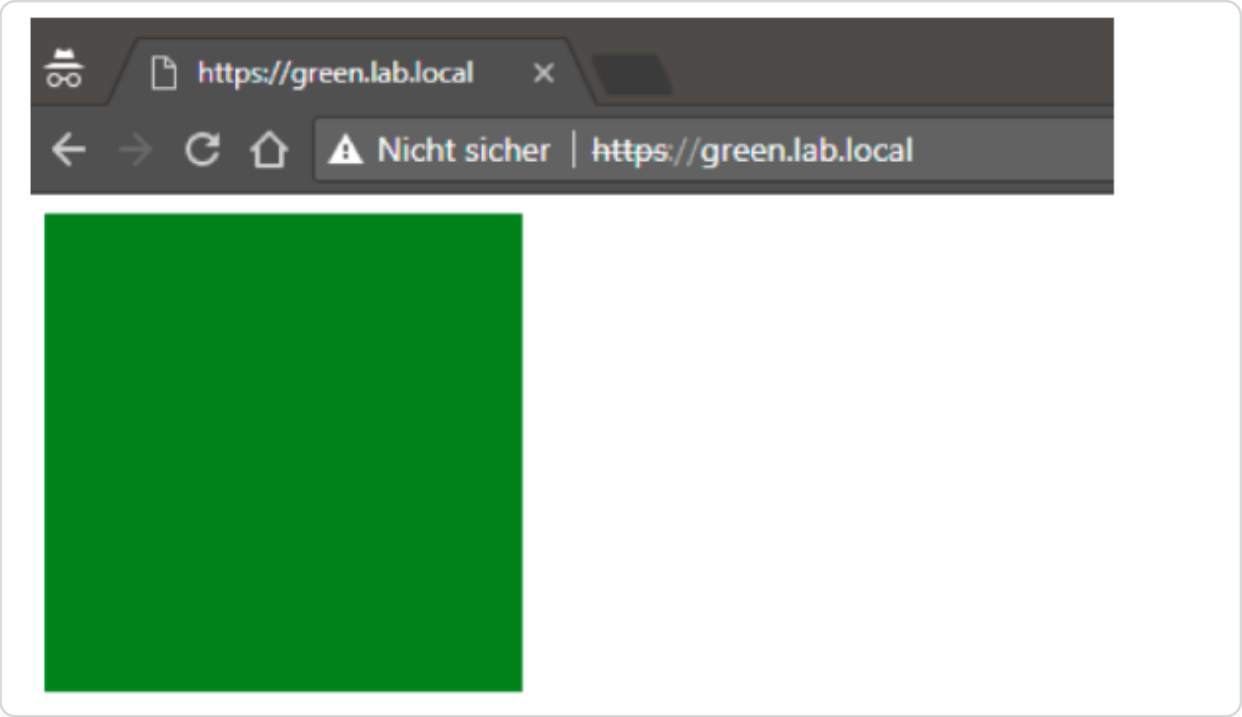


3. NetScaler grants access to application Red.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



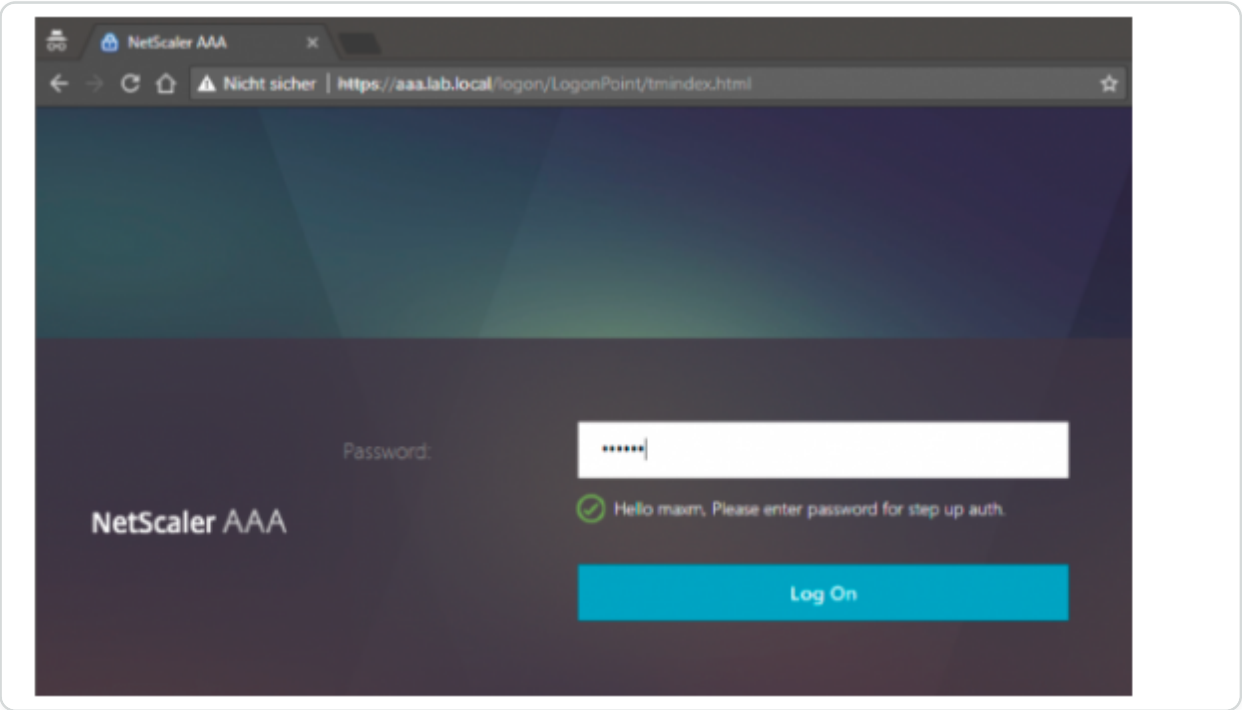
4. Access the application Green as next. NetScaler grants immediate access because the session of stronger application Red.



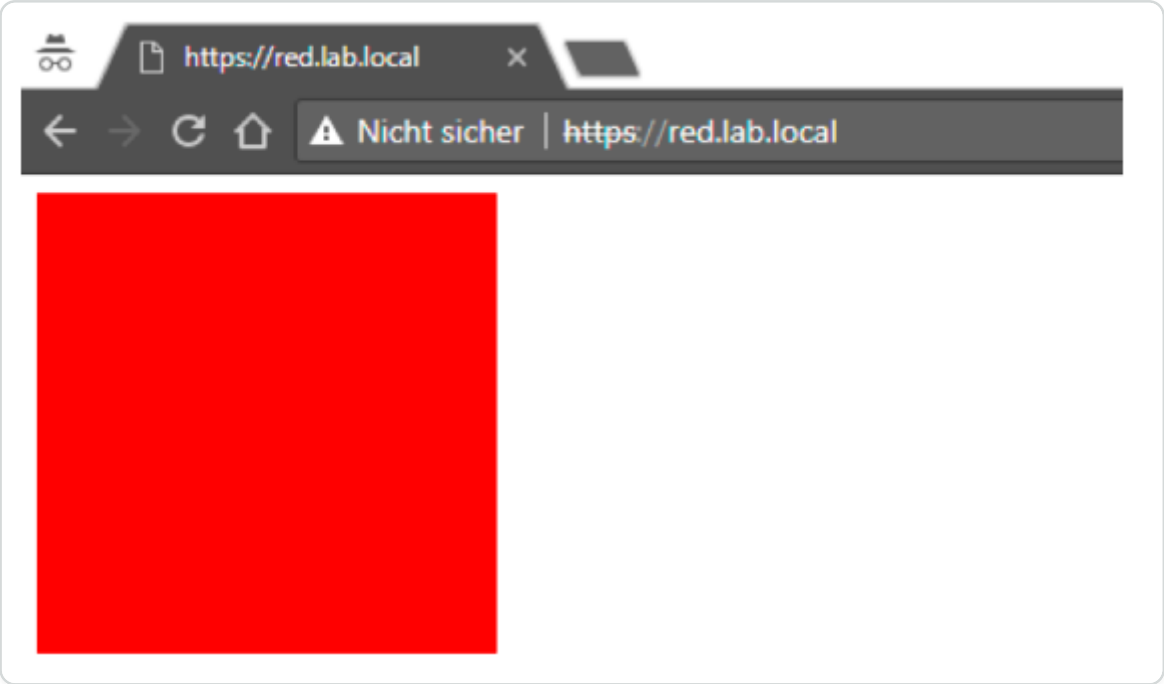
The following steps help you to access the application Green as first.

1. Redirecting to authentication, authorization, and auditing virtual server login page after you access "green.lab.local".

© 1997–2026 Citrix Systems, Inc. All rights reserved.



2. nFactor evaluates application Green and grants access without the second factor.



3. Access the application Red as next. Higher authentication level requires relogin and nFactor does LDAP relogin automatically with saved credentials from the first login at application Green. You enter only the RADIUS credential.

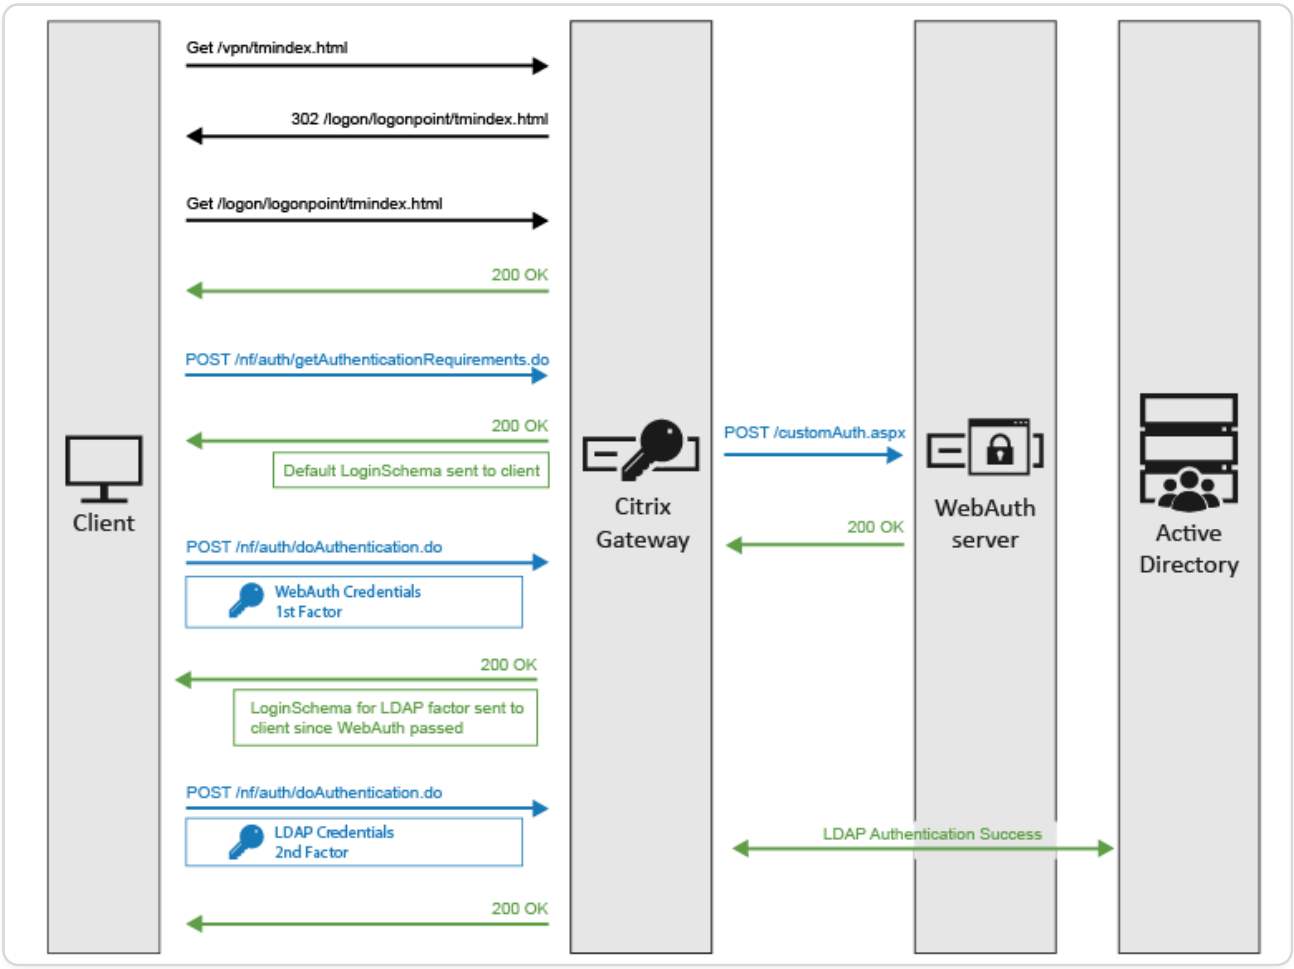
© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. NetScaler grants access to the application Red.

Configure nFactor for NetScaler Gateway with WebAuth in first factor and LDAP with password change in second factor

The following high-level steps are involved in configuring nFactor for NetScaler Gateway with WebAuth in first factor and LDAP with password change in the second factor.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



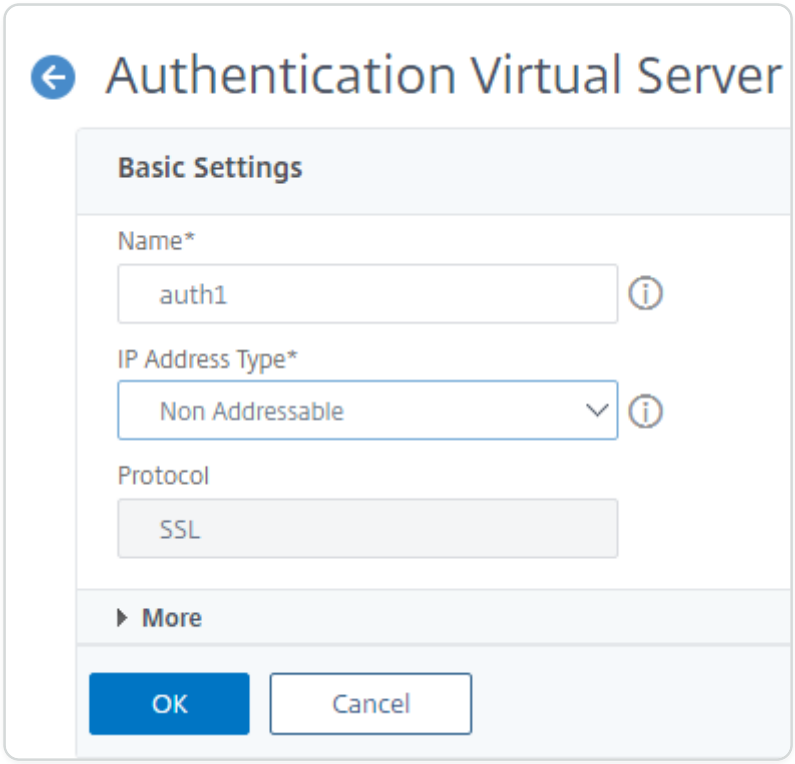
1. Configure an authentication virtual server with zero IP. It is not mandatory to have a certificate bind to authentication virtual server.
2. Configure an authentication profile with the authentication virtual server name.
3. Configure a VPN virtual server.
4. Set the authentication profile on this VPN virtual server.
5. Configure a WebAuth action and policy.
6. Configure LDAP action and policy.
7. Configure a login schema action for LDAP factor.
8. Configure a policy label for LDAP factor using the login schema action for LDAP factor.
9. Bind LDAP policy to the LDAP policy label.
10. Bind WebAuth policy to the authentication virtual server with an LDAP policy label as the next factor.

How it works

- User enters the NetScaler Gateway FQDN in browser and is redirected to the /logon/logonpoint/tmindex.html page.
- This page displays the login schema that is bound to an authentication virtual server. If there is no login schema bound to an authentication virtual server (like in our configuration), then a default schema is displayed.
- The user enters the credentials for the first factor, which in this case is WebAuth.
- NetScaler Gateway checks the WebAuth action and contacts the WebAuth server. It sends HTTP request mentioned in the parameter fullReqExpr to WebAuth server. If the webAuth server's response satisfies the expression mentioned in successRule parameter of WebAuth action, then this policy passes.
- Now NetScaler Gateway moves to the second factor. It checks the configuration of Policy label LDAP_factor that is bound as next factor. Since there is a loginSchema mentioned in this policy label, NetScaler Gateway sends that XML schema to the Client.
- The client receives the schema and enters the LDAP credentials for second factor authentication.
- NetScaler Gateway tries to reach the LDAP server and validates if the client credentials are correct. If they are correct, authentication phase completes and user logs in to the configured VPN mode.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The following figure displays an nFactor authentication sequence in which the first factor is WebAuth and second factor is LDAP.



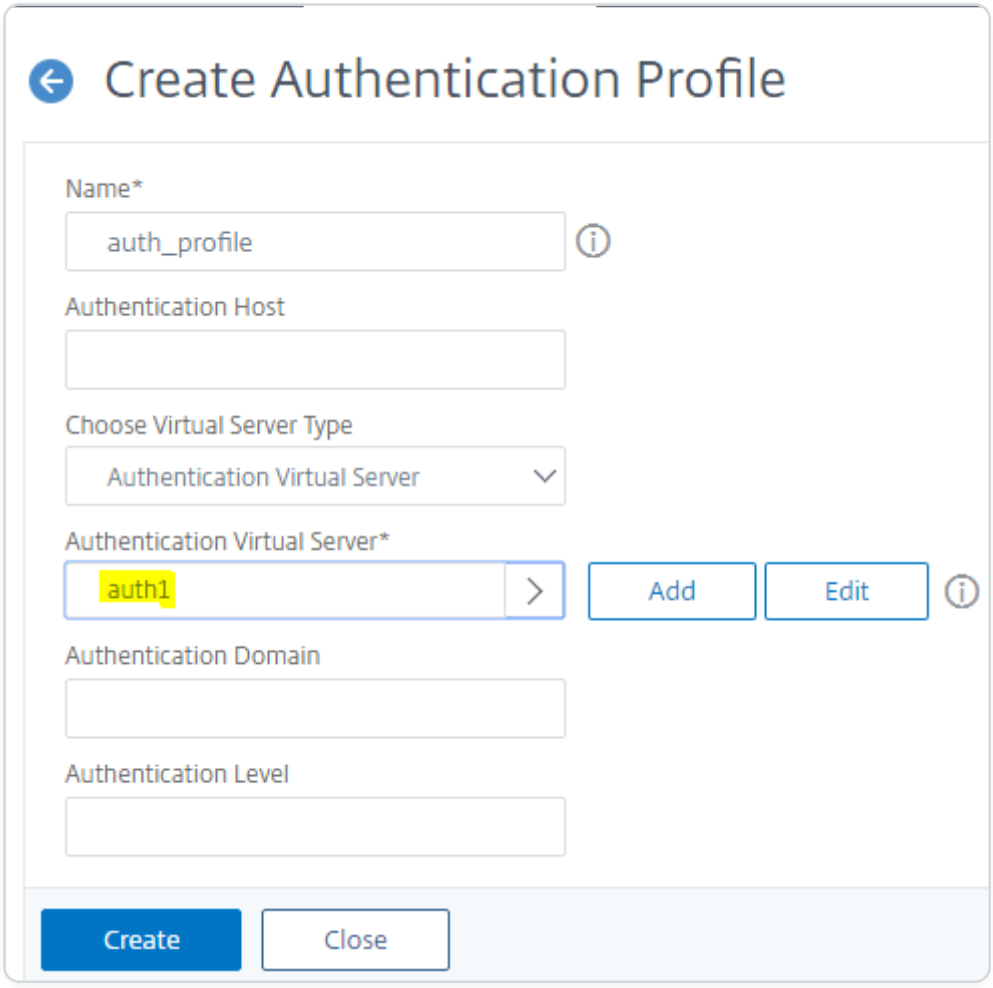
Configuration by using the CLI

1. Configure an authentication virtual server.

   ```
   add authentication vserver auth1 ssl
   ```

   In the GUI, navigate to **Security > AAA - Application traffic > Virtual Server** and click **Add.**

© 1997–2026 Citrix Systems, Inc. All rights reserved.



2. Configure an authentication profile.

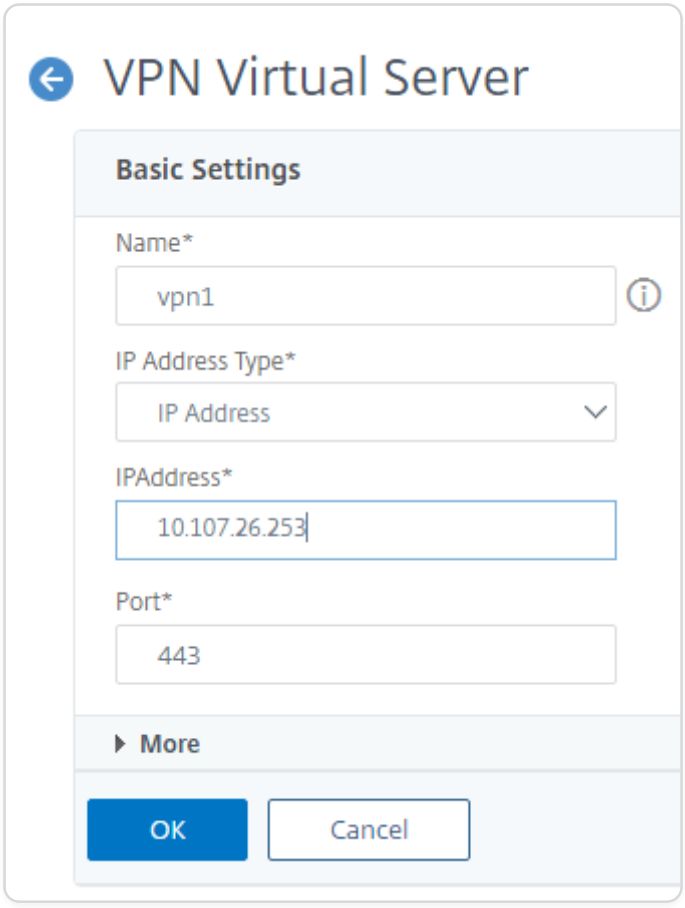
```
add authnProfile auth_profile –authnVsname auth1
```

In the GUI, navigate to **Security > AAA - Application traffic > Authentication profile** and click **Add.**

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. Configure a VPN virtual server.

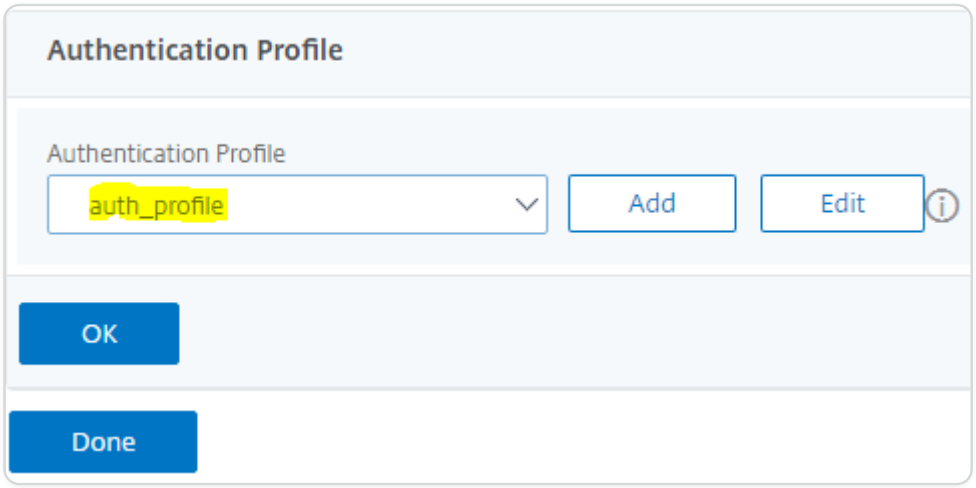
```
add vpn vserver vpn1 ssl 10.1.1.1 443



add ssl certkey ckp –cert test.cer –key test.key

bind ssl vserver vpn1 –certKey ckp
```

Navigate to **NetScaler Gateway > Virtual Server** and click **Add.**



© 1997–2026 Citrix Systems, Inc. All rights reserved.

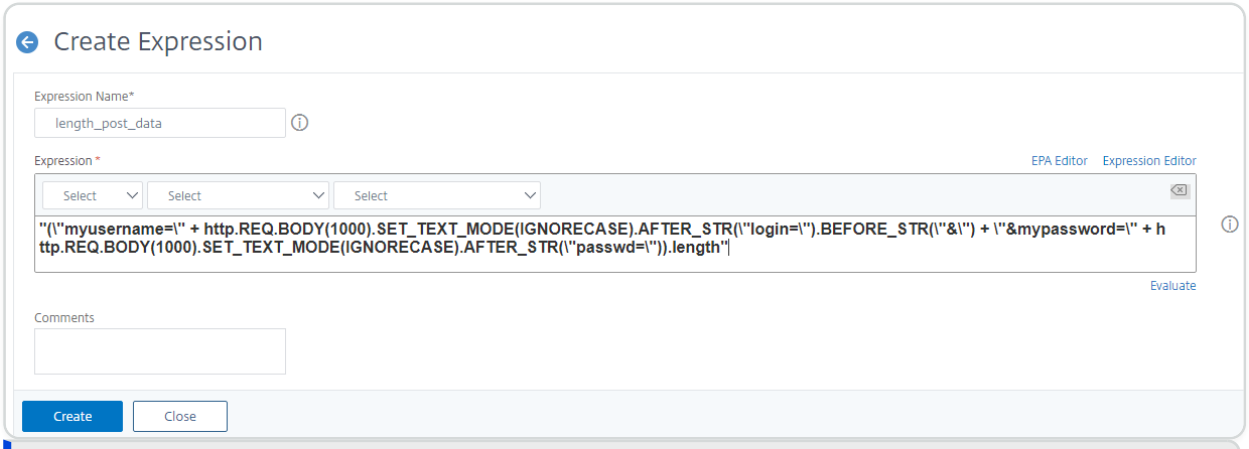
Once the VPN virtual server is created, bind the certificate on the same.

Set the authentication Profile on the VPN virtual server

```
set vpn vserver vpn1 –authnProfile auth_profile
```

4. Configure a WebAuth action and Policy.

   Navigate to **Appexpert > Expression > Advanced Expression.**



© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add policy expression post_data "\"myusername=\" +

http.REQ.BODY(3000).SET_TEXT_MODE(IGNORECASE).AFTER_STR(\"login=\").BEF
ORE_STR(\"&\") + \"&mypassword=\" +

http.REQ.BODY(3000).SET_TEXT_MODE(IGNORECASE).AFTER_STR(\"passwd=\")"
```

```
add policy expression length_post_data "(\"myusername=\" +

http.REQ.BODY(1000).SET_TEXT_MODE(IGNORECASE).AFTER_STR(\"login=\").BEF
ORE_STR(\"&\") + \"&mypassword=\" +
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
\http.REQ.BODY(1000).SET_TEXT_MODE(IGNORECASE).AFTER_STR(\"passwd=\")).
length"
```

Nfactor configuration by using the CLI:

```
add authentication webAuthAction webAuth_action -serverIP 10.102.39.132
-serverPort 443 -fullReqExpr q{"POST /customAuth.aspx HTTP/" +
http.req.version.major + "." + http.req.version.minor + "\r\nAccept: */
*\r\nHost: 10.102.39.132\r\nUser-Agent: Mozilla/5.0 (compatible; MSIE
9.0; Windows NT 6.1; Trident/5.0)\r\nContent-Type: application/x-www-
form-urlencoded\r\n" + "Content-Length: " + length_post_data +
"\r\nConnection: Keep-Alive\r\n\r\n" + post_data} -scheme https
-successRule "http.RES.STATUS.EQ(200)"

add authentication policy webAuth_policy –rule TRUE –action
webAuth_action
```

The webAuth action configured previously uses two policy expressions. One policy expression (post_data) creates the POST body. The other (length_post_data) calculates the length of the POST body, which is used to populate the Content-Length header in the POST request.

The policy expression that creates the POST body parses the login request and extracts the user name and password entered by the user. It then creates the POST body in the format that the WebAuth server expects, using the user name password extracted from the login request.

Finally the WebAuth action creates the below request, which is sent to the WebAuth server.

```
POST /customAuth.aspx HTTP/1.1

Accept: */*

Host: 10.102.39.132

Accept-Language: en-US

User-Agent: Mozilla/5.0 (compatible; MSIE 9.0; Windows NT 6.1; Trident/
5.0)

Content-Type: application/x-www-form-urlencoded
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Content-Length:43

Connection: Keep-Alive

myusername=test_user&mypassword=test_passwd
```

5. Configure LDAP Action and Policy for password change.

```
add authentication ldapAction ldap_action -serverIP 10.102.39.133
-serverPort 636 -secType SSL -ldapBase "dc=domain,dc=com" -ldapBindDn
administrator -ldapBindDnPassword password -ldapLoginName
samAccountName -passwdChange ENABLED

add authentication policy ldap_policy –rule TRUE –action ldap_action
```

   The LDAP action is configured with –passwdChange ENABLED, which enables the user initiated change password after VPN login.

6. Configure a LoginSchema action for LDAP factor.

```
add authentication loginSchema LDAP_schema -authenticationSchema /
nsconfig/loginschema/LoginSchema/SingleAuth.xml
```

   The LDAP factor requires a user name and a password from the end user. The Login form displayed to the end user must depict a user name and password field.

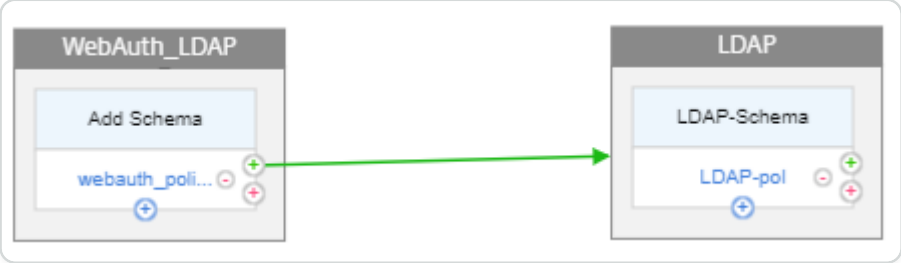
   NetScaler has a few default LoginSchema XMLs which are present at /nsconfig/ loginschema/ LoginSchema location on the NetScaler shell. You can use one of the default LoginSchema XMLs present in the previous location.

7. Configure a policy label for LDAP factor using the LoginSchema action for LDAP factor:

```
add authentication policylabel LDAP_factor -loginSchema LDAP_schema
```

8. Bind LDAP Policy to the LDAP policy label.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



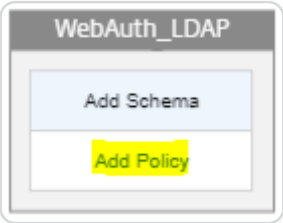
```
bind authentication policylabel LDAP_factor –policyName ldap_policy –
priority 10
```

9. Bind WebAuth policy to authentication virtual server with an LDAP policy label as next factor.

```
bind authentication vserver auth1 –policy webAuth_policy –nextFactor
LDAP_factor –priority 10
```

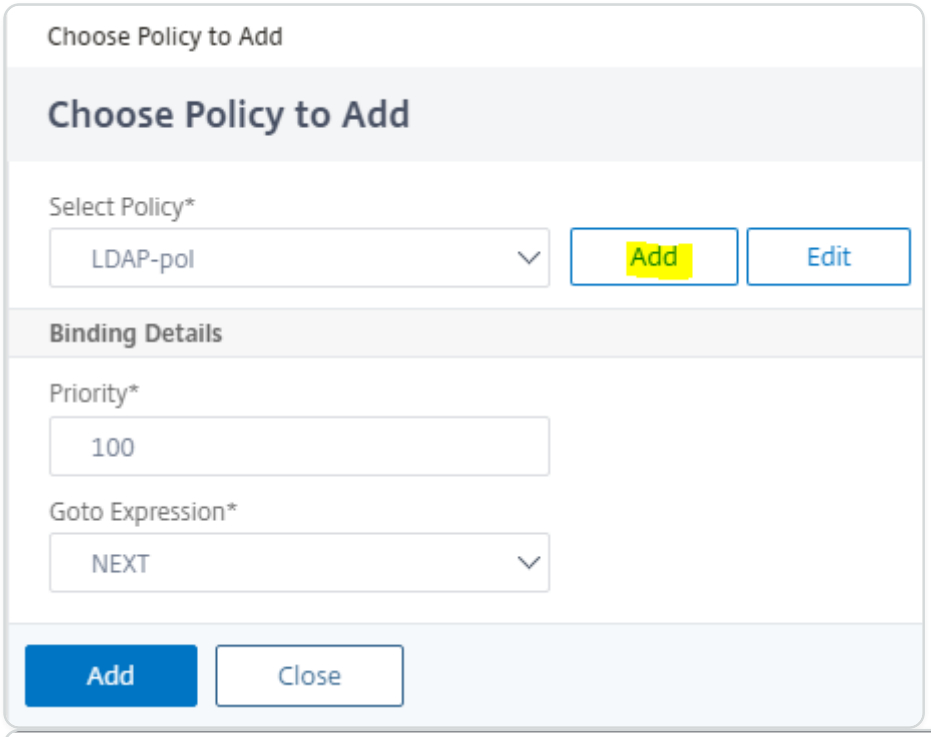
The preceding nFactor configuration can also be done using nFactor visualizer in NetScaler that is available starting from 13.0 firmware version.

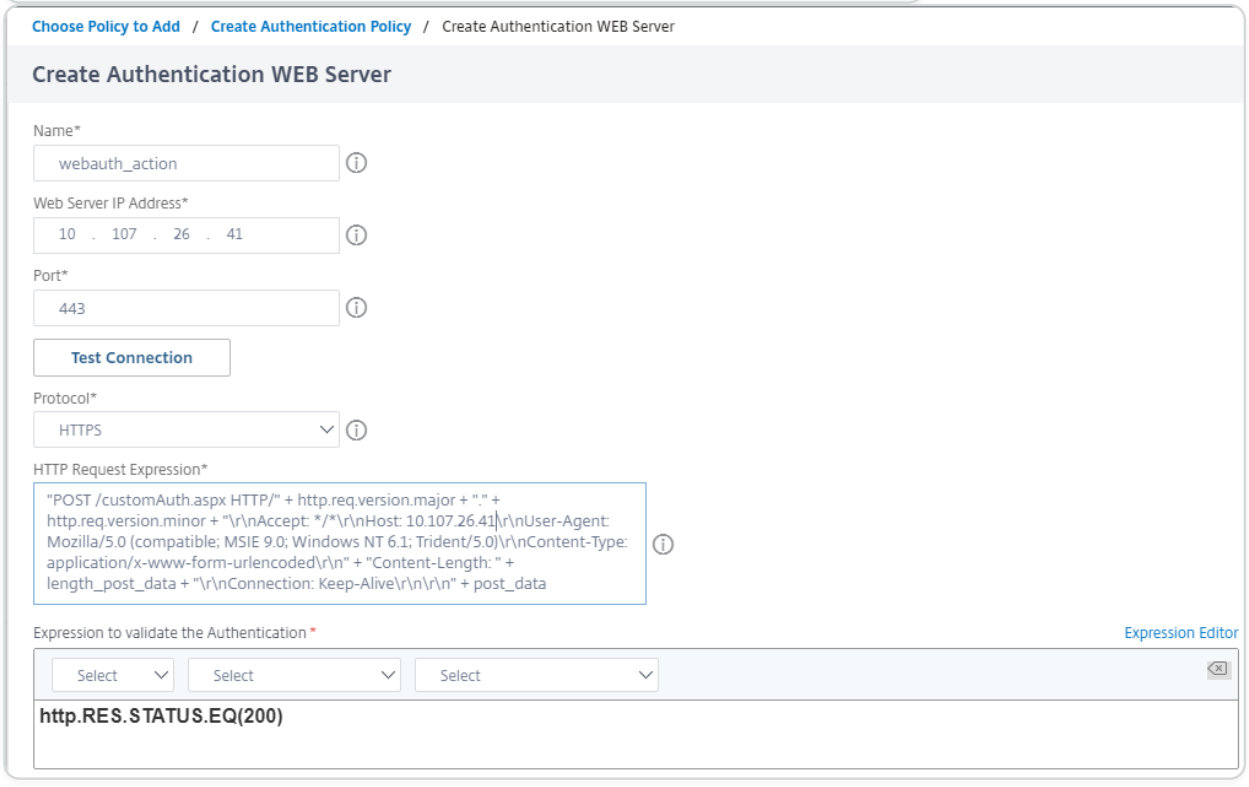
Configuration by using the nFactor Visualizer



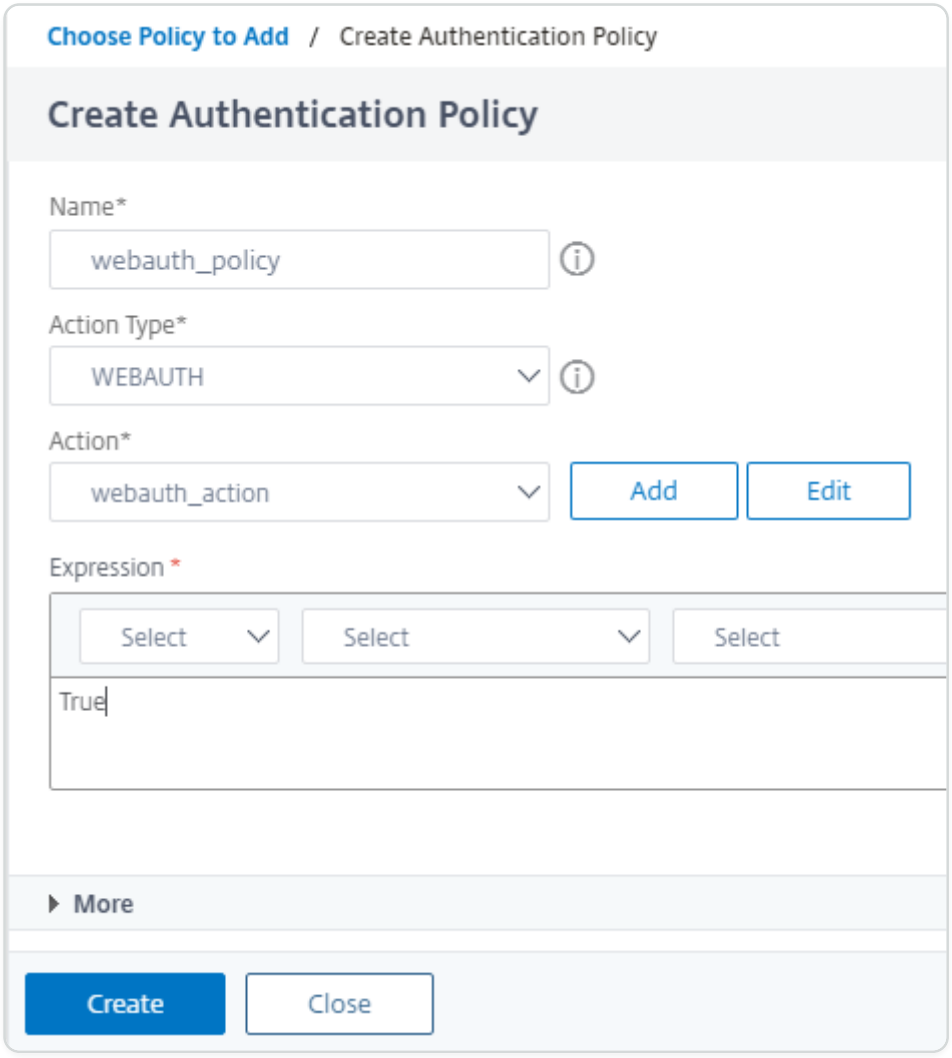
The first factor here is Webauth followed by LDAP with password change option being enabled.

1. Navigate to **Security > AAA-Application Traffic > nFactor Visualizer > nFactor Flow** and click **Add**.
2. Click **+** sign to add the nFactor flow.



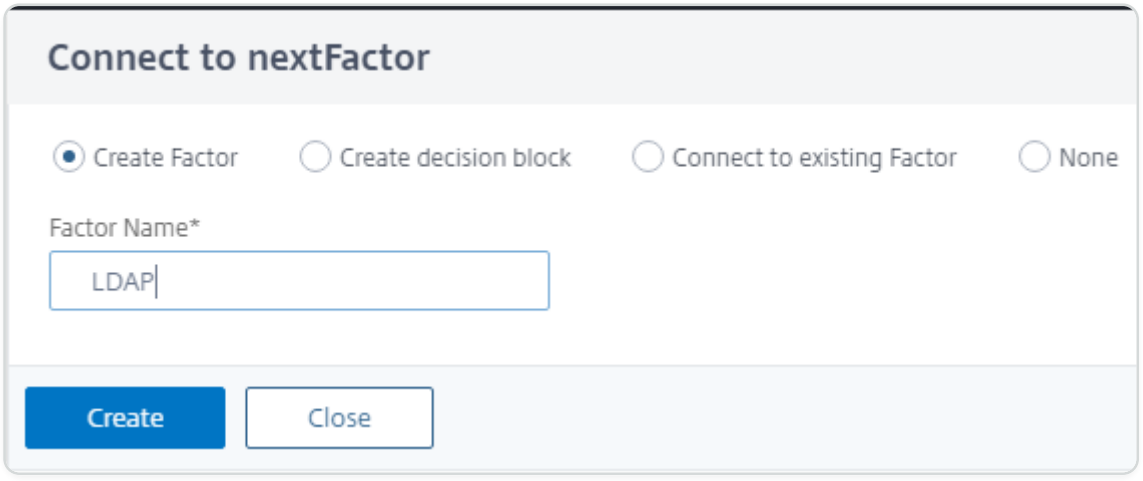


3. Add a factor. This name that you enter for this factor is the name of the nFactor flow.

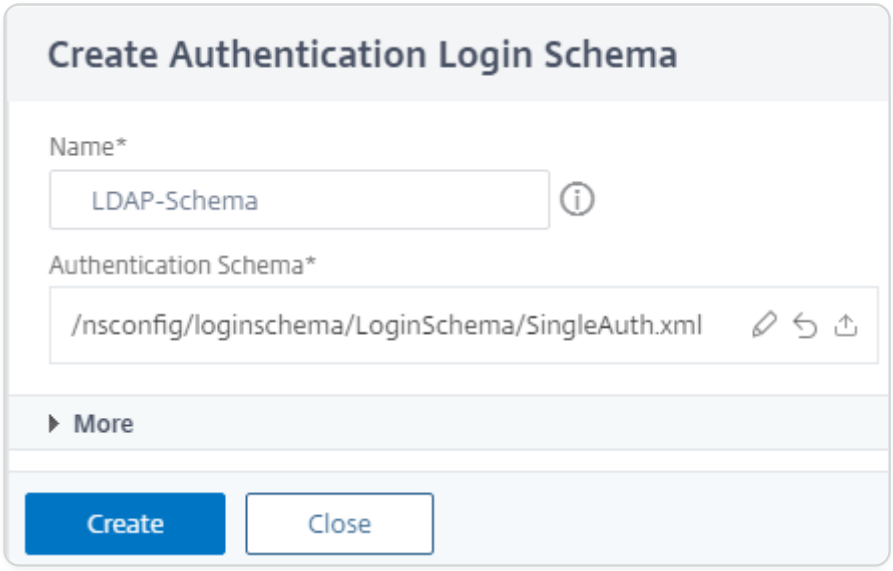


4. Click **Add Policy** to add the Webauth policy and Webauth action/server.

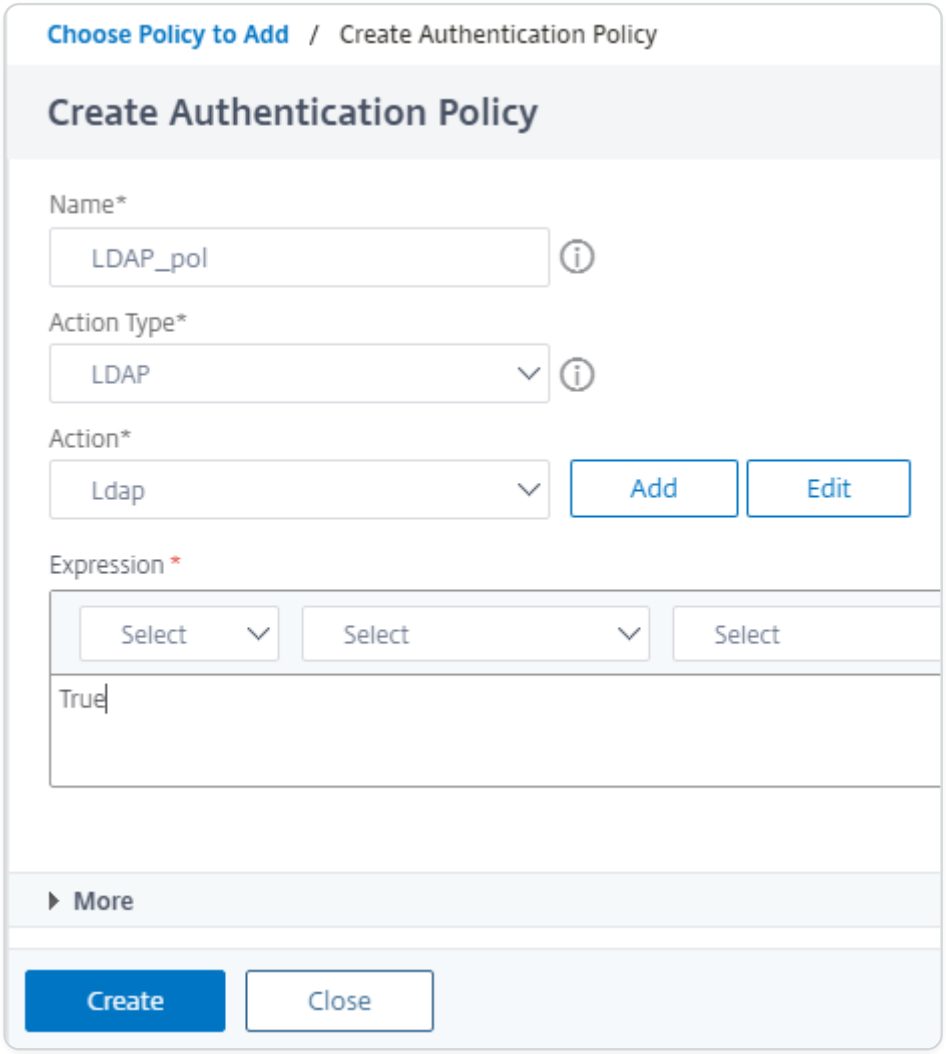
© 1997–2026 Citrix Systems, Inc. All rights reserved.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

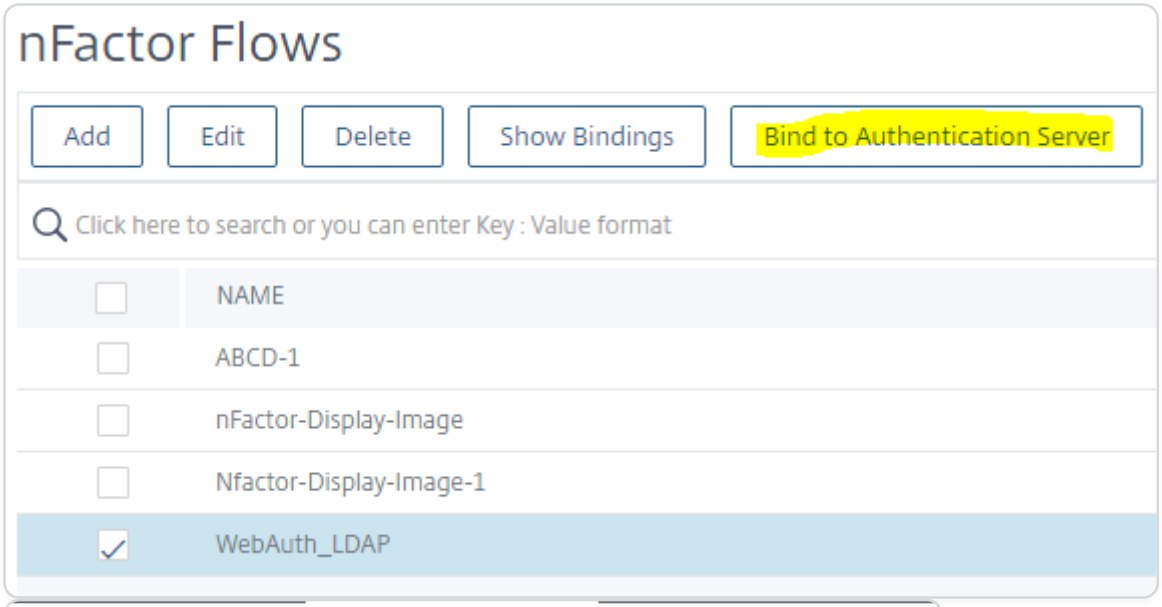


5. Click the green **+** sign to add the next Factor that is LDAP authentication with password change option enabled.

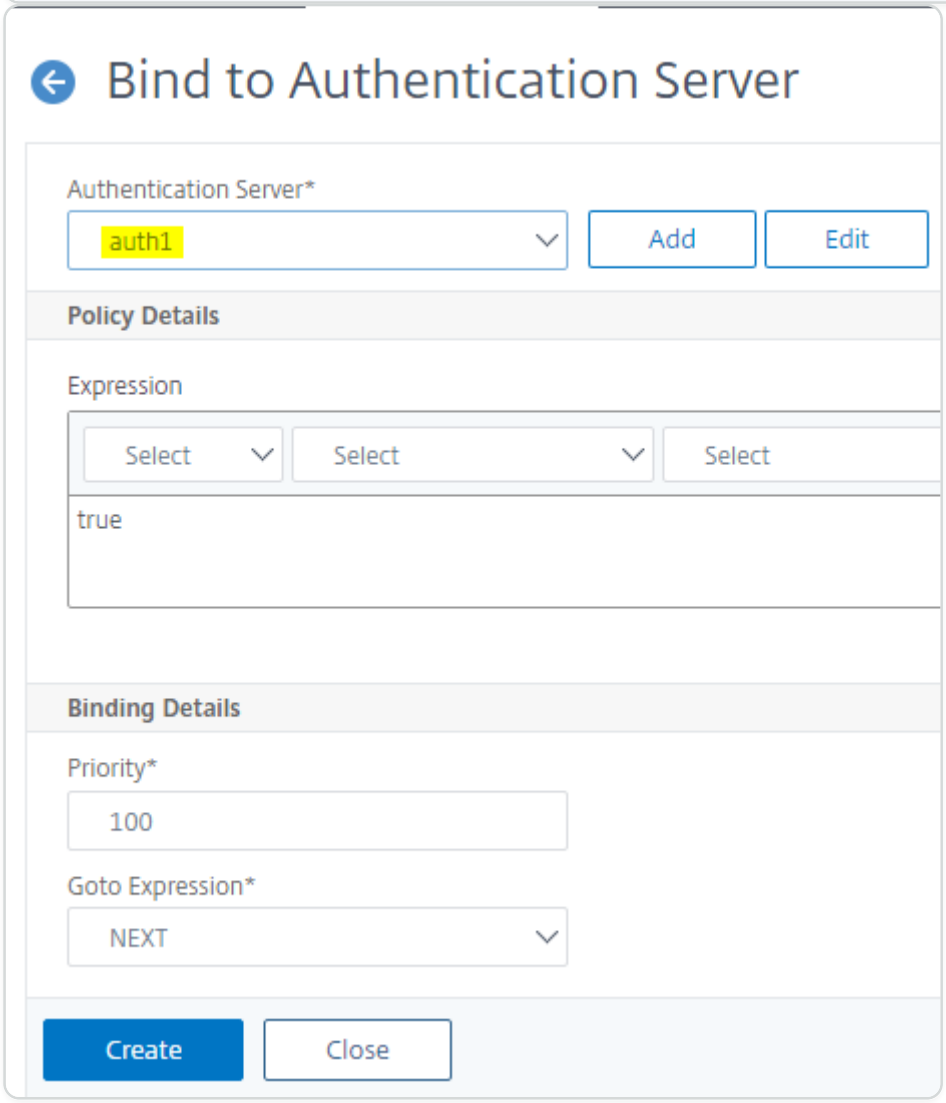


6. Click **Add Schema** to add the login schema for LDAP authentication.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



7. Click **Add Policy** to add the LDAP authentication policy and LDAP action/server.



To create LDAP action/server, refer to the article `<https://support.citrix.com/article/CTX219939>`.

8. Once both the factors are configured, you must bind the flow to the authentication, authorization, and auditing virtual server.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Debugging – Logs and counters

The logs are seen after a successful login with WebAuth and LDAP. To see most of the following logs, set the audit log level to ALL, so that it displays the debug logs also.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
set audit syslogparams –loglevel ALL
```

Note: The timestamps are removed from the logs for brevity.

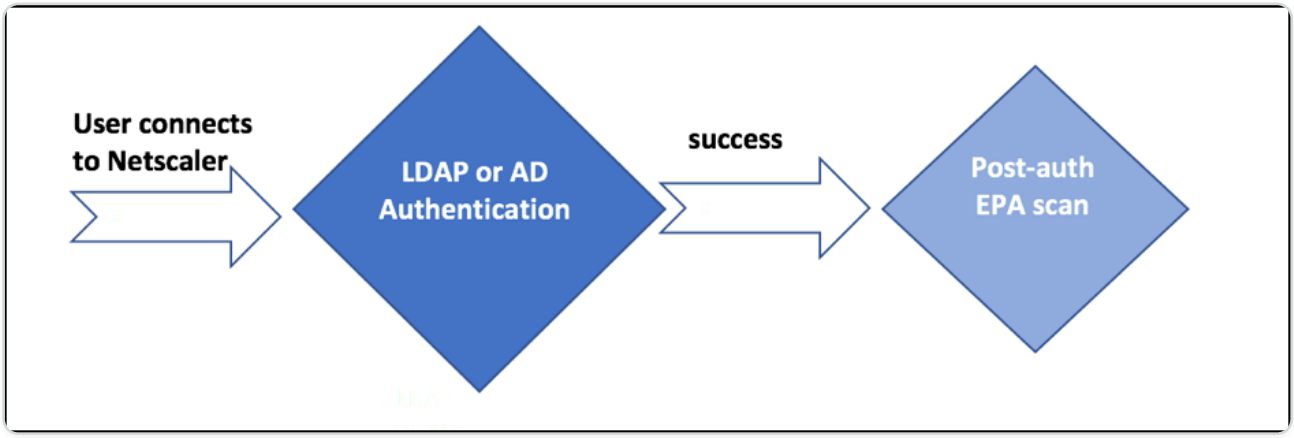
The following counters are incremented after a successful login with WebAuth and LDAP.

- pcp_hits authn(webAuth_policy)
- aaa_tot_webauth_primary_auth
- aaa_tot_webauth_prim_auth_success
- aaa_tot_webauth_prim_succ_check_thru
- pcp_hits authn(webAuth_policy)
- pcp_hits authn(ldap_policy)
- aaa_auth_succ

Configure periodic Endpoint Analysis scan as a factor in nFactor authentication



On NetScaler Gateway, Endpoint Analysis (EPA) can be configured to check if a user device meets certain security requirements and accordingly allow access of internal resources to the user. The Endpoint Analysis plug-in downloads and installs on the user device when users log on to NetScaler Gateway for the first time. If a user does not install the Endpoint Analysis plug-in on the user device, user cannot log on with the NetScaler Gateway plug-in.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

For understanding EPA in nFactor concepts, see, Concepts, and Entities Used for EPA in nFactor Authentication Through NetScaler.

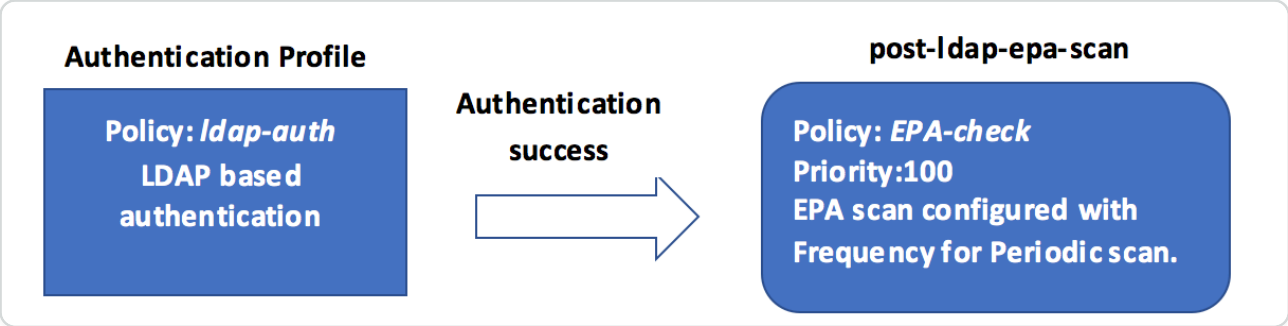
In classic policy, periodic EPA was configured as part of session policy under `vpn session action`. Under **Advanced Policy Infrastructure**, it can be linked to nFactor.

In this topic, EPA scan is used as a continuous check in a nFactor or multifactor authentication.

User tries to connect to NetScaler Gateway virtual IP address. A simple login page with user name and password field is rendered to user to provide login credentials. With these credentials, LDAP or AD based authentication is performed at the back end. If successful, user is presented with a pop up to authorize EPA scan. Once user authorizes, EPA scan is performed and based on the success or failure of user client settings, user is provided access.

If the scan is successful, EPA scan is performed periodically to ascertain that the security requirements configured are still met. If the EPA scan fails during any such check, the session is terminated.

Pre-requisites



It is assumed that the following configurations are in place:

- VPN virtual server/gateway and authentication virtual server configurations
- LDAP server configurations and associated policies

The required policies and policy label configurations are shown and associated to an authentication profile in this topic.

The following image shows mapping of policies and policy label. This is the approach used for configuration, but from right to left.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Perform the following by using the CLI

1. Create an action to perform EPA scan and associate it with an EPA scan policy.

   ```
   add authentication epaAction EPA-client-scan -csecexpr "sys.client_expr
   (\"proc_2_firefox\")"
   ```

   The above expression scans if the process ‘Firefox’ is running. The EPA plug-in checks for the process existence every 2 minutes, signified by the digit ‘2’ in the scan expression.

   ```
   add authentication Policy EPA-check -rule true -action EPA-client-scan
   ```

2. Configure Policy label post-ldap-epa-scan that hosts the policy for EPA scan.

   ```
   add authentication policylabel post-ldap-epa-scan -loginSchema
   LSCHEMA_INT
   ```

   Note: LSCHEMA_INT is in built schema with no schema, meaning no additional webpage is presented to the user at this step.

3. Associate policy configured in step 1 with policy label configured in step 2.

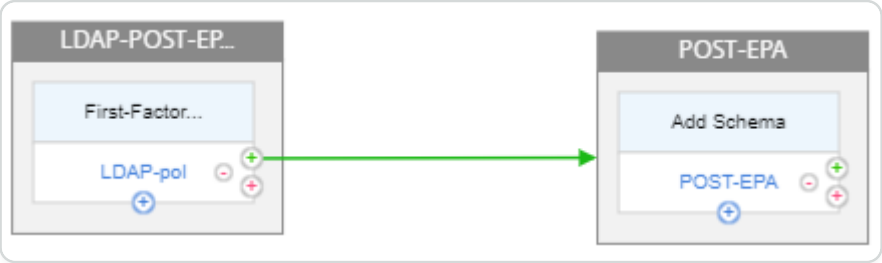
   ```
   bind authentication policylabel post-ldap-epa-scan -policyName EPA-
   check -priority 100 -gotoPriorityExpression END
   ```

   In this command, END indicates end of authentication mechanism.

4. Configure ldap-auth policy to and associate it with an LDAP policy that is configured to authenticate with a particular LDAP server.

   ```
   add authentication Policy ldap-auth -rule true -action ldap_server1
   ```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

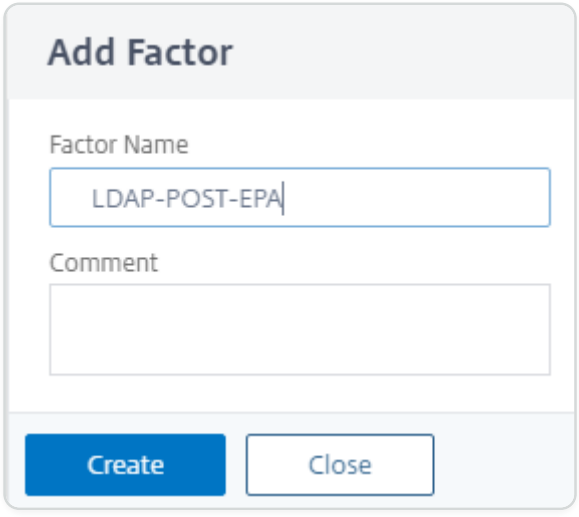


where ldap_server1 is the LDAP policy and ldap-auth is the policy name.

5. Associate the ldap-auth policy to authentication, authorization, and auditing virtual server with next step pointing to policy label post-ldap-epa-scan to perform EPA scan.

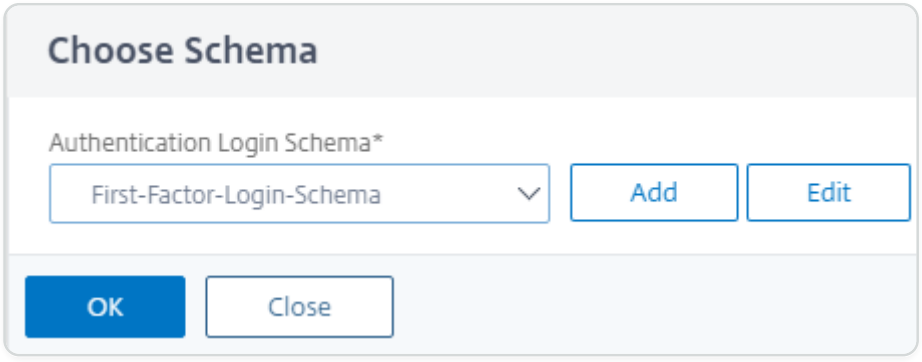
```
bind authentication vserver MFA_AAA_vserver -policy ldap-auth -priority
100 -nextFactor post-ldap-epa-scan -gotoPriorityExpression NEXT
```

Configuration by using the nFactor Visualizer in the GUI

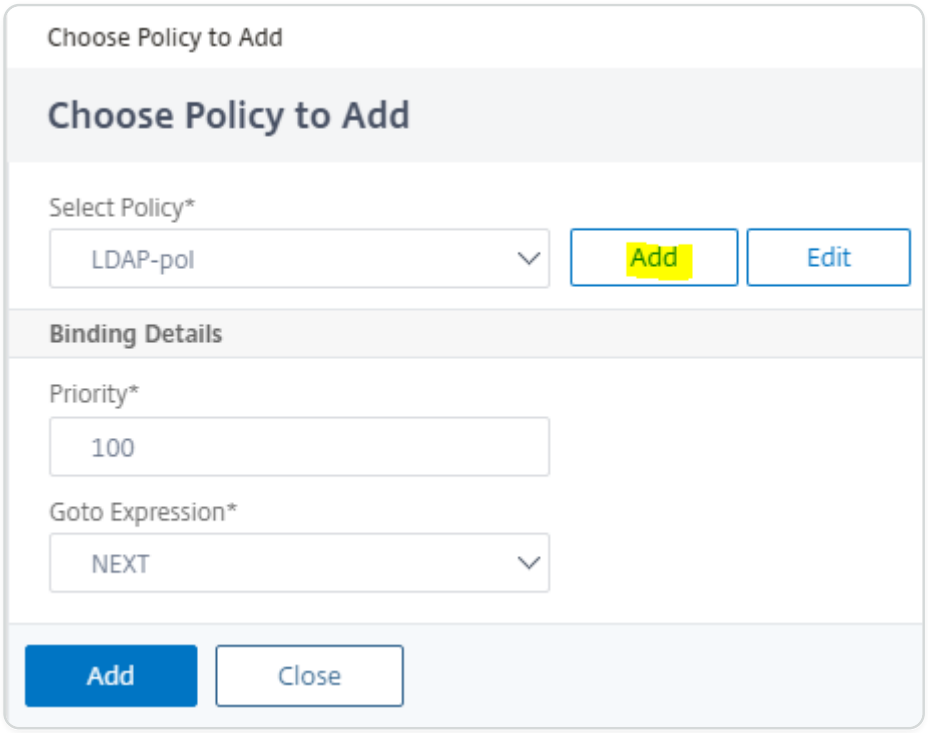


The preceding configuration can also be performed using nFactor Visualizer, which is a feature available on firmware 13.0 and later.

1. Navigate to **Security > AAA-Application Traffic > nFactor Visualizer > nFactor Flow** and click **Add**.
2. Click **+** to add the nFactor flow.



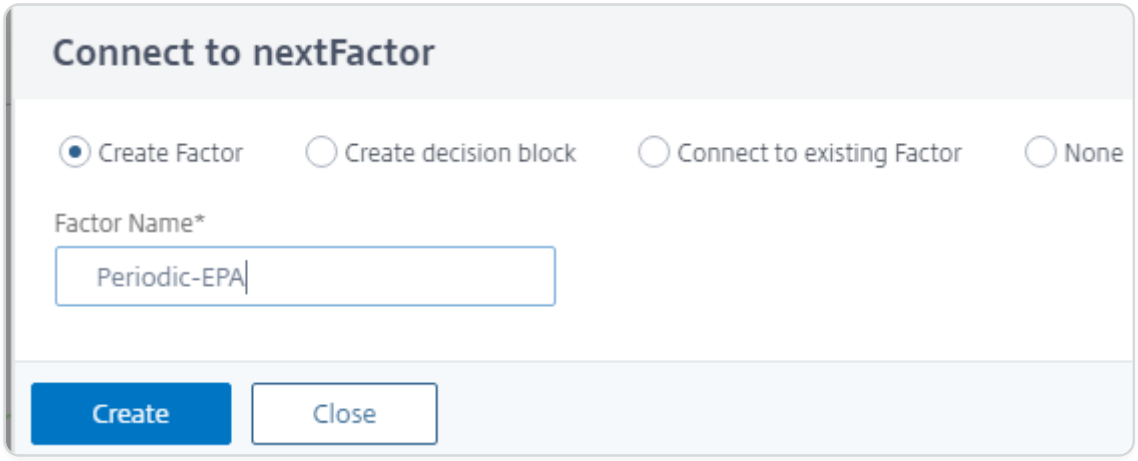
3. Add a factor. The name that you enter is the name of the nFactor flow.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

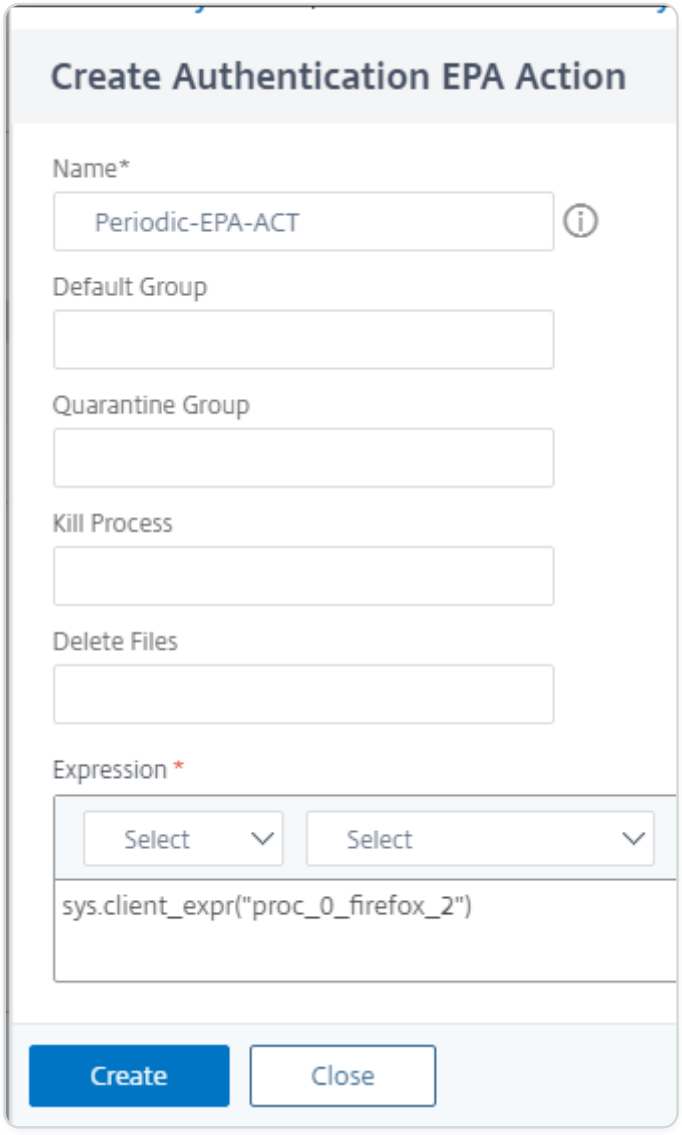
4. Click **Add Schema** to add a schema for the first factor and then click **Add.**

5. Click **Add Policy** to add the LDAP policy. If the LDAP policy is already created, you can select the same.



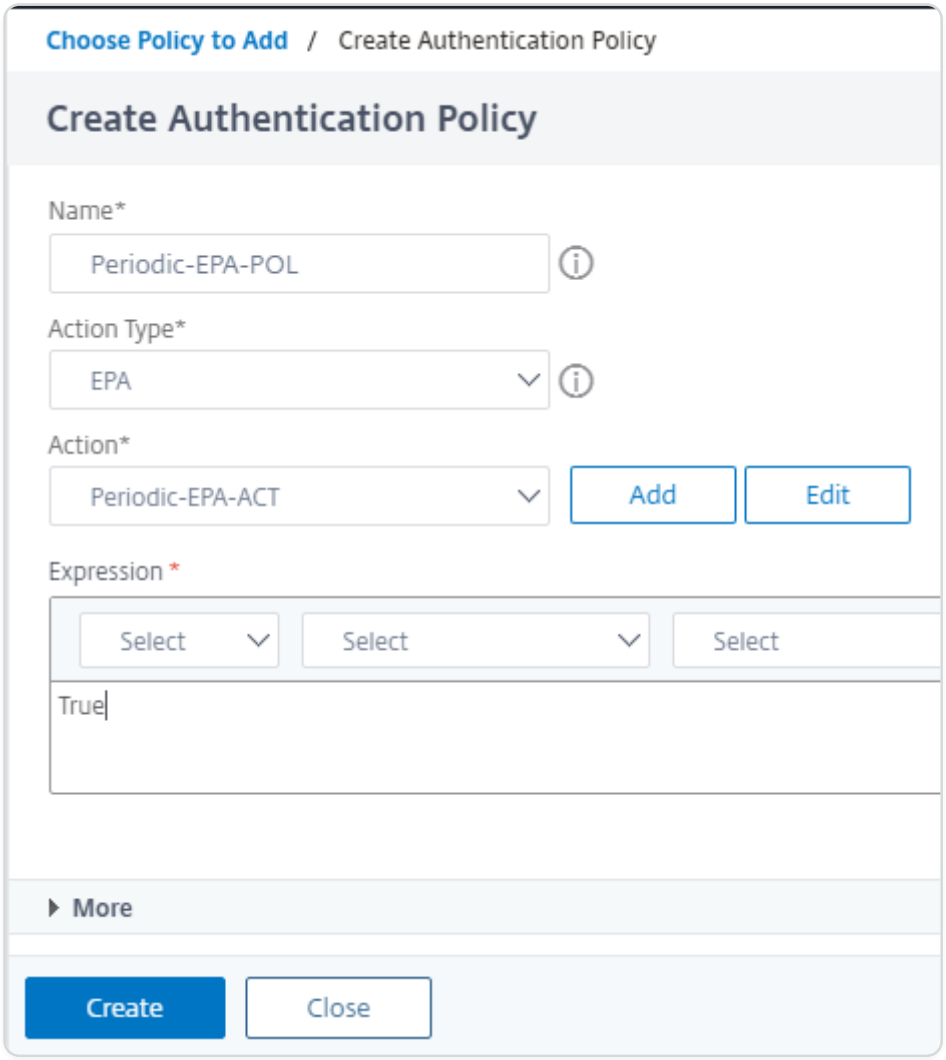
NOTE:

To create an LDAP policy, click **Add** and in the **Action** field, select **LDAP**. For more details about adding an LDAP server, see `<https://support.citrix.com/article/CTX123782>`.



6. Click **+** to add the EPA factor.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



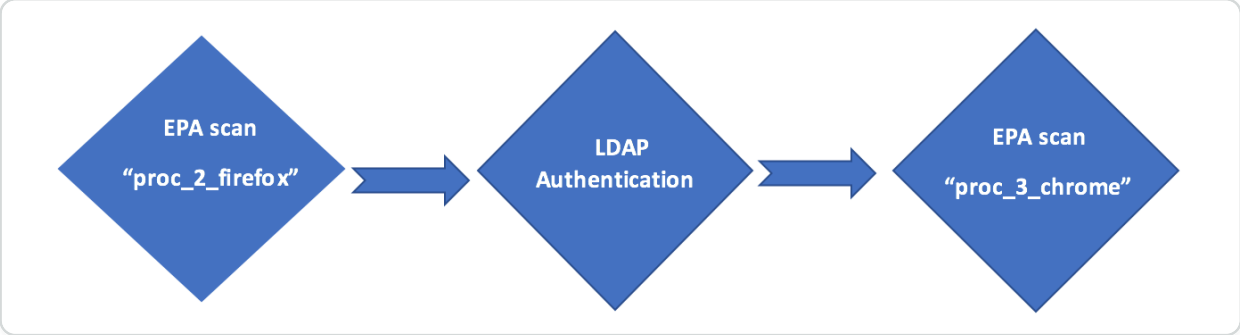
7. Leave the **Add Schema** section blank, to have the default no schema applied for this factor. Click **Add policy** to add the post authentication EPA policy and action.

   EPA Action:

   EPA Policy:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Click **Create**.



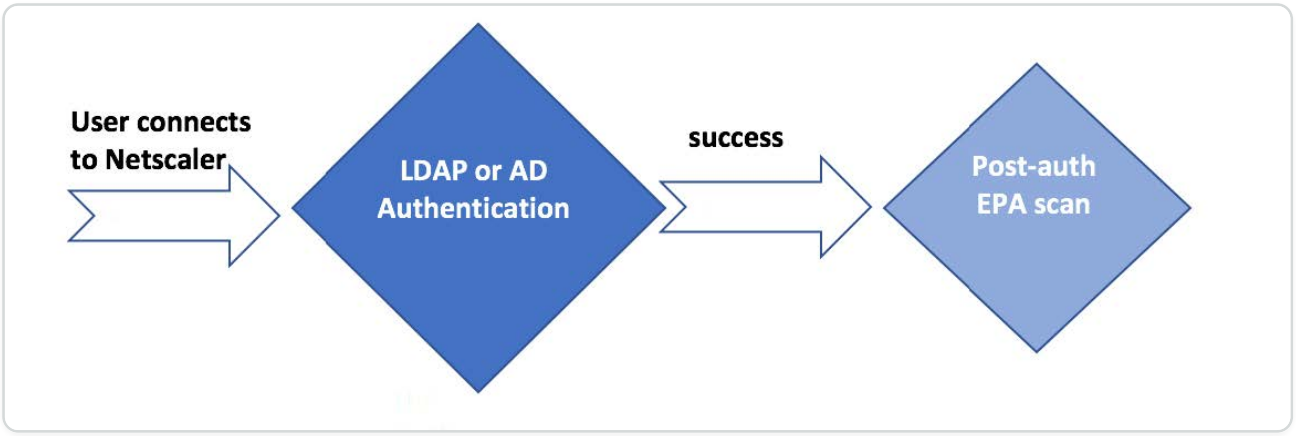
8. After the nFactor flow is complete, bind this flow to the authentication, authorization, and auditing virtual server.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Note: If periodic EPA is configured as multiple factors, the latest factor with periodic EPA configuration is considered.

Example:

In this example, EPA is the first factor where the scan looks for the process 'Firefox.' If the EPA scan is successful, it leads to LDAP authentication, followed by the next EPA scan, that looks for the process 'Chrome.' When there exist multiple periodic scans configured as different factors, the latest scan takes precedence. In this case, the EPA plug-in scans for the process 'Chrome' every 3 minutes after the login is successful.



Configure post-authentication Endpoint Analysis scan as a factor in NetScaler nFactor authentication

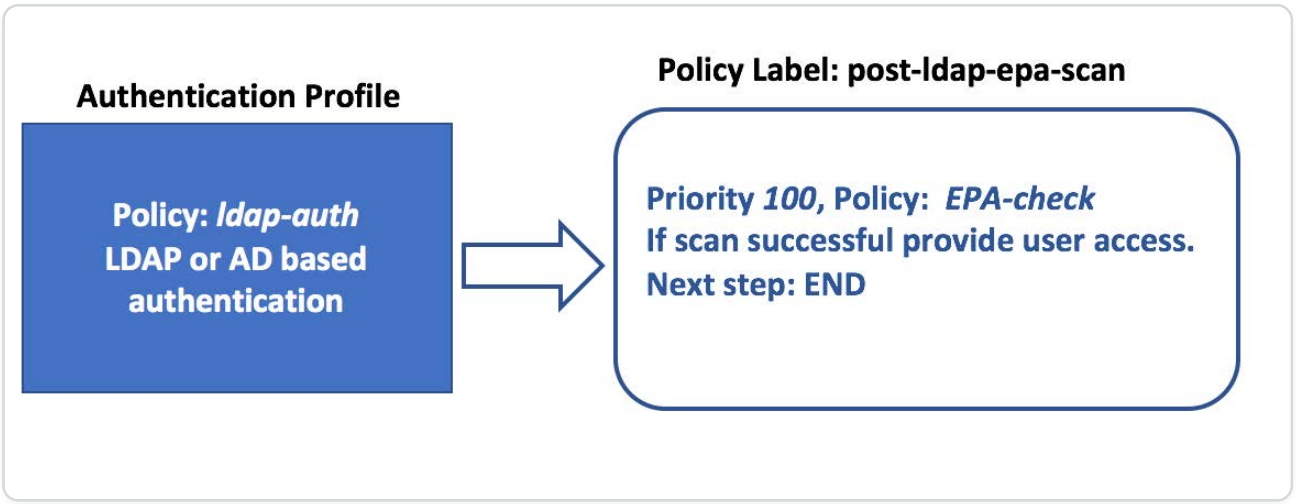
On NetScaler Gateway, Endpoint Analysis (EPA) can be configured to check if a user device meets certain security requirements and accordingly allow internal resources access to the user. The Endpoint Analysis plug-in downloads and installs on the user device when users log on to NetScaler Gateway for the first time. If a user does not install the Endpoint Analysis plug-in on the user device or chooses to skip the scan, the user cannot log on with the NetScaler Gateway plug-in. Optionally, users can be put in a quarantine group where the user gets limited access to internal network resources.

Previously post-EPA was configured as part of session policy. Now it can be linked to nFactor providing more flexibility, as to when it can be performed.

In this topic, EPA scan is used as a final check in a nFactor or multifactor authentication.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

User tries to connect to NetScaler Gateway virtual IP address. A simple login page with user name and password field is rendered to user to provide login credentials. With these credentials, LDAP or AD-based authentication is performed at the back end. If successful, user is presented with a popup message to authorize EPA scan. Once user authorizes, EPA scan is performed and based on the success or failure of user client settings, user is provided access.



Prerequisites

It is assumed that following configuration are in place.

- VPN virtual server/gateway and authentication virtual server configurations
- LDAP server configurations and associated policies

Note: The setup can also be created through the nFactor Visualizer available in NetScaler version 13.0 and later.

The following image shows mapping of policies and policy label. This is the approach used for configuration, but from right to left.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Perform the following by using the CLI

1. Create an action to perform EPA scan and associate it with an EPA scan policy.

```
add authentication epaAction EPA-client-scan -csecexpr "sys.client_expr
(\"app_0_MAC-BROWSER_1001_VERSION_<=_10.0.3\")||
sys.client_expr(\"os_0_win7_sp_1\")"
```

   The above expression scans if macOS users have browser version less than 10.0.3 or if Windows 7 users have Service pack 1 installed.

```
add authentication Policy EPA-check -rule true -action EPA-client-scan
```

2. Configure policy label post-ldap-epa-scan that hosts the policy for EPA scan.

```
add authentication policylabel post-ldap-epa-scan -loginSchema
LSCHEMA_INT
```

   Note: LSCHEMA_INT is an in-built schema with no schema (noschema), meaning no additional webpage is presented to user at this step.

3. Associate policy configured in step 1 with policy label configured in step 2.

```
bind authentication policylabel post-ldap-epa-scan -policyName EPA-
check - priority 100     -gotoPriorityExpression END
```

4. Configure ldap-auth policy to and associate it with an LDAP policy which is configured to authenticate with a particular LDAP server.

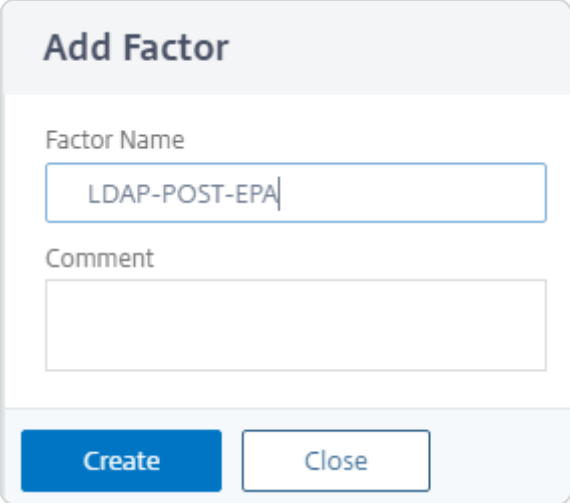
```
add authentication Policy ldap-auth -rule true -action ldap_server1
```

   where ldap_server1 is LDAP policy and ldap-auth is the policy name

5. Associate ldap-auth policy to authentication, authorization, and auditing virtual server with next step pointing to policy label post-ldap-epa-scan to perform EPA scan.

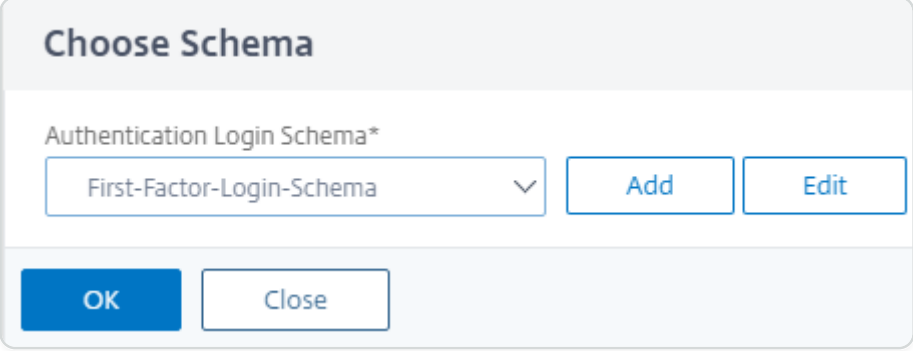
```
bind authentication vserver MFA_AAA_vserver -policy ldap-auth -priority
100 -nextFactor post-ldap-epa-scan -gotoPriorityExpression NEXT
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.



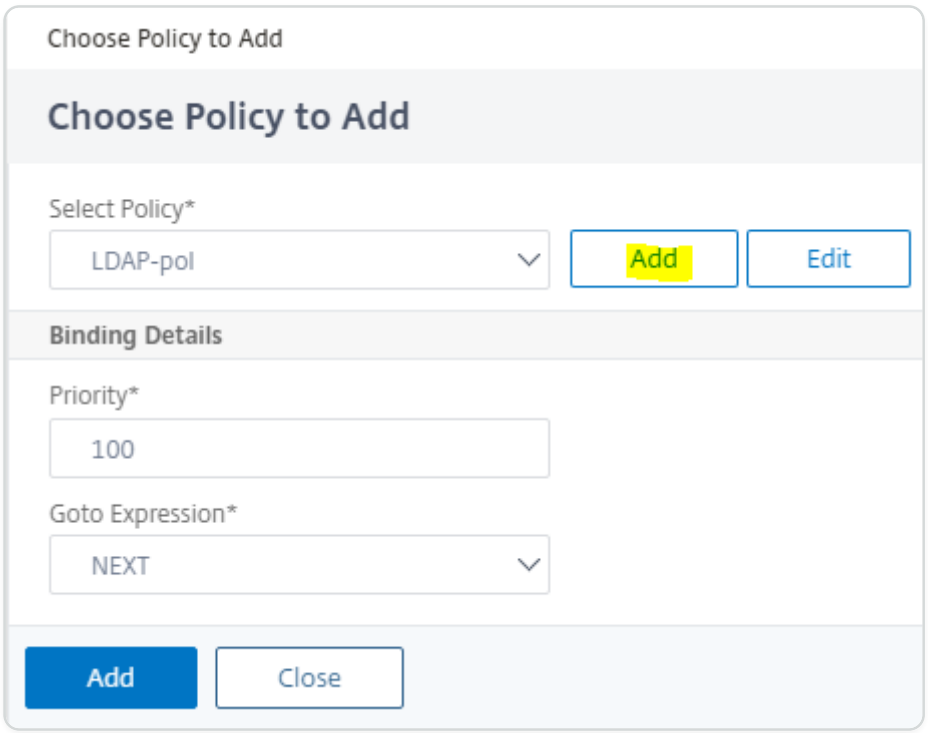
Note: Pre-authentication EPA scan is always performed as the first step in nFactor authentication. Post-authentication EPA scan is always performed as the last step in nFactor authentication. EPA scans cannot be performed in between a nFactor authentication.

Configuring using the nFactor Visualizer

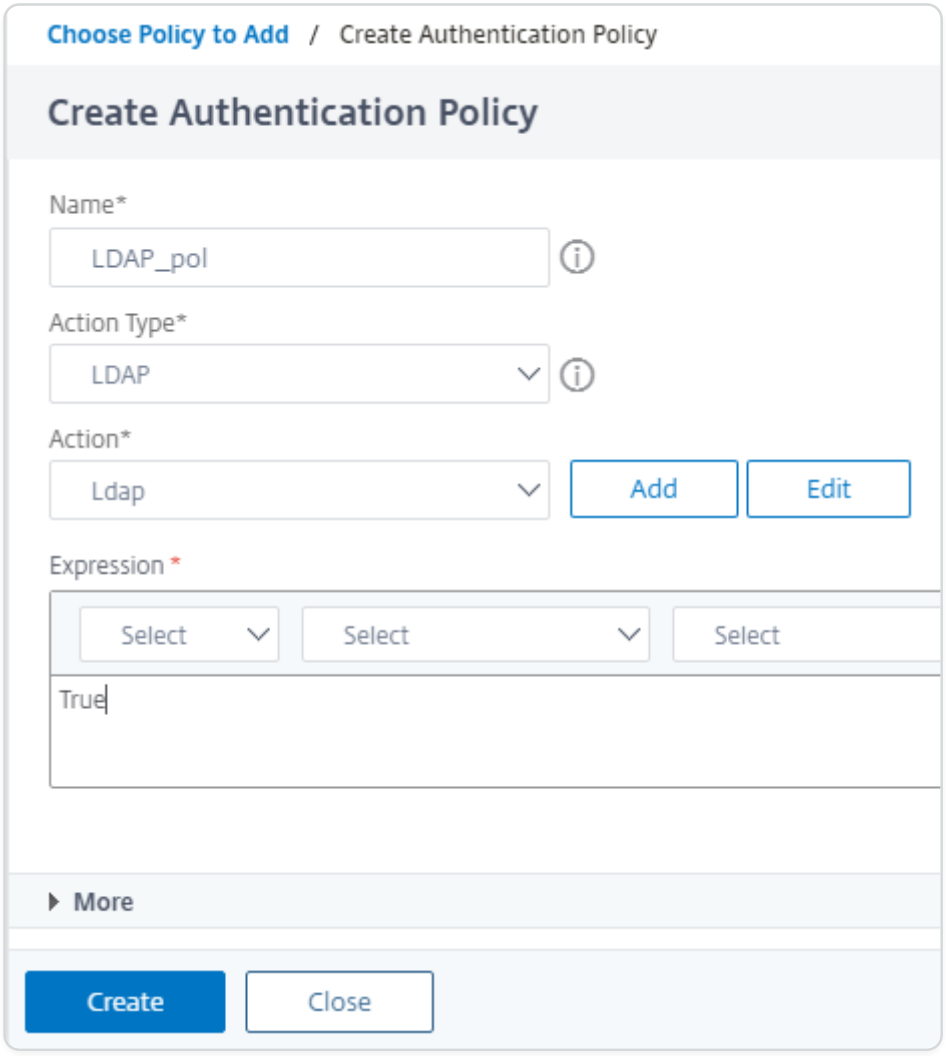


The above configuration can also be performed using nFactor Visualizer, which is a feature available on firmware 13.0 and later.

1. Navigate to **Security > AAA-Application Traffic > nFactor Visualizer > nFactor Flow** and click **Add**.
2. Click **+** to add the nFactor flow.
3. Add a factor. The name that you enter is the name of the nFactor flow.



4. Click **Add Schema** to add a schema for the first factor and then click **Add.**

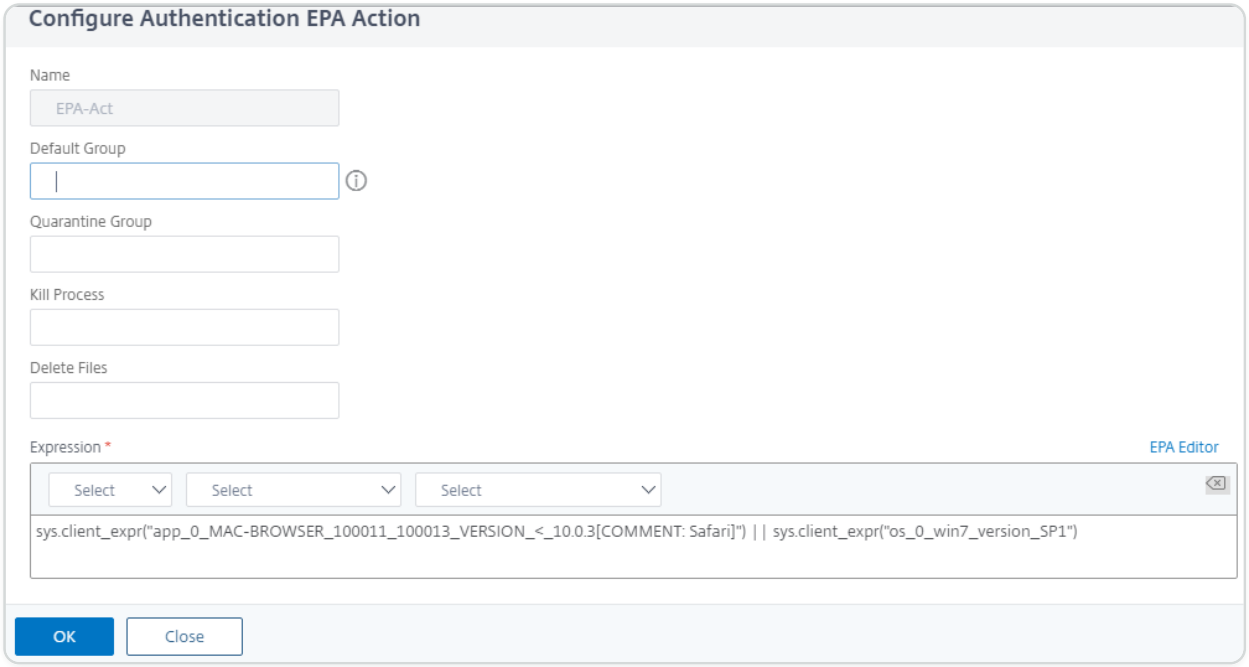


© 1997–2026 Citrix Systems, Inc. All rights reserved.

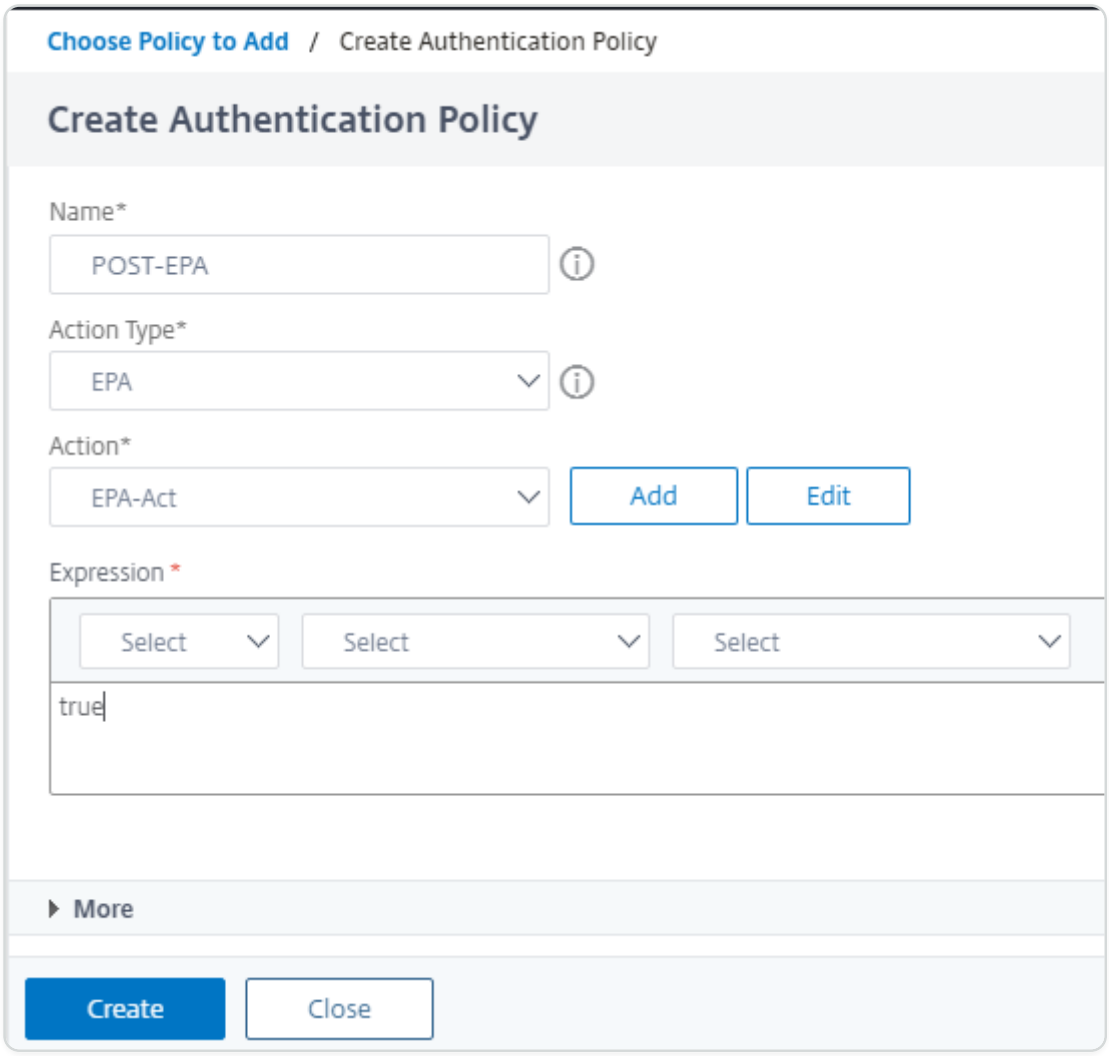
5. Click **Add Policy** to add the LDAP policy. If the LDAP policy is already created, you can select the same.

   Note: You can create an LDAP policy. Click **Add** and in the **Action** field, select **LDAP**. For more details about adding an LDAP server, see `<https://support.citrix.com/article/CTX123782)>`

© 1997–2026 Citrix Systems, Inc. All rights reserved.



6. Click **+** to add the EPA factor.

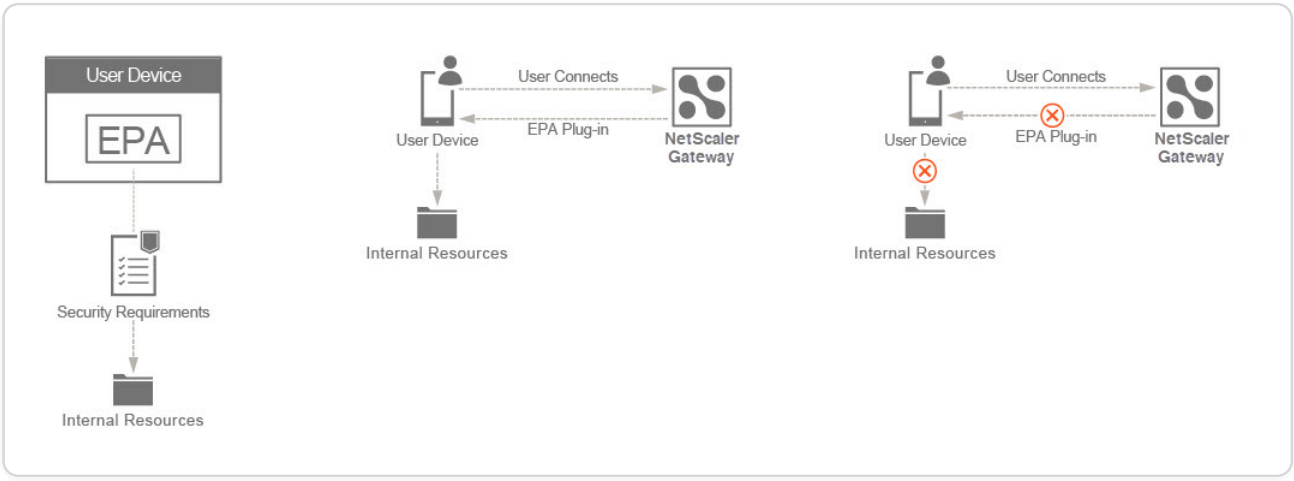


7. Leave the **Add Schema** section blank, to have the default no schema applied for this factor. Click **Add policy** to add the post auth EPA policy and action.

   EPA action:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

EPA policy:



Click **Create**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

8. After the nFactor flow is complete, bind this flow to the authentication, authorization, and auditing virtual server.

Configure pre-authentication Endpoint Analysis scan as a factor in nFactor authentication

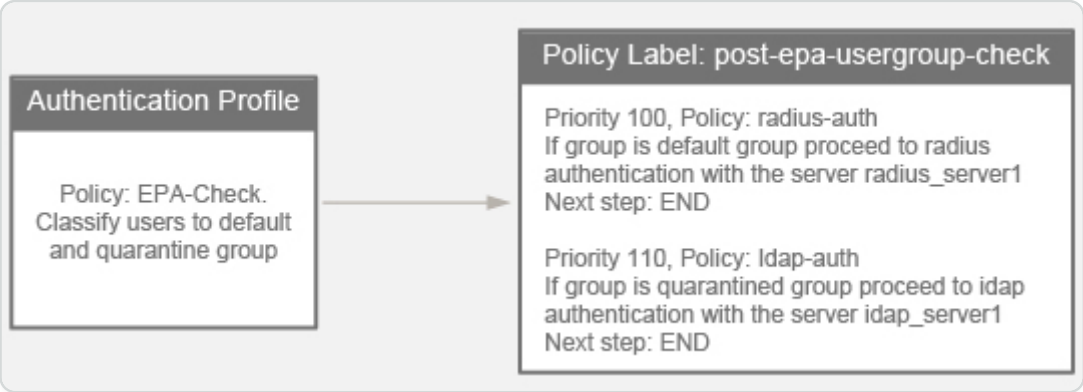
On NetScaler Gateway, Endpoint Analysis (EPA) can be configured to check if a user device meets certain security requirements and accordingly allow access of internal resources to the user. The Endpoint Analysis plug-in downloads and installs on the user device when users log on to NetScaler Gateway for the first time. If a user does not install the Endpoint Analysis Plug-in on the user device or chooses to skip the scan, the user cannot log on with the NetScaler Gateway plug-in. Optionally, the user can be put in a quarantine group where the user gets limited access to internal network resources.

In this topic, an EPA scan is used as an initial check in a nFactor or multifactor authentication.

The user connects to the NetScaler Gateway virtual IP address. An EPA scan is started. If an EPA scan is successful, the user is rendered with the login page with the user name and password fields for RADIUS or OTP-based authentication. Else, the user is rendered with a login page, but this time the user is authenticated using LDAP or AD (Active Directory) based authentication. Based on the success or failure of the user provided credentials, the user is provided access.

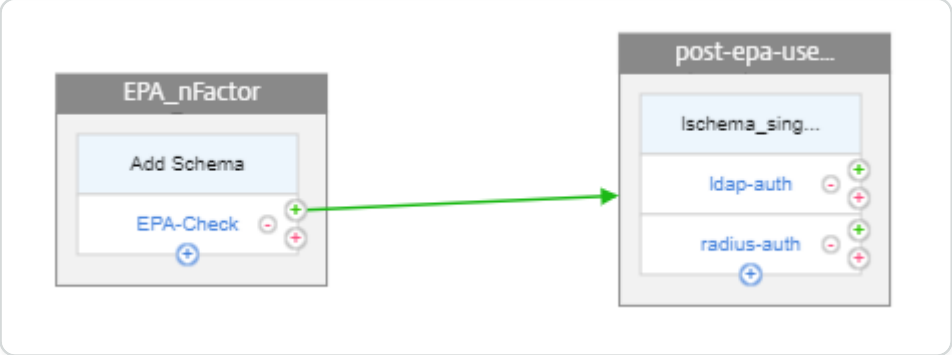
Implementing this logic post the EPA:

1. If the EPA scan is successful, the user is placed or tagged to a default user group.
2. If the EPA scan is a failure, then the user is placed or tagged to a quarantine group.
3. The next method of authentication (RADIUS or LDAP) is chosen based on the user group membership as determined in the first two steps.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

Prerequisites



Make sure that the following configuration is in place.

- VPN virtual server or gateway and authentication virtual server configurations
- Authentication, authorization, and auditing user groups (for default and quarantined user groups) and associated policies
- LDAP and RADIUS server configurations and associated policies

The following figure displays the mapping of policies and policy label. This is the approach used for configuration, but from right to left.

Note: The setup can also be created through the nFactor Visualizer available in NetScaler version 13.0 and later.

Perform the following by using the CLI

1. Configure an LDAP-auth policy to check for quarantined_group membership and associate it with an LDAP policy that is configured to authenticate with a particular LDAP server. In the following sample command, `ldap-auth` is the name of the authentication policy and `ldap_server1` is the name for the LDAP action created.

```
add authentication Policy ldap-auth -rule "AAA.USER.IS_MEMBER_OF
(\"quarantined_group\")" -action ldap_server1
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. Configure Radius-auth policy to check for default_group membership and associate it with a RADIUS policy that is configured to authenticate with a particular RADIUS server. In the following sample command, `radius-auth` is the name of the authentication policy and `radius_server1` is the name for the RADIUS action created.

```
add authentication Policy radius-auth -rule
"AAA.USER.IS_MEMBER_OF(\"default_group\")" -action radius_server1
```

3. Configure policy label post-epa-usergroup-check with a login schema to capture single factor user name and password.

```
add authentication policylabel post-epa-usergroup-check -loginSchema
lschema_single_factor_deviceid
```

Note: If you do not want to use the in-built schema lschema_single_factor_deviceid, you can replace with the schema as per your requirement.

4. Associate policies configured in step 1 and 2 with policy label configured in step 3.

```
bind authentication policylabel post-epa-usergroup-check -policyName
radius-auth -priority 100 -gotoPriorityExpression END

bind authentication policylabel post-epa-usergroup-check -policyName
ldap-auth -priority 110 -gotoPriorityExpression END
```

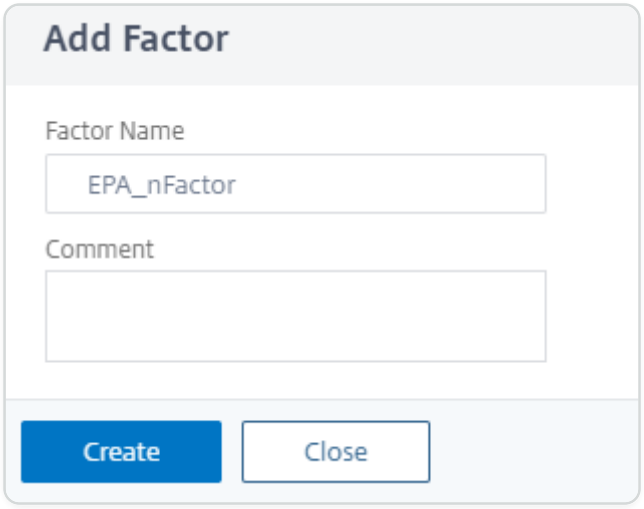
Note: END indicates end of authentication mechanism for that leg.

5. Create an action to perform the EPA scan and associate it with an EPA scan policy.

```
add authentication epaAction EPA-client-scan -csecexpr
"sys.client_expr(\"app_0_MAC- BROWSER_1001_VERSION_<=_10.0.3\")||
sys.client_expr(\"os_0_win7_sp_1\")"  -defaultEPAGroup default_group
-quarantineGroup quarantined_group
```

The default_group and quarantined_group are pre-configured user groups. The expression in step 5 scans if macOS users have browser version less than 10.0.3 or if Windows 7 users have Service pack 1 installed.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

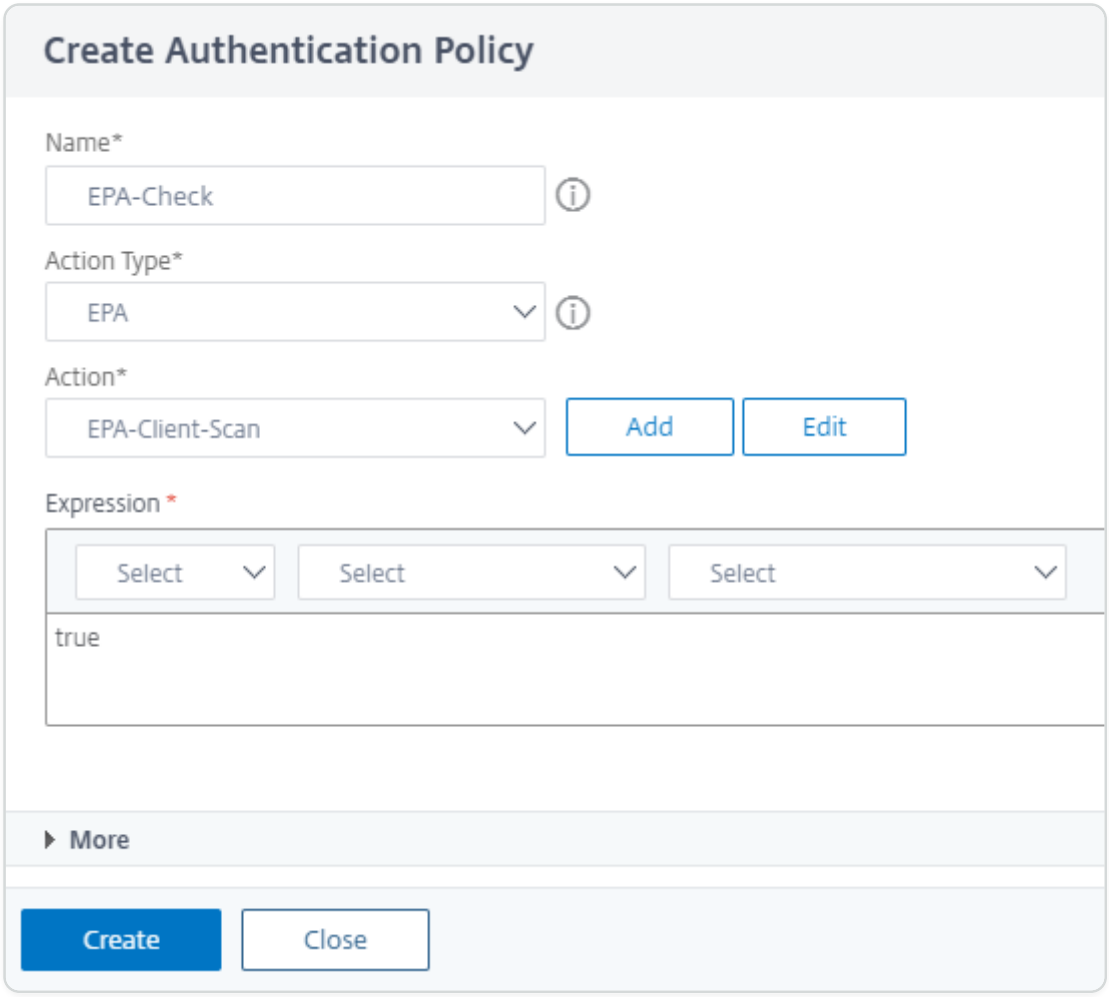


```
add authentication Policy EPA-check -rule true -action EPA-client-scan
```

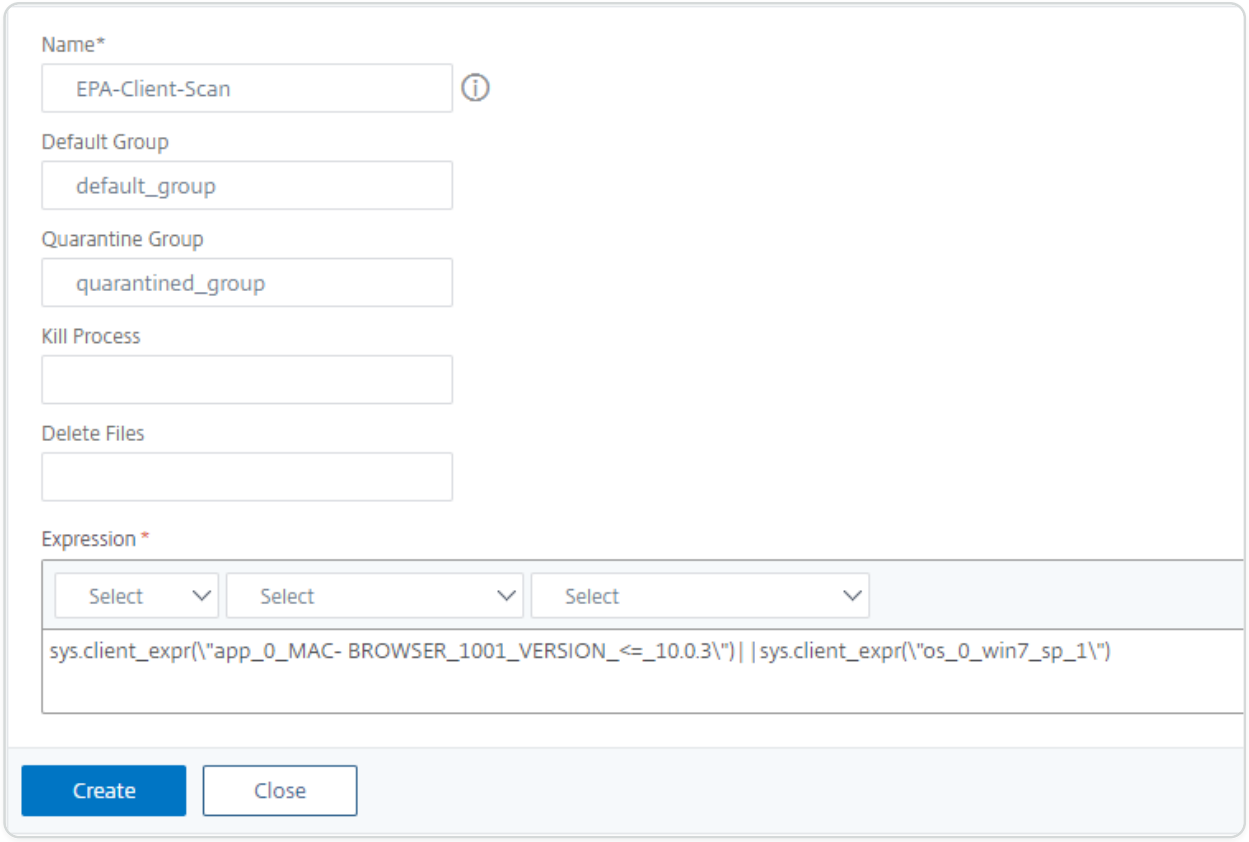
6. Associate an EPA scan policy to the authentication, authorization, and auditing virtual server with the next step pointing to the policy label post-epa-usergroup-check. This is to do the next step in authentication.

```
bind authentication vserver MFA_AAA_vserver -policy EPA-check -priority
100 -nextFactor post-epa-usergroup-check -gotoPriorityExpression NEXT
```

Configuration by using the nFactor Visualizer



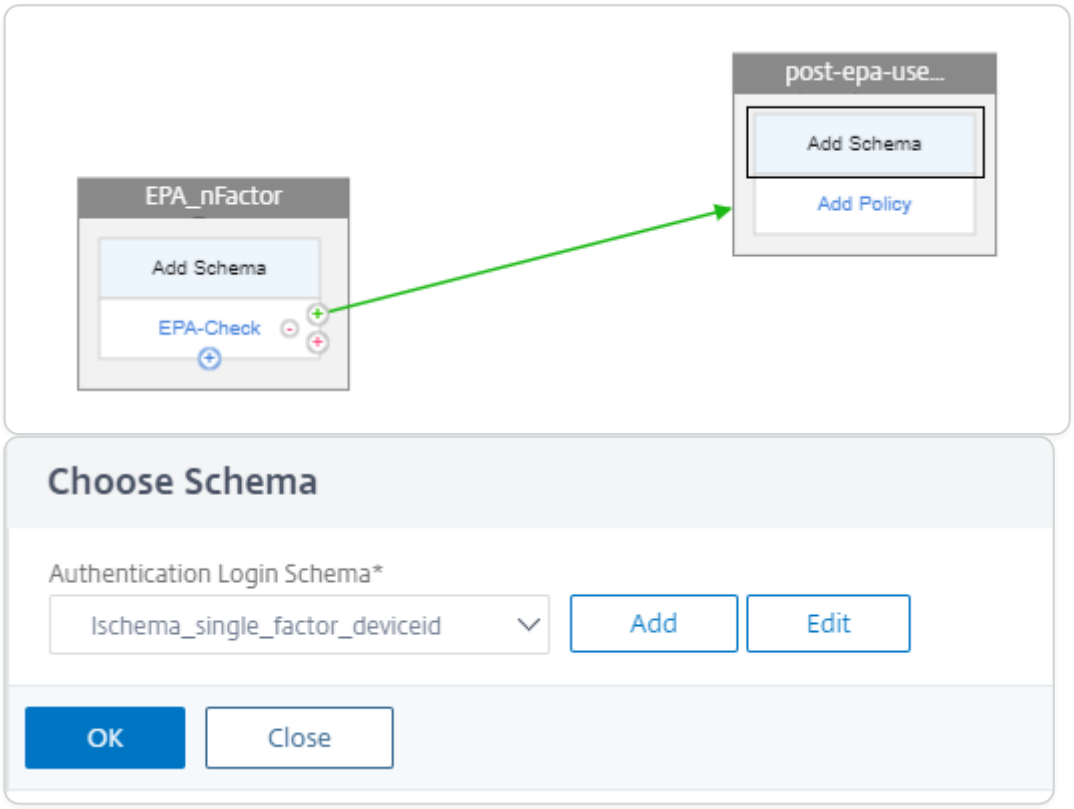
1. Navigate to **Security > AAA-Application Traffic > nFactor Visualizer > nFactor Flow** and click **Add.**
2. Click **+** to add the nFactor flow.
3. Add a factor. The name that you enter is the name of the nFactor flow.



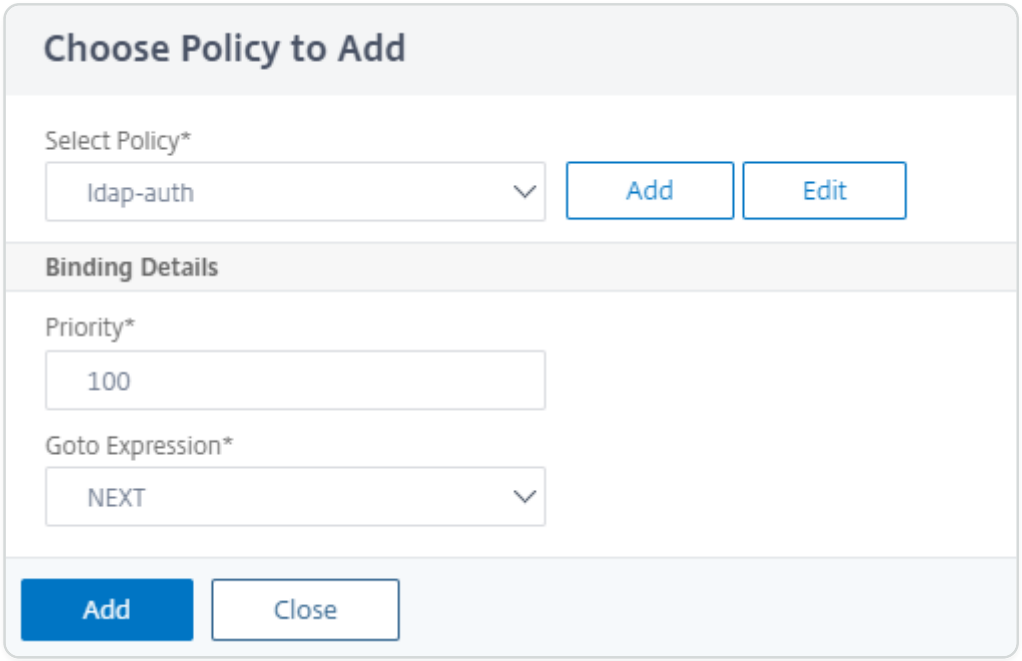
Note: No schema is required for the first factor.

4. Click **Add Policy** and then **Add** to create an authentication policy for EPA check.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



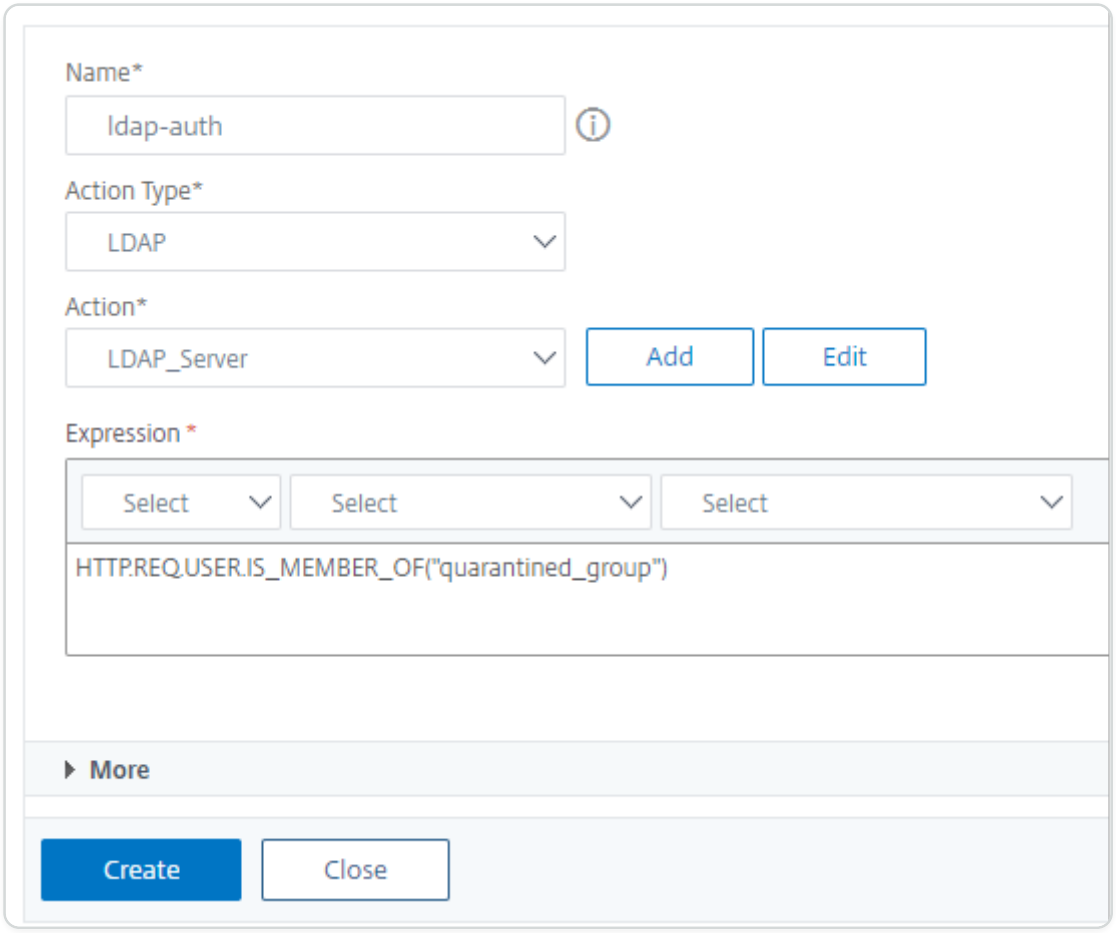
5. In **Action** field, click **Add** to add the EPA action.



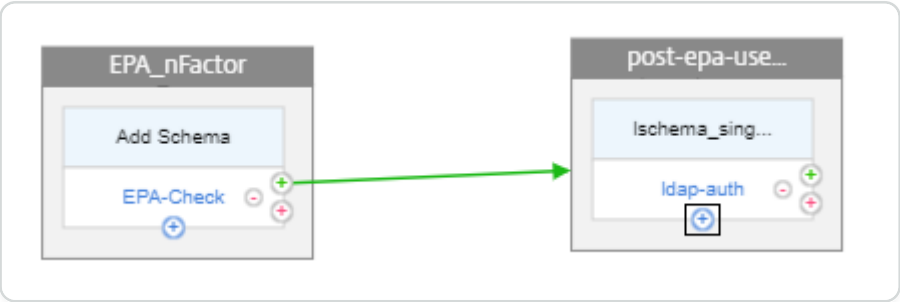
© 1997–2026 Citrix Systems, Inc. All rights reserved.

For more details on the EPA, see Configuring Advanced Endpoint Analysis Scan.

6. Click the green **+** sign on the EPA_nFactor block to add the next factor for the post EPA user group check.
7. Click **Add Schema** to add the schema for the second factor. Select the schema lschema_single_factor_deviceid.

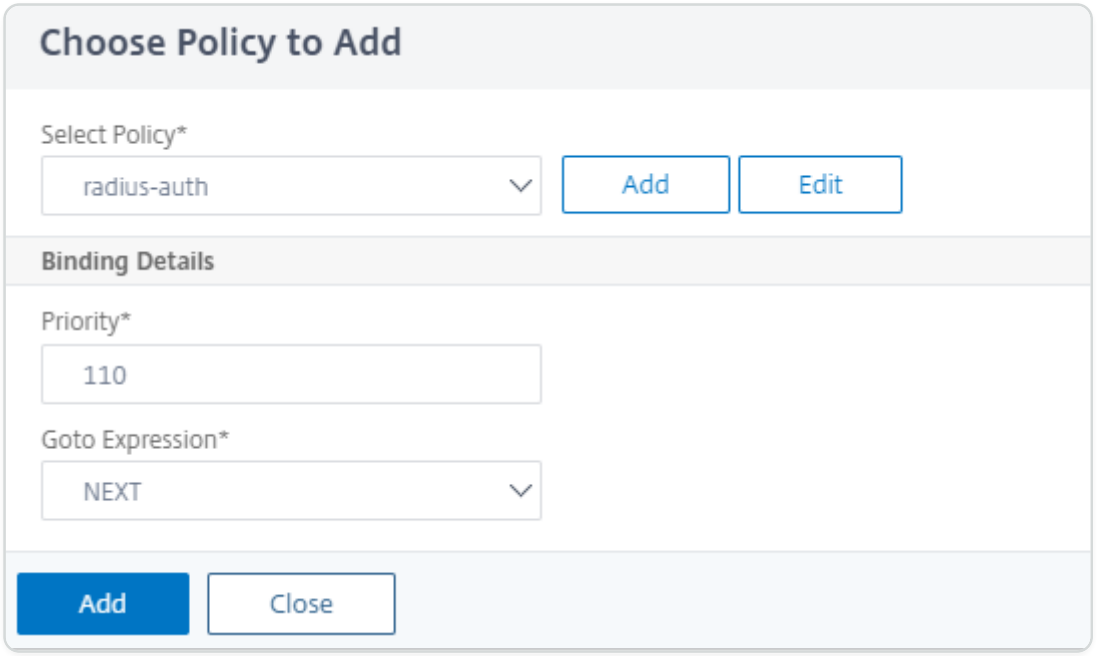


8. Click **Add policy** to select the policy for LDAP authentication.

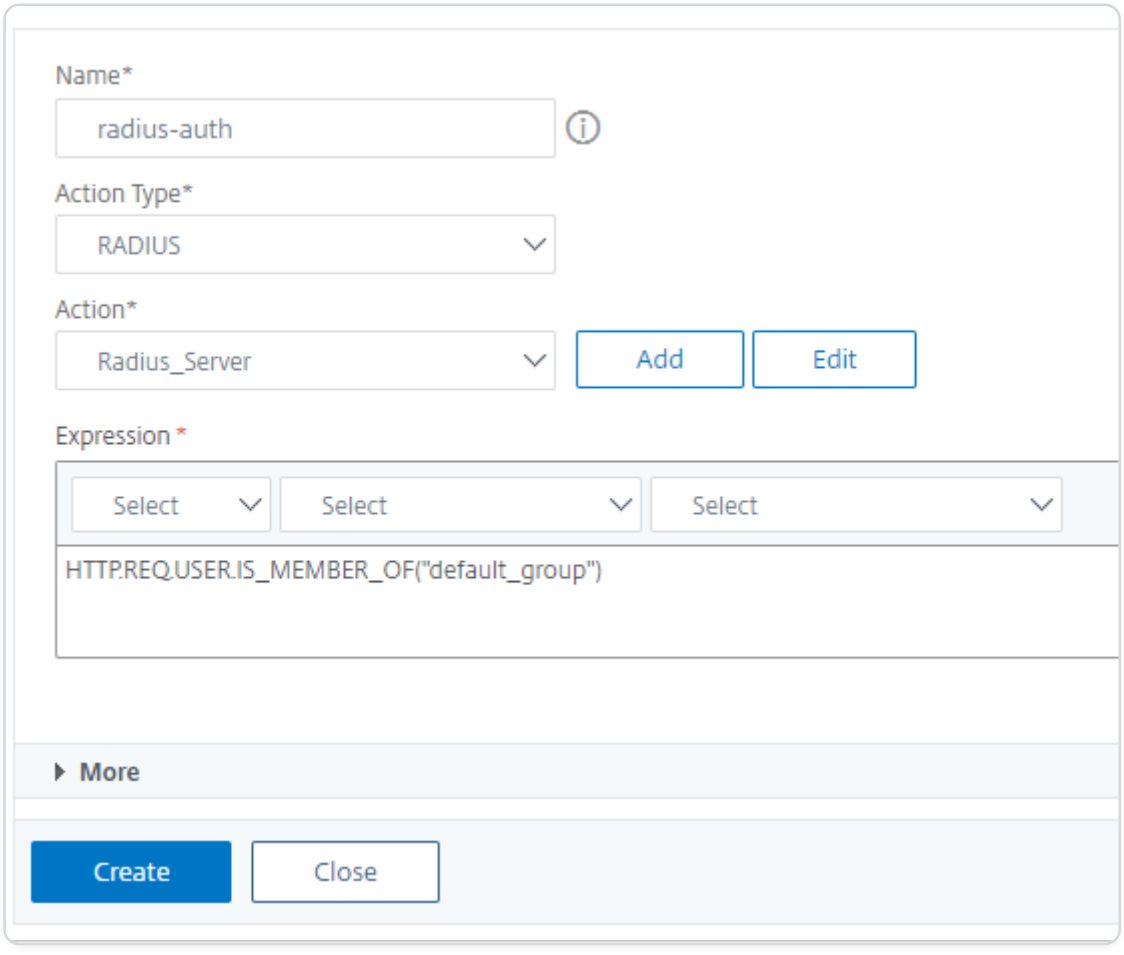


© 1997–2026 Citrix Systems, Inc. All rights reserved.

The policy for LDAP checks if the user is part of the quarantined group. For more information on creating LDAP authentication, see, Configuring LDAP Authentication.



9. Click the blue **+** sign on the EPA_nFactor block to add the second authentication.



10. Click **Add** to select the policy for the RADIUS authentication. For more information on creating RADIUS authentication, see Configuring RADIUS Authentication.

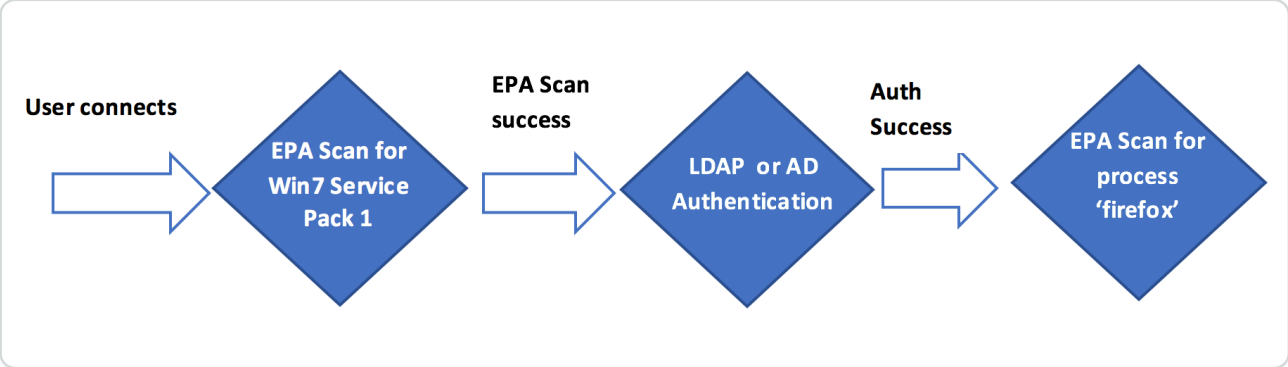
© 1997–2026 Citrix Systems, Inc. All rights reserved.

The policy for the LDAP checks if the user is part of the default group.

11. Click **Done**.
12. After the nFactor flow is complete, bind this flow to the authentication, authorization, and auditing virtual server. Click **Bind to Authentication Server** then click **Create**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Unbind the nFactor flow



1. Select the nFactor flow and click **Show Bindings.**
2. Select the authentication virtual server and click **Unbind.**

Configure pre-auth and post-auth EPA scan as a factor in nFactor authentication

On NetScaler Gateway, Endpoint Analysis (EPA) can be configured to check if a user device meets certain security requirements and accordingly allow access of internal resources to the user. The Endpoint Analysis plug-in downloads and installs on the user device when users log on to NetScaler Gateway for the first time. If a user does not install the Endpoint Analysis plug-in on the user device, the user cannot log on with the NetScaler Gateway plug-in.

For understanding EPA in nFactor concepts, see, Concepts, and Entities Used for EPA in nFactor Authentication Through NetScaler.

In this topic, EPA scan is used as an initial check in a nFactor or multifactor authentication, followed by login and EPA scan as the final check.

User connects to NetScaler Gateway virtual IP address. An EPA scan is initiated. If EPA scan is successful, the user is rendered the login page with user name and password fields for LDAP or AD (Active Directory) based authentication. Based on the success of the user credentials, the user is redirected to the next EPA factor.

High level steps involved in this configuration

1. If the scan is successful, the user is placed or tagged to a default user group.
2. The next method of authentication (LDAP) is chosen.
3. Based on the result of authentication, the user is presented with the next set of scan.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Pre-requisites

It is assumed that the following configurations are in place.

- VPN virtual server/gateway and authentication virtual server configurations. The sample authentication virtual server used in the following section is `MFA_AAA_vserver`.
- Authentication, authorization, and auditing user groups (for default & quarantined user groups) and associated policies. The sample default user group used in the following section is `default_group`.
- LDAP server configurations and associated policies. The sample LDAP policy used in the following section is `ldap_server1`.

Configuration by using the CLI

1. Create an action to perform an EPA scan and associate it with an EPA scan policy.

   ```
   add authentication epaAction SecondEPA_client_scan -csecexpr
   "sys.client_expr(\"proc_0_firefox\")"
   ```

   The preceding expression scans if the Firefox process is running on the client machine.

   ```
   add authentication Policy SecondEPA_check -rule true -action
   SecondEPA_client_scan
   ```

2. Configure a policy label `post-epa-scan` that hosts the policy for EPA scan.

   ```
   add authentication policylabel post-epa-scan -loginSchema LSCHEMA_INT
   ```

   Note: `LSCHEMA_INT` is an in-built schema with no schema (noschema), meaning no additional webpage is presented to user at this step.

3. Associate the policy configured in step 1 with the policy label configured in step 2.

   ```
   bind authentication policylabel post-epa-scan -policyName
   SecondEPA_check -priority 100 -gotoPriorityExpression END
   ```

   `END` indicates end of authentication mechanism.

4. Configure a `ldap-auth` policy and associate it with an LDAP policy, which is configured to authenticate with a particular LDAP server.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add authentication Policy ldap-auth -rule true -action ldap_server1
```

Here `ldap_server1` is a pre-configured LDAP policy and `ldap-auth` is the policy name. For more information on configuring the LDAP policy, see Create an LDAP Authentication Action using the CLI.

5. Configure a policy label `ldap-factor`, with a login schema to capture a single factor user name and password.

```
add authentication policylabel ldap-factor -loginSchema LSCHEMA_INT
```

Note: Replace `LSCHEMA_INT` with the schema that you need, in case you do not want to use in built schema.

6. Associate the policy configured in step 4 with the policy label configured in step 5.

```
bind authentication policylabel ldap-factor -policyName ldap-auth
-priority 100 -gotoPriorityExpression END -nextFactor post-epa-scan
```

`END` indicates the end of authentication mechanism for that factor and `nextFactor` indicates the next factor following authentication.

7. Create an action to perform EPA scan and associate it with an EPA scan policy.

```
add authentication epaAction FirstEPA_client_scan -csecexpr
"sys.client_expr(\"os_0_win7_sp_1\")" -defaultEPAGroup default_group
```

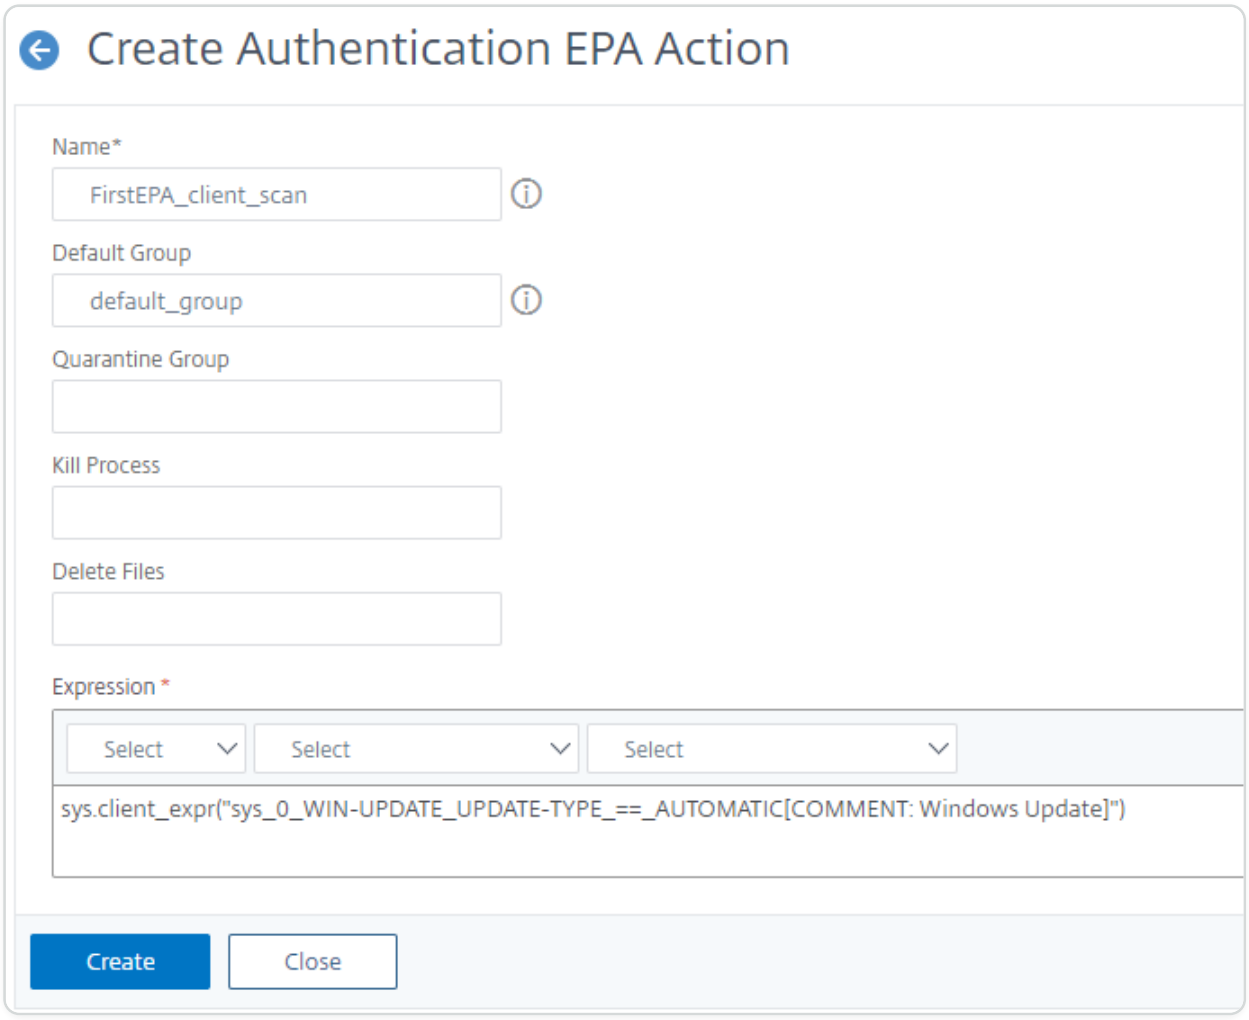
Here `default_group` is a pre-configured user group.

The preceding expression scans if Windows 7 users have Service pack 1 installed.

```
add authentication Policy FirstEPA-check -rule true -action
FirstEPA_client_scan
```

8. Associate an EPA scan policy to authentication, authorization, and auditing virtual server with the next step pointing to the policy label ldap-factor to perform the next step in authentication.

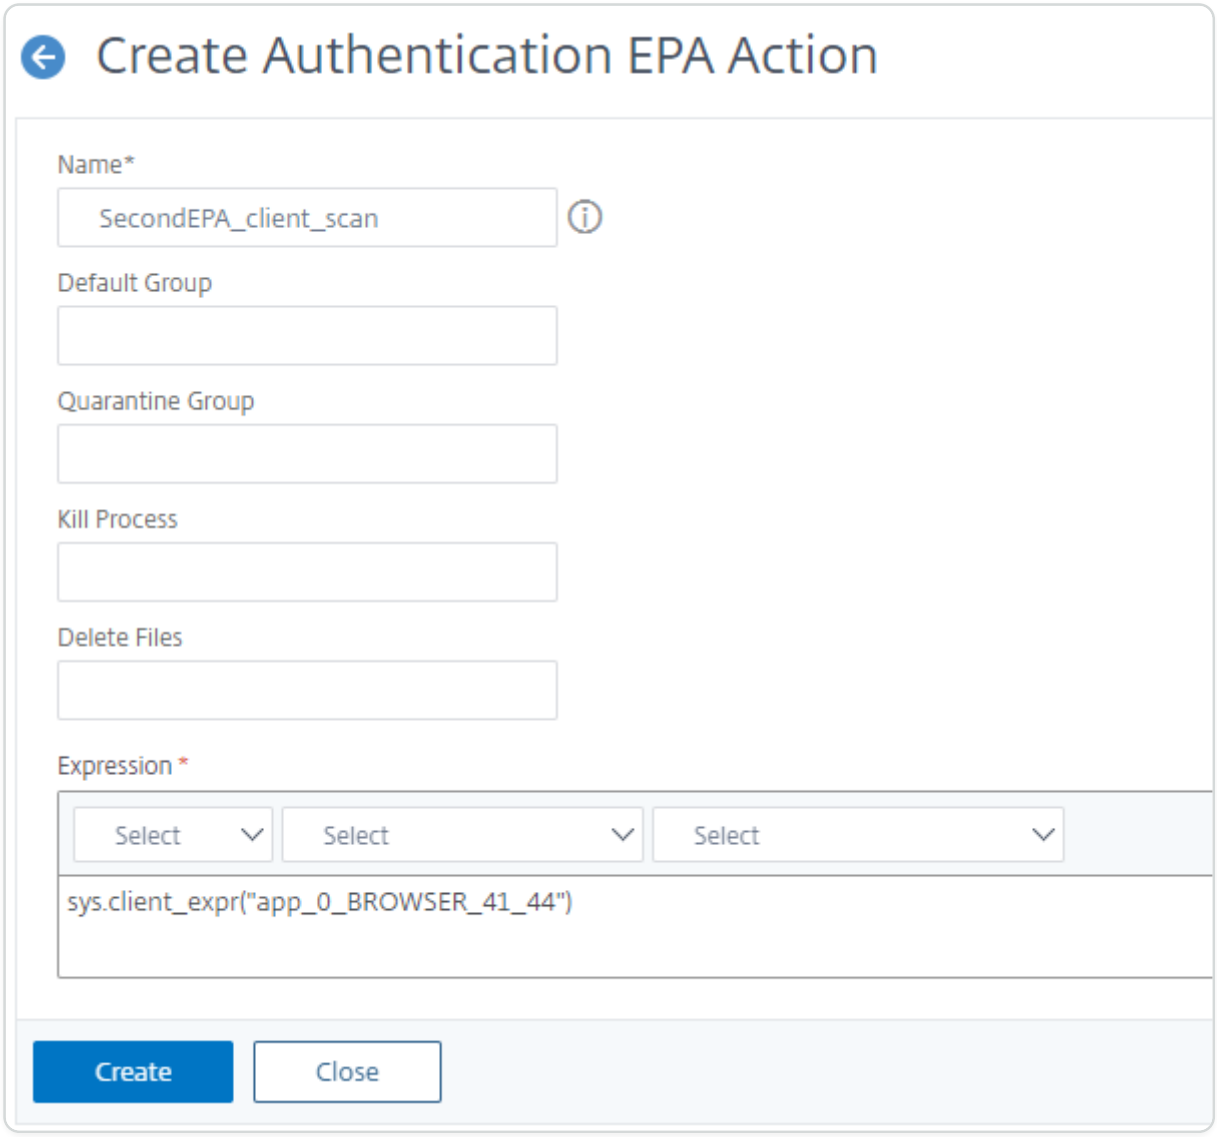
```
bind authentication vserver MFA_AAA_vserver -policy FirstEPA-check
-priority 100 -nextFactor ldap-factor -gotoPriorityExpression NEXT
```



© 1997–2026 Citrix Systems, Inc. All rights reserved.

Here `MFA_AAA_vserver` is a pre-configured authentication, authorization, and auditing virtual server. For more information on configuring the authentication, authorization, and auditing virtual server, see Configure an authentication virtual server by using the CLI.

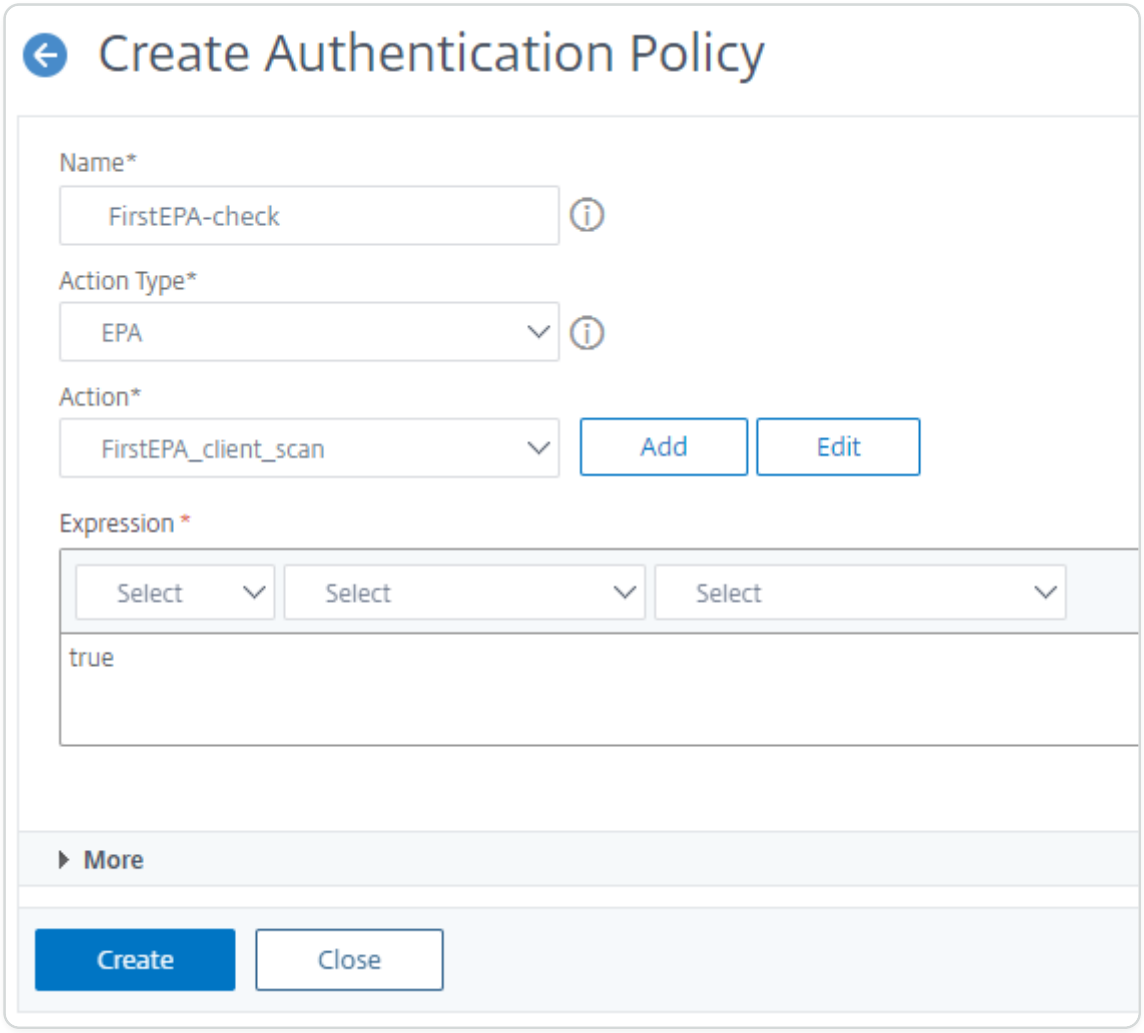
Configuration by using the GUI



1. Navigate to **Security > AAA-Application Traffic > Policies > Authentication > Advanced Policies > Actions > EPA**.

   First EPA Scan to check for Automatic Windows Update and a default group

   Second EPA Scan to check for the Firefox Browser



© 1997–2026 Citrix Systems, Inc. All rights reserved.

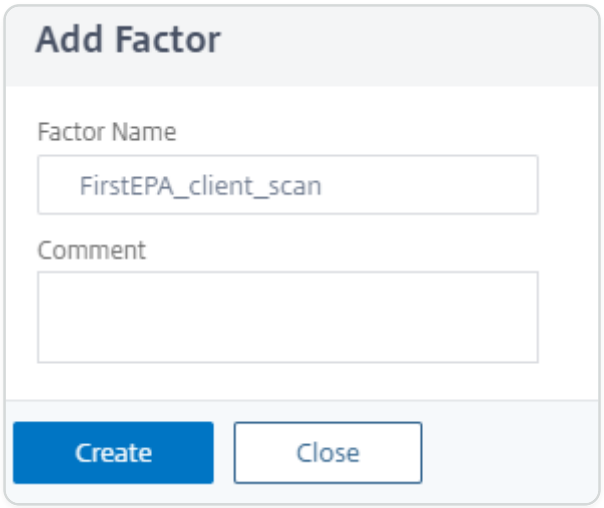
2. Create an EPA Policy. Navigate to **Security > AAA-Application Traffic > Policies > Authentication > Advanced Policies > Policy** and bind the action created in step 1.

   Policy for first EPA scan

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Policy for second EPA Scan

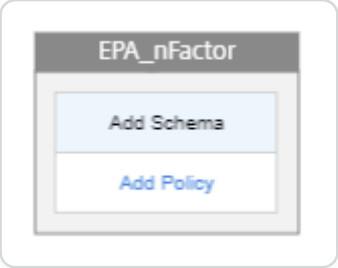
© 1997–2026 Citrix Systems, Inc. All rights reserved.



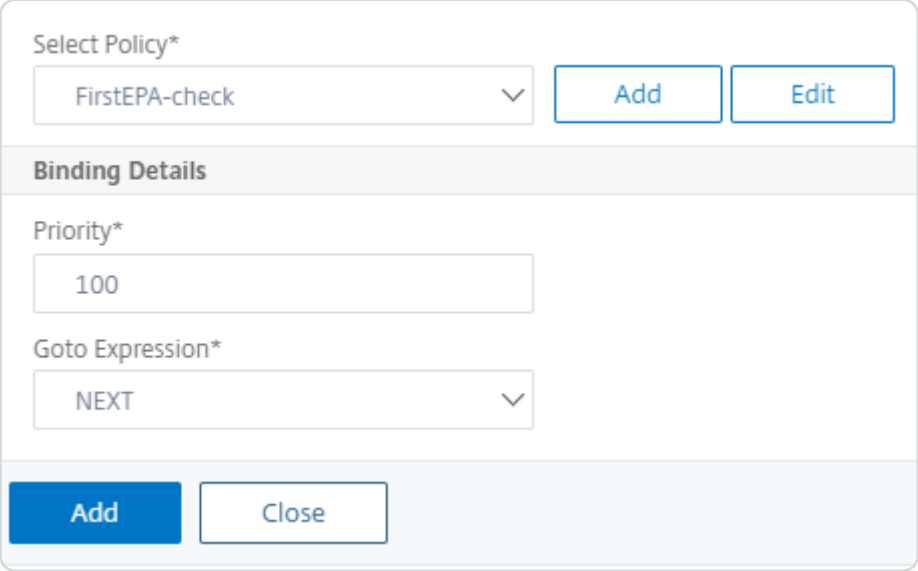
For more information on Advanced EPA see, Advanced Endpoint Analysis Scans

3. Create an nFactor flow. Navigate to **Security > AAA-Application Traffic > nFactor Visualizer > nFactor Flow** and click **Add**.

   Note: nFactor Visualizer is available on firmware 13.0 and later.

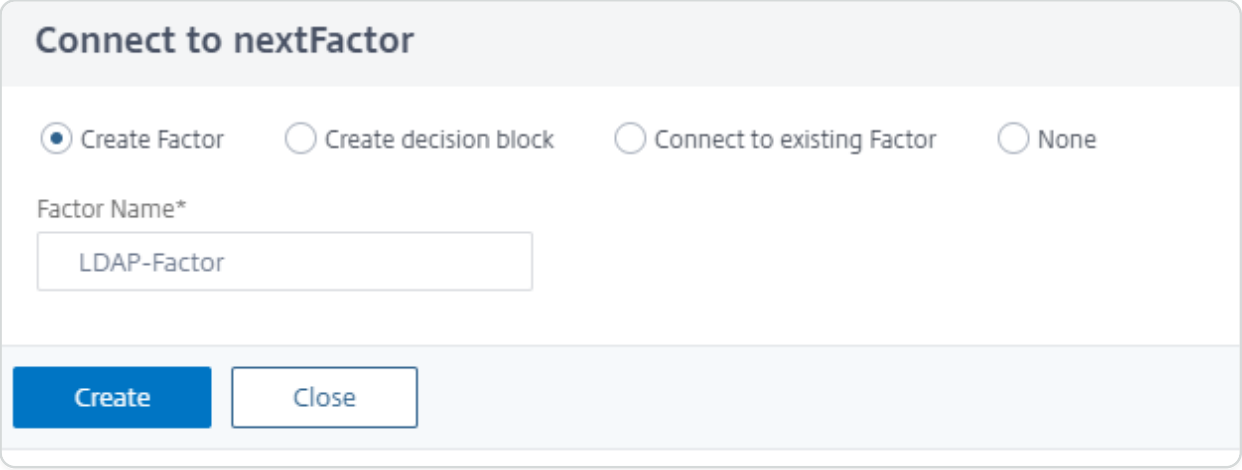


4. Add a factor. The name that you enter is the name of the nFactor flow.



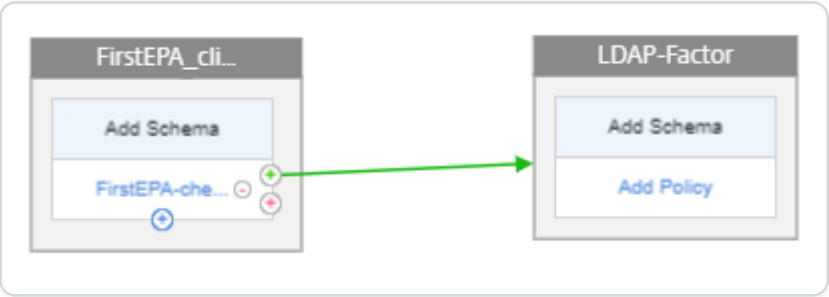
No schema is required for the EPA scan.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

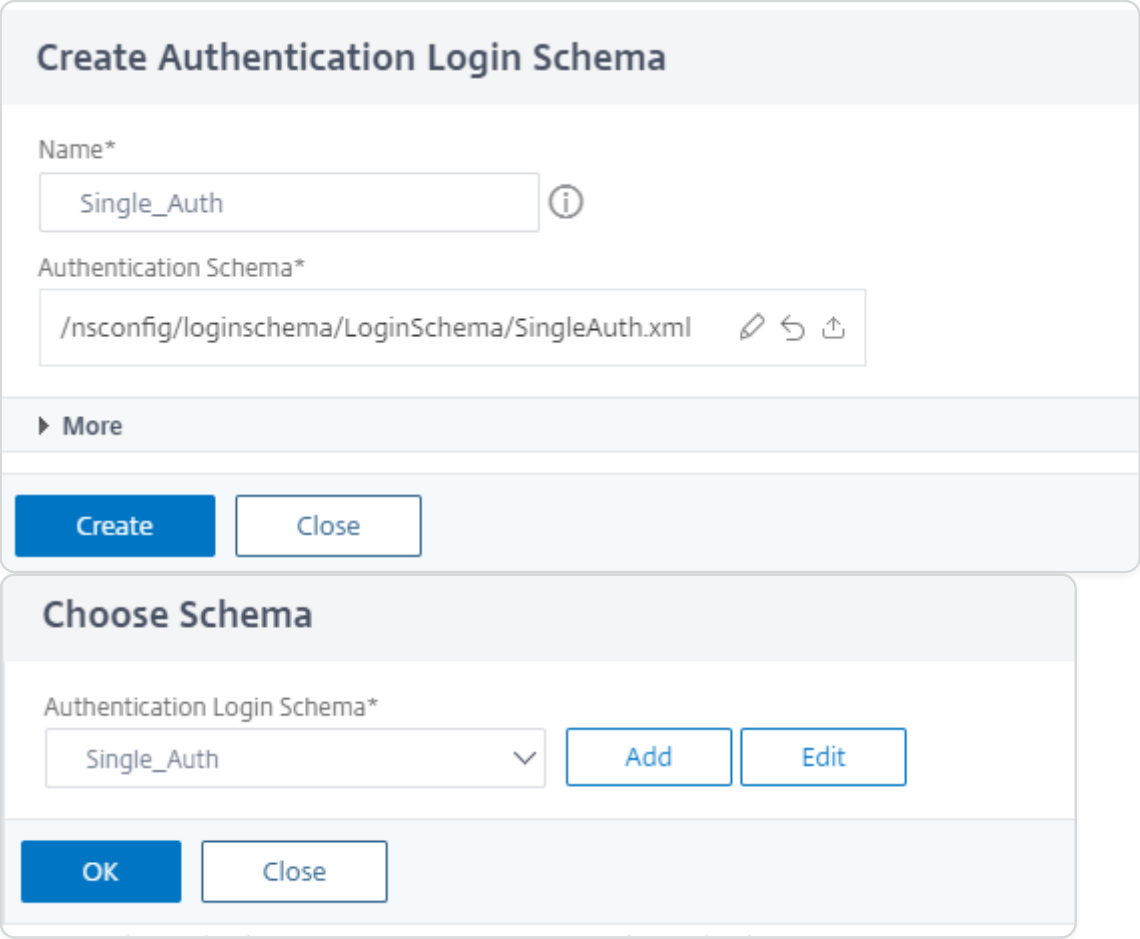


5. Click **Add Policy** to add a policy for the first factor.

6. Select the First EPA policy created in step 2.

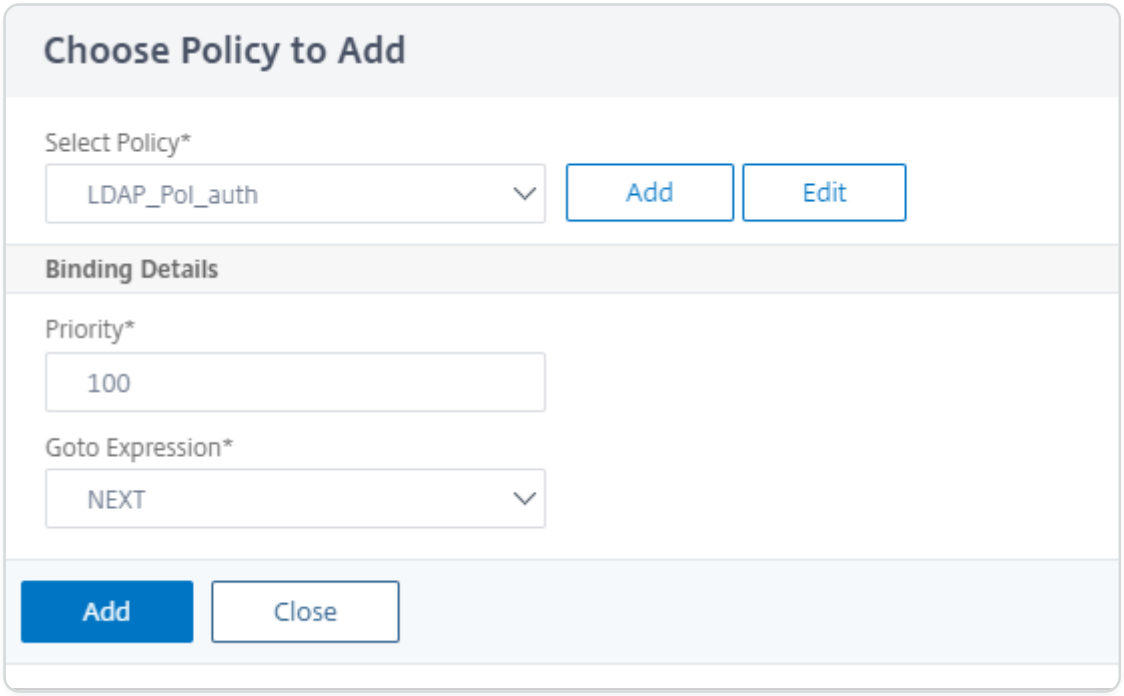


7. Click the green **+** sign and add the next factor that is LDAP authentication.

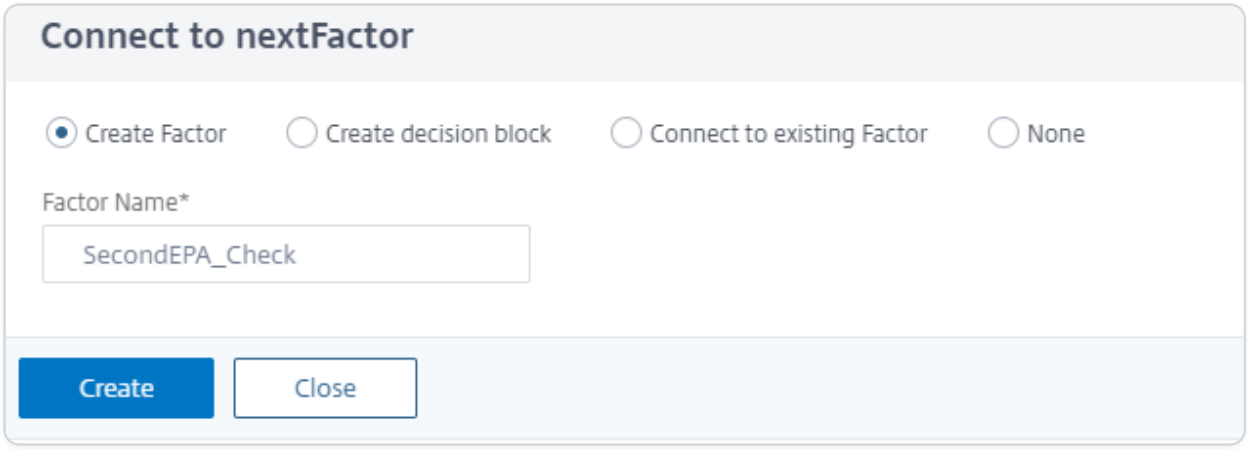


8. Click **Add Schema** and then click **Add** to add a schema for the second factor.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

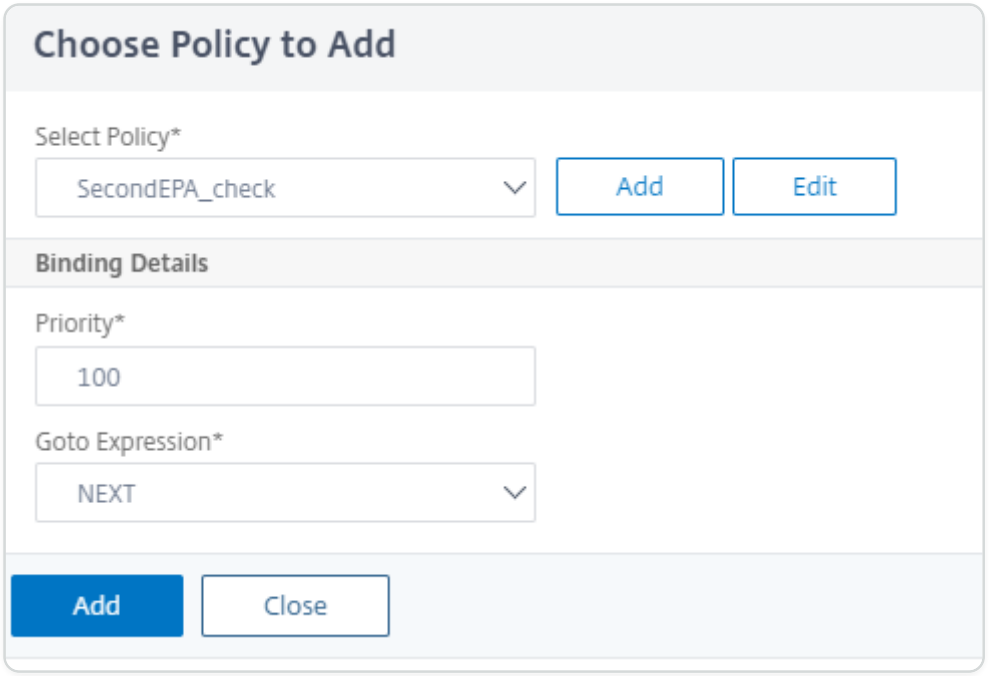


9. Create a schema, in this example Single_Auth and choose this schema.



10. Click **Add Policy** to add an LDAP policy for authentication.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



For more information on creating LDAP authentication see, Configuring LDAP Authentication

11. Create Next factor for post authentication EPA scan.

12. Click **Add Policy**, select the SecondEPA_Check policy created in step 2, and click **Add**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

13. Click **Done**.
14. Click **Bind to Authentication Server**, select the nFactor flow, and then click **Create**.

Unbind the nFactor flow

1. Select the nFactor flow and click **Show Bindings.**
2. Select the authentication virtual server and click **Unbind.**

Configure prefill user name from certificate in NetScaler nFactor authentication

The following section describes the use case of two factor authentication. The first factor is certificate authentication followed by LDAP.

Use Case: Certificate and LDAP authentication

Assume a use case where, admins configure two factor authentication. First-level as certificate authentication and followed by LDAP authentication. As part of the first factor, client requests for a user certificate. The user name is extracted from the certificate and prefilled in the user name field of the logon form returned for the next factor.

1. Client browser accesses traffic management virtual server and gets redirected to a logon page for authentication.
2. First factor is evaluated against a certificate action which extracts the user name. Evaluation is successful and passed to the next factor, policy "label1" in this case.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. The policy label specifies that the second factor is login schema "PrefilUserFromExpr.xml" with LDAP policy.
4. The logon form with the user name prefilled is returned to get the password from the user for LDAP authentication.
5. The authentication server returns cookies and a response that redirects the client's browser back to the traffic management virtual server, where the requested content is. On the other hand, if the login fails, the client's browser is presented with the original logon page, so that the client can retry.

NOTE

The setup can also be created through the nFactor Visualizer available in NetScaler version 13.0 and later.

Perform the following by using the CLI

1. Configure traffic management virtual server and authentication server.
   - `add lb vserver lbvs1 HTTP 10.217.28.152 80 -AuthenticationHost auth1.nsi-test.com -Authentication ON`
   - `add authentication vserver avn SSL 10.217.28.154 443 -AuthenticationDomain nsi-test.com`
   - `set ssl vserver avn -clientAuth ENABLED -clientCert Mandatory`

     or
   - `set ssl parameter –denysslrenegotiation NO`
2. Configure a first factor as certificate action.
   - `add authentication certAction cert -userNameField Subject:CN`
   - `add authentication Policy certpol -rule true -action cert`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. Configure a second factor.

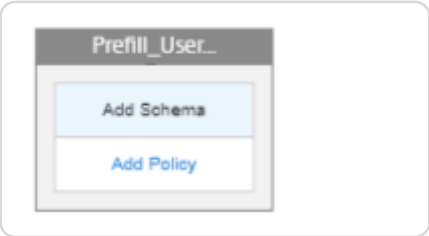
   - `add authentication loginSchema PrefilUserFromExpr -authenticationSchema PrefilUserFromExpr.xml`
   - `add authentication policylabel label1 -loginSchema PrefilUserFromExpr`

4. Configure LDAP action.

   - `add authentication ldapAction ldapact -serverIP 10.217.201.84 -ldapBase "cn=users,dc=dep,dc=sqltest,dc=net" -ldapBindDn Administrator@dep.sqltest.net -ldapBindDnPassword 8f7e6642195bc181f734cbc1bd18dfaf03bf9835abda7c045f7a964ceb58d4c9 -encrypted -encryptmethod ENCMTHD_3 -ldapLoginName sAMAccountName -groupAttrName memberOf -subAttributeName CN -ssoNameAttribute userprincipalname`
   - `add authentication Policy ldappolicy -rule true -action ldapact`

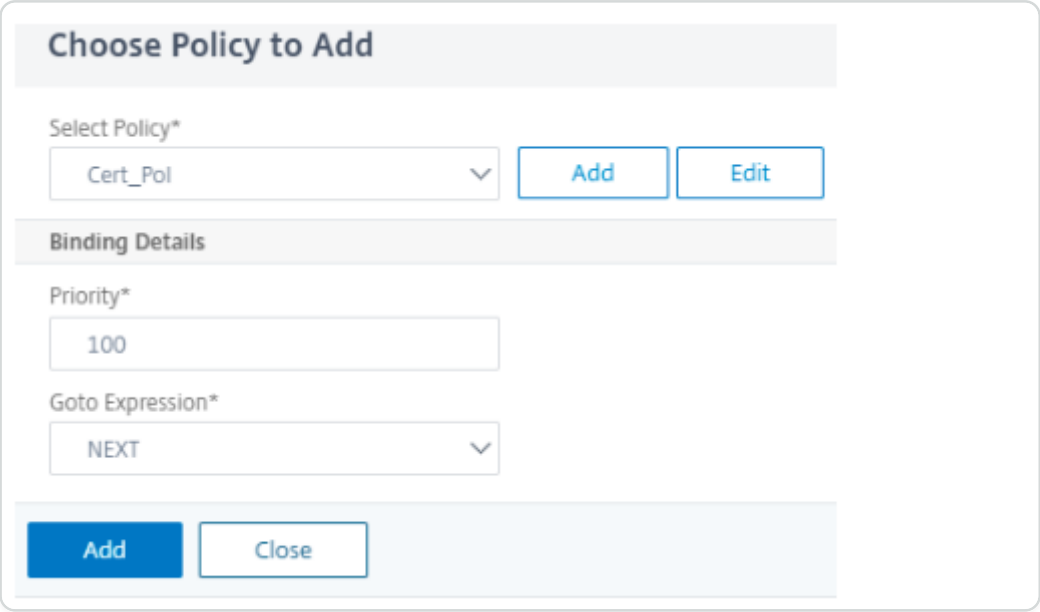
5. Bind the policies.

   - `bind authentication vserver avn -policy certpol -priority 1 -nextFactor label1 -gotoPriorityExpression NEXT`
   - `bind authentication policylabel label1 -policyName ldappolicy -priority 10 -gotoPriorityExpression END`



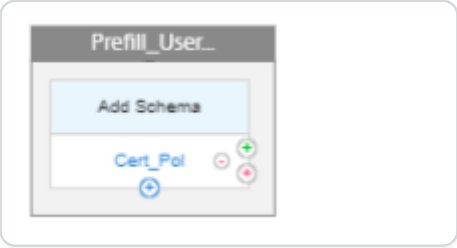
Configuring by using the nFactor Visualizer

1. Navigate to **Security > AAA-Application Traffic > nFactor Visualizer > nFactor Flow** and click **Add**.
2. Click **+** to add the nFactor flow.
3. Add a factor. The name that you enter is the name of the nFactor flow.



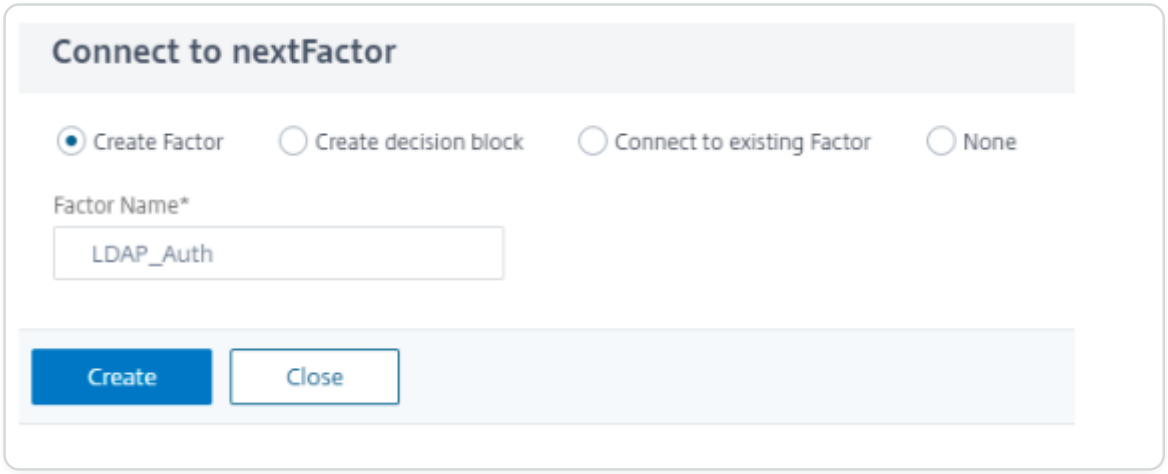
© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. No Schema is needed for the certificate authentication.
5. Click **Add Policy** to create policy for the certificate authentication.



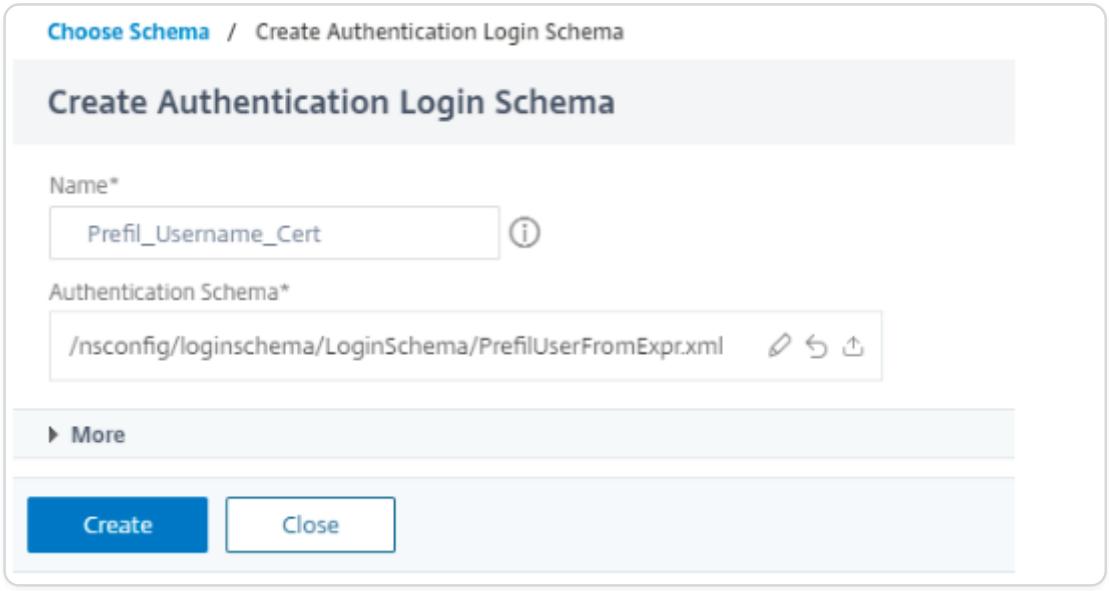
6. Add policy for the certificate authentication.

NOTE

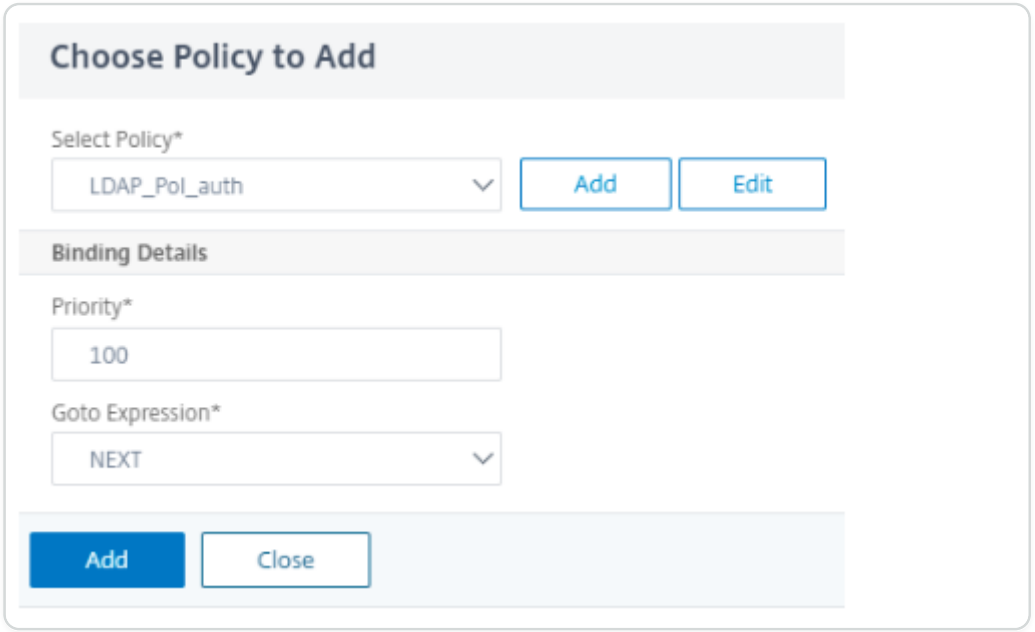


For more information on certificate authentication, see Configuring and Binding a Client Certificate Authentication Policy.

7. Click green **+** next to cert policy to add the next factor.



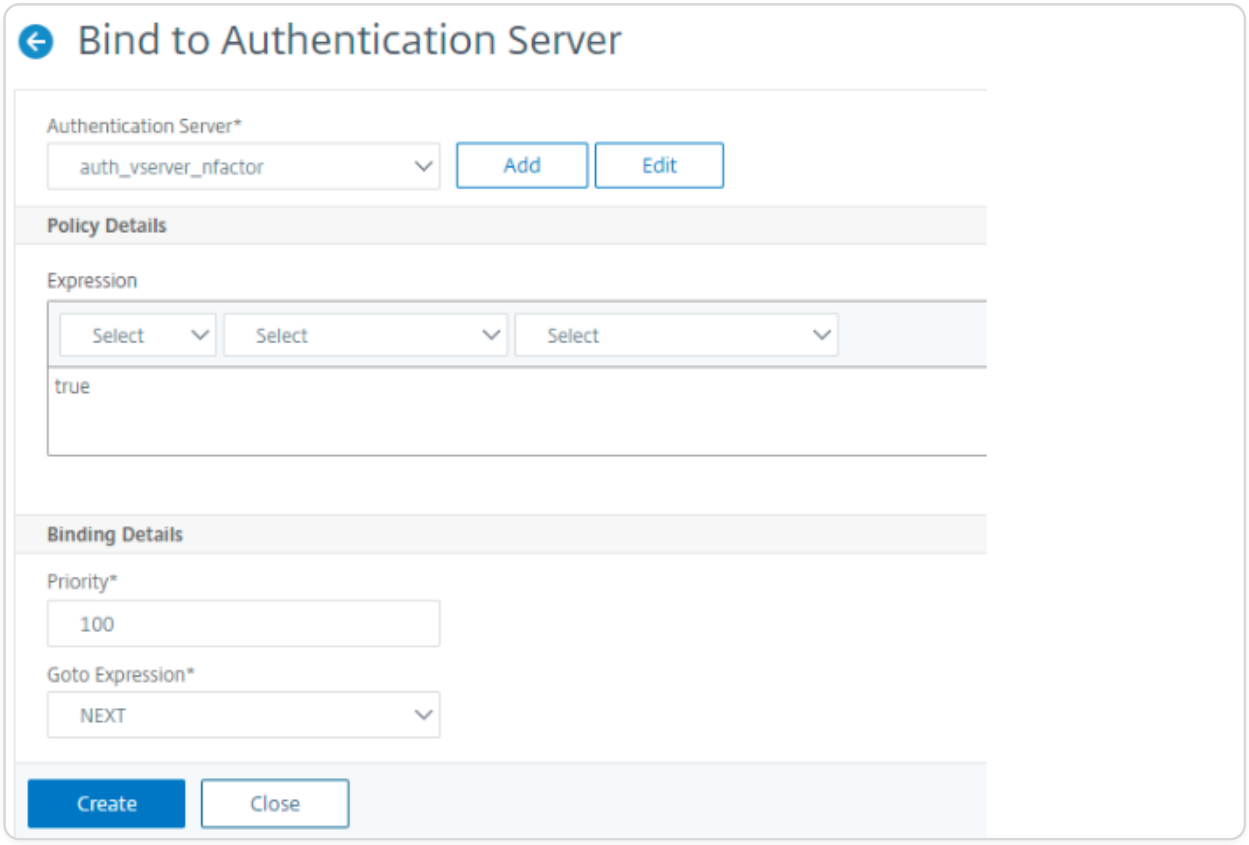
8. Select **Create Factor** to create a factor for LDAP Authentication.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

9. Click **Add Schema** to add a **PrefilUserFormExpr.xml** schema for the second factor that has pre-filled user name.

10. Select **Add Policy** to add policy for LDAP authentication.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE

For more information on creating LDAP authentication, see To configure LDAP authentication by using the configuration utility.

11. Click **Done** to save the configuration.
12. To bind the created nFactor Flow to an authentication, authorization, and auditing virtual server, click **Bind to Authentication Server** and click **Create**.

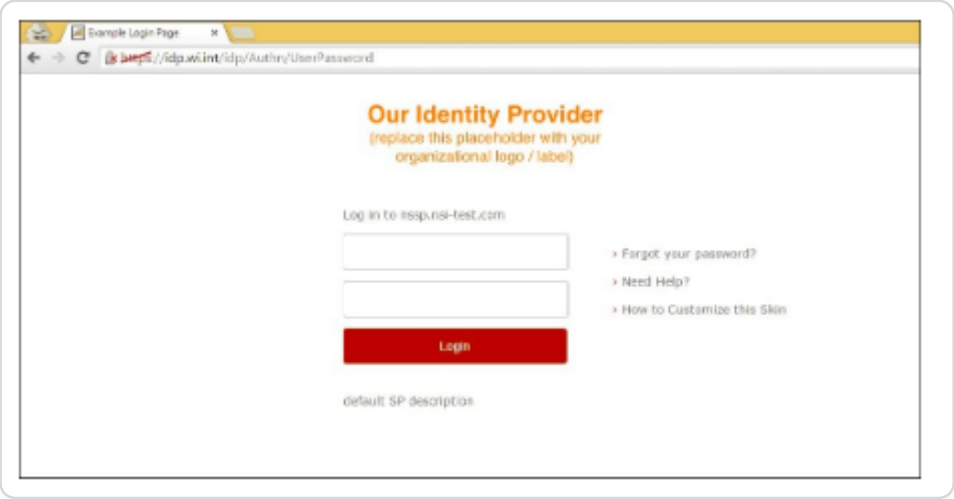
NOTE

Bind and unbind the nFactor Flow through the option given in nFactor Flow under **Show Bindings** only.

Unbind the nFactor Flow

1. Select the nFactor Flow and click **Show Bindings**.
2. Select the authentication virtual server and click **Unbind**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



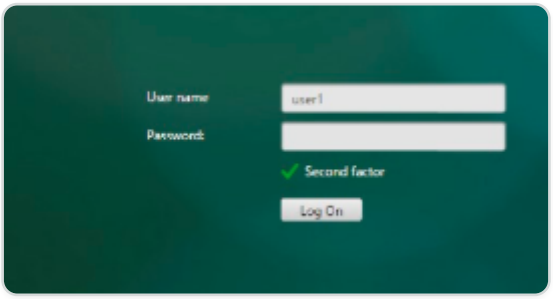
Configure SAML followed by LDAP or certificate authentication based on SAML attribute extraction in nFactor authentication

The following section describes the use case of LDAP or certificate authentication based on SAML attribute extraction in nFactor authentication.

SAML authentication in first factor with attribute extraction from SAML assertion

Assume a use case where, admins configure SAML authentication in a first factor with attribute extraction from SAML assertion. Based on the attributes extracted during the first factor, you can configure next factors, which can either have LDAP authentication or certificate authentication.

1. Once you access the traffic management virtual server, you are redirected to the external SAML IdP for login (in this case, Shibboleth, as shown in the figure). Enter your login credentials. If logon is successful, SAML IdP sends the SAML response containing the attributes.



2. When the SAML response is received at NetScaler appliance, it parses and extracts the attributes as configured in the SAML Action. The SAML assertion is verified, and you move to the second factor.
3. The second factor is configured as passthrough (there is no logon page for this factor) with 2 NO_AUTHN policies. Based on the policy evaluation, you have configured a jump to either LDAP authentication factor or certificate authentication factor.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE

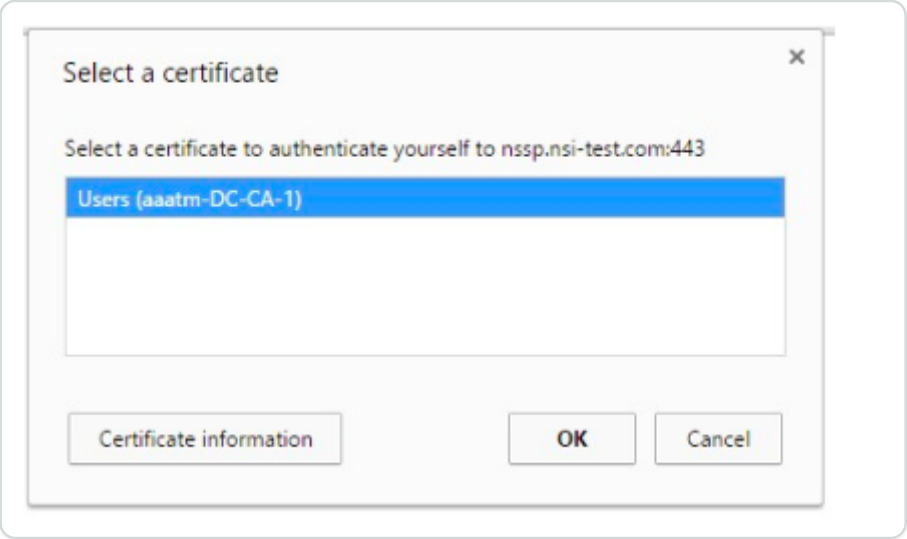
NO_AUTHN policy means that in case the rule configured for this policy evaluates to true, then the NetScaler appliance does not perform any authentication. It points to the next factor that is configured.

4. For example, say the SAML Action is configured to extract the UPN as attribute1, and the value of UPN is `john@example.com`. Now, one of the NO_AUTHN policy rules is configured to verify for the presence of string "example.com". If the policy evaluates to true, you can configure jump to the next factor having LDAP authentication. Similarly, policy can be configured for having next factor as certificate.
5. When the LDAP factor is selected after SAML authentication, the logon page is displayed.

NOTE

The user name value is pre-filled using the expression ${http.req.user.name}, which extracts the user name from the first factor. Other fields such as, labels for user name and password can also be customized.

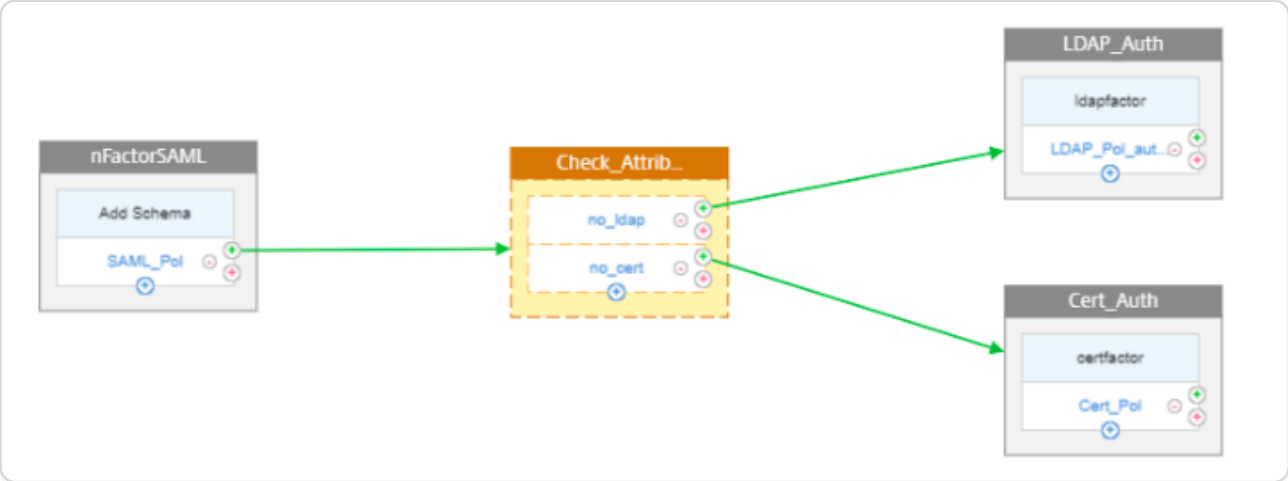
6. The following image shows an example used for this representation of logon form.



```
<?xml version="1.0" encoding="UTF-8"?>
<AuthenticateResponse xmlns="http://[illegible]/authentication/response/1">
<Status>success</Status>
<Result>more-info</Result>
<StateContext></StateContext>
<AuthenticationRequirements>
<PostBack>/nf/auth/doAuthentication.do</PostBack>
<CancelPostBack>/[illegible]Authentication/ExplicitForms/CancelAuthenticate</CancelPostBack>
<CancelButtonText>Cancel</CancelButtonText>
<Requirements>
<Requirement><Credential><ID>login</ID><SaveID>ExplicitForms-Username</SaveID><Type>username</Type></Credential><Label><Text>User name</Text><Type>p
lain</Type></Label><Input><AssistiveText>Please supply either domain\username or user@full
y.qualified.domain</AssistiveText><Text><Secret>false</Secret><ReadOnly>false</ReadOnly><InitialValue>${http.req.user.name}</InitialValue><Constrain
t>.+</Constraint></Text></Input></Requirement>
<Requirement><Credential><ID>passwd</ID><SaveID>ExplicitForms-Password</SaveID><Type>password</Type></Credential><Label><Text>Password:</Text><Type>
plain</Type></Label><Input><Text><Secret>true</Secret><ReadOnly>false</ReadOnly><InitialVa
lue></InitialValue><Constraint>.+</Constraint></Text></Input></Requirement>
<Requirement><Credential><Type>none</Type></Credential><Label><Text>Second factor</Text><Type>confirmation</Type></Label><Input /></Requirement>
<Requirement><Credential><ID>loginBtn</ID><Type>none</Type></Credential><Label><Type>none</Type></Label><Input><Button>Log On</Button></Input></Requ
irement>
</Requirements>
</AuthenticationRequirements>
</AuthenticateResponse>
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE



Based on the requirement, admins can modify the values of logon form.

7. If the certificate factor is selected after SAML, the **Select a Certificate** page is displayed.

NOTE

The setup can also be created through the nFactor Visualizer available in NetScaler version 13.0 and later.

Perform the following by using the CLI

1. Configure traffic management virtual server and authentication server.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- `add lb vserver lb_ssl SSL 10.217.28.166 443 -persistenceType NONE -cltTimeout 180 -AuthenticationHost auth.nsi-test.com -Authentication ON -authnVsName avn`
- `add authentication vserver avn SSL 10.217.28.167 443 -AuthenticationDomain nsi-test.com`

2. Configure a SAML policy with attribute extraction bound to authentication virtual server.

   - `add authentication samlAction shibboleth -samlIdPCertName shib-idp-242 -samlSigningCertName nssp-cert -samlRedirectUrl "https://idp.wi.int/idp/profile/SAML2/POST/SSO" -samlUserField samaccountname -samlIssuerName nssp.nsi-test.com -Attribute1 UserPrincipalName -Attribute2 department`
   - `add authentication Policy saml -rule true -action shibboleth`
   - `bind authentication vserver avn -policy saml -priority 1 -nextFactor label1 -gotoPriorityExpression NEXT`

3. Configure a second factor.

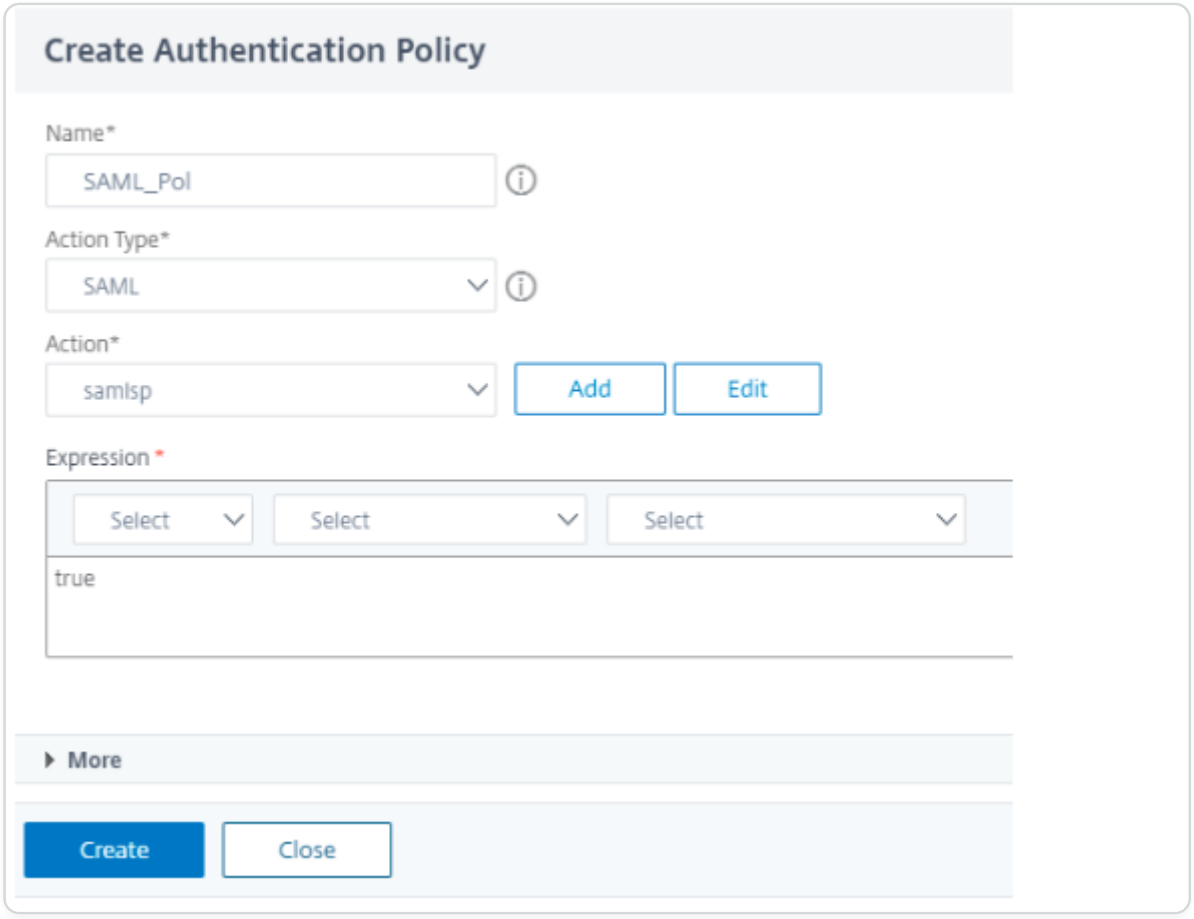
   - `add authentication loginSchema login2 -authenticationSchema noschema`
   - `add authentication Policy no_ldap -rule "http.req.user.attribute(1).contains(\"example.com\")" -action NO_AUTHN`
   - `add authentication Policy no_cert -rule "http.req.user.attribute(2).contains(\"Sales\")" -action NO_AUTHN`
   - `add authentication policylabel label1 -loginSchema login2`
   - `bind authentication policylabel label1 -policyName no_ldap -priority 1 -gotoPriorityExpression NEXT -nextFactor ldapfactor`
   - `bind authentication policylabel label1 -policyName no_cert -priority 2 -gotoPriorityExpression NEXT -nextFactor certfactor`

4. Configure an LDAP authentication factor.

   - `add authentication loginSchema login3 -authenticationSchema login1.xml`
   - `add authentication policylabel ldapfactor -loginSchema login3`
   - `bind authentication policylabel ldapfactor -policyName <LDAP Auth Policy> -priority 10 -gotoPriorityExpression END`

5. Configure a certificate factor authentication.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

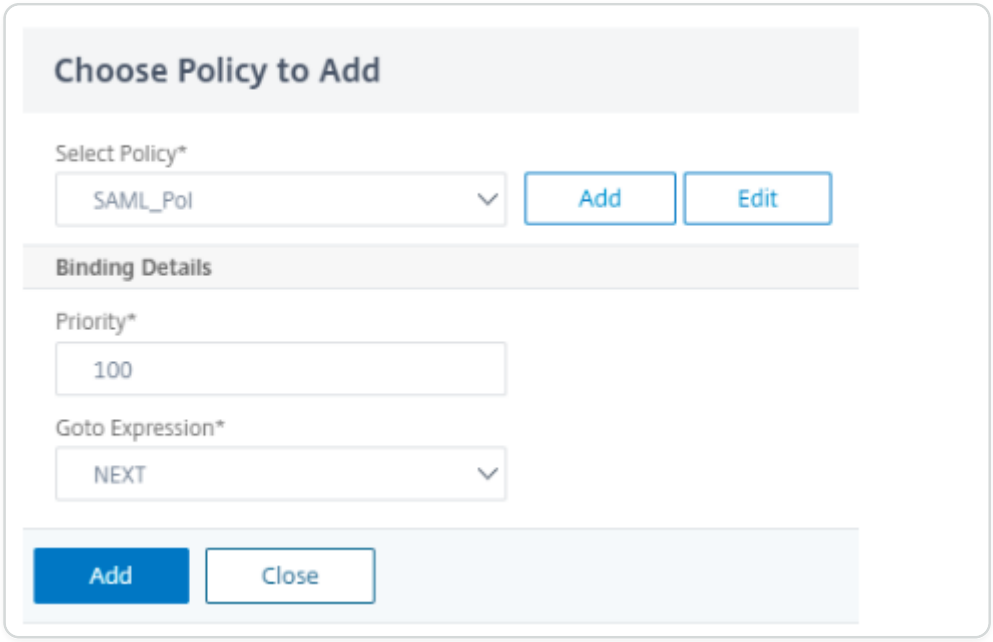


- `add authentication loginSchema login4 -authenticationSchema noschema`
- `add authentication policylabel certfactor -loginSchema login4`
- `bind authentication policylabel certfactor -policyName <Certificate Auth Policy> -priority 10 -gotoPriorityExpression END`

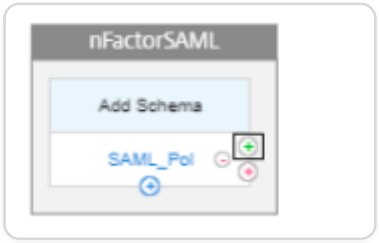
6. Bind the root certificate to the virtual server and enable Client Authentication.

- `bind ssl vserver avn -certkeyName <root cert name>-CA -ocspCheck Optional`
- `set ssl vserver avn -clientAuth ENABLED -clientCert Optional`

Configuring by using the nFactor Visualizer

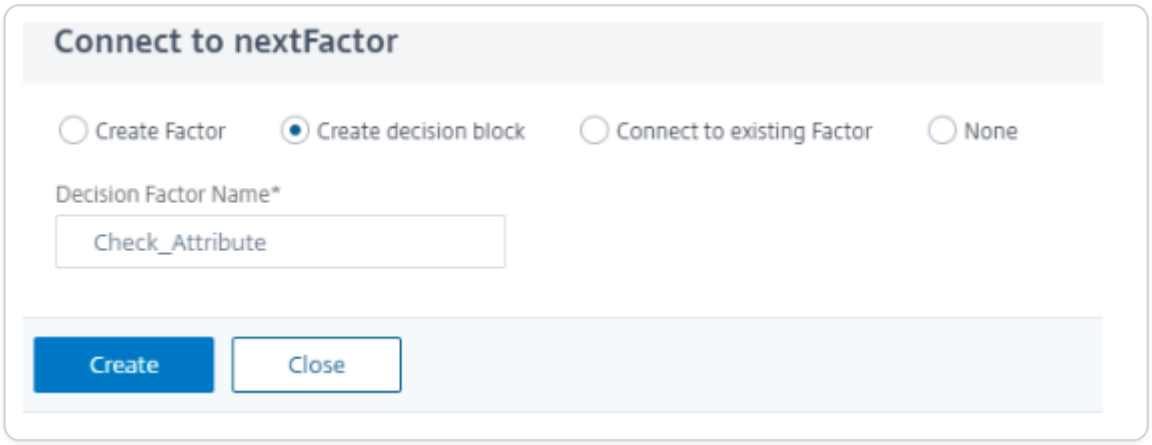


1. Navigate to **Security > AAA-Application Traffic > nFactor Visualizer > nFactor Flows** and click **Add**.
2. Click **+** to add the nFactor flow.
3. Add a factor. The name that you enter is the name of the nFactor flow.
4. No Schema is needed for SAML authentication. Click **Add Policy** to create SAML policy for the first factor.



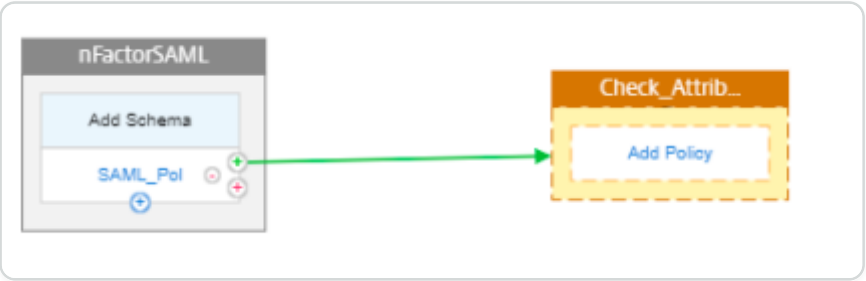
Note: For more information on SAML as SP, see NetScaler as a SAML SP.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

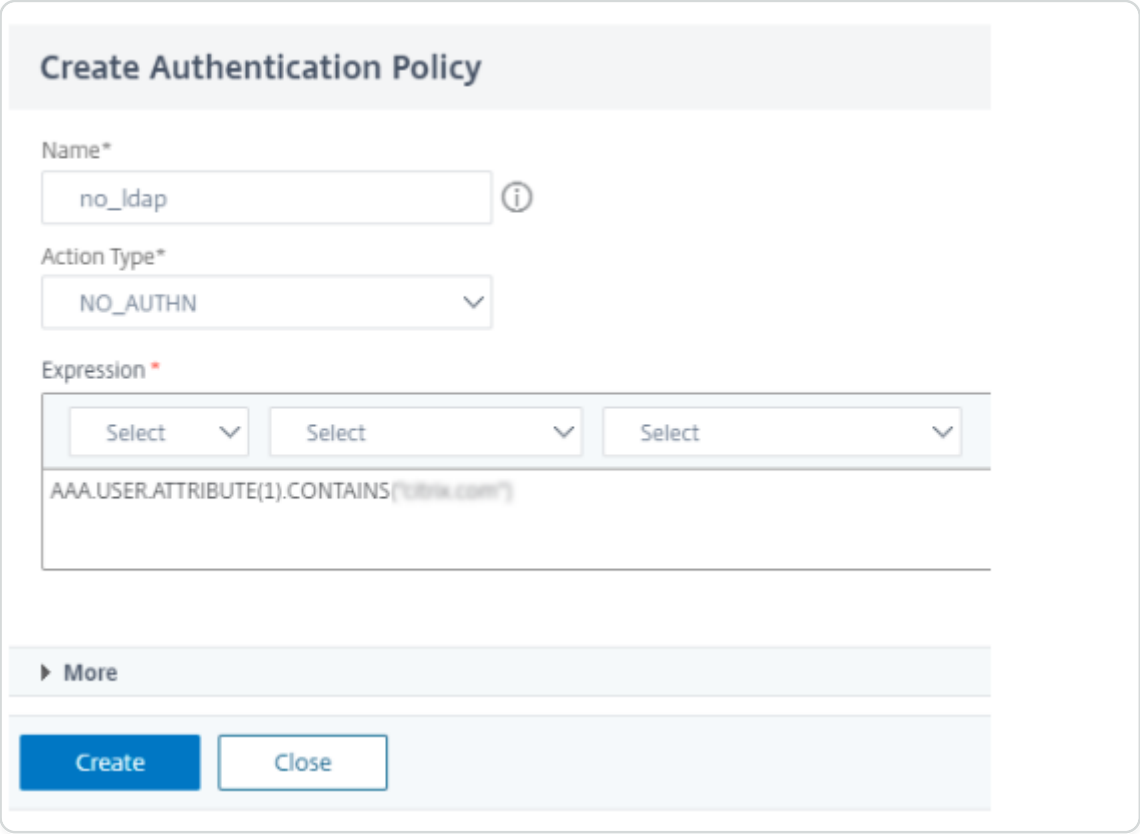


5. Add the SAML policy.

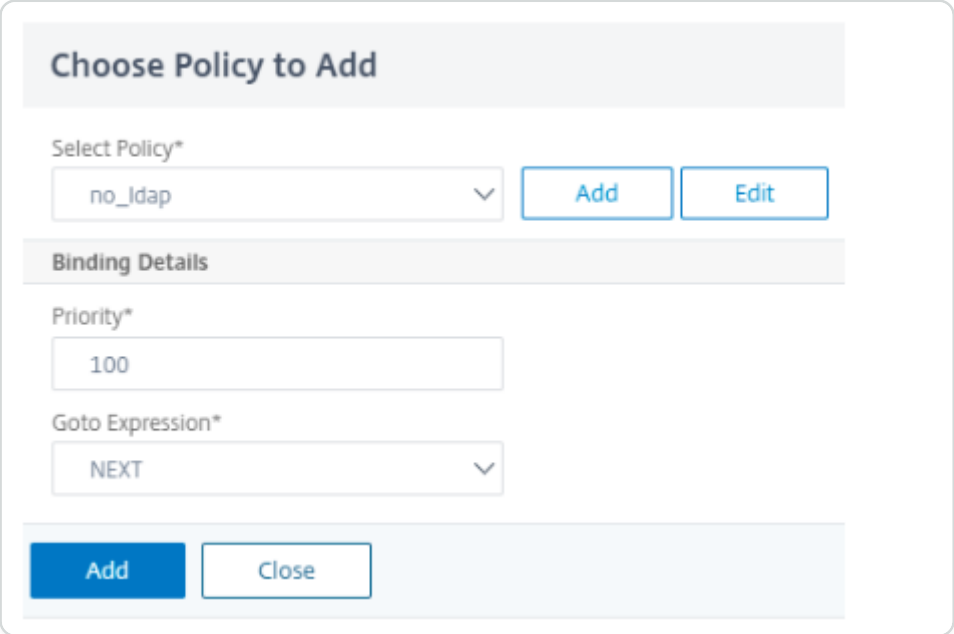
6. Click green **+** to add the next factor.



7. Create a decision box to check for the SAML attributes.

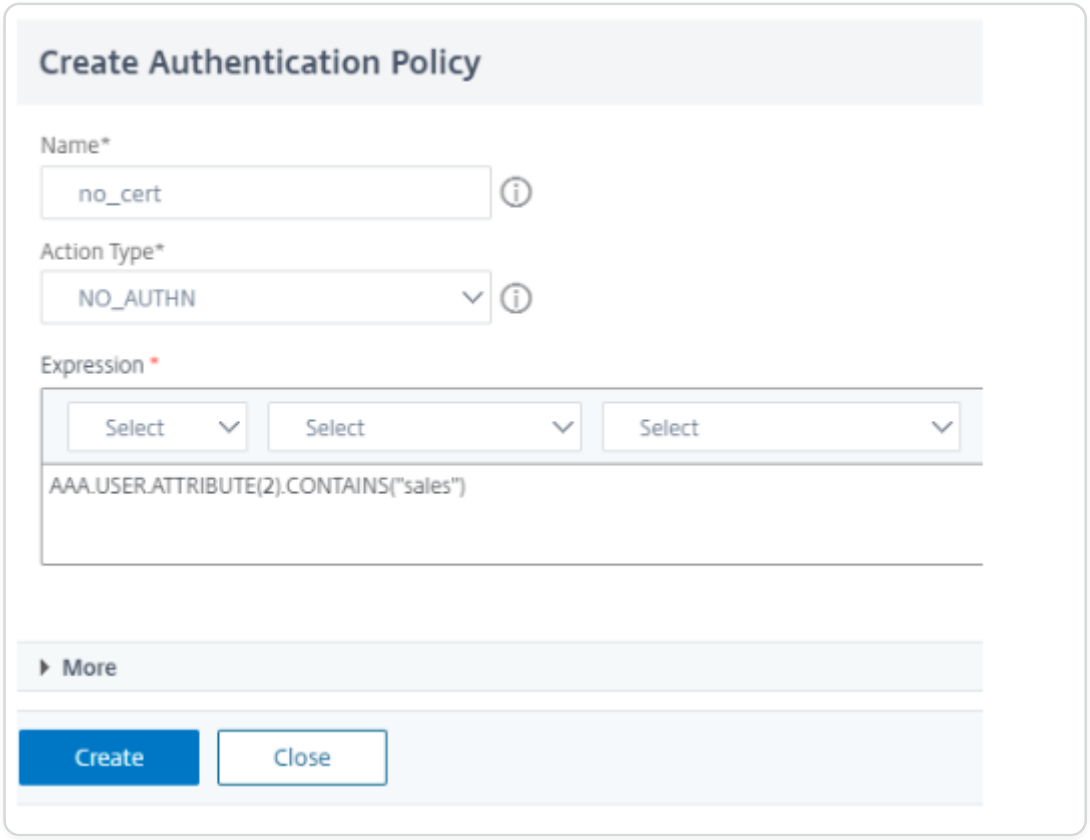


8. Click **Add Policy** to create a policy.

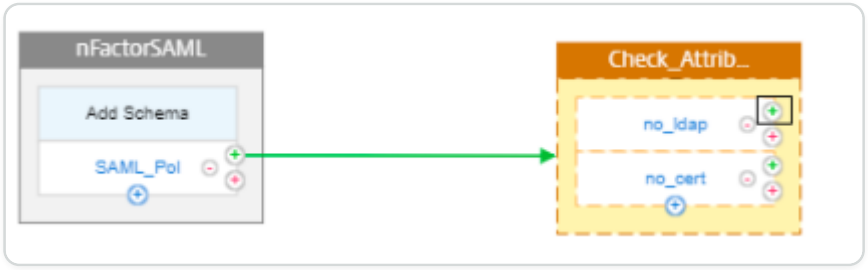


© 1997–2026 Citrix Systems, Inc. All rights reserved.

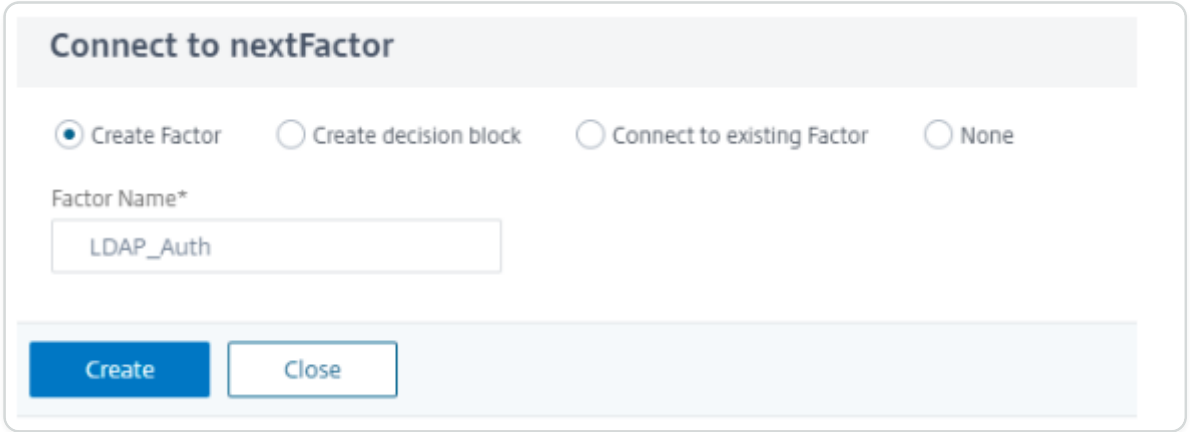
9. Create a policy to check for the attribute "example.com" with action NO_AUTHN.



10. Select the previously created policy and click **Add**.

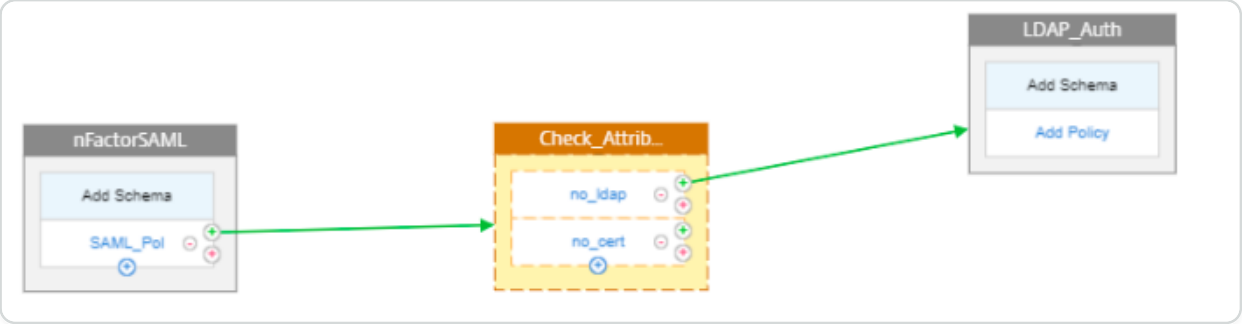


© 1997–2026 Citrix Systems, Inc. All rights reserved.

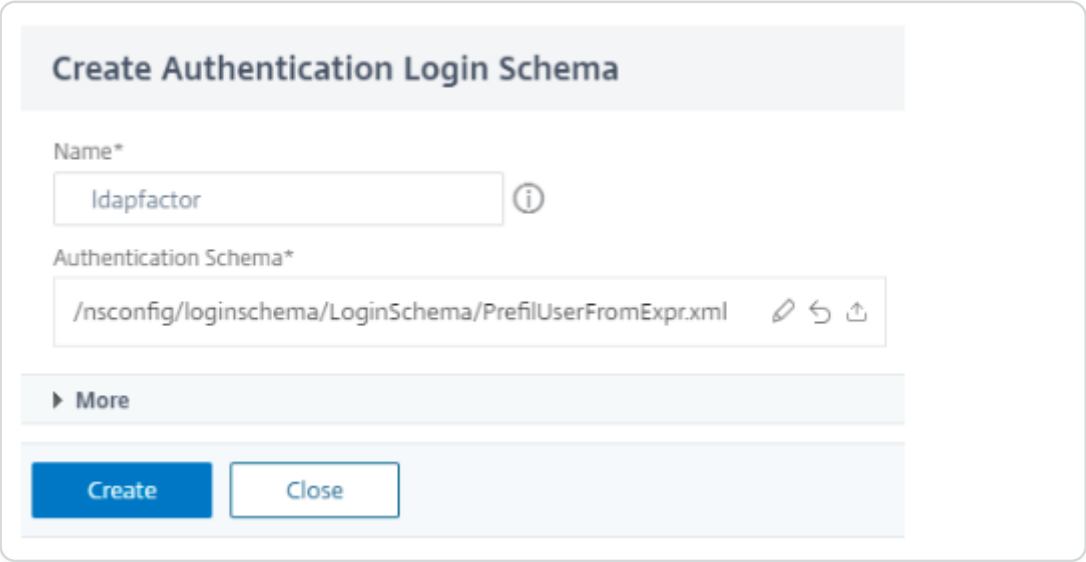


11. Click green **+** sign to add a second policy.
12. Follow steps 9 and 10. Bind the policy to check for attribute sales.

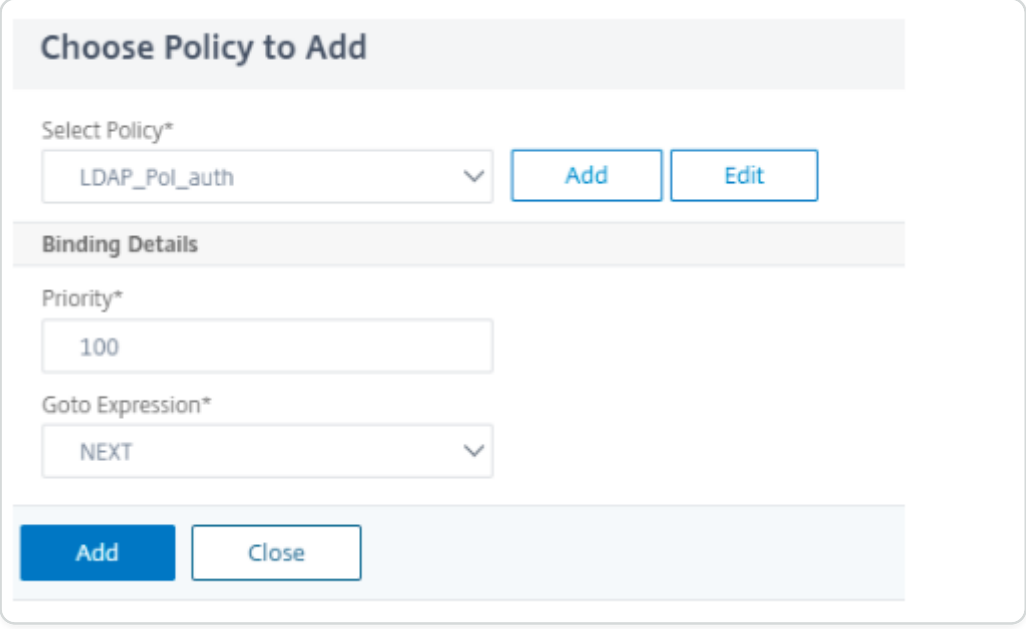
13. To add the second factor for the attribute "example.com," Click the green **+** sign next to no_ldap policy.



14. Create a next factor for LDAP authentication.



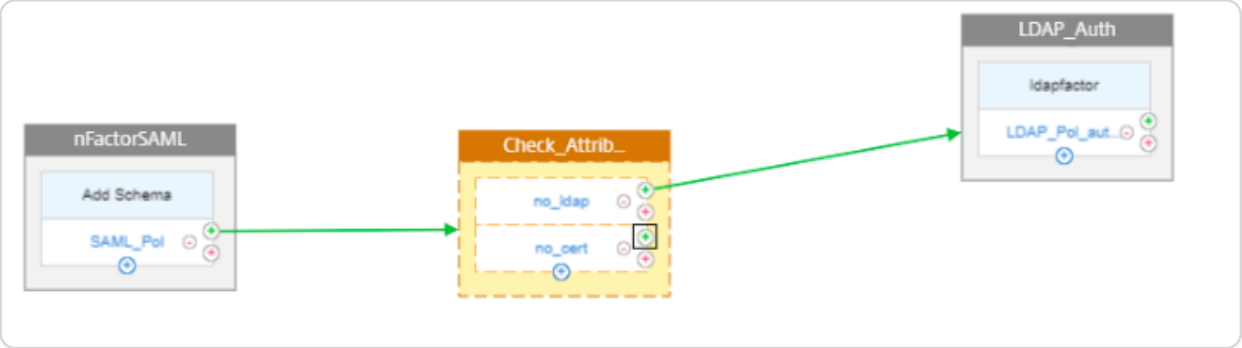
© 1997–2026 Citrix Systems, Inc. All rights reserved.



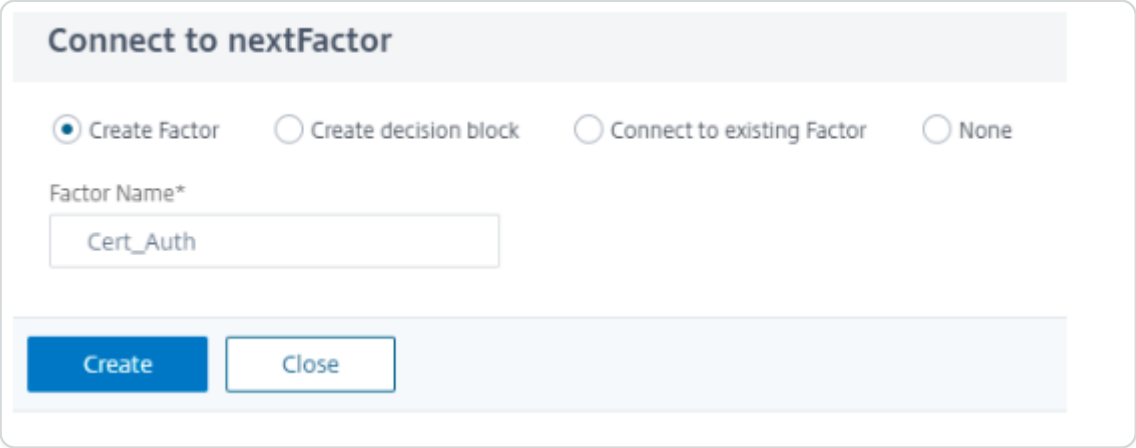
15. Click **Add Schema** for the second factor.

16. Create an authentication login schema with schema "PrefilUserFormExpr.xml" for the second factor that has prefilled user name.

17. Click **Add Policy** to add the LDAP policy.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

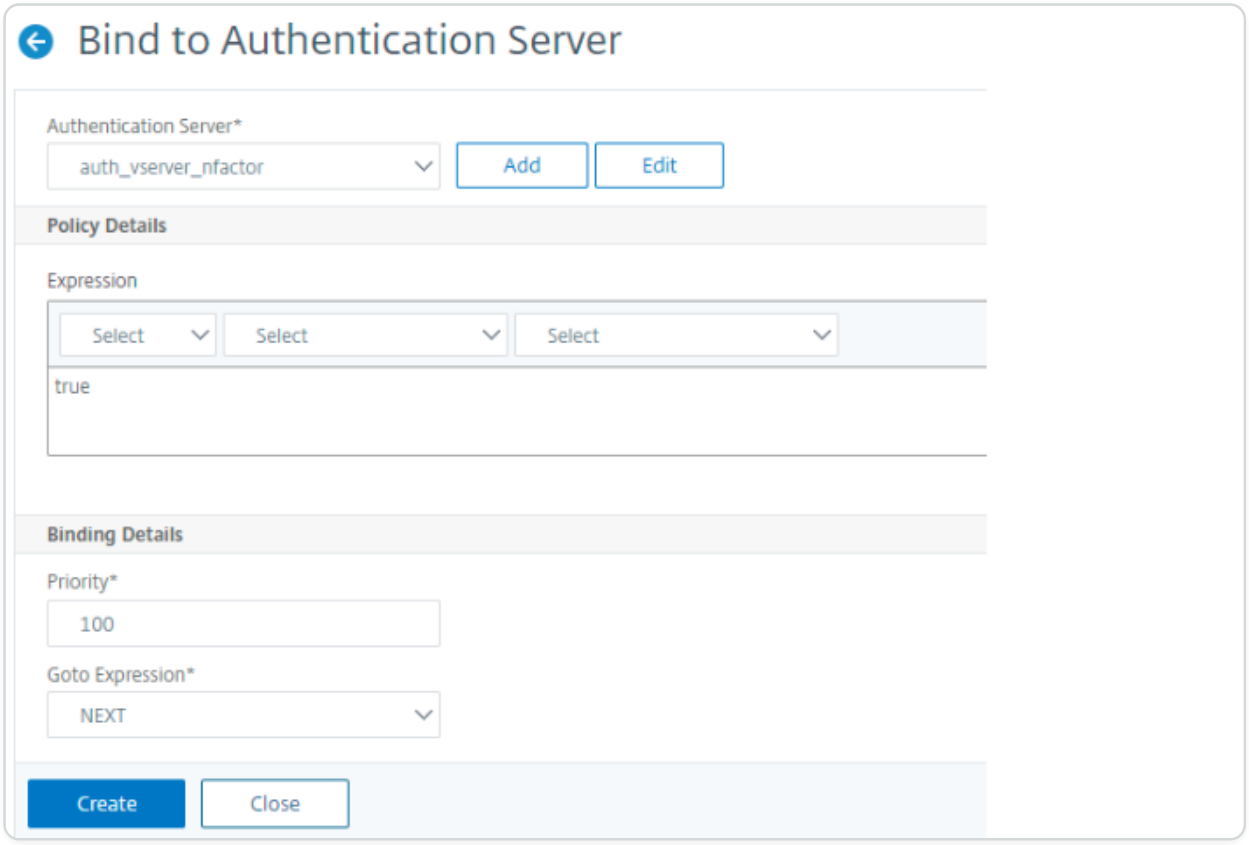


NOTE

For more information on creating LDAP authentication, see To configure LDAP authentication by using the configuration utility.

18. Follow step 13. To add second factor for attribute sales, click green **+** sign next to no_cert.

19. Create a next factor for certificate authentication.



20. Follow steps 15, 16, and 17. Add a schema for the certificate authentication and Add Cert Authentication Policy.

NOTE

For more information on certificate authentication, see Configuring and Binding a Client Certificate Authentication Policy.

21. Click **Done** to save the configuration.
22. To bind the created nFactor flow to an authentication, authorization, and auditing virtual server, click **Bind to Authentication Server** and click **Create**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

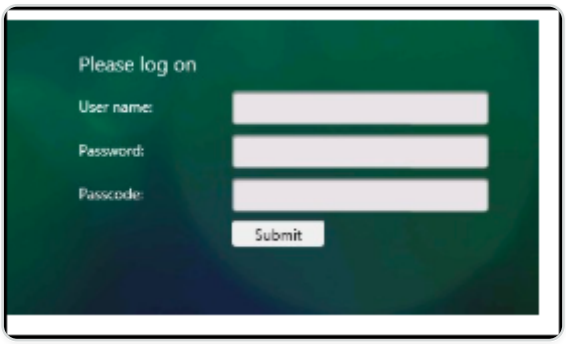
NOTE

Bind and unbind the nFactor flow through the option given in nFactor Flow under **Show Bindings** only.

Unbind the nFactor Flow

1. Select the nFactor flow and click **Show Bindings**.
2. Select the authentication virtual server and click **Unbind**.

Configure two-factor authentication with one login schema and one passthrough schema in NetScaler nFactor authentication



The following section describes the use case of two-factor authentication with one login schema and one passthrough schema.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Two-factor authentication with one login schema and one passthrough schema

Assume a use case where, admins configures two-factor authentication with one login schema and one passthrough schema. Client submits one user name and two passwords. The first set of user name and password is evaluated through an LDAP policy as first-factor, and the second password is evaluated through a RADIUS policy as second-factor.

1. Once you access the traffic management virtual server, you are redirected to the login page for authentication.
2. The client submits a user name and two passwords, for example- user1, pass1 and pass2.
3. First-factor is evaluated against an LDAP action for user1 and pass1. Evaluation is successful and passed to the next factor, policy "label1"; in this case.
4. The policy label specifies that the second-factor is passthrough with a RADIUS policy. A passthrough schema means that NetScaler appliance does not go back to the client for any further input. NetScaler simply uses the information it already has. In this case, it is user1 and pass2. The second-factor is then evaluated implicitly.
5. The authentication server return cookies and a response that redirect the client's browser back to the traffic management virtual server, where the requested content is available. If login fails, the client browser is presented with the original logon page so that the client can retry.

Perform the following by using the CLI

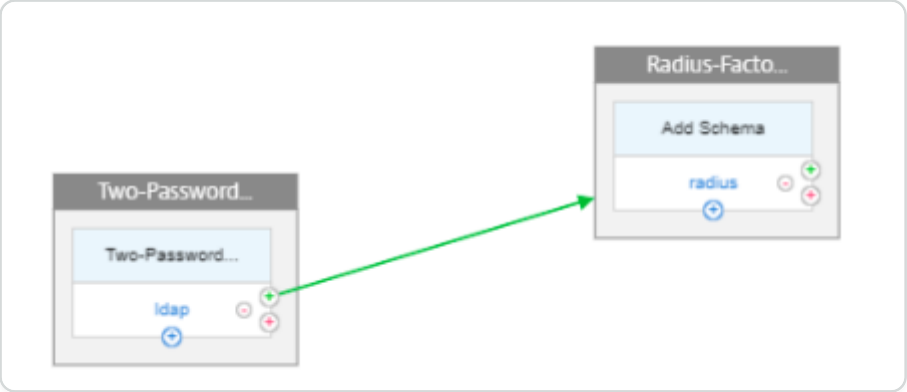
1. Configure traffic management and authentication virtual server.
   - `add lb vserver lbvs55 HTTP 1.217.193.55 80 -AuthenticationHost auth56.aaatm.com -Authentication ON`
   - `add authentication vserver auth56 SSL 1.217.193.56 443 -AuthenticationDomain aaatm.com`
2. Configure a second-factor.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- `add authentication loginSchema login1 -authenticationSchema login-2passwd.xml -userCredentialIndex 1 -passwordCredentialIndex 2`
- `add authentication loginSchemaPolicy login1 -rule true -action login1`
- `add authentication loginSchema login2 -authenticationSchema noschema`
- `add authentication loginSchemaPolicy login2 -rule true -action login2`
- `add authentication policylabel label1 -loginSchema login2`

3. Configure LDAP and RADIUS factor.

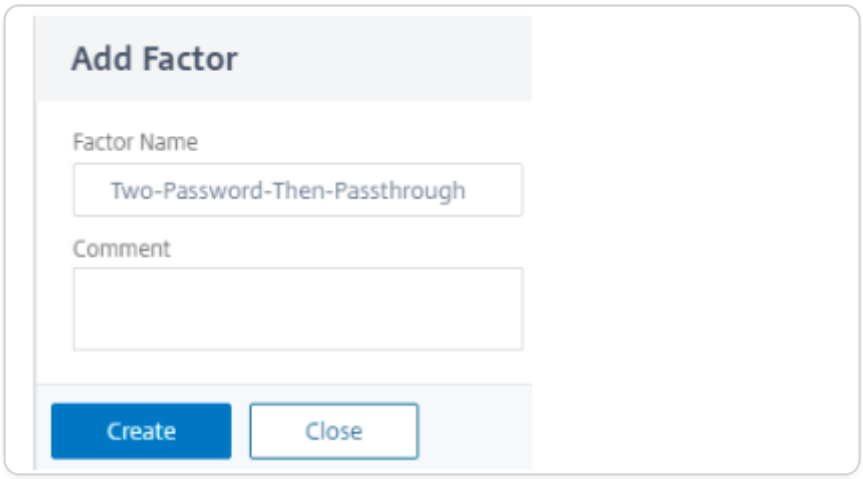
- `add authentication ldapAction ldapAct1 -serverIP 1.217.28.180 -ldapBase "dc=aaatm, dc=com" -ldapBindDn administrator@aaatm.com -ldapBindDnPassword 71ca2b11ad800ce2787fb7deb54842875b8f3c360d7d46e3d49ae65c41550519 -encrypted -encryptmethod ENCMTHD_3 -ldapLoginName samAccountName -groupAttrName memberOf -subAttributeName CN`
- `add authentication Policy ldap -rule true -action ldapAct1`
- `add authentication radiusAction radius -serverIP 1.217.22.20 -radKey a740d6a0aeb3288fa0a6fbe932d329acddd8f448ecb4a3038daa87b36599fd16 -encrypted -encryptmethod ENCMTHD_3 -radNASip ENABLED -radNASid NS28.50 -radAttributeType 11 -ipAttributeType 8`
- `add authentication Policy radius -rule true -action radius`



4. Bind the policies.

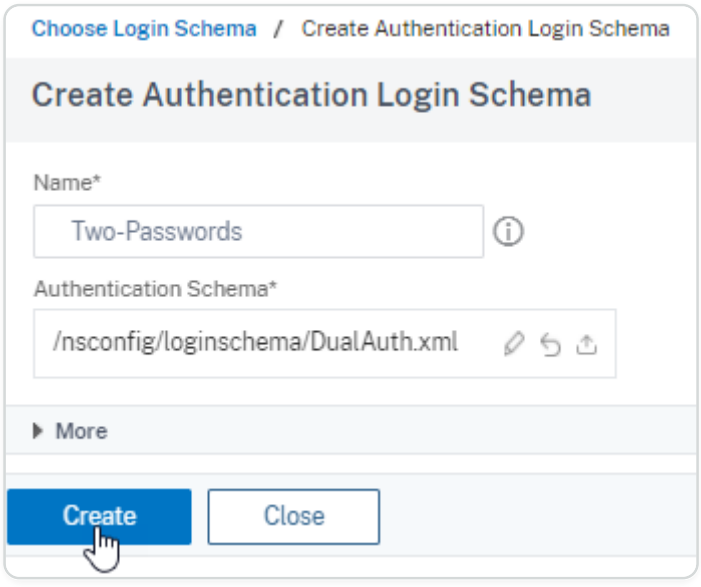
- `bind authentication vserver auth56 -policy login1 -priority 1 -gotoPriorityExpression END`
- `bind authentication vserver auth56 -policy ldap -priority 1 -nextFactor label1 -gotoPriorityExpression next`
- `bind authentication policylabel label1 -policyName radius -priority 2 -gotoPriorityExpression end`

NOTE



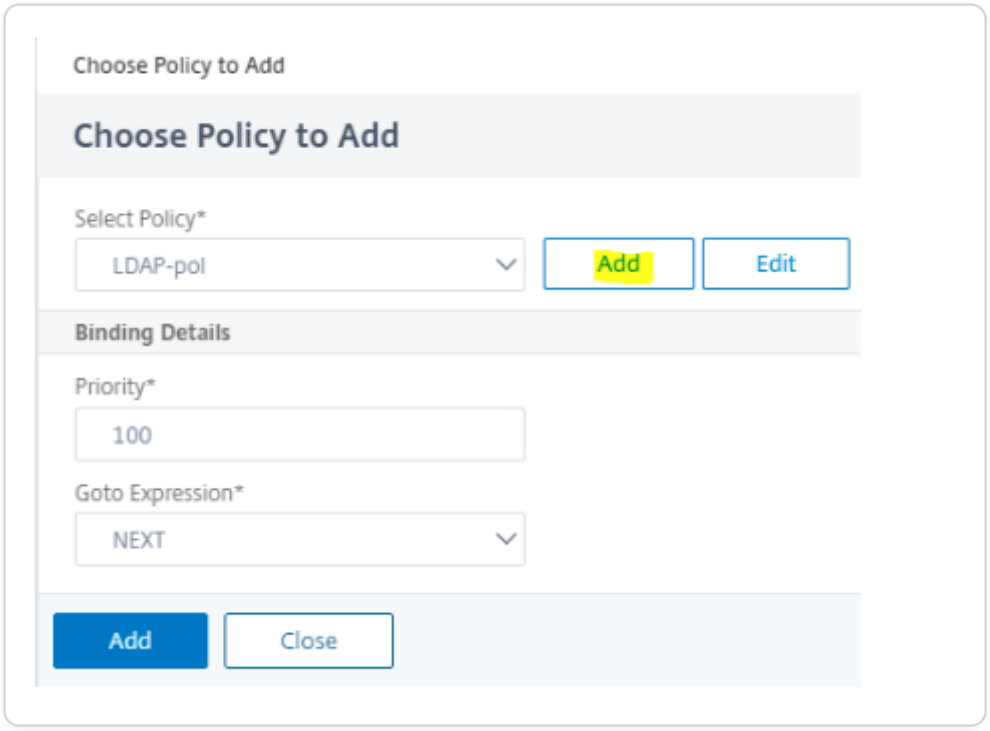
The setup can also be created through the nFactor Visualizer available in NetScaler version 13.0 and later.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

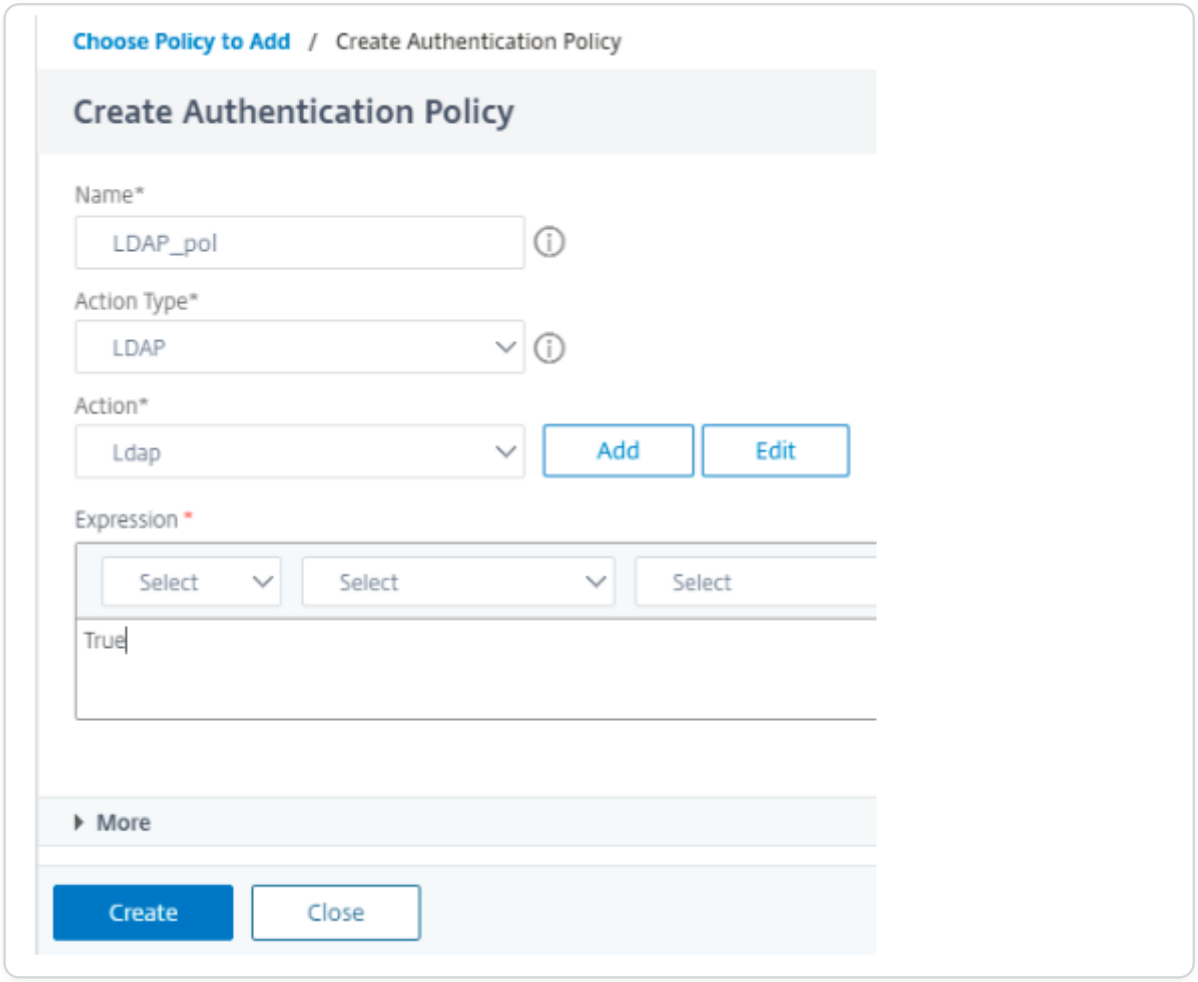


Configuring by using the nFactor Visualizer

1. Navigate to **Security > AAA-Application Traffic > nFactor Visualizer > nFactor Flows** and click **Add**.
2. Click **+** to add the nFactor flow.
3. Add a factor. The name that you enter is the name of the nFactor flow. Click **Create**.



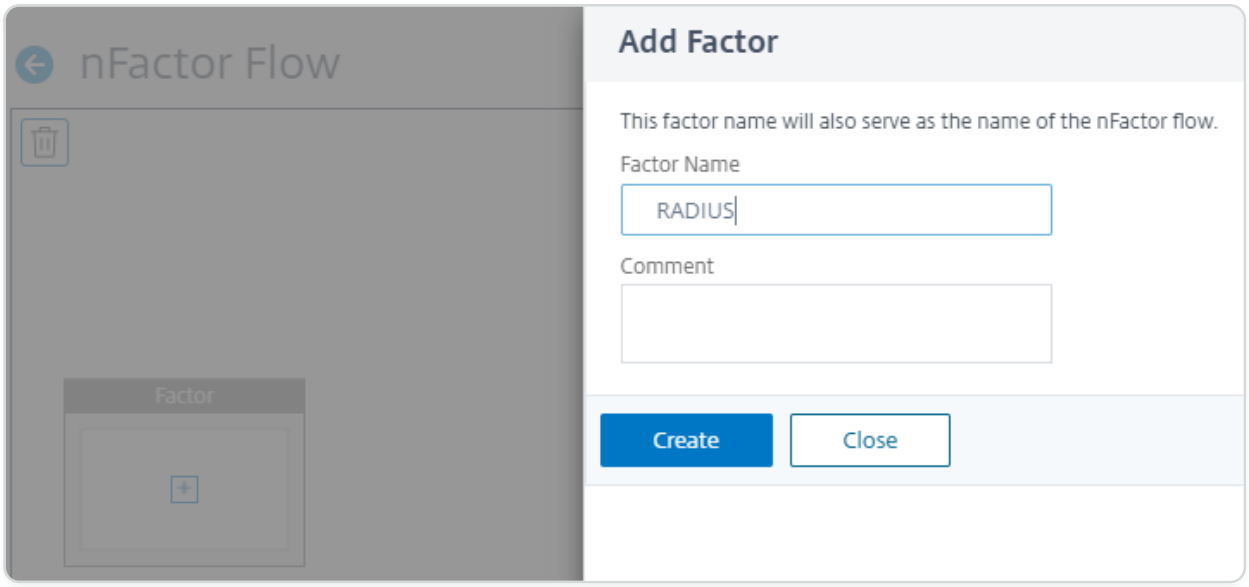
4. To add the two password schema for the first-factor, click **Add Schema**.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

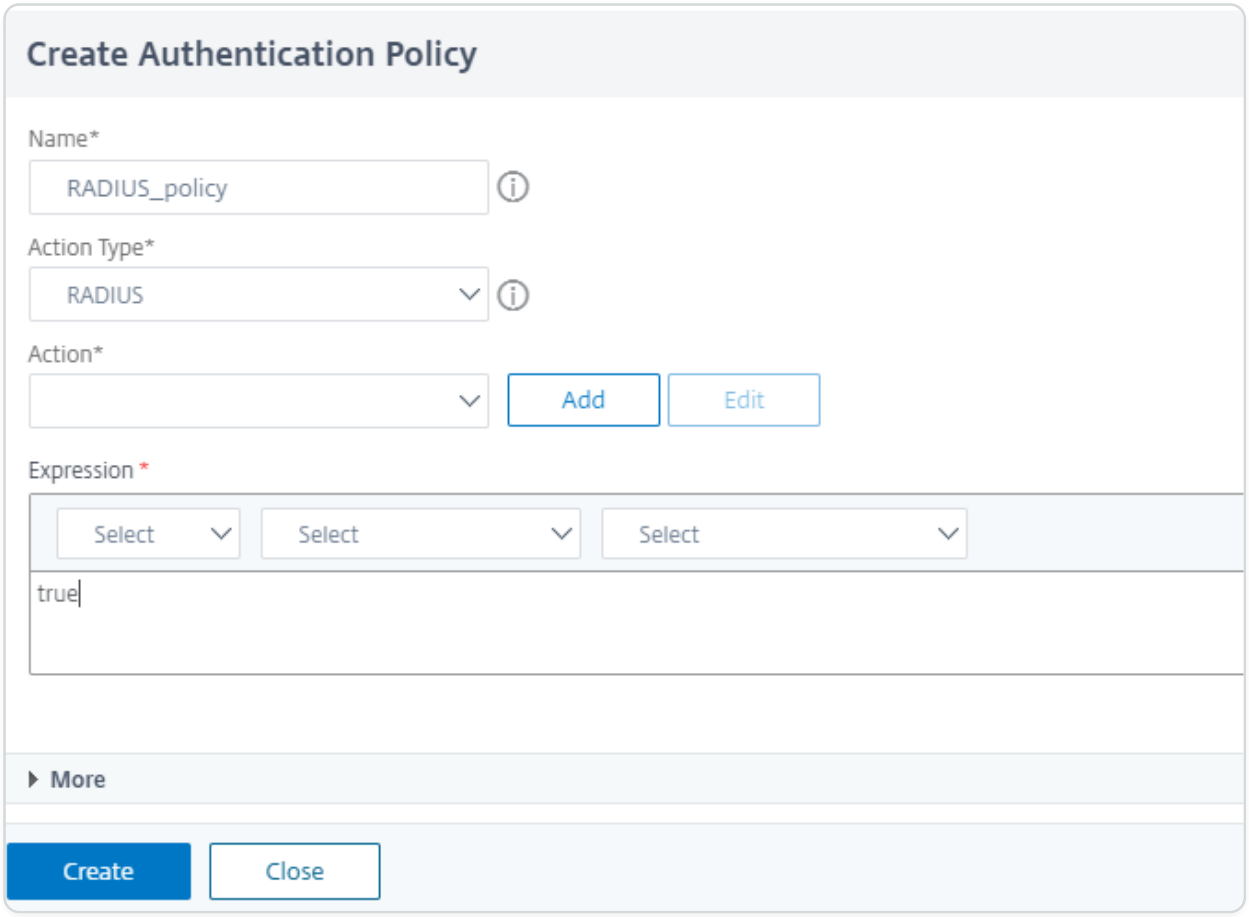
5. Click **Add Policy** to add the LDAP policy. You can create an authentication policy or select an existing authentication policy from the list.

6. In the **Action** tab, select LDAP server.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE



If LDAP server is not added, for more information on adding an LDAP server, see LDAP authentication policies

7. Click green **+** to add the RADIUS factor and click **Create**.

8. Do not add a schema for this factor, as by default it takes no schema. To add RADIUS authentication policy, click **Add Policy**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE

If RADIUS server if not added, for more information on adding an RADIUS server, see To configure RADIUS authentication

9. Click **Done** to save the configuration.
10. To bind the created nFactor flow to an authentication, authorization, and auditing virtual server, click **Bind to Authentication Server** and click **Create**.

Configure user name and two passwords with group extraction in third factor by nFactor authentication

The following section describes the use case of user name and two passwords with group extraction in a third factor by nFactor authentication.

User name and two passwords with group extraction in third factor

Assume a use case where, admins configure first authentication factor to have a user name and two password fields. The second factor is a pass through (there is no login page for this factor),

© 1997–2026 Citrix Systems, Inc. All rights reserved.

which uses the user name and second password from the first factor. The third authentication factor is pass through and is configured for group extraction using user name from first factor.

1. Once you access the traffic management virtual server, you are redirected to the login page.
2. The client submits a user name and two passwords. For example, user1, pass1 and pass2.
3. First factor is evaluated against a local policy for user1 and pass1. Evaluation is successful and the next factor is passed, policy "label1" in this case.
4. The policy label specifies that the second factor is pass through with a RADIUS policy. A pass through schema means that NetScaler appliance does not go back to the client for any further input. NetScaler appliance simply uses the information it already has. In this case, it is user1 and pass2. The second factor is then evaluated implicitly. After successful evaluation, the next factor is passed (policy "label2" in this case.)
5. The policy label specifies that the third factor is pass through with an LDAP policy configured for group extraction. NetScaler appliance implicitly uses the user name from the first factor.
6. The authentication server returns cookies and a response that redirect the client's browser back to the traffic management virtual server, where the requested content is. If a login fails, the client's browser is presented with the original logon page so that the client can retry.

```

Perform the following by using the CLI

1. Configure traffic management and authentication virtual server.
   - `add lb vserver lbvs1 HTTP 10.217.28.152 80 -AuthenticationHost auth1.nsi-test.com -Authentication ON`
   - `add authentication vserver avn SSL 10.217.28.154 443 -AuthenticationDomain dep.sqltest.net`
2. Configure a first factor.
   - `add authentication loginSchema login1 -authenticationSchema login-2passwd.xml`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- `add authentication loginSchemaPolicy login1 -rule true -action login1`

3. Configure a second factor.

   - `add authentication loginSchema login2 -authenticationSchema noschema`
   - `add authentication policylabel label1 -loginSchema login2`

4. Configure a third factor.

   - `add authentication loginSchema login_pass -authenticationSchema noschema`
   - `add authentication policylabel label2 -loginSchema login_pass`

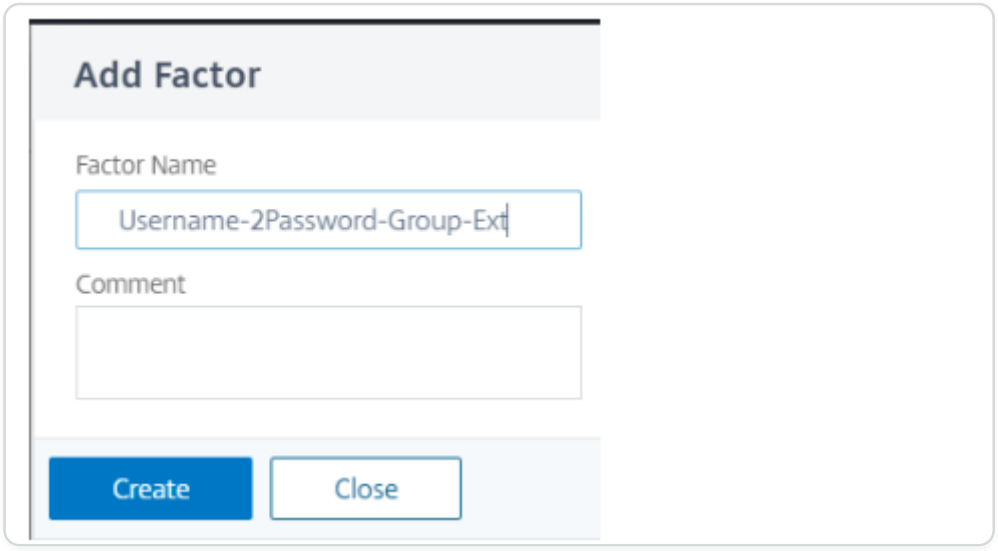
5. Configure LOCAL, RADIUS, and LDAP factor.

   - `add authentication Policy localpolicy -rule true -action LOCAL`
   - `add authentication ldapAction ldapact -serverIP 10.217.201.84 -ldapBase "cn=users,dc=dep,dc=sqltest,dc=net" -ldapBindDn Administrator@dep.sqltest.net -ldapBindDnPassword 8f7e6642195bc181f734cbc1bd18dfaf03bf9835abda7c045f7a964ceb58d4c9 -encrypted -encryptmethod ENCMTHD_3 -ldapLoginName sAMAccountName -groupAttrName memberOf -subAttributeName CN -ssoNameAttribute userprincipalname`
   - `add authentication Policy ldappolicy -rule true -action ldapact`
   - `add authentication radiusAction radius -serverIP 10.217.22.20 -radKey a740d6a0aeb3288fa0a6fbe932d329acddd8f448ecb4a3038daa87b36599fd16 -encrypted -encryptmethod ENCMTHD_3 -radNASip ENABLED -radNASid NS28.50 -radAttributeType 11 -ipAttributeType 8`
   - `add authentication Policy radiuspolicy -rule true -action radius`

6. Bind the policies.

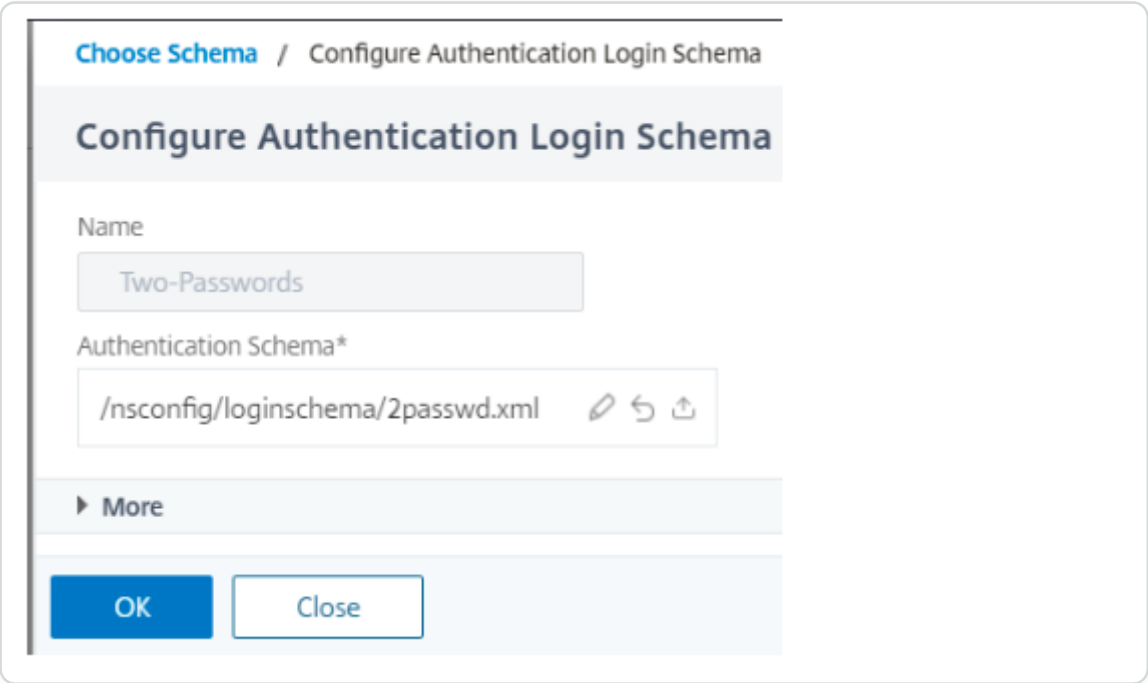
   - `bind authentication vserver avn -policy login1 -priority 10 -gotoPriorityExpression END`
   - `bind authentication vserver avn -policy localpolicy -priority 2 -nextFactor label1 -gotoPriorityExpression NEXT`
   - `bind authentication policylabel label1 -policyName radiuspolicy -priority 1 -gotoPriorityExpression NEXT -nextFactor label2`
   - `bind authentication policylabel label2 -policyName ldappolicy -priority 10 -gotoPriorityExpression NEXT`

© 1997–2026 Citrix Systems, Inc. All rights reserved.



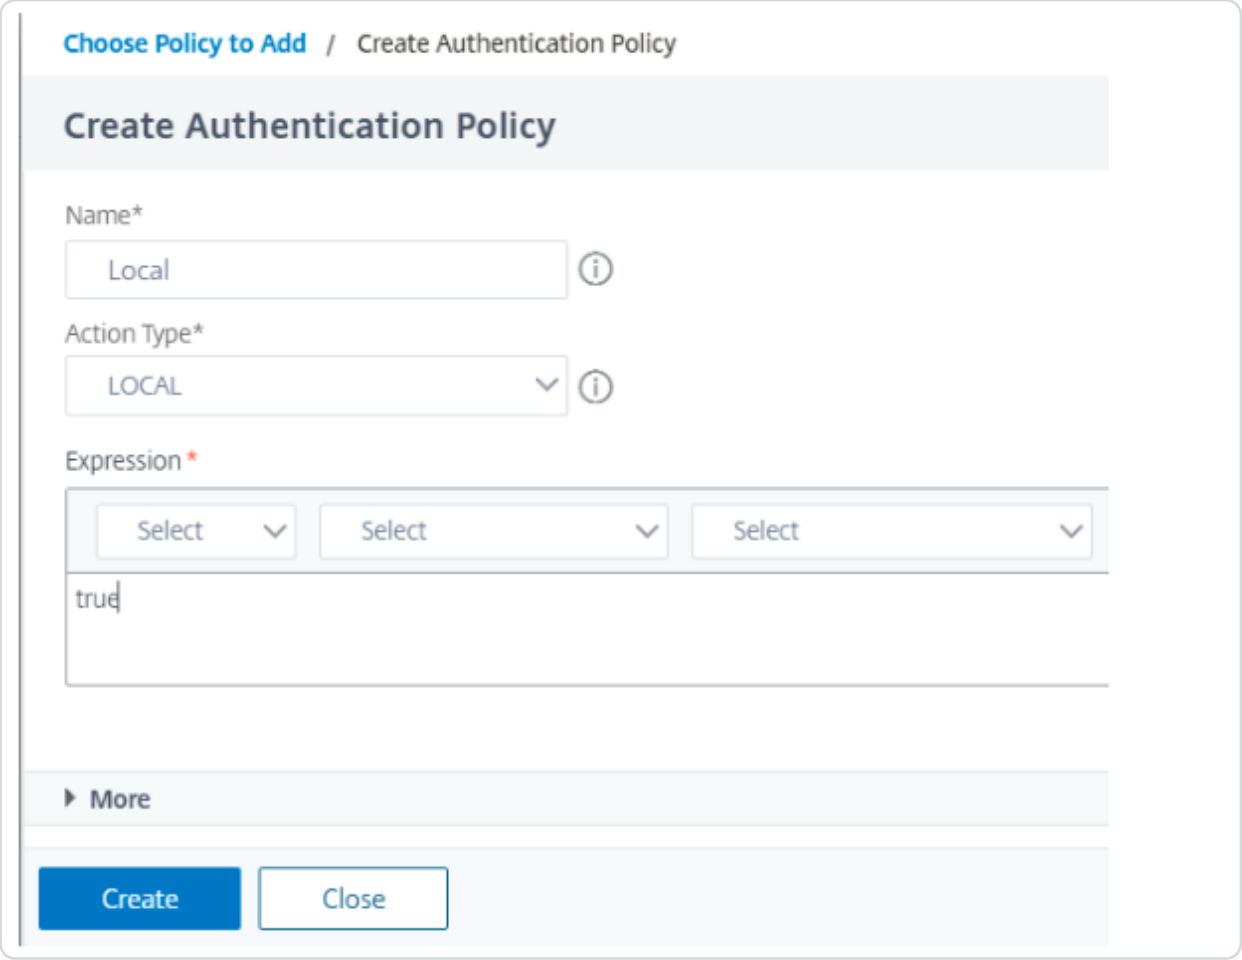
NOTE

The setup can also be created through the nFactor Visualizer available in NetScaler version 13.0 and later.



Configuring by using the nFactor Visualizer

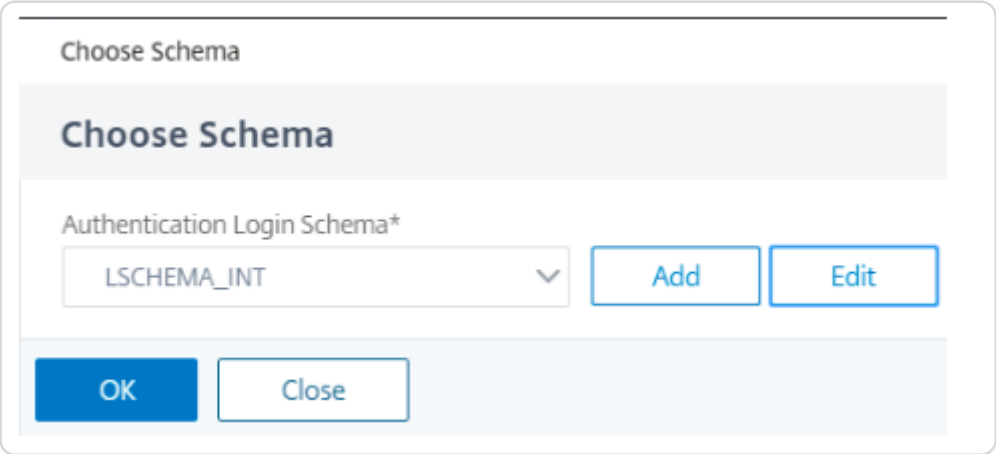
1. Navigate to **Security > AAA-Application Traffic > nFactor Visualizer > nFactor Flows** and click **Add**.
2. Click **+** to add the nFactor flow.
3. Add a factor. The name that you enter is the name of the nFactor flow. Click **Create**.



4. Click **Add Schema** to add the login schema for the first factor. You can create an authentication login schema or select an existing authentication login schema from the list. Click **OK**.

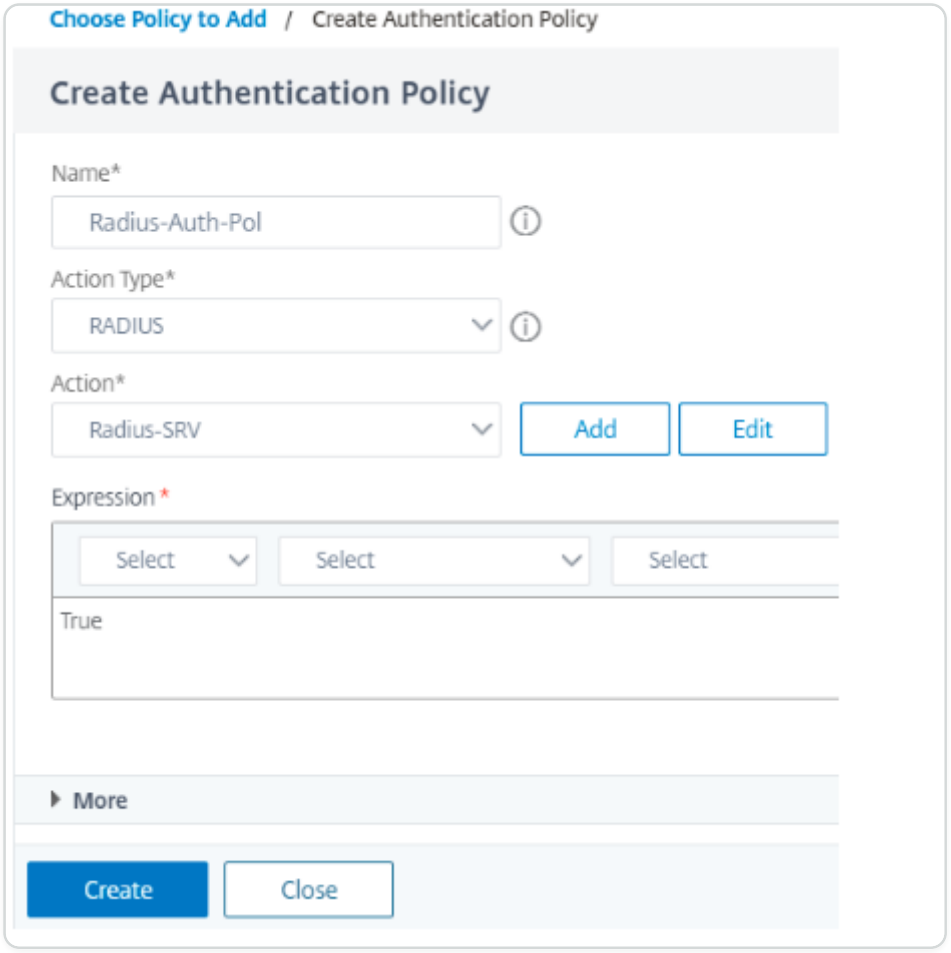
© 1997–2026 Citrix Systems, Inc. All rights reserved.

5. Click **Add Policy** to add the first factor authentication policy. You can create an authentication policy or select an existing authentication policy from the list.
6. Create a Local policy, as per the following.



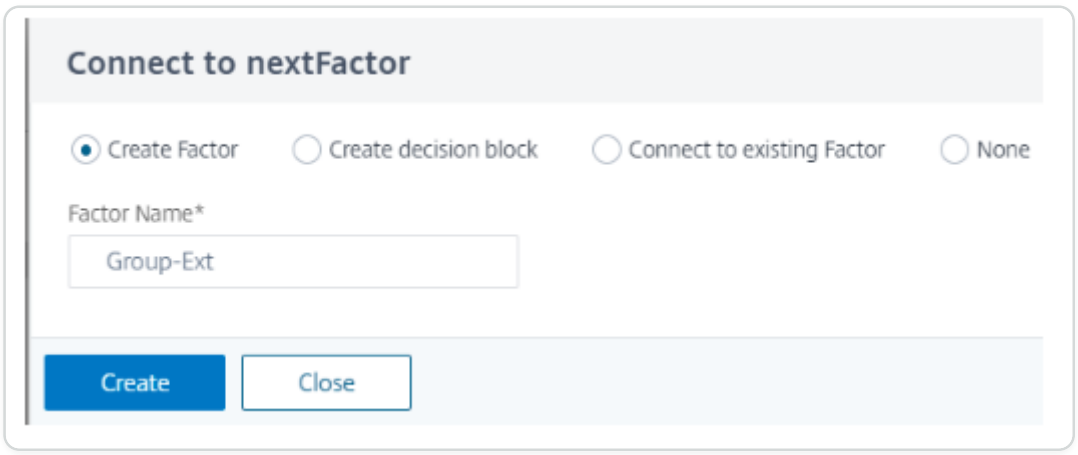
7. Click the green **+** icon to add the second factor.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



8. Click **Add Schema** to add the login schema for the second factor. You can create an authentication login schema or select an existing authentication login schema from the list. Click **OK**.

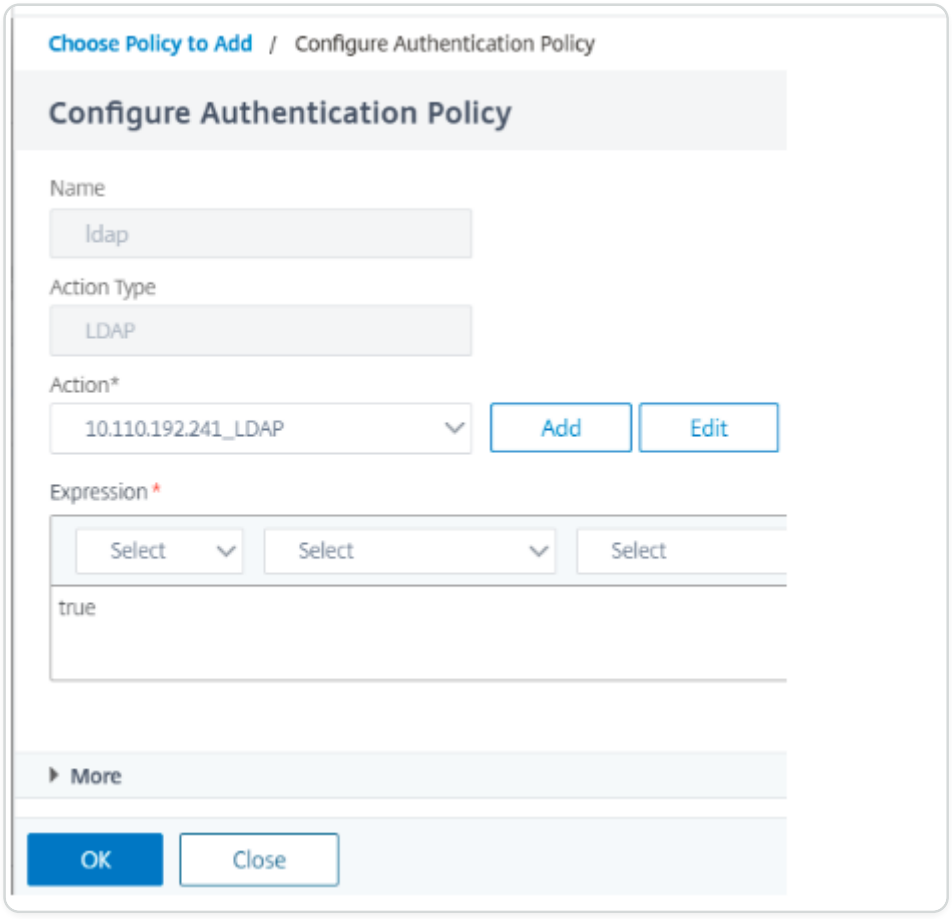
9. Click **Add Policy** to create a policy. Click **Create** and click **Add**.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE

In case the RADIUS actions is not created, see To configure RADIUS authentication



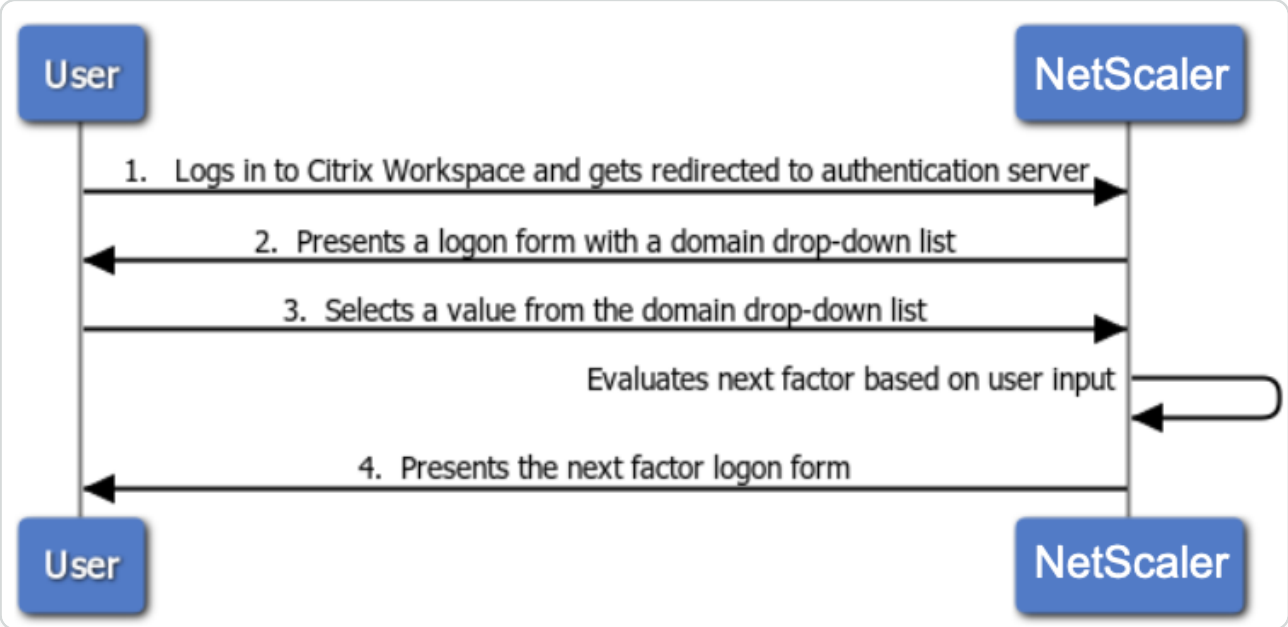
10. Click green **+** to add the third factor, and click **Create**.

11. Click **Add Schema** to add the login schema for the second factor. You can create an authentication login schema or select an existing authentication login schema from the list. Click **OK**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

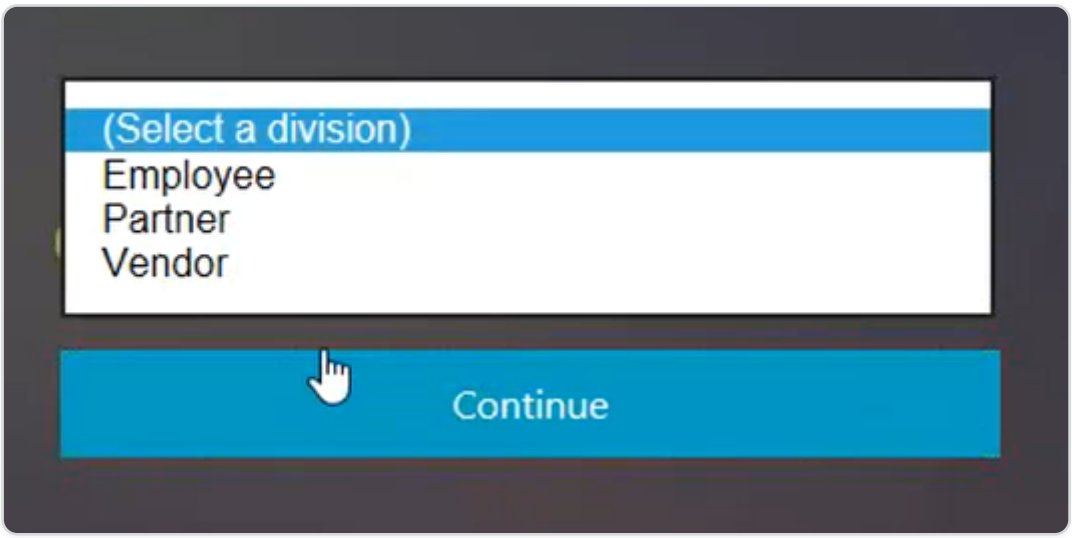
12. Click **Add Policy** to create a policy. Click **Create** and click **Add**.
13. In case the LDAP action is added, select the same. If not, follow the KB article to create one, also since you are doing only extraction, make sure to have the authentication disabled on the LDAP action. For more information, see How to Use LDAP for Group Extraction Through NetScaler Without Authentication
14. On the **Configure Authentication Policy** add LDAP policy and click **OK**.

15. Click **Done**. Select nFactor flow and click **Bind to Authentication Server** option and select the authentication, authorization, and auditing virtual server from the list.



Configure a domain drop-down list for user input in the first factor to decide the next factor authentication flow

Consider an organization which has the following three departments (groups), Employee, Partner, and Vendor. The NetScaler appliance can be configured to present the user with a logon form based on the department the user belongs to. Administrator can configure different authentication flows for respective departments as shown in the following table as an example.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

GROUP NAME	FACTOR
Employee	Single `Auth` (Username/Password)
Partner	`OAuth` (redirects to a different IdP)
Vendor	SAML (redirects to a different IdP)

The following diagram shows a high level interaction between a user and the NetScaler appliance configured for the previously mentioned use case.

1. User logs in to Citrix Workspace and gets redirected to an authentication virtual server.
2. NetScaler presents a logon form with a domain drop-down list.

3. User selects a value from the domain (division) drop-down list.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. NetScaler presents a logon form based on user input for the drop-down list.

Configure domain drop-down list for user input in the first factor to decide the next factor authentication flow using CLI

Prerequisite

A load balancing virtual server is configured with authentication enabled.

Configure authentication virtual server for the domain drop-down list value

NOTE

You can modify the **OnlyDomainDropdown.xml** schema to create a customized login schema (divisionDropdown.xml) in this case.

Create first factor as NO_AUTHN

```
add authentication Policy noauth_division_select_pol -rule true -action
NO_AUTHN
```

Create next factor for Employee, Partner, Vendor Departments/Division using policy labels

```
add authentication loginSchema lschema_division_dropdown
-authenticationSchema "/nsconfig/loginschema/devisionDropdown.xml"

add authentication policylabel plabel_noauth_Employee_Partner_Vendor
-loginSchema lschema_division_dropdown

add authentication Policy noauth_Employee_pol -rule
"AAA.LOGIN.DOMAIN.EQ(\"Employee\")" -action NO_AUTHN

add authentication Policy noauth_Partner_pol -rule
"AAA.LOGIN.DOMAIN.EQ(\"Partner\")" -action NO_AUTHN
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add authentication Policy noauth_Vendor_pol -rule
"AAA.LOGIN.DOMAIN.EQ(\"Vendor\")" -action
```

Create a single authentication policy factor (LDAP is used as an example for this configuration)

```
add authentication loginSchema lschema_singleauth_Employee
-authenticationSchema "/nsconfig/loginschema/LoginSchema/SingleAuth.xml"

add authentication policylabel plabel_singleauth_Employee -loginSchema
lschema_singleauth_Employee

add authentication ldapAction aaa_local_pwd_act -serverIP 90.196.17.40
-ldapBase "OU=ABSOU,dc=aaa,dc=local" -ldapBindDn administrator@aaa.local
-ldapBindDnPassword xxxx -ldapLoginName samAccountName -groupAttrName
memberOf -subAttributeName CN -secType TLS -ssoNameAttribute
userPrincipalName -passwdChange ENABLED -nestedGroupExtraction ON
-maxNestingLevel 7 -groupNameIdentifier sAMAccountName
-groupSearchAttribute memberOf -groupSearchSubAttribute CN
-defaultAuthenticationGroup ldapDefaultAuthGroup -Attribute1
userPrincipalName -Attribute2 mail

add authentication Policy aaa_local_pwd_pol -rule true -action
aaa_local_pwd_act

bind authentication policylabel plabel_singleauth_Employee -policyName
aaa_local_pwd_pol -priority 100 -gotoPriorityExpression NEXT
```

Create OAuth policy for redirecting to OAuth IdP

```
add authentication policylabel plabel_oauth_Partner -loginSchema
lschema_noschema

add authentication OAuthAction oauth_sp_act -authorizationEndpoint
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
"https://absauthidp.aaa.local/oauth/idp/login?
response_type=code&scope=openid&client_id=netscaler" -tokenEndpoint
"https://absauthidp.aaa.local/oauth/idp/token" -clientID netscaler
-clientSecret
1e1155e92ad926dea4fa05a46e1dfa7e10063ad6fe2086394e9e435b19b28a5e
-encrypted -encryptmethod ENCMTHD_3 -kek -suffix 2021_02_18_11_22
-CertEndpoint "https://absauthidp.aaa.local/oauth/idp/certs" -audience
absauthidp.aaa.local

add authentication Policy oauth_sp_pol -rule true -action oauth_sp_act

bind authentication policylabel plabel_oauth_Partner -policyName
oauth_sp_pol -priority 100 -gotoPriorityExpression NEXT
```

Create SAML policy for redirecting to SAML IdP

```
add authentication policylabel plabel_saml_Vendor -loginSchema
lschema_noschema

add authentication samlAction saml_sp_act -samlIdPCertName server_certkey
-samlSigningCertName server_certkey -samlRedirectUrl "https://
absauthidp.aaa.local/saml/login" -samlUserField nameid -samlIssuerName
"https://abssamlissuer.aaa.local"

add authentication Policy saml_sp_pol -rule true -action saml_sp_act

bind authentication policylabel plabel_saml_Vendor -policyName saml_sp_pol
-priority 100 -gotoPriorityExpression NEXT
```

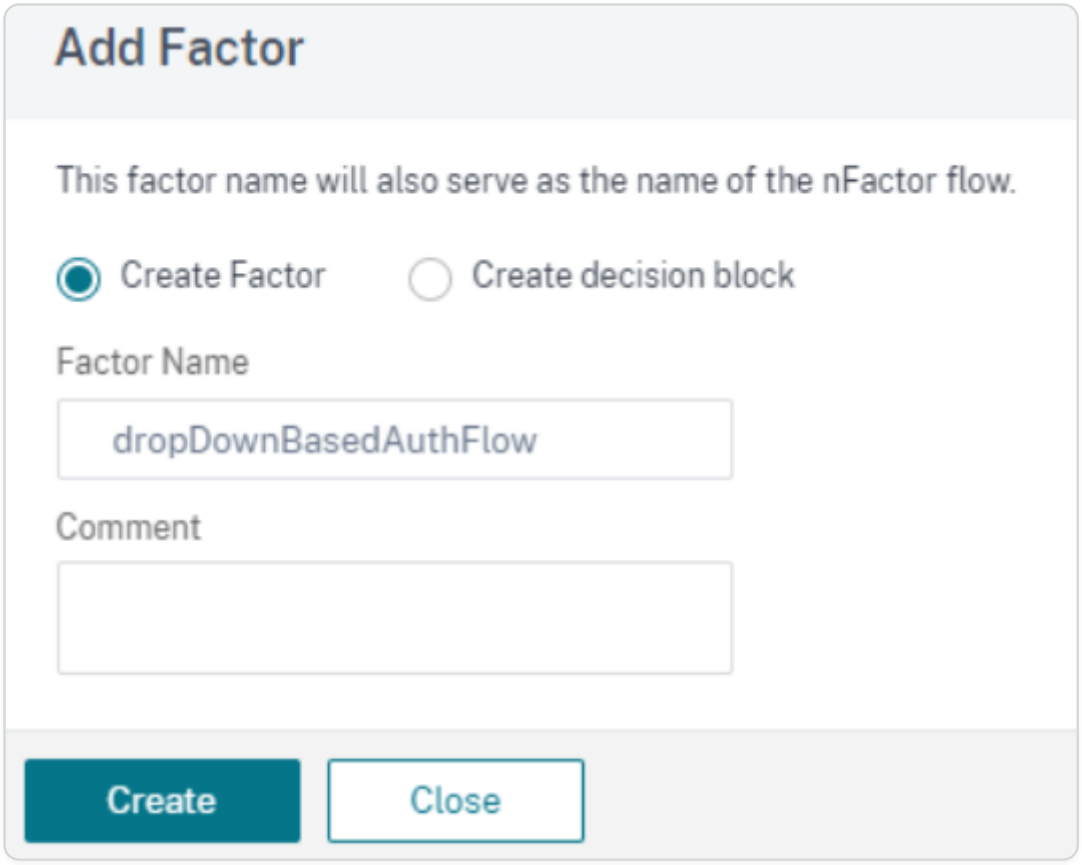
© 1997–2026 Citrix Systems, Inc. All rights reserved.

Bind the three policy factors created previously to plabel_noauth_Employee_Partner_Vendor

```
bind authentication policylabel plabel_noauth_Employee_Partner_Vendor
-policyName noauth_Employee_pol -priority 100 -gotoPriorityExpression NEXT
-nextFactor plabel_singleauth_Employee

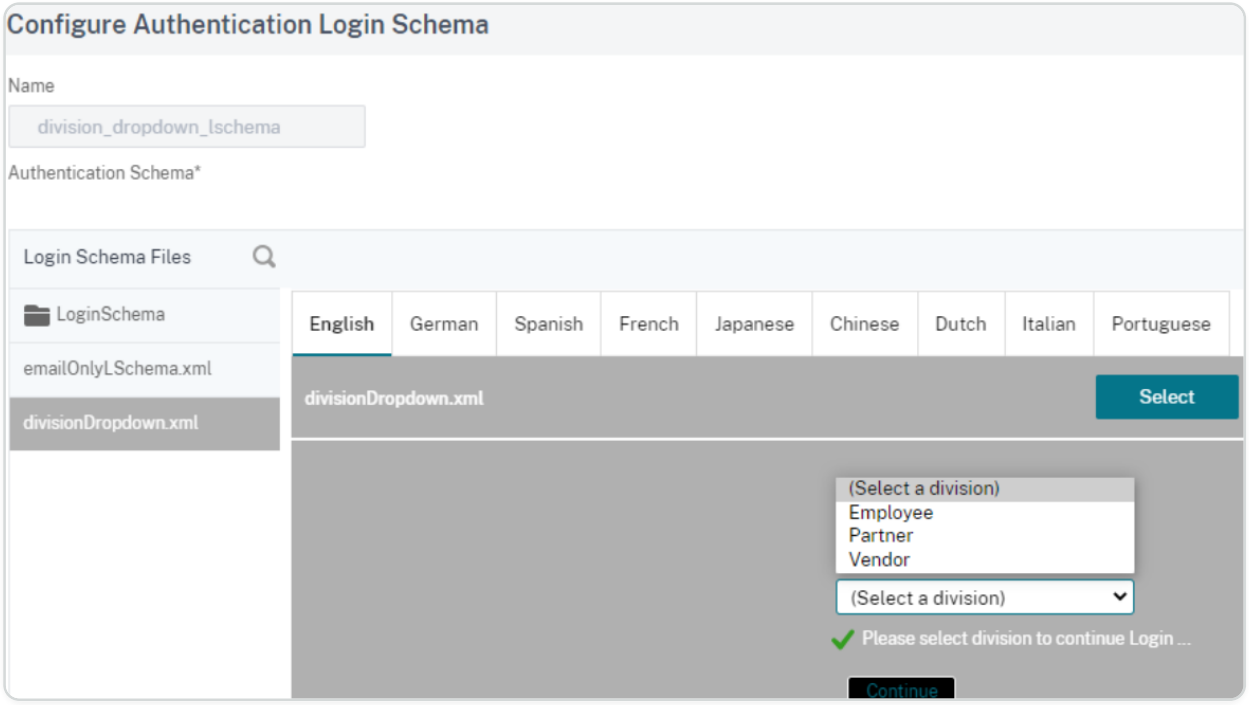
bind authentication policylabel plabel_noauth_Employee_Partner_Vendor
-policyName noauth_Partner_pol -priority 110 -gotoPriorityExpression NEXT
-nextFactor plabel_oauth_Partner

bind authentication policylabel plabel_noauth_Employee_Partner_Vendor
-policyName noauth_Vendor_pol -priority 120 -gotoPriorityExpression NEXT
-nextFactor plabel_saml_Vendor
```



Bind group based policy label as nextFactor for drop-down list based authentication policy selection

```
bind authentication vserver abs_sp_auth_vs -policy
noauth_division_select_pol -priority 100 -nextFactor
plabel_noauth_Employee_Partner_Vendor -gotoPriorityExpression NEXT
```



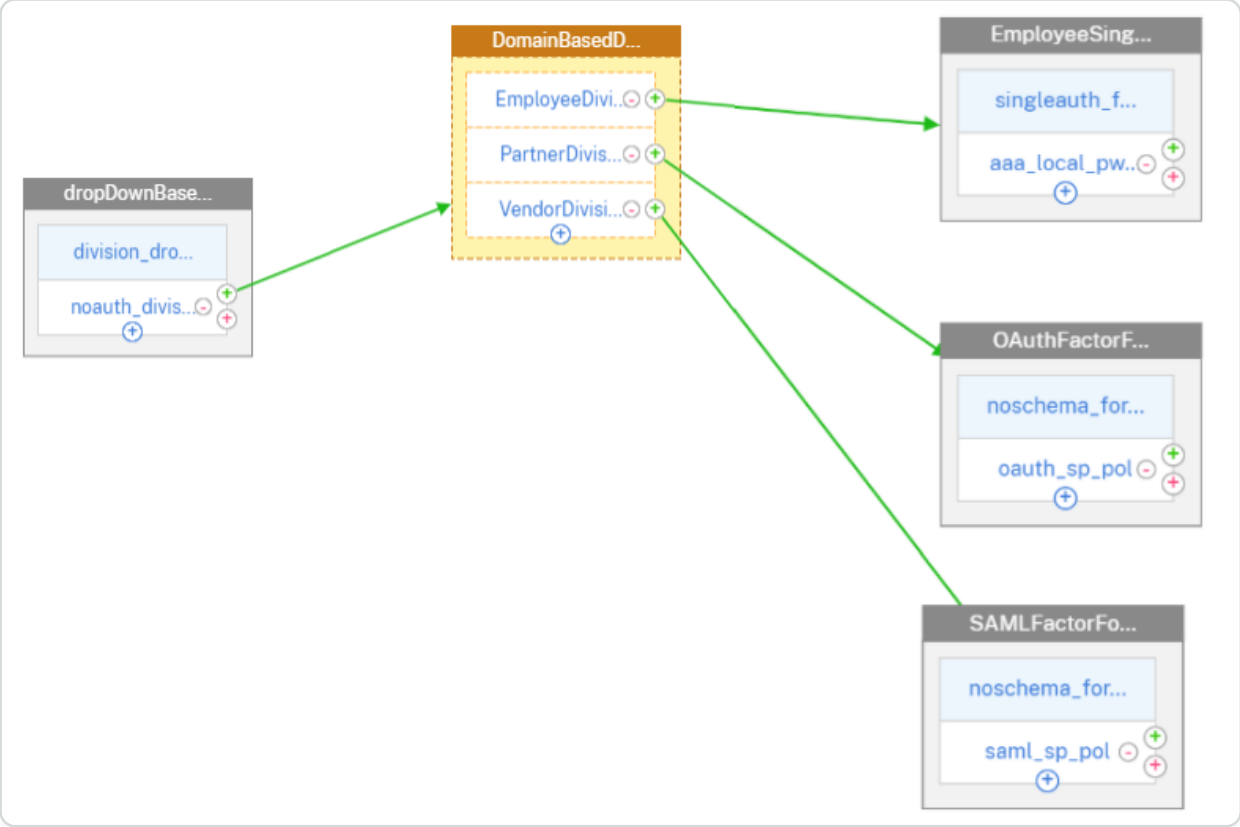
Configure domain drop-down list for user input in first factor to decide the next factor authentication flow using GUI

1. Navigate to **Security > AAA-Application Traffic > nFactor Visualizer > nFactor Flow** and click **Add**.
2. Click + to add the nFactor flow.
3. Add a factor. The name that you enter is the name of the nFactor flow and click **Create**.
4. Create a factor for drop-down list based authentication flow.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

5. Click **Add Schema** on the nFactor block. To create a customized login schema (divisionDropdown in this case), you can edit the built-in **DomainDropdown.xml** schema.

Note: You can create a new domain by using an existing DomainDropdown.xml schema. In the **"select a domain"** tag, add the domain name as per your requirement and then save the XML file. You must then find the domain that you added in the drop-down list.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
ID><SaveID>ExplicitForms-Username</SaveID><Type>username</Type><

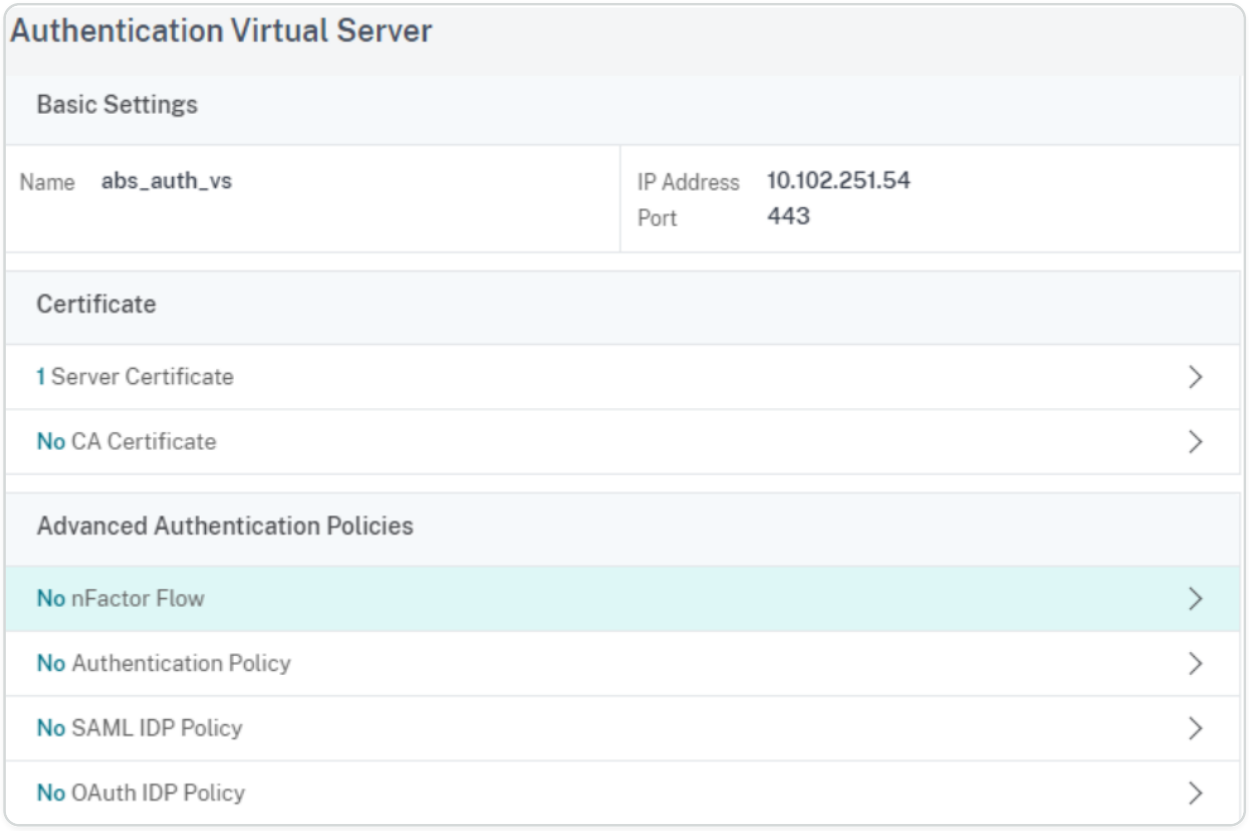
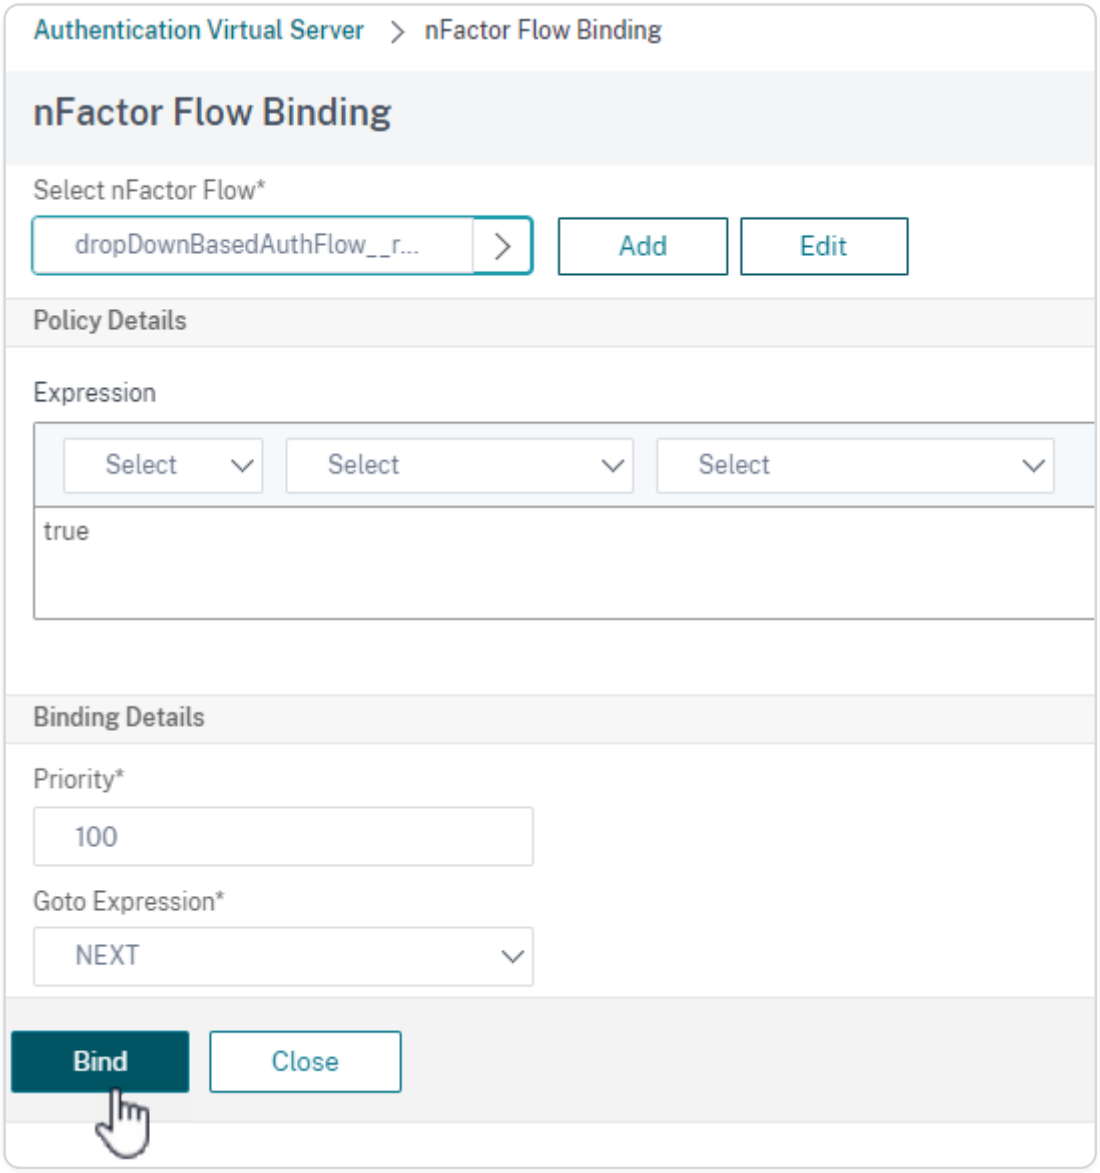
n</ID><Type>none</Type></Credential><Label><Type>none</Type></La
```

6. Create division based decision block based on domain received from end user and create an authentication factor for each decision block.



7. After the nFactor flow is complete, bind this flow to the authentication, authorization, and auditing virtual server. Click **Bind to Authentication Server** and click **Create**.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

8. Select authentication virtual server and click **nFactor Flow**.

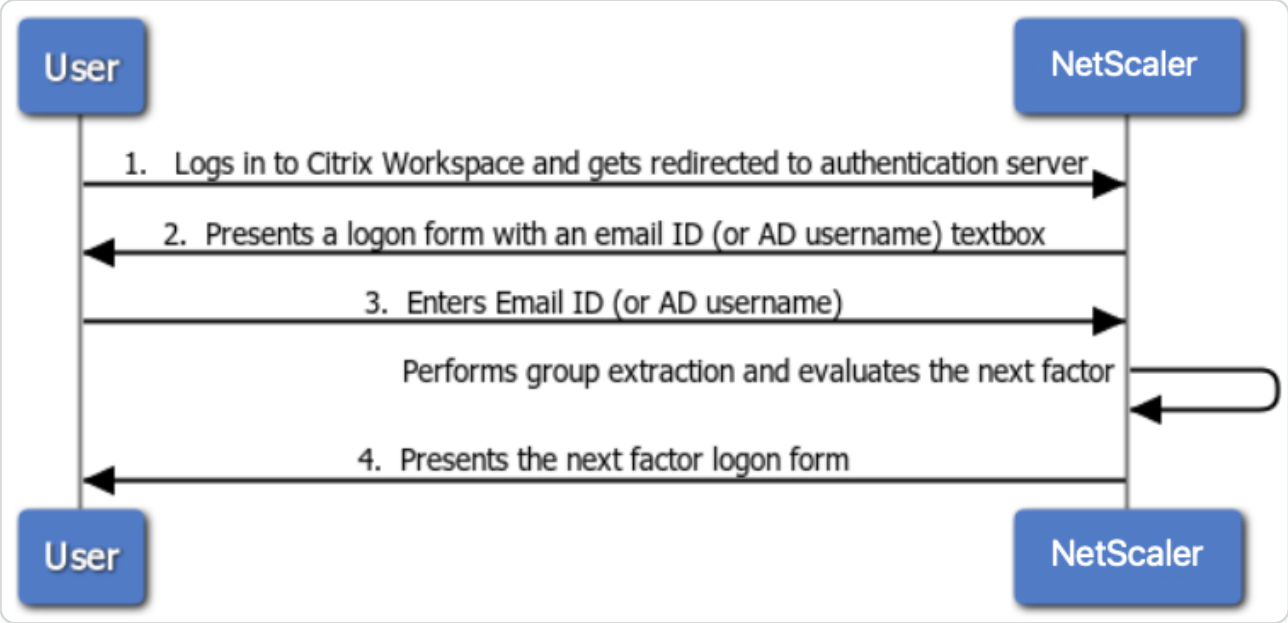
9. Choose the nFactor flow under **Select nfactor Flow field** and click **Bind**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Unbind the nFactor flow

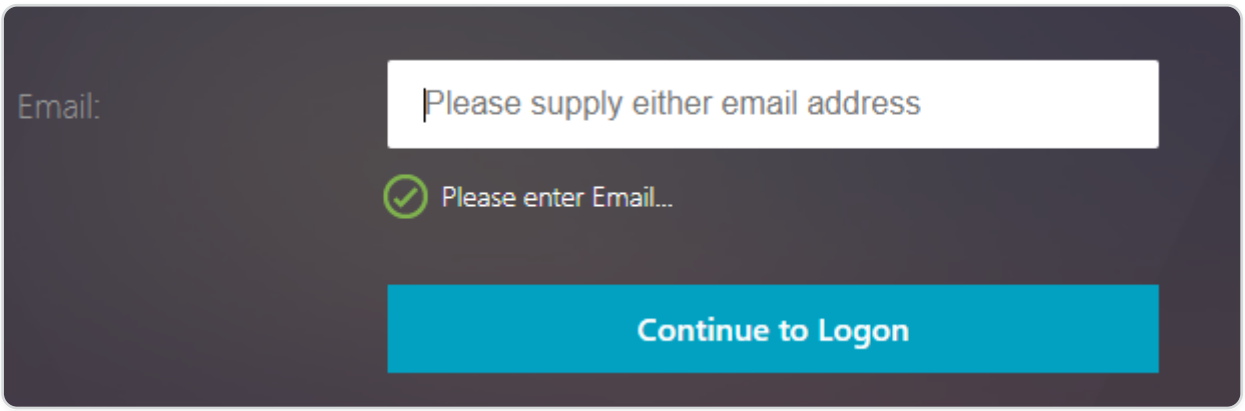
1. Select the nFactor flow and click **Show Bindings**.
2. Select the authentication virtual server and click **Unbind**.

Configure email ID (or user name) input based group extraction at first factor to decide the next factor authentication flow



Consider an organization which has the following three departments (groups), Employee, Partner, and Vendor. The NetScaler appliance can be configured to extract user's group based on the email ID or the AD user name provided by the user in the first factor logon form. Based on the group a

© 1997–2026 Citrix Systems, Inc. All rights reserved.



user belongs to, NetScaler presents an authentication method (LDAP, SAML, OAuth, and so on) as shown is the following table as an example.

GROUP NAME	FACTOR
Employee	Single Auth (Username/Password)
Partner	OAuth (redirects to different IdP)
Vendor	SAML (redirects to different IdP)

The following diagram shows a high level interaction between a user and the NetScaler appliance for the previously mentioned use case.

1. User logs in to Citrix Workspace and gets redirected to an authentication virtual server.
2. NetScaler presents a logon form to enter email ID (or user name).

3. User enters the Email ID (or user name).

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. NetScaler presents a logon form based on the group extracted using the provided email ID (or user name).

Configure email ID (or user name) input based group extraction at first factor to decide the next factor authentication using CLI

Prerequisite

A load balancing virtual server is configured with authentication enabled.

Configure authentication virtual server for email based group extraction

NOTE

You can modify **OnlyUsername.xml** schema to create a customized login schema (emailOnlyLSchema) in this case.

Create login schema policy using email login schema created in the previous step and bind to the authentication virtual server

```
add authentication loginSchema lschema_only_email -authenticationSchema "/
nsconfig/loginschema/only_email.xml"

add authentication loginSchemaPolicy lschema_only_email_pol -rule true
-action lschema_only_email

bind authentication vserver abs_sp_auth_vs -policy lschema_only_email_pol
-priority 100 -gotoPriorityExpression END
```

Create an LDAP authentication policy for group extraction

NOTE

ldapLoginName is "mail" for email ID based login, whereas -ldapLoginName is "samAccountName" for username based login.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add authentication ldapAction aaa_local_grp_extraction -serverIP
90.1.187.40 -ldapBase "OU=ABSOU,dc=aaa,dc=local" -ldapBindDn
administrator@aaa.local -ldapBindDnPassword xxxx -ldapLoginName mail
-groupAttrName memberOf -subAttributeName CN -secType TLS -authentication
DISABLED

add authentication Policy aaa_local_grp_extraction_pol -rule true -action
aaa_local_grp_extraction
```

Extracted group based policy configuration

Create next factor for Employee, Partner, Vendor Groups using policy labels

```
add authentication loginSchema lschema_noschema -authenticationSchema
noschema

add authentication policylabel plabel_noauth_Employee_Partner_Vendor
-loginSchema lschema_noschema

add authentication Policy noauth_Employee_pol -rule
"AAA.USER.IS_MEMBER_OF(\"Employee\")" -action NO_AUTHN

add authentication Policy noauth_Partner_pol -rule
"AAA.USER.IS_MEMBER_OF(\"Partner\")" -action NO_AUTHN

add authentication Policy noauth_Vendor_pol -rule
"AAA.USER.IS_MEMBER_OF(\"Vendor\")" -action NO_AUTHN
```

Create a single Auth policy factor (LDAP is used as an example for this configuration)

```
add authentication loginSchema lschema_singleauth_Employee
-authenticationSchema "/nsconfig/loginschema/LoginSchema/SingleAuth.xml"

add authentication policylabel plabel_singleauth_Employee -loginSchema
lschema_singleauth_Employee
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add authentication ldapAction aaa_local_pwd_act -serverIP 90.196.17.40
-ldapBase "OU=ABSOU,dc=aaa,dc=local" -ldapBindDn administrator@aaa.local
-ldapBindDnPassword xxxx -ldapLoginName samAccountName -groupAttrName
memberOf -subAttributeName CN -secType TLS -ssoNameAttribute
userPrincipalName -passwdChange ENABLED -nestedGroupExtraction ON
-maxNestingLevel 7 -groupNameIdentifier sAMAccountName
-groupSearchAttribute memberOf -groupSearchSubAttribute CN
-defaultAuthenticationGroup ldapDefaultAuthGroup -Attribute1
userPrincipalName -Attribute2 mail

add authentication Policy aaa_local_pwd_pol -rule true -action
aaa_local_pwd_act

bind authentication policylabel plabel_singleauth_Employee -policyName
aaa_local_pwd_pol -priority 100 -gotoPriorityExpression NEXT
```

Create OAuth Policy for redirecting to OAuth IdP

```
add authentication policylabel plabel_oauth_Partner

add authentication OAuthAction oauth_sp_act -authorizationEndpoint
&lt;authorization-endpoint> -tokenEndpoint &lt;token-endpoint> -clientID
&lt;client-id> -clientSecret &lt;client-secret> -CertEndpoint &lt;cert-
endpoint> -userNameField &lt;user-name>

add authentication Policy oauth_sp_pol -rule true -action oauth_sp_act

bind authentication policylabel plabel_oauth_Partner -policyName
oauth_sp_pol -priority 100 -gotoPriorityExpression NEXT
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Create SAML Policy for redirecting to SAML IdP

```
add authentication policylabel plabel_saml_Vendor

add authentication samlAction saml_sp_act -samlIdPCertName &lt;IDP-
CertKeyName> -samlRedirectUrl &lt;Redirect-url> -samlIssuerName
&lt;Issuer-Name>

add authentication Policy saml_sp_pol -rule true -action saml_sp_act

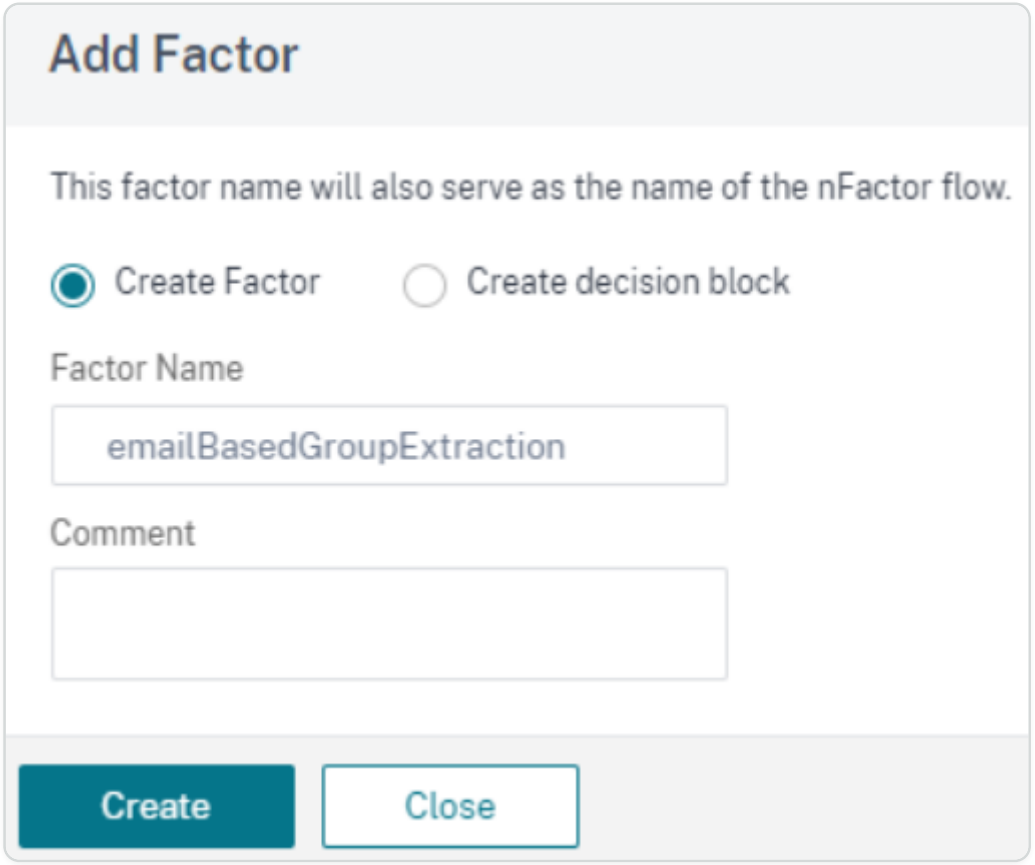
bind authentication policylabel plabel_saml_Vendor -policyName saml_sp_pol
-priority 100 -gotoPriorityExpression NEXT
```

Bind all three policy factors to plabel_noauth_Employee_Partner_Vendor

```
bind authentication policylabel plabel_noauth_Employee_Partner_Vendor
-policyName noauth_Employee_pol -priority 100 -gotoPriorityExpression NEXT
-nextFactor plabel_singleauth_Employee

bind authentication policylabel plabel_noauth_Employee_Partner_Vendor
-policyName noauth_Partner_pol -priority 110 -gotoPriorityExpression NEXT
-nextFactor plabel_oauth_Partner

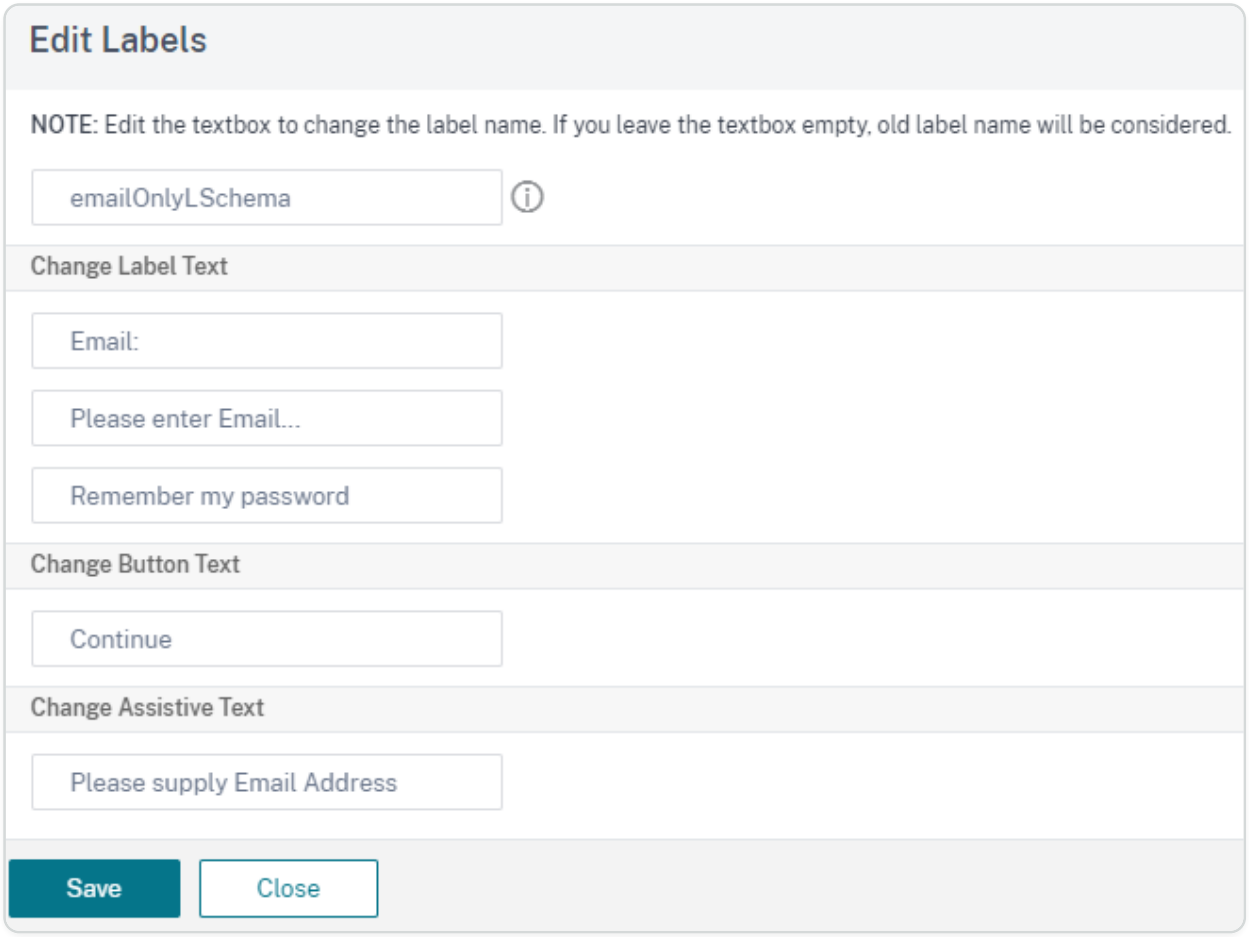
bind authentication policylabel plabel_noauth_Employee_Partner_Vendor
-policyName noauth_Vendor_pol -priority 120 -gotoPriorityExpression NEXT
-nextFactor plabel_saml_Vendor
```



Bind group based policy label as nextFactor for group extraction authentication policy

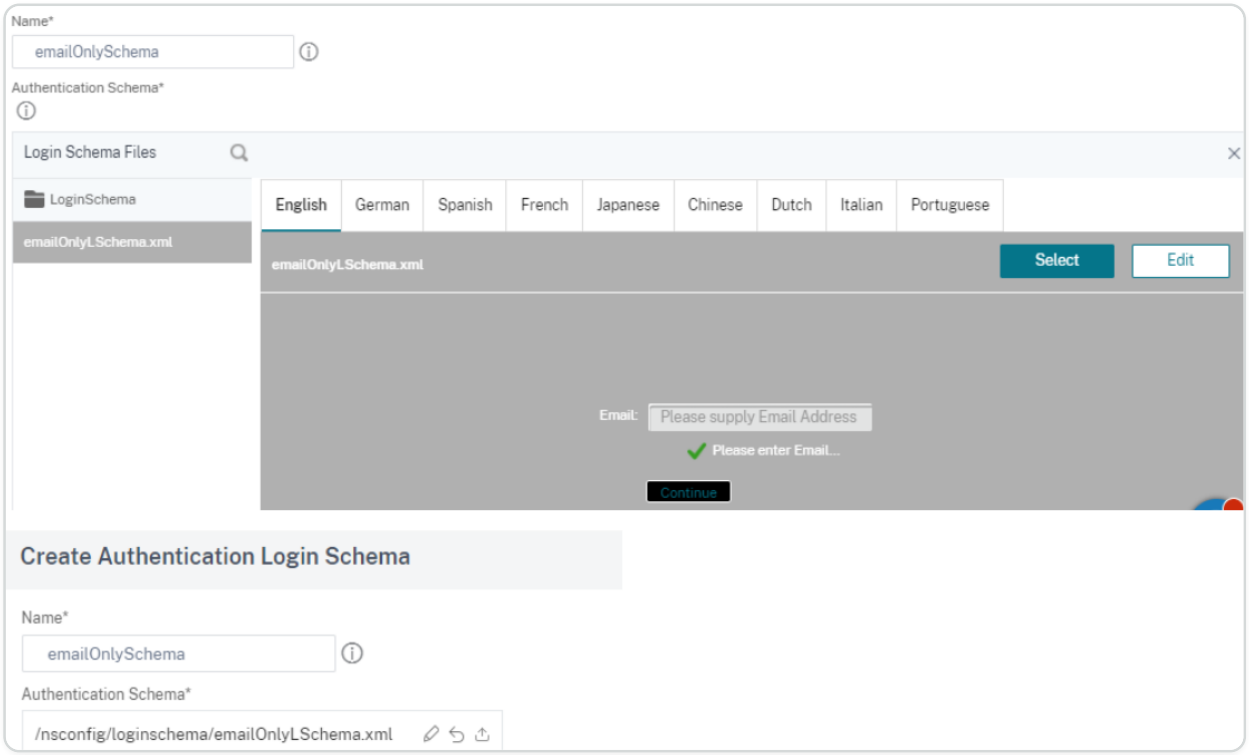
```
bind authentication vserver abs_sp_auth_vs -policy
aaa_local_grp_extraction_pol -priority 100 -nextFactor
plabel_noauth_Employee_Partner_Vendor -gotoPriorityExpression NEXT
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.



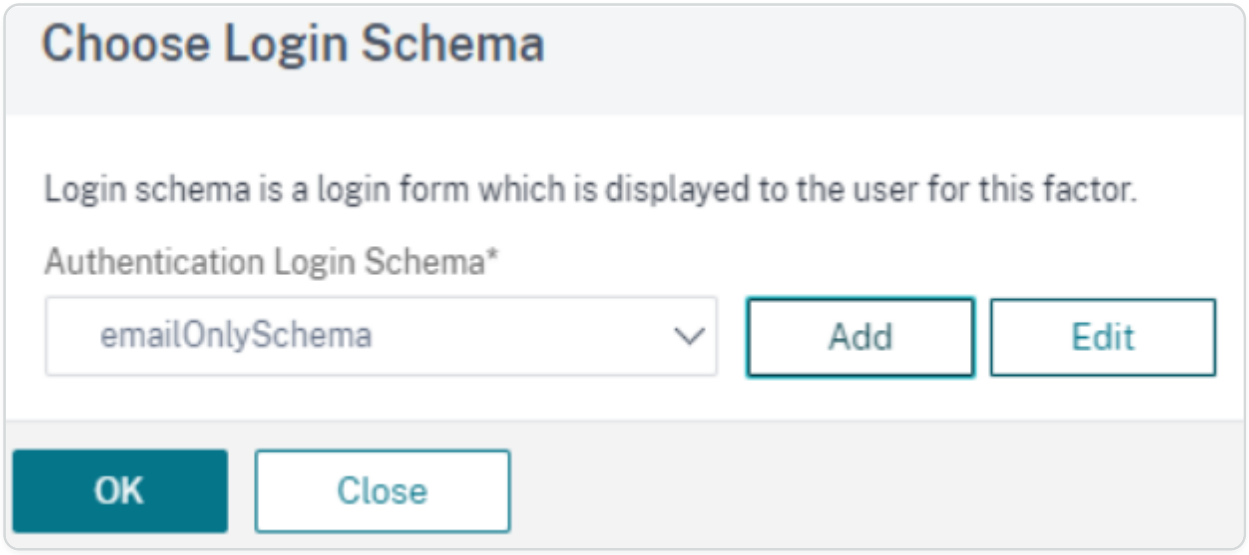
Configure email ID (or user name) input based group extraction at first factor to decide the next factor authentication by using the nFactor Visualizer

1. Navigate to **Security > AAA-Application Traffic > nFactor Visualizer > nFactor Flow** and click **Add**.
2. Click + to add the nFactor flow.
3. Add a factor for group extraction with LDAP group extraction policy using **EmailOnlyLoginSchema**. The name that you enter is the name of the nFactor flow. Click **Create**.

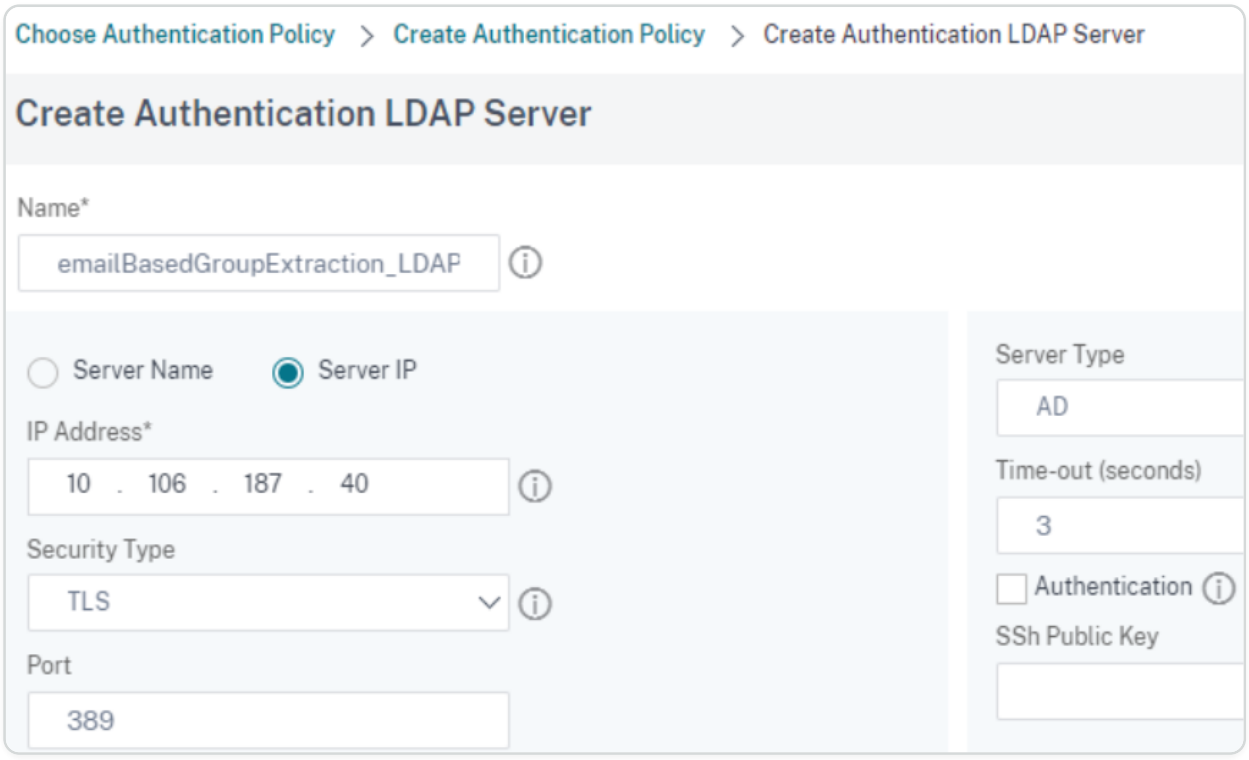


4. Click **Add Schema** on the nFactor block. To create a customized login schema (emailOnlyLSchema in this case), you can edit the built in **OnlyUsername.xml** schema.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

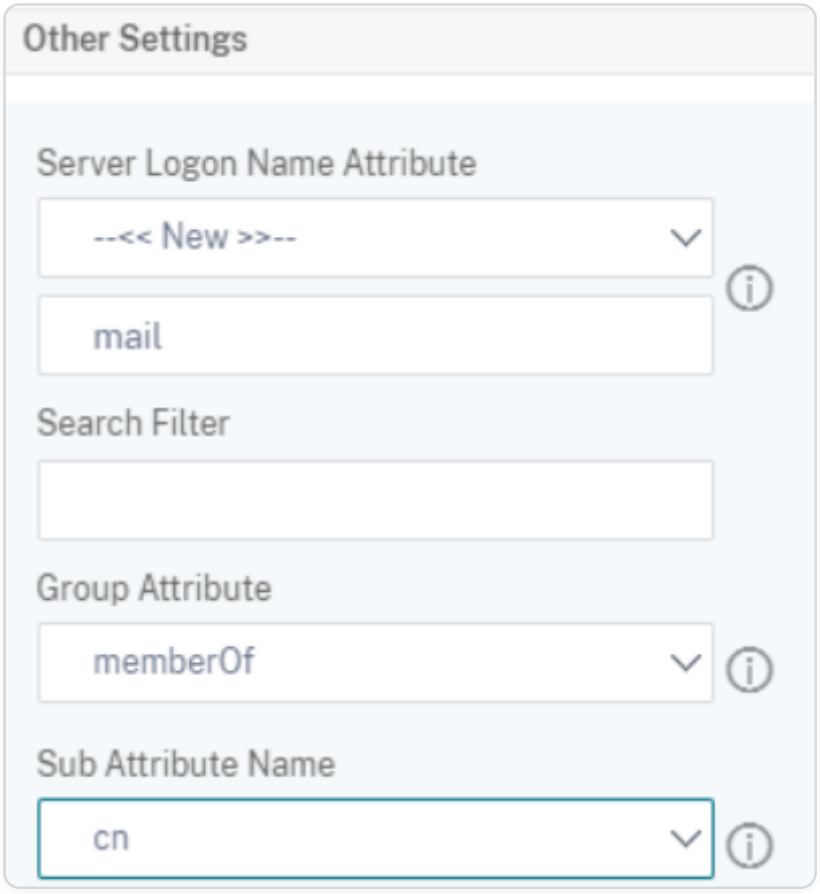


5. Create an authentication login schema using the created login schema file.

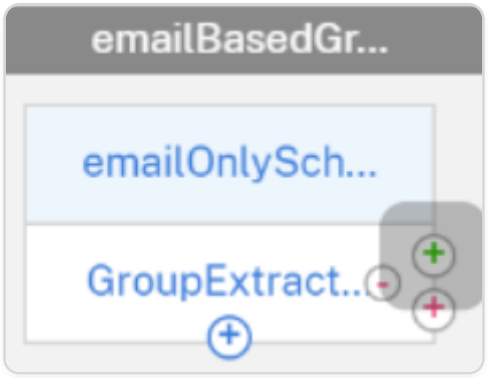


6. Choose a login schema from the **Authentication Login** Schema list and click **OK**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

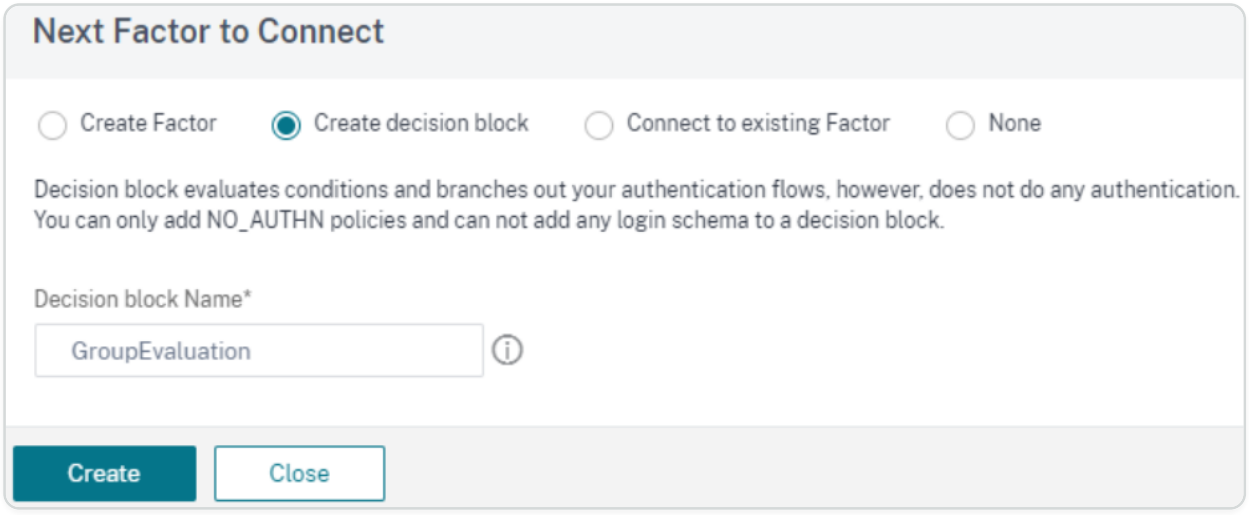


7. Create an LDAP server for group extraction with authentication disabled to be used for authentication policy creation. For more information on creating LDAP authentication, see, Configuring LDAP Authentication.

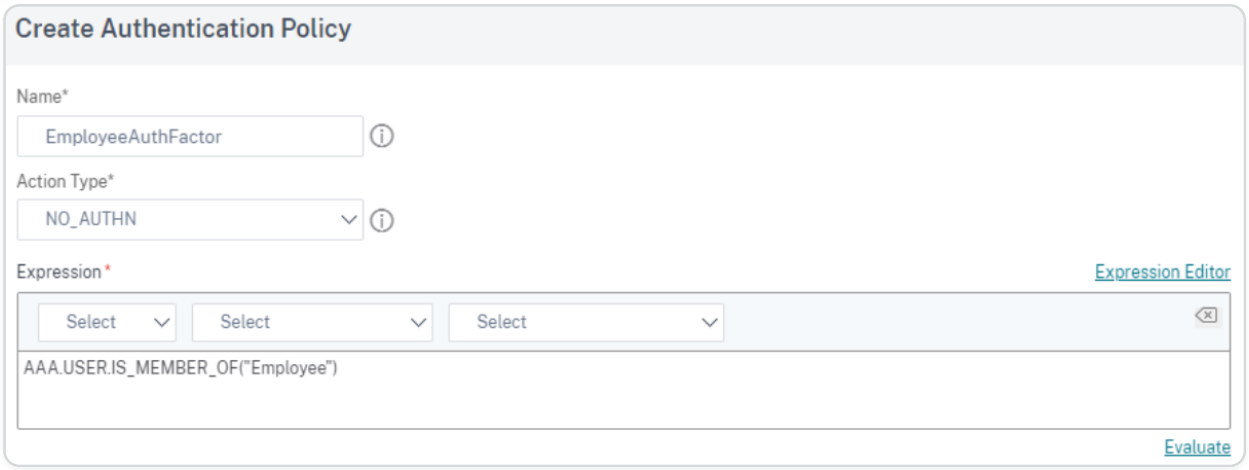


8. Click **Other Settings** to specify the following values for the LDAP server. LDAP login name – **mail**; Group Attribute - **MemberOf**; Sub Attribute Name - **cn**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

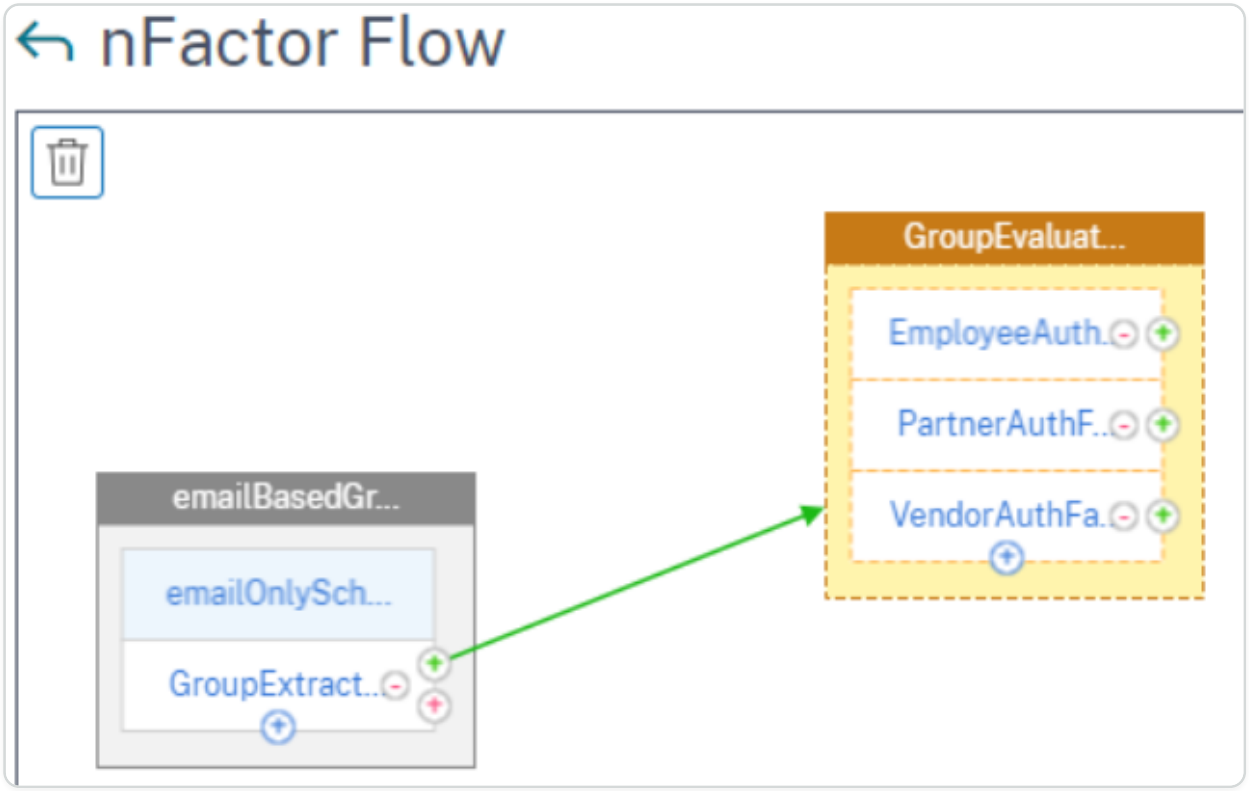


9. Click **Add Policy** and click **Add** to create a group extraction authentication policy.
10. Click the green + sign on the emailbasedGroupExtraction block to create decision blocks for the next factors.

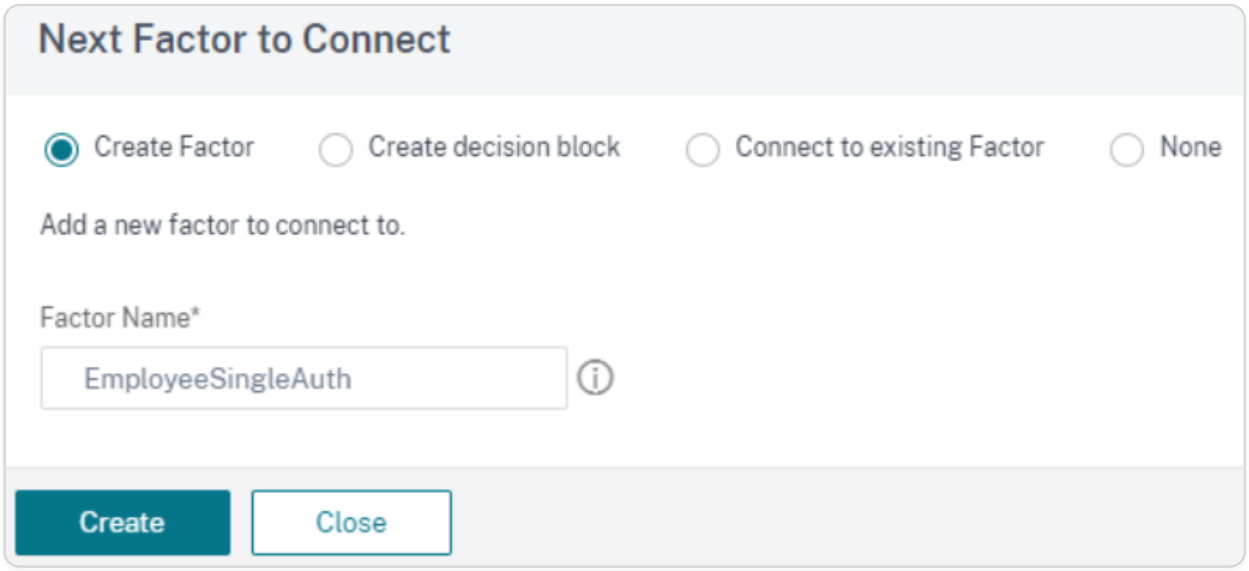


11. On **Next Factor to Connect** screen, select **Create decision block**, enter a name for the decision block, and click **Create**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

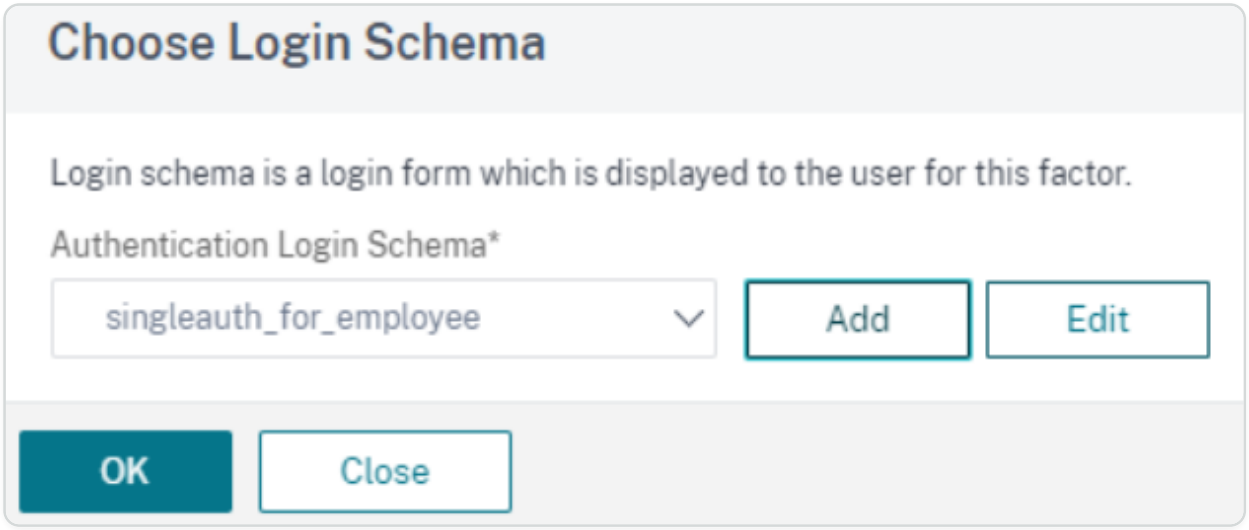


12. Create an authentication policy for each destination group for the respective decision blocks. For example, Group based authentication factor for AD Group "Employee".

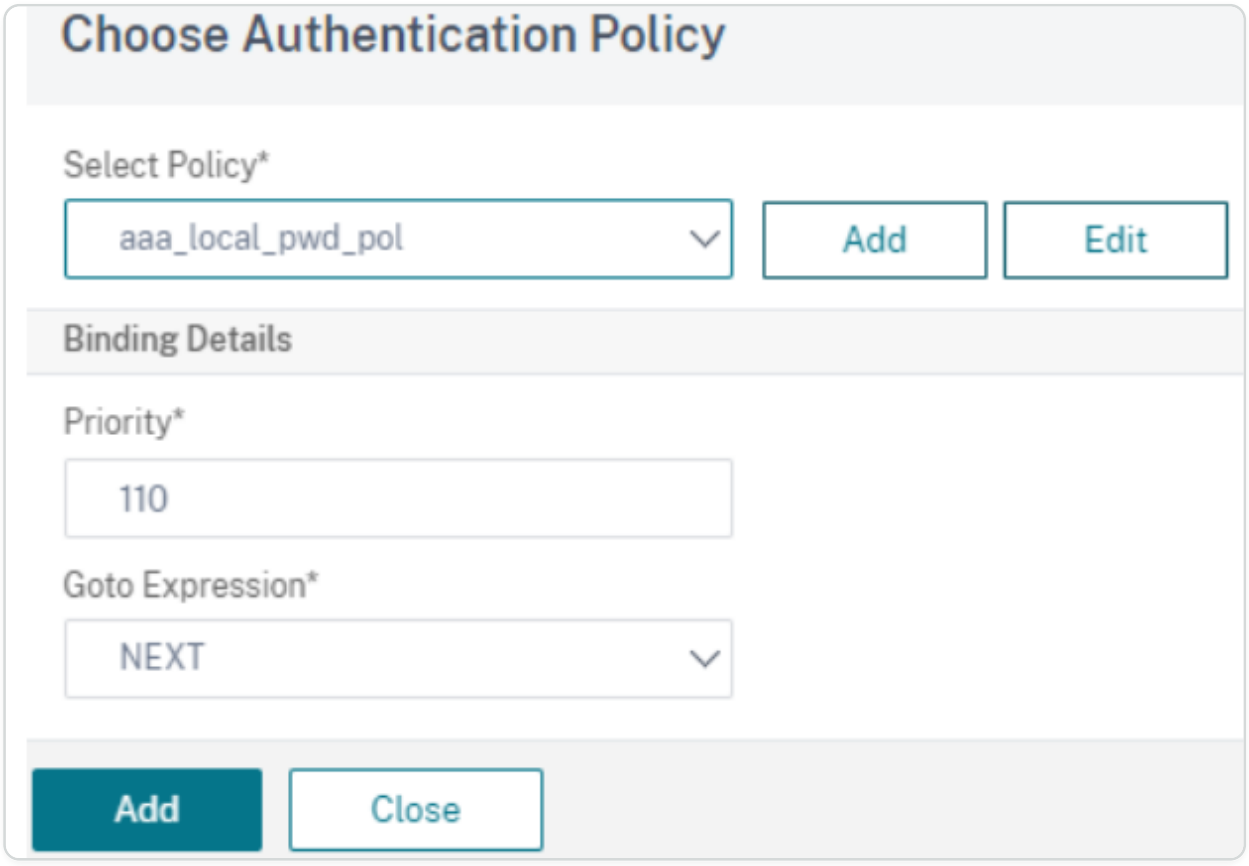


13. The following diagram shows the nFactor flow after all the decision blocks are created.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

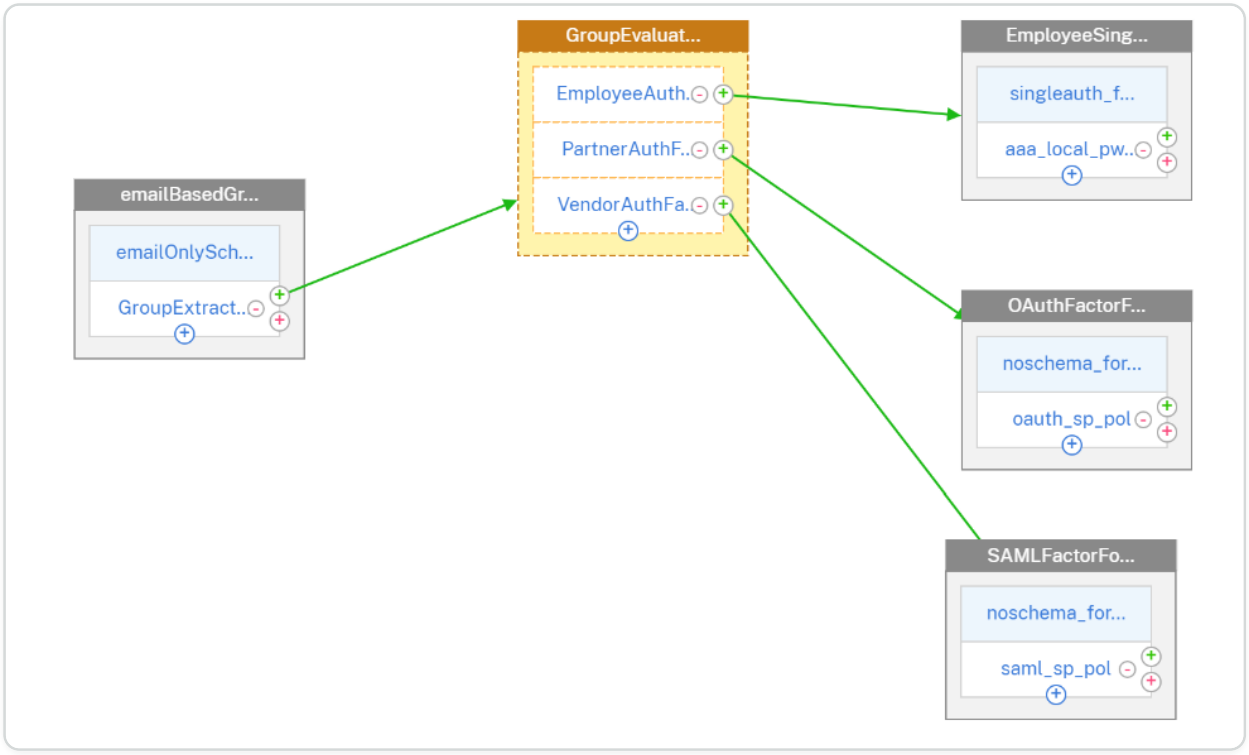


14. Once all the decision blocks are created, bind all the group based decision blocks to the respective authentication factors. For example, Employee group, can have a user name and password authentication factor.

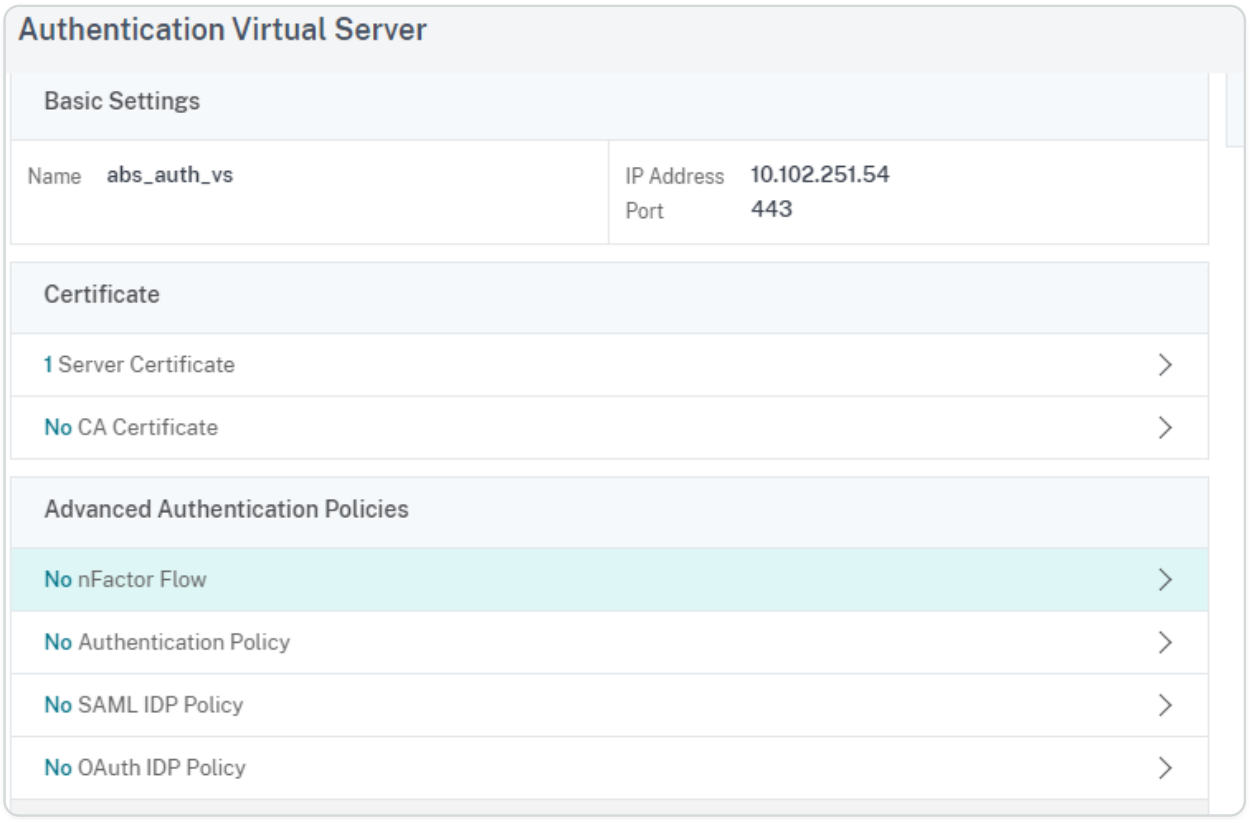


15. Choose login schema from the Authentication Login Schema drop-down menu and click **Add**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

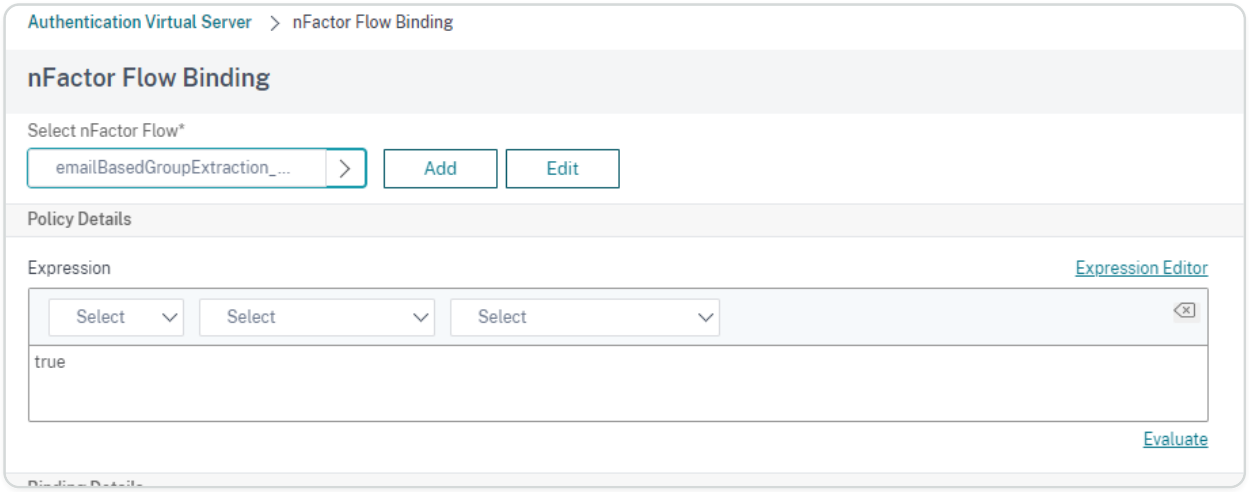


16. Choose the authentication policy and click **Add**.



17. Once all group based decision blocks are configured with authentication policies as factors, the nFactor flow looks like the following diagram.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



18. Click **Bind to Authentication Server** and click **Create**.
19. Select the authentication virtual server and click nFactor Flow.

20. Choose the nFactor flow under **Select nfactor Flow** field and click **Add**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

21. Bind this flow to the authentication, authorization, and auditing virtual server.

Unbind the nFactor

1. Select the nFactor flow and click **Show Bindings**.
2. Select the authentication virtual server and click **Unbind**.

Localize error messages generated by NetScaler nFactor system

This topic captures information on localizing error messages generated by NetScaler nFactor system. These messages include the extended authentication error strings that are obtained as part of enhanced authentication feedback.

The default error strings that are sent by nFactor subsystem are described in /var/netscaler/logon/LogonPoint/receiver/js/localization/en/ctxs.strings.js for English language. Error strings for other languages are found in corresponding directories in /var/netscaler/logon/LogonPoint/receiver/js/localization/.

You must create a portal theme based on RfWeb UI for localizing error messages.

At the command prompt, type:

```
add portaltheme custom_error_theme -basetheme RfWebUI

bind authentication vserver av1  -portaltheme custom_error_theme
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

After these commands are executed, a new directory is created in /var/netscaler/logon/themes/ `<name>`. This directory contains a file named “strings.en.json.” This file is an empty json file to begin with. Administrator can add name-value pairs comprising of old and new error strings.

For example, { "No active policy during authentication": "No active policy during authentication, Please contact administrator" }

In the preceding example, text on the left side is the existing error message that is sent by nFactor. The text on the right side is the replacement for that. Administrator can add more messages as required.

Enhanced authentication feedback

For obtaining extended error messages during authentication process, enhancedAuthenticationFeedback feature must be enabled.

At the command prompt, type:

```
set aaa parameter –enableEnhancedAuthFeedback YES
```

Configure NetScaler Gateway preauthentication EPA scan for the domain check

You can configure NetScaler Gateway preauthentication EPA scan to check if the user device is domain-joined or not. For the scan to pass, the client machine must be domain-joined to the domain whose suffix is configured in the EPA policy.

After enabling the scan, test it with a client machine that has a domain membership matching the configured suffix. Then, test again with a non-domain-joined or mismatched-domain client to verify that the policy correctly blocks access.

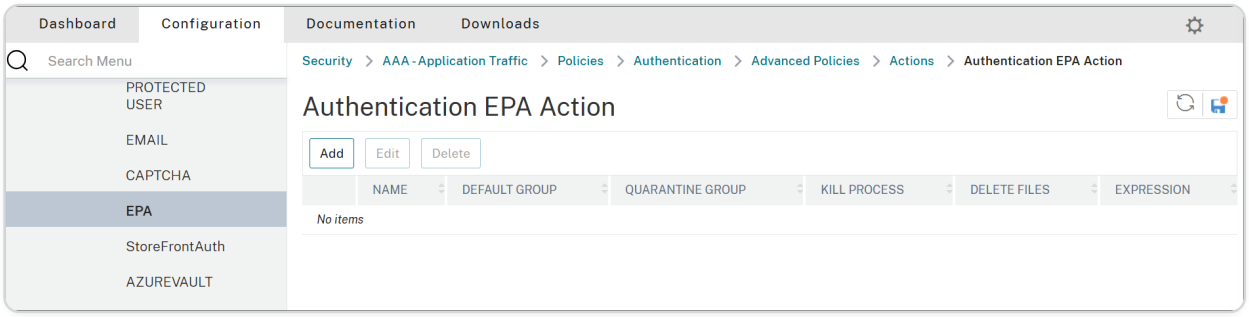
You can configure preauthentication EPA scan using an advanced or a classic authentication policy. We recommend you to use an advanced authentication policy because classic policies are deprecated in future releases.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Preauthentication EPA scan configuration by using the advanced authentication policy

High level steps involved in this configuration

1. Preauthentication EPA scan for domain check validates if the domain suffix of the client machine matches the domain configured in the preauthentication policy.
2. If the EPA scan passes, the authentication process proceeds to the next configured authentication factor (for example, LDAP).
3. If the EPA scan fails, the connection is denied before the next authentication factor is attempted.



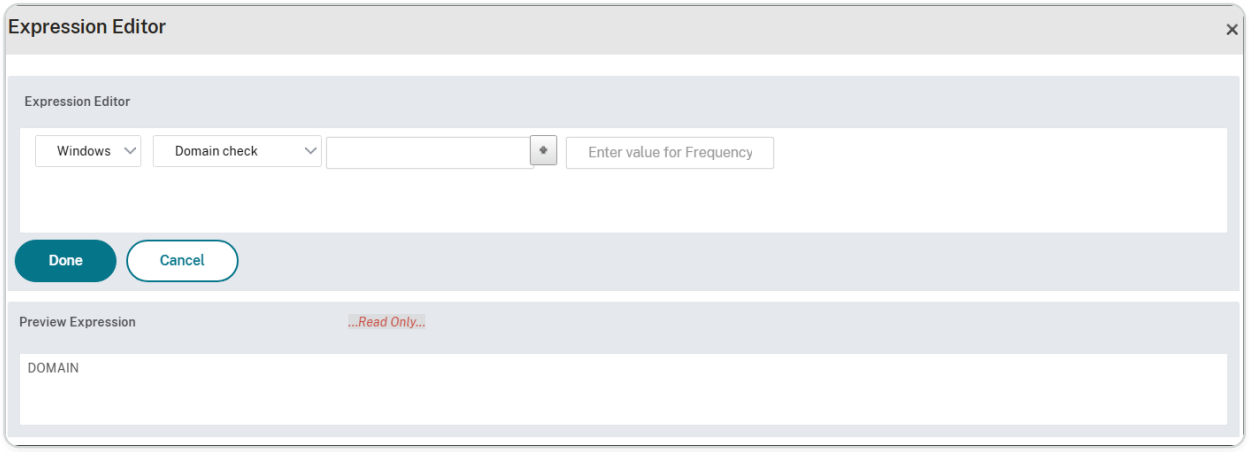
Pre-requisites

It is assumed that the following configurations are in place:

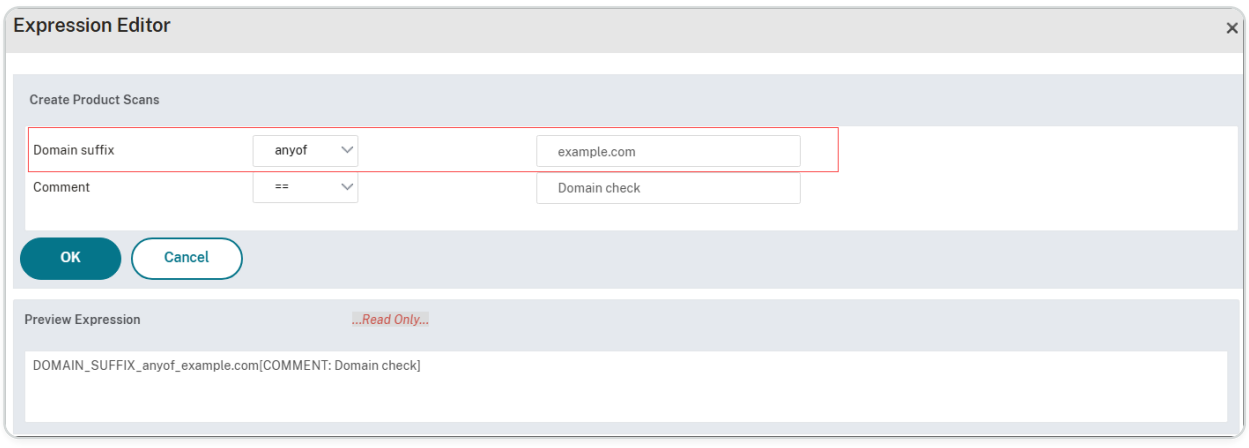
- An authentication virtual server to host the advanced authentication policy.
- An authentication profile must be linked to the VPN virtual server so that the "EPA -> next authentication factor" flow applies to VPN logins.

Configuration by using the GUI

1. Navigate to **Security > AAA - Application Traffic > Policies > Authentication > Advanced Policies > Actions > EPA**.
2. On the **Authentication EPA Action** page, click **Add**.



3. In **Name**, enter a name for the EPA action.
4. Click **EPA Editor**.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

5. On the **Expression Editor** page, select **Windows** and then **Domain check** in the drop-down menus.

6. Click the **+** sign and in **Domain suffix**, select **anyof**.
7. In the textbox next to **Domain suffix**, enter the domain name to be scanned and click **OK**.

8. On the **Expression Editor** page, validate the **Preview Expression** and click **Done**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

9. Click **Create**.

Configuration by using the CLI

1. Configure an EPA Action to check if the client's domain suffix matches the configured domain.

```
add authentication epaAction adv_epa_act -csecexpr
"sys.client_expr(\"sys_0_DOMAIN_SUFFIX_anyof_example.com[COMMENT:
Domain check]\")"
```

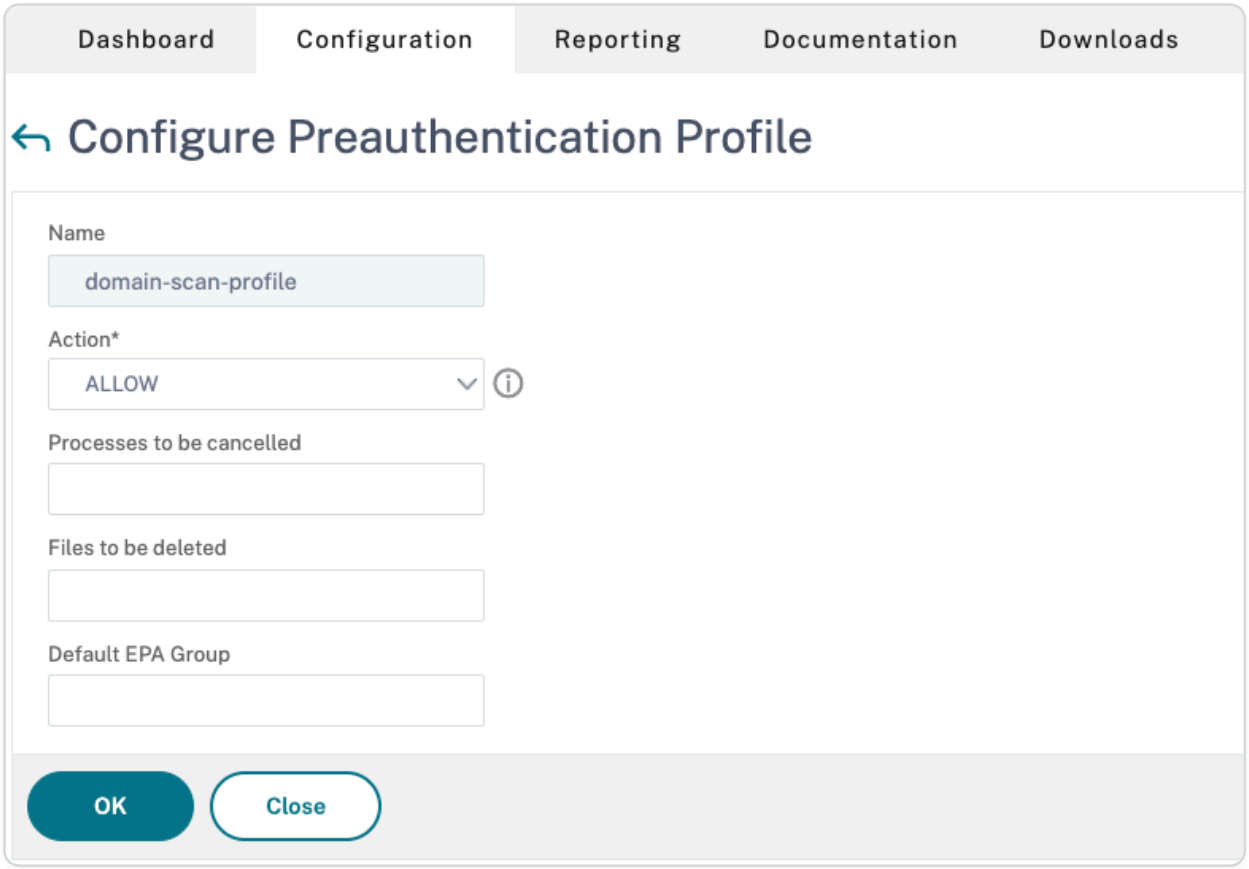
2. Configure an EPA policy.

```
add authentication Policy adv_epa_pol -rule true -action adv_epa_act
```

3. Bind the EPA policy to the authentication virtual server with the next authentication factor. For example, the following command uses LDAP as the next authentication factor.

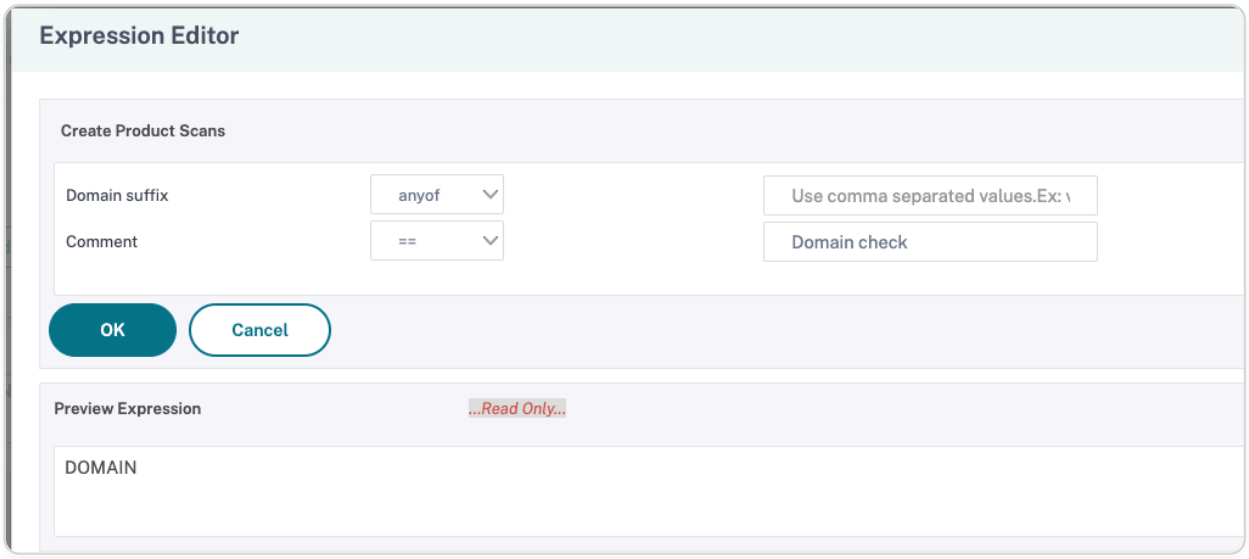
```
bind authentication vserver authn_vserver -policy adv_epa_pol -priority
100 -nextFactor adv_ldap_pol_label -gotoPriorityExpression NEXT
```

4. Bind the policy to the policy label. For example, the following command binds an LDAP policy to an LDAP policy label.



```
bind authentication policylabel adv_ldap_pol_label -policyName
adv_ldap_pol -priority 100 -gotoPriorityExpression END
```

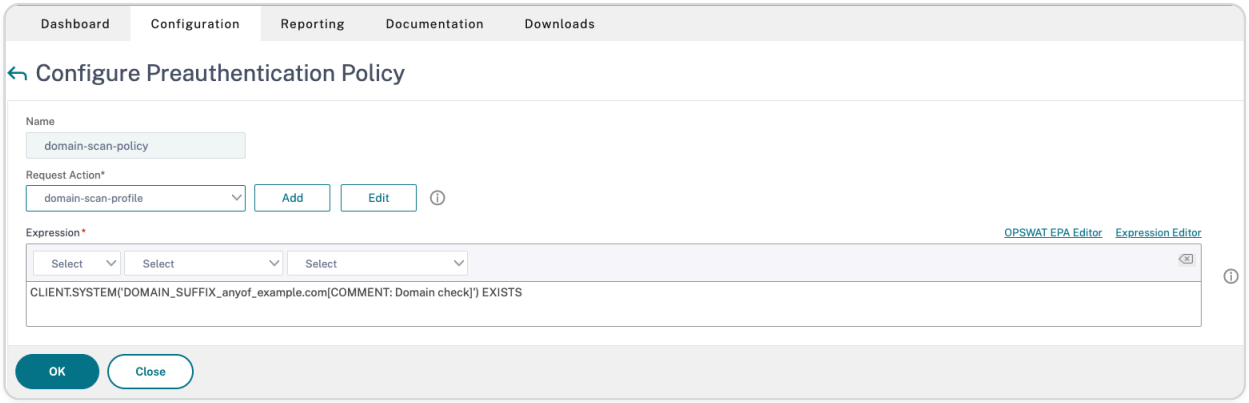
Preauthentication EPA scan configuration by using the classic authentication policy



Configuration by using the GUI

1. Navigate to **NetScaler Gateway > Policies > Preauthentication**.
2. Click the **Preauthentication Profiles,** tab and then click **Add**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



3. Enter a name for the new profile, and click **Create**.
4. Switch to the **Preauthentication Policies** tab and click **Add**.
5. Enter a name for the policy.
6. In **Request Action**, choose the previously created domain scan profile.
7. In **Expression**, click **OPSWAT EPA Editor**.
8. In **Expression Editor**, select **Windows** to scan Windows based systems, and then choose **Domain Check**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

9. Click **+** and enter the domain suffix and comment, if any. In this example, 'example.com' is used as the domain suffix.
10. Click **OK** and then click **Done**.

11. On the **Create Preauthentication Policy** page, click **Create**.
12. Bind the policy to the virtual server to enable the policy.

    a. Navigate to **NetScaler Gateway > Virtual Servers**.

    b. Select the virtual server, and then click **Edit**.

    c. In the **Policies** section, click the **+** sign.

    d. In **Choose Policy**, select **Preauthentication,** and then click **Continue**.

    e. In **Select Policy**, select the policy created for domain scan, and then click **Bind**.

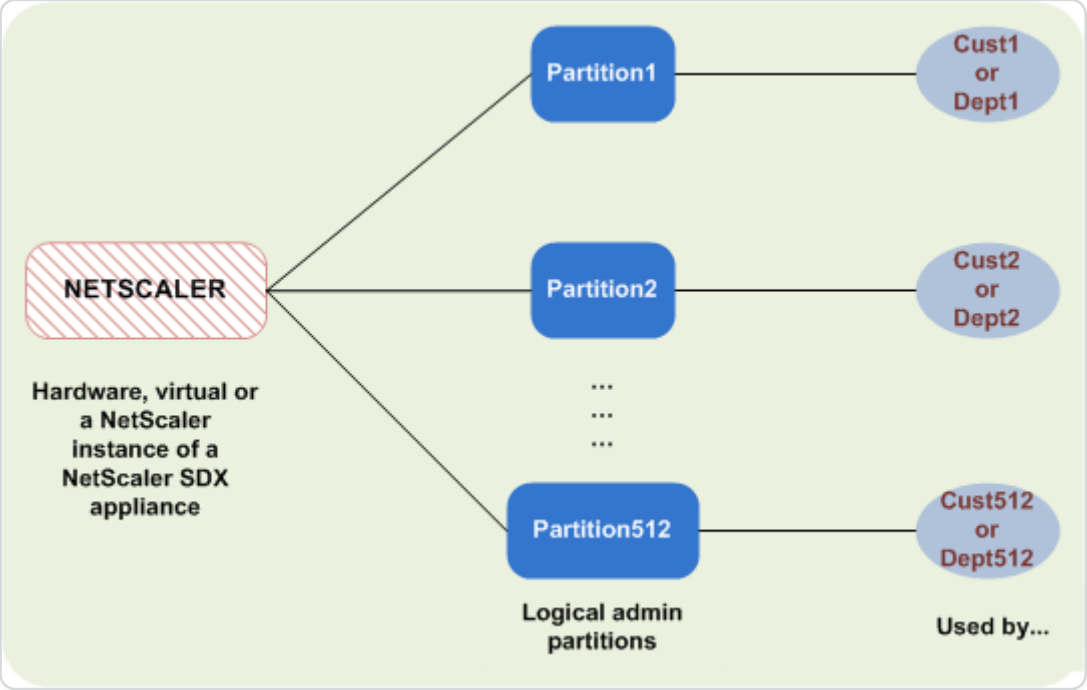
    f. Click **Done**. The **Policies** pane displays the other policies and the new preauthentication policy bound to the virtual server.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configuration by using the CLI

To enable preauthentication policy for domain check, at the command prompt, type:

```
add aaa preauthenticationaction domainCheckEPAAction ALLOW



add aaa preauthenticationpolicy domainCheckEPAPolicy
"CLIENT.SYSTEM(\'DOMAIN_SUFFIX_anyof_example.com[COMMENT: Allow
example.com]\') EXISTS" domainCheckEPAAction
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Admin partition

A NetScaler appliance can be partitioned into logical entities called admin partitions. Each partition can be configured and used as a separate NetScaler appliance. The following figure shows the partitions of a NetScaler being used by different customers and departments:

A partitioned NetScaler appliance has a single default partition and one or more admin partitions. The following table provides further details on the two partition types:

NOTE

In a partitioned appliance, the mode BridgeBPDUs can be enabled only in the default partition and not in the administrative partitions.

Availability:

The NetScaler appliance ships with a single partition, which is called a default partition. The default partition is retained even after the NetScaler appliance is partitioned.

Must be explicitly created as described in Configure admin partitions.

Number of Partitions:

One

© 1997–2026 Citrix Systems, Inc. All rights reserved.

A NetScaler appliance can have one or more (maximum of 512) admin partitions.

User Access and Roles:

All NetScaler users, who are not associated with a *partition-specific* command policy, can access and configure the default partition. As always, the associated command policy restricts the operations that a user can perform.

The user access and roles are created by NetScaler superusers who also specify the users for that partition. Only superusers and associated users of the partition can access and configure the admin partition.

NOTE

Partition users do not have shell access.

File Structure:

All files in a default partition are stored in the default NetScaler file structure.

For example, the */nsconfig* directory stores the NetScaler configuration file and the */var/log/* directory stores the NetScaler logs.

All files in an admin partition are stored in directory paths that have the name of the admin partition.

For example, the NetScaler configuration file (ns.conf) is stored in the `/nsconfig/partitions/<partitionName>` directory. Other partition-specific files are stored in the `/var/partitions/<partitionName>` directories.

Some other paths in an admin partition:

- Downloaded files: `/var/partitions/<partitionName>/download/`
- Log files: `/var/partitions/<partitionName>/log/`

NOTE

Currently, logging is not supported at partition-level. Therefore, this directory is empty and all logs are stored in the `/var/log/` directory.

- SSL CRL certificate related files: `/var/partitions/<partitionName>/netscaler/ssl`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Resources Available:

All NetScaler resources.

NetScaler resources that are explicitly assigned to the admin partition.

User access and roles

In authenticating and authorizing a partitioned NetScaler appliance, a root administrator can assign a partition administrator to one or more partitions. The partition administrator can authorize users to that partition without affecting other partitions. The partition users are authorized to access only that partition using the SNIP address. Both the root administrator and the partition administrator can configure role based access (RBA by authorizing users to access different applications.

Administrators and user roles can be described as follows:

Root Administrator. Accesses the partitioned appliance through its NSIP address and can grant user access to one or more partitions. The administrator can also assign partition administrators to one or more partitions. The administrator can create a partition administrator from the default partition using an NSIP address or switch to a partition and then create a user and assign partition admin access using a SNIP address.

Partition Administrator. Accesses the specified partition through an NSIP address assigned by the root administrator. The administrator can assign role-based access to partition user access to that partition and also configure external server authentication using partition specific configuration.

System User. Accesses partitions through the NSIP address. Has access to the partitions and resources specified by the root administrator.

Partition User. Accesses a partition through a SNIP address. The user account is created by the partition administrator and the user has access to resources, only within the partition.

Points to remember

Following are some points to remember when providing role-based access in a partition.

1. NetScaler users accessing the GUI through the NSIP address uses the default partition authentication configuration to log on to the appliance.
2. Partition system users accessing the GUI through a partition SNIP address uses partition specific authentication configuration to log on to the appliance.
3. Partition user created in a partition cannot log in using the NSIP address.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. The NetScaler user bound to a partition cannot log in using the partition SNIP address.
5. System users authenticating through an external authentication server (for example, LDAP, RADIUS, TACACS) must access a partition through a SNIP address.

Use case for managing role based access in a partitioned setup

Consider a scenario where an enterprise organization, www.example.com has multiple business units and a centralized administrator who manages all instances in their network. However, they want to provide exclusive user privileges and environment for each business unit.

Following are the administrators and users managed by default partition authentication configuration and partition specific configuration in a partitioned appliance.

John: Root Administrator

George: Partition Administrator

Adam: System User

Jane: Partition User

John, is the root administrator of a partitioned NetScaler appliance. John manages all user accounts and administrative user accounts across partitions (for example, P1, P2, P3, P4, and P5) within the appliance. John provides granular role-based access to entities from the default partition of the appliance. John creates user accounts and assigns partition access to each account. George being a network engineer within the organization prefers to have a role based access to few applications running on partition P2. Based on user management, John creates a partition administrator role for George and associates his user account with a partition-admin command policy in the P2 partition. Adam being another network engineer prefers to access an application running on P2. John creates a system user account for Adam and associates his user account to a P2 partition. Once the account is created, Adam can log into the appliance to access the NetScaler management interface through the NSIP address and can switch to partition P2 based on user/ group binding.

Suppose, Jane who is another network engineer wants to directly access an application running only on partition P2, George (partition administrator) can create a partition user account for her and associate her account with command policies for authorization privileges. Jane’s user account created within the partition is now directly associated with P2. Now Jane can access the NetScaler management interface through the SNIP address and cannot switch to any other partition.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE

If Jane's user account is created by a partition administrator in partition P2, the admin can access the NetScaler management interface only through the SNIP address (created within the partition). The admin is not permitted to access the interface through the NSIP address. Similarly, if Adam's user account is created by a root administrator in the default partition and is bound to a P2 partition. The admin can access the NetScaler management interface only through the NSIP address or SNIP address created in the default partition (with management access enabled). And not permitted to access the partition interface through the SNIP address created in the administrative partition.

Configure roles and responsibilities for partition administrators

Following are the configurations performed by a root administrator in a default partition.

Creating administrative partitions and system users – A root administrator creates administrative partitions and system users in the default partition of the appliance. The administrator then associates the users to different partitions. If you are bound to one or more partitions, you can switch from one partition to another based on user bindings. Also, your access to one or more bound partitions is authorized only by the root administrator.

Authorizing the system user as partition administrator for a specific partition – Once a user account is created, the root administrator switches to a specific partition and authorizes the user as the partition administrator. It is done by assigning partition-admin command policy to the user account. Now, the user can access the partition as partition administrator and manage entities within the partition.

Following are the configurations perform by a partition administrator in an administrative partition.

Configuring the SNIP address in an administrative partition- The partition administrator logs on to the partition and creates a SNIP address and provides management access to the address.

Creating and Binding a Partition System User with Partition Command Policy - The partition administrator creates partition users and defines the scope of user access. It is done by binding the user account to partition command policies.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Creating and Binding a Partition System User Groups with Partition Command Policy -The partition administrator creates partition user groups and defines the scope of user group access. It is done by binding the user group account to partition command policies.

Configuring External Server authentication for external users (optional)-This configuration is done for authenticating external TACACS users accessing the partition using the SNIP address.

Following are the tasks performed in configuring role-based access for partition users in an Administrative Partition.

1. Creating an Administrative Partition – Before you create partition users in an administrative partition, you must first create the partition. As a root administrator, you can create a partition from the default partition using the configuration utility or a command line interface.
2. Switching user access from default partition to partition P2 – If you are partition administrator accessing the appliance from the default partition, you can switch from default partition to a specific partition. For example, partition P2 based on user binding.
3. Adding a SNIP address to the partition user account with management access enabled-Once you have switched your access to an administration partition. You create a SNIP address and provide management access to the address.
4. Creating and binding a partition System User with Partition Command Policy-If you are a partition administrator, you can create partition users and define the scope of user access. It is done by binding the user account to partition command policies.
5. Creating and binding partition user group with partition command policy - If you are a partition administrator, you can create partition user groups and define the scope of user access control. It is done by binding the user group account to partition command policies.

Configuring External Server authentication for external users (optional)-This configuration is done for authenticating external TACACS users accessing the partition using a SNIP address.

Benefits of using admin partitions

You can avail the following benefits by using admin partitions for your deployment:

- Allows delegation of administrative ownership of an application to the customer.
- Reduces the cost of ADC ownership without compromising on performance and ease-of-use.
- Safeguards from unwarranted configuration changes. In a non-partitioned NetScaler appliance, authorized users of the other application can intentionally or unintentionally change

© 1997–2026 Citrix Systems, Inc. All rights reserved.

configurations that are required for your application. It can lead to undesirable behavior. This possibility is reduced in a partitioned NetScaler appliance.

- Isolates traffic between different applications by the use of dedicated VLANs for each partition.
- Accelerates and allows application deployments to scale.
- Allows application-level or localized management and reporting.

Let us analyze a couple of cases to understand the scenarios in which you can use admin partitions.

User case 1: How admin partition is used in an enterprise network

Let us consider a scenario faced by a company named **Foo.com**.

- **Foo.com** has a single NetScaler.
- There are five departments and each department has one application that requires to be deployed with the NetScaler.
- Each application must be managed independently by a different set of users or administrators.
- Other users must be restricted from accessing the configurations.
- The application or back-end must be able to share resources like IP addresses.
- The global IT department must be able to control NetScaler-level settings which must be common to all partitions.
- Applications must be independent of one another. An error in the configuration of one application must not affect the other.

A non-partitioned NetScaler would not be able to satisfy these requirements. However, you can achieve all these requirements by partitioning a NetScaler.

Simply create a partition for each of the applications, assign the required users to the partitions, specify a VLAN for each partition, and define global settings on the default partition.

Use case 2: How an admin partition is used by a service provider

Let us consider a scenario faced by a service provider named **BigProvider**:

- BigProvider has 5 customers: 3 small enterprises and 2 large enterprises.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **SmallBiz**, **SmallerBiz**, and **StartupBiz** need only the most basic NetScaler functionality.
- **BigBiz** and **LargeBiz** are larger enterprises and have applications that attract heavy traffic. They would like to use some of the more complex NetScaler functionality.

In a non-partitioned approach, the NetScaler administrator would typically use a NetScaler SDX appliance and provision a NetScaler instance for each customer.

The solution suits **BigBiz** and **LargeBiz** because their applications need the undiminished power of the entire non-partitioned NetScaler appliance. However, this solution might not be as cost effective for servicing **SmallBiz**, **SmallerBiz**, and **StartupBiz**.

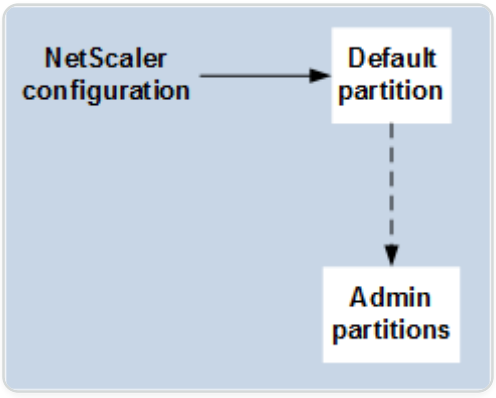
Therefore, **BigProvider** decides on the following solution:

- Using a NetScaler SDX appliance to bring up dedicated NetScaler instances for **BigBiz** and **LargeBiz**.
- Using a single NetScaler which is partitioned into three partitions, one each for **SmallBiz**, **SmallerBiz**, and **StartupBiz**.

The NetScaler administrator (superuser) creates an admin partition for each of these customers, and specifies the users for the partitions. And also specifies the NetScaler resources for the partitions, and specifies the VLAN to be used by the traffic that is destined for each of the partitions.

NetScaler configurations support in admin partition

NetScaler configurations can be categorized into the following three types of configurations. It depends on the Citrix configuration and the partition in which the configuration is performed.

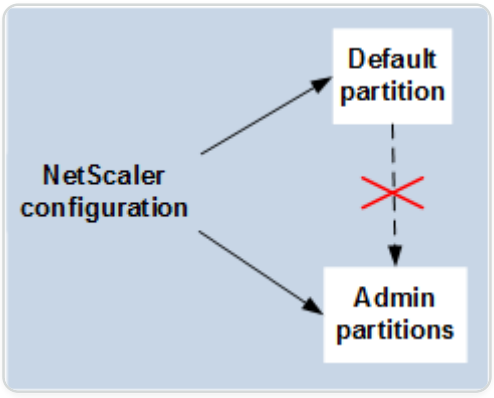


NOTE

- Admin partitions cannot be set up on a NetScaler cluster. It means that a NetScaler cluster cannot be partitioned.
- Admin partitions are not supported on a NetScaler 14000 FIPS appliance.
- Case 3 lists the NetScaler features that are not supported in admin partitions.
- Load balancing templates are not supported in admin partitions.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Case 1 (global configurations)

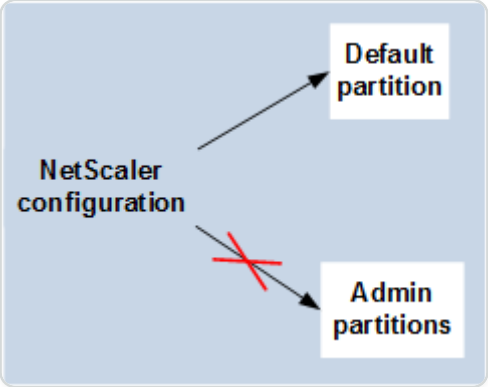


Configurations that can be performed ONLY in the default partition and which are available or impact all the admin partitions.

- Updates to built-in entities for monitors, TCP profiles, HTTP profiles, and so on.
- Updates to global parameters for syslog, NSLOG, weblog, content switching, IPSEC, SIP, DHCP, Surge protection, TCP buffering, and system collection.
- High availability (HA) configurations
- Interface and VLAN changes
- User configurations

Case 2 (partition-specific configurations)

Configurations that can be performed independently in default and admin partitions. These configurations are applicable only to the partition in which they are performed.



- Getting traffic level statistics for a partition.
- Partition admin can update IP bindings for VLAN which is bound to that partition. But cannot update the interface bindings.
- Clearing NetScaler configurations.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Feature-specific parameters for the following features: AppFlow®, AppQoE, HTTP compression, DNS, TCP, HTTP, encryption, responder, rewrite, and SSL.
- Feature-specific configurations such as virtual servers, services, monitors.

Case 3

Configurations that cannot be performed on admin partitions. These features can be configured in the default partition, but there is no impact on admin partitions.

NOTE:

Configurations that are supported on admin partitions for a particular release are marked as **Yes**.

The preceding table lists some of the features as **Restricted Features** in the admin partition setup. The following section provides the reason why some of the features are mentioned as **Restricted Features**.

- **VRRP**. The VRRP is Restricted Feature in the admin partition because of the following:
  - VRID addition or deletion can be done only from the default partition context. However, once a VRID is created, it can be used within non-default partitions.
  - VRRP functionality is supported only over the dedicated VLANs.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- VRRP functionality is not supported on shared VLANs, used by the admin partition. It is blocked internally. No error message is shown during configuration. The protocol is blocked on a shared VLAN (tagged or untagged) bound to a default or any administrative partition.

IMPORTANT

To support active-active deployment using VRRP, main and backup VIP must use the same VRID. Different VRIDs cannot be used.

- **Networking**. Some of the networking configurations (L2 Param and L3 Param) are not supported or valid in the partition context. If you come across any such configurations, the following error message is displayed. "ERROR: This configuration option is not supported on the non-default partition."

Configure admin partitions

IMPORTANT

- Only superusers are authorized to create and configure admin partitions.
- Unless specified otherwise, configurations to set up an admin partition must be done from the default partition.

By partitioning a NetScaler appliance, you are creating multiple instances of a single NetScaler appliance. Each instance has its own configurations and the traffic of each of these partitions is isolated from the other. It is done by assigning each partition a dedicated VLAN or a shared VLAN.

A partitioned NetScaler has one default partition and the admin partitions that are created. To set up an admin partition, you must first create a partition with the relevant resources (memory, maximum bandwidth, and connections). Then, specify the users that can access the partition and the level of authorization for each of the users on the partition.

Accessing a partitioned NetScaler is the same as accessing a non-partitioned NetScaler: through the NSIP address or any other management IP address. As a user, after you provide your valid logon credentials, you are taken to the partition to which you are bound. Any configurations that you create are saved to that partition. If you are associated with more than one partition, you are

© 1997–2026 Citrix Systems, Inc. All rights reserved.

taken to the first partition with which you were associated. If you want to configure entities on one of your other partitions, you must explicitly switch to that partition.

After accessing the appropriate partition, the configurations that you perform are saved to that partition and are specific to that partition.

NOTE

- NetScaler superusers and other non-partition users are taken to the default partition.
- Users of all the 512 partitions can log in simultaneously.

Tip

To access a partitioned NetScaler appliance over HTTPS by using the SNIP (with management access enabled), make sure that each partition has the certificate of its partition administrator. Within the partition, the partition admin must do the following:

1. Add the certificate to the NetScaler.

   ```
   add ssl certKey ns-server-certificate -cert ns-server.cert-key ns-server.key
   ```

2. Bind it to a service named `nshttps-<SNIP>-3009`, where `<SNIP>` must be replaced with the SNIP address, in this case 100.10.10.1.

   ```
   bind ssl service nshttps-100.10.10.1-3009 -certkeyName ns-server-certificate
   ```

Partition resource limiting

In a partitioned NetScaler appliance, a network administrator can create a partition with partition resources such as memory, bandwidth, and connection limit configured as unlimited. It is done by specifying Zero as the partition resource value. Where Zero indicates the resource is unlimited on the partition and it can be consumed up to system limits. Partition resource configuration is useful when you migrate a traffic domain deployment to an administrative partition or if you do not know about the resource allocation limit for a partition in a given deployment.

Resource limit for an administrative partition is as follows:

1. **Partition memory**. It is the maximum allocated memory for a partition. You make sure to specify the values when creating a partition.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE

From NetScaler 12.0 onwards, when you create a partition, you can set the memory limit to Zero. If a partition is already created with a specific memory limit, you can reduce the limit to any value or set the limit as Zero.

Parameter: maxMemLimit

Maximum memory is allocated in MB in a partition. A zero value indicates the memory is unlimited on the partition and it can consume up to the system limits.

Default value: 10

2. **Partition bandwidth**. Maximum allocated bandwidth for a partition. If you specify a limit, make sure it is within the appliance's licensed throughput. Otherwise, you are not limiting the bandwidth that is used by the partition. The specified limit is accountable for the bandwidth that the application requires. If the application bandwidth exceeds the specified limit, packets are dropped.

   NOTE

   From NetScaler 12.0 onwards, when you can create a partition, you can set the partition bandwidth limit to Zero. If a partition is already created with a specific bandwidth, you can reduce the bandwidth or set the limit as Zero.

   Parameter: maxBandwidth

   Maximum bandwidth is allocated in Kbps in a partition. A zero value indicates the bandwidth is unrestricted. That is, the partition can consume up to the system limits.

   Default value: 10240

   Maximum Value: 4294967295

3. **Partition connection**. Maximum number of concurrent connections that can be open in a partition. The value must accommodate the maximum simultaneous flow expected within the partition. The partition connections are accounted from the partition quota memory. Previously, the connections were accounted from the default partition quota memory. It is configured only on the client-side, not on the back-end server-side TCP connections. New connections cannot be established beyond this configured value.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE

From NetScaler 12.0 onwards, you can create a partition with the number of open connections set to Zero. If you have already created a partition with a specific number of open connections, you can reduce the connection limit or set the limit as Zero.

Parameter: maxConnections

Maximum number of concurrent connections that can be open in the partition. A zero value indicates no limit on the number of open connections.

Default value: 1024

Minimum value: 0

Maximum Value: 4294967295

Configure an admin partition

To configure an admin partition, complete the following tasks.

To access in an admin partition by using the CLI

1. Log on to the NetScaler appliance.
2. Check if you are in the correct partition. The command prompt displays the name of the currently selected partition.
3. If yes, skip to the next step.
4. If no, get a list of the partitions with which you are associated and switch over to the appropriate partition.
   - `show system user <username>`
   - `switch ns partition <partitionName>`
5. Now, you can perform the required configurations just as a non-partitioned NetScaler.

To access an admin partition by using the GUI

1. Log on to the NetScaler appliance.
2. Check if you are in the correct partition. The top bar of the GUI displays the name of the currently selected partition.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- If yes, skip to the next step.
- If no, navigate to **Configuration > System > Partition Administration > Partitions**, right-click the partition to which you want to switch, and select **Switch**.

3. Now, you can perform the required configurations just as a non-partitioned NetScaler.

Add an admin partition

The root administrator adds an administrative partition from the default partition and binds the partition with VLAN 2.

To create an administrative partition by using the CLI

At the command prompt, type:

```
add partition &lt;partitionname>
```

Switch user access from default partition to an admin partition

Now you can switch user access from default partition to partition Par1.

To switch a user account from default partition to an admin partition by using the CLI:

At the command prompt, type:

```
Switch ns partition &lt;pname>
```

Adding SNIP address to a partition user account with management access enabled

In the partition, create a SNIP address with management access enabled.

To add SNIP address to the partition user account with management access enabled by using the command line interface:

At the command prompt, type:

```
> add ns ip <ip address> <subnet mask> -mgmtAccess enabled
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Create and Bind a partition user with partition command policy

In partition, create a partition system user and bind the user with partition-admin command policies.

To create and bind a partition system user with partition command policy by using the CLI:

At the command prompt, type:

```
> add system user <username> <password>
```

```
Done
```

Creating and binding partition user group with partition command policy

In Partition Par1, create a partition system user group and bind the group with partition command policy such as partition admin, partition read-only, partition-operator, or partition-network.

To create and bind a partition user group with partition command policy by using the command line interface:

```
> add system group &lt;groupName>

> bind system group &lt;groupname> (-userName | -policyName &lt;cmdpolicy>
&lt;priority> | -partitionName)
```

Configuring external server authentication for external users

In partition Par1 you can configure an external server authentication to authenticate external TACACS users accessing the partition through a SNIP address.

To configure external server authentication for external users by using the command line interface:

At the command prompt, type:

```
> add authentication tacacsaction &lt;name> -serverip &lt;IP>
-tacacsSecret &lt;secret key> -authorization ON -accounting ON

> add authentication policy &lt;policname> -rule true -action &lt;name>

> bind system global &lt;policyname> -priority &lt;value>1
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure a partition system user account in a partition by using the GUI

To configure a partition user account in an administrative partition, you must create a partition user or a partition user group and bind it partition command policies. Also, you can configure the external server authentication for an external user.

To create a partition user account in a partition by using the GUI

Navigate to **System > User Administration**, click **Users** to add a partition system user, and bind the user to command policies (partitionadmin/partitionread-only/partition-operator/partition-network).

To create a partition user group account in a partition by using the GUI

Navigate to **System > User Administration**, click **Groups** to add a partition system user group and bind the user group to command policies (partitionadmin/partitionread-only/partition-operator/partition-network).

To configure external server authentication for external users by using the GUI

Navigate to **System > Authentication > Basic Actions** and click **TACACS** to configure a TACACS server for authenticating external users accessing the partition.

Sample configuration

The following configuration shows how to create a partition user or a partition user group and bind it partition command policies. Also, how to configure the external server authentication for authenticating an external user.

```
> add partition Par1

> switch ns partition Par1

> add ns ip 10.102.29.203 255.255.255.0 -mgmtAccessenabled

> add system user John Password

> bind system user Jane partition-read-only -priority 1

> add system group Retail

> bind system group Retail -policyname partition-network 1 (where 1 is the
priority number)
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
> bind system group Retail –username Jane

> add authentication tacacssaction tacuser –serverip 10.102.29.200 –
tacacsSecret Password –authorization ON –accounting ON

> add authentication policy polname –rule true –action tacacsAction

> bind system global polname –priority 1
```

Command policies for a partition users and partition user groups in administrative partition

COMMANDS TO AUTHORIZE A USER ACCOUNT INSIDE ADMINISTRATIVE PARTITION	COMMAND POLICIES AVAILABLE INSIDE AN ADMINISTRATIVE PARTITION (BUILT-IN POLICIES)	USER ACCOUNT ACCESS TYPE
add system user	Partition-admin	SNIP (with management access enabled)
add system group	Partition-network	SNIP (with management access enabled)
add authentication `<action, policy>`, bind system global `<policy name>`	Partition-read-only	SNIP (with management access enabled)
remove system user	Partition-admin	SNIP(with management access enabled)
remove system group	Partition-admin	SNIP (with management access enabled)
`bind system cmdpolicy` to system user; `bind system cmdpolicy` to system group	Partition-admin	SNIP (with management access enabled)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure an LACP Ethernet channel on the default admin partition

With the Link Aggregation Control Protocol (LACP), you can combine multiple ports into a single, high-speed link (also called a channel). An LACP-enabled appliance exchanges LACP Data Units (LACPDU) over the channel.

There are three LACP configuration modes that you can enable in the default partition of a NetScaler appliance:

1. Active. A port in active mode sends LACPDUs. Link aggregation is formed if the other end of the Ethernet link is in the LACP active or passive mode.
2. Passive. A port in passive mode sends LACPDUs only when it receives LACPDUs. The link aggregation is formed if the other end of the Ethernet link is in the LACP active mode.
3. Disable. Link aggregation is not formed.

NOTE

By default, the link aggregation is disabled in the default partition of the appliance.

LACP exchanges LACPDU between devices connected by an Ethernet link. These devices are typically referred as an actor or partner.

A LACPDU data unit contains the following parameters:

- LACP Mode. Active, passive, or disable.
- LACP timeout. The waiting period before timing out the partner or actor. Possible values: Long and Short. Default: Long.
- Port Key. To distinguish between the different channel. When the key is 1, LA/1 is created. When the key is 2, LA/2 is created. Possible values: Integer from 1 through 8. 4 through 8 is for cluster CLAG.
- Port Priority. Minimum value: 1. Maximum value: 65535. Default: 32768.
- System Priority. Uses this priority along with the system MAC to form the system ID to uniquely identify the system during LACP negotiation with the partner. Sets system priority from 1 and 65535. The default value is set to 32768.
- Interface. Supports 8 interfaces per channel on NetScaler 10.1 appliance and supports 16 interfaces per channel on NetScaler 10.5 and 11.0 appliances.

After exchanging LACPDUs, the actor and partner negotiate the settings and decide whether to add the ports to the aggregation.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure and verify LACP

The following section shows how to configure and verify LACP in the admin partition.

To configure and verify LACP on a NetScaler appliance by using the CLI

1. Enable LACP on each interface.

   ```
   set interface <Interface_ID> -lacpMode PASSIVE -lacpKey 1
   ```

   When you enable LACP on an interface, the channels are dynamically created. Also, when you enable LACP on an interface and set lacpKey to 1, the interface is automatically bound to channel LA/1.

   NOTE

   When you bind an interface to a channel, the channel parameters take precedence over the interface parameters, so the interface parameters are ignored. If a channel is created dynamically by LACP, you cannot perform the add, bind, unbind, or remove operations on the channel. A channel dynamically created by LACP is automatically deleted when you disable LACP on all interfaces of the channel.

2. Set the system priority.

   ```
   set lacp -sysPriority <Positive_Integer>
   ```

3. Verify that LACP is working as expected.

   ```
   show interface <Interface_ID>
   ```

   ```
   show channel
   ```

   ```
   show LACP
   ```

   NOTE

   In some versions of Cisco Internetwork Operating System (iOS), running the switchport trunk native VLAN \<VLAN_ID> command causes the Cisco switch to tag LACP PDUs. It causes the LACP channel between the Cisco switch and the NetScaler appliance to fail. However, this issue does not affect the static link aggregation channels configured in the previous procedure.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Save configuration of all admin partitions from the default partition

Administrators can save the configuration of all the admin partitions at once from the default partition.

Save all admin partitions from default partition by using the CLI

At the command prompt, type:

```
save ns config -all
```

Support for partition and cluster based custom reports

NetScaler GUI displays only the custom reports created in the current viewing partition or in the cluster.

Previously, the NetScaler GUI used to store the Custom Report names directly to the back end file without mentioning the partition or cluster name to differentiate.

To view the custom reports of the current partition or cluster in the GUI

- Navigate to **Reporting** tab.
- Click **Custom Reports** to view the reports created in the current partition or in the cluster.

Support to bind VPN global certificates in a partitioned setup for OAuth IdP

In a Partitioned setup, you can now bind the certificates to VPN global for OAuth IdP deployments.

To bind the certificates in Partitioned setup by using the CLI

At the command prompt, type:

```
bind vpn global [-certkeyName &lt;string>] [-userDataEncryptionKey
&lt;string>]
```

VLAN configuration for admin partitions

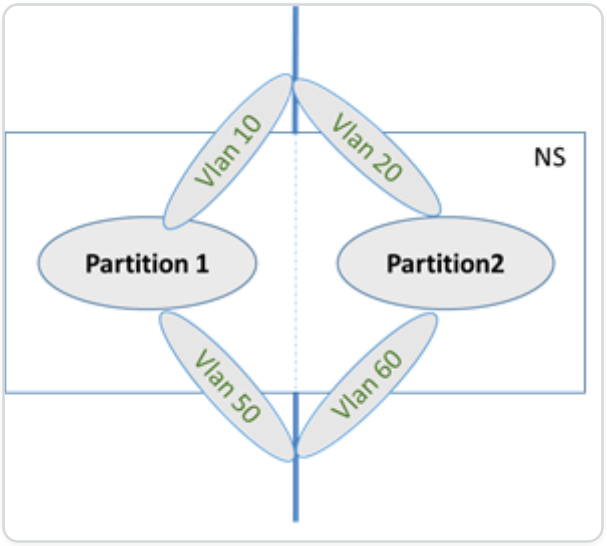
VLANs can be bound to a partition as a "Dedicated" VLAN or a "Shared" VLAN. Based on your deployment, you can bind a VLAN to a partition to isolate its network traffic from other partitions.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Dedicated VLAN – A VLAN bound only to one partition with the "Sharing" option disabled and must be a tagged VLAN. For example, in a client-server deployment, for security reasons a system administrator creates a dedicated VLAN for each partition on the server side.

Shared VLAN – A VLAN bound (shared across) to multiple partitions with the "Sharing" option enabled. For example, in a client-server deployment, if the system administrator do not have control over the client side network, a VLAN is created and shared across multiple partitions.

Shared VLAN can be used across multiple partitions. It is created in the default partition and you can bind a shared VLAN to multiple partitions. By default, a shared VLAN is bound to the default partition implicitly and hence it cannot be bound explicitly.



NOTES

- A NetScaler appliance deployed on any hypervisor (ESX, KVM, Xen, and Hyper-V) platform must comply with both the following conditions in a partition setup and traffic domain:
  - Enable the promiscuous mode, MAC changes, MAC spoofing, or forged transmit for shared VLANs with partition.
  - Enable the VLAN with port group properties of the virtual switch, if the traffic is through a dedicated VLAN.
- In a partitioned (multitenant) NetScaler appliance, a system administrator can isolate the traffic flowing to a particular partition or partitions. It is done by binding one or more VLANs to each partition. A VLAN can be dedicated to one partition or Shared across multiple partitions.
- Internal routing between partitions that are hosted on the same NetScaler appliance is not supported.

Dedicated VLANs

To isolate the traffic flowing into a partition, create a VLAN and associate it with the partition. The VLAN is then visible only to the associated partition, and the traffic flowing through the VLAN is classified and processed only in the associated partition.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To implement a dedicated VLAN for a particular partition, do the following.

1. Add a VLAN (V1).
2. Bind a network interface to VLAN as a tagged network interface.
3. Create a partition (P1).
4. Bind partition (P1) to the dedicated VLAN (V1).

Configure the following by using the CLI

- Create a VLAN

  `add vlan <id>`

Example

```
add vlan 100
```

- Bind a VLAN

  `bind vlan <id> -ifnum <interface> -tagged`

Example

```
bind vlan 100 –ifnum 1/8 -tagged
```

- Create a partition

  `Add ns partition <partition name> [-maxBandwidth <positive_integer>][-maxConn <positive_integer>] [-maxMemLimit <positive_integer>]`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Example

```
    Add ns partition P1 –maxBandwidth 200 –maxconn 50 –maxmemlimit 90

    Done
```

- Bind a partition to a VLAN

  `bind partition <partition-id> -vlan <id>`

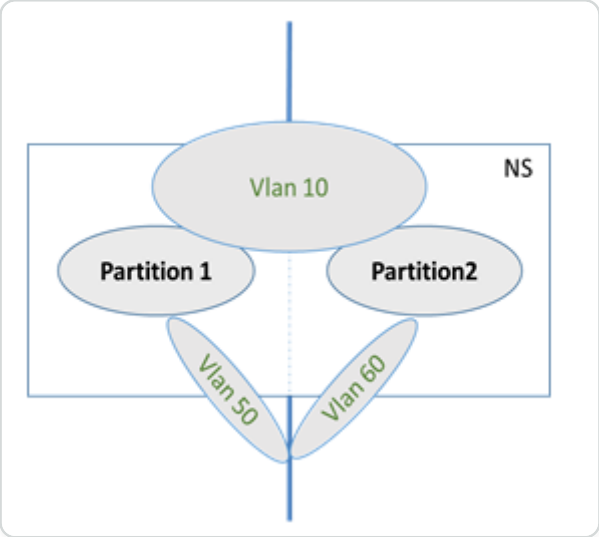
Example

```
bind partition P1 –vlan 100
```

Configure a dedicated VLAN by using the NetScaler GUI

1. Navigate to **Configuration > System > Network > VLANs*** and click **Add** to create a VLAN.
2. On the **Create VLAN** page, set the following parameters:
   - VLAN ID
   - Alias Name
   - Maximum Transmission Unit
   - Dynamic Routing
   - IPv6 Dynamic Routing
   - Partitions Sharing
3. In the **Interface Bindings** section, select one or more interfaces and bind it to the VLAN.
4. In the **IP Bindings** section, select one or more IP addresses and bind to the VLAN.
5. Click **OK** and **Done**.

Shared VLAN



In a shared VLAN configuration, each partition has a MAC address, and traffic received on the shared VLAN is classified by MAC address. Only a Layer3 VLAN is recommended because it can restrict the subnet traffic. A partition MAC address is applicable and important only for a shared VLAN deployment.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE

Starting from NetScaler version 12.1 build 51.16, shared VLAN in a partitioned appliance support dynamic routing protocol.

The following diagram shows how a VLAN (VLAN 10) is shared across two partitions.

To deploy a shared VLAN configuration, do the following:

1. Create a VLAN with the sharing option ‘enabled’, or enable the sharing option on an existing VLAN. By default, the option is ‘disabled’.
2. Bind partition interface to shared VLAN.
3. Create the partitions, each with its own PartitionMAC address.
4. Bind the partitions to the shared VLAN.

Configure a shared VLAN by using the CLI

At the command prompt, type one of the following commands to add VLAN or set the sharing parameter of an existing VLAN:

```
add vlan &lt;id> [-sharing (ENABLED | DISABLED)]

set vlan &lt;id> [-sharing (ENABLED | DISABLED)]

add vlan 100 –sharing ENABLED
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
set vlan 100 –sharing ENABLED
```

Bind a partition to a Shared VLAN by using the CLI

At the command prompt, type:

```
bind partition &lt;partition-id> -vlan &lt;id>

bind partition P1 –vlan 100

add ns partition P1 –maxBandwidth 200 –maxconn 50   –maxmemlimit 90
-partitionMAC<mac_addr

Done
```

Configure a Partition MAC Address by using the CLI

```
set ns partition &lt;partition name> [-partitionMAC&lt;mac_addr>]

set ns partition P1 –partitionMAC 22:33:44:55:66:77
```

Bind partitions to a shared VLAN by using the CLI

```
bind partition &lt;partition-id> -vlan &lt;id>

bind partition &lt;partition-id> -vlan &lt;id>
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
bind partition P1 –vlan 100

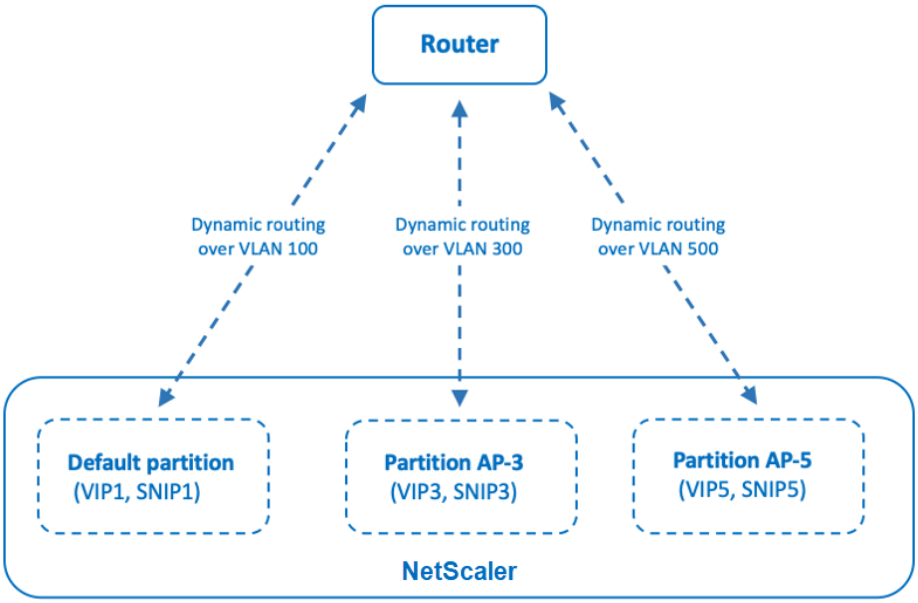
bind partition P2 –vlan 100

bind partition P3 –vlan 100

bind partition P4 –vlan 100
```

Configure Shared VLAN by using the NetScaler GUI

1. Navigate to **Configuration > System > Network > VLANs** and then select a **VLAN** profile and click **Edit** to set the partition sharing parameter.
2. On the **Create VLAN** page, select the **Partitions Sharing** check box.
3. Click **OK** and then **Done**.



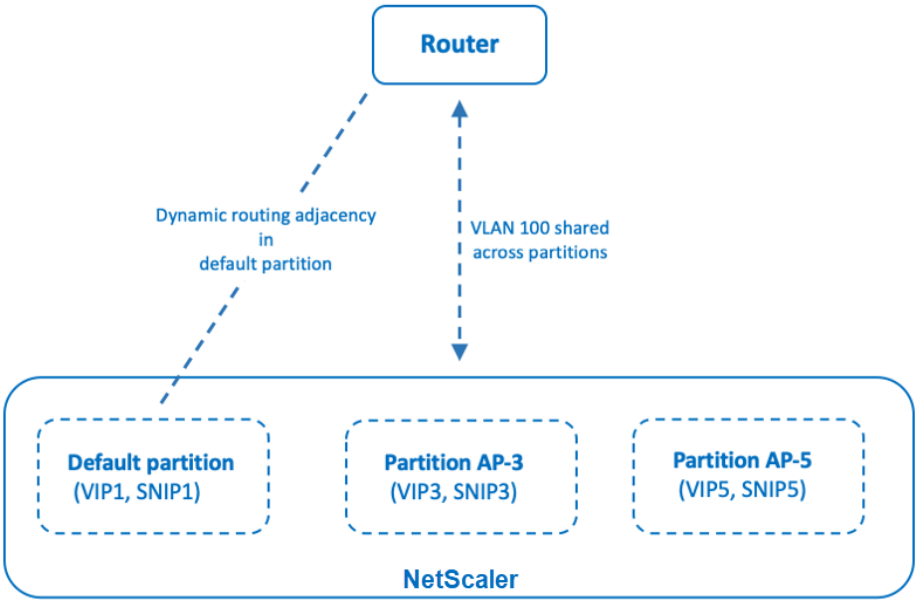
Dynamic routing over a shared VLAN across admin partitions

Admin partitions in a NetScaler appliance provide a way to host multiple tenants.

Starting from NetScaler version 12.1 build 51.16, a shared VLAN in a partitioned appliance supports the dynamic routing protocol. Routing can be configured in dedicated or shared VLANs associated with admin partitions.

Dedicated VLAN of an admin partition. In a dedicated VLAN, the data path for the tenant is identified using one or more VLANs. It results in strict configuration and data-path isolation for the tenant. For advertising the health of a VIP address, dynamic routing is enabled in each partition and the routing adjacency is established per partition.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



Dynamic routing over a dedicated VLAN per partition

A shared VLAN across admin partitions. In a shared VLAN, VIP addresses configured in a non-default partition can be advertised through a single adjacency or peering formed in the default partition. A SNIP address in the non-default partition is used as the next-hop for all the VIP addresses (configured with **advertiseOnDefaultPartition** option) in that non-default partition. The configured SNIP address is marked as a next-hop IP address in the routing advertisements.

Consider an example setup of admin partitions in a NetScaler appliance, VLAN 100 is shared across the default partition, and non-default partitions: AP-3 and AP-5. SNIP addresses SNIP1 is added in the default partition, SNIP3 is added in AP-3, and SNIP5 is added in AP-5. SNIP1, SNIP3, and SNIP5 are reachable over the vlan-100. VIP addresses VIP1 is added in the default partition, VIP3 is added in AP-3, and VIP5 is added in AP-5. VIP3 and VIP5 are advertised through the single adjacency or peering formed in the default partition.

Dynamic routing over a shared VLAN across partitions

Before you begin

Before configuring dynamic routing over a shared VLAN in a non-default admin partition, make sure that:

- **Dynamic routing is configured on the shared VLAN in the default partition**. Configuring dynamic routing on the shared VLAN in the default partition consists of the following steps:
  a. Enable dynamic routing on the shared VLAN.
  b. Add a SNIP IP address with dynamic routing enabled. This SNIP IP address is used for dynamic routing with the upstream.
  c. Bind the SNIP IP subnet to the shared VLAN.
- **One or more dynamic routing protocol is configured on the default partition**. For more information, see configure dynamic routing protocols.

Configuration steps

Configuring dynamic routing over a shared VLAN in a non-default admin partition consists of the following steps:

1. **Add a SNIP IP address in the non-default partition**. This SNIP IP address must be in the same subnet of the SNIP IP address that is being used for dynamic routing in the default partition.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. **Set or enable the following parameters for advertising a VIP address, in a non-default partition, using dynamic routing**.
    - Host route gateway (hostRtGw). Set this parameter to the SNIP address added in the preceding step.
    - Advertise on default partition (advertiseOnDefaultPartition). Enable this parameter.

Sample configuration

Consider an example of an admin partition setup in a NetScaler appliance. A non-default admin partition AP-3 is configured on this appliance. A shared VLAN VLAN100 is bound to AP-3. The following sample configuration configures dynamic routing, through VLAN100, in AP-3.

STEPS	SAMPLE CONFIGURATION
On default admin partition	-
Enable dynamic routing on shared VLAN 100.	`set vlan 100 -dynamicRouting enabled`
Add SNIP IP address 192.0.2.10 with dynamic routing enabled. This SNIP IP address is used for dynamic routing with the upstream.	`add ns ip 192.0.2.10 255.255.255.0 -type SNIP -dynamicRouting enabled`
Bind subnet of 192.0.2.10 to shared VLAN 100.	`bind vlan 100 -IPAddress 192.0.2.10 255.255.255.0`
On non-default admin partition AP-3	-
Add SNIP IP address 192.0.2.30. This SNIP IP address is in the same subnet as the SNIP IP address 192.0.2.10 on the default partition.	`add ns ip 192.0.2.30 255.255.255.0 -type SNIP`
For advertising VIP address 203.0.113.300 using dynamic routing, enable `advertiseOnDefaultPartition` parameter and set `hostRtGw` parameter to 192.0.2.30.	`set ns ip 203.0.113.300 255.255.255.255 -hostRoute enabled -advertiseOnDefaultPartition enabled -hostRtGw 192.0.2.30`

Dynamic routing of IPv6 over a shared VLAN across admin partition

The `enable ns feature IPv6PT` and `set L3Param –ipv6DynamicRouting ENABLED` commands must be enabled for an IPv6 address to dynamically route over a shared VLAN in an

© 1997–2026 Citrix Systems, Inc. All rights reserved.

admin partition. The following sample configurations help you to configure dynamic routing of IPv6 over shared VLAN.

Sample configuration

The following sample configuration configures dynamic routing, through VLAN 100, in AP-3.

STEPS	SAMPLE CONFIGURATION
On default admin partition	-
Enable dynamic routing on shared VLAN 100.	`set vlan 100 -dynamicRouting enabled`
Add SNIP IP address 2001:b:c:d::1/64 with dynamic routing enabled. The SNIP IP address is used for dynamic routing with the upstream.	`add ns ip6 2001:b:c:d::1/64 -type SNIP -dynamicRouting enabled`
Bind subnet of 2001:b:c:d::1/64 to shared VLAN 100.	`bind vlan 100 -IPAddress 2001:b:c:d::1/64`
On non-default admin partition AP-3	-
Add SNIP IP address 2001:b:c:d::2/64. This SNIP IP address is in the same subnet as the SNIP IP address 2001:b:c:d::2/64 on the default partition.	`add ns ip6 2001:b:c:d::2/64 -type SNIP`
For advertising VIP address 2002::1/128 using dynamic routing, enable `advertiseOnDefaultPartition` parameter and set `ip6hostRtGw` parameter to 2001:b:c:d::2.	`set ns ip6 2002::1/128 -hostRoute enabled -advertiseOnDefaultPartition enabled -ip6hostRtGw 2001:b:c:d::2`

The VIP present in the admin partition must be seen on VTYSH of default partition as a kernel route.

```
> switch partition default

Done

>vtysh
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
ns#

ns# sh ipv6 route kernel

IPv6 routing table

Codes: K - kernel route, C - connected, S - static, R - RIP, O - OSPF,

   IA - OSPF inter area, E1 - OSPF external type 1,

   E2 - OSPF external type 2, I - IS-IS, B - BGP

Timers: Uptime

K      2002::1/128 via 2001:b:c:d::2, vlan0, 01:24:15
        >> on Default Partition, VIP : 2002::1 present in AP known via
SNIP6 : 2001:b:c:d::2 is present in AP as a Kernel Route
```

It can be advertised to upstream by using “redistribute kernel” option under OSPFv3/BGP+ in default partition.

```
ns# sh run router ipv6 ospf

!

router ipv6 ospf 1

redistribute kernel

!
```

Shared VLAN with admin partition on NetScaler SDX appliance

On an SDX appliance, you must generate and configure the PMAC address by using the Management Service user interface, before using the admin partitions with shared VLANs. Management Service enables you to generate partition MAC addresses by:

- Using a base MAC address
- Specifying custom MAC addresses
- Randomly generating MAC addresses

NOTES

- The randomly generating MAC addresses are used for other deployments other than high availability.
- After generating the partition MAC addresses, you must restart the NetScaler instance before configuring the admin partitions. For more information on generating partition MAC addresses from the SDX appliance, see Generating Partition MAC Addresses to Configure Admin Partition on a NetScaler instance in the SDX Appliance.

VXLAN support for admin partitions

In a partitioned NetScaler appliance, similar to configuring a VLAN, you can configure a VXLAN in the default partition. After configuring a VXLAN, you can bind it to an administrative partition or if a VXLAN is extending a VLAN that is bound to a partition, the appliance binds the VXLAN to the partition under the same broadcast domain. It is applicable in unbinding a VLAN that unbinds a VXLAN from the partition.

For more information about how VXLAN works in a NetScaler appliance, see VXLAN.

Also, for more information on how VLAN works in a partitioned NetScaler appliance, see Admin Partitioning.

Points to remember before configuring a VXLAN

Remember the following points before you configure a VXLAN in a partitioned NetScaler appliance:

- When you extend a VLAN over VXLAN, make sure VLAN is bound to the partition.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Only a partition administrator must configure the IP and dynamic routing for the VXAN in the administrative partition.

A shared VXLAN is not supported in a partitioned appliance and so a VXLAN cannot be tagged to a shared VLAN or you cannot make a VLAN a shared one when it is tagged to a VXLAN.

Supportable VXLAN configurations

Following are the supportable VXLAN configurations.

Extending VLAN over a VXLAN in the same broadcast domain

The following CLI steps help you to extend a VLAN over a VXLAN and the opposite way within the same broadcast domain.

1. Add a VLAN in the default partition

```
add vlan &lt;id>
```

2. Extend VLAN over a VXLAN within the same broadcast domain.

```
add vxlan &lt;vxlan id> –vlan &lt;id>
```

3. Configure a peer `vtep` to carry all BUM (broadcast unknown multicast) traffic.

NOTE

The `vtep` address can be a multicast address.

```
add bridgetable -mac &lt;mac_addr> -vxlan &lt;positive_integer> -vtep
&lt;ip_addr> [-vni &lt;positive_integer>][-deviceVlan
&lt;positive_integer>]
```

4. Bind IP addresses to VXLAN.

```
bind vxlan &lt;id> [-srcIP &lt;ip_addr>][-IPAddress &lt;ip_addr|
ipv6_addr|*> [&lt;netmask>]]
```

5. Bind VLAN to an administrative partition.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
bind partition &lt;partition-id> -vxlan &lt;id>

add vlan 3000

add vxlan 3000 –vlan 10

add bridgetable –mac 00:00:00:00:00:00 –vxlan 3000 -vtep 10.102.58.8 –
vni 11

bind vxlan 3000 – srcIP 10.102.101.15

bind partition p1 –vlan 10
```

SNMP support for admin partitions

A partitioned NetScaler appliance uses the SNMP infrastructure for partition rate limiting and for monitoring partition resource utilization details.

SNMP traps for admin partition rate limiting

On a partitioned NetScaler appliance, a PARTITION-RATE-LIMIT alarm can generate nine SNMP traps for notifying a partition resource (such as bandwidth, connection, or memory) has reached its limit or returned to normal.

The following nine SNMP traps are generated when:

- **partitionCONNThresholdReached**. The number of active connections for a partition exceeds its high threshold percentage.
- **partitionCONNThresholdNormal**. The number of active connections is less than or equal to the normal threshold percentage.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **partitionBWThresholdReached**. The partition's bandwidth usage reaches its high threshold percentage.
- **partitionMEMThresholdReached**. The current memory usage of the partition exceeds its high threshold percentage.
- **partitionMEMThresholdNormal**. The current memory usage of the partition becomes less than or equal to the normal threshold percentage.
- **partitionMEMLimitExceeded.** The current memory usage of the partition exceeds its memory limit percentage.
- **partitionCONNLimitExceeded**. The number of active connections for a partition exceeds its configured limit and new connections are being dropped.
- **partitionCONNLimitNormal**. The number of active connections for a partition goes below its configured limit and the partition can now accept a new connection.
- **partitionBWLimitExceeded**. The current bandwidth usage for a partition has exceeded its configured limit.

The threshold values for the SNMP traps are non-configurable and are the following:

- High threshold = 80% (applicable for all partition rate limit traps)
- Low threshold = 60% (applicable for all partition rate limit traps)
- Memory limit = 95% (applicable only for partition memory traps)

Configuring PARTITION-RATE-LIMIT alarm

To configure the PARTITION-RATE-LIMIT alarm in a specific partition and enable generation of the SNMP trap messages.

1. Enable PARTITION-RATE-LIMIT Alarm
2. Configure PARTITION-RATE-LIMIT Alarm
3. Configure SNMP Trap Destination

To enable PARTITION-RATE-LIMIT alarm by using the CLI

At the command prompt, type the following commands:

```
enable snmp alarm PARTITION-RATE-LIMIT
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
show snmp alarm PARTITION-RATE-LIMIT
```

To configure PARTITION-RATE-LIMIT Alarm by using the CLI

At the command prompt, type the following command:

```
set snmp alarm PARTITION-RATE-LIMIT [-state ( ENABLED | DISABLED )] [-
severity &lt;severity>] [-logging ( ENABLED | DISABLED )]
```

To configure the SNMP trap destination by using the CLI

At the command prompt, type the following command:

```
add snmp trap &lt;trapClass> &lt;trapDestination> [-version &lt;version>]
[-td &lt;positive_integer>] [-destPort &lt;port>] [-communityName
&lt;string>] [-srcIP &lt;ip_addr|ipv6_addr>] [-severity &lt;severity>] [-
allPartitions ( ENABLED | DISABLED )]
```

To configure the PARTITION-Rate-Limit alarm by using the GUI

Navigate to **System > SNMP > Alarms**, select **PARTITION-RATE-LIMIT** alarm, and configure the alarm parameters.

To configure the SNMP trap destination by using the GUI

Navigate to **System > SNMP > Trap**, specify the IP address of the destination device.

SNMP monitoring for partition resource utilization

Using SNMP, you can monitor a partition's resource (such as bandwidth, connection, and memory) utilization details at real time on a NetScaler appliance. It is done by sending an SNMP request (such as SNMP GET, SNMP GET BULK, SNMP GETNEXT, or SNMP WALK) from the SNMP Manager.

NOTE

To monitor partition resources, you must configure the SNMP community in the default partition. Wherein, the *partitionTable* is maintained in the default partition, and the SNMP communication is done through the NSIP address of the appliance.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Consider a scenario where a NetScaler administrator wants to know the bandwidth usage of partition P1 on the appliance. The SNMP Manager retrieves this information by sending an SNMP GET request on the corresponding OID (partitionCurrentBandwidth) to the NSIP address of the appliance. The SNMP agent on the default partition retrieves and sends the current bandwidth usage of P1 to the SNMP Manager through the NSIP address.

The following table lists the SNMP counters which are part of *partitionTable* and its description:

SNMP PARAMETER	SNMP OID	DESCRIPTION
partitionName	1.3.6.1.4.1.5951.4.1.1.88.1.1	Partition name
partitionCurrentBandwidth	1.3.6.1.4.1.5951.4.1.1.88.1.2	Current bandwidth usage of the partition.
partitionCurrentConnections	1.3.6.1.4.1.5951.4.1.1.88.1.3	Current number of active connections of the partition.
partitionMemoryUsagePcnt	1.3.6.1.4.1.5951.4.1.1.88.1.4	Current Memory usage (in percentage) of the partition.

Audit log support for admin partitions

On a partitioned NetScaler appliance, for enhanced data security, you can configure audit logging in an administrative partition by using advanced policies. For example, you might want to view logs (states and status information) of a specific partition. It has multiple users accessing different sets of features based on their levels of authorization in the partition.

Points to remember

1. The audit logs generated from the partition is stored as a single log file (/var/log/ns.log).
2. Configure the audit log server's (syslog or ns log) subnet address as the source IP address in the partition for sending the audit-log messages.
3. The default partition uses the NSIP as the source IP address for the audit log messages by default.
4. You can display the audit-log message by using the "show audit messages" command.

For information on audit-log configuration, see Configuring the NetScaler Appliance for Audit Logging.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configuring audit logging in partitioned NetScaler appliance

Complete the following tasks to configure audit logging in an administrative partition.

1. Configure partition subnet IP address. An IPv4 SNIP address of an administrative partition.
2. Configure audit-log (syslog and ns log) action. An Audit action is a collection of information that specifies the messages to be logged and how to log the messages on the external log server.
3. Configure audit-log (syslog and ns log) policies. Audit-log policies define log messages for the source partition to the syslog or ns log server.
4. Bind audit-log policy to sysGlobal and nsGlobal entity. Bind an audit-log policy to a system global entity.
5. Review audit-log statistics. Display the audit-log statistics and evaluate the configuration.

Configure the following by using the CLI

1. Create a partition's subnet IP address

   ```
   add ns ip <ip address> <subnet mask>
   ```

2. Create a syslog action

   ```
   add audit syslogAction <name> <serverIP> [-serverPort <port>] -logLevel
   <logLevel> [-dateFormat (MMDDYYYY | DDMMYYYY )] [-transport ( TCP | UDP )]
   ```

3. Create an ns log action

   ```
   add audit nslogAction <name> <serverIP> [-serverPort <port>] -logLevel
   <logLevel> [-dateFormat (MMDDYYYY | DDMMYYYY )]
   ```

4. Create a syslog audit-log policies

   ```
   add audit syslogpolicy syslog-pol1 true audit-action1
   ```

5. Create an ns log audit-log policies

   ```
   add audit nslogpolicy nslog-pol1 true audit-action1
   ```

6. Bind an audit-log policy to syslogGlobal entity

   ```
   bind audit syslogglobal -policyName <name> -priority <priority_integer>
   -globalBindType SYSTEM_GLOBAL
   ```

7. Bind an audit-log policy to nslogGlobal entity

© 1997–2026 Citrix Systems, Inc. All rights reserved.

`bind audit nslogglobal -policyName <name> -priority <priority_integer> -globalBindType SYSTEM_GLOBAL`

8. Display an audit-log statistics

   `stat audit -detail`

Example

```
add ns ip 10.102.1.1 255.255.255.0

add audit syslogAction syslog_action1 10.102.1.2 –logLevel INFORMATIONAL –dateFormat MMDDYYYY –transport UDP

add audit syslogpolicy syslog-pol1 true syslog_action1

bind audit syslogglobal –policyName syslog-pol1 –priority 1 –globalBindType SYSTEM_GLOBAL
```

Storing logs

When the SYSLOG or NSLOG server collects log information from all partitions, it is stored as log messages in the ns.log file. The log messages contain the following information:

- Partition Name.
- The IP address.
- A time stamp.
- The message type
- The predefined log levels (Critical, Error, Notice, Warning, Informational, Debug, Alert, and Emergency)
- The message information.

Display configured PMAC addresses for shared VLAN configuration

To use a partition setup with shared VLAN configuration, you need a virtual MAC address called as partition MAC (PMAC) address. The partition uses the PMAC address for its communication on the shared VLAN. A unique PMAC address is configured for each partition and it is used across all shared VLANs bound to that partition. In the case of a non-SDX platform (VPX or MPX) platform, the PMAC address can be either user specified or internally generated by a NetScaler appliance. If

© 1997–2026 Citrix Systems, Inc. All rights reserved.

the PMAC address is not specified for a partition, it is internally generated when the partition is bound to the first shared VLAN. While in the case of an SDX platform, the PMAC addresses always need to be configured from the SVM tool first and then assigned to a partition.

To display a list of configured PMACs, you can use the **Show ns PartitionMAC** command. The command enables you to verify the configured PMACs either through the NetScaler CLI or GUI. The command displays all the PMAC addresses and the corresponding partitions (if assigned). In the case of a non-SDX platform, the command displays all the PMAC addresses and their corresponding partitions because the PMAC address is assigned to a partition only on need basis (when a partition bound a shared VLAN). However in the case of an SDX platform, you might have some unassigned PMACs in the list.

For information on how to generate PMAC for the SDX platform, see Generating Partition MAC Addresses topic.

Display PMACs by using the NetScaler CLI

At the command prompt, type the following command:

```
show ns partitionMAC
```

```
Partition MAC Partition Name

1) f2:0c:64:da:f6:d7

2) b4:0c:43:da:f6:d2

3) a6:e7:b2:6c:48:e0

Done
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Display PMAC Addresses by using the NetScaler GUI

1. Sign in to the NetScaler appliance and navigate to the **Configuration > System > Partition MAC**.
2. The Partition MAC page displays a list of PMACs and its partitions.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

AppExpert

The following topics provide a conceptual reference and configuration instructions for the AppExpert and other features of the NetScaler appliance.

NOTE

For information about policy extensions, see Policy Extensions.

- Action Analytics: Collects run-time statistics on the basis of pre-defined criteria. When used with policies, the feature also provides you with the infrastructure for automatic, real-time traffic optimization.
- AppQoE: Application level Quality of Experience (AppQoE) integrates several existing policy-based security features of the NetScaler appliance into a single integrated feature that takes advantage of a new queuing mechanism, fair queuing.
- Entity Template: Describes how to use entity templates to set up and configure individual NetScaler entities, such as a policy or virtual server. An entity template provides a specification and a set of defaults for the object.
- HTTP Callouts: An HTTP request that the NetScaler appliance generates and sends to an external application when certain criteria are met during policy evaluation.
- Pattern Sets: Allow string matching during the evaluation of a Advanced policy.
- Policies and Expressions: Rules that determine the operations that the NetScaler appliance must perform.
- Rate Limiting: Defines the maximum load for a given network entity or virtual entity on the NetScaler appliance.
- Responder: Bases responses on who sends the request, where it is sent from, and other criteria with security and system management implications.
- Rewrite: Rewrites information in the requests or responses handled by the NetScaler appliance.
- String Maps: Perform pattern matching in all NetScaler features that use the default policy syntax.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Action analytics

The performance of your website or application depends on how well you optimize the delivery of the most frequently requested content. Techniques such as caching and compression help accelerate the delivery of services to clients, but you need to be able to identify the resources that are requested most frequently, and then cache or compress those resources. You can identify the most frequently used resources by aggregating real-time statistics about website or application traffic. Statistics such as how frequently a resource is accessed relative to other resources and how much bandwidth is consumed by those resources help you determine whether those resources need to be cached or compressed to improve server performance and network utilization. Statistics such as response times and the number of concurrent connections to the application help you determine whether you must enhance server-side resources.

If the website or application does not change frequently, you can use products that collect statistical data, and then manually analyze the statistics and optimize the delivery of content. However, if you do not want to perform manual optimizations, or if your website or application is dynamic in nature, you need infrastructure that can not only collect statistical data but can also automatically optimize the delivery of resources on the basis of the statistics. On the NetScaler appliance, this functionality is provided by the action analytics feature. The feature operates on a single NetScaler appliance and collects run-time statistics on the basis of criteria that you define. When used with NetScaler policies, the feature also provides you with the infrastructure that you need for automatic, real-time traffic optimization.

When configuring the action analytics feature, you specify the request attributes for which you want to collect statistical data, for example, URLs and HTTP methods by configuring Advanced policy expressions in an entity called a selector. Then, you configure an identifier to configure settings such as the sampling interval and sample count. You also configure a policy that enables the appliance to evaluate traffic as specified by the selector-identifier pair. Finally, you bind the policy to a bind point to begin collecting statistics.

The appliance also provides you with a set of built-in selectors, identifiers, and responder policies that you can use to get started with the feature.

The appliance aggregates the following statistics:

- The number of requests.
- The bandwidth consumed by the requests.
- The response time.
- The number of concurrent connections.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

You can configure the feature to perform run-time sorting of the records on an attribute of your choice. You can view the statistical data by using either the command-line interface or the Stream Sessions tool in the configuration utility.

Configure a selector

A selector is a filter for identifying requests. It consists of up to five individual Advanced policy expressions that identify request attributes such as the client IP address and the URL in the request. Each expression is a non-compound Advanced policy expression and is considered to be in an AND relationship with the other expressions. The following are some examples of selector expressions:

- `HTTP.REQ.URL`
- `CLIENT.IP.SRC`
- `HTTP.RES.BODY(1000).AFTER_STR("<string>").BEFORE_STR("<string>")"`
- `CLIENT.IP.SRC.SUBNET(24)`

Selectors are used in rate limiting and action analytics configurations. A selector is optional in a rate limiting configuration but is required in an action analytics configuration.

The order in which you specify parameters is significant. For example, if you configure an IP address and a domain (in that order) in one selector, and then specify the domain and the IP address (in the reverse order) in another selector, the NetScaler considers these values to be unique. This can lead to the same transaction being counted twice. Also, if multiple policies invoke the same selector, the NetScaler, again, can count the same transaction more than once.

If you modify an expression in a selector, you may get an error if any policy that invokes it is bound to a new policy label or bind point. For example, suppose that you create a selector named myLimitSelector1, invoke it from myLimitID1, and invoke the identifier from a DNS policy named dnsRateLimit1. If you change the expression in myLimitSelector1, you might receive an error when binding dnsRateLimit1 to a new bind point. The workaround is to modify these expressions before creating the policies that invoke them.

The NetScaler appliance provides built-in selectors for some of the most common use cases.

You can also configure a selector with expressions that identify the request attributes of your choice. For example, you might want to create a record for a request that arrives with a specific header. To evaluate the header, you can add `HTTP.REQ.HEADER("<header_name>")` to the selector that you intend to use.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To configure a selector by using the command line interface:

At the command prompt, type the following commands to configure a selector and verify the configuration:

- `add stream selector <name> <rule> ...`
- `show stream selector`

Example

```
> add stream selector myselector HTTP.REQ.URL CLIENT.IP.SRC

 Done

> show stream selector myselector

    Name: myselector

    Expressions:

        1) HTTP.REQ.URL

        2) CLIENT.IP.SRC

 Done

>
```

To modify or remove a selector by using the command line interface:

- To modify a selector, type the set stream selector command, the name of the selector, and the rule parameter with the expressions. Enter the existing expressions that you want to retain, along with the new expressions that you want to add.
- To remove a selector, type the rm stream selector command and the name of the selector.

To configure a selector by using the GUI:

1. Navigate to **AppExpert** > **Action Analytics** > **Selectors**.
2. In the details pane, do one of the following:
    - To create a selector, click **Add**.
    - To modify a selector, select the selector, and then click **Edit**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. In the **Create Selector** or **Configure Selector** page, set the following parameters:
    - Name. To add a name for the selector, enter the name in the **Name** field. The Name must begin with an ASCII, alphanumeric, or underscore character. The name must contain only ASCII alphanumeric, underscore, hash, period, space, colon, at, equals, and hyphen characters.
    - Expressions. To add the expression to the selector configuration, click **Insert**. To remove an expression from the selector configuration, in the Expression box, select the expression, and then click **Delete**. Note: In the Expressions box, enter a valid parameter. For example, enter HTTP. Then, enter a period after this parameter. A drop-down menu appears. The contents of this menu provide the keywords that can follow the initial keyword that you entered. To select the next keyword in this expression prefix, double-click the selection in the drop-down menu. The **Expressions** text box displays both the first and second keywords for the expression prefix, for example, HTTP.REQ. Continue adding expression components until the complete expression is formed.
4. Click **Insert**.
5. Continue adding up to five non-compound expressions.
6. Click **Create** and then **Close**.

Configure a stream identifier

You configure a stream identifier to specify parameters for collecting statistical data from requests identified by a given selector. An identifier specifies the selector to be used, the statistics collection interval, the sample count, and the field on which the records are to be sorted.

The NetScaler appliance includes the following built-in stream identifiers for common use cases. All the built-in identifiers specify a sample count of 1 and an interval of 1 minute. Additionally, they sort the data on the REQUESTS attribute. They differ only in being associated with different built-in selectors. Each built-in identifier is associated with a built-in selector of the same name (for example, the built-in identifier Top_URL is associated with the built-in selector Top_URL). Following are the built-in identifiers:

- Top_URL
- Top_CLIENTS
- Top_URL_CLIENTS_LBVSERVER
- Top_URL_CLIENTS_CSVSERVER
- Top_MSSQL_QUERY_DB_LBVSERVER

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Top_MYSQL_QUERY_DB_LBVSERVER

For more information about the built-in selectors, see Configuring a Selector.

Note: The maximum length for storing string results of selectors (for example, HTTP.REQ.URL) is 60 characters. If the string (for example, URL) is 1000 characters long, of which 50 characters are enough to uniquely identify a string, use an expression to extract only the required 50 characters.

You cannot modify a built-in identifier's configuration. However, you can create an identifier with a configuration of your choice.

To configure a stream identifier by using the command line interface

At the command prompt, type the following commands to configure a stream identifier and verify the configuration:

- `add stream identifier <name> <selectorName> [-interval <positive_integer>] [-SampleCount <positive_integer>] [-sort <sort>]`
- `show stream identifier <name>`

Example

```
> add stream identifier myidentifier Top_URL -interval 10 -sampleCount 100

 Done
```

To configure a stream identifier by using the GUI

1. Navigate to **AppExpert** > **Action Analytics** > **Stream Identifiers**.
2. In the details pane, do one of the following:
   - To create a stream identifier, click **Add**.
   - To modify a stream identifier, select the identifier, and then click **Edit**.
3. In the Configure Stream Identifier page, set the following parameters:
   - Name
   - Selector
   - Interval
   - Sample Count
   - Sort

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. Click **Create**, and then click **Close**.

View statistics

You can view the collected statistics in tabular format in the command-line interface and in graphical format in the configuration utility.

The following table describes the collected statistics:

STATISTICS	COLUMN NAME IN THE OUTPUT OF THE STAT STREAM IDENTIFIER `<IDENTIFIER NAME>` COMMAND	DESCRIPTION
Number of requests	**Req**	The number of requests for which records were created in the last `<interval>` number of minutes.
Bandwidth consumed	**BandW**	The total bandwidth consumed by the requests that were received in the last `<interval>` number of minutes. The total bandwidth of a request is the bandwidth consumed by the request and its response. The value is rounded off to the next higher or next lower integer value. So, it might differ slightly from the expected value. For example, if a request's total bandwidth consumption is 2.2 KB. One instance of the request might be shown as having consumed 2 KB. Two instances might be shown as having consumed 4 KB, but three instances might be shown as having consumed 7 KB.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

STATISTICS	COLUMN NAME IN THE OUTPUT OF THE STAT STREAM IDENTIFIER <IDENTIFIER NAME> COMMAND	DESCRIPTION
Response time	**RspTime**	The average response time for all the requests received in the last `<interval>` number of minutes.
Concurrent connections	**Conn**	The total number of concurrent connections that are currently open.

To view the statistical data collected for a stream identifier by using the command line

At the command prompt, type:

```
stat stream identifier <name> [<pattern> ...] [-detail] [-fullValues] [-ntimes <positive_integer>] [-logFile <input_filename>] [-sortBy <sortBy> [<sortOrder>]
```

Examples

Example 1 sorts the output on the BandW column, in the descending order. Example 2 sorts the output in Example 1, on the **Req** column, and in the ascending order

Example 1

```
> stat stream identifier myidentifier -sortBy BandW Descending -fullValues

Stream Session statistics

                    Req                BandW

User1                508               125924

User2               5020                12692

User3               2025                 4316
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
                RspTime                 Conn

User1             5694                    0

User2              109                    0

User3                3                    0

 Done
```

Example 2

```
> stat stream identifier myidentifier -sortBy Req Ascending –fullValues

Stream Session statistics

                   Req                BandW

User1              508               125924

User3             2025                 4316

User2             5020                12692

                RspTime                 Conn

User1             5694                    0

User3                3                    0

User2              109                    0

 Done
```

To view the statistical data collected for a stream identifier by using the GUI

1. Navigate to **AppExpert** > **Action Analytics** > **Stream Identifiers**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. Select the stream identifier whose sessions you want to view, and then click Statistics For information about how you can group the output based on the values collected for various selector expressions.

Grouping records on attribute values

Statistical information such as the number of times a particular URL has been accessed overall and per client, and the total number of GET and POST requests per client can provide valuable insights into whether any of your resources need to be expanded to meet the demand or be optimized for delivery. To obtain such statistics, you must use an appropriate set of selector expressions, and then use the pattern parameter in the stat stream identifier command. The grouping is based on the pattern that is specified in the command. Grouping can be performed concurrently on the values of multiple expressions.

In the command-line interface, you can group the output by using patterns of your choice. In the configuration utility, the pattern depends on the choices you make when drilling down through the values of various selector expressions. For example, consider a selector that has the expressions `HTTP.REQ.URL`, `CLIENT.IP.SRC`, and `HTTP.REQ.LB_VSERVER.NAME`, in that order. The statistics home page displays icons for each of these expressions. If you click the icon for `CLIENT.IP.SRC`, the output is based on the patterns *. The output displays statistics for each client IP address. If you click an IP address, the output is based on the patterns * `<IP address> ?` and ? `<IP address> *` where `<IP address>` is the IP address you selected. In the resulting output, if you click a URL, the pattern used is `<URL> <IP address> ?`.

To group the records on the values of selector expressions by using the command line interface

At the command prompt, enter the following command to group the records on the basis of a selector expression:

```
stat stream identifier <name> [<pattern> ...]
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The following examples use a different pattern to demonstrate the effect of the pattern on the output of the stat stream identifier command. The selector expressions are HTTP.REQ.URL and HTTP.REQ.HEADER("UserHeader"), in that order. The requests contain a custom header whose name is UserHeader. Note that in the examples, a given statistical value changes as determined by the grouping, but the sum total of the values for a given field remains the same.

Example 1

In the following command, the pattern used is ? ?. The appliance groups the output on the values collected for both selector expressions. The row headers consist of the expression values separated by a question mark (?). The row with the header /mysite/mypage1.html?Ed displays statistics for requests made by user Ed for the URL /mysite/mypage1.html.

NOTE:

You must ensure to type the following command with "\?" instead of "?". For example, If selector uses an expression - client.ip.src and client.tcp.srcport. The Stat command to group the output on the values collected for the selector is 'stat stream identifier myidentifier \? \? -fullValues' as given below.

```
> stat stream identifier myidentifier ? ? -fullValues

Stream Session statistics

                                        Req                 BandW

/mysite/mypage2.html?Grace                1                  2553

/mysite/mypage1.html?Grace                2                     4

/mysite/mypage1.html?Ed                   8                    16

/mysite/mypage2.html?Joe                  1                  2554

/mysite/mypage1.html?Joe                  5                    10

/mysite/?Joe                              1                     4

                                    RspTime                 Conn
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
/mysite/mypage2.html?Grace                0                    0

/mysite/mypage1.html?Grace                0                    0

/mysite/mypage1.html?Ed                   0                    0

/mysite/mypage2.html?Joe                  0                    0

/mysite/mypage1.html?Joe                  0                    0

/mysite/?Joe                              6                    0

 Done
```

Example 2

In the following command, the pattern used is * ?. The appliance groups the output on the values accumulated for the second expression HTTP.REQ.HEADER("UserHeader"). The rows display statistics for all requests made by users Grace, Ed, and Joe.

NOTE:

Ensure to type the following command with "\?" instead of "?".

```
> stat stream identifier myidentifier * ?

Stream Session statistics

                  Req    BandW  RspTime     Conn

Grace               3     2557        0        0

Ed                  8       16        0        0

Joe                 7     2568        6        0

 Done
```

Example 3

© 1997–2026 Citrix Systems, Inc. All rights reserved.

In the following command, the pattern used is ? *, which is the default pattern. The output is grouped on the values collected for the first selector expression. Each row displays statistics for one URL.

NOTE:

Ensure to type the following command with "\?" instead of "?".

```
> stat stream identifier myidentifier ? * -fullValues

Stream Session statistics

                                        Req                 BandW

/mysite/mypage2.html                      2                  5107

/mysite/mypage1.html                     15                    30

/mysite/                                  1                     4

                                    RspTime                  Conn

/mysite/mypage2.html                      0                     0

/mysite/mypage1.html                      0                     0

/mysite/                                  6                     0

 Done
```

Example 4

In the following command, the pattern used is `* *`. The appliance displays one set of collective statistics for all the requests received, with no row title.

```
> stat stream identifier myidentifier * *

Stream Session statistics
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
                Req    BandW  RspTime     Conn

                 18     5141        6        0

 Done
```

Example 5

In the following command, the pattern is /mysite/mypage1.html *. The appliance displays one set of collective statistics for all the requests received for the URL /mysite/mypage1.html, with no row title.

```
> stat stream identifier myidentifier /mysite/mypage1.html *

Stream Session statistics

                Req    BandW  RspTime     Conn

                 15       30        0        0

 Done
```

Clearing a stream session

You can flush all the records that have been accumulated for a stream identifier.

To clear a stream session by using the command line interface

At the command prompt, enter the following commands to clear a stream session and verify the results:

- clear stream session
- stat stream identifier

Example

This example uses the stat stream identifier command first, so that a comparison can be made with the stat stream identifier command that is used for verifying the result of the clear stream session command.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
>stat stream identifier myidentifier

Stream Session statistics

                  Req    BandW  RspTime     Conn

/aed....html        2        0        0        0

/                 636      303       12        0

 Done

>clear stream session myidentifier

 Done

>stat stream identifier myidentifier

 Done
```

To clear a stream session by using the GUI

1. Navigate to **AppExpert** > **Action Analytics** > **Stream Identifiers**.
2. Select the stream identifier whose sessions you want to clear, and then click **Clear Sessions**.

Configure policy for optimizing traffic

To put the selector-identifier pair in your action analytics configuration into effect, you must associate the pair with the point in the traffic flow at which you want to collect statistics. You can do

© 1997–2026 Citrix Systems, Inc. All rights reserved.

so by configuring a Advanced policy and referencing the stream identifier from the policy rule. You can use compression policies, caching policies, rewrite policies, application firewall policies, responder policies, and any other policies whose action is based on a Boolean expression.

The action analytics feature introduces a set of Advanced policy expressions and functions for collecting and evaluating data. The expression `ANALYTICS.STREAM(<identifier_name>)` is used for referencing the identifier that you want to use. The expression COLLECT_STATS is used to collect statistical data. Functions such as `IS_TOP(<uint>)` and `IS_TOP_FREQUENTS(<uint>)` are used for making automatic, real-time traffic optimization decisions.

- **IS_TOP(\<number>).** Finds if a given object is in the top \<number> of elements. For example, is the element among the top 10 elements. When multiple elements have the count, they are considered to be similar in nature. The sort function must be turned on to avoid an undef condition.
- **IS_TOP_FREQUENTS(\<frequency>).** Finds if a given object is in the top \<frequency> of the elements that are in the top elements. For example, is the element among the top 50% of all the top elements maintained. Elements having the same values are considered similar in nature. The sort function must be turned on to avoid an undef condition.

It is your policy configuration that determines whether the NetScaler appliance must only collect data from traffic or also perform an action. If the appliance must only collect statistical data, you can configure a policy with the rule `ANALYTICS.STREAM(<identifier_name>).COLLECT_STATS` and the action NOOP. The NOOP policy must be the policy with the highest priority at the bind point. This policy is sufficient if you are only collecting statistics. Traffic optimization decisions, such as what to compress or cache, must be based on manual, periodic evaluation of the statistical data.

If, in addition to collecting statistics, the appliance must also perform an action on the traffic, you must configure the gotoPriorityExpression parameter of the NOOP policy such that another policy that has the desired rule and action is evaluated subsequently. This second policy must have a rule that begins with the `ANALYTICS.STREAM(<identifier_name>)` prefix and a function that evaluates the data.

Following is an example of two responder policies that are configured and bound globally. The policy responder_stat_collection enables the appliance to collect statistics based on the identifier, myidentifier. The policy responder_notify evaluates the data that is collected.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Example

```
> add responder action send_notification respondwith '"You are in the Top
10 list for bandwidth consumption"'

 Done

> add responder policy responder_stat_collection'
ANALYTICS.STREAM("myidentifier").COLLECT_STATS' NOOP

Done

> add responder policy responder_notify
'ANALYTICS.STREAM("myidentifier").BANDWIDTH.IS_TOP(10)' send_notification

 Done

> bind responder global responder_stat_collection 10 NEXT

 Done

> bind responder global responder_notify 20 END

 Done
```

How to limit bandwidth consumption per user or client device

Your web site, application, or file hosting service has finite network and server resources available to it to serve all its users. One of the most important resources is bandwidth. Substantial bandwidth consumption by only a subset of the user base can result in network congestion and reduced resource availability to other users. To prevent network congestion, you might have to limit a client's bandwidth consumption by using temporary service denial techniques such as responding to a client request with an HTML page if it has exceeded a preconfigured bandwidth value over a fixed time period leading up to the request.

In general, you can regulate bandwidth consumption either per client device or per user. This use case demonstrates how you can limit bandwidth consumption per client to 100 MB over a time period of one hour. The use case also demonstrates how you can regulate bandwidth consumption per user to 100 MB over a time period of one hour, by using a custom header that provides the user name. In both cases, the tracking of bandwidth consumption over a moving time period of one hour is achieved by setting the interval parameter in the stream identifier to 60 minutes. The use

© 1997–2026 Citrix Systems, Inc. All rights reserved.

cases also demonstrate how you can import an HTML page to send to a client that has exceeded the limit. Importing an HTML page not only simplifies the configuration of the responder action in these use cases, but also simplifies the configuration of all responder actions that need the same response.

To limit bandwidth consumption per user or client device by using the command line interface

In the command-line interface, perform the following tasks to configure action analytics for limiting a client's or user's bandwidth consumption. Each step includes sample commands and their output.

1. **Set up your load balancing configuration.** Configure load balancing virtual server mysitevip, and then configure all the services that you need. Bind the services to the virtual server. The following example creates ten services and binds the services to mysitevip.

```
> add lb vserver mysitevip HTTP 192.0.2.17 80

 Done

> add service service[1-10] 192.0.2.[240-249] HTTP 80

service "service1" added

service "service2" added

service "service3" added

.

.

.

service "service10" added

 Done

> bind lb vserver vserver1 service[1-10]

service "service1" bound

service "service2" bound
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
service "service3" bound

.

.

.

service "service10" bound

 Done
```

2. **Configure the stream selector.** Configure one of the following stream selectors:

   - To limit bandwidth consumption per client, configure a stream selector that identifies the client IP address.

     ```
     > add stream selector myselector CLIENT.IP.SRC

      Done
     ```

   - To limit bandwidth consumption per user on the basis of the value of a request header that provides the user name, configure a stream selector that identifies the header. In the following example, the name of the header is UserHeader.

     ```
     > add stream selector myselector HTTP.REQ.HEADER(“UserHeader”)

      Done
     ```

3. **Configure a stream identifier.** Configure a stream identifier that uses the stream selector. Set the interval parameter to 60 minutes.

   ```
   > add stream identifier myidentifier myselector -interval 60
   -sampleCount 1 -sort BANDWIDTH

    Done
   ```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. **Configure the responder action.** Import the HTML page that you want to send to users or clients that have exceeded the bandwidth consumption limit, and then use the page in responder action crossed_limits.

```
> import responder htmlpage http://.1.1.1/stdpages/wait.html crossed-
limits.html

This operation may take some time, Please wait...

 Done

> add responder action crossed_limits respondwithhtmlpage crossed-
limits.html

 Done
```

5. **Configure the responder policies.** Configure responder policy myrespol1 with the rule ANALYTICS.STREAM("myidentifier").COLLECT_STATS and the action NOOP. Then, configure policy myrespol2 for determining whether a client or user has crossed the 100 MB limit. The policy myrespol2 is configured with the responder action crossed_limits.

```
> add responder policy myrespol1
'ANALYTICS.STREAM("myidentifier").COLLECT_STATS' NOOP

 Done

> add responder policy myrespol2
'ANALYTICS.STREAM("myidentifier").BANDWIDTH.GT(104857600)'
crossed_limits

 Done
```

6. **Bind the responder policies to the load balancing virtual server.** The policy myrespol1, which only collects statistical data, must have the higher priority and a GOTO expression of NEXT.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
> bind lb vserver mysitevip -policyName myrespol1 -priority 1
-gotoPriorityExpression NEXT

 Done

> bind lb vserver mysitevip -policyName myrespol2 -priority 2
-gotoPriorityExpression END

 Done
```

7. **Test the configuration.** Test the configuration by sending test HTTP requests, from multiple clients or users, to the load balancing virtual server and using the stat stream identifier command to view the statistics that are collected for the specified identifier. The following output displays statistics for clients.

```
> stat stream identifier myidentifier -sortBy BandW –fullValues

Stream Session statistics

                          Req           BandW

192.0.2.30                5000          3761

192.0.2.31                29            2602

192.0.2.32                25            51

                          RspTime       Conn

192.0.2.30                2             0

192.0.2.31                0             0

192.0.2.32                0             0

 Done

>
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

AppExpert applications

WARNING

The application template functionality is deprecated. As an alternative, you can use StyleBooks. For more information, see StyleBooks and Web application firewall StyleBook.

An AppExpert application is a collection of configuration that you set up on the NetScaler appliance. Managing AppExpert applications is simplified by a GUI (GUI) that allows you to specify application traffic subsets and a distinct set of security and optimization policies for processing each traffic subset. Also, it consolidates deployment steps in one view, so you can quickly configure target IP addresses for clients and specify host servers.

After the AppExpert application is set up, you must verify that the application is working correctly. If necessary, you can customize the configuration to suit your requirements.

Periodically, you can verify and monitor the configuration by viewing the counters for various application components, statistics, and the Application Visualizer. You can also configure authentication, authorization, and auditing (authentication, authorization, and auditing) policies for the application.

AppExpert application terminology

Following are the terms used in the AppExpert applications feature and the descriptions of the entities for which the terms are used:

Public endpoint. The IP address and port combination at which the NetScaler appliance receives client requests for the associated web application. A public endpoint can be configured to receive either HTTP or secure HTTP (HTTPS) traffic. All client requests for the web application must be sent to a public endpoint. An AppExpert application can be assigned multiple endpoints.

Application unit. An AppExpert application entity that processes a subset of web application traffic and load balances a set of services that host the associated content. The subset of traffic that an application unit must manage is defined by a rule. Each application unit also defines its own set of traffic optimization and security policies for the requests and responses that it manages. The NetScaler services associated with these policies are Compression, Caching, Rewrite, Responder, and application firewall.

By default, every AppExpert application with at least one application unit includes a default application unit, which cannot be deleted. The default application unit is not associated with a rule

© 1997–2026 Citrix Systems, Inc. All rights reserved.

for identifying requests and is always placed last in the order of application units. It defines a set of policies for processing any request that does not match the rules that are configured for the other application units. Thereby ensuring all client requests are processed.

Service. The combination of the IP address of the server that hosts the web application instance and the port to which the application is mapped on the server, in the format `\<IP address\>:\<Port\>`. A web application that serves many requests is hosted on multiple servers. Each server is said to host an instance of the web application, and each such instance of the web application is represented by a service on the NetScaler appliance.

Application unit rule. Advanced policy expression that defines the characteristics of a traffic subset for an application unit. The following example rule is a Advanced policy expression that identifies a traffic subset that consists of four image types:

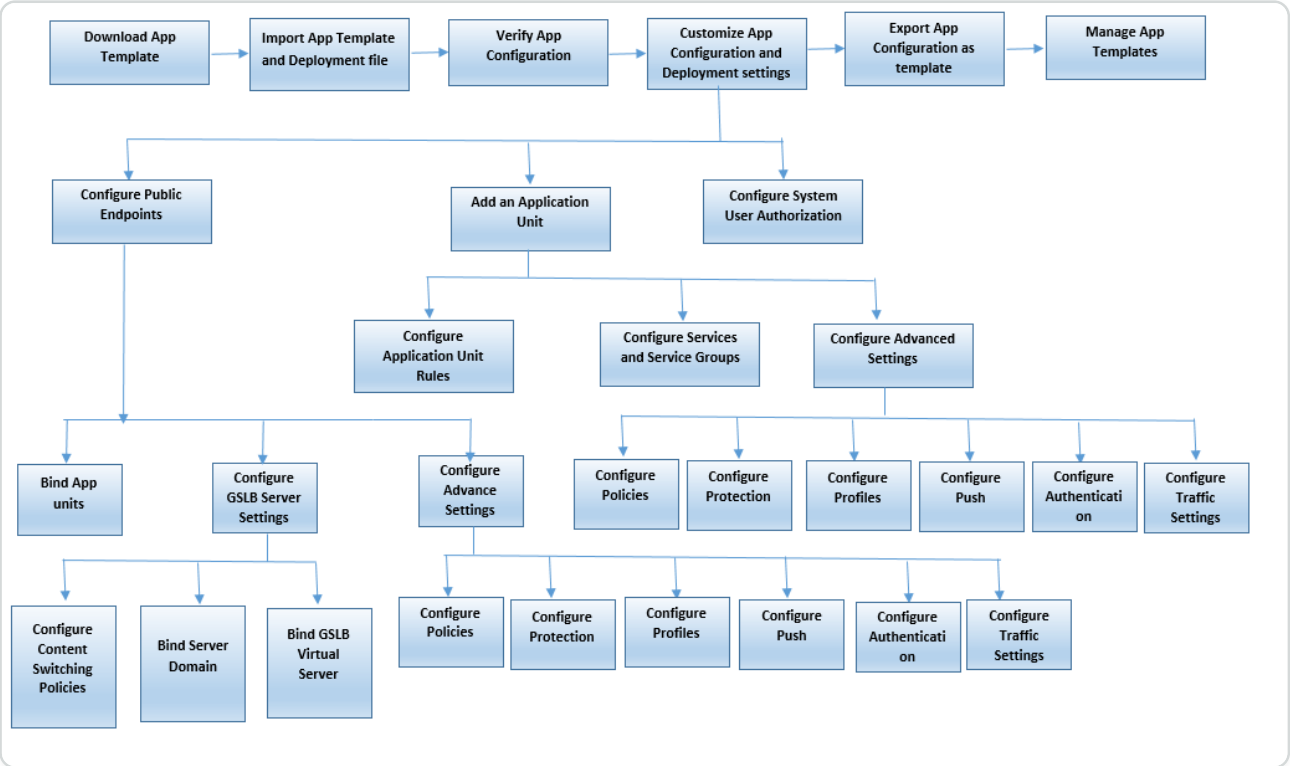
```
HTTP.REQ.URL.SUFFIX.EQ("bmp") || HTTP.REQ.URL.SUFFIX.EQ("gif") ||
HTTP.REQ.URL.SUFFIX.EQ("png") || HTTP.REQ.URL.SUFFIX.EQ("jpg")
```

For more information about Advanced policy expressions, see Policies and Expressions.

Traffic Subset. A set of client requests that require a common set of traffic optimization and security policies. A traffic subset is managed by an application unit and is defined by a rule.

How appExpert application works

When the endpoint receives a client request, the NetScaler appliance evaluates the request against the rule that is configured for the topmost application unit. If the request satisfies this rule, the request is processed by the policies that are configured for the application unit, and then forwarded to a service. The choice of service depends on which services are configured for the application, and on settings such as the load balancing algorithm and persistence method configured for the application unit.



If the request does not satisfy the rule, the request is evaluated against the rule for the next topmost application unit. In this order, the request is evaluated against each application unit rule until the request satisfies a rule. If the request does not satisfy any of the configured rules, it is processed by the default application unit, which is always the last application unit.

You can configure multiple public endpoints for an AppExpert application. In such a configuration, by default, each application unit processes requests received by all the public endpoints and load balances all the services that are configured for the application. However, you can specify that an

© 1997–2026 Citrix Systems, Inc. All rights reserved.

application unit processes traffic from only a subset of the public endpoints and load balances only a subset of the services that are configured for the AppExpert application.

The following flow diagram illustrates the AppExpert Application flow sequence for using a built-in application template.

If you prefer to create a customized application without using a template, do the following:

1. Create a custom application.
2. Configure application and deployment settings.
3. Export the configuration to new template files (optional).
4. Import the template files to other NetScaler appliances that require a similar AppExpert application configuration

Customizing the configuration

After you verify that the AppExpert application is working correctly, you can customize the configuration to suit your requirements.

After you verify that the AppExpert application configuration is working correctly, you can configure the application and the deployment settings to suit your requirements. When you import an application template and deployment file, the system automatically populates the target application with the available configuration settings (such as application units, application unit rules, policies, persistence settings, load balancing methods, profiles, and traffic settings). In this application, you

© 1997–2026 Citrix Systems, Inc. All rights reserved.

can configure deployment settings such as public endpoints, services, and service groups for each traffic subset. If you want the AppExpert application to manage a traffic subset that is not included in the template, you can either add an application unit for a traffic subset or modify the existing application unit. After you customize the configuration, you can also specify the order of evaluation for each traffic subset that the application manages.

Configuring an AppExpert application consists of the following steps:

1. Configuring Public Endpoints
2. Configuring Application Units
3. Specifying the Order of Evaluation
4. Viewing Application Configuration using Visualizer

Also, you can configure the policies that the template provided. If the AppExpert application template does not include policies for a particular NetScaler feature, such as Rewrite or application firewall, you can configure your own policies.

Configure public endpoints

If you did not specify a public endpoint when importing an AppExpert application, you can specify public endpoints after you create the application. You can configure one public endpoint of type HTTP and one public endpoint of type HTTPS for your AppExpert application.

If endpoints are already configured for the application, you can dissociate endpoints from the AppExpert application and delete any endpoints that you no longer need. Note that when you dissociate a public endpoint from the AppExpert application, the endpoint is automatically unbound from the associated application unit, but it is not deleted from the system.

To configure public endpoints for an AppExpert application:

1. Navigate to **AppExpert** > **Applications**.
2. In the details pane, right-click the application for which you want to configure public endpoints, and then click Edit.
3. In the **Applications** page, go to **Public Endpoint** section and click the pencil icon.
4. In the **Public Endpoint** slider, set the following parameters.
    a. Public endpoint type. Select the radio button to define the endpoint type.
    b. Name. Name of the public endpoint.
    c. IP address. IP address of the public endpoint.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

d. Port. Port number of the public endpoint.

e. Protocol. Select a protocol type as HTTP or HTTPS.

5. Click **Continue.**
6. In the **Application Units** section, select an application unit from the list.
7. Click **Continue** to set the policy and server details.
8. Click **OK** and then Done.
9. Click Close.

For more information about the parameters in the **Configure Public Endpoint** dialog box, see Content Switching.

Configure services and service groups for an application unit

When you configure a service or service group, you either modify an existing service or service group, or add new services to the AppExpert application. You add services or service groups if you did not specify them when you imported the application template. You also add services and service groups when you increase the number of servers that host instances of the application. You can configure a service and service group for an application unit only after you configure the service or service group for the AppExpert application.

To configure a service or service group for the AppExpert application:

1. Navigate to **AppExpert** > **Applications**.
2. In the details pane, right-click the application and then click **Edit.**
3. In the **Applications** page, select an application unit and then click **Continue**.
4. In the **Services and Service Groups** section, do the following:

   a. In the Service Binding slider, set the following parameters.

      i. Service. Select a load balancing service from the list or create a new service.

      ii. Weight. Provide a weight value for the service.

   b. Click **Bind** and then **Done.**

   c. In the ServiceGroup Binding slider, set the following parameters:

      i. Service Group Name. Select a load balancing service group or create a new service group.

      ii. Click **Bind** and then **Done**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

   d. Click **Done**.

5. Click **Continue** to set other configurations.

Create application units

You might need to add application units for traffic subsets that are either specific to your web application implementation or not defined in the template. When creating an application unit, you must configure a rule for the application unit.

To create an application unit for the AppExpert application:

1. Navigate to **AppExpert** > **Applications**.
2. In the details pane, right-click the application for which you want to add an application unit, and then click **Add**.
3. In the **Applications** page, go to **Application Units** section and click the **pencil** icon.

To configure policy expressions for an application unit:

1. Navigate to **AppExpert** > **Applications**.
2. In the details pane, right-click the application for which you want to add an application unit, and then click **Add**.
3. In the **Applications** page, go to **Application Units** section and click the **+** icon. to create a unit and add policy expressions.
4. To specify the format of the new expression, do one of the following:

   a. To specify that you want to configure a policy expression in the Rule box, click Classic Syntax.

   b. To specify that you want to configure an advanced expression in the Rule box, click Advanced policy.

   c. In the Rule box, configure the expression.

5. Click **OK**.

Configuring application unit rules

You might want to configure an application unit rule to include or exclude certain types of traffic. When you configure the rule, you can also define the syntax of the expression.

To configure an application unit rule:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. In the navigation pane of the GUI, expand AppExpert, and then click **Applications**.
2. In the details pane, right-click the application unit for which you want to modify the rule, and then click **Open**.
3. In the Configure Application Unit dialog box, do the following:
    a. To specify the format of the new expression, do one of the following:
        - To specify that you want to configure a Advanced policy expression in the Rule box, click **Classic Syntax**.
        - To specify that you want to configure an advanced expression in the Rule box, click **Advanced policy**.
    b. In the Rule box, configure the expression.
4. Click **OK**.

Configuring policies for application units

For an AppExpert application, you can configure policies for Compression, Caching, Rewrite, Responder, and Application Firewall. The templates that you download from the Citrix® Community web site provide you with a set of policies that fulfill the most common application management requirements. You might want to fine-tune or customize these policies. If the set of policies provided for a given application unit does not include policies for a particular feature, you can create and bind your own policies for that feature.

If you create an AppExpert application without using a template, you must configure all the policies that the web application needs.

The GUI uses various icons to indicate whether or not policies are configured for a feature. For an application unit, if a policy is configured for a given feature, an icon that represents the feature is displayed. For example, if a compression policy is configured for an application unit, a compression icon is displayed in the Compression column for the application unit. For features for which no policy is configured, an icon depicting a plus sign (+) is displayed.

Note: When configuring policies for application units, you might need to configure policies and expressions that are either in the classic or Advanced policy. Additionally, when you configure Advanced policy policies, you might need to specify parameters such as Goto expressions and invoke policy banks.

For information about configuring policies and expressions in both formats, see Policies and Expressions.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configuring compression policies

You can use either classic policies or advanced policies to configure compression, but you cannot bind compression policies of both types to the same application unit.

To configure a compression policy for an application unit:

1. Navigate to **AppExpert** > **Applications**.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the Compression column.
3. In the Configure Compression Policies dialog box, do one or more of the following, depending on the configuration tasks you want to perform:

   - Click Switch to Advanced policy if you want to configure a Advanced policy compression policy. If you want to bind or configure classic compression policies, and if you are in the Advanced policy view, you can click Switch to Classic Syntax to return to the classic policy view and begin modifying bound classic policies or create and bind new classic compression policies.

     Important: This setting also determines what policies are displayed when you want to insert a policy. For example, if you are in the Advanced policy view, when you click Insert Policy, the list that appears in the Policy Name column will include only Advanced policy policies. You cannot bind policies of both types to an application unit.
   - If you want to configure classic policies, click either Request or Response, depending on whether you want the policy to be evaluated at request-time or at response-time.

     You can configure both request-time and response-time classic compression policies for an application unit. After evaluating all of the request-time policies, if no match is found, the appliance evaluates response-time policies.
   - To modify a compression policy that is already bound to the application unit, click the name of the policy, and then click Modify Policy. Then, in the Configure Compression Policy dialog box, modify the policy, and then click OK.

     For information about modifying a compression policy, see Compression.
   - To unbind a policy, click the name of the policy, and then click Unbind Policy.
   - To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
   - To regenerate assigned priorities, click Regenerate Priorities.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- To insert a new policy, click **Insert Policy** and, in the list that is displayed in the Policy Name column, click **New Policy**. Then, in the Create Compression Policy dialog box, configure the policy, and then click **Create**.

  For information about modifying a compression policy, see Compression.
- If you are configuring a Advanced policy expression, do the following:
  - In the Goto Expression column, select a Goto expression.
  - In the Invoke column, specify the policy bank that you want to invoke if the current policy evaluates to TRUE.

4. Click **Apply Changes**, and then click **Close**.

Configuring Caching Policies

You can use only Advanced policy policies and expressions to configure Caching policies.

To configure Caching policies for an application unit:

1. Navigate to **AppExpert** > **Applications**.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the Caching column.
3. In the Configure Cache Policies dialog box, do one or more of the following, depending on the configuration tasks you want to perform:
   - Click either Request or Response, depending on whether you want the policy to be evaluated at request-time or at response-time.

     You can configure both request-time and response-time Caching policies for an application unit. After evaluating all of the request-time policies, if no match is found, the appliance evaluates response-time policies.
   - To modify a Caching policy that is already bound to the application unit, click the name of the policy, and then click Modify Policy. Then, in the **Configure Cache Policy** dialog box, modify the policy, and then click **OK**.

     For information about modifying a Caching policy, see Integrated Caching.
   - To unbind a policy, click the name of the policy, and then click **Unbind Policy**.
   - To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
   - To regenerate assigned priorities, click **Regenerate Priorities**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- To insert a new policy, click **Insert Policy** and, in the list that is displayed in the Policy Name column, click **New Policy**. Then, in the **Create Cache Policy** dialog box, configure the policy, and then click **Create**.

  For information about modifying a Caching policy, see Integrated Caching.
- In the Goto Expression column, select a Goto expression.
- In the Invoke column, specify the policy bank that you want to invoke if the current policy evaluates to TRUE.

4. Click **Apply Changes**, and then click **Close**.

Configuring rewrite policies

You can use only Advanced policy policies and expressions to configure Rewrite policies.

To configure Rewrite policies for an application unit:

1. Navigate to **AppExpert** > **Applications**.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the Rewrite column.
3. In the **Configure Rewrite Policies** dialog box, do one or more of the following, depending on the configuration tasks you want to perform:

   - Click either Request or Response, depending on whether you want the policy to be evaluated at request-time or at response-time.

     You can configure both request-time and response-time Rewrite policies for an application unit. After evaluating all of the request-time policies, if no match is found, the appliance evaluates response-time policies.
   - To modify a Rewrite policy that is already bound to the application unit, click the name of the policy, and then click **Modify Policy**. Then, in the Configure Rewrite Policy dialog box, modify the policy, and then click **OK**.

     For information about modifying a Rewrite policy, see Rewrite.
   - To unbind a policy, click the name of the policy, and then click **Unbind Policy**.
   - To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
   - To regenerate assigned priorities, click **Regenerate Priorities**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- To insert a new policy, click **Insert Policy** and, in the list that is displayed in the **Policy Name** column, click **New Policy.** Then, in the **Create Rewrite Policy** dialog box, configure the policy, and then click **Create**.

  For information about modifying a Rewrite policy, see Rewrite.
- In the Goto Expression column, select a Goto expression.
- In the Invoke column, specify the policy bank that you want to invoke if the current policy evaluates to TRUE.

4. Click **Apply Changes**, and then click **Close**.

Configuring responder policies

You can use only Advanced policy policies and expressions to configure Responder policies.

To configure Responder policies for an application unit:

1. Navigate to **AppExpert** > **Applications**.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the Responder column.
3. In the **Configure Responder Policies** dialog box, do one or more of the following, depending on the configuration tasks you want to perform:

   - To modify a Filter policy that is already bound to the application unit, click the name of the policy, and then click **Modify Policy**. Then, in the Configure Responder Policy dialog box, modify the policy, and then click **OK**.

     For information about modifying a Responder policy, see Responder.
   - To unbind a policy, click the name of the policy, and then click **Unbind Policy**.
   - To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
   - To regenerate assigned priorities, click **Regenerate Priorities**.
   - To insert a new policy, click Insert Policy and, in the list that is displayed in the Policy Name column, click New Policy. Then, in the Create Responder Policy dialog box, configure the policy, and then click Create.

     For information about modifying a Responder policy, see Responder.
   - In the Goto Expression column, select a Goto expression.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- In the Invoke column, specify the policy bank that you want to invoke if the current policy evaluates to TRUE.

4. Click **Apply Changes**, and then click **Close**.

Configuring Application Firewall Policies

You can configure both classic and Advanced policy policies and expressions for Application Firewall. However, if a policy of one type is already bound globally or to a virtual server that is configured on the appliance, you cannot bind a policy of the other type to an application unit. For example, if a Advanced policy is already bound either globally or to a virtual server, you cannot bind a classic policy to an application unit.

To configure Application Firewall policies for an application unit:

1. Navigate to **AppExpert** > **Applications**.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the **Application Firewall** column.
3. In the **Configure Application Firewall Policies** dialog box, do one or more of the following, depending on the configuration tasks you want to perform:

   - Click either Classic Expression or Advanced Expression depending on the type of expression you want to configure for the Application Firewall policy.

     Important: This setting also determines what policies are displayed when you want to insert a policy. For example, if you select Advanced Expression, when you click **Insert Policy**, the list that appears in the **Policy Name** column will include only Advanced policy policies. You cannot bind policies of both types to an application unit. This option is not available if a policy of either type is already bound either globally or to a virtual server.
   - To modify an application firewall policy that is already bound to the application unit, click the name of the policy, and then click Modify Policy. Then, in the Configure Application Firewall Policy dialog box, modify the policy, and then click OK.

     For information about modifying a application firewall policy, see Policies.
   - To unbind a policy, click the name of the policy, and then click Unbind Policy.
   - To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
   - To regenerate assigned priorities, click Regenerate Priorities.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- To insert a new policy, click **Insert Policy** and, in the list that is displayed in the **Policy Name** column, click New Policy. Then, in the **Create Application Firewall Policy** dialog box, configure the policy, and then click **Create**.

  For information about modifying a application firewall policy, see Policies.

4. Click **Apply Changes**, and then click **Close**.

Configuring Application Units

To configure an application unit by using the GUI:

1. Navigate to **AppExpert** > **Applications** > **Application Unit** section and then click the plus icon to add a new application unit for a traffic subset.
2. In the **Application Unit** slider, set the following parameters:

   - Name
   - Expression

   You can insert an expression either by adding the expression components manually or by using the Expression Editor link. To manually add an expression, enter a selector component and then type a period (.) to display a list from which you can select the next component. For example, type HTTP and then type a period. A drop-down menu appears. The contents of this menu provide the keywords that can follow the initial keyword that you entered. Select a component from the drop-down menu. The Expression* text box now displays the components that you have added to the expression (for example, HTTP.REQ). Continue adding components until the complete expression is formed.

   If you prefer assistance to form the expression, you can use the Expression Editor link. On the Expression Editor page, you can form an expression by selecting components from the drop-down boxes. Select the components and click Done to insert the expression on the Application Unit page.
3. Click **Continue** to bind services and service groups.
4. Click the **Service** section to select or add a virtual service and bind it to the application unit.
5. Click **Continue** and click the **Service Group** section to select or add a virtual service group and bind it to the application unit.
6. Click **Bind** and **Continue** to configure Advanced Settings (such as Policies, Method, Persistence, Protection, Profiles, Push, Authentication, and Traffic Settings) for the application unit.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

7. Click the **plus** icon in each section to set the configuration parameters.
8. Click **OK** and then **Done**.

To edit an application unit for an application by using the GUI:

Navigate to **AppExpert** > **Applications**, select an application and click **Edit**. In the **Application Unit** section, select an entity, click the edit icon and modify the application unit settings.

Note: You cannot modify the name and rule expression for an existing application unit.

NetScaler's video tutorials enable you to understand NetScaler features in an easy and simple way. Watch `<https://www.youtube.com/watch?v=bJ5_i8fV2hc>` video to learn how configure an application unit.

Configuring Public Endpoints for an application

To configure public endpoints for an application by using the GUI:

1. Navigate to **AppExpert** > **Applications**, select an application entity, and then click **Edit**.
2. In the **Public Endpoint** section, click **+** to configure a new public endpoint.
3. In the **Public Endpoint** slider, do one of the following:
    a. Click **New** to create a new endpoint.
    b. Click **Existing Public Endpoint** to select an endpoint from the drop-down list.
4. Set the following endpoint parameters:
    a. Name
    b. IP address
    c. Protocol
    d. Port
5. Click **Continue** to configure additional settings such as application units, GSLB server bindings, policies, profiles, push, traffic settings, and authentication.
6. Click **OK** and then **Done**.
7. Click **Continue** and then **Done**.

To edit a public endpoint for an application by using the GUI:

Navigate to **AppExpert** > **Applications**, select an application, and click **Edit**. In the **Public Endpoint** section, select an endpoint, click the pen icon, and modify the endpoint settings.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To delete a public endpoint for an application by using the GUI:

Navigate to **AppExpert** > **Applications** > **Public Endpoint,** click the pen icon to view the delete icon next to the entity.

NetScaler's video tutorials enable you to understand NetScaler features in an easy and simply way. Watch `<https://www.youtube.com/watch?v=z4v-edQiVpw>` video to learn how to configure a public endpoint.

Specifying the order of evaluation of application units

Application unit rules are evaluated in the order in which they are placed in the GUI. The rule that is configured for the topmost application unit is always configured first, followed by the rule that is configured for the second topmost application unit, and so on. The default application unit is always evaluated last.

When a request matches the rule that is configured for an application unit, the request is processed by the application unit, and no further matching is performed. Therefore, the order of evaluation of application units becomes an important factor if the traffic subsets for two or more application units overlap. If the traffic subsets for two or more application units overlap, you must specify the order in which an incoming request is matched against the application unit rules.

To specify the order of evaluation of application units:

1. Navigate to **AppExpert** > **Applications**, select an application and click **Edit**. In the **Application Unit** section, click the **Pencil** icon and then hover the cursor over the check box to the left of the name of the application unit. Click the icon that appears next to the check box and hold down the mouse to drag the application up or down to a new location in the priority list.

Configuring persistency groups for application units

You can configure a persistency group for the application units in an AppExpert application. In the context of an AppExpert application, a persistency group is a group of application units that you can treat as a single entity for the purpose of applying common persistence settings. When the application is exported to an application template file, the persistency group settings are included, and they are automatically applied to the application units when you import the AppExpert application.

To configure a persistency group for an application by using the GUI:

1. Navigate to **AppExpert** > **Applications**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. In the **Applications View** dialog box, click the name of the application for whose application units you want to configure a persistency group, and then click Configure **Persistency Groups**.
3. In the **Configure Persistency Groups** dialog box, do one of the following:
   - To add a persistency group, click **Add**.
   - To modify a persistency group, click **Open**.
4. In the **Create Persistency Group** or **Configure Persistency Group** dialog box, set the following parameters:
   - Group Name—Name of the persistency group. For the NetScaler appliance to recognize the persistency group as part of the application's configuration, the name of the AppExpert application must be included in the name of the persistency group, as a prefix. Therefore, by default, the appliance displays the prefix in the Group Name box, and you cannot remove that prefix. Enter a name of your choice after the prefix.
   - Persistence—Type of persistence for the virtual server. If you select SOURCEIP, in the IPv4 Netmask box, enter a network mask that specifies the number of bits that the appliance must consider when creating persistence sessions. If you select COOKIEINSERT, in the Cookie Domain and Cookie Name boxes, specify a domain attribute to send in the Set-Cookie directive, and a name for the cookie, respectively.
   - Timeout—Time period for which a persistence session is in effect.
   - Backup Persistence—Type of backup persistence for the group.
   - Backup Timeout—Time period, in minutes, for which backup persistence is in effect.
   - Application Units—To add an application unit to the persistency group, in the Available Application Units box, click the application unit, and then click Add. To remove an application unit from the persistency group, in the Configured Application Units box, click the application unit, and then click **Remove**.
5. Click **OK**.

Viewing AppExpert applications and configuring entities by using the application visualizer

The Visualizer feature shows you a graphical representation of an application's configuration. It includes the name of the public endpoint, application units assigned to the public endpoint, and the number of policies and services bound to the application. You can use the Visualizer to obtain a visual overview of an AppExpert application’s configuration and configure some of the displayed

© 1997–2026 Citrix Systems, Inc. All rights reserved.

entities. By default, the Visualizer displays application units, services, and monitors for the selected application.

To view an AppExpert application by using the Application Visualizer:

1. Navigate to **AppExpert** > **Applications**, select an application entity, and click **Visualizer**.

Configuring user authentication, authorization, and auditing

You can configure authorization for users and groups to enable then to access an AppExpert application. If the AAA user or group for which you want to configure permissions has not already been created, you can create it from AppExpert and then configure permissions for application access.

To configure AAA users and AAA user groups for an application by using the configuring utility

1. Navigate to **AppExpert** > **Applications**, select an application entity, and then click **Edit**.
2. In the **Advanced Settings** section, click **Authorization**, and configure authorized users and user groups.
3. Click the **AAA** user section to bind authorized users to the application.
4. In the **AAA User** slider, set the parameters .
5. Click **Continue**, and then click **Authorization Policies** in the **Advanced Settings** section.
6. In the **Authorization Policy** slider, bind an authorization policy to the application.
7. Click **Continue**, and then click the **Authorization Group** section in the **Advanced Settings** section.
8. In the **AAA Group Binding** slider, bind an authorization user group to the application.
9. Click **Continue**, and then click **Policies** in the **Advanced Settings** section.
10. In the **Policies** slider, bind an **Audit Syslog** or **Audit NSlog** policy to the application.
11. Click **Continue** and then **Done**.

To edit AAA users and AAA user groups for an application by using the GUI:

Navigate to **AppExpert** > **Applications** > **Advanced Settings** and click **Authorization**. Then click the edit icon and specify values for user or user-group authorization settings.

To delete AAA users and AAA user groups by using the GUI:

Navigate to **AppExpert** > **Applications**, select an application and click **Edit**. In the **Applications** page, click **Advanced Settings** and click **Authorization**. Click the delete icon next to the entity.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Monitoring a NetScaler application

After you customize the AppExpert application, you can view application statistics to make sure that the application and all its entities are working correctly. You can also use the Application Visualizer to monitor statistics associated with certain entities such as policies and virtual servers.

You can also view the hit counters for various entities at regular intervals to make sure that counters are being updated.

View application statistics

In the **Applications** node, you can select an application and view the Statistics page for the application. On the Statistics page, you can monitor the health and states of public endpoints and application units, and view the following statistical information:

- Requests and responses per second for each of the public endpoints and application units.
- Bytes per second, at each endpoint, for incoming and outgoing traffic.
- Application unit hit counters and the number of client and server connections for each application unit.
- Statistics for the services that are bound to the application units.

On the Statistics page, you can also view CPU usage, memory usage, and system logs.

To view statistics for an application:

1. Navigate to **AppExpert** > **Applications**.
2. In the details pane, click the application for which you want to view statistics, and then click **Statistics**.

Monitoring an Application by Using the Application Visualizer

You can use the Application Visualizer to monitor the number of requests received per second at a given point in time by the vservers and the number of hits per second at a given point in time for Rewrite, Responder, and Cache policies.

To view statistical information for vservers, Rewrite policies, Responder policies, and Cache policies in the Visualizer:

1. Navigate to **AppExpert** > **Applications**.
2. In the details pane, select the application for which you want to view statistical information, and then click **Visualizer**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. In the **Application Visualizer** window, do the following:

   - To view the statistics, click **Show Stats**.

     The statistical information is displayed on the respective nodes in the Visualizer. This information is not updated in real time and has to be refreshed manually.

   - To refresh the statistical information, click **Refresh Stats**.

Viewing Hits

The hit counters that are provided for various AppExpert application entities enable you to monitor the functioning of public endpoints and application units. For an application, the Hits dialog box displays the total number of requests received by each configured public endpoint. For an application unit, the Hits dialog box displays the number of requests that the application unit processed from each of the public endpoints and the total hit count.

Deleting an application

If you no longer need an application and its application units, you can delete it. When you delete an AppExpert application, backend services are not deleted, and any public endpoints that the application used become available for use by other applications.

When deleting an application, you are also prompted to specify whether you want to delete any bound policies and actions that are not used elsewhere.

To delete an application unit for an application by using the GUI:

Navigate to **AppExpert** > **Applications**, select an application and click **Edit**. In the **Application Unit** section, click the delete icon next to the entity

Configure application authentication, authorization, and auditing

You can configure Authentication, Authorization, and Auditing (AAA) for the applications that you configure on the appliance. An authentication policy that is configured for an application defines the type of authentication to apply when a user or group attempts to access the application. If external authentication is used, the policy also specifies the external authentication server. Authorization policies configured for an application specify whether a particular user or group can access the application. Auditing policies define the audit log type, the level at which logging is performed, and other audit server settings. Authentication and auditing policies use the classic policy format.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Authentication policies, authorization policies, and auditing policies can be configured in any order. However, before you configure AAA for an application, you must configure a public endpoint for the application.

Configuring authentication for an application involves specifying an authentication FQDN, an authentication virtual server, a server certificate, and authentication and session policies. Authentication policies are automatically bound to the authentication virtual server specified for the application.

To configure authentication for an AppExpert application:

1. Navigate to **AppExpert** > **Applications**.
2. In the details pane, do one of the following:
    a. Click Add to add an authentication for a new application.
    b. Click Edit to modify an existing application.
3. In the **Applications** page, select an Application Unit.
4. In the **Application Unit** slider page, click Authentication from the **Advanced Settings** section.
5. In the **Authentication** section, select the authentication type as follows:
    a. Form based authentication
    b. 401 based authentication
    c. None
6. Click **OK** and then click **Done**.

Configure application authorization

You can configure authorization for users and groups to enable then to access an AppExpert application. If the AAA user or group for which you want to configure permissions has not already been created, you can create it from AppExpert and then configure permissions for application access.

To configure permissions for a AAA user or group to access an AppExpert application:

1. Navigate to **AppExpert** > **Applications**.
2. In the details pane, click the AppExpert application for which you want to configure a user or group access.
3. In the **Applications** page, and then click Authorization. from the **Advanced Settings** section.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. Do one of the following:

   - If the AAA user or group for which you want to configure permissions are already in the Groups/Users tree, drag the user or group from the Groups/Users tree to the Users or Groups node in the application tree. Then, right-click the user or group and click Allow.
   - If the AAA user or group for which you want to configure permissions is not configured on the appliance, in the application tree, right-click Users or Groups, and then click Add. In the Create AAA Group or Create AAA User dialog box, fill in the values, click Create, and then click Close.

     The user or group is created with the permission set to Allow. To change the permission setting, right-click the group or user, and then click the permission setting.

5. Click **Done** and then click **Close**.

Configure application auditing

When you configure auditing policies for an application, you must specify the server to which the log messages must be directed, the format of the messages logged, and the log level. Optionally, you can configure other settings, such as the log facility and date format. Auditing policies are automatically bound to all the AppExpert application's public endpoints.

To configure auditing policies for an application:

1. Navigate to **AppExpert** > **Applications**.
2. In the details pane, click the application for which you want to configure auditing policies.
3. In the Application Unit slider page, click + icon in the **Policies** section to configure the auditing policies.
4. In the **Policies** slider page, select policy type as Syslog auditing or Nslog auditing and click **Continue**.
5. In the Policy binding section, set the following parameters.

   a. Select a policy for binding. If you do not have a policy for binding. click + to create a new policy.

   b. To create a new auditing policy, under Policy Name, click **New Policy,** and then, in the **Policy** page do the following:

      i. In the Name box, type a name for the policy.

      ii. The Name box already contains the string that is required at the beginning of the server name. You cannot modify the string.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

iii. From the Auditing Type list, select the auditing type (either SYSLOG or NSLOG).

iv. If the audit server you want to specify is already listed in the Server list, select the server from the list, and then, if you want to modify the server settings, click Modify. In the Configure Auditing Server dialog box, modify the settings as appropriate, and then click OK. For more information about the settings in the Configure Auditing Server dialog box, see Auditing Authenticated Sessions.

v. If you want to configure a new audit server, click New, and then, in the Create Auditing Server dialog box, type a name for the server, specify the server IP address, port number, and other settings as appropriate. When finished, click **OK**.

vi. Click **Create**.

c. To change the priorities for the new auditing policies you created, under Priority, for each policy for which you want to change the priority, double-click the priority value and type new priority value.

d. To regenerate priorities, click **Regenerate Priorities**.

e. To unbind a policy, click the policy, and then click **Unbind Policy**.

f. To modify a policy, click the policy, and then click **Modify Policy.**

6. Click **Apply Changes,** and then click **Close**.

Disabling AAA for an Application

After you configure AAA for an application, you can disable the AAA configuration for that application. When you disable AAA for an application, the configuration is not lost. You can enable AAA for the application when you want to reapply the configuration.

To enable or disable AAA for an application:

1. Navigate to **AppExpert** > **Applications**.
2. In the details pane, click the application for which you want to enable or disable AAA, and then do one of the following:
3. To disable AAA for the application, click **Turn Off AAA.**
4. To enable AAA for the application, click **Turn On AAA**.

Setting up a custom NetScaler application

If an AppExpert application template is not available for the Web application that you want to manage through the NetScaler appliance, or if available AppExpert application templates do not suit your requirements, you can create an AppExpert application without a template.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To create an AppExpert application without a template, you must first create an application and application units. Then, you configure public endpoints, services, and service groups. Finally, you configure the policies that determine how application traffic is evaluated and processed.

After you create the application and application units and configure policies, you must verify the configuration and test it to make sure that it is working correctly, just as you would when you configure an application by using a prebuilt AppExpert application template. Then, you must monitor the application to make sure that the application and its entities are working correctly.

Creating an application

When you create an AppExpert application, the appliance creates a container to which you can add application units. The default application unit is not created until you create the first application unit.

To create an AppExpert application by using the GUI:

1. Navigate to **AppExpert** > **Applications**.
2. In the details pane, right-click **Applications**, and then click **Add**.
3. In the **Create Application** dialog box, in Name, enter a name for the application, and then click **OK**.

Creating application units

For each subset of traffic associated with your web application, you must create an application unit.

To create an application unit for the AppExpert application by using the GUI:

1. Navigate to **AppExpert** > **Applications**.
2. In the details pane, right-click the application for which you want to add an application unit, and then click **Add**.
3. Click **Create**.

Configuring public endpoints for an AppExpert application

After you have created all the application units that you require, you must configure one or more public endpoints to enable clients to access the web application through the NetScaler appliance.

To configure public endpoints for an AppExpert application by using the GUI:

1. Navigate to **AppExpert** > **Applications**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. In the details pane, right-click the application for which you want to configure public endpoints, and then click **Configure Public Endpoints**.
3. In the Choose Public Endpoints dialog box for the application, do one of the following:
   - If the endpoints you want are listed in the dialog box, click the corresponding check boxes.
   - If you want to specify all the public endpoints, click **Activate All**.
   - If you want to dissociate endpoints from the AppExpert application, clear the corresponding check boxes.
   - If you want to create a new public endpoint, click **Add**. Then, in the Create public endpoint dialog box, configure endpoint settings, and then click **OK**.

     In the **Create public endpoint** dialog box, you can specify only the name, IP address, port, and protocol for the endpoint. You can specify additional endpoint settings after you create the public endpoint. To specify additional endpoint settings, after you create the endpoint, in the Choose Public Endpoints dialog box, click the endpoint, and then click **Open**. Then, in the **Configure Public Endpoint** dialog box, provide additional settings, and then click **OK**.

     For more information about the parameters in the **Create public endpoint** and **Configure Public Endpoint** dialog boxes, see Content Switching.
   - If you want to modify a public endpoint, click the endpoint, and then click **Open**. Then, in the **Configure Public Endpoint** dialog box, modify settings for the endpoint, and then click **OK**.

     For more information about the parameters in the Configure Public Endpoint dialog box, see Content Switching.
4. Click **Close**.

Configuring public endpoints for an application unit

For an application unit, you specify public endpoints in the same way as you would specify public endpoints for an application that is created from an AppExpert application template. For more information about specifying a subset of the endpoints for an application unit, see Configuring Endpoints for an Application Unit.

To configure endpoints for an application unit by using the GUI:

1. Navigate to **AppExpert** > **Applications**.
2. In the details pane, right-click the application unit for which you want to specify public endpoints, and then click **Configure Public Endpoints**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. In the **Choose Public Endpoints** dialog box for the application unit, do one of the following:
    - If you are specifying endpoints for the application unit for the first time, clear the check boxes that correspond to the endpoints that you do not want to be bound to the application unit.
    - If you want to specify endpoints that are listed in the dialog box but not currently bound to the application unit, click the corresponding check boxes.
4. Click **OK**.

Configuring Services and Service Groups for an AppExpert Application

Services and service groups are available for application units only after you configure the services and service groups for the AppExpert application. Therefore, you must configure services and service groups for the AppExpert application before you configure the services for the application units. All the services and service groups that you configure for an AppExpert application must use the same protocol (either HTTP or HTTPS). The procedure for configuring services and service groups for an AppExpert application that is not created from a template is the same as that for an application created from a template.

To configure a service or service group for the AppExpert application by using the GUI:

1. Navigate to **AppExpert** > **Applications**.
2. In the details pane, right-click the application for which you want to configure services or service groups, and then click **Configure Backend Services**.
3. In the Configure Backend Services dialog box, do one of the following:
    - To configure services, click the **Services** tab.
    - To configure service groups, click the **Service Groups** tab.
4. On the **Service** or **Service Groups** tab, do one of the following:
    - If the services or service groups that you want are listed on the tab, click the corresponding check boxes.
    - If you want to specify all the services or service groups, click **Activate All**.
    - If you want to create a new service or service group, click **Add**. Then, in the **Create Service** dialog box or **Create Service Group** dialog box, configure settings for the service or service group, respectively, and then click **Create**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- If you want to modify a service, click the service, and then click Open. Then, in the **Configure Service** dialog box or **Create Service Group** dialog box, configure settings for the service or service group, respectively, and then click **OK**.

For information about the settings in the Create Service, Configure Service, and **Create Service Group** dialog boxes, see Load Balancing.

Configuring services and service groups for an application unit

After you configure services and service groups, you must configure services and service groups for each application unit. However, this step is not necessary if each backend service hosts all the content associated with the web application. You configure services and service groups for an application unit if the content associated with the application unit is hosted on only a subset of the backend servers.

To configure services or service groups for an application unit by using the GUI:

1. Navigate to **AppExpert** > **Applications**.
2. In the details pane, right-click the application unit for which you want to configure a service or service group, and then click **Configure Backend Services**.
3. In the **Configure Backend Services** dialog box, do one of the following:
   - To configure services, click the **Services** tab.
   - To configure service groups, click the **Service Groups** tab.
4. In the **Services** or **Service Groups** tab, do one of the following:
   - Clear the check boxes that correspond to the services or service groups that you do not want configured for the application unit. Make sure that the check boxes that correspond to the services or service groups that you want configured for the application unit are selected. Then, in the Weight column, specify the weight that you want to assign to each configured service.
   - To specify all services or service groups, click **Activate All**.
5. On the **Method** and **Persistence** and **Advanced** tabs, specify the desired parameters.
6. Click **OK**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configuring policies

The procedures for configuring policies for an AppExpert application that is created without using a template are the same as those for an AppExpert application that was created from a template. For more information, see Configuring Policies for Application Units.

NetScaler Gateway applications

When you configure an AppExpert application to manage a web application through the Citrix NetScaler appliance, you also create a set of application units and configure a set of traffic optimization and security policies for each unit. The policies that you configure for each application unit (policies for features such as Compression, Caching, and Rewrite) evaluate traffic that is meant only for that unit. In addition to these policies, you might want to configure Access Gateway policies for the application as a whole to optimize the application traffic when accessed through the Access Gateway. The Access Gateway Applications feature enables you to configure Access Gateway policies (Authorization, Traffic, Clientless Access, and TCP Compression) for an AppExpert application. After you configure NetScaler Gateway policies for AppExpert applications, you can include the policy configuration in the AppExpert application templates that you create.

You can also configure NetScaler Gateway policies for intranet subnets, file shares, and other network resources. Finally, you can create bookmarks for AppExpert applications and certain resources if you want users to be able to access them from the NetScaler Gateway home page.

You can configure the entities in the NetScaler Gateway Applications feature only by using the GUI.

How an NetScaler Gateway application works

When you create an AppExpert application in the Applications node in the GUI, a corresponding Access Gateway application is automatically created in the Access Gateway Applications node. Additionally, a rule that uses the AppExpert application’s configured public endpoint is automatically created for the Access Gateway application entry. If multiple endpoints are configured for the AppExpert application, the rule includes all the configured public endpoints. The NetScaler appliance uses this rule to apply any configured Access Gateway policies to the traffic received at the AppExpert application's public endpoint. Traffic received at the AppExpert application’s public endpoint is first evaluated against the NetScaler Gateway policies and then evaluated against the policies configured for AppExpert application’s application units.

The rule that is created for the Clientless Access policies for an Access Gateway application is an advanced expression that also uses the public endpoint that is configured for the AppExpert

© 1997–2026 Citrix Systems, Inc. All rights reserved.

application. Therefore, before you configure NetScaler Gateway policies for an AppExpert application, you must configure public endpoints for the AppExpert application.

When you include the NetScaler Gateway configuration in an application template, deployment-specific information, such as IP address and port information, and the rule that is created from this information are not included in the template.

How a NetScaler configuration for a file share works

On the NetScaler appliance, you can configure Authorization policies for a file share that is hosted on your organization's network.

When you create a file share, you specify a name for the file share and the network path to the file share. In the network path, you can specify either the name of the server or the server IP address. A rule that uses the components of the file share path is automatically created for the file share. This rule enables the appliance to identify requests for files hosted on the file share server. Any Authorization policies that are configured for the file share are applied to incoming requests.

The NetScaler configuration for a file share cannot be saved in AppExpert application templates.

How a NetScaler configuration for an intranet subnet works

For the intranet subnets that form a part of your network, you can configure policies for Authorization, Traffic, and TCP Compression on the NetScaler appliance. When adding an intranet subnet, you specify the IP address and the netmask of the intranet subnet. A rule that uses these two parameters is automatically created for the intranet subnet. The appliance applies the configured policies to any request that has a destination IP address and netmask set to the subnet's IP address and netmask, respectively.

The NetScaler configuration for an intranet subnet cannot be saved in AppExpert application templates.

How other resources category works

The Other Resources category enables you to configure Access Gateway policies for any network resource by using a rule of your choice. When you configure the NetScaler appliance to process requests for the network resource, you configure a classic expression to identify the requests that are associated with the network resource. You can configure Authorization, Traffic, Clientless Access, and TCP Compression policies for a network resource in Other Resources. The NetScaler appliance applies the configured NetScaler Gateway policies to any requests that match the configured rule.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The NetScaler configuration for a network resource in Other Resources cannot be saved in AppExpert application templates.

Entity naming conventions

The NetScaler Gateway Applications feature enforces a naming convention for some of the entities that you create in this feature. For example, the names of the profiles that you create for Traffic policies for an intranet subnet always begin with a string that consists of the name of the intranet subnet followed by an underscore (_). The name that you provide for the entity is appended to this string. If the name of a subnet is "subnet1," the name of the profile begins with "subnet1_." When such a naming convention is required (in the text box in which you type the name of an entity, for example), the user interface automatically inserts the string with which the name of the entity must begin and does not allow you to modify it.

Adding intranet subnets

You can specify the authorization and traffic policies for traffic that is bound for the intranet subnets that are configured in your network. The rules for these policies are automatically created by using the parameters you specify for the subnet.

To configure an intranet subnet by using the GUI:

1. In the navigation pane of the GUI, expand **AppExpert**, and then click Access Gateway Applications.
2. In the details pane, do one of the following:
   - To add an intranet subnet, click **Intranet Subnets**, and then click **Add**.
   - To modify an intranet subnet, click an intranet subnet, and then click **Open**.
3. In the **Create Intranet Subnet** or **Configure Intranet Subnet** dialog box, do the following:
   a. In the Name box, type a name for the intranet subnet you are adding. This parameter cannot be changed for an existing intranet subnet.
   b. In the IP Address box, type the IP address of the intranet subnet.
   c. In the Netmask box, type the netmask that will be used for the intranet subnet.
   d. Click **Create** or **OK**, and then click **Close**.

Adding other resources

For a network resource that you add to Other Resources, you must configure Advanced policy expression that identifies the subset of traffic associated with the resource.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To configure a resource in other Resources by using the GUI:

1. In the navigation pane of the GUI, expand AppExpert, and then click **Access Gateway Applications**.
2. In the details pane, do one of the following:
   - To add a resource, click **Other Resources**, and then click **Add**.
   - To modify a resource, click a resource, and then click **Open**.
3. In the **Create Resource** or **Configure Resource** dialog box, do the following:
   a. In the Name box, type a name for the resource you are adding. This parameter cannot be changed for an existing resource.
   b. In the Rule box, type the rule that will identify the subset of traffic that is associated with the resource you are adding.

      Alternatively, click **Configure**, and then create the rule in the **Create Expression** dialog box.
   c. Click **Create** or **OK**, and then click **Close**.

Configuring authorization policies

You can configure NetScaler Gateway authorization policies for AAA users and groups to access a resource.

To configure permissions for a AAA user or group to access a resource by using the GUI:

1. In the navigation pane of the GUI, expand AppExpert, and then click **Access Gateway Applications**.
2. In the details pane, in the Authorization column, click the icon for the application, file share, intranet subnet, or resource for which you want to configure authorization policies for AAA users and groups.
3. Do one of the following:
   - If the AAA user or group for which you want to configure permissions is already in the Groups/Users tree, drag the user or group from the Groups/Users tree to the Users or Groups node in the `<application name>` tree. Then, right-click the user or group and click **Allow**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- If the AAA user or group for which you want to configure permissions is not configured on the appliance, in the `<application name>` tree, right-click Users or Groups, and then click **Add**. In the Create **AAA Group** or **Create AAA User** dialog box, fill in the values, click **Create**, and then click **Close**.

  The user or group is created with the permission set to Allow. To change the permission setting, right-click the group or user, and then click the permission setting.

4. Click **Close**.

Configuring traffic policies

The traffic policies that you configure for the resources in the NetScaler Gateway Applications node control client connections to the application. You do not have to configure a rule for the resource. The rule created automatically when you create the resource. You only need to associate a request profile with the traffic policy. In the traffic profile, you specify parameters such as the protocol, application time-out, and file type association.

To configure traffic policies for a resource

1. In the navigation pane of the GUI, expand AppExpert, and then click Access Gateway Applications.
2. In the details pane, in the Traffic column, click the icon provided for the application, file share, intranet subnet, or resource for which you want to configure traffic policies.
3. In the **Configure Traffic Policies** dialog box, do the following:

   - To specify an existing traffic policy, click **Insert Policy**, and then, in the Policy Name column, click the name of the policy.
   - To configure a new policy, click Insert Policy, and then, in the Policy Name column, click New Policy. In the Create Traffic Policy dialog box, in the Name box, after the underscore (_), type a name for the policy. Then, in Request Profile, either select an existing request profile or click New to configure a new request profile. You can also select an existing profile and then click Modify to modify the profile.

     For more information about configuring a traffic policy or profile, see NetScaler Gateway.
   - To modify a policy that you have inserted, in the Policy Name column, click the policy name, and then click Modify Policy. To modify only the associated profile, in the Profile column, click the name of the profile, and then click **Modify Profile**.
   - To regenerate the priorities assigned to the policies, click **Regenerate Priorities**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- To specify a new priority value for a policy, in the Priority column, double-click the assigned priority, and then enter the value you want.
- To unbind a policy, click the policy, and then click **Unbind Policy**.

4. Click **Apply Changes**, and then click **Close**.

Configuring clientless access policies

Clientless access, when configured for a resource on the NetScaler appliance, allows end-users to access the resource without using the NetScaler Gateway client software. Users can use web browsers to access resources such as Outlook Web Access. You configure clientless access for a resource by configuring a clientless access policy that is associated with a clientless access profile.

To configure a clientless access policy for a resource in the NetScaler Gateway Applications node:

1. In the navigation pane of the GUI, expand **AppExpert**, and then click **Access Gateway Applications**.
2. In the details pane, in the **Clientless Access** column, click the icon for the application, file share, intranet subnet, or resource for which you want to configure a clientless access policy.
3. In the **Configure Clientless Access Policies** dialog box, do the following:

   - To specify an existing clientless access policy, click **Insert Policy**, and then, in the **Policy Name** column, click the name of the policy.
   - To configure a new clientless access policy, click **Insert Policy**, and then, in the **Policy Name** column, click **New Policy**. In the **Create Clientless Access Policy** dialog box, in the Name box, after the underscore (_), type a name for the policy. Then, in Profile, either select an existing profile or click New to configure a new profile. You can also select an existing profile and then click **Modify** to modify the profile.

     For more information about configuring a clientless access policy or profile, see NetScaler Gateway.
   - To modify a policy that you have inserted, in the Policy Name column, click the policy name, and then click **Modify Policy**. To modify only the associated profile, in the Profile column, click the name of the profile, and then click Modify Profile.
   - To specify a new priority value for a policy, in the Priority column, double-click the assigned priority, and then enter the value you want.
   - To unbind a policy, click the policy, and then click **Unbind Policy**.

4. Click **Apply Changes**, and then click **Close**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configuring TCP compression policies

You can configure TCP compression policies for an application to increase the performance of the application. TCP compression reduces network latency, reduces bandwidth requirements, and increases the speed of transmission. When configuring a TCP compression policy, you associate a compression action with the policy. The compression action specifies either Compress, GZIP, Deflate, or NoCompress as the compression type. For more information about the compression policies, and compression actions, see NetScaler Gateway.

To configure a TCP compression policy for a resource in the NetScaler Gateway Applications node

1. In the navigation pane of the GUI, expand **AppExpert**, and then click **Access Gateway Applications**.
2. In the details pane, in the TCP Compression column, click the icon for the application, file share, intranet subnet, or resource for which you want to configure a TCP compression policy.
3. In the **Configure TCP Compression Policies** dialog box, do the following:

    - To specify an existing TCP compression policy, click **Insert Policy**, and then, in the **Policy Name** column, click the name of the policy.
    - To create a new TCP compression policy, click Insert Policy, and then, in the Policy Name column, click New Policy. In the Create TCP Compression Policy dialog box, in the Policy Name box, after the underscore ("_"), type a name for the policy. Then, in Action, either select an existing action or click New and configure a new action. You can also click View to view the configured compression type.

      For more information about configuring a TCP compression policy or action, see NetScaler Gateway , Advanced Edition at NetScaler Gateway.
    - To modify a policy that you have inserted, in the Policy Name column, click the policy name, and then click **Modify Policy**.
    - To regenerate the priorities assigned to the policies, click **Regenerate Priorities**.
    - To specify a new priority value for a policy, in the Priority column, double-click the assigned priority, and then enter the value you want.
    - To unbind a policy, click the policy, and then click **Unbind Policy**.
4. Click **Apply Changes,** and then click **Close**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure bookmarks

You can configure bookmarks for internal applications or resources that are available for an entitled user. You can then bind the bookmark to a user, user group or virtual server globally and enable it for the user in the Access Interface. The bookmark links that you create appear on the web sites panes under enterprise web sites.

For more information, see Creating and Applying Web Links topic.

AppQoE

Application level Quality of Experience (AppQoE) integrates several existing policy-based security features of the NetScaler appliance into a single integrated feature that takes advantage of a new queuing mechanism, fair queuing. Fair queuing manages requests to load-balanced web servers and applications at the virtual server level instead of at the service level, allowing it to handle the queuing of all requests to a website or application as one group before load balancing, instead of as separate streams after load balancing.

- **Simple overload.** Any server, no matter how robust, can accept only a limited number of connections at one time. When a protected website or application receives too many requests at once, the Surge Protection feature detects the overload and queues the excess connections til the server can accept them. The AppQoE feature displays an alternate webpage that notifies users that the resource that they requested is not available.
- **Denial-of-Service (DOS) attacks.** Any public-facing resource is vulnerable to attacks whose purpose is to bring that service down and deny legitimate users access to it. The Surge Protection feature help manage DOS attacks in addition to other types of high load. In addition, the HTTP Denial-of-Service Protection feature targets DOS attacks against your websites, sending challenges to suspected attackers and dropping connections if the clients do not send an appropriate response.

Until the current version of the NetScaler operating system, these features were implemented at the service level, which means that each service was assigned its own queues. While service-level queues work, they also have some disadvantages, most of which are due to the NetScaler appliance having to load balance requests before implementing any of the protection features that rely on queuing. Implementing protection features before queuing has various advantages, some of which are listed below:

- Connections are not flushed if a service transitions state, as they are in a service-level queue.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- During periods of high load, such as a denial-of-service attack, and HTTP DoS come into play before load balancing, allowing these features to detect and divert unwanted or lower-priority traffic from the load balancer before the load balancer must cope with it.

In addition to implementing fair queuing, AppQoE integrates a set of features that each provide a different set of tools to achieve a common goal: protecting your networked resources from excessive or inappropriate demand. Putting these features into a common framework enables you to configure and implement them more easily.

Enabling AppQoE

To configure AppQoE, you must first enable the feature.

To enable AppQoE by using the command line

At the command prompt, type the following commands:

- enable ns feature appqoe
- show ns feature

Example:

```
> enable ns feature appqoe
 Done
> show ns feature

        Feature                         Acronym             Status
        -------                         -------             ------
 1)     Web Logging                     WL                  ON
 2)     Surge Protection                SP                  ON
 3)     Load Balancing                  LB                  ON
 ...
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
1)     AppQoE                          AppQoE              ON

Done
```

To enable AppQoE by using the GUI

1. Navigate to **System** > **Settings**.
2. In the details pane, click **Configure Advanced Features**.
3. In the **Configure Advanced Features** dialog box, select the **AppQoE** check box.
4. Click **OK**.

AppQoE actions

After enabling the AppQoE feature, you must configure one or more actions for handling request.

IMPORTANT:

No specific individual parameters are required to create an action, but you must include at least one parameter or you cannot create the action.

To configure an AppQoE action by using the command line

At the command prompt, type the following commands:

- `add appqoe action <name> [-priority <priority>] [-respondWith (ACS|NS) [<customfile>] [-altContentSvcName <string>] [-altContentPath <string>] [-maxConn <positive_integer>] [-delay <usecs>] [-polqDepth <positive_integer>] [-priqDepth <positive_integer>] [-dosTrigExpression <expression>] [-dosAction (**SimpleResponse** | **HICResponse**)]`
- `show appqoe action`

Example

To configure priority queuing with policy queue depths of 10 and 1000 for medium and lowest priority queues, respectively:

```
> add appqoe action appqoe-act-basic-prhigh -priority HIGH

 Done
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
> add appqoe action appqoe-act-basic-prmedium -priority MEDIUM -polqDepth
10

 Done

> add appqoe action appqoe-act-basic-prlow -priority LOW -polqDepth 1000

 Done

> show appqoe action

1.       Name: appqoe-act-basic-prhigh

        ActionType: PRIORITY_QUEUING

        Priority: HIGH

        PolicyQdepth: 0

        Qdepth: 0

1.      Name: appqoe-act-basic-prmedium

        ActionType: PRIORITY_QUEUING

        Priority: MEDIUM

        PolicyQdepth: 10

        Qdepth: 0
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
1.      Name: appqoe-act-basic-prlow

        ActionType: PRIORITY_QUEUING

        Priority: LOW

        PolicyQdepth: 1000

        Qdepth: 0

Done
```

To modify an existing AppQoE action by using the command line

At the command prompt, type the following commands:

- `set appqoe action <name> [-priority <priority>] [-altContentSvcName <string>] [-altContentPath <string>] [-polqDepth <positive_integer>] [-priqDepth <positive_integer>] [-maxConn <positive_integer>] [-delay <usecs>] [-dosTrigExpression <expression>] [-dosAction ( SimpleResponse | HICResponse )]`
- `show appqoe action`

To remove an AppQoE action by using the command line

At the command prompt, type the following commands:

- `rm appqoe action <name>`
- `show appqoe action`

Parameters for configuring an AppQoE action

- name. A name for the new action, or the name of the existing action that you want to modify. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols.
- priority. The priority queue to which the request is assigned. When a protected web server or application is heavily loaded and cannot accept additional requests, specifies the order in which waiting requests are to be fulfilled when resources are available. The choices are:

1. **HIGH.** Fulfills the request as soon as resources are available.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. **MEDIUM.** Fulfills the request after it has fulfilled all requests in the HIGH priority queue.
3. **LOW.** Fulfills the request after it has fulfilled all requests in the HIGH and MEDIUM priority queues.
4. **LOWEST.** Fulfills the request only after it has fulfilled all requests in higher-priority queues.

If priority is not configured, then the NetScaler appliance assigns the request to the LOWEST priority queue by default.

- respondWith. Configures the NetScaler to take the specified Responder action when the specified threshold is reached. Must be used with one of the following settings:
  - **ACS:** Serves content from an alternate content service. Threshold: maxConn (maximum connections) or delay.
  - **NS:** Serves a built-in response from the NetScaler. Threshold: maxConn (maximum connections) or delay.
  - **NO ACTION:** Serves no alternative content. Assigns connections to the LOWEST priority queue if the maxConn (maximum connections) or delay threshold is reached.
- altContentSvcName. If -responseWith ACS is specified, the name of the alternative content service, usually an absolute URL to the web server that hosts the alternate content.
- altContentPath. If -responseWith (ACS | NS) is specified, the path to the alternative content.
- olqDepth. Policy queue depth threshold value for the policy queue associated with this action. When the number of connections in the policy queue associated with this action increases to the specified number, subsequent requests are assigned to the LOWEST policy queue. Minimum value: 1 Maximum value: 4,294,967,294
- priqDepth. Policy queue depth threshold value for the specified priority queue. If the number of requests in the specified queue on the virtual server to which the policy associated with the current action is bound increases to the specified number, subsequent requests are assigned to the LOWEST priority queue. Minimum value: 1 Maximum value: 4,294,967,294
- maxConn. The maximum number of connections that can be open for requests that match the policy rule. Minimum value: 1 Maximum value: 4,294,967,294
- delay. The delay threshold, in microseconds, for requests that match the policy rule. If a matching request has been delayed for longer than the threshold, the NetScaler appliance performs the specified action. If NO ACTION is specified, then the appliance assigns requests to the LOWEST priority queue. Minimum value: 1 Maximum value: 599999,999
- dosTrigExpression. Adds an optional second-level check to trigger DoS actions.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- dosAction. Action to take when the appliance determines that it or a protected server is under DoS attack. Possible values: SimpleResponse, HICResponse.

These values specify HTTP challenge-response methods for validating the authenticity of incoming requests to mitigate an HTTP-DDoS attack.

In the HTTP challenge-response generation and validation process, AppQoE uses cookies to validate the client's response and verify that the client seems to be genuine. When sending a challenge, a NetScaler appliance generates two cookies:

Header cookie (_DOSQ). Contains client-specific information, so that the NetScaler appliance can verify the response.

Body cookie (_DOSH). Information used to validate the client machine. The client's browser (or the user, in the case of HIC) computes a value for this cookie. The NetScaler appliance compares that value with the expected value to verify the client.

The information that the appliance sends to the client for computing the _DOSH value is based on the DoS Action configuration.

1. SimpleResponse: In this case, a NetScaler appliance splits the value and generates a JavaScript code to combine the final value. A client machine capable of computing the original value is considered genuine.
2. HICResponse: in this case, a NetScaler appliance generates two single-digit numbers and generates images for those numbers. Then, using a backpatch framework, the appliance inserts those images as base64 strings.

Limitations

1. This is not a trivial CAPTCHA implementation, which is why that term not used.
2. The validation number is based on a NetScaler-generated number that does not change for 120s. This number should be dynamic or client specific.

To configure an AppQoE action by using the configuration utility

1. Navigate to **App-Expert** > **AppQoE** > **Actions**.
2. In the details pane, do one of the following:
   - To create a new action, click **Add**.
   - To modify an existing action, select the action, and then click **Edit**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. In the **Create AppQoE Action** or the **Configure AppQoE Action** screen, type or select values for the parameters. The contents of the dialog box correspond to the parameters described in "Parameters for configuring the AppQoE Action" as follows (asterisk indicates a required parameter):

   - Name—name
   - Action type—respondWith
   - Priority—priority
   - Policy Queue Depth—polqDepth
   - Queue Depth—priqDepth
   - DOS Action—dosAction

4. Click **Create** or **OK**.

AppQoE parameters

In the AppQoE parameters, you configure the session life of an AppQoE session, the file name of the file containing the customized response, and the number of client connections that can be placed in a queue.

To configure the AppQoE parameter settings by using the command line

At the command prompt, type the following commands:

- `set appqoe parameter [-sessionLife <secs>] [-avgwaitingclient <positive_integer>] [-MaxAltRespBandWidth <positive_integer>] [-dosAttackThresh <positive_integer>]`
- `show appqoe parameter`

Parameters for configuring the AppQoE parameters

- sessionLife

  Number of seconds to wait after displaying alternate content before the appliance displays the same content again. Default value: 300 Maximum Minimum value: 1 Maximum value: 4,294,967,294

- avgwaitingclient

  The average number of client requests that can be in the service waiting queue. Default value: 1000000 Maximum value: 4,294,967,294

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- MaxAltRespBandWidth

  The maximum bandwidth to consume when sending alternate responses. If the maximum is reached, the appliance quits sending the alternate content til bandwidth consumption drops. Default value: 100 Minimum value: 1 Maximum value: 4,294,967,294

- dosAtckThrsh

  The denial-of-service attack threshold. The number of connections that must be waiting in queues before the appliance responds with DoS protection measures. Default value: 2000 Minimum value: 0 Maximum value: 4,294,967,294

To configure the AppQoE parameter settings by using the GUI

1. Navigate to **AppExpert** > **AppQoE**.
2. In the details pane, click **Configure AppQoE Parameters**.
3. In the **Configure AppQoE params** screen, type or select values for the parameters. The contents of the dialog box correspond to the parameters described in "Parameters for configuring the AppQoE Parameters" as follows (asterisk indicates a required parameter):
   - Session Life (secs)
   - sessionLife
   - Average waiting client—avgwaitingclient
   - Alternate Response Bandwidth Limit(Mbps) —MaxAltRespBandWidth
   - DOS Attack Threshold —dosAttackThresh
4. Click **OK**.

AppQoE policies

To implement AppQoE, you must configure at least one policy to tell your NetScaler how to distinguish the connections to be queued in a specific queue.

To configure an AppQoE policy by using the command line

At the command prompt, type the following command:

```
add appqoe policy <name> -rule <expression> -action <string>
```

Example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The following example selects requests with a User-Agent header that contains "Android," and assigns them to the medium priority queue. These requests come from smartphones and tablets that run the Google Android operating system.

```
> add appqoe action appqoe-act-primd -priority MEDIUM

Done

> add appqoe policy appqoe-pol-primd -rule "HTTP.REQ.HEADER("User-
Agent").CONTAINS("Android")" -action appqoe-act-primd

Done

> sh appqoe policy appqoe-pol-primd

        Name: appqoe-pol-primd

        Rule: HTTP.REQ.HEADER("User-Agent").CONTAINS("Android")

        Action: appqoe-act-primd

        Hits: 0

Done
```

Parameters for configuring an AppQoE policy

- name. A name for the AppQoE policy. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 127 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols. You should chose a name that helps identify the type of action.
- rule. A NetScaler expression that tells the appliance which connections it should handle.
- action. The AppQoE action to perform when a connection matches the policy.

To configure an AppQoE policy by using the configuration utility

1. Navigate to **App-Expert** > **AppQoE** > **Policies**.
2. In the details pane, do one of the following:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- To create a policy, click **Add**.
- To modify an existing policy, select the policy, and then click **Edit**.

3. If you are creating a policy, in the **Create AppQoE Policy** dialog, in the Name text box, type a name for your new policy.

   The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 127 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols. You should chose a name that helps identify the purpose and effect of this policy.

   If you are modifying an existing policy, skip this step. You cannot change the name of an existing policy.

4. In the **Action** drop-down list, choose the AppQoE action to perform when the policy matches a connection. Click the plus (+) to open the **Add AppQoE Action** dialog and add a new action.
5. In the **Rule** text box, either enter the policy expression directly, or click New to create a policy expression. If you click New, perform the following steps:

   a. In the **Create Expression** dialog box, click **Add**. 1 In the **Add Expression** dialog box, select a common expression from the **Frequently Used Expressions** drop-down list, or use the **Construct Expression** drop-down lists to create the expression that defines which traffic to filter. If you choose to create your own expression, you start by selecting the first term from the first drop-down list on the left side of the Construct Expression area. The choices in that list are:

- HTTP
- SYS
- CLIENT
- SERVER
- ANALYTICS
- TEXT

The default choice is HTTP. After you make a choice in the first drop-down list (or accept the default), you can choose the next term in your expression from the drop-down list to the right of it. The terms in that list and other lists that follow change depending on your previous choices. The lists offer only terms that are valid choices. Continue to select terms until you have finished the expression.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

a. When you have created the expression that you want, click **OK**. The expression is added in the **Expression** text box.

6. Click **Create**. The expression appears in the **Rule** text box.

Entity template for load balancing virtual server

WARNING

The entity template functionality is deprecated from NetScaler 13.0 build 82.x onwards and as an alternative Citrix recommends you to use the Style Books. For more information, see Style Books topic.

An entity template is a collection of information for creating a load balancing virtual server template on a NetScaler appliance. It provides a specification and a set of defaults to be configured for a load balancing virtual server. By using a template that defines a set of defaults, you can quickly configure multiple virtual servers that require a similar configuration while eliminating several configuration steps.

You can create an entity template by exporting the load balancing virtual server details to a template file. This can done only through the NetScaler GUI. You use the NetScaler GUI to export, import, and manage entity templates. You can share entity templates with other administrators and manage templates saved locally on your appliance or machine. You can also import entity templates from the appliance or your local computer.

Before creating a template, you should be familiar with the configuration of the load balancing virtual server.

Load balancing virtual server template

Load balancing entity templates are created in the same way that NetScaler application templates are created. When you export a load balancing virtual server to a template file, the following two files are automatically created:

- Load balancing virtual server template file. Contains XML elements that store the values of the parameters that are configured for the load balancing virtual server. The file also contains XML elements for storing information about bound policies.
- Deployment file. Contains XML elements that store deployment-specific information such as services, service groups, and configured variables. In the template and deployment files, each

© 1997–2026 Citrix Systems, Inc. All rights reserved.

unit of configuration information is encapsulated in a specific XML element that is meant for that unit type. For example, the load balancing method parameter, lbMethod, is encapsulated within the `<lbmethod>` and `</lbmethod>` tags.

NOTE:

After you export a load balancing virtual server, you can add elements, remove elements, and modify existing elements before importing the configuration information to a NetScaler appliance.

How a load balancing virtual server template works

When you create a template for a load balancing virtual server, you specify default values for the server. You specify what values must be read-only, what values must not be displayed, and what values users can configure. You also configure the pages that compose the template import wizard. All the information and settings you provide are stored in the template file. When a user imports the template to a NetScaler appliance, the GUI guides the user through the various pages that you configured for the template. The GUI displays the read-only parameter values and prompts the user to specify values for the configurable parameters. After the user follows the instructions, the appliance creates the entity with the configured values. You can create or modify an entity template for a load balancing virtual server from the Traffic Management node. To export virtual server details to a template, you must specify the following options and settings for the template:

- The default value of a parameter.
- Whether the default values are visible to users.
- Whether the default values can be changed by users.
- The number of pages in the entity import wizard, including the page names, text, and available parameters.
- The entities that must be bound to the entity for which the template is being created.

For example, when you are creating a load balancing virtual server template, you can specify the policies that you want to bind to the virtual server that you create from the template. However, only binding information is included in the template. The bound entities are not included. If the entity template is imported to another NetScaler appliance, the bound entities must exist on the appliance at import time for the binding to succeed. If none of the bound entities exist on the target appliance, the entity (for which the template was configured) is created without any bindings. If only a subset of the bound entities exist on the target appliance, they are bound to the entity that is

© 1997–2026 Citrix Systems, Inc. All rights reserved.

created from the template. When you export a template for the load balancing virtual server, the configuration settings of the entity appear in the template. All bound entities are selected by default, but you can modify bindings as necessary. As in the case of a template that is not based on an existing entity, only binding information is included and not the entities. You can either save the template with the existing configuration settings or use the settings as a basis for creating a new configuration for a template.

Configure variables in load balancing virtual server template

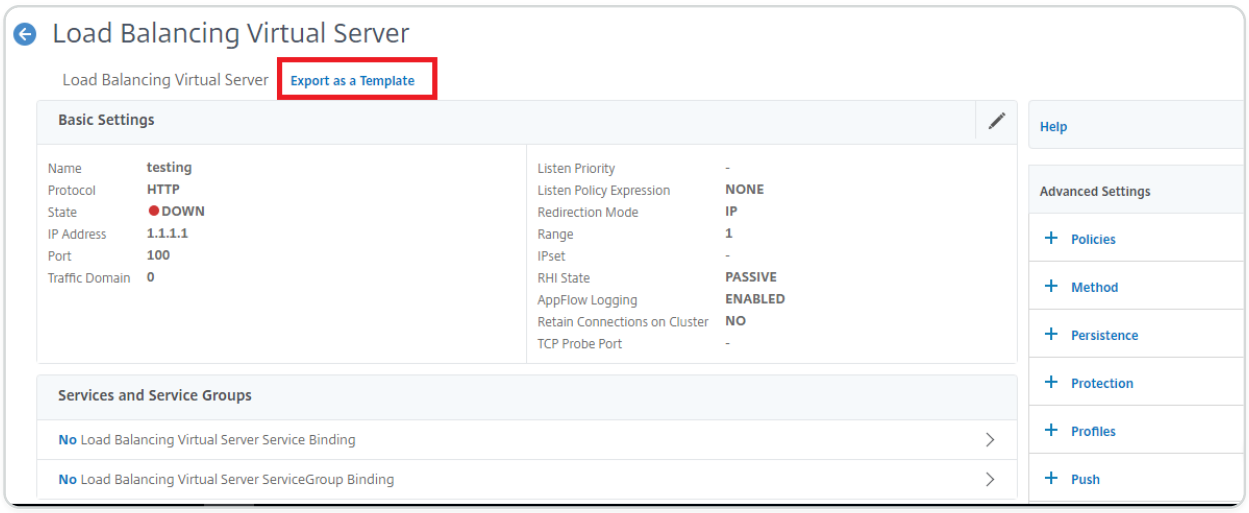
Load balancing virtual server templates support the declaration of variables in the configured load balancing parameters and in bound policies and actions. The ability to declare variables enables you to replace preconfigured values with values that suit the environment into which you are importing the template.

As an example, consider the following expression configured for a policy that is bound to a load balancing virtual server for which you are creating a template. The expression evaluates the value of the accept-language header in an HTTP request. `HTTP.REQ.HEADER("Accept-Language").CONTAINS("en-us")`

If you want the value of the header to be configurable at import time, you can specify the string en-us as a variable.

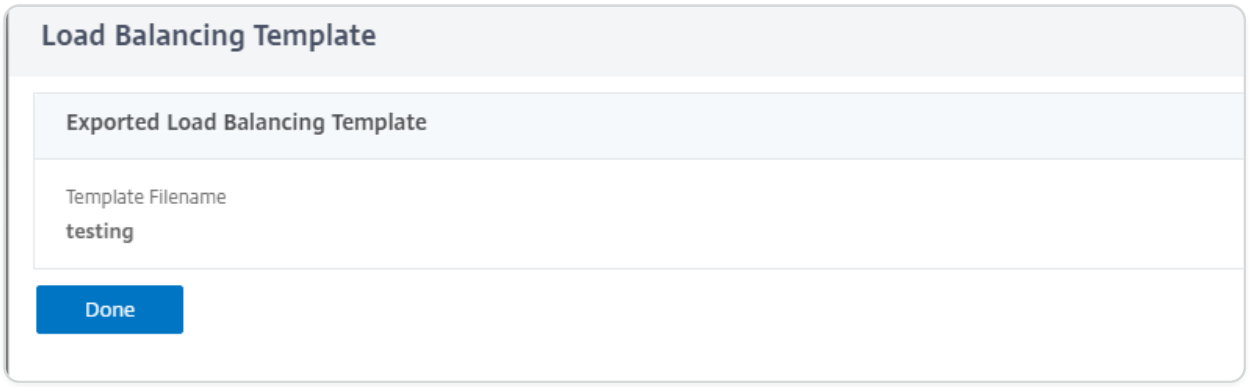
After you create a variable, you can do the following:

- Assign more strings to an existing variable. After you create a variable for a string, you can select and assign other parts of the same or different expression to the variable. The strings you assign to a variable need not be the same. At import time, all the strings that are assigned to the variable are replaced with the value that you provide.
- View the string or strings that are assigned to the variable.
- View a list of all the entities and parameters that use the variable



To configure variables in a load balancing virtual server template

Complete the following procedure to configure variables for a load balancing virtual server template by using the NetScaler GUI



1. Navigate to **Traffic Management** > **Load Balancing** > **Virtual Servers**
2. In the details pane, right-click the virtual server that you want to export to a template file, and then click **Add**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. In the **Create Load balancing Virtual Server** page, set the virtual server parameters. For more information on configuring a load balancing virtual server, see How load balancing works
4. Once you have the set the parameters for the load balancing virtual server, click **Done**.

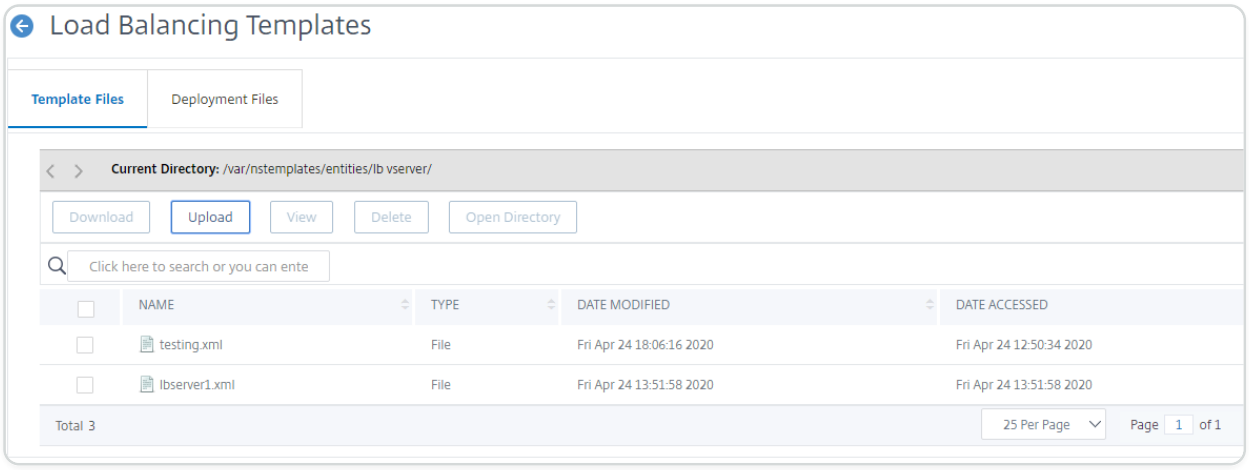
5. Click **Export as Template** link at the top to export the server details as a template file.
6. In the **Create Load Balancing Template** page, enter the template settings.
7. Click **Done**.

Modify a load balancing virtual server template

You can modify only the parameters, bindings, and pages configured for a template. The name and location of the template specified when the template was created cannot be changed. The NetScaler appliance does not provide you with the option of modifying a load balancing virtual server template.

To modify a load balancing virtual server by using NetScaler GUI

1. Navigate to **Traffic Management** > **Load balancing** > **Virtual Servers**.
2. In the **Load Balancing Virtual Server** page, modify the entity parameters.
3. Click Done.



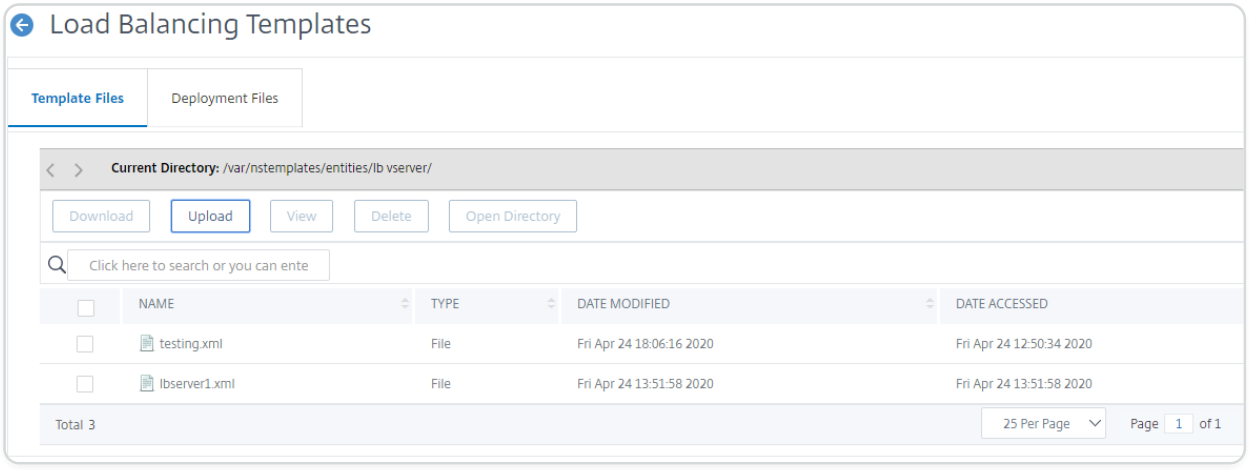
© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. Click **Export as a Template** link.
5. The modified changes are now available in the load balancing virtual server template file.
6. In the **Exported Load Balancing Template** page, click **Done**.

Manage load balancing virtual server templates

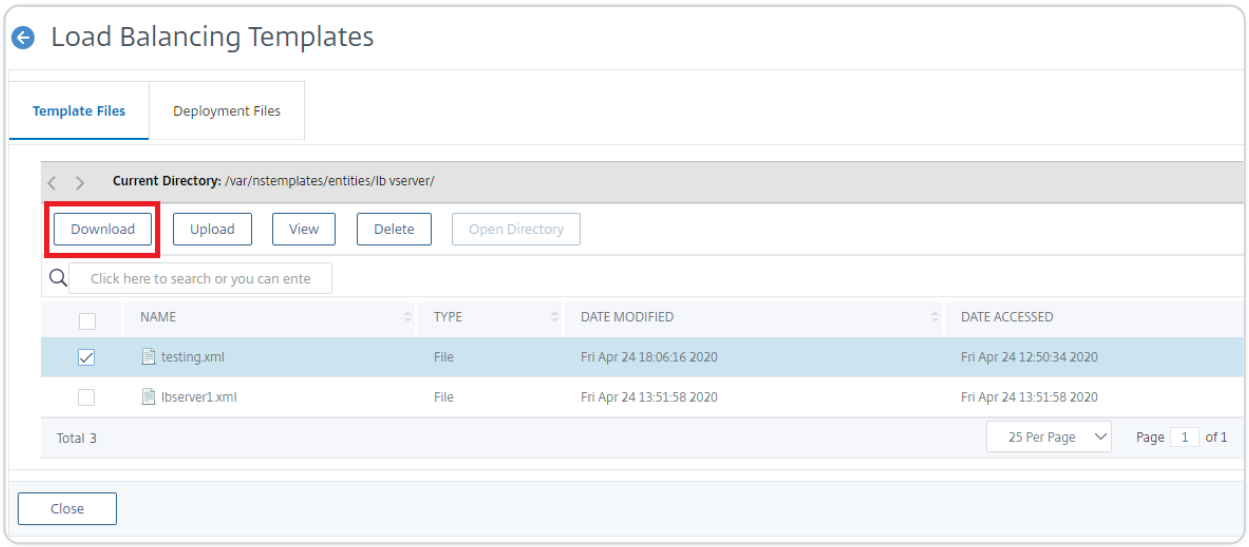
You can organize load balancing virtual server template files and deployment files by using the NetScaler GUI.

1. Navigate to **Traffic Management** > **Load Balancing** > **Virtual Servers**.
2. In the **Virtual Servers** page, select **Manage Template action**.
3. In the **Load Balancing Templates** page, click **Template File** tab.
4. In the **Template Files** tab page, you can upload or download a template from and to the appliance template folder.



5. Click **Close**.

To upload load balancing virtual server entity template by using NetScaler GUI



1. Navigate to **Traffic Management** > **Load Balancing** > **Virtual Servers**.
2. In the **Virtual Servers** page, click **Select Action** and then select **Manage Template**.
3. In the Load Balancing Templates page, click **Template Files** tab.
4. In the **Template Files** tab page, click **Upload** to upload a template.
5. Click **Close**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To download load balancing virtual server entity template by using NetScaler GUI

1. Navigate to **Traffic Management** > **Load Balancing** > **Virtual Servers**.
2. In the **Virtual Servers** page, click **Select Action** and then select **Manage Template**.
3. In the **Load Balancing Templates** page, click **Template Files** tab.
4. In the Template Files tab page, select a template file and click Download.
5. Click Close.

Example of load balancing virtual server template and deployment template

Following is an example of a template file that was created from a load balancing virtual server called “Lbvip":

```
COPY

<?xml version="1.0" encoding="UTF-8" ?>
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
<template>
  <template_info>

HTTP callouts

For certain types of requests, or when certain criteria are met during policy evaluation, you might want to stall policy evaluation briefly, retrieve information from a server, and then perform a specific action that depends on the information that is retrieved. At other times, when you receive certain types of requests, you might want to update a database or the content hosted on a Web server. HTTP callouts enable you to perform all these tasks.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

An HTTP callout is an HTTP or HTTPS request that the NetScaler appliance generates and sends to an external application when certain criteria are met during policy evaluation. The information that is retrieved from the server can be analyzed by Advanced policy expressions, and an appropriate action can be performed. You can configure HTTP callouts for HTTP content switching, TCP content switching, rewrite, responder, and for the token-based method of load balancing.

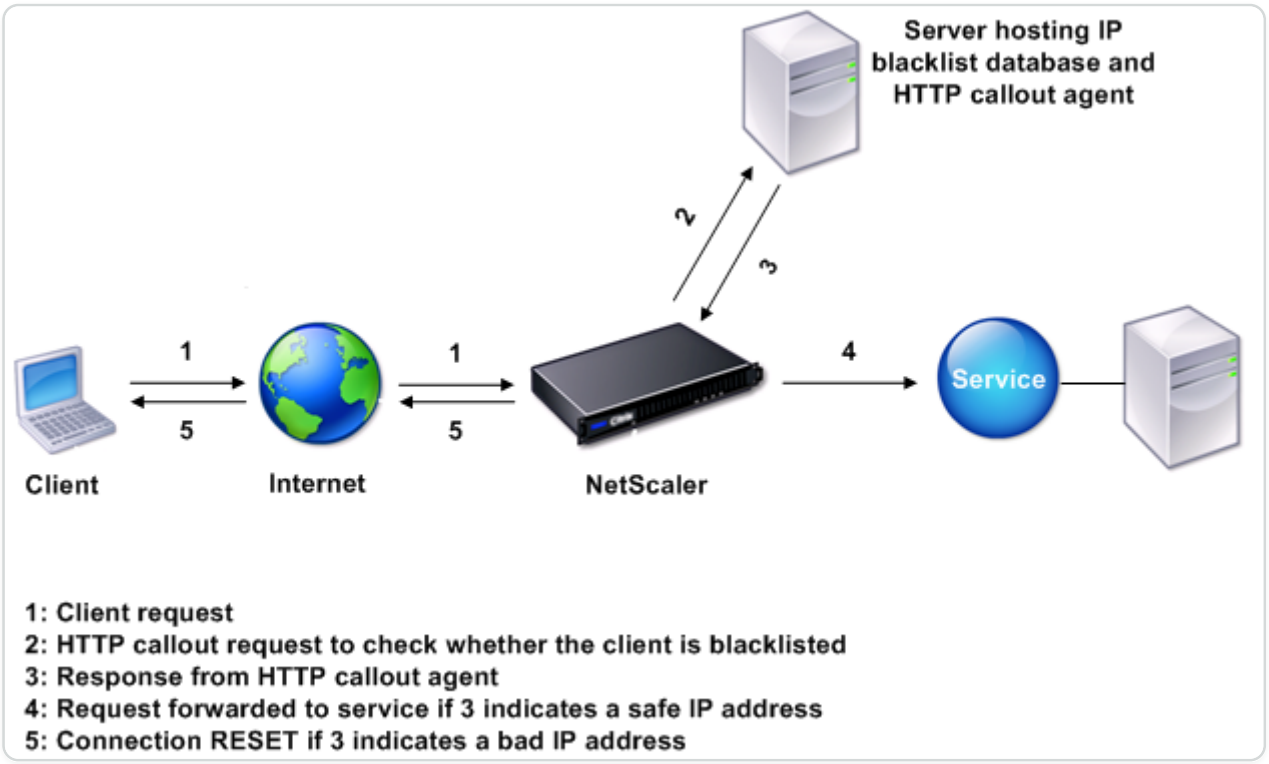
Before you configure an HTTP callout, you must set up an application on the server to which the callout will be sent. The application, which is called the *HTTP callout agent* , must be configured to respond to the HTTP callout request with the required information. The HTTP callout agent can also be a Web server that serves the data for which the NetScaler appliance sends the callout. You must make sure that the format of the response to an HTTP callout does not change from one invocation to another.

After you set up the HTTP callout agent, you configure the HTTP callout on the NetScaler appliance. Finally, to invoke the callout, you include the callout in a Advanced policy in the appropriate NetScaler feature and then bind the policy to the bind point at which you want the policy to be evaluated.

After you have configured the HTTP callout, you must verify the configuration to make sure that the callout is working correctly.

How an HTTP callout works

When the NetScaler appliance receives a client request, the appliance evaluates the request against the policies bound to various bind points. During this evaluation, if the appliance encounters the HTTP callout expression, `SYS.HTTP_CALLOUT(<name>)`, it stalls policy evaluation briefly and sends a request to the HTTP callout agent by using the parameters configured for the specified HTTP callout. Upon receiving the response, the appliance inspects the specified portion of the response, and then either performs an action or evaluates the next policy, depending on whether the evaluation of the response from the HTTP callout agent evaluates to TRUE or FALSE, respectively. For example, if the HTTP callout is included in a responder policy, if the evaluation of the response evaluates to TRUE, the appliance performs the action associated with the responder policy.



If the HTTP callout configuration is incorrect or incomplete, or if the callout invokes itself recursively, the appliance raises an UNDEF condition, and updates the undefined hits counter.

The following figure illustrates the working of an HTTP callout that is invoked from a globally bound responder policy. The HTTP callout is configured to include the IP address of the client that is associated with an incoming request. When the NetScaler appliance receives a request from a

© 1997–2026 Citrix Systems, Inc. All rights reserved.

client, the appliance generates the callout request and sends it to the callout server, which hosts a database of blacklisted IP addresses and an HTTP callout agent that checks whether the client's IP address is listed in the database. The HTTP callout agent receives the callout request, checks whether the client's IP address is listed, and sends a response that the NetScaler appliance evaluates. If the response indicates that the client's IP address is not blacklisted, the appliance forwards the response to the configured service. If the client's IP address is blacklisted, the appliance resets the client connection

Figure 1. HTTP Callout Entity Model

Notes on the format of HTTP requests and responses

The NetScaler appliance does not check for the validity of the HTTP callout request. Therefore, before you configure HTTP callouts, you must know the format of an HTTP request. You must also know the format of an HTTP response, because configuring an HTTP callout involves configuring expressions that evaluate the response from the HTTP callout agent.

This section includes the following sections:

- Format of an HTTP Request
- Format of an HTTP Response

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Format of an HTTP Request

An HTTP request contains a series of lines that each end with a carriage return and a line feed, represented as either `<CR><LF> or \r\n`.

The first line of a request (the *message line*) contains the HTTP method and target. For example, a message line for a GET request contains the keyword GET and a string that represents the object that is to be fetched, as shown in the following example:

```
GET /mysite/mydirectory/index.html HTTP/1.1\r\n
```

The rest of the request contains HTTP headers, including a required Host header and, if applicable, a message body.

The request ends with a bank line (an extra `<CR><LF> or \r\n`).

Following is an example of a request:

```
Get /mysite/index.html HTTP/1.1\r\n

Host: 10.101.101.10\r\n

Accept: */*\r\n

\r\n
```

Format of an HTTP Response

An HTTP response contains a status message, response HTTP headers, and the requested object or, if the requested object cannot be served, an error message.

Following is an example of a response:

```
HTTP/1.1 200 OK\r\n

Content-Length: 55\r\n

Content-Type: text/html\r\n

Last-Modified: Wed, 12 Aug 1998 15:03:50 GMT\r\n

Accept-Ranges: bytes\r\n
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
ETag: “04f97692cbd1:377”\r\n

Date: Thu, 19 Jun 2008 19:29:07 GMT\r\n

\r\n

<55-character response>
```

Configuring an HTTP callout

When configuring an HTTP callout, you specify the type of request (HTTP or HTTPS), destination, and format of the request. The expected format of the response, and, finally, the portion of the response that you want to analyze.

For the destination, you either specify the IP address and port of the HTTP callout agent. Or engage a load balancing, content switching, or cache redirection virtual server, to manage the HTTP callout requests.

In the first case, the HTTP callout requests are sent directly to the HTTP callout agent. In the second case, the HTTP callout requests are sent to the virtual IP address (VIP) of the specified virtual server. The virtual server processes the request in the same way as it processes a client request. For example, if you expect many callouts to be generated, you can configure instances of the HTTP callout agent on multiple servers, bind these instances (as services) to a load balancing virtual server, and then specify the load balancing virtual server in the HTTP callout configuration. The load balancing virtual server then balances the load on those configured instances as determined by the load balancing algorithm.

For the format of the HTTP callout request, you can specify the individual attributes of the HTTP callout request (an attribute-based HTTP callout), or you can specify the entire HTTP callout request as a advanced policy expression (an expression-based HTTP callout).

For the format of the HTTP callout request, you can specify the individual attributes of the HTTP callout request (an attribute-based HTTP callout), or you can specify the entire HTTP callout request as a Advanced policy expression (an expression-based HTTP callout).

For more information, see policy-httpCallout.

PARAMETER	DESCRIPTION
Name	Name of the callout, 127 character maximum

© 1997–2026 Citrix Systems, Inc. All rights reserved.

PARAMETER	DESCRIPTION
IP address and port (ip-address / *port*) or Virtual server name (vserver)	IPv4 or IPv6 address of the server to which the callout is sent, or a wildcard, and the port on the server to which the callout is sent, or a wildcard. Or, the name of a load balancing, content switching, or cache redirection virtual server with a service type of HTTP.
HTTP Method (httpMethod)	HTTP Method (httpMethod). Method used in the HTTP request that this callout sends. Valid values: GET or POST. Default: GET.
Host expression (hostExpr)	Host expression (hostExpr). Advanced text expression to configure the Host header. Maximum length: 255. The expression can be a literal value or it can be an advanced expression that derives the value. Examples: "10.101.10.11" , "http.req.header("Host")"
URL stem expression (urlStemExpr)	URL stem expression (urlStemExpr) An advanced string expression for generating the URL stem. Maximum length: 8191. The expression can be a literal string or an expression that derives the value. Examples: ""/mysite/index.html"" "http.req.url"
HTTP Headers (headers)	HTTP Headers (headers). Advanced text expression to insert HTTP headers and their values in the HTTP callout request. Specify a value for every header. You specify the header name as a string and the header value as an advanced expression. Specify the headers separated by space. Such as -headers cip(client.ip.src) hdr(http.req.header("HDR")). The number of headers can be 8
Expression-based request to send to the server (fullReqExpr)	Exact HTTP request that the NetScaler is to send as an advanced expression to 8191 characters. If you specify this parameter, you must omit the httpMethod, hostExpr, urlStemExpr, headers, and parameters arguments. The request expression is

© 1997–2026 Citrix Systems, Inc. All rights reserved.

PARAMETER	DESCRIPTION
	constrained by the feature where the callout is used. For example, an HTTP.RES expression cannot be used in a request-time policy bank or in a TCP content switching policy bank.
Expression-based request to send to the server (bodyExpr)	An advanced string expression for generating the body of the request. The expression can contain a literal string or an expression that derives the value (for example, client.ip.src). Mutually exclusive with -fullReqExpr.
Parameters	Advanced expression to insert query parameters in the HTTP request that the callout sends. Specify a value for every parameter that you configure. If the callout request uses the GET method, these parameters are inserted in the URL. If the callout request uses the POST method, these parameters are inserted in the POST body. You configure the query parameter name as a string and the value as an advanced expression. The parameter values are URL encoded. Specify the parameters separated by space like: -parameters name1("name1") name2(http.req.header("hdr")). The maximum 8 parameters can be configured.
Return type (returnType)	Type of data that the target application returns in the response to the callout. Valid values: TEXT: Treat the returned value as a text string. NUM: Treat the returned value as a number. BOOL: Treat the returned value as a Boolean value. Note: You cannot change the return type after it is set.
Expression to extract data from the response (resultExpr)	Advanced expression that extracts HTTP.RES objects from the response to the HTTP callout. The maximum length is 8191. The operations in this expression must match the return type. For example, if you configure a return type of text, the result expression must be a text-

© 1997–2026 Citrix Systems, Inc. All rights reserved.

PARAMETER	DESCRIPTION
	based expression. If the return type is num, the result expression (resultExpr) must return a numeric value similar to the following: "http.res.body(10000).length" Note: Sometimes, if you set a return type of TEXT and the result sent from the server exceeds 16 KB, the result expression can return NULL. For example, when the result is a concatenated string that exceeds 16 KB.
Scheme	The type of scheme for the callout server. Example: HTTP, https
cacheForSecs	Duration, in seconds, for which the callout response is cached. The cached responses are stored in an integrated caching content group named "calloutContentGroup". If no duration is configured, the callout responses are not cached unless a normal caching configuration is used to cache them. This parameter takes precedence over any normal caching configuration that would otherwise apply to these responses.

Note: The appliance does not check for the validity of the request. You must make sure that the request is a valid request and doesn't contain any confidential information. An incorrect or incomplete HTTP callout configuration results in a runtime UNDEF condition that is not associated with an action. The UNDEF condition merely updates the Undefined Hits counter, which enables you to troubleshoot an incorrectly configured HTTP callout. However, the appliance parses the HTTP callout request to enable you to configure certain NetScaler features for the callout. This can lead to an HTTP callout invoking itself. For information about callout recursion and how you can avoid it, see Avoiding HTTP Callout Recursion.

Finally, regardless of whether you use HTTP request attributes or an expression to define the format of the HTTP callout request, you must specify the format of the response from the HTTP callout agent and the portion of the response that you want to evaluate. The response type can be a Boolean value, a number, or text. Based on this return type only, you can use the further expression methods on the callout response. If the return type is a number, then you can use the number based expression on the callout response. The portion of the response that you want to

© 1997–2026 Citrix Systems, Inc. All rights reserved.

evaluate is specified by an expression. For example, if you specify that the response contains text, you can use `HTTP.RES.BODY(<unit>)` to specify that the appliance must evaluate only the first \<unit> bytes of the response from the callout agent.

At the command line, you first create an HTTP callout by using the add command. When you add a callout, all parameters are set to a default value of NONE, except the HTTP method, which is set to a default value of GET. You then configure the callout's parameters by using the set command. The set command is used to configure both types of callouts (attribute-based and expression-based). The difference lies in the parameters that are used for configuring the two types of callouts. So, the command-line instructions that follow include a set command for configuring an attribute-based callout and a set command for configuring an expression-based callout. In the configuration utility, all of these configuration tasks are performed in a single dialog box.

Note: Before you put an HTTP callout into a policy, you can modify all configured parameters except the return type. Once an HTTP callout is in a policy, you cannot completely modify an expression that is configured in the callout. For example, you cannot change HTTP.REQ.HEADER("myval") to CLIENT.IP.SRC. You can modify the operators and arguments that are passed to the expression. For example, you can change `HTTP.REQ.HEADER("myVal1")` to `HTTP.REQ.HEADER("myVal2")`, or `HTTP.REQ.HEADER("myVal")` to `HTTP.REQ.HEADER("myVal").AFTER_STR(<string>)`. If the set command fails, create an HTTP callout.

HTTP callout configuration involves configuring Advanced policy expressions. For more information about configuring Advanced policy expressions, see Configuring Advanced policy Expressions: Getting Started.

To configure an HTTP callout by using the command line interface

At the command prompt, do the following:

Create an HTTP callout.

```
add policy httpCallout <name> [-IPAddress <ip_addr|ipv6_addr>] [-
port<port>] [-vServer <string>] [-returnType <returnType>] [-httpMethod
(GET | POST )] [-hostExpr <expression>]  [-urlStemExpr <expression>] [-
headers <name(value)> ...] [-parameters <name(value)> ...] [-bodyExpr
<expression>] [-fullReqExpr <expression>] [-scheme ( http | https )] [-
resultExpr <expression>] [-cacheForSecs <secs>] [-comment <string>]
```

Example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add policy httpCallout mycallout -vserver lbv1 -returnType num -httpMethod
GET -hostExpr 'http.req.header("Host")'-urlStemExpr "http.req.url"
-parameters Name("My Name") -headers Name("MyHeader")-resultExpr
"http.res.body(10000).length"
```

Modify the HTTP callout configuration.

```
set policy httpCallout <name> [-IPAddress <ip_addr|ipv6_addr|*>] [-port
<port|*>] [-vServer <string>] [-returnType <returnType>] [-httpMethod
( GET | POST )] [-hostExpr <string>] [-urlStemExpr <string>] [-headers
<name(value)> ...] [-parameters <name(value)> ...] [-resultExpr <string>]
```

Example:

```
> set policy httpCallout mycallout -vserver lbv1 -returnType num
-httpMethod GET -hostExpr 'http.req.header("Host")'-urlStemExpr
"http.req.url" -parameters Name("My Name") -headers Name("MyHeader")
-resultExpr "http.res.body(10000).length"
```

Configure HTTP callout using fullReqExpr parameter.

```
set policy httpCallout <name> [-vServer <string>] [-returnType
<returnType>] [-fullReqExpr <string>] [-resultExpr <string>]
```

Example:

```
> set policy httpCallout mycallout1 -vserver lbv1 -returnType num
fullReqExpr q{"GET " + http.req.url + "HTTP/" + http.req.version.major +
"." + http.req.version.minor.sub(1) + "r\nHost:10.101.10.10\r\nAccept: */
*\r\n\r\n"}
```

Verify the configurations of the HTTP callout.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
show policy httpCallout `<name>`
```

```
sh policy httpCallout mycallout1

> Name: mycallout1

>Vserver: lbv1 (UP)

Effective Vserver state: UP

Return type: TEXT

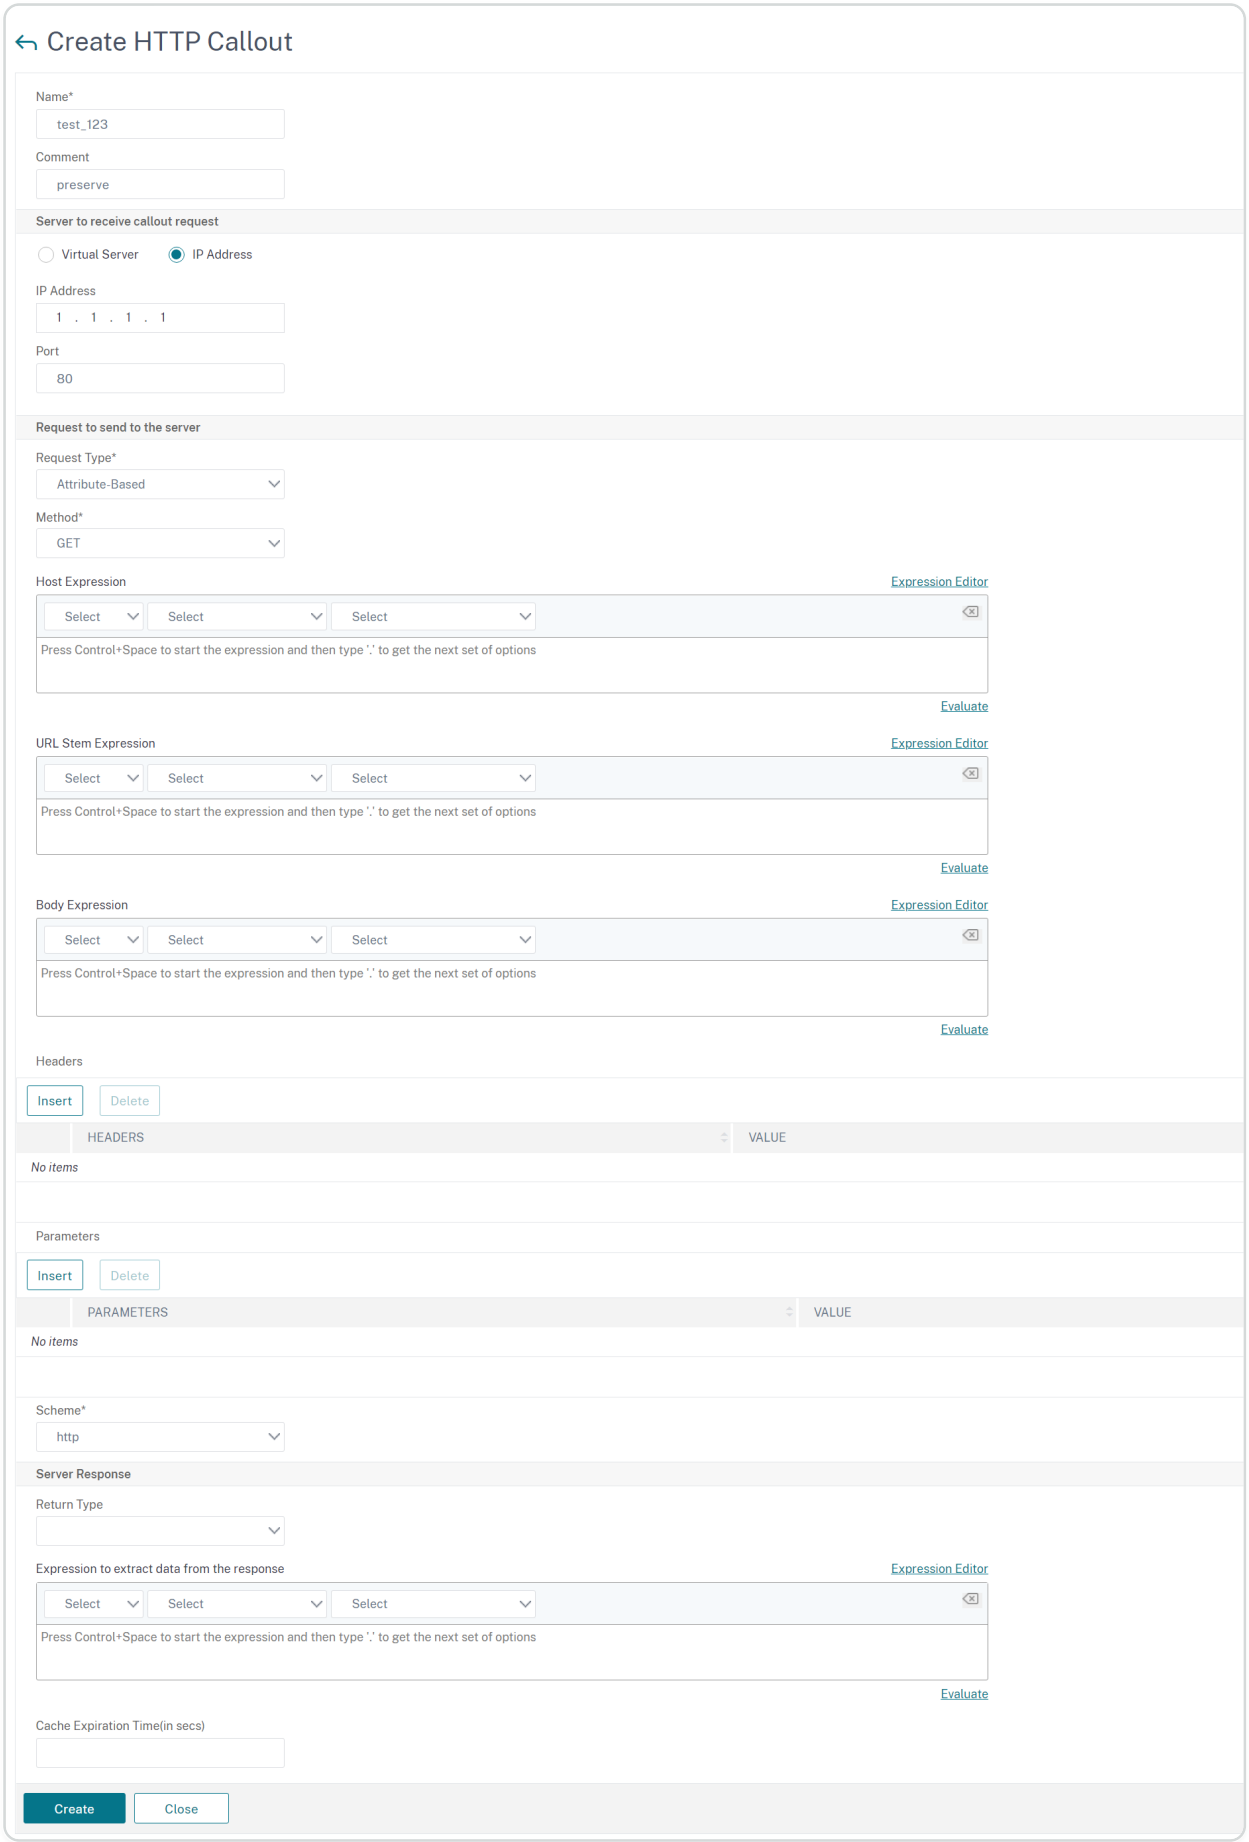
Scheme: HTTP

Full REQ expr: "GET " + http.req.url + "HTTP/" + http.req.version.major +
"." + http.req.version.minor.sub(1)+ "r\nHost:10.101.10.10\r\nAccept: */
*\r\n\r\n"

Result expr: http.res.body(100)

Hits: 0

Undef Hits: 0



Done

>
```

To configure an HTTP callout by using the configuration utility

1. Navigate to **AppExpert** > **HTTP Callouts**.
2. In the details pane, click **Add**.
3. In the **Create HTTP Callout** dialog box, configure the parameters of the HTTP callout. For a description of the parameter, hover the mouse cursor over the check box.
4. Click **Create** and then click **Close**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Verifying the configuration

For an HTTP callout to work correctly, all the HTTP callout parameters and the entities associated with the callout must be configured correctly. While the NetScaler appliance does not check the validity of the HTTP callout parameters, it indicates the state of the bound entities, namely the server or virtual server to which the HTTP callout is sent. The following table lists the icons and describes the conditions under which the icons are displayed.

ICON	INDICATES THAT
	The state of the server that hosts the HTTP callout agent, or the load balancing, content switching, or cache redirection virtual server to which the HTTP callout is sent is UP.
	The state of the server that hosts the HTTP callout agent, or the load balancing, content switching, or cache redirection virtual server to which the HTTP callout is sent is OUT OF SERVICE.
	The state of the server that hosts the HTTP callout agent, or the load balancing, content switching, or cache redirection virtual server to which the HTTP callout is sent is DOWN.

Table 1. Icons That Indicate the States of Entities Bound to an HTTP Callout

For an HTTP callout to function correctly, the icon must be green at all times. If the icon is not green, check the state of the callout server or virtual server to which the HTTP callout is sent. If the HTTP callout is not working as expected even though the icon is green, check the parameters configured for the callout.

You can also verify the configuration by sending test requests that match the policy from which the HTTP callout is invoked, checking the hits counter for the policy and the HTTP callout, and verifying the responses that the NetScaler appliance sends to the client.

Note: An HTTP callout can sometimes invoke itself recursively a second time. If this happens, the hits counter is incremented by two counts for each callout that is generated by the appliance. For the hits counter to display the correct value, you must configure the HTTP callout in such a way that it does not invoke itself a second time. For more information about how you can avoid HTTP callout recursion, see Avoiding HTTP Callout Recursion.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To view the hits counter for an HTTP callout

1. Navigate to **AppExpert** > **HTTP Callouts**.
2. In the details pane, click the HTTP callout for which you want to view the hits counter, and then view the hits in the **Details** area.

Invoking an HTTP Callout

After you configure an HTTP callout, you invoke the callout by including the `SYS.HTTP_CALLOUT(<name>)` expression in a Advanced policy rule. In this expression, `<name>` is the name of the HTTP callout that you want to invoke.

You can use Advanced policy expression operators with the callout expression to process the response and then perform an appropriate action. The return type of the response from the HTTP callout agent determines the set of operators that you can use on the response. If the part of the response that you want to analyze is text, you can use a text operator to analyze the response. For example, you can use the CONTAINS(\<string\>) operator to check whether the specified portion of the response contains a particular string, as in the following example:

```
SYS.HTTP_CALLOUT(mycallout).contains("Good IP address")
```

If you use the preceding expression in a responder policy, you can configure an appropriate responder action.

Similarly, if the part of the response that you want to evaluate is a number, you can use a numeric operator such as GT(int). If the response contains a Boolean value, you can use a Boolean operator.

Note: An HTTP callout can invoke itself recursively. HTTP callout recursion can be avoided by combining the HTTP callout expression with a Advanced policy expression that prevents recursion. For information about how you can avoid HTTP callout recursion, see Avoiding HTTP Callout Recursion.

You can also cascade HTTP callouts by configuring policies that each invoke a callout after evaluating previously generated callouts. In this scenario, after one policy invokes a callout, when the NetScaler appliance is parsing the callout before sending the callout to the callout server, a second set of policies can evaluate the callout and invoke additional callouts, which can in turn be evaluated by a third set of policies, and so on. Such an implementation is described in the following example.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

First, you could configure an HTTP callout called myCallout1, and then configure a responder policy, Pol1, to invoke myCallout1. Then, you could configure a second HTTP callout, myCallout2, and a responder policy, Pol2. You configure Pol2 to evaluate myCallout1 and invoke myCallout2. You bind both responder policies globally.

To avoid HTTP callout recursion, myCallout1 is configured with a unique custom HTTP header called "Request1." Pol1 is configured to avoid HTTP callout recursion by using the Advanced policy expression,

```
HTTP.REQ.HEADER("Request1").EQ("Callout Request").NOT.
```

Pol2 uses the same Advanced policy expression, but excludes the .NOT operator so that the policy evaluates myCallout1 when the NetScaler appliance is parsing it. Note that myCallout2 identifies its own unique header called "Request2," and Pol2 includes a Advanced policy expression to prevent myCallout2 from invoking itself recursively.

Example:

```
> add policy httpCallout myCallout1

Done

> set policy httpCallout myCallout1 -IPAddress 10.102.3.95 -port 80
-returnType TEXT -hostExpr

 ""10.102.3.95"" -urlStemExpr "\"/cgi-bin/check_clnt_from_database.pl\""
-headers Request1

("Callout Request") -parameters cip(CLIENT.IP.SRC) -resultExpr
"HTTP.RES.BODY(100)"

Done
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
> add responder policy Pol1 "HTTP.REQ.HEADER(\"Request1\").EQ(\"Callout
Request\").NOT &&

SYS.HTTP_CALLOUT(myCallout1).CONTAINS(\"IP Matched\")" RESET

Done

> bind responder global Pol1 100 END -type OVERRIDE

Done

> add policy httpCallout myCallout2

Done

> set policy httpCallout myCallout2 -IPAddress 10.102.3.96 -port 80
-returnType TEXT -hostExpr

"\"10.102.3.96\"" -urlStemExpr "\"/cgi-bin/
check_clnt_location_from_database.pl\"" -headers Request2

("Callout Request") -parameters cip(CLIENT.IP.SRC) -resultExpr
"HTTP.RES.BODY(200)"

 Done

> add responder policy Pol2 "HTTP.REQ.HEADER(\"Request2\").EQ(\"Callout
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Request\").NOT &&

 HTTP.REQ.HEADER(\"Request1\").EQ(\"Callout Request\") &&
SYS.HTTP_CALLOUT(myCallout2).CONTAINS

(\"APAC\")" RESET

 Done

> bind responder global Pol2 110 END -type OVERRIDE

Done
```

Avoiding HTTP callout recursion

Even though the NetScaler appliance does not check for the validity of the HTTP callout request, it parses the request once before it sends the request to the HTTP callout agent. This parsing allows the appliance to treat the callout request as any other incoming request, which in turn allows you to configure several useful NetScaler features (such as integrated caching) to work on the callout request.

However, during this parsing, the HTTP callout request can select the same policy and therefore invoke itself recursively. The appliance detects the recursive invocation and raises an undefined (UNDEF) condition. However, the recursive invocation results in the policy and HTTP callout select counters being incremented by two counts each instead of one count each.

To prevent a callout from invoking itself, you must identify at least one unique characteristic of the HTTP callout request, and then exclude all requests with this characteristic from being processed by the policy rule that invokes the callout. You can do so by including another Advanced policy expression in the policy rule. The expression must precede the `SYS.HTTP_CALLOUT(<name>)` expression so that it is evaluated before the callout expression is evaluated. For example:

```
<Expression that prevents callout recursion> OR SYS.HTTP_CALLOUT(<name>)
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

When you configure a policy rule in this way, when the appliance generates the request and parses it, the compound rule evaluates to FALSE, the callout is not generated a second time, and the select counters are incremented correctly.

One way by which you can assign a unique characteristic to an HTTP callout request is to include a unique custom HTTP header when you configure the callout. Following is an example of an HTTP callout called "myCallout." The callout generates an HTTP request that checks whether a client's IP address is present in a database of blacklisted IP addresses. The callout includes a custom header called "Request," which is set to the value "Callout Request." A globally bound responder policy, "Pol1," invokes the HTTP callout but excludes all requests whose Request header is set to this value, thus preventing a second invocation of myCallout. The expression that prevents a second invocation is HTTP.REQ.HEADER("Request").EQ(\"Callout Request\").NOT.

Example:

```
> add policy httpCallout myCallout

 Done

> set policy httpCallout myCallout -IPAddress 10.102.3.95 -port 80
-returnType TEXT -hostExpr "\"10.102.3.95\"" -urlStemExpr "\"/cgi-bin/
check_clnt_from_database.pl\"" -headers Request("Callout Request")
-parameters cip(CLIENT.IP.SRC) -resultExpr "HTTP.RES.BODY(100)"

Done

> add responder policy Pol1 "HTTP.REQ.HEADER(\"Request\").EQ(\"Callout
Request\").NOT && SYS.HTTP_CALLOUT(myCallout).CONTAINS(\"IP Matched\")"
RESET

Done

> bind responder global Pol1 100 END -type OVERRIDE

Done
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE:

You can also configure an expression to check whether the request URL includes the stem expression configured for the HTTP callout. To implement the solution, ensure the HTTP callout agent can respond only to HTTP callouts and not to other requests directed through the appliance. If the HTTP callout agent is an application or Web server that serves other client requests, such an expression prevents the appliance from processing those client requests. Instead, use a unique custom header as described earlier.

Caching HTTP callout responses

For improved performance while using callouts, you can use the integrated caching feature to cache callout responses. The responses are stored in an integrated caching content group named calloutContentGroup for a specified time duration.

Note: To cache callout responses, make sure that the integrated caching feature is enabled.

To set the cache duration by using the command line interface

At the command prompt, type:

```
set policy httpCallout <name> -cacheForSecs <secs>
```

Example:

```
> set httpcallout httpcallout1 -cacheForSecs 120
```

To set the cache duration by using the configuration utility

1. Navigate to **AppExpert > HTTP Callouts**.
2. In the details pane, select the HTTP callout for which you want to set the cache duration and click **Open**.
3. In the **Configure HTTP Callout** dialog box, specify the **Cache Expiration Time**.
4. Verify that you have entered the correct time duration, and then click **OK**.

Use Case: Filtering clients by using an IP blacklist

HTTP callouts can be used to block requests from clients that are blacklisted by the administrator. The list of clients can be a publicly known blacklist, a blacklist that you maintain for you organization, or a combination of both.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The NetScaler appliance checks the IP address of the client against the pre-configured blacklist and blocks the transaction if the IP address has been blacklisted. If the IP address is not in the list, the appliance processes the transaction.

To implement this configuration, you must perform the following tasks:

1. Enable responder on the NetScaler appliance.
2. Create an HTTP callout on the NetScaler appliance and configure it with details about the external server and other required parameters.
3. Configure a responder policy to analyze the response to the HTTP callout, and then bind the policy globally.
4. Create an HTTP callout agent on the remote server.

Enabling responder

You must enable responder before you can use it.

To enable responder by using the GUI

1. Make sure that you have installed the responder license.
2. In the configuration utility, expand AppExpert, and right-click **Responder**, and then click **Enable Responder** feature.

Creating an HTTP callout on the NetScaler appliance

Create an HTTP callout, HTTP_Callout, with the parameter settings shown in the following table. For more information about creating an HTTP callout, see Configuring an HTTP Callout pdf.

Configuring a responder policy and binding it globally

After you configure the HTTP callout, verify the callout configuration, and then configure a responder policy to invoke the callout. While you can create a responder policy in the Policies sub-node and then bind it globally by using the Responder Policy Manager, this demonstration uses the Responder Policy Manager to create the responder policy and bind the policy globally.

To create a responder policy and bind it globally by usin

1. Navigate to **AppExpert** > **Responder**.
2. In the details pane, under **Policy Manager**, click **Policy Manager**.
3. In the **Responder Policy Manager** dialog box, click **Override Global**.
4. Click **Insert Policy**, and then, under **Policy Name**, click **New Policy**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

5. In the **Create Responder Policy** dialog box, do the following:
   a. In Name, type **PolicyResponder1**.
   b. In **Action**, select **RESET**.
   c. In **Undefined-Result Action**, select **Global undefined-result** action.
   d. In **Expression**, type the following Advanced policy expression:

```
"HTTP.REQ.HEADER("Request").EQ("Callout Request").NOT &&
SYS.HTTP_CALLOUT(HTTP_Callout).CONTAINS("IP Matched")"
```

   e. Click **Create**, and then click **Close**.
6. Click **Apply Changes**, and then click **Close**.

Creating an HTTP callout agent on the remote server

You must now create an HTTP callout agent on the remote callout server that will receive callout requests from the NetScaler appliance and respond appropriately. The HTTP callout agent is a script that is different for each deployment and must be written with the server specifications in mind, such as the type of database and the scripting language supported.

Following is a sample callout agent that verifies whether the given IP address is part of an IP blacklist. The agent has been written in the Perl scripting language and uses a MYSQL database.

The following CGI script checks for a given IP address on the callout server.

```
#!/usr/bin/perl -w

print "Content-type: text/html\n\n";

        use DBI();

        use CGI qw(:standard);

#Take the Client IP address from the request query

        my $ip_to_check = param('cip');

# Where a MYSQL database is running

        my $dsn = 'DBI:mysql:BAD_CLIENT:localhost';
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
# Database username to connect with

        my $db_user_name = ‘dbuser’;

# Database password to connect with

        my $db_password = 'dbpassword';

        my ($id, $password);

# Connecting to the database

        my $dbh = DBI->connect($dsn, $db_user_name, $db_password);

        my $sth = $dbh->prepare(qq{ select * from bad_clnt });

        $sth->execute();

        while (my ($ip_in_database) = $sth->fetchrow_array()) {

        chomp($ip_in_database);

# Check for IP match

        if ($ip_in_database eq $ip_to_check) {

              print "\n IP Matched\n";

                                                    $sth->finish();

                                               exit;

                }

       }

       print "\n IP Failed\n";

       $sth->finish();

       exit;
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Use Case: ESI support for fetching and updating content dynamically

Edge Side Includes (ESI) is a markup language for edge-level dynamic Web content assembly. It helps in accelerating dynamic Web-based applications by defining a simple markup language to describe cacheable and non-cacheable Web page components that can be aggregated, assembled, and delivered at the network edge. By using HTTP callouts on the NetScaler appliance, you can read through the ESI constructs and aggregate or assemble content dynamically.

To implement this configuration, you must perform the following tasks:

1. Enable rewrite on the NetScaler appliance.
2. Create an HTTP callout on the appliance and configure it with details about the external server and other required parameters.
3. Configure a rewrite action to replace the ESI content with the callout response body.
4. Configure a rewrite policy to specify the conditions under which the action is performed, and then bind the rewrite policy globally.

Enabling rewrite

Rewrite must be enabled before it is used on the NetScaler appliance. The following procedure describes the steps to enable the rewrite feature.

To enable rewrite by using the GUI

1. Make sure that you have installed the rewrite license.
2. In the configuration utility, expand AppExpert, and right-click Rewrite, and then click Enable Rewrite feature.

Creating an HTTP Callout on the NetScaler Appliance

For more information about creating an HTTP callout, see Configuring an HTTP Callout. For more information about the parameter values, see Parameters and Values for HTTP-Callout-2 pdf.

Configuring the Rewrite Action

Create a rewrite action, Action-Rewrite-1, to replace the ESI content with the callout response body. Use the parameter settings shown in the following table.

Table 2. Parameters and Values for Action-Rewrite-1

© 1997–2026 Citrix Systems, Inc. All rights reserved.

PARAMETER	VALUE
Name	Action-Rewrite-1
Type	Replace
Expression to choose target text reference	"HTTP.RES.BODY(500).AFTER_STR (\"<example>\").BEFORE_STR (\"</example>\")"
String expression for replacement text	"SYS.HTTP_CALLOUT(HTTP-Callout-2)"

To configure the rewrite action by using the configuration utility

1. Navigate to **AppExpert** > **Rewrite** > **Actions**.
2. In the details pane, click **Add**.
3. In the **Create Rewrite Action** dialog box, in Name, type **Action-Rewrite-1**.
4. In Type, select **REPLACE**.
5. In **Expression** to choose target text reference, type the following Advanced policy expression:

```
"HTTP.RES.BODY(500).AFTER_STR("<example>").BEFORE_STR("<example>")"
```

6. In the String expression for replacement text, type the following string expression:

```
"SYS.HTTP_CALLOUT(HTTP-Callout-2)"
```

7. Click **Create**, and then click **Close**.

Creating the Rewrite Policy and Binding it Globally

Create a rewrite policy, Policy-Rewrite-1, with the parameter settings shown in the following table. You can create a rewrite policy in the Policies subnode and then bind it globally by using the Rewrite Policy Manager. Alternatively, you can use the Rewrite Policy Manager to perform both these tasks simultaneously. This demonstration uses the Rewrite Policy Manager to perform both tasks.

Table 3. Parameters and Values for Policy-Rewrite-1

PARAMETER	VALUE
Name	Policy-Rewrite-1

© 1997–2026 Citrix Systems, Inc. All rights reserved.

PARAMETER	VALUE
Action	Action_Rewrite-1
Undefined Result Action	-Global undefined-result action-
Expression	"HTTP.REQ.HEADER("Name").CONTAINS ("Callout").NOT"

To configure a rewrite policy and bind it globally by using the configuration utility

1. Navigate to **AppExpert** > **Rewrite**.
2. In the details pane, under **Policy Manager**, click **Rewrite Policy Manager**.
3. In the **Rewrite Policy Manager** dialog box, click **Override Global**.
4. Click **Insert Policy**, and then, in the **Policy Name** column, click **New Policy**.
5. In the **Create Rewrite Policy** dialog box, do the following: 1.In Name, type Policy-Rewrite-1.
    a. In Action, select Action-Rewrite-1.
    b. In Undefined-Result Action, select Global undefined-result action.
    c. In Expression, type the following Advanced policy expression:

```
"HTTP.REQ.HEADER("Name").CONTAINS("Callout").NOT"
```

    a. Click **Create**, and then click **Close**.
6. Click **Apply Changes**, and then click **Close**.

Use Case: Access control and authentication

In high security zones, it is mandatory to externally authenticate the user before a resource is accessed by clients. On the NetScaler appliance, you can use HTTP callouts to externally authenticate the user by evaluating the credentials supplied. In this example, the assumption is that the client is sending the user name and password through HTTP headers in the request. However, the same information could be fetched from the URL or the HTTP body.

To implement this configuration, you must perform the following tasks:

1. Enable the responder feature on the NetScaler appliance.
2. Create an HTTP callout on the appliance and configure it with details about the external server and other required parameters.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. Configure a responder policy to analyze the response, and then bind the policy globally.
4. Create a callout agent on the remote server.

Enabling Responder

The responder feature must be enabled before it is used on the NetScaler appliance.

To enable responder by using the configuration utility

1. Make sure that the responder license is installed.
2. In the configuration utility, expand AppExpert, and right-click Responder, and then click **Enable Responder feature**.

Creating an HTTP callout on the NetScaler appliance

Create an HTTP callout, HTTP-Callout-3, with the parameter settings shown in the following table. For more information about creating an HTTP callout, see Configuring an HTTP Callout.

Table 1. Parameters and Values for HTTP-Callout-3

PARAMETER	VALUE	NAME
Name	Policy-Responder-3	

Parameter

Value

Name

HTTP-Callout-3

Server to receive callout request:

IP Address

10.103.9.95

Port

80

Request to send to the server:

Method

© 1997–2026 Citrix Systems, Inc. All rights reserved.

GET

Host Expression

10.102.3.95

URL Stem Expression

“/cgi-bin/authenticate.pl”

Headers:

Name

Request

Value-expression

Callout Request

Parameters:

Name

Username

Value-expression

HTTP.REQ.HEADER("Username").VALUE(0)

Name

Password

Value-expression

HTTP.REQ.HEADER("Password").VALUE(0)

Server Response:

Return Type

TEXT

Expression to extract data from the response

HTTP.RES.BODY(100)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Creating a Responder Policy to Analyze the Response

Create a responder policy, Policy-Responder-3, that will check the response from the callout server and RESET the connection if the source IP address has been blacklisted. Create the policy with the parameters settings shown in the following table. While you can create a responder policy in the Policies subnode and then bind it globally by using the Responder Policy Manager, this demonstration uses the Responder Policy Manager to create the responder policy and bind the policy globally.

Table 2. Parameters and Values for Policy-Responder-3

PARAMETER	VALUE
Name	Policy-Responder-3
Action	RESET
Undefined-Result-Action	-Global undefined-result action-
Expression	"HTTP.REQ.HEADER(\"Request\").EQ(\"Callout Request\").NOT && SYS.HTTP_CALLOUT(HTTP-Callout-3).CONTAINS(\"Authentication Failed\")"

To create a responder policy and bind it globally by using the configuration utility

1. Navigate to **AppExpert** > **Responder**.
2. In the details pane, under **Policy Manager**, click **Responder Policy Manager**.
3. In the **Responder Policy Manger** dialog box, click **Override Global**.
4. Click **Insert Policy**, and then, in the **Policy Name** column, click **New Policy**.
5. In the **Create Responder Policy** dialog box, do the following:
    a. In Name, type Policy-Responder-3.
    b. In Action, select **RESET**.
    c. In Undefined-Result Action , select Global undefined-result action.
    d. In the Expression text box, type:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
"HTTP.REQ.HEADER(\"Request\").EQ(\"Callout Request\").NOT &&
SYS.HTTP_CALLOUT(HTTP-Callout-3).CONTAINS(\"Authentication Failed\")"
```

a. Click **Create**, and then click **Close**.

6. Click **Apply Changes**, and then click **Close**.

Creating an HTTP Callout Agent on the Remote Server

You now need to create an HTTP callout agent on the remote callout server. The HTTP callout agent receives callout requests from the NetScaler appliance and responds appropriately. The callout agent is a script that is different for each deployment and must be written with server specifications in mind, such as the type of database and the scripting language supported.

Following is sample callout agent pseudo-code that verifies whether the supplied user name and password are valid. The agent can be implemented in any programming language of your choice. The pseudo-code is to be used only as a guideline for developing the callout agent. You can build additional functionality into the program.

To verify the supplied user name and password by using pseudo-code

1. Accept the user name and password supplied in the request and format them appropriately.
2. Connect to the database that contains all the valid user names and passwords.
3. Check the supplied credentials against your database.
4. Format the response as required by the HTTP callout.
5. Send the response to the NetScaler appliance.

Use Case: OWA-based spam filtering

Spam filtering is the ability to dynamically block emails that are not from a known or trusted source or that have inappropriate content. Spam filtering requires an associated business logic that indicates that a particular kind of message is spam. When the NetScaler appliance processes Outlook Web Access (OWA) messages based on the HTTP protocol, HTTP callouts can be used to filter spam.

You can use HTTP callouts to extract any portion of the incoming message and check with an external callout server that has been configured with rules that are meant for determining whether a message is legitimate or spam. In case of spam email, for security reasons, the NetScaler appliance does not notify the sender that the email is marked as spam.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The following example conducts a very basic check for various listed keywords in the email subject. These checks can be more complex in a production environment.

To implement this configuration, you must perform the following tasks:

1. Enable the responder feature on the NetScaler appliance.
2. Create an HTTP callout on the NetScaler appliance and configure it with details about the external server and other required parameters.
3. Create a responder policy to analyze the response, and then bind the policy globally.
4. Create a callout agent on the remote server.

Enabling responder

The responder feature must be enabled before it can be used on the NetScaler appliance.

To enable responder by using the GUI

1. Make sure that the responder license is installed.
2. In the configuration utility, expand AppExpert, and right-click **Responder**, and then click **Enable Responder** feature.

Creating an HTTP callout on the NetScaler appliance

Create an HTTP callout, HTTP-Callout-4, with the parameter settings shown in the following table. For more information about creating an HTTP callout, see Configuring an HTTP Callout.

For more information, see Parameters and Values for HTTP-Callout-4 pdf.

Creating a responder action

Create a responder action, Action-Responder-4. Create the action with the parameter settings shown in the following table.

PARAMETER	VALUE
Name	Action-Responder-4
Type	Respond with
Target	""HTTP/1.1 200 OK\r\nServer: Microsoft-IIS/6.0\r\nX-Powered-By: ASP.NET\r\nContent-Length: 0\r\nMS-WebStorage: 6.5.6944\r\nCache-Control: no-cache\r\n\r\n""

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Table 2. Parameters and Values for Action-Responder-4

To create a responder action by using the configuration utility

1. Navigate to **AppExpert** > **Responder** > **Actions**.
2. In the details pane, click **Add**.
3. In the **Create Responder Action** dialog box, in Name, type **Action-Responder-4**.
4. In Type, click **Respond with**.
5. In Target, type:

```
"\"HTTP/1.1 200 OK\r\nServer: Microsoft-IIS/6.0\r\nX-Powered-By:
ASP.NET\r\nContent-Length: 0\r\nMS-WebStorage: 6.5.6944\r\nCache-
Control: no-cache\r\n\r\n\""
```

6. Click **Create**, and then click **Close**.

Creating a Responder Policy to Invoke the HTTP Callout

Create a responder policy, Policy-Responder-4, that will check the request body and, if the body contains the word “ *subject*,” invoke the HTTP callout to verify the email. Create the policy with the parameter settings shown in the following table. While you can create a responder policy in the Policies subnode and then bind it globally by using the Responder Policy Manager, this demonstration uses the Responder Policy Manager to create the responder policy and bind it globally.

PARAMETER	VALUE
Name	Policy-Responder-4
Action	Action-Responder-4
Undefined-Result-Action	-Global undefined-result action-
Expression	"HTTP.REQ.BODY(1000).CONTAINS("urn:schemas:httpmail:subject") && SYS.HTTP_CALLOUT(HTTP-Callout-4)"

To create a responder policy by using the configuration utility

1. Navigate to **AppExpert** > **Responder**.
2. In the details pane, under **Policy Manager**, click **Responder policy** manager.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. In the **Responder Policy Manger** dialog box, click **Override Global**.
4. Click **Insert Policy**, and then, in the **Policy Name** column, click **New Policy**.
5. In the **Create Responder Policy** dialog box, do the following:
    a. In Name, type **Policy-Responder-4**.
    b. In Action, click **Action-Responder-4**.
    c. In Undefined-Result Action, click **Global undefined-result** action.
    d. In the **Expression** text box, type:

```
"HTTP.REQ.BODY(1000).CONTAINS(\"urn:schemas:httpmail:subject\") &&
SYS.HTTP_CALLOUT(HTTP-Callout-4)"
```

    e. Click **Create**, and then click **Close**.
6. Click **Apply Changes**, and then click **Close**.

Creating an HTTP callout agent on the remote server

You will now need to create an HTTP callout agent on the remote callout server. The HTTP callout agent receives callout requests from the NetScaler appliance and responds accordingly. The callout agent is a script that is different for each deployment and must be written with server specifications in mind, such as the type of database and the scripting language supported.

The following pseudo-code provides instructions for creating a callout agent that checks a list of words that are generally understood to indicate spam mails. The agent can be implemented in any programming language of your choice. The pseudo-code is to be used only as a guideline for developing the callout agent. You can build additional functionality into the program.

To identify spam email by using pseudo-code

1. Accept the email subjecta provided by the NetScaler appliance.
2. Connect to the database that contains all the terms against which the email subject is checked.
3. Check the words in the email subject against the spam word list.
4. Format the response as required by the HTTP callout.
5. Send the response to the NetScaler appliance.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Use Case: Dynamiccontent switching

This use case provides dynamic content switching by using an HTTP callout to get the name of the load balancing virtual server to which the request is forwarded.

1. Add a content switching virtual server.

```
add cs vserver cs_vserver1 HTTP 10.102.29.196 80
```

2. Create an HTTP callout.

```
add policy httpCallout http_callout1
```

3. Configure the HTTP callout to respond with the name of the load balancing virtual server from a request that contains the client IP address in the HTTP header "X-CLIENT-IP".

```
> set policy httpCallout http_callout1 -IPAddress 10.217.14.23 -port 80
-returnType TEXT -hostExpr ""www.get-lbvip.com"" -urlStemExpr "\"/
index.html\"" -headers X-CLIENT-IP(CLIENT.IP.SRC) -resultExpr
"HTTP.RES.BODY(1000).AFTER_STR(\"<lbvip>\").BEFORE_STR("<lbvip")"
```

4. Configure the content switching action to retrieve the callout response.

```
add cs action cs_action1 -targetVserverExpr
'SYS.HTTP_CALLOUT(http_callout1)'
```

   Note:

   > You must bind a load balancing virtual server to the content switching virtual server to account for:

   - The non-availability of the load balancing virtual server that the callout resolves to.
   - A UNDEF condition that results from the execution of the callout.

```
> bind cs vserver cs_vserver1 -lbvserver default_lbvip
```

5. Configure the content switching policy.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add cs policy cs_policy1 -rule true -action cs_action1
```

6. Binding the content switching policy to the content switching virtual server.

```
bind cs vserver cs_vserver1 -policyName cs_policy1 -priority 10
```

Pattern sets and data sets

Policy expressions for string matching operations on a large set of string patterns tend to become long and complex. Resources consumed by the evaluation of such complex expressions are significant in terms of processing cycles, memory, and configuration size. You can create simpler, less resource-intensive expressions by using pattern matching.

Depending on the type of patterns that you want to match, you can use one of the following features to implement pattern matching:

- A pattern set is an array of indexed patterns used for string matching during default syntax policy evaluation. Example of a pattern set: image types {svg, bmp, PNG, GIF, tiff, jpg}.
- A data set is a specialized form of pattern set. It is an array of patterns of types number (integer), IPv4 address, or IPv6 address.

The difference between a `patset` and a `dataset` is that in a `dataset` we compare the boundary condition. For example, if the input string is 1.1.1.11 and supposes that the 1.1.1.1 pattern is bound to a `patset` and a `dataset` of IPv4 type, then a `patset` and dataset is configured to check whether the IP address is present in the request. After evaluation, `patset` returns that the 1.1.1.1 is present in the input, but `dataset` evaluation is false. This is because of a boundary check-in which the IP address is not been part of some other IP address. It means, after the bound pattern there must not be any integer.

Often, you can use either pattern sets or data sets. However, in cases where you want specific matches for numerical data or IPv4 and IPv6 addresses, you must use data sets.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTES:

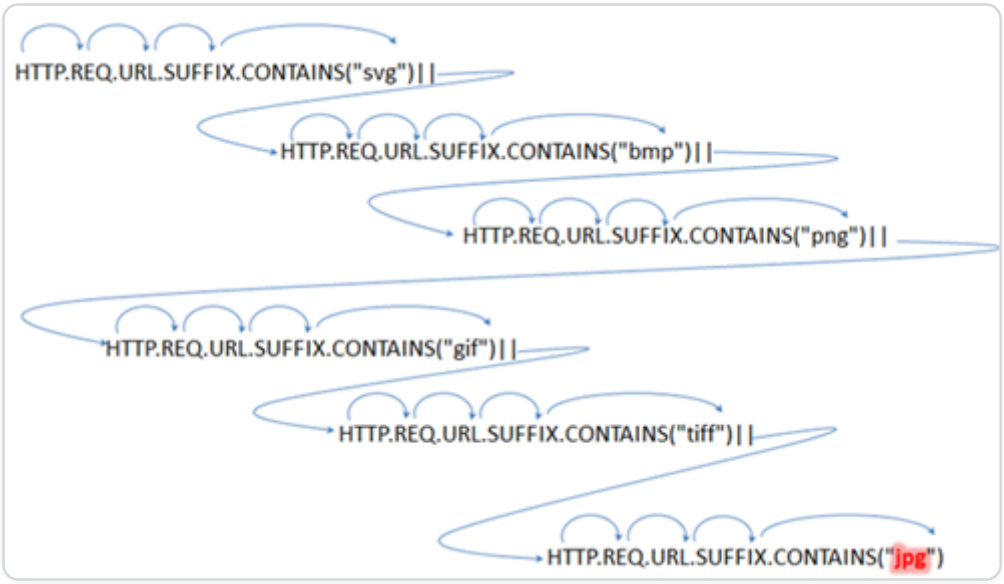
- Pattern sets and data sets can be used only in default syntax policies.
- From release 13.1 build 42.x and later, you can bind 50000 patterns to a pattern set. With the pattern set file, only 10000 patterns can be bound to a pattern set. Also, If the pattern set is used in streaming, then only 5000 patterns can be bound to that pattern set. A pattern set for streaming is used in the rewrite action search parameter, HTTP body, or TCP payload based expression.

How string matching works with pattern sets and data sets

A pattern set or data set contains a set of patterns, and each pattern is assigned a unique index. When a policy is applied to a packet, an expression identifies a string to be evaluated, and the operator compares the string to the patterns defined in the pattern set or data set until a match is found or all patterns have been compared. Then, depending on its function, the operator returns either a boolean value that indicates whether or not a matching pattern was found or the index of the pattern that matches the string.

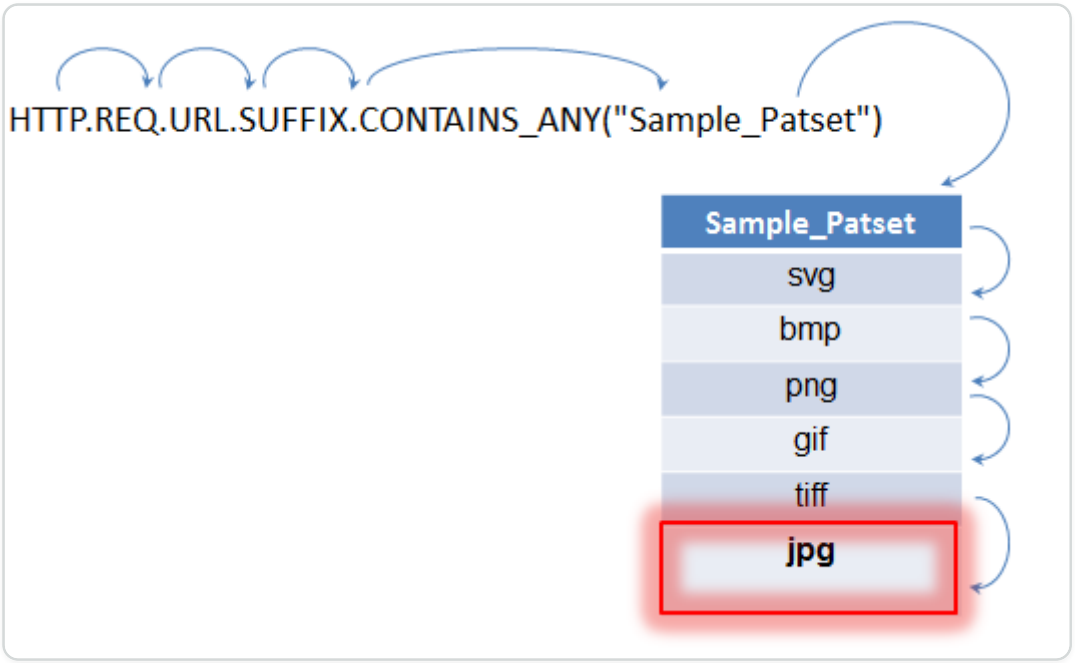
Note: This topic explains the working of a pattern set. Data sets work the same way. The only difference between pattern sets and data sets is the type of patterns defined in the set.

Consider the following use case to understand how patterns can be used for string matching.



You want to determine whether the URL suffix (target text) contains any of the image file extensions. Without using pattern sets, you would have to define a complex expression, as follows:

```
HTTP.REQ.URL.SUFFIX.CONTAINS("svg") ¦¦ HTTP.REQ.URL.SUFFIX.CONTAINS("bmp")
¦¦ HTTP.REQ.URL.SUFFIX.CONTAINS("png") ¦¦



HTTP.REQ.URL.SUFFIX.CONTAINS("gif") ¦¦
HTTP.REQ.URL.SUFFIX.CONTAINS("tiff") ¦¦
HTTP.REQ.URL.SUFFIX.CONTAINS("jpg")
```

If the URL has a suffix of "jpg," with the above compound expression, the NetScaler appliance has to iterate through the entire compound expression sequentially, from one sub expression to the next, to determine that the request refers to a jpg image. The following figure shows the steps in the process.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

When a compound expression includes hundreds of sub expressions, the above process is resource intensive. A better alternative is an expression that invokes a pattern set, as shown in the following figure.

During policy evaluation as shown above, the operator (CONTAINS_ANY) compares the string identified in the request with the patterns defined in the pattern set until a match is found. With the Sample_Patset expression, the multiple iterations through six sub expressions are reduced to just one.

By eliminating the need to configure compound expressions that perform string matching with multiple OR operations, pattern sets or data sets simplify configuration and accelerate processing of requests and responses.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configuring a Pattern Set

To configure a pattern set, you must specify the strings that are to serve as patterns. You can manually assign a unique index value to each of these patterns, or you can allow the index values to be assigned automatically.

NOTE:

Pattern sets are case sensitive (unless you specify the expression to ignore case). Therefore, the string pattern "product1," for example, is not the same as the string pattern "Product1."

Points to remember about index values:

- You cannot bind the same index value to more than one pattern.
- An automatically assigned index value is one number larger than the highest index value of the existing patterns within the pattern set. For example, if the highest index value of existing patterns in a pattern set is 104, the next automatically assigned index value is 105.
- If you do not specify an index for the first pattern, index value 1 is automatically assigned to that pattern.
- Index values are not regenerated automatically if one or more patterns are deleted or modified. For example, if the set contains five patterns, with indexes from 1 through 5, and if the pattern with an index of 3 is deleted, the other index values in the pattern set are not automatically regenerated to produce values from 1 through 4.
- The maximum index value that can be assigned to a pattern is 4294967290. If that value is already assigned to a pattern in the set, you must manually assign index values to any newly added patterns. An unused index value that is lower than a currently used value cannot be assigned automatically.

Configure a pattern set by using the command line interface

At the command prompt, do the following:

1. Create a pattern set.

   ```
   add policy patset <name>
   ```

Example:

```
add policy patset samplepatset
```

1. Bind patterns to the pattern set.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
bind policy patset <name> <string> [-index <positive_integer>][-charset
( ASCII | UTF_8 )] [-comment <string>]
```

Example:

```
bind policy patset samplepatset product1 -index 1 -comment short description
about the pattern bound to the pattern set
```

Note: Repeat this step for all the patterns you want to bind to the pattern set.

1. Verify the configuration.

```
show policy patset <name>
```

Configure a pattern set by using the configuration utility

1. Navigate to **AppExpert** > **Pattern Sets**.
2. In the details pane, click **Add** to open the **Create Pattern Set** dialog box.
3. Specify a name for the pattern set in the Name text box.
4. Under Specify Pattern, type the first pattern and, optionally, specify values for the following parameters:
   - Treat back slash as escape character—Select this check box to specify that any backslash characters that you might include in the pattern are to be treated as escape characters.
   - Index—A user assigned index value, from 1 through 4294967290.
5. Verify that you have entered the correct characters, and then click **Add**.
6. Repeat steps 4 and 5 to add more patterns, and then click **Create**.

Configure file-based pattern sets

The NetScaler appliance supports file-based pattern sets.

Configure file-based pattern sets by using the CLI

At the command prompt, type the following commands:

- Import a new pattern set file into the NetScaler appliance.

  ```
  import policy patsetfile <src> <name> -delimiter <char> -charset <ASCII
  | UTF_8>
  ```

  Example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
import policy patsetfile local:test.csv clientids_list –delimiter ,
```

You can import a file from a local device, HTTP server, or FTP server. To add the file from your local device, the file must be available in `/var/tmp` location.

- Add a pattern set file to the packet engine.

```
add policy patsetfile <patset filename>
```

Example:

```
add policy patsetfile clientids_list
```

- Update an existing pattern set file on the NetScaler appliance.

```
update policy patsetfile <patset filename>
```

Example:

```
update policy patsetfile clientids_list
```

- Bind patterns to the pattern set.

```
add policy patset <patset name> -patsetfile <patset filename>
```

Example:

```
add policy patset clientid_patset -patsetfile clientids_list
```

- Verify the configuration.

```
show policy patsetfile clientids_list

Name: clientids_list

Patset Name: clientid_patset
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Number of Imported Patterns: 8

Number of Bound Patterns: 8

(All the patterns bound successfully)

Done
```

Configure file-based pattern sets by using the GUI

1. Navigate to **AppExpert-> Pattern Set Files**.
2. In the **Imported** pane, click **Import**.
3. In the **Configure Policy Patset File** page, select the file you want to import, and click **OK**.
4. Select the imported file, and click **Add**.
5. In the **Create Policy Patset File** page, enter the details, and click **Create** to add a policy pattern set.

Configuring a data set

To configure a data set, you must specify the strings that server as a pattern, assign a type (number, IPv4 address, or IPv6 address) and configure the dataset range. You can manually assign a unique index value to the pattern, or you can allow the index values to be assigned automatically. Dataset is not related to HTTP or any 7-layer protocol. It works only on text or string. There are different types of dataset such as NUM, ULONG, IPv4, IPv6, MAC, DOUBLE. You can select a type and define the dataset range based on the specified type.

NOTE:

Policy data sets are case sensitive (unless you specify the expression to ignore case). Therefore, the MAC address ff:ff:ff:ff:ff:ff for example, is not the same as the MAC address FF:FF:FF:FF:FF:FF.

The rules applied for index values of data sets are similar to pattern sets. For information about index values, see Configuring a Pattern Set.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure a data set

Complete the following steps to configure a data set:

1. Add a policy dataset
2. Bind pattern to a policy dataset
3. Add a policy expression
4. Verify the policy configuration

Add a policy dataset

At the command prompt, do the following:

```
add policy dataset <name> <type>
```

Example:

```
add policy dataset ds1 ipv4 -comment numbers
```

Bind a pattern to the data set

At the command prompt, type:

```
bind policy dataset <name> <value> [-index <positive_integer>] [-endRange <string>] [-comment <string>]
```

Example:

```
bind policy dataset ds1 1.1.1.1 -endRange 1.1.1.10 -comment short description about the pattern bound to the data set
```

NOTE:

You must repeat this step for all the patterns you want to bind to the data set. You can bind only up to 5000 patterns to a dataset.

And, a dataset range must not overlap with other ranges bound to a dataset and cannot include single values bound to the dataset. If you bind a dataset with an overlapping range results in an error.

Example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add policy dataset ip_set ipv4

 Done

bind policy dataset ip_set 2.2.2.25

 Done

bind policy dataset ip_set 2.2.2.20 -endRange 2.2.2.30

ERROR: The range overlaps an existing range or includes a value bound to
the dataset.
```

A value is considered to be in the dataset if it is either equal to a single value bound to the data set or is between the lower-value and upper-value (lower-value <= value && value <- upper-value), for a range bound to the data set.

Use policy expression in a policy data set

At the command prompt, type:

```
add policy expression exp1 http.req.body(100).contains_any("ds1")
```

Where, The expression checks whether there is any pattern (or pattern within the range) bound to the dataset ds1 is present in the first 100 bytes of the HTTP request body.

Verify dataset configuration

At the command prompt, type:

```
show policy dataset ds1
```
```
> show policy dataset ds1
```

Example:

```
       Dataset:        ds1

        Type:   IPV4

1)      Bound Dataset Range from: 1.1.1.1       through: 1.1.1.10
Index:  1
```

Configure a data set by using the configuration utility

Follow the steps given below to configure a policy dataset:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. Navigate to **AppExpert > Data Sets**.
2. In the details pane, under Data Sets, click **Add**.
3. In the **Configure Data Set** page, set the following parameters.

    a. Name. Name of the policy data set.

    b. Type. Type of value to bind to the dataset.

    Configuring data set

4. Click **Insert** to bind the dataset value of specific type.

    a. Value. Value of the specified type associated with the dataset.

    b. Index. The index value of the dataset.

    c. End range. The dataset entry. This is a range `<value>` to `<end_range>`.

    d. Comments. A short description about the data set.

    dataset binding

5. Click **Insert** and **Close**.
6. Enter comments.
7. Click **Create** and **Close**.

CIDR subnet notation in IPv4 and IPv6 addresses for policy dataset

The Policy datasets for IPv4 and IPv6 address allow the bound value to be subnets using the CIDR notation. The CIDR notation specifies the address and the range of the subnet. CIDR notation `<address>/<n>`, where `<address>` is the first address in the subnet and `<n>` is an integer specifying the number of left-most bits set in the subnet mask, which defines the range of the subnet.

For example, 192.128.0.0/10 represents an IPv4 subnet starting at address 192.129.0.0 with a mask 0xFFC0000 (255.192.0.0).

Example:

```
add policy dataset ds1 ipv4

bind policy dataset ds1 192.128.0.0/10
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
show policy dataset ds1

    Dataset: ds1

    Type: IPV4

Bound Dataset Value: 192.128.0.0/10 Index: 1 Comment: Subnet range from
192.128.0.0 through 192.191.255.255
```

An example to use this dataset in an expression:

```
add responder policy resp_ipv4_pol
client.ip.src.typecast_text_t.equals_any("ds1") drop
```

Example of an IPv6 subnet:

An example of an IPv6 subnet would be 2001:db8:123::/56, which starts at address 2001:db8:123:: with a mask FFFF:FFFF:FFFF:FF00::

```
add policy dataset ds2 ipv6

bind policy dataset ds2 2001:db8:123::/56

show policy dataset ds2

    Dataset: ds2

    Type: IPV61

Bound Dataset Value: 2001:db8:123::/56 Index: 1 Comment: Subnet range from
2001:db8:123:: through 2001:db8:123:ff:ffff:ffff:ffff:ffff
```

The starting address of the subnet will be determined by the specified address masked by the subnet mask. A warning is issued if the specified address does not match the resulting starting address.

Example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
bind policy dataset ds1 192.168.0.0/10

Warning: Starting subnet address masked using subnet mask to create new
starting address [192.128.0.0]

show policy dataset ds1

    Dataset: ds1

    Type: IPV4

Bound Dataset Value:192.168.0.0/10 Index: 1 Comment: Subnet range from
192.128.0.0 through 192.191.255.255
```

An example to use this dataset in an expression:

```
add responder policy resp_ipv6_pol
client.ipv6.src.typecast_text_t.equals_any("ds2") drop
```

Using pattern sets and data sets

Advanced policy expressions that take pattern sets or data sets as an argument can be used to perform string matching operations.

The usage is as follows:

```
<text>.<operator>("<name>")
```

where,

- `<text>` is the expression that identifies a string in a packet. Example: HTTP.REQ.HEADER("Host").
- `<operator>` is one of the operators described in the Pattern Set Types table pdf.

For sample usage, see Sample Usage.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Sample usage

To understand the usage of pattern sets in expressions, consider the example of a pattern set named "imagetypes."

PATTERNS	INDEX VALUE
svg	1
bmp	2
png	3
gif	4
tiff	5
jpg	6

Table 1. Pattern set "imagetypes"

Example 1: Determine whether the suffix of an HTTP request is one of the file extensions defined in the "imagetypes" pattern set.

- **Expression.** HTTP.REQ.URL.SUFFIX.EQUALS_ANY("imagetypes")
- **Sample URL.** `http://www.example.com/homepageicon.jpg`
- **Result.** TRUE

Example 2: Determine whether the suffix of an HTTP request is one of the file extensions defined in the "imagetypes" pattern set, and return the index of that pattern.

- **Expression.** HTTP.REQ.URL.SUFFIX.EQUALS_INDEX("imagetypes")
- **Sample URL.** `http://www.example.com/mylogo.gif`
- **Result.** 4 (The index value of the pattern "gif".)

Example 3: Use the index value of a pattern to determine whether the URL suffix is within a specified index-value range.

- **Expression.** HTTP.REQ.URL.SUFFIX.EQUALS_INDEX("imagetypes").GE(3) && HTTP.REQ.URL.SUFFIX.EQUALS_INDEX("imagetypes").LE(5)
- **Sample URL.** `http://www.example.com/mylogo.gif`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Result.** TRUE (The index value of gif file types is 4.)

Example 4: Implement one set of policies for file extensions bmp, jpg, and png, and a different set of policies for gif, tiff, and svg files.

An expression that returns the index of a matched pattern can be used to define traffic subsets for a web application. The following two expressions could be used in content switching policies for a content switching virtual server:

- HTTP.REQ.URL.SUFFIX.EQUALS_INDEX("imagetypes").LE(3)
- HTTP.REQ.URL.SUFFIX.EQUALS_INDEX("imagetypes").GE(4)

Variables

Variables are named objects that store information in the form of tokens. These tokens are used within and across different transactions on the NetScaler Appliance for internal computation and policy processing.

The NetScaler appliance supports creation of variables of the following types:

- **Singleton variables.** Can have a single value of one of the following types: ulong and text (max-size). The ulong type is an unsigned 64-bit integer, the text type is a sequence of bytes, and max-size is the maximum number of bytes in the sequence.
- **Map variables.** Maps hold values associated with keys: each key-value pair is called a map entry. The key for each entry is unique within the map. Maps are specified as follows:

  map (key_type, value_type, max-values).

  where,

  - *key_type* is the data type of the key. It is of type text (max-size).
  - *value_type* is the data type of the values of the map. It can be of type ulong or text (max-size).
  - *max-values* is the maximum number of entries that the map can contain. It is of type ulong.

Values for these variables are set using assignments which must be invoked on policy actions.

Variables Scope

A map variable or a singleton variable can have a global scope. Alternatively, the scope of a singleton variable can be limited to a single transaction.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Global Scope Variable** - A variable with global scope (the default) has only one instance, and that instance has the same value(s) across all cores of a NetScaler appliance and across all nodes of a cluster or HA configuration. Global variable values exist until they are explicitly deleted, until they expire, or until a standalone appliance is restarted or all nodes of a cluster or HA configuration are restarted.
- **Transaction Scope Variable** - A variable with transaction scope has a separate instance, with its own value, for each transaction processed by the NetScaler appliance. When the transaction processing is complete, the transaction variable value is deleted.

NOTE

. Transaction scope variables are available in NetScaler release 10.5.e or later.

Configuring and Using Variables

You must first create a variable and then assign a value or specify the operation that must be performed on the variable. After performing these operations, you can use the assignment as a policy action.

Note: Once configured, a variable's settings cannot be modified or reset. If the variable needs to be changed, the variable and all references to the variable (expressions and assignments) must be deleted. The variable can then be re-added with new settings, and the references (expressions and assignments) can be re-added.

To configure variables by using the command line interface

1. Create a variable.

```
add ns variable <name> -type <string> [-scope global] [-ifFull ( undef |
lru )] [-ifValueTooBig ( undef | truncate )] [-ifNoValue ( undef | init )]
[-init <string>] [-expires <positive_integer>] [-comment <string>]
```

Note: Refer to the man page "man add ns variable" for description of the command parameters.

Example 1: Create a ulong variable named "my_counter" and initialize it to 1.

```
add ns variable my_counter –type ulong -init 1
```

Example 2: Create a map named "user_privilege_map". The map will contain keys of maximum length 15 characters and text values of maximum length 10 characters, with a maximum of 10000 entries.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add ns variable user_privilege_map -type map(text(15),text(10),10000)
```

Note: If the map contains 10000 unexpired entries, assignments for new keys reuse one of the least recently used entries. By default, an expression trying to get a value for a non-existent key will initialize an empty text value.

Assign the value or specify the operation to be performed on the variable. This is done by creating an assignment.

```
add ns assignment <name> -variable <expression> [-set <expression> | -add
<expression> | -sub <expression> | -append <expression> | -clear] [-
comment <string>]
```

Note: A variable is referenced by using the variable selector ($). Therefore, **$variable1** is used to refer to text or ulong variables. Similarly, **$variable2** is used to refer to map variables.

Example 1: Define an assignment named "inc_my_counter" that automatically adds 1 to the "my_counter" variable.

```
add ns assignment inc_my_counter -variable $my_counter -add 1
```

Example 2: Define an assignment named "set_user_privilege" that adds to the "user_privilege_map" variable an entry for the client's IP address with the value returned by the "get_user_privilege" HTTP callout.

```
add ns assignment set_user_privilege -variable
$user_privilege_map[client.ip.src.typecast_text_t] -set
sys.http.callout(get_user_privilege)
```

Note: If an entry for that key already exists, the value will be replaced. Otherwise a new entry for the key and value will be added. Based on the previous declaration for user_privilege_map, if the map already has 10000 entries, one of the least recently used entries will be reused for the new key and value.

1. Invoke the variable assignment in a policy.

   There are two functions that can operate on map variables.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **$name.valueExists(key-expression).** Returns true if there is a value in the map selected by the key-expression. Otherwise returns false. This function will update the expiration and LRU information if the map entry exists, but will not create a new map entry if the value does not exist.
- **$name.valueCount.** Returns the number of values currently held by the variable. This is the number of entries in a map. For a singleton variable, this is 0 if the variable is uninitialized or 1 otherwise.

Example: Invoke the assignment named "set_user_privilege" with a compression policy.

```
add cmp policy set_user_privilege_pol -rule
$user_privilege_map.valueExists(client.ip.src.typecast_text_t).not
-resAction set_user_privilege
```

Use Case to Insert HTTP header in the Response Side

The following example shows an example of a singleton variable.

Add a singleton variable of type text. This variable can hold maximum 100 Bytes data.

```
add ns variable http_req_data -type text(100) -scope transaction
```

Add an assignment action, which will be used to store the HTTP request data into the variable.

```
add ns assignment set_http_req_data -variable $http_req_data -set
http.req.body(100)
```

Add a rewrite action to insert HTTP header, whose value will be fetched from the variable.

```
add rewrite action act_ins_header insert_http_header user_name
$http_req_data.after_str("user_name").before_str("password")
```

Add a rewrite policy which will evaluate in the request time, and take assignment action to store data. When we hit this policy, we'll take assignment action and store the data into the ns variable (http_req_data)

```
add rewrite policy pol_set_variable true set_http_req_data
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
bind rewrite global pol_set_variable 10 -type req_dEFAULT
```

Add a rewrite policy which will evaluate in the response time, and add an HTTP header in the response.

```
add rewrite policy pol_ins_header true act_ins_header

bind rewrite global pol_ins_header 10 -type res_dEFAULT
```

Assignment action

In a NetScaler appliance, an assignment action bound to the policy is triggered when the policy rule evaluates to true. The action updates the value in the variable which can be used in subsequent policy rule evaluations. This way, the same variable can be updated and used for subsequent policy evaluations in the same feature. Previously, the appliance executed assignment actions only after evaluating all of the policies in the feature when the policies of the associated assignment actions evaluated to true. Therefore, the variable value set by the assignment action cannot be used in the subsequent policy rule evaluations within the feature.

This functionality can be understood better with a use case that controls access list for clients on a NetScaler appliance. The access decision is provided by a separate web service, with the request `GET /client-access?<client-IP-address>` which returns a response with “BLOCK” or “ALLOW” in the body. The HTTP callout is configured to include the IP address of the client that is associated with an incoming request. When the NetScaler appliance receives a request from a client, the appliance generates the callout request and sends it to the callout server, which hosts a database of blacklisted IP addresses and an HTTP callout agent that checks whether the client’s IP address is listed in the database. The HTTP callout agent receives the callout request, checks whether the client’s IP address is listed, and sends a response. The response is a status code, 200, 302 along with “BLOCK” or “ALLOW” in the body. Based on the status code, the appliance performs the policy evaluation. If the policy evaluation is true, the assignment action is triggered immediately and action sets the value to the variable. The appliance uses and sets this variable value for subsequent policy evaluation in the same module.

Use case for configuring assignment action

Follow the steps below to configure assignment action and use variable for subsequent policies:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. The access decision is provided by a separate web service, with the request which returns a response with BLOCK or ALLOW in the body.

   ```
   GET /url-service>/url-allowed?<URL path>
   ```

2. Set up a map variable to hold the access decisions for URLs.

   ```
   add ns variable url_list_map -type 'map(text(1000),text(10),10000)'
   ```

3. Set up an HTTP callout to send the access request to the web service.

   ```
   add policy httpCallout url_list_callout -vserver url_vs -returnType TEXT
   -urlStemExpr '"/url-allowed?" + HTTP.REQ.URL.PATH' -resultExpr
   'HTTP.RES.BODY(10)'
   ```

4. Set up an assignment action to invoke the callout to get the access decision and assign it to the map entry for the URL.

   ```
   add ns assignment client_access_assn -variable
   '$client_access_map[CLIENT.IP.SRC.TYPECAST_TEXT_T]' -set
   SYS.HTTP_CALLOUT(client_access_callout)
   ```

5. Set up a responder action to send a 403 response if a URL request is blocked.

   ```
   add responder action url_list_block_act respondwith '"HTTP/1.1 403 Forbidden\
   \r\\n\\r\\n"'
   ```

6. Set up a responder policy to set the map entry for the URL if it is not already set. With the immediate action enhancement, the map entry value is set when this policy is evaluated. Prior to the enhancement, the assignment was not done until all responder policies had been evaluated decision is provided by a separate web service.

   ```
   add responder policy url_list_assn_pol '!
   $url_list_map.VALUEEXISTS(HTTP.REQ.URL.PATH)' url_list_assn
   ```

7. Set up a responder policy to block access to a URL if its map entry value is BLOCK. With the immediate action enhancement, the map entry set by the preceding policy is available for use in this policy. Prior to the enhancement, the map entry would still be unset at this point.

   ```
   add responder policy client_access_block_pol
   '$client_access_map[CLIENT.IP.SRC.TYPECAST_TEXT_T] == "BLOCK"'
   client_access_block_act
   ```

8. Bind the responder policies to the virtual server. **Note**: We cannot globally bind the policies because we don't want to execute them for the HTTP callout on a separate virtual server.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

`bind lb vserver vs -policyName client_access_assn_pol -priority 10 -gotoPriorityExpression NEXT -type REQUEST` `bind lb vserver vs -policyName client_access_block_pol -priority 20 -gotoPriorityExpression END -type REQUEST`

To configure variables by using the configuration utility

1. Navigate to **AppExpert > NS Variables**, to create a variable.
2. Navigate to **AppExpert > NS Assignments**, to assign value(s) to the variable.
3. Navigate to the appropriate feature area where you want to configure the assignment as an action.

Use Case: Caching User Privileges

In this use case, user privileges ("GOLD", "SILVER", and so on) must be retrieved from an external web service.

To achieve this use case, perform the following operations

Create an HTTP callout to fetch the user privileges from the external web service.

```
add policy httpcallout <name> [-IPAddress <ip_addr|ipv6_addr>] [-port
<port>] [-vServer <string>] [-returnType <returnType>] [-httpMethod (GET |
POST )] [-hostExpr <string>] [-urlStemExpr <string>] [-headers
<name(value)> ...] [-parameters <name(value)> ...] [-bodyExpr <string>][-
fullReqExpr <string>] [-scheme ( http | https )] [-resultExpr <string>] [-
cacheForSecs <secs>] [-comment <string>]

add policy httpcallout get_user_privilege -ipaddress 10.217.193.84 -port
80 -returnType text -httpMethod GET -hostExpr '"/get_user_privilege"'
-resultExpr 'http.res.body(5)'
```

Store the privileges in a variable.

```
add ns variable <name> -type <string> [-scope ( global | transaction )][-
ifFull ( undef | lru )] [-ifValueTooBig ( undef | truncate )][-ifNoValue
( undef | init )] [-init <string>] [-expires <positive_integer>] [-comment
<string>]
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add ns variable user_privilege_map -type map(text(15),text(10),10000)
-expires 1200

add ns assignment set_user_privilege -variable
$user_privilege_map[client.ip.src] -set
sys.http_callout(get_user_privilege)
```

Create a policy to check if there is already a cached entry for the client's IP address; if not, it calls the HTTP callout to set a map entry for the client.

```
add cmp policy <name> -rule <expression> -resAction <string>

add cmp policy set_user_privilege_pol -rule
$user_privilege_map.valueExists(client.ip.src).not -resAction
set_user_privilege>
```

Create a policy that compresses if the cached privilege entry for the client is "GOLD".

```
add cmp policy <name> -rule <expression> -resAction <string>

add cmp policy compress_if_gold_privilege_pol -rule
'$user_privilege_map[client.ip.src].eq("GOLD")' -resAction compress
```

Bind the compression policies globally.

```
bind cmp global <policyName> [-priority <positive_integer>] [-state
(ENABLED | DISABLED )] [-gotoPriorityExpression <expression>] [-type
<type>] [-invoke (<labelType> <labelName>) ]

bind cmp global set_user_privilege_pol -priority 10 NEXT
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
bind cmp global compress_if_gold_privilege_pol -priority 20 END
```

Use Case: Limiting the Number of Sessions

In this use case, the requirement is to limit the number of active back-end sessions. In the deployment, each session login has login in the URL and each session logout has logout in the URL. On successful login, the back-end sets a session id cookie with a unique ten character value.

To achieve this use case, perform the following operations:

1. Create a map variable that can store each active session. The key of the map is the session id. The expiry time for the variable is set to 600 seconds (10 minutes).

   ```
   > add ns variable session_map -type map(text(10),ulong,100) -expires
   600
   ```

2. Create the following assignments for the map variable:

   - Create an entry for the session id and set that value to 1 (this value is not used).

     ```
     > add ns assignment add_session -variable
     '$session_map[http.req.cookie.value("sessionid")]' -set 1
     ```

   - Deallocate the entry for a session ID, which implicitly decrements the value count for session_map.

     ```
     > add ns assignment delete_session -variable
     '$session_map[http.req.cookie.value("sessionid")]' -clear
     ```

3. Create responder policies for the following:

   - To check if a map entry exists for that session id in the HTTP request. The add_session assignment is run if the map entry does not exist.

     ```
     > add responder policy add_session_pol
     'http.req.url.contains("example") ||
     $session_map.valueExists(http.req.cookie.value("abc"))' add_session
     ```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Note: The valueExists() function in the add_session_pol policy counts as a reference to the session's map entry, so each request resets the expiration timeout for its session. If no requests for a session are received after 10 minutes, the session's entry will be deallocated.

- To check when the session is logged out. The delete_session assignment is run.

```
add responder policy delete_session_pol
"http.req.url.contains(\"Logout\")" delete_session
```

- To check for login requests and if the number of active sessions exceed 100. If these conditions are satisfied, to limit the number of sessions, the user is redirected to a page that indicates that the server is busy.

```
add responder action redirect_too_busy redirect "\"/too_busy.html\""

add responder policy check_login_pol
"http.req.url.contains(\"example\") && $session_map.valueCount >
100" redirect_too_busy
```

4. Bind the responder policies globally.

```
bind responder global add_session_pol 30 next

bind responder global delete_session_pol 10

bind responder global check_login_pol 20
```

Policies and expressions

The following topics provide the conceptual and reference information that you require for configuring advanced policies on the NetScaler.

To know about all the advanced policy expressions supported on the NetScaler, see Policy Expressions.

TOPIC	DESCRIPTION
Introduction to Policies and Expressions	Describes the purpose of expressions, policies, and actions, and how different NetScaler applications make use of them.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

TOPIC	DESCRIPTION
Configuring Advanced Policies	Describes the structure of advanced policies and how to configure them individually and as policy banks.
Configuring Advanced Expressions: Getting Started	Describes expression syntax and semantics, and briefly introduces how to configure expressions and policies.
Advanced Expressions: Evaluating Text	Describes expressions that you configure when you want to operate on text (for example, the body of an HTTP POST request or the contents of a user certificate).
Advanced Expressions: Working with Dates, Times, and Numbers	Describes expressions that you configure when you want to operate on any type of numeric data (for example, the length of a URL, a client's IP address, or the date and time that an HTTP request was sent).
Advanced Expressions: Parsing HTTP, TCP, and UDP Data	Describes expressions for parsing IP and IPv6 addresses, MAC addresses, and data that is specific to HTTP and TCP traffic.
Advanced Expressions: Parsing SSL Certificates	Describes how to configure expressions for SSL traffic and client certificates, for example, how to retrieve the expiration date of a certificate or the certificate issuer.
Advanced Expressions: IP and MAC Addresses, Throughput, VLAN IDs	Describes expressions that you can use to work with any other client-related or server-related data not discussed in other chapters.
Typecasting Data	Describes expressions for transforming data of one type to another.
Regular Expressions	Describes how to pass regular expressions as arguments to operators in advanced expressions.
Expressions Reference	A reference for advanced expression arguments.

TOPIC	DESCRIPTION
Summary Examples of Advanced Expressions and Policies	Examples of advanced expressions and policies, in both quick reference and tutorial format, that you can customize for your own use.
Tutorial Examples of Advanced Policies for Rewrite	Examples of advanced policies for use in the Rewrite feature.
Tutorial Examples of Policies	Examples of policies for NetScaler features such as application firewall and SSL.
Migration of Apache mod_rewrite Rules to Advanced Policies	Examples of functions that were written using the Apache HTTP Server mod_rewrite engine, with examples of these functions after translation into Rewrite and Responder policies on the NetScaler.

Introduction to policies and expressions

For many NetScaler features, policies control how a feature evaluates data. A policy uses a logical expression, called as rule, to evaluate data, and applies one or more actions based on evaluation. Alternatively, a policy can apply a profile, which defines a complex action.

Some NetScaler features use Advanced policies, which provide greater capabilities than older classic policies. If you have migrated to a newer release of the NetScaler software and have configured classic policies for features that use Advanced policies, you have to manually migrate policies to advanced policy infrastructure.

Advanced policy Infrastructure

The advanced policy infrastructure enables you to analyze many pieces of data (for example, the body of an HTTP request) and to configure many operations in the policy rule (for example, transforming data in the body of a request into an HTTP header). You must bind the policy to a particular point in the processing associated with the NetScaler features. The bind point is one factor that determines when the policy will be evaluated.

Benefits of using advanced policies

Advanced policies use a powerful expression language that is built on a class-object model, and they offer several options that enhance your ability to configure the behavior of various NetScaler features. With advanced policy infrastructure, you can do the following:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Perform fine-grained analyses of network traffic from layers 2 through 7.
- Evaluate any part of the header or body of an HTTP or HTTPS request or response.
- Bind policies to the multiple bind points that the advanced policy infrastructure supports at the default, override, and virtual server levels.
- Use special tools such as pattern sets, policy labels, rate limit identifiers, HTTP callouts, and variables, which enable you to configure policies effectively for complex use cases.

Also, the configuration utility extends robust GUI support for advanced policy infrastructure and expressions and enables users who have limited knowledge of networking protocols to configure policies quickly and easily. The configuration utility also includes a policy evaluation feature for advanced policies. You can use this feature to evaluate an advanced policy and test its behavior before you commit it, thus reducing the risk of configuration errors.

Basic components of an advanced policy

Following are a few characteristics of an Advanced policy:

- Name. Each policy has a unique name.
- Rule. The rule is a logical expression that enables the NetScaler feature to evaluate a piece of traffic or another object. For example, a rule can enable the NetScaler to determine whether an HTTP request originated from a particular IP address, or whether a Cache-Control header in an HTTP request has the value “No-Cache.”
- Bindings. To ensure that the NetScaler can invoke a policy when it is needed, you associate the policy, or bind it, to one or more bind points.

  You can bind a policy globally or to a virtual server. For more information, see About policy bindings.
- An associated action. An action is a separate entity from a policy. Policy evaluation ultimately results in the NetScaler performing an action.

  For example, a policy in the integrated cache can identify HTTP requests for .gif or .jpeg files. An action that you associate with this policy determines that the responses to these types of requests are served from the cache.

For some features, you configure actions as part of a more complex set of instructions known as a profile.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

How different NetScaler® features use policies

The NetScaler supports various features that rely on policies for operation. The following table summarizes how the NetScaler features use policies.

FEATURE NAME	HOW YOU USE POLICIES IN THE FEATURE
Rewrite	To identify the data that you want to modify before serving. The policies provide rules for modifying the data. For example, you can modify HTTP data to redirect a request to a new home page, or a new server, or a selected server based on the address of the incoming request, or you can modify the data to mask server information in a response for security purposes. The URL Transformer function identifies URLs in HTTP transactions and text files for evaluating whether a URL must be transformed.
Responder	To configure the behavior of the Responder function. A responder policy is based on a rule, which consists of one or more expressions. The rule is associated with an action, which is performed if a request matches the rule.
Content Switching	To determine what server or group of servers is responsible for serving responses, based on the characteristics of an incoming request. Request characteristics include device type, language, cookies, HTTP method, content type, and associated cache server.
Cache Redirection	To determine whether responses are served from a cache or from an origin server.
Compression Control	To determine what type of traffic must be compressed.
DNS	To modify various portions of DNS requests and responses

© 1997–2026 Citrix Systems, Inc. All rights reserved.

FEATURE NAME	HOW YOU USE POLICIES IN THE FEATURE
VPN clientless access	To determine how the NetScaler Gateway performs authentication, authorization, auditing, and other functions, and to define rewrite rules for general Web access using the NetScaler Gateway.
Cache	To determine whether to serve a response from the cache or the origin server.
URL Transform Policy	To select the requests and responses that the NetScaler must transform by using the URL transformation profile.
Application Firewall Policy	To assign different filtering rules to different types of web content.
Authorization	To provide access to the requested content without exposing unnecessary details about the website's actual configuration.
TM traffic	To set the characteristics (such as connection timeout, single sign-on, and initiating logout) of application traffic at run time.
TM session	To customize user sessions after the user logs on to the Authorization, Authorization, and Accounting virtual server.
SSL Policies	To define a control or a data action to be performed on requests. SSL policies can therefore be categorized as control policies and data policies. A control policy uses a control action, such as forcing client authentication. A data policy uses a data action, such as inserting some data into the request.
Autoscale	To scale the number of virtual servers up or down seamlessly and automatically according to the defined conditions.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

FEATURE NAME	HOW YOU USE POLICIES IN THE FEATURE
AppFlow	To allow NetScaler to export flow data to collection tools, often to be used for network or security analysis.
Content optimization	To reduce transaction times between the clients and the servers, and reduce bandwidth consumption. Also to enhance server performance by offloading some tasks and making others more efficient.
Spillover	To use a NetScaler rule to specify the conditions for spillover to occur. The rules give you the flexibility to configure spillover for various operational conditions.
ICA	To dynamically generate an ICAP request, receive the ICAP response, and log content inspection data.
VPN Session	On a NetScaler Gateway, to configure Endpoint Analysis (EPA) to check if a user device meets certain security requirements and accordingly allow access of internal resources to the user.
VPN Traffic	On a NetScaler Gateway, to configure Endpoint Analysis (EPA) to check if a user device meets certain security requirements and accordingly allow access of internal resources to the user.
syslog	To define which messages to log to the specified syslog server.
nslog	To define which messages to log to the specified nslog server.
Video Optimization Detection	To create a user-defined video optimization detection policy label, to which you can bind detection policies. A policy label is a tool for evaluating a set of policies in a specified order.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

FEATURE NAME	HOW YOU USE POLICIES IN THE FEATURE
	By using a policy label, you can configure the video optimization feature to choose the next policy, invoke a different policy label, or terminate a policy evaluation completely by looking at whether the previous policy evaluated to TRUE or FALSE.
Tunneling	To define the type of compression to be used for the tunneled traffic.
Content Inspection	To specify requests that the NetScaler ADC intercepts and runs the specified action.
VPN URL	To create a bookmark link to an external or internal resource that appears on the Access Interface, according to type, as a website link or file share link.
Bot	To create a user-defined bot policy label, to which you can bind policies. A policy label is a tool for evaluating a set of policies in a specified order. By using a policy label, you can configure the responder feature to choose the next policy, invoke a different policy label, or terminate a policy evaluation completely by looking at whether the previous policy evaluated to TRUE or FALSE.
VPN intranet application policy	To define intranet applications to be made accessible through a NetScaler Gateway.
SmartAccess	To create an ICA access profile that specifies the status of the features(Default or Disabled).
Load Balancing	To define how to distribute the client connections among the load-balanced servers that it manages.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

About actions and profiles

Policies do not themselves take action on data. Policies provide read-only logic for evaluating traffic. To enable a feature to perform an operation based on a policy evaluation, you configure actions or profiles and associate them with policies.

NOTE:

Actions and profiles are specific to particular features. For information about assigning actions and profiles to features, see the documentation for the individual features.

ABOUT ACTIONS

Actions are steps that the NetScaler takes, depending on the evaluation of the expression in the policy. For example, if an expression in a policy matches a particular source IP address in a request, the action that is associated with this policy determines whether the connection is permitted.

The types of actions that the NetScaler can take are feature specific. For example, in Rewrite, actions can replace text in a request, change the destination URL for a request, and so on. In Integrated Caching, actions determine whether HTTP responses are served from the cache or an origin server.

In some NetScaler features actions are predefined, and in others they are configurable. In some cases (for example, Rewrite), you configure the actions using the same types of expressions that you use to configure the associated policy rule.

NOTE:

Not all combinations of feature, protocol, direction, and entity are valid.

ABOUT PROFILES

Some NetScaler features enable you to associate profiles, or both actions and profiles, with a policy. A profile is a collection of settings that enable the feature to perform a complex function. For example, in the application firewall, a profile for XML data can perform multiple screening operations, such as examining the data for illegal XML syntax or evidence of SQL injection.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

About policy bindings

A policy is associated with, or bound to an entity that enables the policy to be invoked. For example, you can bind a policy to request-time evaluation that applies to all virtual servers. A collection of policies that are bound to a particular bind point constitutes a policy bank.

Following is an overview of the different types of bind points for a policy:

- Request time global. A policy can be available to all components in a feature at request time.
- Response time global. A policy can be available to all components in a feature at response time.
- Request time, virtual server-specific. A policy can be bound to request-time processing for a particular virtual server. For example, you can bind a request-time policy to a cache redirection virtual server to ensure that particular requests are forwarded to a load balancing virtual server for the cache, and other requests are sent to a load balancing virtual server for the origin.
- Response time, virtual server-specific. A policy can also be bound to response-time processing for a particular virtual server.
- User-defined policy label. For advanced policy infrastructure, you can configure custom groupings of policies (policy banks) by defining a policy label and collecting a set of related policies under the policy label.
- Other bind points. The availability of additional bind points depends on type of advanced policy, and the specifics of the relevant NetScaler feature.

For additional information about advanced policy bindings, see Bind policies that use the advanced policies topic.

About evaluation order of policies

The features in the NetScaler are processed in a certain order, which includes evaluating the policies for the feature and performing the actions selected. For more information, see Packet flow.

At any one point in message processing, policy evaluation is performed depending on the combination of the following:

- Protocol (such HTTP, SIP TCP, or Diameter)
- Direction (request or response)
- Feature (such as Rewrite, Responder, or Bot)

The combinations cannot be mixed up. Policies are evaluated in groups of policies called banks (also called policy labels or bind points) in the following order:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. Global override
2. Specific LB virtual server used
3. If any specific CS virtual server used
4. Global default

Within a bank, policies are evaluated from the lowest numbered priority to the highest. If a policy rule evaluates to false, evaluation automatically goes to the next higher numbered priority in the same bank. If there are no policy rules in the same bank, then the evaluation falls to the first policy of the next bank in the order. If there are no more policies, then policy evaluation ends. If a policy rule evaluates to true, the corresponding action or profile is remembered for possible later execution.

If the policy is evaluated to true, then the "gotoPriorityExpression" value is checked. If "gotoPriorityExpression" is "END" then policy evaluation stops. If "NEXT" then the next policy (as described above) gets evaluated. If it is an expression then that expression is evaluated and the policy with that priority is selected next.

NOTE

The default "gotoPriorityExpression" value except for policy labels is "END". However, for some features that can run all the actions, we recommend you to explicitly specify the "gotoPriorityExpression" value.

Once policy evaluation stops, the feature runs the ordered list of actions or profiles. The features either run all actions (for example Rewrite) or run one action (for example, Responder or Bot). If more than one action or profile is associated with a feature that can only run one, the standard is to run the last one. If there are no actions or profiles selected, then the feature performs its default action.

Order of evaluation based on traffic flow

Some policies affect the outcome of other policies. Following are examples:

- If a response is served from the integrated cache, some other NetScaler features do not process the response or the request that initiated it.
- If the application firewall rejects an incoming request, no other features can process it.
- Most actions that are performed by Responder stops further processing.
- The Drop and Reset actions performed by Rewrite stops further processing.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Advanced policy expressions

One of the most fundamental components of a policy is its rule. A policy rule is a logical expression that enables the policy to analyze traffic. Most of the policy's functionality is derived from its expression.

An expression matches characteristics of traffic or other data with one or more parameters and values. For example, an expression can enable the NetScaler to accomplish the following:

- Determine whether a request contains a certificate.
- Determine the IP address of a client that sent a TCP request.
- Identify the data that an HTTP request contains (for example, a popular spreadsheet or word processing application).
- Calculate the length of an HTTP request.

About advanced policy expressions

Any feature that uses advanced policy infrastructure also uses Advanced expressions. For information about which features use Advanced policies, see the table NetScaler Feature, Policy Type, and Policy Usage.

Advanced policy expressions have a few other uses. In addition to configuring Advanced expressions in policy rules, you configure Advanced expressions in the following situations:

- Integrated Caching:

  You use Advanced policy expressions to configure a selector for a content group in the integrated cache.
- Load Balancing:

  You use Advanced policy expressions to configure token extraction for a load balancing virtual server that uses the TOKEN method for load balancing.
- Rewrite:

  You use Advanced policy expressions to configure rewrite actions.
- Rate-based policies:

  You use Advanced policy expressions to configure limit selectors when configuring a policy to control the rate of traffic to various servers.

Following are a few simple examples of Advanced policy expressions:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- An HTTP request URL contains no more than 500 characters.

```
http.req.url.length \<= 500
```

- An HTTP request contains a cookie that has fewer than 500 characters.

```
http.req.cookie.length \< 500
```

- An HTTP request URL contains a particular text string.

```
http.req.url.contains(".html")
```

Converting policy expressions using the NSPEPI tool

NOTE:

You can download the NSPEPI and preconfig check tool from the public GitHub. For more information, see GitHub NSPEPI page and README page for detailed instructions to download, install, and use the tools. We recommend customers to use the tools available in GitHub for the most complete and up-to-date version.

Classic policy-based features and functionalities are deprecated from NetScaler 12.0 build 56.20 onwards. As an alternative, NetScaler recommends you to use the Advanced policy infrastructure for the features supported by the NSPEPI tool. For the list of supported features, see Commands or features handled by the nspepi conversion tool. The features that are not supported by the NSPEPI tool continue to support classic policies. For the list of unsupported features, see NSPEPI tool unsupported features.

The `nspepi` tool can perform the following:

1. Convert Classic policy expressions to Advanced policy expressions.
2. Convert certain Classic policies and their entity bindings to Advanced policies and bindings.
3. Convert a few more deprecated features to their corresponding non-deprecated features.
4. Convert classic filter commands to advanced filter commands.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE:

After the `nspepi` tool successfully converts the ns.conf config file, the tool displays the converted file as a new file with a prefix, "new_". If the converted config file has errors or warnings, you must manually fix them as part of the conversion process. Once converted, you must test the file in the test environment and then use it to replace the actual ns.conf config file. After testing, you must reboot the appliance for the newly converted or fixed ns.conf config file.

Features that only support Classic policies or expressions are deprecated and they can be replaced by the corresponding non-deprecated features.

NOTE:

Information pertaining to the older version of the `nspepi` tool is available in a PDF format. For more information, see Classic policy conversion using nspepi tool prior to 12.1-51.16 PDF.

Conversion warnings and error files

Before you use the tool for your conversion, there are few warnings to keep in mind:

1. All warnings and errors are output to the console. There is a warning file created where the configuration files are stored.
2. The warnings and error file has the same name as the input file but with a prefix "warn_" added to the file name. During expression conversion (when using -e), the warnings show up in the current directory with a name "warn_expr".

NOTE:

This file is in a standard log file format, with date/time stamp and log level. Previous instances of the file are kept with suffixes like ".1", ".2", and so forth as the tool is run multiple times. At most 10 instances will be kept.

Converted file format

When converting a configuration file (using "-f"), the converted file is put into the same directory as where the input configuration file exists with the same name but a prefix "new_".

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Commands or features handled by the nspepi conversion tool

Following are the commands handled during the auto conversion process.

- The following Classic policies and their expressions are converted to Advanced policies and expressions. The conversion includes entity bindings and global bindings.

1. add appfw policy
2. add cmp policy
3. add cr policy
4. add cs policy
5. add ssl policy
6. add filter action
7. add filter policy
8. filter policy binding to load balancing, content switching, cache redirection, and global.

- The rule parameter configured in "add lb virtual server" is converted from Classic expression to Advanced expression.
- The SPDY parameter configured in the "add ns httpProfile" or the "set ns httpProfile" command is changed to "-http2 ENABLED".
- Named expressions ("add policy expression" commands). Each Classic named policy expression is converted to its corresponding Advanced named expression with "nspepi_adv_" set as the prefix. In addition, usage of named expressions for the converted Classic expressions is changed to the corresponding Advanced named expressions. In addition, every named expression has two named expressions, where one is Classic and the other one is Advanced (as shown below).
- Handling built-in classic policy bindings in CMP and CR.
- Patclass feature is converted to Pat set feature.
- "-pattern" parameter in the "add rewrite action" command is converted to use "-search" parameter.
- Q and S prefixes of advanced expressions are converted to equivalent non-deprecated advanced expressions. These expressions can be seen in any command where advanced expressions are allowed.

For example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add policy expression classic_expr ns_true

Converts to:

add policy expression classic_expr ns_true

add policy expression nspepi_adv_classic_expr TRUE
```

- The policyType parameter configured in the "set cmp parameter" command is removed. By default, the policy type is "Advanced".

Convert classic filter commands to advanced filter commands

The `nspepi` tool can convert commands based on classic filter actions such as add, bind and so forth to advanced filter commands.

However, the `nspepi` tool does not support the following filter commands.

1. add filter action `<action Name>` FORWARD `<service name>`
2. add filter action `<action name>` ADD prebody
3. add filter action `<action name>` ADD postbody

NOTE:

1. If there are existing rewrite or responder features in ns.conf and their policies are bound globally with the `GOTO` expression as `END` or `USER_INVOCATION_RESULT` and the bind type is `REQ_X` or `RES_X` then the tool converts bind filter commands partially and comments out. An error is displayed for the manual conversion.
2. If there are existing rewrite or responder features and their policies are bound to virtual servers(for example, load balancing, content switching or cache redirect) of type HTTPS with `GOTO - END` or `USER_INVOCATION_RESULT`, the tool converts bind filter commands partially and then comments out. Warning is displayed for the manual conversion.

EXAMPLE

Following is a sample input:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add lb vserver v1 http 1.1.1.1 80 -persistenceType NONE -cltTimeout 9000

add cs vserver csv1 HTTP 1.1.1.2 80 -cltTimeout 180 -persistenceType NONE

add cr vserver crv1 HTTP 1.1.1.3 80 -cacheType FORWARD

add service svc1 1.1.1.4 http 80

add filter action fact_add add 'header:value'

add filter action fact_variable add 'H1:%%HTTP.TRANSID%%'

add filter action fact_prebody add prebody

add filter action fact_error_act1 ERRORCODE 200 "<HTML>Good URL</HTML>"

add filter action fact_forward_act1 FORWARD svc1

add filter policy fpol_add_res -rule ns_true -resAction fact_add

add filter policy fpol_error_res -rule ns_true -resAction fact_error_act1

add filter policy fpol_error_req -rule ns_true -reqAction fact_error_act1

add filter policy fpol_add_req -rule ns_true -reqAction fact_add

add filter policy fpol_variable_req -rule ns_true -reqAction fact_variable

add filter policy fpol_variable_res -rule ns_true -resAction fact_variable

add filter policy fpol_prebody_req -rule ns_true -reqAction fact_prebody

add filter policy fpol_prebody_res -rule ns_true -resAction fact_prebody

add filter policy fpol_forward_req -rule ns_true -reqAction
fact_forward_act1

bind lb vserver v1 -policyName fpol_add_res

bind lb vserver v1 -policyName fpol_add_req

bind lb vserver v1 -policyName fpol_error_res
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
bind lb vserver v1 -policyName fpol_error_req

bind lb vserver v1 -policyName fpol_variable_res

bind lb vserver v1 -policyName fpol_variable_req

bind lb vserver v1 -policyName fpol_forward_req

bind cs vserver csv1 -policyName fpol_add_req

bind cs vserver csv1 -policyName fpol_add_res

bind cs vserver csv1 -policyName fpol_error_res

bind cs vserver csv1 -policyName fpol_error_req

bind cr vserver crv1 -policyName fpol_add_req

bind cr vserver crv1 -policyName fpol_add_res

bind cr vserver crv1 -policyName fpol_error_res

bind cr vserver crv1 -policyName fpol_error_req

bind cr vserver crv1 -policyName fpol_forward_req

bind filter global fpol_add_req

bind filter global fpol_add_res

bind filter global fpol_error_req

bind filter global fpol_error_res

bind filter global fpol_variable_req

bind filter global fpol_variable_res

bind filter global fpol_variable_res -state DISABLED

bind filter global fpol_prebody_req
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
bind filter global fpol_forward_req
```

After conversion, warnings or error messages are displayed for manual effort.

```
ERROR - Line(7): Conversion of HTMLInjection feature related command [add
filter action fact_prebody add prebody] is not supported in this tool.

ERROR - Line(9): Conversion of FORWARD action type related command [add
filter action fact_forward_act1 FORWARD svc1] not supported in this tool

bind cr vserver crv1 -policyName fpol_error_req -type REQUEST -priority
100 -gotoPriorityExpression END
```

Convert classic filter commands to advanced feature commands if existing rewrite or responder policy bindings have goto expression END or USE_INNVOCATION

In this conversion, if a rewrite policy bound to one or more virtual servers and if the server has END or USE_INVOCATION_RESULT, the tool comments out the commands.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

EXAMPLE

Following is a sample input command:

```
add lb vserver v1_tcp TCP

add lb vserver v1_http HTTP

add lb vserver v2_http HTTP

add cs vserver csv1_tcp TCP 1.1.1.1 12345

add cs vserver csv1_http HTTP 2.2.2.1 80

add cs vserver csv2_http HTTP 2.2.2.5 180

add cr vserver crv1_tcp TCP 1.1.1.2 2345

add cs vserver crv2_http HTTP 2.2.2.2 90

add filter policy fpol1 -rule ns_true -resAction reset

add filter policy fpol2 -rule ns_true -reqAction reset

add rewrite policy pol1 true NOREWRITE

add rewrite policylabel pl http_res

bind rewrite policylabel pl pol1 1

bind rewrite global NOPOLICY 1 USE_INVOCATION_RESULT -type RES_DEFAULT
-invoke policylabel pl

add responder policy pol2 true NOOP

add responder policylabel pl -policylabeltype HTTP

bind responder policylabel pl pol2 1

bind responder global NOPOLICY 1 USE_INVOCATION_RESULT -type REQ_DEFAULT
-invoke policylabel pl

bind lb vserver v1_tcp -policyName pol1 -priority 100
-gotoPriorityExpression USE_INVOCATION_RESULT -type RESPONSE
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
bind cs vserver csv1_tcp -policyName pol1 -priority 100
-gotoPriorityExpression USE_INVOCATION_RESULT -type RESPONSE

bind lb vserver v1_tcp -policyName pol2 -priority 100
-gotoPriorityExpression USE_INVOCATION_RESULT -type REQUEST

bind cs vserver csv1_tcp -policyName pol2 -priority 100
-gotoPriorityExpression USE_INVOCATION_RESULT -type REQUEST

bind cr vserver crv1_tcp -policyName pol2 -priority 100
-gotoPriorityExpression USE_INVOCATION_RESULT -type REQUEST

bind lb vserver v1_http -policyName fpol1

bind cs vserver csv1_http -policyName fpol1

bind lb vserver v2_http -policyName fpol2

bind cs vserver csv2_http -policyName fpol2

bind cr vserver crv2_http -policyName fpol2

bind filter global fpol1 -priority 100

bind filter global fpol2 -priority 100
```

Following is a sample output command:

```
add lb vserver v1_tcp TCP

add lb vserver v1_http HTTP

add lb vserver v2_http HTTP

add cs vserver csv1_tcp TCP 1.1.1.1 12345

add cs vserver csv1_http HTTP 2.2.2.1 80

add cs vserver csv2_http HTTP 2.2.2.5 180

add cr vserver crv1_tcp TCP 1.1.1.2 2345
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add cs vserver crv2_http HTTP 2.2.2.2 90

add rewrite policy pol1 true NOREWRITE

add rewrite policylabel pl http_res

bind rewrite policylabel pl pol1 1

add responder policy pol2 true NOOP

add responder policylabel pl -policylabeltype HTTP

bind responder policylabel pl pol2 1

bind lb vserver v1_tcp -policyName pol1 -priority 100
-gotoPriorityExpression USE_INVOCATION_RESULT -type RESPONSE

bind cs vserver csv1_tcp -policyName pol1 -priority 100
-gotoPriorityExpression USE_INVOCATION_RESULT -type RESPONSE

bind lb vserver v1_tcp -policyName pol2 -priority 100
-gotoPriorityExpression USE_INVOCATION_RESULT -type REQUEST

bind cs vserver csv1_tcp -policyName pol2 -priority 100
-gotoPriorityExpression USE_INVOCATION_RESULT -type REQUEST

bind cr vserver crv1_tcp -policyName pol2 -priority 100
-gotoPriorityExpression USE_INVOCATION_RESULT -type REQUEST

add rewrite policy fpol1 TRUE RESET

add responder policy fpol2 TRUE RESET

#bind lb vserver v2_http -policyName fpol2 -type REQUEST

#bind cs vserver csv2_http -policyName fpol2 -type REQUEST

#bind cr vserver crv2_http -policyName fpol2 -type REQUEST

#bind responder global fpol2 100 -type REQ_DEFAULT

bind rewrite global NOPOLICY 1 USE_INVOCATION_RESULT -type RES_DEFAULT
-invoke policylabel pl
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
bind rewrite global fpol1 100 NEXT -type RES_DEFAULT

bind responder global NOPOLICY 1 USE_INVOCATION_RESULT -type REQ_DEFAULT
-invoke policylabel pl

bind lb vserver v1_http -policyName fpol1 -type RESPONSE -priority 100
-gotoPriorityExpression NEXT

bind cs vserver csv1_http -policyName fpol1 -type RESPONSE -priority 100
-gotoPriorityExpression NEXT
```

Running the nspepi tool

The following is a command line example for running the `nspepi` tool. This tool is run from the command line of the shell (you need to type the "shell" command to the NetScaler"CLI" to get to that). Either "-f" or"-e" must be specified to perform a conversion. Use of "-d" is intended for Citrix personnel to analyze for support purposes.

```
usage: nspepi [-h] (-e <classic policy expression> | -f <path to ns config
file>)[-d] [-v] [-V

Convert classic policy expressions to advanced policy expressions and
deprecated commands to non-deprecated

commands.

optional arguments:

-h, --help show this help message and exit

-e <classic policy expression>, --expression <classic policy expression>

convert classic policy expression to advanced policy

expression (maximum length of 8191 allowed)

-f <path to ns config file>, --infile <path to ns config file>
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
convert netscaler config file

-d, --debug log debug output

-v, --verbose show verbose output

-V, --version show program's version number and exit
```

Usage Examples:

1. `nspepi -e "req.tcp.destport == 80"`
2. `nspepi -f /nsconfig/ns.conf`

Following are few examples of running the `nspepi` tool by using the CLI

Example output for –e parameter:

```
root@ns# nspepi -e "req.http.header foo == \"bar\""

"HTTP.REQ.HEADER(\"foo\").EQ(\"bar\")"
```

Example output for -f parameter:

```
root@ns# cat sample.conf

add cr vserver cr_vs HTTP -cacheType TRANSPARENT -cltTimeout 180
-originUSIP OFF

add cr policy cr_pol1 -rule ns_true

bind cr vserver cr_vs -policyName cr_pol1
```

Running nspepi with -f parameter:

```
nspepi -f sample.conf
```

Converted config is available in a new file `new_sample.conf`. Check the `warn_sample.conf` file for any warnings or errors that might have been generated.

Example output of -f parameter along with -v parameter

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
nspepi -f sample.conf -v

INFO - add cr vserver cr_vs HTTP -cacheType TRANSPARENT -cltTimeout 180
-originUSIP OFF

INFO - add cr policy cr_pol1 -rule TRUE -action ORIGIN

INFO - bind cr vserver cr_vs -policyName cr_pol1 -priority 100
-gotoPriorityExpression END -type REQUEST
```

Converted config is available in a new file `new_sample.conf`. Check the `warn_sample.conf` file for any warnings or errors that might have been generated.

Converted Config file:

```
root@ns# cat new_sample.conf

add cr vserver cr_vs HTTP -cacheType TRANSPARENT -cltTimeout 180
-originUSIP OFF

add cr policy cr_pol1 -rule TRUE -action ORIGIN

set cmp parameter -policyType ADVANCED

bind cr vserver cr_vs -policyName cr_pol1 -priority 100
-gotoPriorityExpression END -type REQUEST
```

Example output of a sample configuration with no errors or warnings:

```
nspepi -f sample_2.conf
```

Converted config is available in a new file `new_sample_2.conf`. Check the `warn_sample_2.conf` file for any warnings or errors that might have been generated.

Example output of a sample configuration with warnings:

```
root@ns# cat sample_2.conf

add policy expression security_expr "req.tcp.destport == 80"
-clientSecurityMessage "Not allowed"
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
set cmp parameter -policyType CLASSIC

add cmp policy cmp_pol1 -rule ns_true -resAction COMPRESS

add cmp policy cmp_pol2 -rule ns_true -resAction COMPRESS

add cmp policy cmp_pol3 -rule TRUE -resAction COMPRESS

bind cmp global cmp_pol1

bind cmp global cmp_pol2 -state DISABLED

bind cmp global cmp_pol3 -priority 1 -gotoPriorityExpression END -type
RES_DEFAULT

bind lb vserver lb_vs -policyName cmp_pol2

root@ns#
```

Converted file:

```
root@ns# cat new_sample_2.conf

add policy expression security_expr "req.tcp.destport == 80"
-clientSecurityMessage "Not allowed"

set cmp parameter -policyType ADVANCED

add cmp policy cmp_pol1 -rule TRUE -resAction COMPRESS

add cmp policy cmp_pol2 -rule TRUE -resAction COMPRESS

add cmp policy cmp_pol3 -rule TRUE -resAction COMPRESS

#bind cmp global cmp_pol2 -state DISABLED

#bind cmp global cmp_pol3 -priority 1 -gotoPriorityExpression END -type
RES_DEFAULT

bind cmp global cmp_pol1 -priority 100 -gotoPriorityExpression END -type
RES_DEFAULT
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
bind lb vserver lb_vs -policyName cmp_pol2 -priority 100
-gotoPriorityExpression END -type RESPONSE

root@ns#
```

Warning file:

```
WARNING - Following bind command is commented out because state is
disabled. If state is disabled, then command is not in use. Since state
parameter is not supported with the advanced configuration, so if we
convert this config then functionality will change. If command is required
please take a backup because comments will not be saved in ns.conf after
triggering 'save ns config': bind cmp global cmp_pol2 -state DISABLED

WARNING - Initial global cmp parameter is classic and in this case
advanced policies's bindings are not evaluated. Now global cmp parameter
policy type is set to advanced, so existing advanced policies's bindings
will be evaluted and can change the functionality. So, bindings of
advanced CMP policies to cmp global are commented out. If commands are
required please take a backup because comments will not be saved in
ns.conf after triggering 'save ns config'.
```

Binding Priorities

Advanced policies do not allow arbitrary interleaving by priority between global and non-global and between different binding types. If you rely on such interleaving of Classic policy priorities, you need to adjust the priorities to conform to the Advanced policy rules and to get the behavior you desire. Priorities in Advanced policies are local to a bind point. A bind point is a unique combination of protocol, feature, direction, and entity (entities are specific virtual servers, users, groups, services, and either global override or global default). Policy priorities are not followed across bind points.

For a given protocol, feature, and direction, the following is the order of evaluation of Advanced policies:

- Global override.
- (Current) authentication, authorization, and auditing user.
- Authentication, authorization, and auditing groups (that the user is a member of) in order of weight - ordering is undefined if two or more groups have the same weight.
- LB virtual server that either the request was received on or that Content Switching selected.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Content switching virtual server, cache redirection virtual server that the request was received on.
- Service selected by load balancing.
- Global default.

Within each bind point, the policies are evaluated in order of priority from lowest numbered to highest numbered. Policies are only evaluated for the protocol used and the direction that the message was received from.

Classic policy bindings that require manual reprioritization

Here are some types of Classic policy bindings that require manual reprioritization to accomplish your needs. All these are for a given feature and the direction.

- Classic priorities that increase in priority number opposite to the direction of the above entity type lists. For example a content switching virtual server binding lower than a load balancing virtual server binding.
- Classic priorities that increase in number other than the order of weights of authentication, authorization, and auditing groups.
- Classic global priorities that are less than some non-global priority and the same global priorities are greater than some other non-global priority (in other words, any segment of priorities that are a non-global, followed by one or more globals, followed by a non-global).

The `NSPEPI` and `check_invalid_config` tools can be run on the `CentOS` and `Ubuntu` systems

The following modules are the prerequisites for using these tools:

- Python
- Perl
- Python pip module
- Ply module for Python
- Switch.pm for Perl

If Python 3 is installed, create a soft link, for example, `"ln -s /usr/bin/python3 /usr/bin/python"`.

To install Python pip module, PLY module for Python, and Switch.pm for Perl in CentOS, run the following commands:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- `sudo yum install -y perl-Switch`
- `sudo yum install python-pip`
- `sudo yum install python-ply`

To install Python pip module, PLY module for Python, and Switch.pm for Perl in Ubuntu, run the following commands:

- `sudo apt install libswitch-perl`
- `sudo apt install python-ply`
- `sudo apt install python-pip or sudo apt install python3-pip`

NSPEPI tool unsupported features

This topic provides information about the features that are not supported by the NSPEPI tool.

Commands or features not handled by the nspepi conversion tool

The following are some commands that are not handled as part of the auto conversion process.

- Client security expressions are not handled.
- Authentication
- Authorization
- VPN
- Syslog
- Nslog
- File based Classic expressions are not handled.

NOTE:

For some features like Patclass/filter, the command syntax is changed. If there are command policies, then command policies might need to be changed depending on customer requirement.

To convert classic policies to advanced policies for the following features, reach out to NetScaler customer support:

- Sure Connect (SC)
- Priority Queuing (PQ)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- HTTP Denial of Service (HDOS)
- HTML Injection

Binding Priorities

Advanced policies do not allow arbitrary interleaving by priority between global and non-global and between different binding types. If you rely on such interleaving of Classic policy priorities, you need to adjust the priorities to conform to the Advanced policy rules and to get the desired behavior. Priorities in Advanced policies are local to a bind point. A bind point is a unique combination of protocol, feature, direction, and entity (entities are specific virtual servers, users, groups, services, and either global override or global default). Policy priorities are not followed across bind points.

For a given protocol, feature, and direction, the following is the order of evaluation of Advanced policies:

- Global override.
- Authentication, authorization, and auditing user(Current).
- Authentication, authorization, and auditing groups (that the user is a member of) in order of weight. The ordering is undefined if two or more groups have the same weight.
- LB virtual server that either the request was received on or that was selected by CS.
- Content switching virtual server, cache redirection virtual server that the request was received on.
- Service selected by load balancing.
- Global default.

For authorization policy evaluation, the order is:

- Systems override.
- Load balancing virtual server that either the request was received on or that was selected by CS.
- Content switching virtual server that the request was received on.
- System default.

Within each bind point, the policies are evaluated in order of priority from lowest numbered to highest numbered. Policies are only evaluated for the protocol used and the direction that the message was received from.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Warning

The following scenarios show the warnings in the `nspepi` tool:

- If the rule expression of load balancing virtual server is a boolean expression, the equivalent advanced expression results in boolean value in string format. This results in functionality change when the rule is used for `persistenceType` or `lbMethod`. To avoid the functionality change, the command is modified by removing the `keywords rule` and `persistenceType`.
- If the state field of the binding command is DISABLED. If the state is disabled, then command is not in use. The state parameter is not supported with the advanced configuration. So, if we convert this configuration then the functionality changes. If the command is required, take a backup because comments will not be saved in `ns.conf` after triggering `save ns config`.

Warning in CMP feature conversion:

- If a global cmp parameter policy type is set to CLASSIC and advanced policies are bound to global. Without conversion, bounded advanced policies will not be evaluated because the global policy type is set to CLASSIC. After conversion, the policy type would be converted to ADVANCED. So, if we do not comment out the existing global advanced bindings, then these bindings are evaluated and can change the functionality.
- If the global cmp parameter policy type is set to ADVANCED and classic policies are bound to global. Without conversion, these global classic bindings would not be evaluated because global policy type is ADVANCED. So, to preserve the functionality, we comment out the converted configuration, otherwise converted advanced policies are evaluated and can change the functionality.

NOTE:

All classic policy bindings with -state option disabled are commented out. The -state option is not available for Advanced policy bindings.

Limitations of NSPEPI tool

The following scenarios cause errors in the `nspepi` tool:

- If there is an issue when converting an expression
- If a named policy expression uses the -clientSecurityMessage parameter because this parameter is not supported in the Advanced policy expression
- If load balancing virtual server rule expression is a complex expression and has multiple CONTENT based expressions

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Errors in CMP feature conversion occur in the following scenarios:
  - Both classic and advanced policies are bound to global
  - Classic policies are bound at global and CMP parameter is advanced
  - Advanced policies are bound at global and CMP parameter is classic
  - Classic policies are bound to a virtual server and advanced policies are bound to a global server
  - Advanced policies are bound to a virtual server and classic policies are bound to a global server
  - Classic policies are bound to a virtual server and both classic and advanced policies are bound to a global server
  - Advanced policies are bound to a virtual server and both classic and advanced policies are bound to a global server
- Errors in converting filter feature policy occur in the following scenarios:
  - If action is of type FORWARD
  - If action is part of HTMLInjection feature, mainly following commands:
    - `add filter action <action name> ADD prebody`
    - `add filter action <action name> ADD postbody`
  - If there are existing rewrite or responder policy bindings with `gotoPriorityExpression END` or `USE_INNVOCATION`, then fitler policy bindings cannot be converted.
- When both classic and advanced SSL policies are bound, classic SSL bindings cannot be converted.
- If the classic named expression has the same name as the callout entity name
- If the classic expression name is invalid for the advanced expression
- If the converted expression length is more than 1499 characters
- If the classic expression has client security or file-based expressions

Classic policy bindings that require manual reprioritization

Here are some types of Classic policy bindings that require manual reprioritization to accomplish your needs. All these are for a given feature and the direction.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Classic priorities that increase in priority number opposite to the direction of the above entity type lists. For example, a content switching virtual server binding lower than a load balancing virtual server binding.
- Classic priorities that interleave authentication, authorization, and auditing groups. One part of one group is before some other group and yet another part is after part of that other group.
- Classic priorities that increase in number other than the order of weights of authentication, authorization, and auditing groups.
- Classic global priorities that are less than some non-global priority and the same global priorities are greater than some other non-global priority (in other words, any segment of priorities that are a non-global, followed by one or more globals, followed by a non-global).

Preconfiguration check tool

NOTE:

You can download the NSPEPI and preconfig check tool from public GitHub. For more information, see GitHub NEPEPI page and GitHub preconfig page for detailed instructions to download the tools. We recommend customers to use the tools available in GitHub for the most complete and up-to-date version.

A pre-validation tool is available in the NetScaler 12.1, 13.0 and 13.1 versions to check if any invalid or removed functionality is still used in any feature configuration. The tools validate the `nsconfig` file if it contains commands or parameters in a command that has been removed in the NetScaler 13.1 version. If the validation result shows usage of removed or invalid commands, then before upgrading your appliance, you must first modify the configuration to the Citrix recommended alternative.

The tool also validates the usage of Classic policy expressions used in feature configuration that does not support Classic policies. You can modify either manually or use the `nspepi` tool.

The tool validates the following usage:

1. Classic policy expressions in Content Switching, Cache Redirection, AppFW, SSL, and CMP features.
2. Filter feature (also known as Content Filtering) - actions, policies, and binding
3. SPDY in HTTP profile, sure connect (SC), priority queuing (PQ), HTTP Denial of Service (DoS), and HTML Injection features.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. Classic expressions in load balancing persistence rules.
5. “Pattern" and "bypassSafetyCheck" parameters in Rewrite actions.
6. "patclass" configuration entity.
7. "HTTP.REQ.BODY" with no argument in Advanced expressions.
8. Q and S prefixes in Advanced expressions.
9. "PolicyType" parameter for the cmp parameter setting.

Run pre-revalidation tool in UNIX Shell

At the command prompt, type:

```
check_invalid_config <config_file>
```

Example:

```
root@ns# check_invalid_config /nsconfig/ns.conf -buildVersion 13.1
```

Where, config file is NetScaler configuration file. The file must be from a saved configuration such as `ns.conf`.

Sample output with validation errors

Following is a sample output of the configuration file with errors in NetScaler version 13.1:

```
add cmp policy cmp_pol -rule ns_true -resAction GZIP

add cs policy cs_pol_2 -rule ns_true

add cs policy cs_pol_3 -domain www.abc.com

add cs policy cs_pol_4 -url "/abc"

add rewrite action act_1 replace_all "http.req.body(1000)" http.req.url
-pattern abcd

add rewrite action act_123 replace_all http.req.url "\"aaaa\"" -pattern
abcd

add responder action ract respondwith "Q.URL + Q.HEADER(\"abcd\")"

add appfw policy aff_pol_1 "http.req.body.length.gt(10)" APPFW_BYPASS
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add appfw policy aff_pol ns_true APPFW_BYPASS
```

Upon getting these errors, you can use the `nspepi` upgrade tool to convert your configuration or manually convert your configuration. For more information, see nspepi tool topic.

NOTE:

You can run the `nspepi` tool only on NetScaler version 12.1, 13.0 and later versions.

Sample output with no validation errors

Following is a sample output of the configuration file with no removed or invalid configuration:

```
root@ns# check_invalid_config /var/tmp/new_ns.conf

No issue detected with the configuration.

root@ns#
```

Classic Policy Deprecation FAQs

- **What are the classic policies deprecated from NetScaler 12.0 release onwards?**

  All the features and functionalities mentioned in the Deprecated policies table are deprecated from NetScaler release 12.0 build 56.20. See the following tables (in PDF format) for deprecated feature and policy details.

  - Table 1 for deprecated policies and its alternative.
  - Table 2 for deprecated NetScaler functionalities and its alternative with configuration details.

- **How can I convert classic policy based feature and functionalities to Advanced policy?**

  You can use the NetScaler proprietary `nspepi` tool to convert commands, expressions, and configurations. `nspepi` tool helps to convert all the classic expressions in the NetScaler configuration to the Advanced policy expressions. For more information about the `nspepi` tool, see Converting policy expressions using NSPEPI tool.

- **From which release are classic policy based features and functionalities deprecated?**

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NetScaler 12.0 build 56.20 and later.

- **From which release are the deprecated classic policy based features and functionalities removed from the NetScaler appliance?**

  NetScaler version 13.1 onwards. For more information, see Deprecated policies table.

- **What steps to follow when I upgrade my appliance to a build that does not support the classic policy based features?**

  - Some of the classic policy-based features are no longer available in NetScaler® and must be converted manually. Contact NetScaler customer support to convert manually.
  - Some of the classic policy-based features are no longer supported and must be converted using `nspepi` tool. For more information on how to convert, see Upgrade considerations for configurations with classic policies.
  - Some of the classic policy-based features are still supported until a further announcement is made.

  For more information on classic features that are supported and not supported, see CTX296948.

- **How long will the deprecated features be supported on a NetScaler appliance?**

  Classic policies are deprecated since NetScaler release 12.0 build 56.20. Starting with release 13.1, support for classic policies is removed from certain features. To view the complete list of features or commands that are no longer supported from release 13.1 onwards, see Table 2 in Notice of Status Change Announcement for NetScaler Classic Policy-Based Features and Functionalities.

- **Do I have to reboot my appliance after converting the configuration file?**

  Yes, you have to reboot the NetScaler instance after successful conversion of the `ns.conf` file.

Before you proceed

Before configuring expressions and policies, be sure you understand the relevant NetScaler feature and the structure of your data, as follows:

- Read the documentation on the relevant feature.
- Look at the data stream for the type of data that you want to configure.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

You may want to run a trace on the type of traffic or content that you want to configure. This will give you an idea of the parameters and values, and operations on these parameters and values, that you need to specify in an expression.

Note: The NetScaler supports Advanced policy within a feature. You cannot have both types in the same feature. Over the past few releases, some NetScaler features have migrated from using policies and expressions to Advanced policy and expressions. If a feature of interest to you has changed to the Advanced policy format, you may have to manually migrate the older information. Following are guidelines for deciding if you need to migrate your policies:

- If you configured classic policies in a version of the Integrated Caching feature prior to release 9.0 and then upgrade to version 9.0 or later, there is no impact. All legacy policies are migrated to the Advanced policy format.
- For other features, you need to manually migrate classic policies and expressions to the Advanced syntax if the feature has migrated to the Advanced policy.

Configure advanced policy infrastructure

You can create advanced policies for various NetScaler features, including DNS, Rewrite, Responder, and Integrated Caching, and the clientless access function in the NetScaler Gateway. Policies control the behavior of these features.

When you create a policy, you assign it a name, a rule (an expression), feature-specific attributes, and an action that is taken when data matches the policy. After creating the policy, you determine when it is invoked by binding it globally or to either request-time or response-time processing for a virtual server.

Policies that share the same bind point are known as a *policy bank*. For example, all policies that are bound to a virtual server constitute the policy bank for the virtual server. When binding the policy, you assign it a priority level to specify when it is invoked relative to other policies in the bank. In addition to assigning a priority level, you can configure an arbitrary evaluation order for policies in a bank by specifying Goto expressions.

In addition to policy banks that are associated with a built-in bind point or a virtual server, you can configure *policy labels*. A policy label is a policy bank that is identified by an arbitrary name. You invoke a policy label, and the policies in it, from a global or virtual-server-specific policy bank. A policy label or a virtual-server policy bank can be invoked from multiple policy banks.

For some features, you can use the policy manager to configure and bind policies.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Rules for names in identifiers used in policies

The names of identifiers in the named expression, HTTP callout, pattern set, and rate limiting features must begin with an ASCII alphabet or an underscore (_). The remaining characters can be ASCII alphanumeric characters or underscores (_).

The names of these identifiers must not begin with the following reserved words:

- The words ALT, TRUE, or FALSE or the Q or S one-character identifier.
- The special-syntax indicator RE (for regular expressions) or XP (for XPath expressions).
- Expression prefixes, which currently are the following:
  - CLIENT
  - EXTEND
  - HTTP
  - SERVER
  - SYS
  - TARGET
  - TEXT
  - URL
  - MYSQL
  - MSSQL

Additionally, the names of these identifiers cannot be the same as the names of enumeration constants used in the policy infrastructure. For example, the name of an identifier cannot be IGNORECASE, YEAR, or LATIN2_CZECH_CS (a MySQL character set).

Note: The NetScaler appliance performs a case-insensitive comparison of identifiers with these words and enumeration constants. For example, names of the identifiers cannot begin with TRUE, True, or true.

Create or modify a policy

All policies have some common elements. Creating a policy consists, at minimum, of naming the policy and configuring a rule. The policy configuration tools for the various features have areas of overlap, but also differences. For the details of configuring a policy for a particular feature, including associating an action with the policy, see the documentation for the feature.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To create a policy, begin by determining the purpose of the policy. For example, you may want to define a policy that identifies HTTP requests for image files, or client requests that contain an SSL certificate. In addition to knowing the type of information that you want the policy to work with, you need to know the format of the data that the policy is analyzing.

Next, determine whether the policy is globally applicable, or if it pertains to a particular virtual server. Also consider the effect that the order in which your policies are evaluated (which will be determined by how you bind the policies) will have on the policy that you are about to configure.

Create a policy by using the CLI

At the command prompt, type the following commands to create a policy and verify the configuration:

```
-  add responder|dns|cs|rewrite|cache policy <policyName> -rule
<expression> [<feature-specific information>]

-  show rewrite policy <name>
```

Example 1:

```
add rewrite policy "pol_remove-ae" true "act_remove-ae"

Done

> show rewrite policy pol_remove-ae

            Name: pol_remove-ae

            Rule: true

            RewriteAction: act_remove-ae

            UndefAction: Use Global

            Hits: 0

            Undef Hits: 0

            Bound to: GLOBAL RES_OVERRIDE
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
            Priority: 90

            GotoPriorityExpression: END

Done
```

Example 2:

```
add cache policy BranchReportsCachePolicy -rule
q{http.req.url.query.value("actionoverride").contains("branchReport s")}
-action cache

Done

show cache policy BranchReportsCachePolicy

            Name: BranchReportsCachePolicy

            Rule:
http.req.url.query.value("actionoverride").contains("branchReports")

            CacheAction: CACHE

            Stored in group: DEFAULT

            UndefAction: Use Global

            Hits: 0

            Undef Hits: 0

Done
```

Note: At the command line, quote marks within a policy rule (the expression) must be escaped or delimited with the q delimiter.

Create or modify a policy by using the GUI

1. In the navigation pane, expand the name of the feature for which you want to configure a policy, and then click **Policies**. For example, you can select **Content Switching, Integrated Caching, DNS, Rewrite, or Responder**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. In the details pane, click **Add**, or select an existing policy and click **Open**. A policy configuration dialog box appears.
3. Specify values for the following parameters. (An asterisk indicates a required parameter. For a term in parentheses, see the corresponding parameter in "Parameters for creating or modifying a policy.")
4. Click **Create**, and then click **Close**.
5. Click **Save**. A policy is added. Note: After you create a policy, you can view the policy's details by clicking the policy entry in the configuration pane. Details that are highlighted and underlined are links to the corresponding entity (for example, a named expression).

Policy configuration examples

These examples show how policies and their associated actions are entered at the command line interface. In the configuration utility, the expressions would appear in the Expression window of the feature-configuration dialog box for the integrated caching or rewrite feature.

Following is an example of creating a caching policy. Note that actions for caching policies are built in, so you do not need to configure them separately from the policy.

```
add cache policy BranchReportsCachePolicy -rule
q{http.req.url.query.value("actionoverride").contains("branchReports")}
-action cache
```

Following is an example of a rewrite policy and action:

```
add rewrite action myAction1 INSERT_HTTP_HEADER "myHeader"
"valueForMyHeader"

add rewrite policy myPolicy1 "http.req.url.contains(\"myURLstring\")"
myAction1
```

Note: At the command line, quote marks within a policy rule (the expression) must be escaped or delimited with the q delimiter. For more information, see Configure advanced policy expressions: Get started.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure and bind policies with the policy manager

WARNING:

Classic policy expressions are no longer supported from NetScaler 12.0 build 56.20 onwards and as an alternative, Citrix recommends you to use Advanced policies. For more information, see Advanced Policies.

Some applications provide a specialized Policy Manager in the NetScaler configuration utility to simplify configuring policy banks. It also lets you find and delete policies and actions that are not being used.

The Policy Manager is currently available for the Rewrite, Integrated Caching, Responder, and Compression features.

The following are keyboard equivalents for the procedures in this section:

- For editing a cell in the Policy Manager, you can tab to the cell and click F2 or press the SPACE bar on the keyboard.
- To select an entry in a drop-down menu, you can tab to the entry, press the space bar to view the drop-down menu, use the UP and DOWN ARROW keys to navigate to the entry that you want, and press the space bar again to select the entry.
- To cancel a selection in a drop-down menu, press the Escape key.
- To insert a policy, tab to the row above the insertion point and press Control + Insert, or click Insert Policy.
- To remove a policy, tab to the row that contains the policy and press Delete.

Note: Note that when you delete the policy, the NetScaler searches the Goto Expression values of other policies in the bank. If any of these Goto Expression values match the priority level of the deleted policy, they are removed.

Configure policy bindings by using the policy manager

1. In the navigation pane, click the feature for which you want to configure policies. The choices are Responder, Integrated Caching, Rewrite or Compression.
2. In the details pane, click **Policy Manager**.
3. At any time before you complete configuring policy bindings, if you want to configure bindings for policies that use the Advanced Policy click the Switch to Advanced Policy button.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. For features other than Responder, to specify the bind point, click Request or Response, and then click one of the request-time or response-time bind points. The options are Override Global, LB Virtual Server, CS Virtual Server, Default Global, or Policy Label. If you are configuring the Responder, the Request and Response flow types are not available.
5. To bind a policy to this bind point, click Insert Policy, and select a previously configured policy, a NOPOLICY label, or the New policy option. Depending on the option that you select, you have the following choices:

   - **New policy:** Create the policy as described in "Create or modify a policy," and then configure the priority level, GoTo expression, and policy invocation as described in the table, "Format of each entry in a policy bank."
   - **Existing policy**, **NOPOLICY**, or `NOPOLICY\<feature name\>`: Configure the priority level, GoTo expression, and policy invocation as described in the table, "Format of each entry in a policy bank." The **NOPOLICY** or `NOPOLICY\<feature name\>` options are available only for policies that use Advanced Policies.

6. Repeat the preceding steps to add entries to this policy bank.
7. To modify the priority level for an entry, you can do any of the following:

   - Double-click the Priority field for an entry and edit the value.
   - Click and drag a policy to another row in the table.
   - Click Regenerate Priorities.

   In all three cases, priority levels of all other policies are modified as needed to accommodate the new value. Goto Expressions with integer values are also updated automatically. For example, if you change a priority value of 10 to 100, all policies with a Goto Expression value of 10 are updated to the value 100.
8. To change the policy, action, or policy bank invocation for an row in the table, click the down arrow to the right of the entry and do one of the following:

   - To change the policy, select another policy name or select New Policy and follow the steps in Create or modify a policy.
   - To change the Goto Expression, select Next, End, USE_INVOCATION_RESULT, or select more and enter an expression whose result returns the priority level of another entry in this policy bank.
   - To modify an invocation, select an existing policy bank, or click New Policy Label and follow the steps in Bind a policy to a policy label.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

9. To unbind a policy or a policy label invocation from this bank, click any field in the row that contains the policy or policy label, and then click Unbind Policy.
10. When you are done, click Apply Changes. A message in the status bar indicates that the policy is bound successfully.

Remove unused policies by using the policy manager

1. In the navigation pane, click the feature for which you want to configure the policy bank. The choices are Responder, Integrated Caching, or Rewrite.
2. In the details pane, click `<Feature Name>` policy manager.
3. In the **Feature Name** > **Policy Manage**r dialog box, click **Cleanup Configuration**.
4. In the **Cleanup Configuration** dialog box, select the items that you want to delete, and then click **Remove**.
5. In the Remove dialog box, click **Yes**.
6. Click **Close**. A message in the status bar indicates that the policy is removed successfully.

Bind a policy globally

The following binding procedures are typical. However, refer to the documentation for the feature of interest to you for complete instructions.

BIND AN INTEGRATED CACHING POLICY GLOBALLY BY USING THE CLI

At the command prompt, type the following commands to bind an Integrated Caching policy and verify the configuration:

```
-  bind cache global <policy> -priority <positiveInteger> [-type
REQ_OVERRIDE | REQ_DEFAULT | RES_OVERRIDE | RES_DEFAULT]

-  show cache global
```

Example:

```
> bind cache global _nonPostReq -priority 100 -type req_default

     Done

> show cache global
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
    1)      Global bindpoint: REQ_DEFAULT

            Number of bound policies: 2

    2)      Global bindpoint: RES_DEFAULT

            Number of bound policies: 1

Done
```

The type argument is optional to maintain backward compatibility. If you omit the type, the policy is bound to REQ_DEFAULT or RES_DEFAULT, depending on whether the policy rule is a response-time or a request-time expression.

BIND A REWRITE POLICY GLOBALLY BY USING THE CLI

At the command prompt, type the following commands to bind a Rewrite policy and verify the configuration:

```
-  bind rewrite global <policyName> <priority> [-type REQ_OVERRIDE |
REQ_DEFAULT | RES_OVERRIDE | RES_DEFAULT]

-  show rewrite global
```

Example:

```
bind rewrite global pol_remove-pdf 100

Done

> show rewrite global

    1)      Global bindpoint: REQ_DEFAULT

            Number of bound policies: 1
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
    2)      Global bindpoint: REQ_OVERRIDE

            Number of bound policies: 1

Done
```

The type argument is optional for globally bound policies, to maintain backward compatibility. If you omit the type, the policy is bound to REQ_DEFAULT or RES_DEFAULT, depending on whether the policy rule is a response-time or a request-time expression.

BIND A COMPRESSION POLICY GLOBALLY BY USING THE CLI

At the command prompt, type the following commands to bind a compression policy and verify the configuration:

```
-  bind cmp global <policyName> -priority <positiveInteger> [-type
REQ_OVERRIDE | REQ_DEFAULT | RES_OVERRIDE | RES_DEFAULT]

-  show cmp global
```

Example:

```
> bind cmp global cmp_pol_1 -priority 100

Done

> show cmp policy cmp_pol_1

            Name: cmp_pol_1

            Rule: HTTP.REQ.URL.SUFFIX.EQ("BMP")

            Response Action: COMPRESS

            Hits: 0
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
            Policy is bound to following entities

            1) GLOBAL REQ_DEFAULT

            Priority: 100

            GotoPriorityExpression: END

Done
```

BIND A RESPONDER POLICY GLOBALLY BY USING THE CLI

At the command prompt, type the following commands to bind a Responder policy and verify the configuration:

```
-  bind responder global <policyName> <priority> [-type OVERRIDE |
DEFAULT ]

-  show responder global
```

Example:

```
bind responder global pol404Error1 200

Done

> show responder global

    1)      Global bindpoint: REQ_DEFAULT

            Number of bound policies: 1

Done
```

BIND A DNS POLICY GLOBALLY BY USING THE CLI

At the command prompt, type the following commands to bind a DNS policy and verify the configuration:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
-  bind dns global <policyName> <priority>

-  show dns global
```

Example:

```
> bind dns global pol_ddos_drop1 150

Done

> show dns global

    Policy name : pol_ddos_drop

            Priority : 100

            Goto expression : END

    Policy name : pol_ddos_drop1

            Priority : 150

Done
```

BIND AN INTEGRATED CACHING, RESPONDER, REWRITE, OR COMPRESSION POLICY GLOBALLY BY USING THE GUI

1. In the navigation pane, click the name of the feature for which you want to bind the policy.
2. In the details pane, click **Feature Name** > **policy manager**.
3. In the Policy Manager dialog box, select the bind point to which you want to bind the policy (for example, for Integrated Caching, Rewrite, or Compression, you could select Request and Default Global). The Responder does not differentiate between request-time and response-time policies.
4. Click Insert Policy and, from the Policy Name pop-up menu, select the policy name. A priority is assigned automatically to the policy, but you can click the cell in the Priority column and drag it anywhere within the dialog box if you want the policy to be evaluated after other policies in this bank. The priority is automatically reset. Note that priority values within a policy bank must be unique.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

5. Click **Apply Changes**.
6. Click **Close**. A message in the status bar indicates that the policy is bound successfully.

BIND A DNS POLICY GLOBALLY BY USING THE GUI

1. Navigate to **Traffic Management** > **DNS** > **Policies**.
2. In the details pane, click **Global Bindings**.
3. In the global bindings dialog box, click **Insert Policy**, and select the policy that you want to bind globally.
4. Click in the **Priority** field and enter the priority level.
5. Click **OK**. A message in the status bar indicates that the policy is bound successfully.

Bind a policy to a virtual server

A globally bound policy applies to all load balancing and content switching virtual servers.

Note that when binding a policy to a virtual server, you must identify it as a request-time or a response-time policy.

BIND A POLICY TO A LOAD BALANCING OR CONTENT SWITCHING VIRTUAL SERVER BY USING THE CLI

At the command prompt, type the following commands to bind a policy to a load balancing or content switching virtual server and verify the configuration:

```
-  bind lb|cs vserver <virtualServerName> -policyName <policyName>
-priority <positiveInteger> -type REQUEST|RESPONSE

-  show lb vserver <name>
```

Example:

```
> bind lb vserver lbvip -policyName ns_cmp_msapp -priority 50

Done

> show lb vserver lbvip

            lbvip (8.7.6.6:80) - HTTP       Type: ADDRESS
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
            State: DOWN

            Last state change was at Wed Jul 15 05:54:24 2009 (+226 ms)

            Time since last state change: 28 days, 01:57:26.350

            Effective State: DOWN

            Client Idle Timeout: 180 sec

            Down state flush: ENABLED

            Disable Primary Vserver On Down : DISABLED

            Port Rewrite : DISABLED

            No. of Bound Services :  0 (Total)       0 (Active)

            Configured Method: LEASTCONNECTION

            Mode: IP

            Persistence: NONE

            Vserver IP and Port insertion: OFF

            Push: DISABLED  Push VServer:

            Push Multi Clients: NO

            Push Label Rule: none

    1)      Policy : ns_cmp_msapp Priority:50

    2)      Policy : cf-pol Priority:1      Inherited

Done
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

BIND A POLICY TO AN SSL OFFLOAD VIRTUAL SERVER BY USING THE CLI

At the command prompt, type the following commands to bind a policy to an SSL offload virtual server and verify the configuration:

```
bind ssl vserver <vServerName>@ -policyName <policyName> -priority
<positiveInteger>
```

BIND A POLICY TO A VIRTUAL SERVER BY USING THE GUI

1. In the navigation pane, expand **Traffic Management** > **Load Balancing**, **Traffic Management** > **Content Switching**, **Traffic Management** > **SSL Offload**, **Security** > **AAA- Application Traffic**, or **NetScaler Gateway**, and then click **Virtual Servers**.
2. In the details pane, double-click the virtual server to which you want to bind the policy, and then click **Open**.
3. On the **Policies** tab, click the icon for the type of policy that you want to bind (the choices are feature-specific), and then click the name of the policy. Note that for some features, you can bind both classic policies and policies that use the Advanced policy to the virtual server.
4. If you are binding a policy to a Content Switching virtual server, in the Target field select a load balancing virtual server to which traffic that matches the policy is sent.
5. Click **OK**. A message in the status bar indicates that the policy is bound successfully.

Display policy bindings

You can display policy bindings to verify that they are correct.

DISPLAY POLICY BINDINGS BY USING THE CLI

At the command prompt, type the following commands to display policy bindings and verify the configuration:

```
show rewrite policy <name>
```

Example:

```
> show rewrite policy pol_remove-pdf

        Name: pol_remove-pdf

        Rule: http.req.url.contains(".pdf")

        RewriteAction: act_remove-ae
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
        UndefAction: Use Global

        Hits: 0

        Undef Hits: 0

        Bound to: GLOBAL REQ_DEFAULT

        Priority: 100

        GotoPriorityExpression: END

 Done

>
```

DISPLAY GLOBAL POLICY BINDINGS FOR INTEGRATED CACHING, REWRITE, OR RESPONDER BY USING THE GUI

1. In the navigation pane, expand the feature that contains the policy that you want to view, and then click Policies.
2. In the details pane, click the policy. Bound policies have a check mark next to them.
3. At the bottom of the page, under Details, next to Bound to, view the entity to which the policy is bound.

DISPLAY GLOBAL POLICY BINDINGS FOR DNS OR CLIENTLESS ACCESS IN THE NETSCALER GATEWAY BY USING THE GUI

1. Navigate to **Traffic Management** > **DNS** > **Policies**.
2. In the details pane, click **Global Bindings**.

DISPLAY GLOBAL POLICY BINDINGS FOR CONTENT SWITCHING BY USING THE GUI

1. Navigate to **Traffic Management** > **Content Switching**> **Policies**.
2. In detailed pane, select **Policy**.
3. In the details pane, click **Show Bindings**.

Unbind a policy

If you want to re-assign a policy or delete it, you must first remove its binding.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Unbind an integrated caching, rewrite, or compression advanced policy globally by using the CLI

At the command prompt, type the following commands to unbind an integrated caching, rewrite, or compression Advanced policy globally and verify the configuration:

```
-  unbind cache|rewrite|cmp global <policyName> [-type req_override|
req_default|res_override|res_default] [-priority <positiveInteger>]

-  show cache|rewrite|cmp global
```

Example:

```
> unbind cache global_nonPostReq

Done

> show cache global

    1)      Global bindpoint: REQ_DEFAULT

            Number of bound policies: 1

    2)      Global bindpoint: RES_DEFAULT

            Number of bound policies: 1

Done
```

The priority is required only for the “dummy” policy named NOPOLICY.

Unbind a responder policy globally by using the CLI

At the command prompt, type the following commands to unbind a responder policy globally and verify the configuration:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
-  unbind responder global <policyName> [-type override|default] [-
priority <positiveInteger>]

-  show responder global
```

Example:

```
> unbind responder global pol404Error

Done

> show responder global

    1)      Global bindpoint: REQ_DEFAULT

            Number of bound policies: 1

Done
```

The priority is required only for the “dummy” policy named NOPOLICY.

Unbind a DNS policy globally by using the CLI

At the command prompt, type the following commands to unbind a DNS policy globally and verify the configuration:

```
-  unbind responder global <policyName>

-  unbind responder global
```

Example:

```
unbind dns global dfgdfg

Done

show dns global
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
    Policy name : dfgdfggfhg

            Priority : 100

            Goto expression : END

Done
```

Unbind an advanced policy from a virtual server by using the CLI

At the command prompt, type the following commands to unbind an Advanced policy from a virtual server and verify the configuration:

```
-  unbind cs vserver <name> -policyName <policyName> [-priority
<positiveInteger>] [-type REQUEST|RESPONSE]

-  show lb vserver <name>
```

Example:

```
unbind cs vserver vs-cont-switch  -policyName pol1

Done

> show cs vserver vs-cont-switch

            vs-cont-switch (10.102.29.10:80) - HTTP Type: CONTENT

            State: UP

            Last state change was at Wed Aug 19 08:56:55 2009 (+18 ms)

            Time since last state change: 0 days, 02:47:55.750

            Client Idle Timeout: 180 sec

            Down state flush: ENABLED

            Disable Primary Vserver On Down : DISABLED
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
            Port Rewrite : DISABLED

            State Update: DISABLED

            Default:        Content Precedence: RULE

            Vserver IP and Port insertion: OFF

            Case Sensitivity: ON

            Push: DISABLED  Push VServer:

            Push Label Rule: none

Done
```

The priority is required only for the “dummy” policy named NOPOLICY.

Unbind an integrated caching, responder, rewrite, or compression Advanced policy globally by using the GUI

1. In the navigation pane, click the feature with the policy that you want to unbind (for example, Integrated Caching).
2. In the details pane, click `<Feature Name>` policy manager.
3. In the **Policy Manager** dialog box, select the bind point with the policy that you want to unbind, for example, Advanced Global.
4. Click the policy name that you want to unbind, and then click Unbind Policy.
5. Click **Apply Changes**.
6. Click **Close**. A message in the status bar indicates that the policy is unbound successfully.

Unbind a DNS policy globally by using the GUI

1. Navigate to **Traffic Management** > **DNS** > **Policies**.
2. In the details pane, click **Global Bindings**.
3. In the **Global Bindings** dialog box, select policy and click **unbind policy**.
4. Click **OK**. A message in the status bar indicates that the policy is unbinded successfully.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Unbind an advanced policy from a load balancing or content switching virtual server by using the GUI

1. Navigate to **Traffic Management,** and expand Load Balancing or Content Switching, and then click **Virtual Servers**.
2. In the details pane, double-click the virtual server from which you want to unbind the policy.
3. On the **Policies** tab, in the **Active** column, clear the check box next to the policy that you want to unbind.
4. Click **OK**. A message in the status bar indicates that the policy is unbinded successfully.

Create policy labels

In addition to the built-in bind points where you set up policy banks, you can also configure user-defined policy labels and associate policies with them.

Within a policy label, you bind policies and specify the order of evaluation of each policy relative to others in the bank of policies for the policy label. The NetScaler also permits you to define an arbitrary evaluation order as follows:

- You can use “goto” expressions to point to the next entry in the bank to be evaluated after the current one.
- You can use an entry in a policy bank to invoke another bank.

Each feature determines the type of policy that you can bind to a policy label, the type of load balancing virtual server that you can bind the label to, and the type of content switching virtual server from which the label can be invoked. For example, a TCP policy label can only be bound to a TCP load balancing virtual server. You cannot bind HTTP policies to a policy label of this type. And you can invoke a TCP policy label only from a TCP content switching virtual server.

After configuring a new policy label, you can invoke it from one or more banks for the built-in bind points.

Create a caching policy label by using the CLI

At the command prompt, type the following commands to create a Caching policy label and verify the configuration:

```
-  add cache policylabel <labelName> -evaluates req|res
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
-  show cache policylabel<labelName>
```

Example:

```
> add cache policylabel lbl-cache-pol -evaluates req

Done

> show cache policylabel lbl-cache-pol

            Label Name: lbl-cache-pol

            Evaluates: REQ

            Number of bound policies: 0

            Number of times invoked: 0

Done
```

Create a content switching policy label by using the CLI

At the command prompt, type the following commands to create a Content Switching policy label and verify the configuration:

```
-  add cs policylabel <labelName> http|tcp|rtsp|ssl

-  show cs policylabel <labelName>
```

Example:

```
> add cs policylabel lbl-cs-pol http

Done

> show cs policylabel lbl-cs-pol
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
            Label Name: lbl-cs-pol

            Label Type: HTTP

            Number of bound policies: 0

            Number of times invoked: 0

Done
```

Create a rewrite policy label by using the CLI

At the command prompt, type the following commands to create a Rewrite policy label and verify the configuration:

```
-  add rewrite policylabel <labelName> http_req|http_res|url|text|
clientless_vpn_req|clientless_vpn_res

-  show rewrite policylabel <labelName>
```

Example:

```
> add rewrite policylabel lbl-rewrt-pol http_req

Done

> show rewrite policylabel lbl-rewrt-pol

            Label Name: lbl-rewrt-pol

            Transform Name: http_req

            Number of bound policies: 0

            Number of times invoked: 0
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Done
```

Create a responder policy label by using the CLI

At the command prompt, type the following commands to create a Responder policy label and verify the configuration:

```
-  add responder policylabel <labelName>

-  show responder policylabel <labelName>
```

Example:

```
> add responder policylabel lbl-respndr-pol

Done

> show responder policylabel lbl-respndr-pol

            Label Name: lbl-respndr-pol

            Number of bound policies: 0

            Number of times invoked: 0

Done
```

Note: Invoke this policy label from a policy bank. For more information, see the "Binding a Policy to a Policy Label" section.

Create a policy label by using the GUI

1. In the navigation pane, expand the feature for which you want to create a policy label, and then click **Policy Labels**. For example, to create a rewrite policy label, navigate to **AppExpert > Rewrite** and then click **Policy Labels**.
2. In the details pane, click **Add**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. In the Name box, enter a unique name for this policy label.
4. Enter feature-specific information for the policy label. For example, for rewrite policy label specific information, see Configure a rewrite policy label.
5. Click **Create**.
6. Configure one of the built-in policy banks to invoke this policy label. For more information, see the Binding a Policy to a Policy Label section. A message in the status bar indicates that the policy label is created successfully.

For more examples on creating a policy label, see the following:

- Create an authentication policy label
- Configure content switching policy labels
- Configure a policy label in an integrated cache

Bind a policy to a policy label

As with policy banks that are bound to the built-in bind points, each entry in a policy label is a policy that is bound to the policy label. As with policies that are bound globally or to a vserver, each policy that is bound to the policy label can also invoke a policy bank or a policy label that is evaluated after the current entry has been processed. The following table summarizes the entries in a policy label.

- **Name**. The name of a policy, or, to invoke another policy bank without evaluating a policy, the “dummy” policy name NOPOLICY.

  You can specify NOPOLICY more than once in a policy bank, but you can specify a named policy only once.
- **Priority**. An integer. This setting can work with the Goto expression.
- **Goto Expression**. Determines the next policy to evaluate in this bank. You can provide one of the following values:
  - **NEXT**. Go to the policy with the next higher priority.
  - **END**. Stop evaluation.
  - **USE_INVOCATION_RESULT**. Applicable if this entry invokes another policy bank. If the final Goto in the invoked bank has a value of END, evaluation stops. If the final Goto is anything other than END, the current policy bank performs a NEXT.
  - **Positive number:** The priority number of the next policy to be evaluated.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

    - **Numeric expression**. An expression that produces the priority number of the next policy to be evaluated.

  The Goto can only proceed forward in a policy bank.

  If you omit the Goto expression, it is the same as specifying END.

- **Invocation Type**. Designates a policy bank type. The value can be one of the following:
    - **Request Vserver**. Invokes request-time policies that are associated with a virtual server.
    - **Response Vserver**. Invokes response-time policies that are associated with a virtual server.
    - **Policy label**. Invokes another policy bank, as identified by the policy label for the bank.
- **Invocation Name**. The name of a virtual server or a policy label, depending on the value that you specified for the Invocation Type.

Configure a policy label or virtual server policy bank

After you have created policies, and created policy banks by binding the policies, you can perform additional configuration of policies within a label or policy bank. For example, before you configure invocation of an external policy bank, you might want to wait until you have configured that policy bank.

This topic includes the following sections:

- Configure a policy label
- Configure a policy bank for a virtual server

Configure a policy label

A policy label consists of a set of policies and invocations of other policy labels and virtual server-specific policy banks. An Invoke parameter enables you to invoke a policy label or a virtual server-specific policy bank from any other policy bank. A special-purpose NoPolicy entry enables you to invoke an external bank without processing an expression (a rule). The NoPolicy entry is a “dummy” policy that does not contain a rule.

For configuring policy labels from the NetScaler command line, note the following elaborations of the command syntax:

- gotoPriorityExpression is configured as described in Table 2. Format of Each Entry in a Policy Bank of the section "Entries in a Policy Bank" in Bind policies using advanced policy.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- The type argument is required. This is unlike binding a conventional policy, where this argument is optional.
- You can invoke the bank of policies that are bound to a virtual server by using the same method as you use for invoking a policy label.

CONFIGURE A POLICY LABEL BY USING THE CLI

At the command prompt, type the following commands to configure a policy label and verify the configuration:

```
-  bind cache|rewrite|responder policylabel <policylabelName> -policyName
<policyName> -priority <priority> [-gotoPriorityExpression
<gotoprioritыExpression>] [-invoke reqvserver|resvserver|policylabel
<policyLabelName>|<vserverName>]

-  show cache|rewrite|responder policylabel <policylabelName>
```

Example:

```
bind cache policylabel _reqBuiltinDefaults -policyName  _nonGetReq
-priority 100

Done

show cache policylabel _reqBuiltinDefaults

            Label Name: _reqBuiltinDefaults

            Evaluates: REQ

            Number of bound policies: 3

            Number of times invoked: 0

    1)      Policy Name: _nonGetReq

            Priority: 100

            GotoPriorityExpression: END
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
    2)      Policy Name: _advancedConditionalReq

            Priority: 200

            GotoPriorityExpression: END

    3)      Policy Name: _personalizedReq

            Priority: 300

            GotoPriorityExpression: END

Done
```

INVOKE A POLICY LABEL FROM A REWRITE POLICY BANK WITH A NOPOLICY ENTRY BY USING THE CLI

At the command prompt, type the following commands to invoke a policy label from a Rewrite policy bank with a NOPOLICY entry and verify the configuration:

```
-  bind rewrite global <policyName> <priority> <gotoPriorityExpression>
-type REQ_OVERRIDE|REQ_DEFAULT|RES_OVERRIDE|RES_DEFAULT -invoke
reqvserver|resvserver|policylabel <policyLabelName>|<vserverName>

-  show rewrite global
```

Example:

```
> bind rewrite global NOPOLICY 100 -type REQ_DEFAULT -invoke policylabel
lbl-rewrt-pol

Done

> show rewrite global

    1)      Global bindpoint: REQ_DEFAULT

            Number of bound policies: 1
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
    2)      Global bindpoint: REQ_OVERRIDE

            Number of bound policies: 1

Done
```

INVOKE A POLICY LABEL FROM AN INTEGRATED CACHING POLICY BANK BY USING THE CLI

At the command prompt, type the following commands to invoke a policy label from an Integrated Caching policy bank and verify the configuration:

```
-  bind cache global NOPOLICY -priority <priority> -gotoPriorityExpression
<gotopriorityExpression> -type REQ_OVERRIDE|REQ_DEFAULT|RES_OVERRIDE|
RES_DEFAULT -invoke reqvserver|resvserver|policylabel <policyLabelName>|
<vserverName>

-  show cache global
```

Example:

```
bind cache global NOPOLICY -priority 100 -gotoPriorityExpression END -type
REQ_DEFAULT -invoke policylabel lbl-cache-pol

Done

> show cache global

    1)      Global bindpoint: REQ_DEFAULT

            Number of bound policies: 2

    2)      Global bindpoint: RES_DEFAULT

            Number of bound policies: 1
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Done
```

INVOKE A POLICY LABEL FROM A RESPONDER POLICY BANK BY USING THE CLI

At the command prompt, type the following commands to invoke a policy label from a Responder policy bank and verify the configuration:

```
-  bind responder global NOPOLICY <priority> <gotoprioritыExpression>
-type OVERRIDE|DEFAULT -invoke vserver|policylabel <policyLabelName>|
<vserverName>

-  show responder global
```

Example:

```
> bind responder global NOPOLICY 100 NEXT -type DEFAULT -invoke
policylabel lbl-respndr-pol

Done

> show responder global

    1)      Global bindpoint: REQ_DEFAULT

            Number of bound policies: 2

Done
```

CONFIGURE A POLICY LABEL BY USING THE GUI

1. In the navigation pane, expand the feature for which you want to configure a policy label, and then click Policy Labels. The choices are Integrated Caching, Rewrite, or Responder.
2. In the details pane, double-click the label that you want to configure.
3. If you are adding a new policy to this policy label, click Insert Policy, and in the Policy Name field, select New Policy. For more information about adding a policy, see Create or modify a

© 1997–2026 Citrix Systems, Inc. All rights reserved.

policy. Note that if you are invoking a policy bank, and do not want a rule to be evaluated prior to the invocation, click Insert Policy, and in the Policy Name field select NOPOLICY.

4. For each entry in this policy label, configure the following:

   - **Policy Name:**

     This is already determined by the Policy Name, new policy, or NOPOLICY entry that you inserted in this bank.

   - **Priority:**

     A numeric value that determines either an absolute order of evaluation within the bank, or is used in conjunction with a Goto expression.

   - **Expression:**

     The policy rule. Policy expressions are described in detail in the following chapters. For an introduction, see Configure advanced policy expressions: Get started.

   - **Action:**

     The action to be taken if this policy evaluates to TRUE.

   - **Goto Expression:**

     Optional. Used to augment the Priority level to determine the next policy or policy bank to evaluate. For more information on possible values for a Goto expression, see Table 2. Format of Each Entry in a Policy Bank of the section "Entries in a Policy Bank" in Bind policies using advanced policy.

   - **Invoke:**

     Optional. Invokes another policy bank.

5. Click **OK**. A message in the status bar indicates that the policy label is configured successfully.

Configure a policy bank for a virtual server

You can configure a bank of policies for a virtual server. The policy bank can contain individual policies, and each entry in the policy bank can optionally invoke a policy label or a bank of policies that you configured for another virtual server. If you invoke a policy label or policy bank, you can do so without triggering an expression (a rule) by selecting a NOPOLICY “dummy” entry instead of a policy name.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

ADD POLICIES TO A VIRTUAL SERVER POLICY BANK BY USING THE CLI

At the command prompt, type the following commands to add policies to a virtual server policy bank and verify the configuration:

```
-  bind lb|cs vserver <virtualServerName> <serviceType> [-policyName
<policyName>] [-priority <positiveInteger>] [-gotoPriorityExpression
<expression>] [-type REQUEST|RESPONSE]

-  show lb|cs vserver <virtualServerName>
```

Example:

```
add lb vserver vs-cont-sw TCP

Done

show lb vserver vs-cont-sw

            vs-cont-sw (0.0.0.0:0) - TCP    Type: ADDRESS

            State: DOWN

            Last state change was at Wed Aug 19 10:04:02 2009 (+279 ms)

            Time since last state change: 0 days, 00:02:14.420

            Effective State: DOWN

            Client Idle Timeout: 9000 sec

            Down state flush: ENABLED

            Disable Primary Vserver On Down : DISABLED

            No. of Bound Services :  0 (Total)       0 (Active)

            Configured Method: LEASTCONNECTION

            Mode: IP
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
            Persistence: NONE

            Connection Failover: DISABLED

Done
```

INVOKE A POLICY LABEL FROM A VIRTUAL SERVER POLICY BANK WITH A NOPOLICY ENTRY BY USING THE CLI

At the command prompt, type the following commands to invoke a policy label from a virtual server policy bank with a NOPOLICY entry and verify the configuration:

```
-  bind lb|cs vserver <virtualServerName> -policyName NOPOLICY-REWRITE|
NOPOLICY-CACHE|NOPOLICY-RESPONDER -priority <integer> -type REQUEST|
RESPONSE -gotoPriorityExpression <gotoprioritыExpression> -invoke
reqVserver|resVserver|policyLabel <vserverName>|<labelName>

-  show lb vserver
```

Example:

```
> bind lb vserver vs-cont-sw -policyname NOPOLICY-REWRITE -priority 200
-type REQUEST -gotoPriorityExpression NEXT -invoke policyLabel lbl-rewrt-
pol

Done
```

CONFIGURE A VIRTUAL SERVER POLICY BANK BY USING THE GUI

1. In the left navigation pane, expand **** **Traffic Management** > **Load Balancing, Traffic Management** > **Content Switching, Traffic Management** > **SSL Offload, Security** > **AAA - Application Traffic**, or **NetScaler Gateway**, as appropriate, and then click **Virtual Servers.**
2. In the details pane, select the virtual server that you want to configure, and then click **Open**.
3. In the **Configure Virtual Server** dialog box click the **Policies** tab.
4. To create a new policy in this bank, click the icon for the type of policy or policy label that you want to add to the virtual server’s bank of policies, click **Insert Policy**. Note that if you want to invoke a policy label without evaluating a policy rule, select the NOPOLICY “dummy” policy.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

5. To configure an existing entry in this policy bank, enter the following:

   - **Priority:**

     A numeric value that determines either an absolute order of evaluation within the bank or is used in conjunction with a Goto expression.

   - **Expression:**

     The policy rule. Policy expressions are described in detail in the following chapters. For an introduction, see Configuring Advanced Policy Expressions: Getting Started.

   - **Action:**

     The action to be taken if this policy evaluates to TRUE.

   - **Goto Expression:**

     Optional. Determines the next policy or policy bank evaluate. For more information on possible values for a Goto expression, see the section "Entries in a Policy Bank" in Bind policies using advanced policy.

   - **Invoke:**

     Optional. To invoke another policy bank, select the name of the policy label or virtual server policy bank that you want to invoke.

6. Click **OK**. A message in the status bar indicates that the policy is configured successfully.

Invoke or remove a policy label or virtual server policy bank

Unlike a policy, which can only be bound once, you can use a policy label or a virtual server's policy bank any number of times by invoking it. Invocation can be performed from two places:

- From the binding for a named policy in a policy bank.
- From the binding for a NOPOLICY "dummy" entry in a policy bank.

Typically, the policy label must be of the same type as the policy from which it is invoked. For example, you would invoke a responder policy label from a responder policy.

Note: When binding or unbinding a global NOPOLICY entry in a policy bank at the command line, you specify a priority to distinguish one NOPOLICY entry from another.

Invoke a rewrite or integrated caching policy label by using the CLI

At the command prompt, type the one of the following commands to invoke a rewrite or integrated caching policy label and verify the configuration:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
-  bind cache global <policy> -priority <positive_integer> [-
gotoPriorityExpression <expression>] -type REQ_OVERRIDE|REQ_DEFAULT|
RES_OVERRIDE|RES_DEFAULT] -invoke reqvserver|resvserver|policylabel
<label_name>

-  bind rewrite global<policy> -priority <positive_integer> [-
gotoPriorityExpression <expression>] -type REQ_OVERRIDE|REQ_DEFAULT|
RES_OVERRIDE|RES_DEFAULT] -invoke reqvserver|resvserver|policylabel
<label_name>

-  show cache global|show rewrite global
```

Example:

```
> bind cache global _nonPostReq2 -priority 100 -type req_override -invoke

    policylabel lbl-cache-pol

Done

> show cache global

    1)      Global bindpoint: REQ_DEFAULT

            Number of bound policies: 2

    2)      Global bindpoint: RES_DEFAULT

            Number of bound policies: 1

    3)      Global bindpoint: REQ_OVERRIDE

            Number of bound policies: 1
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Done
```

Invoke a responder policy label by using the CLI

At the command prompt, type the following commands to invoke a responder policy label and verify the configuration:

```
-  bind responder global <policy_Name> <priority_as_positive_integer>
[<gotoPriorityExpression>] -type REQ_OVERRIDE|REQ_DEFAULT|OVERRIDE|DEFAULT
-invoke vserver|policylabel <label_name>

-  show responder global
```

Example:

```
> bind responder global pol404Error1 300 -invoke policylabel lbl-respndr-
pol

Done

> show responder global

    1)      Global bindpoint: REQ_DEFAULT

            Number of bound policies: 2

Done
```

Invoke a virtual server policy bank by using the CLI

At the command prompt, type the following commands to invoke a Virtual Server Policy Bank and verify the configuration:

```
-  bind lb vserver <vserver_name> -policyName <policy_Name> -priority
<positive_integer> [-gotoPriorityExpression <expression>] -type REQUEST|
RESPONSE -invoke reqvserver|resvserver|policylabel <policy_Label_Name>
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
-  bind lb vserver <vserver_name>
```

Example:

```
> bind lb vserver lbvip -policyName ns_cmp_msapp -priority 100

Done

> show lb vserver lbvip

            lbvip (8.7.6.6:80) - HTTP       Type: ADDRESS

            State: DOWN

            Last state change was at Wed Jul 15 05:54:24 2009 (+166 ms)

            Time since last state change: 28 days, 06:37:49.250

            Effective State: DOWN

            Client Idle Timeout: 180 sec

            Down state flush: ENABLED

            Disable Primary Vserver On Down : DISABLED

            Port Rewrite : DISABLED

            No. of Bound Services :  0 (Total)       0 (Active)

            Configured Method: LEASTCONNECTION

            Mode: IP

            Persistence: NONE

            Vserver IP and Port insertion: OFF
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
            Push: DISABLED  Push VServer:

            Push Multi Clients: NO

            Push Label Rule: none

    1)      CSPolicy: pol-cont-sw   CSVserver: vs-cont-sw   Priority: 100
  Hits: 0

    2)      Policy : pol-ssl Priority:0

    3)      Policy : ns_cmp_msapp Priority:100

    4)      Policy : cf-pol Priority:1      Inherited

Done
```

Remove a rewrite or integrated caching policy label by using the CLI

At the command prompt, type one of the following commands to remove a rewrite or integrated caching policy label and verify the configuration:

```
-  unbind rewrite global <policyName> -priority <positiveInteger> -type
REQ_OVERRIDE|REQ_DEFAULT|RES_OVERRIDE|RES_DEFAULT

-  unbind cache global <policyName> -priority <positiveInteger> -type
REQ_OVERRIDE|REQ_DEFAULT|RES_OVERRIDE|RES_DEFAULT

-  show rewrite global|show cache global
```

Example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
> unbind rewrite global NOPOLICY -priority 100 -type REQ_OVERRIDE

> show rewrite global

Done

    1)      Global bindpoint: REQ_DEFAULT

            Number of bound policies: 1

Done
```

Remove a responder policy label by using the CLI

At the command prompt, type the following commands to remove a responder policy label and verify the configuration:

```
-  unbind responder global <policyName> -priority <positiveInteger> -type
OVERRIDE|DEFAULT

-  show responder global
```

Example:

```
> unbind responder global NOPOLICY -priority 100 -type REQ_DEFAULT

Done

> show responder global

    1)      Global bindpoint: REQ_DEFAULT

            Number of bound policies: 1

Done
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Remove a virtual server policy label by using the CLI

At the command prompt, type one of the following commands to remove a Virtual Server policy label and verify the configuration:

```
-  unbind lb vserver <virtualServerName> -policyName NOPOLICY-REWRITE|
NOPOLICY-RESPONDER|NOPOLICY-CACHE -type REQUEST|RESPONSE -priority
<positiveInteger>

-  unbind cs vserver <virtualServerName> -policyName NOPOLICY-REWRITE|
NOPOLICY-RESPONDER|NOPOLICY-CACHE -type REQUEST|RESPONSE -priority
<positiveInteger>

-  show lb vserver|show cs vserver
```

Example:

```
> unbind lb vserver lbvip -policyName ns_cmp_msapp -priority 200

Done

> show lb vserver lbvip

            lbvip (8.7.6.6:80) - HTTP       Type: ADDRESS

            State: DOWN

            Last state change was at Wed Jul 15 05:54:24 2009 (+161 ms)

            Time since last state change: 28 days, 06:47:54.600

            Effective State: DOWN

            Client Idle Timeout: 180 sec

            Down state flush: ENABLED

            Disable Primary Vserver On Down : DISABLED
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
            Port Rewrite : DISABLED

            No. of Bound Services :  0 (Total)       0 (Active)

            Configured Method: LEASTCONNECTION

            Mode: IP

            Persistence: NONE

            Vserver IP and Port insertion: OFF

            Push: DISABLED  Push VServer:

            Push Multi Clients: NO

            Push Label Rule: none

    1)      CSPolicy: pol-cont-sw   CSVserver: vs-cont-sw   Priority: 100
  Hits: 0

    1)      Policy : pol-ssl Priority:0

    2)      Policy : cf-pol Priority:1      Inherited

Done
```

Invoke a policy label or virtual server policy bank by using the GUI

1. Bind a policy, as described in Bind a policy globally, Bind a policy to a virtual server, or Bind a policy to a policy label. Alternatively, you can enter a NOPOLICY “dummy” entry instead of a policy name. You do this if you do not want to evaluate a policy before evaluating the policy bank.
2. In the Invoke field, select the name of the policy label or virtual server policy bank that you want to evaluate if traffic matches the bound policy. A message in the status bar indicates that the policy label or virtual server policy bank is invoked successfully.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Remove a policy label invocation by using the GUI

1. Open the policy and clear the Invoke field. Unbinding the policy also removes the invocation of the label. A message in the status bar indicates that the policy label is removed successfully.

Configuring advanced policy expression: getting started

Advanced policies evaluate data based on information that you supply in Advanced policy expressions. An Advanced policy expression analyzes data elements (for example, HTTP headers, source IP addresses, the NetScaler system time, and POST body data). In addition to configuring an Advanced policy expression in a policy, in some NetScaler features, you configure Advanced policy expression outside of the context of a policy.

To create an Advanced policy expression, you select a prefix that identifies a piece of data that you want to analyze, and then you specify an operation to perform on the data. For example, an operation can match a piece of data with a text string that you specify, or it can transform a text string into an HTTP header. Other operations match a returned string with a set of strings or a string pattern. You configure compound expressions by specifying Boolean and arithmetic operators, and by using parentheses to control the order of evaluation.

Advanced policy expression can also contain classic expressions. You can assign a name to a frequently used expression to avoid having to build the expression repeatedly.

Policies and a few other entities include rules that the NetScaler uses to evaluate a packet in the traffic flowing through it, to extract data from the NetScaler system itself, to send a request (a “callout”) to an external application, or to analyze another piece of data. A rule takes the form of a logical expression that is compared against traffic and ultimately returns values of TRUE or FALSE.

The elements of the rule can themselves return TRUE or FALSE, string, or numeric values.

Before configuring an Advanced policy expression, you need to understand the characteristics of the data that the policy or other entity is to evaluate. For example, when working with the Integrated Caching feature, a policy determines what data can be stored in the cache. With Integrated Caching, you need to know the URLs, headers, and other data in the HTTP requests and responses that the NetScaler receives. With this knowledge, you can configure policies that match the actual data and enable the NetScaler to manage caching for HTTP traffic. This information helps you determine the type of expression that you need to configure in the policy.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Basic elements of an advanced policy expression

An Advanced policy expression consists of, at a minimum, a prefix (or a single element used in place of a prefix). Most expressions also specify an operation to be performed on the data that the prefix identifies. You format an expression of up to 1,499 characters as follows:

```
<prefix>.<operation> [<compound-operator> <prefix>.<operation>. . .]
```

where

- \<prefix\>

  is an anchor point for starting an expression.

  The prefix is a period-delimited key that identifies a unit of data. For example, the following prefix examines HTTP requests for the presence of a header named Content-Type:

  http.req.header("Content-Type")

  Prefixes can also be used on their own to return the value of the object that the prefix identifies.

- \<operation\>

  identifies an evaluation that is to be performed on the data identified by the prefix.

  For example, consider the following expression:

  http.req.header("Content-Type").eq("text/html")

  In this expression, the following is the operator component:

  eq("text/html")

  This operator causes the NetScaler to evaluate any HTTP requests that contain a Content-Type header, and in particular, to determine if the value of this header is equal to the string “text/html.” For more information, see "Operations."

- \<compound-operator\>

  is a Boolean or arithmetic operator that forms a compound expression from multiple prefix or prefix.operation elements.

  For example, consider the following expression:

  http.req.header("Content-Type").eq("text/html") && http.req.url.contains(".html")

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Prefixes

An expression prefix represents a discrete piece of data. For example, an expression prefix can represent an HTTP URL, an HTTP Cookie header, or a string in the body of an HTTP POST request. An expression prefix can identify and return a wide variety of data types, including the following:

- A client IP address in a TCP/IP packet
- NetScaler system time
- An external callout over HTTP
- A TCP or UDP record type

In most cases, an expression prefix begins with one of the following keywords:

- CLIENT:
  - Identifies a characteristic of the client that is either sending a request or receiving a response, as in the following examples:
  - The prefix client.ip.dst designates the destination IP address in the request or response.
  - The prefix client.ip.src designates the source IP address.
- HTTP:
  - Identifies an element in an HTTP request or a response, as in the following examples:
  - The prefix http.req.body(integer) designates the body of the HTTP request as a multiline text object, up to the character position designated in integer.
  - The prefix http.req.header("header_name") designates an HTTP header, as specified in header_name.
  - The prefix http.req.url designates an HTTP URL in URL-encoded format.
- SERVER:

  Identifies an element in the server that is either processing a request or sending a response.
- SYS:

  Identifies a characteristic of the NetScaler that is processing the traffic.

  Note: Note that DNS policies support only SYS, CLIENT, and SERVER objects.

  In addition, in the NetScaler Gateway, the Clientless VPN function can use the following types of prefixes:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- TEXT:

  Identifies any text element in a request or a response.

- TARGET:

  Identifies the target of a connection.

- URL:

  Identifies an element in the URL portion of an HTTP request or response.

As a general rule of thumb, any expression prefix can be a self-contained expression. For example, the following prefix is a complete expression that returns the contents of the HTTP header specified in the string argument (enclosed in quotation marks):

```
http.res.header.("myheader")
```

Or you can combine prefixes with simple operations to determine TRUE and FALSE values. For example, the following returns a value of TRUE or FALSE:

```
http.res.header.("myheader").exists
```

You can also use complex operations on individual prefixes and multiple prefixes within an expression, as in the following example:

```
http.req.url.length + http.req.cookie.length <= 500
```

Which expression prefixes you can specify depends on the NetScaler feature. The following table describes the expression prefixes that are of interest on a per-feature basis

FEATURE	TYPES OF EXPRESSION PREFIX USED IN THE FEATURE
DNS	SYS, CLIENT, SERVER
Responder in Protection Features	HTTP, SYS, CLIENT
Content Switching	HTTP, SYS, CLIENT
Rewrite	HTTP, SYS, CLIENT, SERVER, URL, TEXT, TARGET, VPN
Integrated Caching	HTTP, SYS, CLIENT, SERVER

© 1997–2026 Citrix Systems, Inc. All rights reserved.

FEATURE	TYPES OF EXPRESSION PREFIX USED IN THE FEATURE
NetScaler Gateway, Clientless Access	HTTP, SYS, CLIENT, SERVER, URL, TEXT, TARGET, VPN

Table 1. Permitted Types of Expression Prefixes in Various NetScaler Features

Note: For details on the permitted expression prefixes in a feature, see the documentation for that feature.

Single-element expressions

The simplest type of Advanced policy expression contains a single element. This element can be one of the following:

- true. An Advanced policy expression can consist simply of the value true. This type of expression always returns a value of TRUE. It is useful for chaining policy actions and triggering Goto expressions.
- false. An Advanced policy expression can consist simply of the value false. This type of expression always returns a value of FALSE.
- A prefix for a compound expression. For example, the prefix HTTP.REQ.HOSTNAME is a complete expression that returns a host name and HTTP.REQ.URL is a complete expression that returns a URL. The prefix could also be used in conjunction with operations and additional prefixes to form a compound expression.

Operations

In most expressions, you also specify an operation on the data that the prefix identifies. For example, suppose that you specify the following prefix:

```
http.req.url
```

This prefix extracts URLs in HTTP requests. This expression prefix does not require any operators to be used in an expression. However, when you configure an expression that processes HTTP request URLs, you can specify operations that analyze particular characteristics of the URL. Following are a few possibilities:

- Search for a particular host name in the URL.
- Search for a particular path in the URL.
- Evaluate the length of the URL.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Search for a string in the URL that indicates a time stamp and convert it to GMT.

The following is an example of a prefix that identifies an HTTP header named Server and an operation that searches for the string IIS in the header value:

```
http.res.header("Server").contains("IIS")
```

Following is an example of a prefix that identifies host names and an operation that searches for the string “www.mycompany.com” as the value of the name:

```
http.req.hostname.eq("www.mycompany.com")
```

Basic operations on expression prefixes

The following table describes a few of the basic operations that can be performed on expression prefixes.

OPERATION	DETERMINES WHETHER OR NOT
CONTAINS(<string>)	The object matches <string>. Following is an example: http.req.header("Cache-Control").contains("no-cache")
EXISTS	A particular item is present in an object. Following is an example: http.res.header("MyHdr").exists
EQ(<text>)	A particular non-numeric value is present in an object. Following is an example: http.req.method.eq(post)
EQ(<integer>)	A particular numeric value is present in an object. Following is an example: client.ip.dst.eq(10.100.10.100)
LT(<integer>)	An object's value is less than a particular value. Following is an example: http.req.content_length.lt(5000)
GT(<integer>)	An object's value is greater than a particular value. Following is an example: http.req.content_length.gt(5)

The following table summarizes a few of the available types of operations.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

OPERATION TYPE	DESCRIPTION
Text operations	Match individual strings and sets of strings with any portion of a target. The target can be an entire string, the start of a string, or any portion of text in between the start and the end of the string. For example, you can extract the string "XYZ" from "XYZSomeText". Or, you can compare an HTTP header value with an array of different strings. You can also transform text into another type of data. Following are examples: Transform a string into an integer value, create a list from the query strings in a URL, and transform a string into a time value.
Numeric operations	Numeric operations include applying arithmetic operators, evaluating content length, the number of items in a list, dates, times, and IP addresses.

Compound advanced policy expressions

You can configure an Advanced policy expression with boolean or arithmetic operators and atomic operations. The following compound expression has a boolean AND:

```
http.req.hostname.eq("mycompany.com") && http.req.method.eq(post)
```

The following expression adds the value of two targets, and compares the result to a third value:

```
http.req.url.length + http.req.cookie.length \<= 500
```

A compound expression can have any number of logical and arithmetic operators.

The following expression evaluates the length of an HTTP request. This expression is based on the URL and cookie. This expression evaluates the text in the header. Also, does a Boolean AND on these two results:

```
http.req.url.length + http.req.cookie.length \<= 500 &&
http.req.header.contains("some text")
```

You can use parentheses to control the order of evaluation in a compound expression.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Booleans in compound expressions

You configure compound expressions with the following operators:

- &&.

  This operator is a logical AND. For the expression to evaluate to TRUE, all components must evaluate to TRUE.

  Example:

  http.req.url.hostname.eq("myHost") && http.req.header("myHeader").exists

- \|\|.

  This operator is a logical OR. If any component of the expression evaluates to TRUE, the entire expression is TRUE.

- !.

  P Does a logical NOT on the expression.

Sometimes, the NetScaler configuration utility offers AND, NOT, and OR operators in the **Add Expression** dialog box. However, these compound expressions are of limited use. Citrix recommends that you use the operators &&, \|\|, and! To configure compound expressions that use Boolean logic.

Parentheses in compound expressions

You can use parentheses to control the order of evaluation of an expression. The following is an example:

```
http.req.url.contains("myCompany.com") || (http.req.url.hostname.eq("myHost") && http.req.header("myHeader").exists)
```

The following is another example:

```
(http.req.header("Content-Type").exists && http.req.header("Content-Type").eq("text/html")) || (http.req.header("Transfer-Encoding").exists || http.req.header("Content-Length").exists)
```

Compound operations for strings

The following table describes operators that you can use to configure compound operations on string data.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

OPERATIONS THAT PRODUCE A STRING VALUE	DESCRIPTION
str + str	Concatenates the value of the expression on the left of the operator with the value on the right. Example: http.req.hostname + http.req.url.protocol
str + num	Concatenates the value of the expression on the left of the operator with a numeric value on the right. Example: http.req.hostname + http.req.url.content_length
num + str	Concatenates the numeric value of the expression on the left side of the operator with a string value on the right. Example: http.req.url.content_length + http.req.url.hostname
str + ip	Concatenates the string value of the expression on the left side of the operator with an IP address value on the right. Example: http.req.hostname + 10.00.000.00
IP + str	Concatenates the IP address value of the expression on the left of the operator with a string value on the right. Example: client.ip.dst + http.req.url.hostname
str1 ALT str2	Uses string2 if the evaluation of string1 results in an undef exception or the result is a null string. Otherwise uses string1 and never evaluates string2. Example: http.req.hostname alt client.ip.src

OPERATIONS ON STRINGS THAT PRODUCE A RESULT OF TRUE OR FALSE	DESCRIPTION
str == str	Evaluates whether the strings on either side of the operator are the same. Following is an example: http.req.header("myheader") == http.res.header("myheader")

© 1997–2026 Citrix Systems, Inc. All rights reserved.

OPERATIONS ON STRINGS THAT PRODUCE A RESULT OF TRUE OR FALSE	DESCRIPTION
str <= str	Evaluates whether the string on the left side of the operator is the same as the string on the right, or precedes it alphabetically.
str >= str	Evaluates whether the string on the left side of the operator is the same as the string on the right, or follows it alphabetically.
str < str	Evaluates whether the string on the left side of the operator precedes the string on the right alphabetically.
str > str	Evaluates whether the string on the left side of the operator follows the string on the right alphabetically.
str !!= str	Evaluates whether the strings on either side of the operator are different.

LOGICAL OPERATIONS ON STRINGS	DESCRIPTION
bool && bool	This operator is a logical AND. When evaluating the components of the compound expression, all components that are joined by the AND must evaluate to TRUE. Following is an example: http.req.method.eq(GET) && http.req.url.query.contains("viewReport && my_pagelabel")
bool || bool	This operator is a logical OR. When evaluating the components of the compound expression, if any component of the expression belonging to OR evaluates to TRUE, the entire expression is TRUE. Following is an example: http.req.url.contains(".js") || http.res.header. ("Content-Type"). Contains("javascript")
bool	Performs a logical NOT on the expression.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Compound operations for numbers

You can configure compound numeric expressions. For example, the following expression returns a numeric value that is the sum of an HTTP header length and a URL length:

```
http.req.header.length + http.req.url.length
```

The following tables describe operators that you can use to configure compound expressions for numeric data.

ARITHMETIC OPERATIONS ON NUMBERS	DESCRIPTION
num + num	Add the value of the expression on the left of the operator to the value of the expression on the right. Following is an example: http.req.content_length + http.req.url.length
num – num	Subtract the value of the expression on the right of the operator from the value of the expression on the left.
num*num	Multiply the value of the expression on the left of the operator with the value of the expression on the right. Following is an example: client.interface.rxthroughput* 9
num / num	Divide the value of the expression on the left of the operator by the value of the expression on the right.
num % num	Calculate the modulo, or the numeric remainder on a division of the value of the expression on the left of the operator by the value of the expression on the right. For example, the values "15 mod 4" equals 3, and "12 mod 4" equals 0.
~number	Returns a number after applying a bitwise logical negation of the number. The following example assumes that numeric.expression returns 12 (binary 1100): ~numeric.expression. The result of applying the ~ operator is -11 (a binary 1110011, 32 bits total with all ones to the left). Note that all returned values of less than

© 1997–2026 Citrix Systems, Inc. All rights reserved.

ARITHMETIC OPERATIONS ON NUMBERS	DESCRIPTION
	32 bits before applying the operator implicitly have zeros to the left to make them 32 bits wide.
number \^ number	Compares two bit patterns of equal length and performs an XOR operation on each pair of corresponding bits in each number argument, returning 1 if the bits are different, and 0 if they are the same. Returns a number after applying a bitwise XOR to the integer argument and the current number value. If the values in the bitwise comparison are the same, the returned value is a 0. The following example assumes that numeric.expression1 returns 12 (binary 1100) and numeric.expression2 returns 10 (binary 1010): numeric.expression1 \^ numeric.expression2The result of applying the \^ operator to the entire expression is 6 (binary 0110). Note that all returned values of less than 32 bits before applying the operator implicitly have zeros to the left to make them 32 bits wide.
number | number	Returns a number after applying a bitwise OR to the number values. If either value in the bitwise comparison is a 1, the returned value is a 1. The following example assumes that numeric.expression1 returns 12 (binary 1100) and numeric.expression2 returns 10 (binary 1010): numeric.expression1 | numeric.expression2 The result of applying the | operator to the entire expression is 14 (binary 1110). Note that all returned values of less than 32 bits before applying the operator implicitly have zeros to the left to make them 32 bits wide.
number & number	Compares two bit patterns of equal length and performs a bitwise AND operation on each pair of corresponding bits, returning 1 if both of the bits contains a value of 1, and 0 if either bits

© 1997–2026 Citrix Systems, Inc. All rights reserved.

ARITHMETIC OPERATIONS ON NUMBERS	DESCRIPTION
	are 0. The following example assumes that numeric.expression1 returns 12 (binary 1100) and numeric.expression2 returns 10 (binary 1010): numeric.expression1 & numeric.expression2 The whole expression evaluates to 8 (binary 1000). Note that all returned values of less than 32 bits before applying the operator implicitly have zeros to the left to make them 32 bits wide.
num << num	Returns a number after a bitwise left shift of the number value by the right-side number argument number of bits. Note that the number of bits shifted is integer modulo 32. The following example assumes that numeric.expression1 returns 12 (binary 1100) and numeric.expression2 returns 3: numeric.expression1 << numeric.expression2 The result of applying the LSHIFT operator is 96 (a binary 1100000).Note that all returned values of less than 32 bits before applying the operator implicitly have zeros to the left to make them 32 bits wide.
num >> num	Returns a number after a bitwise right shift of the number value by the integer argument number of bits. Note that the number of bits shifted is integer modulo 32. The following example assumes that numeric.expression1 returns 12 (binary 1100) and numeric.expression2 returns 3: numeric.expression1 >> numeric.expression2 The result of applying the RSHIFT operator is 1 (a binary 0001). Note that all returned values of less than 32 bits before applying the operator implicitly have zeros to the left to make them 32 bits wide.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NUMERIC OPERATORS THAT PRODUCE A RESULT OF TRUE OR FALSE	DESCRIPTION	
num == num	Determine if the value of the expression on the left of the operator is equal to the value of the expression on the right.	
num!= num	Determine if the value of the expression on the left of the operator is not equal to the value of the expression on the right.	
num > num	Determine if the value of the expression on the left of the operator is greater than the value of the expression on the right.	
num < num	Determine if the value of the expression on the left of the operator is less than the value of the expression on the right.	
num >= num	Determine if the value of the expression on the left of the operator is greater than or equal to the value of the expression on the right.	
num <= num	Determine if the value of the expression on the left of the operator is less than or equal to the value of the expression on the right	

FUNCTIONS FOR DATA TYPES IN THE POLICY INFRASTRUCTURE

The NetScaler policy infrastructure supports the following numeric data types:

- Integer (32 bits)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Unsigned long (64 bits)
- Double (64 bits)

Simple expressions can return all of these data types. Also, you can create compound expressions that use arithmetic operators and logical operators to evaluate or return the values of these data types. Also, you can use all of these values in policy expressions. Literal constants of type unsigned long can be specified by appending the string ul to the number. Literal constants of type double contain a period (.), an exponent, or both.
Arithmetic Operators, Logical Operators, and Type Promotion
In compound expressions, the following standard arithmetic and logical operators can be used for the double and unsigned long data types:

- +, -, *, and /
- %, ~, \^, &, |, \<\<, and \>\> (do not apply to double)
- \==,!=, \>, \<, \>=, and \<=

All of these operators have the same meaning as in the C programming language.

In all cases of mixed operations between operands of type integer, unsigned long, and double. Type promotion is done to do the operation on the operands of the same type. The operation promotes a lower precedence type to the operand with the highest precedence type. The order of precedence (higher to lower) is as follows:

- Double
- Unsigned long
- Integer

So, an operation that returns a numeric result returns a result of the highest type involved in the operation.

For example, if the operands are of type integer and unsigned long, the integer operand is automatically converted to type unsigned long. This type conversion is done in simple expressions. The type of data identified by the expression prefix does not match the type of data that is passed as the argument to the function. In the operation HTTP.REQ.CONTENT_LENGTH.DIV(3ul), the prefix HTTP.REQ.CONTENT_LENGTH returns an integer that becomes an unsigned long. Unsigned long: the data type passed as the argument to the DIV() function, an unsigned long division is done. Similarly, the argument can be promoted in an expression. For example, HTTP.REQ.HEADER("myHeader").TYPECAST_DOUBLE_AT.DIV(5) promotes the integer 5 to type double and does double-precision division.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

For information about expressions to cast data of one type to data of another type, see Typecasting data.

Specify the character set in expressions

The policy infrastructure on the NetScaler appliance supports ASCII and UTF-8 character sets. The default character set is ASCII. If the traffic for which you are configuring an expression consists of only ASCII characters, you need not specify the character set in the expression. The appliance allows all string and character literals which include binary characters. However, the UTF-8 character sets still require the string and character literals to be a valid UTF-8.

```
CLIENT.TCP.PAYLOAD(100).CONTAINS("\xff\x02")
```

In an expression, the SET_CHAR_SET() function must be introduced at the point in the expression after which data processing must be carried out in the specified character set. For example, in the expression HTTP.REQ.BODY(1000).AFTER_REGEX(re/following example/).BEFORE_REGEX(re/In the preceding example/).CONTAINS_ANY("Greek_ alphabet"), if the strings stored in the pattern set "Greek_alphabet" are in UTF-8, you must include the SET_CHAR_SET(UTF_8) function immediately before the CONTAINS_ANY("\<string\>") function, as follows:

```
HTTP.REQ.BODY(1000).AFTER_REGEX(re/following example/).BEFORE_REGEX(re/In the preceding example/).SET_CHAR_SET(UTF_8).CONTAINS_ANY("Greek_ alphabet")
```

The SET_CHAR_SET() function sets the character set for all further processing (that is, for all subsequent functions) in the expression unless it is overridden later in the expression by another SET_CHAR_SET() function that changes the character set. Therefore, if all the functions in a given simple expression are intended for UTF-8, you can include the SET_CHAR_SET(UTF_8) function immediately after functions that identify text (for example, the HEADER("\<name\>") or BODY(\<int\>) functions). In the second example that follows the first paragraph above, if the ASCII arguments passed to the AFTER_REGEX() and BEFORE_REGEX() functions are changed to UTF-8 strings, you can include the SET_CHAR_SET(UTF_8) function immediately after the BODY(1000) function, as follows:

```
HTTP.REQ.BODY(1000).SET_CHAR_SET(UTF_8).AFTER_REGEX(re/Bücher/).BEFORE_REGEX(re/Wörterbuch/).CONTAINS_ANY("Greek_alphabet")
```

The UTF-8 character set is a superset of the ASCII character set, so expressions configured for the ASCII character set continue to work as expected if you change the character set to UTF-8.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Compound expressions with different character sets

In a compound expression, if one subset of expressions is configured to work with data in the ASCII character set and the rest of the expressions are configured to work with data in the UTF-8 character set, the character set specified for each individual expression is considered when the expressions are evaluated individually. However, when processing the compound expression, just before processing the operators, the appliance promotes the character set of the returned ASCII values to UTF-8. For example, in the following compound expression, the first simple expression evaluates data in the ASCII character set while the second simple expression evaluates data in the UTF-8 character set:

```
HTTP.REQ.HEADER("MyHeader") == HTTP.REQ.BODY(10).SET_CHAR_SET(UTF_8)
```

However, when processing the compound expression, just before evaluating the "is equal to" Boolean operator, the NetScaler appliance promotes the character set of the value returned by HTTP.REQ.HEADER("MyHeader") to UTF-8.

The first simple expression in the following example evaluates data in the ASCII character set. However, when the NetScaler appliance processes the compound expression, just before concatenating the results of the two simple expressions, the appliance promotes the character set of the value returned by HTTP.REQ.BODY(10) to UTF-8.

```
HTTP.REQ.BODY(10) + HTTP.REQ.HEADER("MyHeader").SET_CHAR_SET(UTF_8)
```

Therefore, the compound expression returns data in the UTF-8 character set.

Specify the character set based on the character set of traffic

You can set the character set to UTF-8 based on traffic characteristics. If you are not sure whether the character set of the traffic being evaluated is UTF-8, you can configure a compound expression in which the first expression checks for UTF-8 traffic and subsequent expressions set the character set to UTF-8. Following is an example of a compound expression that first checks the value of "charset" in the request's Content-Type header for "UTF-8" before checking whether the first 1000 bytes in the request contain the UTF-8 string Bücher:

```
HTTP.REQ.HEADER("Content-Type").SET_TEXT_MODE(IGNORECASE).TYPECAST_NVLIST_T('=', '; ', '"').VALUE("charset").EQ("UTF-8") &&
HTTP.REQ.BODY(1000).SET_CHAR_SET(UTF_8).CONTAINS("Bücher")
```

If you are sure that the character set of the traffic being evaluated is UTF-8, the second expression in the example is sufficient.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Character and string literals in expressions

During expression evaluation, even if the current character set is ASCII, character literals and string literals, which are enclosed in single quotation marks (‘’) and quotation marks (“”), respectively, are considered to be literals in the UTF-8 character set. In a given expression, if a function is operating on character or string literals in the ASCII character set and you include a non-ASCII character in the literal, an error is returned.

NOTE

The string literals in advanced policy expressions are now as long as the policy expression. The expression is allowed to be 1499 bytes or 8191 bytes long.

Values in hexadecimal and octal formats

When configuring an expression, you can enter values in octal and hexadecimal formats. However, each hexadecimal or octal byte is considered a UTF-8 byte. Invalid UTF-8 bytes result in errors regardless of whether the value is entered manually or pasted from the clipboard. For example, "\xce\x20" is an invalid UTF-8 character because "c8" cannot be followed by "20" (each byte in a multi-byte UTF-8 string must have the high bit set). Another example of an invalid UTF-8 character is "\xce \xa9," since the hexadecimal characters are separated by a white-space character.

Functions that return UTF-8 strings

Only the `text>.XPATH` and `<text>.XPATH_JSON` functions always return UTF-8 strings. The following MYSQL routines determine at runtime which character set to return, depending on the data in the protocol:

- `MYSQL_CLIENT_T.USER`
- `MYSQL_CLIENT_T.DATABASE`
- `MYSQL_REQ_QUERY_T.COMMAND`
- `MYSQL_REQ_QUERY_T.TEXT`
- `MYSQL_REQ_QUERY_T.TEXT(<unsigned int>)`
- `MYSQL_RES_ERROR_T.SQLSTATE`
- `MYSQL_RES_ERROR_T.MESSAGE`
- `MYSQL_RES_FIELD_T.CATALOG`
- `MYSQL_RES_FIELD_T.DB`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- `MYSQL_RES_FIELD_T.TABLE`
- `MSQL_RES_FIELD_T.ORIGINAL_TABLE`
- `MYSQL_RES_FIELD_T.NAME`
- `MYSQL_RES_FIELD_T.ORIGINAL_NAME`
- `MYSQL_RES_OK_T.MESSAGE`
- `MYSQL_RES_ROW_T.TEXT_ELEM(<unsigned int>)`

Terminal connection settings for UTF-8

When you set up a connection to the NetScaler appliance by using a terminal connection (by using PuTTY, for example), you must set the character set for transmission of data to UTF-8.

Minimum and maximum functions in an advanced policy expression

The advanced policy expressions support the below minimum and maximum functions.

1. `(<expression1>.max(<expression2>)` - returns the maximum of the two values.
2. `(<expression1>.min(<expression2>)` - returns the minimum of the two values.

Configure advanced policy expressions in a policy

You can configure an Advanced policy expression of up to 1,499 characters in a policy. The user interface for Advanced policy expressions depends to some extent on the feature for which you are configuring the expression, and on whether you are configuring an expression for a policy or for another use.

When configuring expressions on the command line, you delimit the expression by using quotation marks (“. . .” or '. . .'). Within an expression, you escape additional quotation marks by using a back-slash (\). For example, the following are standard methods for escaping quotation marks in an expression:

```
"\"abc\""
```

```
‘\"abc\"’
```

You must also use a backslash to escape question marks and other backslashes on the command line. For example, the expression http.req.url.contains(“\?”) requires a backslash so that the question mark is parsed. Note that the backslash character will not appear on the command line after you type the question mark. On the other hand, if you escape a backslash (for example, in the expression 'http.req.url.contains("\\\\http")'), the escape characters are echoed on the command line.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To make an entry more readable, you can escape the quotation marks for an entire expression. At the start of the expression you enter the escape sequence “q” plus one of the following special characters: /{\<|~$\^+=&%@`?.

You enter only the special character at the end of the expression, as follows:

```
q@http.req.url.contains("sometext") && http.req.cookie.exists@

q~http.req.url.contains("sometext") && http.req.cookie.exists~
```

Note that an expression that uses the { delimiter is closed with }.

For some features (for example, Integrated Caching and Responder), the policy configuration dialog box provides a secondary dialog box for configuring expressions. This dialog enables you to choose from drop-down lists that show the available choices at each point during expression configuration. You cannot use arithmetic operators when using these configuration dialogs, but most other advanced policy expression features are available. To use arithmetic operators , write your expressions in free-form format.

Configure an Advanced policy syntax rule by using the CLI

At the command prompt, type the following commands to configure a Advanced policy rule and verify the configuration:

1. `add cache|dns|rewrite|cs policyName **-rule** expression featureSpecificParameters **-action**`
2. `show cache|dns|rewrite|cs policyName` Following is an example of configuring a caching policy:

   Example:

   ```
   > add cache policy pol-cache -rule http.req.content_length.le(5)
   -action INVAL

    Done

   > show cache policy pol-cache
   ```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
        Name: pol-cache

        Rule: http.req.content_length.le(5)

        CacheAction: INVAL

        Invalidate groups: DEFAULT

        UndefAction: Use Global

        Hits: 0

        Undef Hits: 0

  Done
```

Configure a Advanced policy expression by using the GUI

1. In the navigation pane, click the name of the feature where you want to configure a policy, for example, you can select Integrated Caching, Responder, DNS, Rewrite, or Content Switching, and then click **Policies**.
2. Click Add.
3. For most features, click in the **Expression** field. For content switching, click **Configure**.
4. Click the **Prefix** icon (the house) and select the first expression prefix from the drop-down list. For example, in Responder, the options are HTTP, SYS, and CLIENT. The next set of applicable options appear in a drop-down list.
5. Double-click the next option to select it, and then type a period (.). Again, a set of applicable options appears in another drop-down list.
6. Continue selecting options until an entry field (signalled by parentheses) appears. When you see an entry field, enter an appropriate value in the parentheses. For example, if you select GT(int) (greater-than, integer format), you specify an integer in the parentheses. Text strings are delimited by quotation marks. Following is an example:

   `HTTP.REQ.BODY(1000).BETWEEN("this","that")`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

7. To insert an operator between two parts of a compound expression, click the Operators icon (the sigma), and select the operator type. Following is an example of a configured expression with a Boolean OR (signalled by double vertical bars, ||):

   ```
   HTTP.REQ.URL.EQ("www.mycompany.com")||
   HTTP.REQ.BODY(1000).BETWEEN("this","that")
   ```

8. To insert a named expression, click the down arrow next to the Add icon (the plus sign) and select a named expression.
9. To configure an expression using drop-down menus, and to insert built-in expressions, click the Add icon (the plus sign). The **Add Expression** dialog box works in a similar way to the main dialog box, but it provides drop-down lists for selecting options, and it provides text fields for data entry instead of parentheses. This dialog box also provides a Frequently Used Expressions drop-down list that inserts commonly used expressions. When you are done adding the expression, click **OK**.
10. When finished, click **Create**. A message in the status bar indicates that the policy expression is configured successfully.

Test a Advanced policy expression by using the GUI

1. In the navigation pane, click the name of the feature for which you want to configure a policy (for example, you can select Integrated Caching, Responder, DNS, Rewrite, or Content Switching), and then click Policies.
2. Select a policy and click **Open**.
3. To test the expression, click the Evaluate icon (the check mark).
4. In the expression evaluator dialog box, select the Flow Type that matches the expression.
5. In the **HTTP Request Data** or **HTTP Response Data** field, paste the HTTP request or response that you want to parse with the expression, and click **Evaluate**. Note that you must supply a complete HTTP request or response, and the header and body should be separated by blank line. Some programs that trap HTTP headers do not also trap the response. If you are copying and pasting only the header, insert a blank line at the end of the header to form a complete HTTP request or response.
6. Click **Close** to close this dialog box.

Configure named advanced policy expressions

Instead of retyping the same expression multiple times in multiple policies, you can configure a named expression and refer to the name any time you want to use the expression in a policy. For example, you could create the following named expressions:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- ThisExpression:

  ```
  http.req.body(100).contains("this")
  ```

- ThatExpression:

  ```
  http.req.body(100).contains("that")
  ```

You can then use these named expressions in a policy expression. For example, the following is a legal expression based on the preceding examples:

ThisExpression || ThatExpression

You can use the name of an advanced policy expression as the prefix to a function. The named expression can be either a simple expression or a compound expression. The function must be one that can operate on the type of data that is returned by the named expression.

Example 1: Simple Named Expression as a Prefix

The following simple named expression, which identifies a text string, can be used as a prefix to the AFTER_STR("\<string\>")function, which works with text data:

```
HTTP.REQ.BODY(1000)
```

If the name of the expression is top1KB, you can use top1KB.AFTER_STR("username") instead of HTTP.REQ.BODY(1000).AFTER_STR("username").

Example 2: Compound named expression as a prefix

You can create a compound named expression called basic_header_value to concatenate the user name in a request, a colon (:), and the user's password, as follows:

```
add policy expression basic_header_value "HTTP.REQ.USER.NAME + \":\" +
HTTP.REQ.USER.PASSWD"
```

You can then use the name of the expression in a rewrite action, as shown in the following example:

```
add rewrite action insert_b64encoded_authorization insert_http_header
authorization '"Basic " + basic_header_value.b64encode'
```

In the example, in the expression that is used to construct the value of the custom header, the B64 encoding algorithm is applied to the string returned by the compound named expression.

You can also use a named expression (either by itself or as a prefix to a function) to create the text expression for the replacement target in a rewrite.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure a named Advanced policy expression by using the CLI

At the command prompt, type the following commands to configure a named expression and verify the configuration:

```
-  add policy expression \<name\>\<value\>

-  show policy expression \<name\>
```

Example:

```
> add policy expression myExp "http.req.body(100).contains(\"the other\")"

Done

> show policy expression myExp

    1)      Name: myExp  Expr: "http.req.body(100).contains("the other")"
 Hits: 0 Type : ADVANCED

Done
```

The expression can be up to 1,499 characters.

Configure a named expression by using the GUI

1. In the navigation pane, expand **AppExpert**, and then click **Expressions**.
2. Click **Advanced Expressions**.
3. Click **Add**.
4. Enter a name and a description for the expression.
5. Configure the expression by using the process described in Configure advanced policy expression. A message in the status bar indicates that the policy expression is configured successfully.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure advanced policy expressions outside the context of a policy

A number of functions, including the following, can require an advanced policy expression that is not part of a policy:

- Integrated Caching selectors:

  You define multiple non-compound expressions (selectlets) in the definition of the selector. Each selectlet is in an implicit logical AND relationship with the others.

- Load Balancing:

  You configure an expression for the TOKEN method of load balancing for a load balancing virtual server.

- Rewrite actions:

  Expressions define the location of the rewrite action and the type of rewriting to be performed, depending on the type of rewrite action that you are configuring. For example, a DELETE action only uses a target expression. A REPLACE action uses a target expression and an expression to configure the replacement text.

- Rate-based policies:

  You use advanced policy expressions to configure Limit Selectors. You can use these selectors when configuring policies to throttle the rate of traffic to various servers. You define up to five non-compound expressions (selectlets) in the definition of the selector. Each selectlet is in an implicit logical AND with the others.

Configure an advanced policy expression outside a policy by using the CLI (cache selector example)

At the command prompt, type the following commands to configure an advanced policy expression outside a policy and verify the configuration:

```
-  add cache selector <selectorName> <rule>

-  show cache selector <selectorName>
```

Example:

```
> add cache selector mainpageSelector "http.req.cookie.value("ABC_def")"

    "http.req.url.query.value("_ghi")"selector "mainpageSelector" added
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Done

> show cache selector mainpageSelector

            Name: mainpageSelector

            Expressions:

                    1) http.req.cookie.value("ABC_def")

                    2) http.req.url.query.value("_ghi")

Done
```

Following is an equivalent command that uses the more readable q delimiter, as described in Configure advanced policy expressions in a policy:

```
> add cache selector mainpageSelector2 q~http.req.cookie.value("ABC_def")~

    q~http.req.url.query.value("_ghi")~selector "mainpageSelector2" added

Done

> show cache selector mainpageSelector2

            Name: mainpageSelector2

            Expressions:

                    1) http.req.cookie.value("ABC_def")

                    2) http.req.url.query.value("_ghi")

Done
```

Advanced policy expressions: evaluating text

You can configure a policy with an advanced policy expression that evaluates text in a request or response. Advanced policy text expressions can range from simple expressions that perform string matching in HTTP headers to complex expressions that encode and decode text. You can configure text expressions to be case sensitive or case insensitive and to use or ignore spaces.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

You can also configure complex text expressions by combining text expressions with Boolean operators

You can use expression prefixes and operators for evaluating HTTP requests, HTTP responses, and VPN and Clientless VPN data. However, text expression prefixes are not restricted to evaluating these elements of your traffic.

About text expressions

You can configure various expressions for working with text that flows through the NetScaler appliance. Following are some examples of how you can parse text by using a Advanced policy expression:

- Determine that a particular HTTP header exists.

  For example, you may want to identify HTTP requests that contains a particular Accept-Language header for the purpose of directing the request to a particular server.
- Determine that a particular HTTP URL contains a particular string.

  For example, you may want to block requests for particular URLs. Note that the string can occur at the beginning, middle, or end of another string.
- Identify a POST request that is directed to a particular application.

  For example, you may want to identify all POST requests that are directed to a database application for the purpose of refreshing cached application data.

Note that there are specialized tools for viewing the data stream for HTTP requests and responses. You can use the tools to view the data stream.

About operations on text

A text-based expression consists of at least one prefix to identify an element of data and usually (although not always) an operation on that prefix. Text-based operations can apply to any part of a request or a response. Basic operations on text include various types of string matches.

For example, the following expression compares a header value with a string:

```
http.req.header("myHeader").contains("some-text")
```

Following expressions are examples of matching a file type in a request:

```
http.req.url.suffix.contains("jpeg")
```

```
http.req.url.suffix.eq("jpeg")
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

In the preceding examples, the contains operator permits a partial match and the eq operator looks for an exact match.

Other operations are available to format the string before evaluating it. For example, you can use text operations to strip out quotes and white spaces, to convert the string to all lowercase, or to concatenate strings.

NOTE

Complex operations are available to perform matching based on patterns or to convert one type of text format to another type.

For more information, see the following topics:

- Pattern sets and data sets.
- Regular expressions.
- Typecasting data.

Compounding and precedence in text expressions

You can apply various operators to combine text prefixes or expressions. For example, the following expression concatenates the returned values of each prefix:

```
http.req.hostname + http.req.url
```

Following is an example of a compound text expression that uses a logical AND. Both components of this expression must be TRUE for a request to match the expression:

```
http.req.method.eq(post) && http.req.body(1024).startswith("destination=")
```

NOTE:

For more information on operators for compounding, see Compound advanced expressions.

Categories of text expressions

The primary categories of text expressions that you can configure are:

- Information in HTTP headers, HTTP URLs, and the POST body in HTTP requests.

  For more information, see Expression prefixes for text in HTTP requests and responses.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Information regarding a VPN or a clientless VPN.

  For more information, see Expression prefixes for VPNs and clientless VPNs.

- TCP payload information.

  For more information about TCP payload expressions, see Advanced policy expressions: Parsing HTTP, TCP, and UDP data.

- Text in a Secure Sockets Layer (SSL) certificate.

  For information about text expressions for SSL and SSL certificate data, see Advanced policy expressions: Parsing SSL certificates and Expressions for SSL certificate dates.

NOTE:

Parsing a document body, such as the body of a POST request, can affect performance. You may want to test the performance impact of policies that evaluate a document body.

Guidelines for text expressions

From a performance standpoint, it typically is best to use protocol-aware functions in an expression. For example, the following expression makes use of a protocol-aware function:

```
HTTP.REQ.URL.QUERY
```

The previous expression performs better than the following equivalent expression, which is based on string parsing:

```
HTTP.REQ.URL.AFTER_STR("?")
```

In the first case, the expression looks specifically at the URL query. In the second case, the expression scans the data for the first occurrence of a question mark.

There is also a performance benefit from structured parsing of text, as in the following expression:

```
HTTP.REQ.HEADER("Example").TYPECAST_LIST_T(',').GET(1)
```

(For more information on typecasting, see Typecasting data. The typecasting expression, which collects comma-delimited data and structures it into a list, typically would perform better than the following unstructured equivalent:

```
HTTP.REQ.HEADER("Example").AFTER_STR(",").BEFORE_STR(",")
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Finally, unstructured text expressions typically have better performance than regular expressions. For example, the following is an unstructured text expression:

```
HTTP.REQ.HEADER("Example").AFTER_STR("more")
```

The previous expression would generally provide better performance than the following equivalent, which uses a regular expression:

```
HTTP.REQ.HEADER("Example").AFTER_REGEX(re/more/)
```

For more information on regular expressions, see Regular expressions.

Expression prefixes for text in HTTP requests and responses

An HTTP request or response typically contains text, such as in the form of headers, header values, URLs, and POST body text. You can configure expressions to operate on one or more of these text-based items in an HTTP request or response.

For more information on parameters, see NetScaler Advanced Policy Expression Reference.

Refer to the following topics to get more details on how to configure using advanced expression.

- Compound advanced policy expressions
- Advanced policy expressions: IP and MAC addresses, throughput, VLAN IDs
- Advanced policy expressions: parsing SSL
- Advanced policy expressions: working with dates, times, and numbers
- Basic elements of an advanced policy expression
- Advanced policy expressions: evaluating text
- Advanced policy expressions: parsing HTTP, TCP, and UDP data
- Summary examples of default syntax expressions and policies

Expression prefixes for VPNs and clientless VPNs

The Advanced policy engine provides prefixes that are specific to parsing VPN or Clientless VPN data. This data includes the following:

- Host names, domains, and URLs in VPN traffic.
- Protocols in the VPN traffic.
- Queries in the VPN traffic.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

These text elements are often URLs and components of URLs. In addition to applying the text-based operations on these elements, you can parse these elements by using operations that are specific to parsing URLs. For more information, see Expressions for extracting segments of URLs

For information about VPN expression prefixes, see VPN expression table.

Basic operations on text

Basic operations on text include operations for string matching, calculating the length of a string, and controlling case sensitivity. You can include white space in a string that is passed as an argument to an expression, but the string cannot exceed 255 characters.

String comparison functions

The following table lists basic string matching operations in which the functions return a Boolean TRUE or FALSE.

FUNCTION	DESCRIPTION
`<text>.CONTAINS(<string>)`	Returns a Boolean TRUE value if the target contains `<string>`. Example: `http.req.url.contains(".jpeg")`
`<text>.EQ(<string>)`	Returns a Boolean TRUE value if the target is an exact match with `<string>`. For example, the following expression returns a Boolean TRUE for a URL with a host name of "myhostabc": `http.req.url.hostname.eq("myhostabc")`
`<text>.STARTSWITH(<string>)`	Returns a Boolean TRUE value if the target begins with `<string>`. For example, the following expression returns a Boolean TRUE for a URL with a host name of "myhostabc": `http.req.url.hostname.startswith("myhost")`
`<text>.ENDSWITH(<string>)`	Returns a Boolean TRUE value if the target ends with <string>. For example, the following expression returns a Boolean TRUE for a URL with a host name of "myhostabc": `http.req.url.hostname.endswith("abc")`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

FUNCTION	DESCRIPTION
`<text>.NE(<string>)`	Returns a Boolean TRUE value if the prefix is not equal to the string argument. If the prefix returns a non-string value, the function argument is compared to the string representation of the value returned by the prefix. You can use the functions with `SET_TEXT_MODE(IGNORECASE) or SET_TEXT_MODE(NOIGNORECASE)`, and with both ASCII and UTF-8 character sets.
`<text>.GT(<string>)`	Returns a Boolean TRUE value if the prefix is alphabetically greater than the string argument. If the prefix returns a non-string value, the function argument is compared to the string representation of the value returned by the prefix. You can use the functions with `SET_TEXT_MODE(IGNORECASE)` or `SET_TEXT_MODE(NOIGNORECASE)`, and with both ASCII and UTF-8 character sets.
`<text>.GE(<string>)`	Returns a Boolean TRUE value if the prefix is alphabetically greater than or equal to the string argument. If the prefix returns a non-string value, the function argument is compared to the string representation of the value returned by the prefix. You can use the functions with `SET_TEXT_MODE(IGNORECASE)` or `SET_TEXT_MODE(NOIGNORECASE)`, and with both ASCII and UTF-8 character sets.
`<text>.LT(<string>)`	Returns a Boolean TRUE value if the prefix is alphabetically lesser than the string argument. If the prefix returns a non-string value, the function argument is compared to the string representation of the value returned by the prefix. You can use the functions with `SET_TEXT_MODE(IGNORECASE)` or `SET_TEXT_MODE(NOIGNORECASE)`, and with both ASCII and UTF-8 character sets.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

FUNCTION	DESCRIPTION
`<text>.LE(<string>)`	Returns a Boolean TRUE value if the prefix is alphabetically lesser than or equal to the string argument. If the prefix returns a non-string value, the function argument is compared to the string representation of the value returned by the prefix. You can use the functions with `SET_TEXT_MODE(IGNORECASE)` or `SET_TEXT_MODE(NOIGNORECASE)`, and with both ASCII and UTF-8 character sets.

Calculate the length of a string

The `<text>.LENGTH` operation returns a numeric value that is equal to the number of characters (not bytes) in a string:

```
<text>.LENGTH
```

For example, you may want to identify request URLs that exceed a particular length. Following is an expression that implements this example:

```
HTTP.REQ.URL.LENGTH < 500
```

After taking a count of the characters or elements in a string, you can apply numeric operations to them. For more information, see Advanced policy Expressions: Working with Dates, Times, and Numbers.

Consider, ignore, and change text case

The following functions operate on the case (upper-case or lower-case) of the characters in the string.

FUNCTION	DESCRIPTION	
`<text>.SET_TEXT_MODE` (IGNORECASE	NOIGNORECASE)	This function turns case sensitivity on or off for all text operations.
`<text>.TO_LOWER`	Converts the target to lowercase for a text block of up to 2 kilobyte (KB). Returns UNDEF if the target exceeds 2 KB. For example, the string	

© 1997–2026 Citrix Systems, Inc. All rights reserved.

FUNCTION	DESCRIPTION	
	“ABCd:” is converted to “abcd:”.	
`<text>.TO_UPPER`	Converts the target to uppercase. Returns UNDEF if the target exceeds 2 KB. For example, the string “abcD:” is converted to “ABCD:”.	

Strip specific characters from a string

You can use the STRIP_CHARS(`<string>`) function to remove specific characters from the text that is returned by a Advanced policy expression prefix (the input string). All instances of the characters that you specify in the argument are stripped from the input string. You can use any text method on the resulting string, including the methods used for matching the string with a pattern set.

For example, in the expression `CLIENT.UDP.DNS.DOMAIN.STRIP\_CHARS(".-\_")`, the `STRIP\_CHARS(<string>)` function strips all periods (.), hyphens (-), and underscores (_) from the domain name returned by the prefix CLIENT.UDP.DNS.DOMAIN. If the domain name that is returned is "a.dom_ai_n-name", the function returns the string "adomainname".

In the following example, the resulting string is compared with a pattern set called "listofdomains":

```
CLIENT.UDP.DNS.DOMAIN.STRIP_CHARS(".-_").CONTAINS_ANY("listofdomains")
```

Note: You cannot perform a rewrite on the string that is returned by the `STRIP_CHARS(<string>)` function.

The following functions strip matching characters from the beginning and end of a given string input.

FUNCTION	DESCRIPTION
`<text>.STRIP_START_CHARS(s)`	Strips matching characters from the beginning of the input string until the first non-matching character is found and returns the remainder of the string. You must specify the characters that you want to strip as a single string within quotation marks. For example, if the name of a header is TestLang and :/_en_us:is its

© 1997–2026 Citrix Systems, Inc. All rights reserved.

FUNCTION	DESCRIPTION
	value,HTTP.RES.HEADER("TestLang").STRIP _START_CHARS(":_")strips the specified characters from the beginning of the value of the header until the first non-matching character e is found and returnsen_us: as a string.
`<text>`.STRIP_END_CHARS(s)	Strips matching characters from the end of the input string to the first non-matching character is found and returns the remainder of the string. You must specify the characters that you want to strip as a single string within quotation marks. For example, if the name of a header is TestLang and :/_en_us:is its value,HTTP.RES.HEADER("TestLang").STRIP _START_CHARS(":_")strips the specified characters from the end of the value of the header until the first non-matching character s is found and returns:/_en_us as a string.

Append a string to another string

You can use the APPEND() function to append the string representation of the argument to the string representation of the value returned by the preceding function. The preceding function can be one that returns a number, unsigned long, double, time value, IPv4 address, or IPv6 address. The argument can be a text string, number, unsigned long, double, time value, IPv4 address, or IPv6 address. The resulting string value is the same string value that is obtained by using the + operator.

Complex operations on text

In addition to simple string matching, you can configure expressions that examine string length and text block for patterns rather than specific strings.

Be aware of the following for any text-based operation:

- For any operation that takes a string argument, the string cannot exceed 255 characters.
- You can include white space when you specify a string in an expression.

Operations on the length of a string

The following operations extract strings by a character count.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

CHARACTER COUNT OPERATION	DESCRIPTION
`<text>.TRUNCATE(<count>)`	Returns a string after truncating the end of the target by the number of characters in `<count>`. If the entire string is shorter than `<count>`, nothing is returned.
`<text>.TRUNCATE(<character>, <count>)`	Returns a string after truncating the text after `<character>` by the number of characters specified in `<count>`.
`<text>.PREFIX(<character>, <count>)`	Selects the longest prefix in the target that has at most `<count>` occurrences of `<character>`.
`<text>.SUFFIX(<character>, <count>)`	Selects the longest suffix in the target that has at most `<count>` occurrences of `<character>`. For example, consider the following response body: `peninsula`. The following expression returns a value of `sula:` `http.res.body(100).suffix('n',0)`. The following expression returns `insula:` `http.res.body(100).suffix('n',1)`. The following expression returns a value of `peninsula:` `http.res.body(100).suffix('n',2)`. The following expression returns a value of `peninsula:` `http.res.body(100).suffix('n',3)`.
`<text>.SUBSTR(<starting_offset>, <length>)`	Select a string with `<length>` number of characters from the target object. Begin extracting the string after the `<starting_offset>`. If the number of characters after the offset are fewer than the value of the `<length>` argument, select all the remaining characters.
`<text>.SKIP(<character>, <count>)`	Select a string from the target after skipping over the longest prefix that has at most `<count>` occurrences of `<character>`.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Operations on a portion of a string

Refer to the String operations table to know how to extract a subset of a larger string by using one of the operations.

Operations for comparing the alphanumeric order of two strings

The COMPARE operation examines the first nonmatching character of two different strings. This operation is based on lexicographic order, which is the method used when ordering terms in dictionaries.

This operation returns the arithmetic difference between the ASCII values of the first nonmatching characters in the compared strings. The following differences are examples:

- The difference between "abc" and "and" is -1 (based on the third pair-wise character comparison).
- The difference between "@" and "abc" is -33.
- The difference between "1" and "abc" is -47.

Following is the syntax for the COMPARE operation.

```
<text>.COMPARE(<string>)
```

Extract an integer from a string of bytes that represent text

Refer to the Integer extraction table to know how to treat a string of bytes that represent text as a sequence of bytes, extract 8 bits, 16 bits, or 32 bits from the sequence, and then convert the extracted bits to an integer.

Convert text to a hash value

You can convert a text string to a hash value by using the HASH function. This function returns a 31-bit positive integer as a result of the operation. Following is the format of the expression:

```
<text>.HASH
```

This function ignores case and white spaces. For example, after the operation, the two strings Ab c and a bc would produce the same hash value.

Encode and decode text by applying the Base64 encoding algorithm

The following two functions encode and decode a text string by applying the Base64 encoding algorithm

© 1997–2026 Citrix Systems, Inc. All rights reserved.

FUNCTION	DESCRIPTION
text.B64ENCODE	Encodes the text string (designated by text) by applying the Base64 encoding algorithm.
text.B64DECODE	Decodes the Base64-encoded string (designated by text) by applying the Base64 decoding algorithm. The operation raises an UNDEF if text is not in B64-encoded format.

Refine the search in a rewrite action by using the EXTEND function

The EXTEND function is used in rewrite actions that specify patterns or pattern sets and target the bodies of HTTP packets. When a pattern match is found, the EXTEND function extends the scope of the search by a predefined number of bytes on both sides of the matching string. A regular expression can then be used to perform a rewrite on matches in this extended region. Rewrite actions that are configured with the EXTEND function perform rewrites faster than rewrite actions that evaluate entire HTTP bodies using only regular expressions.

The format of the EXTEND function is EXTEND(m,n), where m and n are the number of bytes by which the scope of the search is extended before and after the matching pattern, respectively. When a match is found, the new search scope comprises m bytes that immediately precede the matching string, the string itself, and the n bytes that follow the string. A regular expression can then be used to perform a rewrite on a portion of this new string.

The EXTEND function can be used only if the rewrite action in which it is used fulfills the following requirements:

- The search is performed by using patterns or patterns sets (not regular expressions)
- The rewrite action evaluates only the bodies of HTTP packets.

Also, the EXTEND function can be used only with the following types of rewrite actions:

- replace_all
- insert_after_all
- delete_all
- insert_before_all

For example, you might want to delete all instances of "`<http://exampleurl.com/>`" and "`<http://exampleurl.au/>`" in the first 1000 bytes of the body. To do this, you can configure a rewrite action to search for all instances of the string exampleurl, extend the scope of the search

© 1997–2026 Citrix Systems, Inc. All rights reserved.

on both sides of the string when a match is found, and then use a regular expression to perform the rewrite in the extended region. The following example extends the scope of the search by 20 bytes to the left and 50 bytes to the right of the matching string:

```
add rewrite action delurl_example delete_all 'HTTP.REQ.BODY(1000)' -search exampleurl -refineSearch 'extend(20,50).regex_select(re#http://exampleurl.(com|au)#)'
```

Convert text to hexadecimal format

The following function converts text to hexadecimal format and extracts the resulting string:

```
<text>.BLOB_TO_HEX(<string>)
```

For example, this function converts the byte string "abc" to "61:62:63".

Encrypt and decrypt text

In Advanced policy expressions, you can use the ENCRYPT and DECRYPT functions to encrypt and decrypt text. Data encrypted by the ENCRYPT function on a given NetScaler appliance or high availability (HA) pair is intended for decryption by the DECRYPT function on the same NetScaler appliance or HA pair. The appliance supports the RC4, DES3, AES128, AES192, and AES256 encryption methods. The key value that is required for encryption is not user-specifiable. When an encryption method is set, the appliance automatically generates a random key value that is appropriate for the specified method. The default method is AES256 encryption, which is the most secure encryption method and the one that Citrix recommends.

You do not need to configure encryption unless you want to change the encryption method or you want the appliance to generate a new key value for the current encryption method.

Note: You can also encrypt and decrypt XML payloads. For information about the functions for encrypting and decrypting XML payloads, see Encrypt and decrypt XML payloads.

CONFIGURE ENCRYPTION

During startup, the appliance runs the set ns encryptionParams command with, by default, the AES256 encryption method, and uses a randomly generated key value that is appropriate for AES256 encryption. The appliance also encrypts the key value and saves the command, with the encrypted key value, to the NetScaler configuration file. Therefore, the AES256 encryption method is enabled for the ENCRYPT and DECRYPT functions by default. The key value that is saved in the configuration file persists across reboots even though the appliance runs the command each time you restart it.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

You can run the set ns encryptionParams command manually, or use the configuration utility, if you want to change the encryption method or if you want the appliance to generate a new key value for the current encryption method. To use the CLI to change the encryption method, set only the method parameter, as shown in "**Example 1: Changing the Encryption Method**." If you want the appliance to generate a new key value for the current encryption method, set the method parameter to the current encryption method and the keyValue parameter to an empty string (""), as shown in "**Example 2: Generating a New Key Value for the Current Encryption Method**." After you generate a new key value, you must save the configuration. If you do not save the configuration, the appliance uses the newly generated key value only until the next restart, after which it reverts to the key value in the saved configuration.

Configure encryption by using the GUI

1. Navigate to **System** > **Settings**.
2. In the **Settings** area, click **Change Encryption** parameters.
3. In the **Change Encryption Parameters** dialog box, do one of the following:
   - To change the encryption method, in the Method list, select the encryption method that you want.
   - To generate a new key value for the current encryption method, click Generate a new key for the selected method.
4. Click **OK**.

USE THE ENCRYPT AND DECRYPT FUNCTIONS

You can use the ENCRYPT and DECRYPT functions with any expression prefix that returns text. For example, you can use the ENCRYPT and DECRYPT functions in rewrite policies for cookie encryption. In the following example, the rewrite actions encrypt a cookie named MyCookie, which is set by a back-end service, and decrypt the same cookie when it is returned by a client:

```
add rewrite action my-cookie-encrypt-action replace
"HTTP.RES.SET_COOKIE.COOKIE("MyCookie").VALUE(0)"
"HTTP.RES.SET_COOKIE.COOKIE("MyCookie").VALUE(0).ENCRYPT"

add rewrite action my-cookie-decrypt-action replace
"HTTP.REQ.COOKIE.VALUE("MyCookie")"
"HTTP.REQ.COOKIE.VALUE("MyCookie").DECRYPT"
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

After you configure policies for encryption and decryption, save the configuration to bring the policies into effect.

Configure encryption key for third-party encryption

In Advanced policy expressions, you can use ENCRYPT and DECRYPT functions for encrypting and decrypting text in a request or response. The data encrypted by the ENCRYPT function on an appliance (standalone, high availability, or cluster) is intended to be decrypted by the DECRYPT function by the same appliance. The appliance supports RC4, DES, Triple-DES, AES92, and AES256 encryption methods and each of these methods use a secret key for both encryption and decryption of data. You can use the any of these methods to encrypt and decrypt data in two ways - self-encryption and third-party encryption.

The self-encryption feature in an appliance (standalone, high availability or cluster) encrypts and then decrypts data by evaluating the header value. One example to understand this is the HTTP Cookie encryption. The expression evaluates the header, encrypts the HTTP cookie value in the Set-Cookie header in the outgoing response and then decrypts the cookie value when it is returned in the cookie header of a subsequent incoming request from the client. The key value is not user configurable, instead when an encryption method is configured in the set ns encryptionParams command, the appliance automatically generates a random key value for the configured method. By default, the command uses the AES256 encryption method, which is the highly secured method and Citrix® recommends this method.

The third-party encryption feature encrypts or decrypts data with a third-party application. For example, a client may encrypt data in a request and the appliance decrypts the data before sending it the back-end server or vice versa. To perform this, the appliance and the third party application must share a secret key. On the appliance, you can directly configure the secret key using an encryption key object and key value is automatically generated by the appliance for a stronger encryption. The same key is manually configured on the third-party appliance so that both appliance and third-party application can use the same key for encrypting and decryption data.

Note: Using third-party encryption, you can also encrypt and decrypt XML payloads. For information about the functions for encrypting and decrypting XML payloads, see "Encrypting and Decrypting XML Payloads.

CIPHER METHODS

A cipher method provides two functions: an encryption function that transforms a plaintext byte sequence into a ciphertext byte sequence, and a decryption function that transforms the ciphertext back to the plaintext. Cipher methods use byte sequences called keys to perform encryption and decryption. Cipher methods that use the same key for encryption and decryption are called

© 1997–2026 Citrix Systems, Inc. All rights reserved.

symmetric. Cipher methods that use different keys for encryption and decryption are asymmetric. The most notable examples of asymmetric ciphers are in public key cryptography, which uses a public key available to anyone for encryption and a private key known only to the decrypter.

A good cipher method makes it infeasible to decrypt ("crack") ciphertext if you don't possess the key. "Infeasible" really means that cracking the cyphertext would take more time and computing resources than it is worth. As computers become more powerful and cheaper, ciphers that were formerly infeasible to crack become more feasible. Also, over time, flaws are found in cipher methods (or their implementations), making cracking easier. Newer cipher methods are therefore preferred over older ones. In general, longer length keys provide better security than shorter keys, at the cost of longer encryption and decryption times.

A cipher method can use stream ciphers or block ciphers. RC4 is the mostly secured stream ciphers and it is used only for legacy application. Block ciphers can include padding.

STREAM CIPHERS

A stream cipher method operates on individual bytes. Only one stream cipher is available on NetScaler- appliances: RC4, which uses a 128 bit (16 bytes) key length. For a given key, RC4 generates a pseudo-random sequence of bytes, call a keystream, which is X-ORed with the plaintext to produce the ciphertext. RC4 is no longer considered secure and should be used only if required by legacy applications.

BLOCK CIPHERS

A block cipher method operates on a fixed block of bytes. A NetScaler appliance provides two block ciphers: Data Encryption Standard (DES) and the Advanced Encryption Standard (AES). DES uses a block size of 8 bytes and (on a NetScaler appliance) two choices for key length: 64 bits (8 bytes), of which 56 bits are data and 8 bits are parity, and Triple-DES, a 192 bit (24 bytes) key length. AES has a block size of 16 bytes and (on NetScaler) three choices for key length: 128 bits (16 bytes), 192 bits (24 bytes) and 256 bits (32 bytes).

PADDING

If the plaintext for a block cipher is not an integral number of blocks, padding with more bytes might be required. For example, suppose the plaintext is "xyzzy" (hex 78797a7a79). For an 8-byte Triple-DES block, this value would have to be padded to create 8 bytes. The padding scheme must allow the decryption function to determine the length of the original plaintext after decryption. Following are some padding schemes currently in use (n is the number of bytes added):

- PKCS7: Adds n bytes of value n each. For example, 78797a7a79030303. This is the padding scheme used by OpenSSL and ENCRYPT() policy function. The PKCS5 padding scheme is the same as PKCS7.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- ANSI X.923: Adds n-1 zero bytes and a final byte of value n. For example, 78797a7a79000003.
- ISO 10126: Adds n-1 random bytes and a final byte of value n. For example, 78797a7a79xxxx03, where xx can be any byte value. The DECRYPT() policy function accepts this padding scheme, which also allows it to accept the PKCS7 and ANSI X.923 schemes.
- ISO/IEC 7816-4: Adds a 0x80 byte and n-1 zero bytes. For example, 78797a7a79800000. This is also call OneAndZeros padding.
- Zero: Adds n zero bytes. Example: 78797a7a79000000. This can only be used with plaintext that does not include NUL bytes.

If padding is used and the plaintext is an integral number of blocks, an extra block is typically added so that the decryption function can unambiguously determine the original plaintext length. For PCKS7 and 8 byte block, this would be 0808080808080808.

MODES OF OPERATION

There are a number of different modes of operation for block ciphers, which specify how multiple blocks of plaintext are encrypted. Some modes use an initialization vector (IV), a block of data apart from the plaintext that is used to start the encryption process. It is a good practice to use a different IV for each encryption, so that the same plaintext produces different ciphertext. The IV does not need to be secret, and so is prepended to the ciphertext. Modes include:

- Electronic Codebook (ECB): Each block of plaintext is encrypted independently. An IV is not used. Padding is required if the plaintext is not a multiple of the cipher block size. The same plaintext and key always produces the same ciphertext. Because of this, ECB is considered less secure than other modes and should only be used for legacy applications.
- Cipher Block Chaining (CBC): Each block of plaintext is XORed with the previous ciphertext block, or the IV for the first block, before being encrypted. Padding is required if the plaintext is not a multiple of the cipher block size. This is the mode used with the NetScaler encryptionParams method.
- Cipher Feedback (CFB): The previous ciphertext block, or the IV for the first block, is encrypted and the output is XORed with the current plaintext block to create the current ciphertext block. The feedback can be 1 bit, 8 bits, or 128 bits. Since the plaintext is XORed with the cipher text, padding is not required.
- Output Feedback (OFB): A keystream is generated by applying the cipher successively to the IV and XORing the keystream blocks with the plaintext. Padding is not required.

Configure encryption keys for third-party encryption

Following are the configuration tasks performed in configuring encryption key.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. Adding an encryption key. Configures an encryption key for a specified cipher method with a specified key value.
2. Modifying an encryption key. You can edit parameters for a configured encryption key.
3. Unsetting an encryption key. Sets parameters for a configured encryption key to their default values. An encryptionKey value with the name must exist. Sets padding to DEFAULT (determined by the method), Deletes an existing IV, which causes ENCRYPT() to generate a random IV. Deletes an existing comment. The method and key value cannot be reset.
4. Removing an encryption key. Deletes a configured encryption key. The key cannot have any references.
5. Show an encryption key. Displays parameters for the configured encryption key or all configured keys. If the name is omitted, the key value is not displayed.

Add an encryption key by using the CLI
At the command prompt, type:

```
add ns encryptionKey <name> -method <method> [-keyValue <keyvalue>][-padding (OFF | ON)] [-iv <hexstring>] -keyValue <keyvalue> [-comment <string>]
```

Where,

```
<method> = ( NONE | RC4 | DES3 | AES128 | AES192 | AES256 | DES | DES-CBC | DES-CFB | DES-OFB | DES-ECB | DES3-CBC | DES3-CFB | DES3-OFB | DES3-ECB | AES128-CBC | AES128-CFB | AES128-OFB | AES128-ECB | AES192-CBC | AES192-CFB | AES192-OFB | AES192-ECB | AES256-CBC | AES256-CFB | AES256-OFB | AES256-ECB ) <hexstring> = hex-encoded byte sequence
```

The above encryption methods specify the operation mode with CBC as the default mode of operation. Therefore, DES, DES2, AES128, AES192, and AES256 methods are equivalent to DES-CBC, DES3-CBC, AES128-CBC, AES192-CBC, and AES256-CBC methods.
Modify an encryption key by using the CLI
At the command prompt, type:

```
set ns encryptionKey <name> [-method <method>] [-keyValue <keyvalue>] [-padding ( OFF | ON )] [-iv <string>] [-comment <string>]
```

Unset an encryption key by using the CLI
At the command prompt, type:

```
unset ns encryptionKey <name> [-padding] [-iv] [-comment]
```

Remove an encryption key by using the CLI

© 1997–2026 Citrix Systems, Inc. All rights reserved.

At the command prompt, type:

`rm ns encryptionKey <name>`

Show an encryption key by using the CLI

At the command prompt, type:

Example:

```
show ns encryptionKey [<name>]

add ns encryptionKey my_key -method aes256 -keyValue
26ea5537b7e0746089476e5658f9327c0b10c3b4778c673a5b38cee182874711 –iv
c2bf0b2e15c15004d6b14bcdc7e5e365

set ns encryptionKey my_key -keyValue
b8742b163abcf62d639837bbee3cef9fb5842d82d00dfe6548831d2bd1d93476

unset ns encryptionKey my_key -iv

rm ns encryptionKey my_key

show ns encryptionKey my_key

Name: my_key

Method: AES256

Padding: DEFAULT

Key Value: (not disclosed)
```

Add an encryption key by using the GUI

Navigate to **System** > **Encryption Keys** and click **Add** to create an encryption key.

Modify an encryption key by using the GUI

Navigate to **System** > **Encryption Keys** and click **Edit** to modify parameters for a configured encryption key.

Remove an encryption key by using the GUI

Navigate to **System** > **Encryption keys** and click **Delete**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

ENCRYPT AND DECRYPT FUNCTIONS FOR THIRD-PARTY ENCRYPTION

Following is the ENCRYPT function used for third-part encryption.

```
ENCRYPT (encryptionKey, out_encoding)
```

Where,

Input data for the appliance is the text to be encrypted

encryptionKey: An optional string parameter that specifies the configured encryption key object to provide the encryption method, secret key value and other encryption parameters. If omitted, the method uses the automatically generated key value associated with the set ns encryptionParamS command.

out_encoding: This value specifies how the output is encoded. If omitted, BASE64 encoding is used.

Input:

```
BASE64: original PEM base64-encoding: 6 bits (0..63) encoded as one ASCII
character:

                  0..23 = 'A'..'Z', 24..51 = 'a'..'z', 52..61 = '0'..'9',
62 = '+', 63 = '/', '=' = pad byte.

      BASE64URL:  URL and Filename safe base64-encoding: same as BASE64
except 62 = '-', 63 = '_'

      HEX_UPPER:  Hexadecimal with 0..9 = '0'..'9' and 10..15 = 'A'..'F'.

      HEX_LOWER:  Hexadecimal with 0..9 = '0'..'9' and 10..15 = 'a'..'f'.

      HEX_COLONS: Hexadecimal with 0..9 = '0'..'9' and 10..15 = 'A'..'F';
':' between each hex byte. Matches BLOB_TO_HEX() output format

      HEX:  For input, accepts HEX_UPPER, HEX_LOWER, and HEX_COLONS
format. For output, produces HEX_LOWER format
```

Output: The output is a text encrypted using the specified method and key and encoded using a specified output encoding. It inserts a generated IV before the encrypted text for block methods and modes that require an IV, and either no IV is specified for the encryptionKey or the encryptionKey is omitted.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Following is the DECRYPT function used for third-part decryption.

```
DECRYPT(encryptionKey, in_encoding)
```

Where,

Input data is an encrypted text using the specified method and key encoded using the specified input encoding. This text is expected to include a generated IV before the encrypted text for block methods and modes that require an IV, and either no IV is specified for the encryptionKey or the encryptionKey is omitted.

encryptionKey—An optional string parameter that specifies the configured encryptionKey object to provide the encryption method, secret key and other encryption parameters. If omitted, the method and automatically generated key associated with the encryptionParams setting will be used

in_encoding—An optional enumeration parameter that specifies how the input is expected to be encoded. The values are the same as the out_encoding of ENCRYPT. If omitted, BASE64 encoding will be expected.

The output data is an unencoded decrypted text.
Variants and optional parameters
Following are the variants of these functions with the optional parameters:

VARIANT	DESCRIPTION
ENCRYPT	Use encryptionParams command and BASE64 output encoding parameter.
ENCRYPT(out_encoding)	Use encryptionParams and specified output encoding parameter.
ENCRYPT(encryptionKey)	Use the specified encryptionKey and BASE64 output encoding parameter.
ENCRYPT(encryptionKey, out_encoding)	Use the specified encryptionKey and output encoding parameter.
DECRYPT	Use encryptionParams command and BASE64 input encoding parameter.
DECRYPT(out_encoding)	Use encryptionParams command and the specified input encoding parameter.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

VARIANT	DESCRIPTION
DECRYPT(encryptionKey)	Use the specified encryptionKey and BASE64 input encoding parameter.
DECRYPT(encryptionKey, out_encoding)	Use the specified encryptionKey and input encoding parameter.

Configure HMAC keys

NetScaler appliances support a Hashed Message Authentication Code (HMAC) function that calculates a digest method or hash of input text by using a secret key shared between a message sender and message receiver. The digest method (derived from an RFC 2104 technique) authenticates the sender and verifies that the message content has not been altered. For example, when a client sends a message with the shared HMAC key to a NetScaler appliance, advanced (PI) policy expressions use the HMAC function to compute the hash-based code on the selected text. Then, when the receiver receives the message with the secret key, it recomputes the HMAC by comparing it with the original HMAC to determine whether the message has been altered. The HMAC function is supported by standalone appliances and by appliances in a high availability configuration or in a cluster. Using it is similar to configuring an encryption key.

The add ns hmackey and set ns hmackey commands include a parameter that specifies the digest method and the shared secret key to use for the HMAC computation.

To configure a HMAC key, you must perform the following:

1. Adding an HMAC key. Configures an HMAC key with a specified key value.
2. Modifying an HMAC key. Modifies parameters for a configured HMAC key. The digest method can be changed without changing the key value, since the key value length is not determined by the digest. However, it is advisable to specify a new key when changing the digest.
3. Unsetting an HMAC key. Sets parameters for a configured HMAC key to their default values. An hmacKey object with the name must exist. The only parameter that can be unset is the comment, which is deleted.
4. Removing an HMAC key. Deletes a configured key. The key cannot have any references.
5. Show an HMAC key. Displays parameters for the configured HMAC ac key or all configured keys. If the name is omitted, the key value is not displayed.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

CONFIGURE A UNIQUE AND RANDOM HMAC KEY

You can automatically generate an unique HMAC key. If you appliance is a cluster configuration, the HMAC key is generated at the start of the process and distributed to all nodes and packet engines. This ensures the HMAC key is same for all packet engines and all nodes in the cluster.

At the command prompt, type:

```
add ns hmacKey <your_key> -digest <digest> -keyValue <keyvalue>
```

Example:

```
add ns hmacKey <name> -digest sha1 -keyValue AUTO
```

Where,

- Name syntax is correct and does not duplicate the name of an existing key.
- The "AUTO" keyValue can be used in the set commands to generate new keys for existing encrytionKey and hmacKey objects.

NOTE:

The automatic key generation is useful if the NetScaler appliance is encrypting and decrypting data with the key, or generating and verifying an HMAC key. Since the key value itself is already encrypted when displayed, you cannot retrieve the generated key value for use by any other party.

Example:

```
add ns hmacKey my_hmac_key -digest sha1 -keyValue
0c753c6c5ef859189cacdf95b506d02c1797407d
```

The above encryption methods specify the operation mode with CBC as the default mode of operation. Therefore, DES, DES2, AES128, AES192, and AES256 methods are equivalent to DES-CBC, DES3-CBC, AES128-CBC, AES192-CBC, and AES256-CBC methods.

MODIFY AN HMAC KEY BY USING THE CLI

This command modifies the parameters configured for an HMAC key. You can change the digest without changing the key value, since the key value length is not determined by the digest. However, it is advisable to specify a new key when changing the digest. At the command prompt, type:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
set ns hmacKey <name> [-digst <digest>] [-keyValue <keyvalue>]

[-comment <string>]
```

UNSET AN HMAC KEY BY USING THE CLI

This command sets parameters configured for an HMAC key with their default values. An hmacKey object with the name must exist. The only parameter that you can unset is the comment option, which is deleted. At the command prompt, type:

```
unset ns hmacKey <name> -comment
```

REMOVE AN HMAC KEY BY USING THE CLI

This command deletes the configured hmac key. The key cannot have references. At the command prompt, type:

```
rm ns hmacKey <name>
```

Show an HMAC key by using the CLI

At the command prompt, type:

```
show ns encryptionKey [<name>]

add ns hmacKey my_hmac_key -digest sha1 -keyValue
0c753c6c5ef859189cacdf95b506d02c1797407d

set ns hmacKey my_hmac_key -keyValue
f348c594341a840a1f641a1cf24aa24c15eb1317

rm ns hmacKey my_hmac_key

show ns hmacKey my_hmac_key

          Name: my_hmac_key

    Digest: SHA1

    Key Value: (not disclosed)
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Advanced policy expressions: working with dates, times, and numbers

Most numeric data that the NetScaler appliance processes consists of dates and times. In addition to working with dates and times, the appliance processes other numeric data, such as the lengths of HTTP requests and responses. To process this data, you can configure advanced policy expressions that process numbers.

A numeric expression consists of an expression prefix that returns a number and sometimes, but not always, an operator that can perform an operation on the number. Examples of expression prefixes that return numbers are `SYS.TIME.DAY`, `HTTP.REQ.CONTENT_LENGTH`, and `HTTP.RES.BODY.LENGTH. Numeric` operators can work with any prefix expression that returns data in numeric format. The `GT(<int>)` operator, for example, can be used with any prefix expression, such as HTTP.REQ.CONTENT_LENGTH, that returns an integer.

Format of dates and times in an expression

When configuring an advanced policy expression in a policy that works with dates and times (for example, the NetScaler system time or a date in an SSL certificate), you specify a time format as follows:

```
GMT|LOCAL [<yyyy>] [<month>] [<d>] [<h>] [<m>] [<s>]
```

Where:

- \<yyyy\> is a four-digit year after GMT or LOCAL.
- \<month\> is a three-character abbreviation for the month, for example, Jan, Dec.
- \<d\> is a day of the week or an integer for the date.

  You cannot specify the day as Monday, Tuesday, and so on. You specify either an integer for a specific day of the month, or you specify a date as the first, second, third weekday of the month, and so on. Following are examples of specifying a day of the week:

  - Sun_1 is the first Sunday of the month.
  - Sun_3 is the third Sunday of the month.
  - Wed_3 is the third Wednesday of the month.
  - 30 is an example of an exact date in a month.
- \<h\> is the hour, for example, 10h.
- <s> is the number of seconds, for example, 30s.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The following example expression is true if the date is between 2008 Jan and 2009 Jan, based on GMT.

```
http.req.date.between(GMT 2008 Jan, GMT 2009 Jan)
```

The following example expression is true for March and all months that follow March in the calendar year, based on GMT:

```
sys.time.ge(GMT 2008 Mar)
```

When you specify a date and time, note that the format is case sensitive and must preserve the exact number of blank spaces between entries.

```
**Note:**

In an expression that requires two time values, both must use GMT or both
must use LOCAL. You cannot mix the two in an expression.

Unlike when you use the SYS.TIME prefix in an advanced policy expression,
if you specify SYS.TIME in a rewrite action, the NetScaler returns a
string in conventional date format (for example, Sun, 06 Nov 1994 08:49:37
GMT). For example, the following rewrite action replaces the http.res.date
header with the NetScaler system time in a conventional date format:

add rewrite action sync_date replace http.res.date sys.time
```

Expressions for the NetScaler system time

The SYS.TIME expression prefix extracts the NetScaler system time. You can configure expressions that establish whether a particular event occurred at a particular time or within a particular time range according to the NetScaler system time.

The following table describes the expressions that you can create by using the SYS.TIME prefix.

- **SYS.TIME.BETWEEN(\<time1\>, \<time2\>):**

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Returns a Boolean TRUE if the returned value is later than \<time1\> and earlier than \<time2\>.

You format the \<time1\>, \<time2\> arguments as follows:

- They must both be GMT or both LOCAL.
- \<time2\> must be later than \<time1\>.

For example, if the current time is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month, you can specify the following:

- sys.time.between(GMT 2004, GMT 2006)
- sys.time.between(GMT 2004 Jan, GMT 2006 Nov)
- sys.time.between(GMT 2004 Jan, GMT 2006)
- sys.time.between(GMT 2005 May Sun_1, GMT 2005 May Sun_3)
- sys.time.between(GMT 2005 May 1, GMT May 2005 1)
- sys.time.between(LOCAL 2005 May 1, LOCAL May 2005 1)

- **SYS.TIME.DAY:**

  Returns the current day of the month as a number from 1 through 31.

- **SYS.TIME.EQ(\<time\>):**

  Returns a Boolean TRUE if the current time is equal to the \<time\> argument.

  For example, if the current time is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month, you can specify the following (evaluation results are shown in parentheses):

  - sys.time.eq(GMT 2005) (TRUE in this example.)
  - sys.time.eq(GMT 2005 Dec) (FALSE in this example.)
  - sys.time.eq(LOCAL 2005 May) (Evaluates to TRUE or FALSE in this example, depending on the current time zone.)
  - sys.time.eq(GMT 10h) (TRUE in this example.)
  - sys.time.eq(GMT 10h 30s) (TRUE in this example.)
  - sys.time.eq(GMT May 10h) (TRUE in this example.)
  - sys.time.eq(GMT Sun) (TRUE in this example.)
  - sys.time.eq(GMT May Sun_1) (TRUE in this example.)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **SYS.TIME.NE(\<time\>):**

  Returns a Boolean TRUE if the current time is not equal to the \<time\> argument.

- **SYS.TIME.GE(\<time\>):**

  Returns a Boolean TRUE if the current time is later than or equal to \<time\>.

  For example, if the current time is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month, you can specify the following (evaluation results are shown in parentheses):

  - sys.time.ge(GMT 2004) (TRUE in this example.)
  - sys.time.ge(GMT 2005 Jan) (TRUE in this example.)
  - sys.time.ge(LOCAL 2005 May) (TRUE or FALSE in this example, depending on the current time zone.)
  - sys.time.ge(GMT 8h) (TRUE in this example.)
  - sys.time.ge(GMT 30m) (FALSE in this example.)
  - sys.time.ge(GMT May 10h) (TRUE in this example.)
  - sys.time.ge(GMT May 10h 0m) (TRUE in this example.)
  - sys.time.ge(GMT Sun) (TRUE in this example.)
  - sys.time.ge(GMT May Sun_1) (TRUE in this example.)

- **SYS.TIME.GT(\<time\>):**

  Returns a Boolean TRUE if the time value is later than the \<time\> argument.

  For example, if the current time is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month, you can specify the following (evaluation results are shown in parentheses):

  - sys.time.gt(GMT 2004) (TRUE in this example.)
  - sys.time.gt(GMT 2005 Jan) (TRUE in this example.)
  - sys.time.gt(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.)
  - sys.time.gt(GMT 8h) (TRUE in this example.)
  - sys.time.gt(GMT 30m) (FALSE in this example.)
  - sys.time.gt(GMT May 10h) (FALSE in this example.)
  - sys.time.gt(GMT May 10h 0m) (TRUE in this example.)
  - sys.time.gt(GMT Sun) (FALSE in this example.)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- sys.time.gt(GMT May Sun_1) (FALSE in this example.)

- **SYS.TIME.HOURS:**

  Returns the current hour as an integer from 0 to 23.

- **SYS.TIME.LE(\<time\>):**

  Returns a Boolean TRUE if the current time value precedes or is equal to the \<time\> argument.

  For example, if the current time is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month, you can specify the following (evaluation results are shown in parentheses):

  - sys.time.le(GMT 2006) (TRUE in this example.)
  - sys.time.le(GMT 2005 Dec) (TRUE in this example.)
  - sys.time.le(LOCAL 2005 May) (TRUE or FALSE depending on the current timezone.)
  - sys.time.le(GMT 8h) (FALSE in this example.)
  - sys.time.le(GMT 30m) (TRUE in this example.)
  - sys.time.le(GMT May 10h) (TRUE in this example.)
  - sys.time.le(GMT Jun 11h) (TRUE in this example.)
  - sys.time.le(GMT Wed) (TRUE in this example.)
  - sys.time.le(GMT May Sun_1) (TRUE in this example.)

- **SYS.TIME.LT(\<time\>):**

  Returns a Boolean TRUE if the current time value precedes the \<time\> argument.

  For example, if the current time is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month, you can specify the following (evaluation results are shown in parentheses):

  - sys.time.lt(GMT 2006) (TRUE in this example.)
  - sys.time.lt.time.lt(GMT 2005 Dec) (TRUE in this example.)
  - sys.time.lt(LOCAL 2005 May) (TRUE or FALSE depending on the current time zone.)
  - sys.time.lt(GMT 8h) (FALSE in this example.)
  - sys.time.lt(GMT 30m) (TRUE in this example.)
  - sys.time.lt(GMT May 10h) (FALSE in this example.)
  - sys.time.lt(GMT Jun 11h) (TRUE in this example.)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- sys.time.lt(GMT Wed) (TRUE in this example.)
- sys.time.lt(GMT May Sun_1) (FALSE in this example.)

- **SYS.TIME.MINUTES:**

  Returns the current minute as an integer from 0 to 59.

- **SYS.TIME.MONTH:**

  Extracts the current month and returns an integer from 1 (January) to 12 (December).

- **SYS.TIME.RELATIVE_BOOT:**

  Calculates the number of seconds to the closest previous or scheduled reboot, and returns an integer.

  If the closest boot time is in the past, the integer is negative. If it is in the future, the integer is positive.

- **SYS.TIME.RELATIVE_NOW:**

  Calculates the number of seconds between the current NetScaler system time and the specified time, and returns an integer showing the difference.

  If the designated time is in the past, the integer is negative; if it is in the future, the integer is positive.

- **SYS.TIME.SECONDS:**

  Extracts the seconds from the current NetScaler system time, and returns that value as an integer from 0 to 59.

- **SYS.TIME.WEEKDAY:**

  Returns the current weekday as a value from 0 (Sunday) to 6 (Saturday).

- **SYS.TIME.WITHIN (\<time1\>, \<time2\>):**

  If you omit an element of time in \<time1\>, for example, the day or hour, it is assumed to have the lowest value in its range. If you omit an element in \<time2\>, it is assumed to have the highest value of its range.

  The ranges for the elements of time are as follows: month 1-12, day 1-31, weekday 0-6, hour 0-23, minutes 0-59 and seconds 0-59. If you specify the year, you must do so in both \<time1\> and \<time2\>.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

For example, if the time is GMT 2005 May 10 10h 15m 30s, and it is the second Tuesday of the month, you can specify the following (evaluation results are shown in parentheses):

- sys.time.within(GMT 2004, GMT 2006) (TRUE in this example.)
- sys.time.within(GMT 2004 Jan, GMT 2006 Mar) (FALSE, May is not in the range of January to March.)
- sys.time.within(GMT Feb, GMT) (TRUE, May is in the range of February to December.)
- sys.time.within(GMT Sun_1, GMT Sun_3) (TRUE, the second Tuesday is between the first Sunday and the third Sunday.)
- sys.time.within(GMT 2005 May 1 10h, GMT May 2005 1 17h) (TRUE in this example.)
- sys.time.within(LOCAL 2005 May 1, LOCAL May 2005 1) (TRUE or FALSE, depending on the NetScaler system time zone.)

- **SYS.TIME.YEAR:**

  Extracts the year from the current system time and returns that value as a four-digit integer.

Expressions for SSL certificate dates

You can determine the validity period for SSL certificates by configuring an expression that contains the following prefix:

```
CLIENT.SSL.CLIENT_CERT
```

The following example expression matches a particular time for expiration with the information in the certificate:

```
client.ssl.client_cert.valid_not_after.eq(GMT 2009)
```

The following table describes time-based operations on SSL certificates. To obtain the expression you want, replace *certificate* in the expression in the first column with the prefix expression, “CLIENT.SSL.CLIENT_CERT”.

- `<certificate>.VALID_NOT_AFTER:`

  Returns the last day before certificate expiration. The return format is the number of seconds since GMT January 1, 1970 (0 hours, 0 minutes, 0 seconds).

- **<certificate\>.VALID_NOT_AFTER.BETWEEN(\<time1\>, \<time2\>):**

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Returns a Boolean TRUE value if the certificate validity is between the \<time1\> and \<time2\> arguments. Both \<time1\> and \<time2\> must be fully specified. Following are examples:

GMT 1995 Jan is fully specified.

GMT Jan is not fully specified

GMT 1995 20 is not fully specified.

GMT Jan Mon_2 is not fully specified.

The \<time1\> and \<time2\> arguments must be both GMT or both LOCAL, and \<time2\> must be greater than \<time1\>.

For example, if it is GMT 2005 May 1 10h 15m 30s, and the first Sunday of the month, you can specify the following (evaluation results are in parentheses).

- . . .between(GMT 2004, GMT 2006) (TRUE)
- . . .between(GMT 2004 Jan, GMT 2006 Nov) (TRUE)
- . . .between(GMT 2004 Jan, GMT 2006) (TRUE)
- . . .between(GMT 2005 May Sun_1, GMT 2005 May Sun_3) (TRUE)
- . . .between(GMT 2005 May 1, GMT May 2005 1) (TRUE)
- . . .between(LOCAL 2005 May 1, LOCAL May 2005 1) (TRUE or FALSE, depending on the NetScaler system time zone.)

- **\<certificate\>.VALID_NOT_AFTER.DAY:**

  Extracts the last day of the month that the certificate is valid, and returns a number from 1 through 31, as appropriate for the date.

- **\<certificate\>.VALID_NOT_AFTER.EQ(\<time\>):**

  Returns a Boolean TRUE if the time is equal to the \<time\> argument.

  For example, if the current time is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month, you can specify the following (evaluation results for this example are in parentheses):

  - . . .eq(GMT 2005) (TRUE)
  - . . .eq(GMT 2005 Dec) (FALSE)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- . . .eq(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone)
- . . .eq(GMT 10h) (TRUE)
- . . .eq(GMT 10h 30s) (TRUE)
- . . .eq(GMT May 10h) (TRUE)
- . . .eq(GMT Sun) (TRUE)
- . . .eq(GMT May Sun_1) (TRUE)

- **\<certificate\>.VALID_NOT_AFTER.GE(\<time\>):**

  Returns a Boolean TRUE if the time value is greater than or equal to the argument \<time\>.

  For example, if the time value is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month of May in 2005, you can specify the following (evaluation results for this example are in parentheses):

  - . . .ge(GMT 2004) (TRUE)
  - . . .ge(GMT 2005 Jan) (TRUE)
  - . . .ge(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.)
  - . . .ge(GMT 8h) (TRUE)
  - . . .ge(GMT 30m) (FALSE)
  - . . .ge(GMT May 10h) (TRUE)
  - . . .ge(GMT May 10h 0m) (TRUE)
  - . . .ge(GMT Sun) (TRUE)
  - . . .ge(GMT May Sun_1) (TRUE)

- **\<certificate\>.VALID_NOT_AFTER.GT(\<time\>):**

  Returns a Boolean TRUE if the time value is greater than the argument \<time\>.

  For example, if the time value is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month of May in 2005, you can specify the following (evaluation results for this example are in parentheses):

  - . . .gt(GMT 2004) (TRUE)
  - . . .gt(GMT 2005 Jan) (TRUE)
  - . . .gt(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.)
  - . . .gt(GMT 8h) (TRUE)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- . . .gt(GMT 30m) (FALSE)
- . . .gt(GMT May 10h) (FALSE)
- . . .gt(GMT Sun) (FALSE)
- . . .gt(GMT May Sun_1) (FALSE)

- **\<certificate\>.VALID_NOT_AFTER.HOURS:**

  Extracts the last hour that the certificate is valid and returns that value as an integer from 0 to 23.

- **\<certificate\>.VALID_NOT_AFTER.LE(\<time\>):**

  Returns a Boolean TRUE if the time precedes or is equal to the \<time\> argument.

  For example, if the time value is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month of May in 2005, you can specify the following (evaluation results for this example are in parentheses):

  - . . .le(GMT 2006) (TRUE)
  - . . .le(GMT 2005 Dec) (TRUE)
  - . . .le(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.)
  - . . .le(GMT 8h) (FALSE)
  - . . .le(GMT 30m) (TRUE)
  - . . .le(GMT May 10h) (TRUE)
  - . . .le(GMT Jun 11h) (TRUE)
  - . . .le(GMT Wed) (TRUE)
  - . . .le(GMT May Sun_1) (TRUE)

- **\<certificate\>.VALID_NOT_AFTER.LT(\<time\>):**

  Returns a Boolean TRUE if the time precedes the \<time\> argument.

  For example, if the current time is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month, you can specify the following:

  - . . .lt(GMT 2006) (TRUE)
  - . . .lt(GMT 2005 Dec) (TRUE)
  - . . .lt(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- . . .lt(GMT 8h) (FALSE)
- . . .lt(GMT 30m) (TRUE)
- . . .lt(GMT May 10h) (FALSE)
- . . .lt(GMT Jun 11h) (TRUE)
- . . .lt(GMT Wed) (TRUE)
- . . .lt(GMT May Sun_1) (FALSE)

- **\<certificate\>.VALID_NOT_AFTER.MINUTES:**

  Extracts the last minute that the certificate is valid and returns that value as an integer from 0 to 59.

- **\<certificate\>.VALID_NOT_AFTER.MONTH:**

  Extracts the last month that the certificate is valid and returns that value as an integer from 1 (January) to 12 (December).

- **\<certificate\>.VALID_NOT_AFTER.RELATIVE_BOOT:**

  Calculates the number of seconds to the closest previous or scheduled reboot and returns an integer. If the closest boot time is in the past, the integer is negative. If it is in the future, the integer is positive.

- **\<certificate\>.VALID_NOT_AFTER.RELATIVE_NOW;**

  Calculates the number of seconds between the current system time and the specified time and returns an integer. If the time is in the past, the integer is negative; if it is in the future, the integer is positive.

- **\<certificate\>.VALID_NOT_AFTER.SECONDS:**

  Extracts the last second that the certificate is valid and returns that value as an integer from 0 to 59.

- **\<certificate\>.VALID_NOT_AFTER.WEEKDAY:**

  Extracts the last weekday that the certificate is valid. Returns a number between 0 (Sunday) and 6 (Saturday) to give the weekday in the time value.

- **\<certificate\>.VALID_NOT_AFTER.WITHIN(\<time1\>, \<time2\>):**

  Returns a Boolean TRUE if the time lies within all the ranges defined by the elements in \<time1\> and \<time2\>.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

If you omit an element of time from \<time1\>, it is assumed to have the lowest value in its range. If you omit an element from \<time2\>, it is assumed to have the highest value of its range. If you specify a year in \<time1\>, you must specify it in \<time2\>.

The ranges for elements of time are as follows: month 1-12, day 1-31, weekday 0-6, hour 0-23, minutes 0-59 and seconds 0-59. For the result to be TRUE, each element in the time must exist in the corresponding range that you specify in \<time1\>, \<time2\>.

For example, if time is GMT 2005 May 10 10h 15m 30s, and it is the second Tuesday of the month, you can specify the following (evaluation results are in parentheses):

- . . .within(GMT 2004, GMT 2006) (TRUE)
- . . .within(GMT 2004 Jan, GMT 2006 Mar) (FALSE, May is not in the range of January to March.)
- . . .within(GMT Feb, GMT) (TRUE, May is in the range for February to December)
- . . .within(GMT Sun_1, GMT Sun_3) (TRUE, the second Tuesday lies within the range of the first Sunday through the third Sunday)
- . . .within(GMT 2005 May 1 10h, GMT May 2005 1 17h) (TRUE)
- . . .within(LOCAL 2005 May 1, LOCAL May 2005 1) (TRUE or FALSE, depending on the NetScaler system time zone)

- **\<certificate\>.VALID_NOT_AFTER.YEAR:**

  Extracts the last year that the certificate is valid and returns a four-digit integer.

- **\<certificate\>.VALID_NOT_BEFORE:**

  Returns the date that the client certificate becomes valid.

  The return format is the number of seconds since GMT January 1, 1970 (0 hours, 0 minutes, 0 seconds).

- **\<certificate\>.VALID_NOT_BEFORE.BETWEEN(\<time1\>, \<time2\>):**

  Returns a Boolean TRUE if the time value is between the two time arguments. Both \<time1\> and \<time2\> arguments must be fully specified.

  Following are examples:

  GMT 1995 Jan is fully specified. GMT Jan is not fully specified. GMT 1995 20 is not fully specified. GMT Jan Mon_2 is not fully specified. The time arguments must be both GMT or both LOCAL, and \<time2\> must be greater than \<time1\>.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

For example, if the time value is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month of May in 2005, you can specify the following (evaluation results for this example are in parentheses):

- . . .between(GMT 2004, GMT 2006) (TRUE)
- . . .between(GMT 2004 Jan, GMT 2006 Nov) (TRUE)
- . . .between(GMT 2004 Jan, GMT 2006) (TRUE)
- . . .between(GMT 2005 May Sun_1, GMT 2005 May Sun_3) (TRUE)
- . . .between(GMT 2005 May 1, GMT May 2005 1) (TRUE)
- . . .between(LOCAL 2005 May 1, LOCAL May 2005 1) (TRUE or FALSE, depending on the NetScaler system time zone.)

- **\<certificate\>.VALID_NOT_BEFORE.DAY:**

  Extracts the last day of the month that the certificate is valid and returns that value as a number from 1 through 31 representing that day.

- **\<certificate\>.VALID_NOT_BEFORE.EQ(\<time\>):**

  Returns a Boolean TRUE if the time is equal to the \<time\> argument.

  For example, if the time value is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month of May in 2005, you can specify the following (evaluation results for this example are in parentheses):

  - . . .eq(GMT 2005) (TRUE)
  - . . .eq(GMT 2005 Dec) (FALSE)
  - . . .eq(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.)
  - . . .eq(GMT 10h) (TRUE)
  - . . .eq(GMT 10h 30s) (TRUE)
  - . . .eq(GMT May 10h) (TRUE)
  - . . .eq(GMT Sun) (TRUE)
  - . . .eq(GMT May Sun_1) (TRUE)

- **\<certificate\>.VALID_NOT_BEFORE.GE(\<time\>):**

  Returns a Boolean TRUE if the time is greater than (after) or equal to the \<time\> argument.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

For example, if the time value is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month of May in 2005, you can specify the following (evaluation results are in parentheses):

- . . .ge(GMT 2004) (TRUE)
- . . .ge(GMT 2005 Jan) (TRUE)
- . . .ge(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.)
- . . .ge(GMT 8h) (TRUE)
- . . .ge(GMT 30m) (FALSE)
- . . .ge(GMT May 10h) (TRUE)
- . . .ge(GMT May 10h 0m) (TRUE)
- . . .ge(GMT Sun) (TRUE)
- . . .ge(GMT May Sun_1) (TRUE)

- **\<certificate\>.VALID_NOT_BEFORE.GT(\<time\>):**

  Returns a Boolean TRUE if the time occurs after the \<time\> argument.

  For example, if the time value is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month of May in 2005, you can specify the following (evaluation results are in parentheses):

  - . . .gt(GMT 2004) (TRUE)
  - . . .gt(GMT 2005 Jan) (TRUE)
  - . . .gt(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.)
  - . . .gt(GMT 8h) (TRUE)
  - . . .gt(GMT 30m) (FALSE)
  - . . .gt(GMT May 10h) (FALSE)
  - . . .gt(GMT May 10h 0m) (TRUE)
  - . . .gt(GMT Sun) (FALSE)
  - . . .gt(GMT May Sun_1) (FALSE)

- **\<certificate\>.VALID_NOT_BEFORE.HOURS:**

  Extracts the last hour that the certificate is valid and returns that value as an integer from 0 to 23.

- **\<certificate\>.VALID_NOT_BEFORE.LE(\<time\>)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Returns a Boolean TRUE if the time precedes or is equal to the \<time\> argument.

For example, if the time value is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month of May in 2005, you can specify the following (evaluation results for this example are in parentheses):

- . . .le(GMT 2006) (TRUE)
- . . .le(GMT 2005 Dec) (TRUE)
- . . .le(LOCAL 2005 May) (TRUE or FALSE,depending on the current time zone.)
- . . .le(GMT 8h) (FALSE) . - . .le(GMT 30m) (TRUE)
- . . .le(GMT May 10h) (TRUE)
- . . .le(GMT Jun 11h) (TRUE)
- . . .le(GMT Wed) (TRUE)
- . . .le(GMT May Sun_1) (TRUE)

- **\<certificate\>.VALID_NOT_BEFORE.LT(\<time\>):**

  Returns a Boolean TRUE if the time precedes the \<time\> argument.

  For example, if the time value is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month of May in 2005, you can specify the following (evaluation results for this example are in parentheses):

  - . . .lt(GMT 2006) (TRUE)
  - . . .lt(GMT 2005 Dec) (TRUE)
  - . . .lt(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.)
  - . . .lt(GMT 8h) (FALSE)
  - . . .lt(GMT 30m) (TRUE)
  - . . .lt(GMT May 10h) (FALSE)
  - . . .lt(GMT Jun 11h) (TRUE)
  - . . .lt(GMT Wed) (TRUE)
  - . . .lt(GMT May Sun_1) (FALSE)

- **\<certificate\>.VALID_NOT_BEFORE.MINUTES:**

  Extracts the last minute that the certificate is valid. Returns the current minute as an integer from 0 to 59.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **\<certificate\>.VALID_NOT_BEFORE.MONTH:**

  Extracts the last month that the certificate is valid. Returns the current month as an integer from 1 (January) to 12 (December).

- **\<certificate\>.VALID_NOT_BEFORE.RELATIVE_BOOT:**

  Calculates the number of seconds to the closest previous or scheduled NetScaler reboot and returns an integer. If the closest boot time is in the past, the integer is negative; if it is in the future, the integer is positive.

- **\<certificate\>.VALID_NOT_BEFORE.RELATIVE_NOW:**

  Returns the number of seconds between the current NetScaler system time and the specified time as an integer. If the designated time is in the past, the integer is negative. If it is in the future, the integer is positive.

- **\<certificate\>.VALID_NOT_BEFORE.SECONDS:**

  Extracts the last second that the certificate is valid. Returns the current second as an integer from 0 to 59.

- **\<certificate\>.VALID_NOT_BEFORE.WEEKDAY:**

  Extracts the last weekday that the certificate is valid. Returns the weekday as a number between 0 (Sunday) and 6 (Saturday).

- **\<certificate\>.VALID_NOT_BEFORE.WITHIN(\<time1\>, \<time2\>):**

  Returns a Boolean TRUE if each element of time exists within the range defined in the \<time1\>, \<time2\> arguments.

  If you omit an element of time from \<time1\>, it is assumed to have the lowest value in its range. If you omit an element of time from \<time2\>, it is assumed to have the highest value in its range. If you specify a year in \<time1\>, it must be specified in \<time2\>. The ranges for elements of time are as follows: month 1-12, day 1-31, weekday 0-6, hour 0-23, minutes 0-59 and seconds 0-59.

  For example, if the time is GMT 2005 May 10 10h 15m 30s, and it is the second Tuesday of the month, you can specify the following (evaluation results are in parentheses):

  - . . .within(GMT 2004, GMT 2006) (TRUE)
  - . . .within(GMT 2004 Jan, GMT 2006 Mar) (FALSE, May is not in the range of January to March.)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- . . .within(GMT Feb, GMT) (TRUE, May is in the range of February to December.)
- . . .within(GMT Sun_1, GMT Sun_3) (TRUE, the second Tuesday is between the first Sunday and the third Sunday.)
- . . .within(GMT 2005 May 1 10h, GMT May 2005 1 17h) (TRUE)
- . . .within(LOCAL 2005 May 1, LOCAL May 2005 1) (TRUE or FALSE, depending on the NetScaler system time zone)

- **\<certificate\>.VALID_NOT_BEFORE.YEAR:**

  Extracts the last year that the certificate is valid. Returns the current year as a four-digit integer.

Expressions for HTTP request and response dates

The following expression prefixes return the contents of the HTTP Date header as text or as a date object. These values can be evaluated as follows:

- As a number. The numeric value of an HTTP Date header is returned in the form of the number of seconds since Jan 1, 1970.

  For example, the expression http.req.date.mod(86400) returns the number of seconds since the beginning of the day. These values can be evaluated using the same operations as other non-date-related numeric data. For more information, see Expression prefixes for numeric data other than date and time.
- As an HTTP header. Date headers can be evaluated using the same operations as other HTTP headers.

  For more information, see Advanced policy expressions: Parsing HTTP, TCP, and UDP data.
- As text. Date headers can be evaluated using the same operations as other strings.

For more information, see Advanced Policy Expressions: Evaluating Text.

PREFIX	DESCRIPTION
HTTP.REQ.DATE	Returns the contents of the HTTP Date header as text or as a date object. The date formats recognized are: RFC822. Sun, 06 Jan 1980 08:49:37 GMT, RFC850. Sunday, 06-Jan-80 09:49:37 GMT, and ASCTIME. Sun Jan 6 08:49:37 1980.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

PREFIX	DESCRIPTION
HTTP.RES.DATE	Returns the contents of the HTTP Date header as text or as a date object. The date formats recognized are: RFC822. Sun, 06 Jan 1980 8:49:37 GMT, RFC850. Sunday, 06-Jan-80 9:49:37 GMT, and ASCTIME. Sun Jan 6 08:49:37 1980.

Generate the day of the week, as a string, in short and long formats

The functions, `WEEKDAY_STRING_SHORT` and `WEEKDAY_STRING`, generate the day of the week, as a string, in short and long formats, respectively. The strings that are returned are always in English. The prefix used with these functions must return the day of the week in integer format and the acceptable range for the value returned by the prefix is 0-6. Therefore, you can use any prefix that returns an integer in the acceptable range. An UNDEF condition is raised if the returned value is not in this range or if memory allocation fails.

Following are the descriptions of the functions:

FUNCTION	DESCRIPTION
`<prefix>.WEEKDAY_STRING_SHORT`	Returns the day of the week in short format. The short form is always 3 characters long with an initial capital and the remaining characters in lower case. For example, SYS.TIME.WEEKDAY.WEEKDAY_STRING_SHORT returns Sun if the value returned by the WEEKDAY function is 0 and Sat if the value returned by the prefix is 6.
`<prefix>.WEEKDAY_STRING`	Returns the day of the week in long format. The long form always has an initial capital, with the remaining characters in lower case. For example, `SYS.TIME.WEEKDAY.WEEKDAY_STRING` returns Sunday if the value returned by the WEEKDAY function is 0 and Saturday if the value returned by the prefix is 6.

Expression prefixes for numeric data other than date and time

In addition to configuring expressions that operate on time, you can configure expressions for the following types of numeric data:

- The length of HTTP requests, the number of HTTP headers in a request, and so on.

  For more information, see Expressions for numeric HTTP payload data other than dates.

- IP and MAC addresses.

  For more information, see Expressions for IP addresses and IP subnets.

- Client and server data in regard to interface IDs and transaction throughput rate.

  For more information, see Expressions for numeric client and server data.

- Numeric data in client certificates other than dates.

  For information on these prefixes, including the number of days until certificate expiration and the encryption key size, see Prefixes for numeric data in SSL certificates.

Converting numbers to text

The following functions produce binary strings from a number returned by an expression prefix. These functions are particularly useful in the TCP rewrite feature as replacement strings for binary data. For more information about the TCP rewrite feature, see Rewrite.

All the functions return a value of type text. The endianness that some of the functions accept as a parameter is either LITTLE_ENDIAN or BIG_ENDIAN.

FUNCTION	DESCRIPTION
<number>.SIGNED8_STRING	Produces an 8-bit signed binary string representing the number. If the value is out of range, an undef condition is raised. Example: HTTP.REQ.BODY(100).GET_SIGNED8(16).SUB(3).SIGNED8_STRING
<number>.UNSIGNED8_STRING	Produces an 8-bit unsigned binary string representing the number. If the value is out of range, an undef condition is raised. Example: HTTP.REQ.BODY(100).GET_UNSIGNED8(31).ADD(3).UNSIGNED8_STRING

© 1997–2026 Citrix Systems, Inc. All rights reserved.

FUNCTION	DESCRIPTION
<number>.SIGNED16_STRING(<endianness>)	Produces a 16-bit signed binary string representing the number. If the value is out of range, an undef condition is raised. Example: HTTP.REQ.BODY(100).SKIP(12).GET_SIGNED16(0, BIG_ENDIAN).SUB(4).SIGNED16_STRING(BIG_ENDIAN)
<number>.UNSIGNED16_STRING(<endianness>)	Produces a 16-bit unsigned binary string representing the number. If the value is out of range, an undef condition is raised. Example: HTTP.REQ.BODY(100).GET_UNSIGNED16(47, LITTLE_ENDIAN).ADD(7).UNSIGNED16_STRING(LITTLE_ENDIAN)
<number>.SIGNED32_STRING(<endianness>)	Produces a 32-bit signed binary string representing the number. Example: HTTP.REQ.BODY(100).AFTER_STR("delim").GET_SIGNED32(0, BIG_ENDIAN).SUB(1).SIGNED32_STRING(BIG_ENDIAN)
<unsigned_long_number>.UNSIGNED8_STRING	Produces an 8-bit unsigned binary string representing the number. If the value is out of range, an undef condition is raised. Example: HTTP.REQ.BODY(100).GET_UNSIGNED8(24).TYPECAST_UNSIGNED_LONG_AT.ADD(12).UNSIGNED8_STRING
<unsigned_long_number>.UNSIGNED16_STRING(<endianness>)	Produces a 16-bit unsigned binary string representing the number. If the value is out of range, an undef condition is raised. Example: HTTP.REQ.BODY(100).GET_UNSIGNED16(23, LITTLE_ENDIAN).TYPECAST_UNSIGNED_LONG_AT.ADD(10).UNSIGNED16_STRING(LITTLE_ENDIAN)
<unsigned_long_number>.UNSIGNED32_STRING(<endianness>)	Produces a 32-bit unsigned binary string representing the number. If the value is out of

© 1997–2026 Citrix Systems, Inc. All rights reserved.

FUNCTION	DESCRIPTION
	range, an undef condition is raised. Example: HTTP.REQ.BODY(100).AFTER_STR("delim2") .GET_UNSIGNED32(0, BIG_ENDIAN).ADD(2).UNSIGNED32_STRIN G(BIG_ENDIAN)

Virtual server based expressions

The `SYS.VSERVER("<vserver-name>")` expression prefix enables you to identify a virtual server. You can use the following functions with this prefix to retrieve information related to the specified virtual server:

- **THROUGHPUT.** Returns the throughput of the virtual server in Mbps (Megabits per second). The value returned is an unsigned long number.

  Usage: SYS.VSERVER("vserver").THROUGHPUT
- **CONNECTIONS.** Returns the number of connections being managed by the virtual server. The value returned is an unsigned long number.

  Usage: SYS.VSERVER("vserver").CONNECTIONS
- **STATE.** Returns the state of the virtual server. The value returned is UP, DOWN, or OUT_OF_SERVICE. One of these values can therefore be passed as an argument to the EQ() operator to perform a comparison that results in a Boolean TRUE or FALSE.

  Usage: SYS.VSERVER("vserver").STATE
- **HEALTH.** Returns the percentage of services in an UP state for the specified virtual server. The value returned is an integer.

  Usage: SYS.VSERVER("vserver").HEALTH
- **RESPTIME.** Returns the response time as an integer representing the number of microseconds. Response time is the average TTFB (Time To First Byte) from all the services bound to the virtual server.

  Usage: SYS.VSERVER("vserver").RESPTIME
- **SURGECOUNT.** Returns the number of requests in the surge queue of the virtual server. The value returned is an integer.

  Usage: SYS.VSERVER("vserver").SURGECOUNT

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Example 1:

The following rewrite policy aborts rewrite processing if the number of connections at the load balancing virtual server LBvserver exceeds 10000:

```
add rewrite policy norewrite_pol sys.vserver("LBvserver").connections.gt(10000) norewrite
```

Example 2:

The following rewrite action inserts a custom header, TP, whose value is the throughout at the virtual server LBvserver:

```
add rewrite action tp_header insert_http_header TP SYS.VSERVER("LBvserver").THROUGHPUT
```

Example 3:

The following audit log message action writes the average TTFB of the services bound to a virtual server, to the newnslog log file:

```
add audit messageaction log_vserver_resptime_act INFORMATIONAL "\"NS Response Time to Servers:\" + sys.vserver(\"ssllb\").resptime + \" millisec\"" -logtoNewnslog YES
```

Advanced policy expressions: Parsing HTTP, TCP, and UDP data

You can configure advanced policy expressions to evaluate the payload in an HTTP request or response. The payload associated with an HTTP connection includes HTTP headers (standard or custom headers), body, and connection URL. Also, you can evaluate and process the payload in a TCP or a UDP packet. For HTTP connections, for example, you can check whether a particular HTTP header is present or if the URL includes a particular query parameter.

You can configure expressions to transform the URL encoding and apply HTML or XML “safe” coding for subsequent evaluation. You can also use XPATH and JSON prefixes to evaluate date in XML and JSON files, respectively.

You can also use text-based and numeric Advanced policy expressions to evaluate HTTP request and response data. For more information, see Advanced policy expressions: Evaluating text and Advanced policy Expressions: Working with Dates, Times, and Numbers.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

About evaluating HTTP and TCP payload

The payload of an HTTP request or response consists of HTTP protocol information such as headers, a URL, body content, and version and status information. When you configure an advanced policy expression to evaluate HTTP payload, you use an advanced policy expression prefix and, if necessary, an operator.

For example, use the following expression, which includes the `http.req.header("<header_name>")` prefix and the exists operator, if you want to determine whether an HTTP connection includes a custom header named "myHeader":

```
http.req.header("myHeader").exists
```

You can also combine multiple Advanced policy expressions with Boolean and arithmetic operators. For example, the following compound expression can be useful with various NetScaler features, such as Integrated Caching, Rewrite, and Responder. This expression first uses the && Boolean operator to determine whether an HTTP connection includes the Content-Type header with a value of "text/html." If that operation returns a value of FALSE, the expression determines whether the HTTP connection includes a "Transfer-Encoding" or "Content-Length" header.

```
(http.req.header("Content-Type").exists && http.req.header("Content-Type").eq("text/html")) || (http.req.header("Transfer-Encoding").exists) || (http.req.header("Content-Length").exists)
```

The payload of a TCP or UDP packet is the data portion of the packet. You can configure Advanced policy expressions to examine features of a TCP or UDP packet, including the following:

- Source and destination domains
- Source and destination ports
- The text in the payload
- Record types

The following expression prefixes extract text from the body of the payload:

- `HTTP.REQ.BODY(integer)`. Returns the body of an HTTP request as a multiline text object, up to the character position designated in the integer argument. If there are fewer characters in the body than is specified in the argument, the entire body is returned.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE:

The HTTP.REQ based expressions don't work with the SSL_BRIDGE protocol type.

- `HTTP.RES.BODY(integer)`. Returns a portion of the HTTP response body. The length of the returned text is equal to the number in the integer argument. If there are fewer characters in the body than is specified in an integer, the entire body is returned.
- `CLIENT.TCP.PAYLOAD(integer)`. Returns TCP payload data as a string, starting with the first character in the payload and continuing for the number of characters in the integer argument.

Following is an example that evaluates to TRUE if a response body of 1024 bytes contains the string "https", and this string occurs after the string "start string" and before the string "end string":

```
http.res.body(1024).after_str("start_string").before_str("end_string").contains("https")
```

NOTE:

You can apply any text operation to the payload body. For information on operations that you can apply to text, see Advanced policy expressions: Evaluating text.

Expressions for identifying the protocol in an incoming IP packet

The following table lists the expressions that you can use to identify the protocol in an incoming packet.

EXPRESSION	DESCRIPTION
CLIENT.IP.PROTOCOL	Identifies the protocol in IPv4 packets sent by clients.
CLIENT.IPV6.PROTOCOL	Identifies the protocol in IPv6 packets sent by clients.
SERVER.IP.PROTOCOL	Identifies the protocol in IPv4 packets sent by servers.
SERVER.IPV6.PROTOCOL	Identifies the protocol in IPv6 packets sent by servers.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Arguments to the PROTOCOL function

You can pass the Internet Assigned Numbers Authority (IANA) protocol number to the PROTOCOL function. For example, if you want to determine whether the protocol in an incoming packet is TCP, you can use CLIENT.IP.PROTOCOL.EQ(6), where 6 is the IANA-assigned protocol number for TCP. For some protocols, you can pass an enumeration value instead of the protocol number. For example, instead of CLIENT.IP.PROTOCOL.EQ(6), you can use CLIENT.IP.PROTOCOL.EQ(TCP). The following table lists the protocols for which you can use enumeration values, and the corresponding enumeration values for use with the PROTOCOL function.

PROTOCOL	ENUMERATION VALUE
Transmission Control Protocol (TCP)	TCP
User Datagram Protocol (UDP)	UDP
Internet Control Message Protocol (ICMP)	ICMP
IP Authentication Header (AH), for providing authentication services in IPv4 and IPv6	AH
Encapsulating Security Payload (ESP) protocol	ESP
General Routing Encapsulation (GRE)	GRE
IP-within-IP Encapsulation Protocol	IPIP
Internet Control Message Protocol for IPv6 (ICMPv6)	ICMPv6
Fragment Header for IPv6	FRAGMENT

Use case scenarios

The protocol expressions can be used in both request-based and response-based policies. You can use the expressions in various NetScaler features, such as load balancing, WAN optimization, content switching, rewrite, and listen policies. You can use the expressions with functions such as EQ() and NE(), to identify the protocol in a policy and perform an action.

Following are some use cases for the expressions:

- In Branch Repeater load balancing configurations, you can use the expressions in a listen policy for the wildcard virtual server. For example, you can configure the wildcard virtual server

© 1997–2026 Citrix Systems, Inc. All rights reserved.

with the listen policy CLIENT.IP.PROTOCOL.EQ(TCP) so that the virtual server processes only TCP traffic and simply bridges all non-TCP traffic. Even though you can use an Access Control List instead of the listen policy, the listen policy provides better control over what traffic is processed.

- For content switching virtual servers of type ANY, you can configure content switching policies that switch requests on the basis of the protocol in incoming packets. For example, you can configure content switching policies to direct all TCP traffic to one load balancing virtual server and all non-TCP traffic to another load balancing virtual server.
- You can use the client-based expressions to configure persistence based on the protocol. For example, you can use CLIENT.IP.PROTOCOL to configure persistence on the basis of the protocols in incoming IPv4 packets.

Expressions for HTTP and cache-control headers

One common method of evaluating HTTP traffic is to examine the headers in a request or a response. A header can perform a number of functions, including the following:

- Provide cookies that contain data about the sender.
- Identify the type of data that is being transmitted.
- Identify the route that the data has traveled (the Via header).

NOTE:

If an operation is used to evaluate both header and text data, the header-based operation always overrides the text-based operation. For example, the AFTER_STR operation, when applied to a header, overrides text-based AFTER_STR operations for all instances of the current header type.

Prefixes for HTTP headers

The Prefixes for HTTP headers table for expression prefixes that extract HTTP headers.

Operations for HTTP headers

The Operations for HTTP headers table for operations that you can specify with the prefixes for HTTP headers.

Prefixes for cache-control headers

The following prefixes apply specifically to Cache-Control headers.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

HTTP HEADER PREFIX	DESCRIPTION
HTTP.REQ.CACHE_CONTROL	Returns a Cache-Control header in an HTTP request.
HTTP.RES.CACHE_CONTROL	Returns a Cache-Control header in an HTTP response.

Operations for cache-control headers

You can apply any of the operations for HTTP headers to Cache-Control headers.

In addition, the following operations identify specific types of Cache-Control headers. See RFC 2616 for information about these header types.

HTTP HEADER OPERATION	DESCRIPTION
`Cache-Control header.NAME(<integer>)`	Returns as a text value the name of the Cache-Control header that corresponds to the nth component in a name-value list, as specified by `<integer>`. The index of the name-value component is 0-based. If the `<integer>` that is specified by the integer argument is greater than the number of components in the list, a zero-length text object is returned. Following is an example: `http.req.cache_control.name(3).contains("some_text")`
Cache-Control header.IS_INVALID	Returns a Boolean TRUE if the Cache-Control header is not present in the request or response. Following is an example: `http.req.cache_control.is_invalid`
`Cache-Control header.IS_PRIVATE`	Returns a Boolean TRUE if the Cache-Control header has the value Private. Following is an example: `http.req.cache_control.is_private`
Cache-Control header.IS_PUBLIC	Returns a Boolean TRUE if the Cache-Control header has the value Private. Following is an example: http.req.cache_control.is_public

© 1997–2026 Citrix Systems, Inc. All rights reserved.

HTTP HEADER OPERATION	DESCRIPTION
Cache-Control header.IS_NO_STORE	Returns a Boolean TRUE if the Cache-Control header has the value No-Store. Following is an example: http.req.cache_control.is_no_store
Cache-Control header.IS_NO_CACHE	Returns a Boolean TRUE if the Cache-Control header has the value No-Cache. Following is an example: http.req.cache_control.is_no_cache
Cache-Control header.IS_MAX_AGE	Returns a Boolean TRUE if the Cache-Control header has the value Max-Age. Following is an example: http.req.cache_control.is_max_age
Cache-Control header.IS_MIN_FRESH	Returns a Boolean TRUE if the Cache-Control header has the value Min-Fresh. Following is an example: http.req.cache_control.is_min_fresh
Cache-Control header.IS_MAX_STALE	Returns a Boolean TRUE if the Cache-Control header has the value Max-Stale. Following is an example: http.req.cache_control.is_max_stale
Cache-Control header.IS_MUST_REVALIDATE	Returns a Boolean TRUE if the Cache-Control header has the value Must-Revalidate. Following is an example: http.req.cache_control.is_must_revalidate
Cache-Control header.IS_NO_TRANSFORM	Returns a Boolean TRUE if the Cache-Control header has the value No-Transform. Following is an example: http.req.cache_control.is_no_transform
Cache-Control header.IS_ONLY_IF_CACHED	Returns a Boolean TRUE if the Cache-Control header has the value Only-If-Cached. Following is an example: http.req.cache_control.is_only_if_cached
Cache-Control header.IS_PROXY_REVALIDATE	Returns a Boolean TRUE if the Cache-Control header has the value Proxy-Revalidate.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

HTTP HEADER OPERATION	DESCRIPTION
	Following is an example: http.req.cache_control.is_proxy_revalidate
Cache-Control header.IS_S_MAXAGE	Returns a Boolean TRUE if the Cache-Control header has the value S-Maxage. Following is an example: http.req.cache_control.is_s_maxage
Cache-Control header.IS_UNKNOWN	Returns a Boolean TRUE if the Cache-Control header is of an unknown type. Following is an example: http.req.cache_control.is_unknown
Cache-Control header.MAX_AGE	Returns the value of the Cache-Control header Max-Age. If this header is absent or invalid, 0 is returned. Following is an example: http.req.cache_control.max_age.le(3)
Cache-Control header.MAX_STALE	Returns the value of the Cache-Control header Max-Stale. If this header is absent or invalid, 0 is returned. Following is an example: http.req.cache_control.max_stale.le(3)
Cache-Control header.MIN_FRESH	Returns the value of the Cache-Control header Min-Fresh. If this header is absent or invalid, 0 is returned. Following is an example: http.req.cache_control.min_fresh.le(3)
Cache-Control header.S_MAXAGE	Returns the value of the Cache-Control header S-Maxage. If this header is absent or invalid, 0 is returned.Following is an example: http.req.cache_control.s_maxage.eq(2)

Expressions for extracting segments of URLs

You can extract URLs and portions of URLs, such as the host name, or a segment of the URL path. For example, the following expression identifies HTTP requests for image files by extracting image file suffixes from the URL:

```
http.req.url.suffix.eq("jpeg") || http.req.url.suffix.eq("gif")
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Most expressions for URLs operate on text and are described in Expression Prefixes for Text in HTTP Requests and Responses. This section discusses the GET operation. The GET operation extracts text when used with the following prefixes:

- HTTP.REQ.URL.PATH
- VPN.BASEURL.PATH
- VPN.CLIENTLESS_BASEURL.PATH

The following table describes prefixes for HTTP URLs.

URL PREFIX	DESCRIPTION
HTTP.REQ.URL.PATH.GET(<n>)	Returns a slash- (“/”) separated list from the URL path. For example, consider the following URL: `<http://www.mycompany.com/dir1/dir2/dir3/index.html?a=1>`. The following expression returns dir1 from this URL: `<http.req.url.path.get(1)>`. The following expression returns dir2: http.req.url.path.get(2)
HTTP.REQ.URL.PATH.GET_REVERSE(<n>)	Returns a slash- (“/”) separated list from the URL path, starting from the end of the path. For example, consider the following URL: `<http://www.mycompany.com/dir1/dir2/dir3/index.html?a=1>`. The following expression returns index.html from this URL: `<http.req.url.path.get_reverse(0)>`. The following expression returns dir3: http.req.url.path.get_reverse(1)

Expressions for HTTP status codes and numeric HTTP payload data other than dates

The following table describes prefixes for numeric values in HTTP data other than dates.

PREFIX	DESCRIPTION
HTTP.REQ.CONTENT_LENGTH	Returns the length of an HTTP request as a number. Following is an example: http.req.content_length < 500

© 1997–2026 Citrix Systems, Inc. All rights reserved.

PREFIX	DESCRIPTION
HTTP.RES.CONTENT_LENGTH	Returns the length of the HTTP response as a number. Following is an example: http.res.content_length <= 1000
HTTP.RES.STATUS	Returns the response status code
HTTP.RES.IS_REDIRECT	Returns a Boolean TRUE if the response code is associated with a redirect. Following are the redirect response codes: 300 (Multiple Choices), 301 (Moved Permanently), 302 (Found), 303 (See Other), 305 (Use Proxy), and 307 (Temporary Redirect). Note: Status code 304 is not considered a redirect HTTP response status code. Status code 306 is unused.

SIP expressions

The NetScaler Advanced policy expressions language contains a number of expressions that operate on Session Initiation Protocol (SIP) connections. These expressions are intended to be used in policies for any supported protocol that operates on a request/response basis. These expressions can be used in content switching, rate limiting, responder, and rewrite policies.

Certain limitations apply to SIP expressions used with responder policies. Only the DROP, NOOP or RESPONDWITH actions are allowed on a SIP load balancing virtual server. Responder policies can be bound to a load balancing virtual server, an override global bind point, a default global bind point, or a sip_udp policy label.

The header format used by the SIP protocol is similar to that used by the HTTP protocol, so many of the new expressions look and function much like their HTTP analogs. Each SIP header consists of a line that includes the SIP method, the URL, and the version, followed by a series of name-value pairs that look like HTTP headers.

Following is a sample SIP header that is referred to in the expressions tables beneath it:

```
INVITE sip:16@www.sip.com:5060;transport=udp SIP/2.0

Record-Route: <sip:200.200.100.22;lr=on>

Via: SIP/2.0/UDP 200.200.100.22;branch=z9hG4bK444b.c8e103d1.0;rport=5060;
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
    received=10.102.84.18
Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;
    received=10.102.84.160
From: "12" <sip:12@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53cc0185
To: "16" <sip:16@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53cc0185
Call-ID: 00127f54-ec850017-0e46f5b9-5ec149c2@10.102.84.180
Max-Forwards: 69CSeq: 101 INVITE
User-Agent: Cisco-CP7940G/8.0
Contact: <sip:12@10.102.84.180:5060;transport=udp>
Expires: 180
Accept: application/sdp
Allow: ACK,BYE,CANCEL,INVITE,NOTIFY,OPTIONS,REFER,REGISTER,UPDATE
Supported: replaces,join,norefersub
Content-Length: 277
Content-Type: application/sdp
Content-Disposition: session;handling=optiona
```

SIP reference tables

The following tables contain lists of expressions that operate on SIP headers. The first table contains expressions that apply to request headers. Most response-based expressions are nearly the same as the corresponding request-based expressions. To create a response expression from the corresponding request expression, you change the first two sections of the expression from SIP.REQ to SIP.RES, and make other obvious adjustments. The second table contains those response expressions that are unique to responses and have no request equivalents. You can use any element in the following tables as a complete expression on its own, or you can use various operators to combine these expression elements with others to form more complex expressions.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIP REQUEST EXPRESSIONS

EXPRESSION	DESCRIPTION
SIP.REQ.METHOD	Operates on the method of the SIP request. The supported SIP request methods are ACK, BYE, CANCEL, INFO, INVITE, MESSAGE, NOTIFY, OPTIONS, PRACK, PUBLISH, REFER, REGISTER, SUBSCRIBE, and UPDATE. This expression is a derivative of the text class, so all operations that are applicable to text are applicable to this method. For example, for a SIP request of INVITE sip:16@10.102.84.181:5060;transport=udp SIP/2.0, this expression returns INVITE.
SIP.REQ.URL	Operates on the SIP request URL. This expression is a derivative of the text class, so all operations that are applicable to text are applicable to this method. For example, for a SIP request of INVITE sip:16@10.102.84.181:5060;transport=udp SIP/2.0, this expression returnssip:16@10.102.84.181:5060;transport=udp.
SIP.REQ.URL.PROTOCOL	Returns the URL protocol. For example, for a SIP URL ofsip:16@www.sip.com:5060;transport=udp, this expression returns sip.
SIP.REQ.URL.HOSTNAME	Returns the hostname portion of the SIP URL. For example, for a SIP URL ofsip:16@www.sip.com:5060;transport=udp, this expression returns www.sip.com:5060.
SIP.REQ.URL.HOSTNAME.PORT	Returns the port portion of the SIP URL hostname. If no port is specified, this expression returns the default SIP port, 5060. For example, for a SIP hostname of www.sip.com:5060, this expression returns 5060.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

EXPRESSION	DESCRIPTION
SIP.REQ.URL.HOSTNAME.DOMAIN	Returns the domain name portion of the SIP URL hostname. If the host is an IP address, then this expression returns an incorrect result. For example, for a SIP hostname of www.sip.com:5060, this expression returns sip.com. For a SIP hostname of 192.168.43.15:5060, this expression returns an error.
SIP.REQ.URL.HOSTNAME.SERVER	Returns the server portion of the host. For example, for a SIP hostname of www.sip.com:5060, this expression returns www.
SIP.REQ.URL.USERNAME	Returns the username that precedes the @ character. For example, for a SIP URL of sip:16@www.sip.com:5060;transport=udp, this expression returns 16.
SIP.REQ.VERSION	Returns the SIP version number in the request. For example, for a SIP request of INVITE sip:16@10.102.84.181:5060;transport=udp SIP/2.0, this expression returns SIP/2.0.
SIP.REQ.VERSION.MAJOR	Returns the major version number (the number to the left of the period). For example, for a SIP version number of SIP/2.0, this expression returns 2.
SIP.REQ.VERSION.MINOR	Returns the minor version number (the number to the right of the period). For example, for a SIP version number of SIP/2.0, this expression returns 0.
SIP.REQ.CONTENT_LENGTH	Returns the contents of the Content-Length header. This expression is a derivative of thesip_header_t class, so all operations that are available for SIP headers can be used. For example, for a SIP Content-Length header of Content-Length: 277, this expression returns 277.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

EXPRESSION	DESCRIPTION
SIP.REQ.TO	Returns the contents of the To header. For example, for a SIP To header of To: "16" <sip:16@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53cc0185, this expression returns "16" <sip:16@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53cc0185.
SIP.REQ.TO.ADDRESS	Returns the SIP URI, which is found in the sip_url object. All operations that are available for SIP URIs can be used. For example, for a SIP To header of To: "16" <sip:16@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53cc0185, this expression returns sip:16@sip_example.com.
SIP.REQ.TO.DISPLAY_NAME	Returns the display name portion of the To header. For example, for a SIP To header of To: "16" <sip:16@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53cc0185, this expression returns 16.
SIP.REQ.TO.TAG	Returns the "tag" value from the "tag" name value pair in the TO header. For example, for a SIP To header of To: "16" <sip:16@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53cc0185, this expression returns 00127f54ec85a6d90cc14f45-53cc0185.
SIP.REQ.FROM	Returns the contents of the From header. For example, for a SIP From header of From: "12" <sip:12@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53cc0185, this expression returns sip:12@sip_example.com.
SIP.REQ.FROM.ADDRESS	Returns the SIP URI, which is found in the sip_url object. All operations that are available for SIP URIs can be used. For example, for a SIP From header of From: "12"

© 1997–2026 Citrix Systems, Inc. All rights reserved.

EXPRESSION	DESCRIPTION
	<sip:12@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53cc0185, this expression returns sip:12@sip_example.com.
SIP.REQ.FROM.DISPLAY_NAME	Returns the display name portion of the To header. For example, for a SIP From header of From: "12" <sip:12@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53cc0185, this expression returns 12.
SIP.REQ.FROM.TAG	Returns the "tag" value from the "tag" name/value pair in the TO header. For example, for a SIP From header of From: "12" <sip:12@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53cc0185, this expression returns 00127f54ec85a6d90cc14f45-53cc0185.
SIP.REQ.VIA	Returns the complete Via header. If there are multiple Via headers in the request, returns the last Via header. For example, for the two Via headers in the sample SIP header, this expression returns Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;received=10.102.84.160.
SIP.REQ.VIA.SENTBY_ADDRESS	Returns the address that sent the request. For example, for the Via header Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;received=10.102.84.160, this expression returns 10.102.84.180.
SIP.REQ.VIA.SENTBY_PORT	Returns the port that sent the request. For example, for the Via header Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;received=10.102.84.160, this expression returns 5060.
SIP.REQ.VIA.RPORT	Returns the value from the rport name/value pair. For example, for the Via header Via: SIP/2.0/UDP

© 1997–2026 Citrix Systems, Inc. All rights reserved.

EXPRESSION	DESCRIPTION
	10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;received=10.102.84.160, this expression returns 5060.
SIP.REQ.VIA.BRANCH	Returns the value from the branch name/value pair. For example, for the Via header Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;received=10.102.84.160, this expression returns z9hG4bK03e76d0b.
SIP.REQ.VIA.RECEIVED	Returns the value from the received name/value pair. For example, for the Via header Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;received=10.102.84.160, this expression returns 10.102.84.160.
SIP.REQ.CALLID	Returns the contents of the Callid header. This expression is a derivative of the sip_header_t class, so all operations that are available for SIP headers can be used. For example, for a SIP Callid header ofCall-ID: 00127f54-ec850017-0e46f5b9-5ec149c2@10.102.84.180, this expression returns00127f54-ec850017-0e46f5b9-5ec149c2@10.102.84.180.
SIP.REQ.CSEQ	Returns the CSEQ number from the CSEQ, as an integer. For example, for a SIP CSEQ header of CSeq: 101 INVITE, this expression returns 101.
SIP.REQ.HEADER(<header_name>)	Returns the specified SIP header. For <header_name>, substitute the name of the header that you want. For example, to return the SIP From header, you would type SIP.REQ.HEADER("From").
SIP.REQ.HEADER(<header_name>).INSTANCE(<line_number>)	Returns the specified instance of the specified SIP header. Multiple instances of the same SIP header can occur. Where you want a specific

© 1997–2026 Citrix Systems, Inc. All rights reserved.

EXPRESSION	DESCRIPTION
	instance of such a SIP header (for example, a specific Via header), you can specify that header by typing a number as the <line_number>. Header instances are matched from last (0) to first. In other words, SIP.REQ.HEADER("Via").INSTANCE(0) returns the last instance of the Via header, while SIP.REQ.HEADER("Via").INSTANCE(1) returns the last instance but one of the Via header, and so on. For example, if used on the example SIP header, SIP.REQ.HEADER("Via").INSTANCE(1) returnsVia: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060.
SIP.REQ.HEADER(<header_name>).VALUE(<line_number>)	Returns the contents of the specified instance of the specified SIP header. The usage is nearly the same as the previous expression. For example, if used on the SIP header example in the preceding table entry, SIP.REQ.HEADER("Via").VALUE(1) returns SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060.
SIP.REQ.HEADER(<header_name>).COUNT	Returns the number of instances of a particular header as an integer. For example, if used on the SIP header example above, SIP.REQ.HEADER("Via").COUNT returns 2.
SIP.REQ.HEADER(<header_name>).EXISTS	Returns a boolean value of true or false, depending upon whether the specified header exists or not. For example, if used on the SIP header example above, SIP.REQ.HEADER("Expires").EXISTSreturns true, while SIP.REQ.HEADER("Caller-ID").EXISTS returns false.
SIP.REQ.HEADER(<header_name>).LIST	Returns the comma-separated parameter list in the specified header. For example, if used on

© 1997–2026 Citrix Systems, Inc. All rights reserved.

EXPRESSION	DESCRIPTION
	the SIP header example above, SIP.REQ.HEADER("Allow").LIST returns ACK,BYE,CANCEL,INVITE,NOTIFY,OPTIONS ,REFER,REGISTER,UPDATE. You can append the string .GET(<list_item_number>) to select a specific list item. For example, to get the first item (ACK) from the above list, you would type SIP.REQ.HEADER("Allow").LIST.GET(0). To extract the second item (BYE), you would type SIP.REQ.HEADER("Allow").LIST.GET(1). Note: If the specified header contains a list of name/ value pairs, the entire name/value pair is returned.
SIP.REQ.HEADER(<header_name>).TYPECA ST_SIP_HEADER_T("<in_header_name>")	Typecasts <header_name> to <in_header_name>. Any text can be typecasted to thesip_header_t class, after which all header-based operations can be used. After you perform this operation, you can apply all operations that can be used with <in_header_name>. For example, the expression SIP.REQ.CONTENT_LENGTH.TYPECAST_SI P_HEADER_T typecasts all instances of the Content-Length header. After you perform this operation, you can apply all header operations to all instances of the specified header.
SIP.REQ.HEADER(<header_name>).CONTAI NS(<string>).	Returns boolean true if the specified text string is present in any instance of the specified header. Operates on all the instances of the specified header. Header instances are matched from last (0) to first.
SIP.REQ.HEADER(<header_name>).EQUALS _ANY(<patset>)	Returns boolean true if any pattern associated with <patset> matches any content in any instance of the specified header. Operates on all the instances of the specified header. Header instances are matched from last (0) to first.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

EXPRESSION	DESCRIPTION
SIP.REQ.HEADER(<header_name>).CONTAINS_ANY(<patset>)	Returns Boolean true if any pattern associated with <patset> matches any content in any instance of the specified header. Operates on all the instances of the specified header. Header instances are matched from last (0) to first.
SIP.REQ.HEADER(<header_name>).CONTAINS_INDEX(<patset>)	Returns the index of the matching pattern associated with <patset> if that pattern matches any content in any instance of the specified header. Operates on all the instances of the specified header. Header instances are matched from last (0) to first.
SIP.REQ.HEADER(<header_name>).EQUALS_INDEX(<patset>)	Returns the index of the matching pattern associated with <patset> if that pattern matches any instance of the specified header. Operates on all the instances of the specified header. Header instances are matched from last (0) to first.
SIP.REQ.HEADER(<header_name>).SUBSTR(<string>)	If the specified string is present in any instance of the specified header, this expression returns that string. For example, for the SIP header Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;received=10.102.84.160",SIP.REQ.HEADER("Via").SUBSTR("rport=5060") returns "rport=5060".SIP.REQ.HEADER("Via").SUBSTR("rport=5061") returns an empty string.
SIP.REQ.HEADER(<header_name>).AFTER_STR(<string>)	If the specified string is present in any instance of the specified header, this expression returns the string immediately after that string. For example, for the SIP header Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;received=10.102.84.160, the expression SIP.REQ.HEADER("Via").AFTER_STR("rport=") returns 5060.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

EXPRESSION	DESCRIPTION
SIP.REQ.HEADER(<header_name>).REGEX_MATCH(<regex>)	Returns boolean true if the specified regular expression (regex) matches any instance of the specified header. You must specify the regular expression in the following format: re<delimiter>regular expression<same delimiter>. The regular expression cannot be larger than 1499 characters in length. It must conform to the PCRE regular expression library. See `<http://www.pcre.org/pcre.txt>` for documentation on PCRE regular expression syntax. The pcrepattern man page also has useful information on specifying patterns by using PCRE regular expressions. The regular expression syntax supported in this expression has some differences from PCRE. Back references are not allowed. You should avoid recursive regular expressions; although some work, many do not. The dot (.) metacharacter matches newlines. Unicode is not supported.SET_TEXT_MODE(IGNORECASE) overrides the (?i) internal option specified in the regular expression.
SIP.REQ.HEADER(<header_name>).REGEX_SELECT(<regex>)	If the specified regex matches any text in any instance of the specified header, this expression returns the text. For example, for the SIP header Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;received=10.102.84.160, the expression SIP.REQ.HEADER("Via").REGEX_SELECT("received=[0-9]{1,3}.[0-9]{1,3}.[0-9]{1,3}.[0-9]{1,3}") returns received=10.102.84.160.
SIP.REQ.HEADER(<header_name>).AFTER_REGEX(<regex>)	If the specified regex matches any text in any instance of the specified header, this expression returns the string immediately after that text. For example, for the SIP header Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0

© 1997–2026 Citrix Systems, Inc. All rights reserved.

EXPRESSION	DESCRIPTION
	b;rport=5060;received=10.102.84.160, the expression SIP.REQ.HEADER("Via").AFTER_REGEX("received=") returns10.102.84.160.
SIP.REQ.HEADER(<header_name>).BEFORE_REGEX(<regex>)	If the specified regex matches any text in any instance of the specified header, this expression returns the string immediately before that text. For example, for the SIP header Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;received=10.102.84.160, the expression SIP.REQ.HEADER("Via").BEFORE_REGEX("[0-9]{1,3}.[0-9]{1,3}.[0-9]{1,3}.[0-9]{1,3}") returns received=.
SIP.REQ.FULL_HEADER	Returns the entire SIP header, including the terminating CR/LF.
SIP.REQ.IS_VALID	Returns boolean true if the request format is valid.
SIP.REQ.BODY(<length>)	Returns the request body, up to the specified length. If the specified length is greater than the length of the request body, this expression returns the entire request body.
SIP.REQ.LB_VSERVER	Returns the name of the load balancing virtual server (LB vserver) that is serving the current request.
SIP.REQ.CS_VSERVER	Returns the name of the content switching virtual server (CS vserver) that is serving the current request.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SIP RESPONSE EXPRESSIONS

EXPRESSION	DESCRIPTION
SIP.RES.STATUS	Returns the SIP response status code. For example, if the first line of the response is SIP/2.0 100 Trying, this expression returns 100.
SIP.RES.STATUS_MSG	Returns the SIP response status message. For example, if the first line of the response is SIP/2.0 100 Trying, this expression returns Trying.
SIP.RES.IS_REDIRECT	Returns boolean true if the response code is a redirect.
SIP.RES.METHOD	Returns the response method extracted from the request method string in the CSeq header.

Operations for HTTP, HTML, and XML encoding and "safe" characters

The following operations work with the encoding of HTML data in a request or response and XML data in a POST body.

- **\<text\>.HTML_XML_SAFE:** Transforms special characters into XML safe format, as in the following examples:

  A left-pointing angle bracket (\<) is converted to < A right-pointing angle bracket (\>) is converted to > An ampersand (&) is converted to & This operation safeguards against cross-site scripting attacks. Maximum length of the transformed text is 2048 bytes. This is a read-only operation.

  After applying the transformation, additional operators that you specify in the expression are applied to the selected text. Following is an example:

  http.req.url.query.html_xml_safe. contains("myQueryString")

- **\<text\>.HTTP_HEADER_SAFE:** Converts all new line ('\n') characters in the input text to '%0A' to enable the input to be used safely in HTTP headers.

  This operation safeguards against response-splitting attacks.

  The maximum length of the transformed text is 2048 bytes. This is a read-only operation.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **\<text\>.HTTP_URL_SAFE:** Converts unsafe URL characters to '%xx' values, where "xx" is a hex-based representation of the input character. For example, the ampersand (&) is represented as %26 in URL-safe encoding. The maximum length of the transformed text is 2048 bytes. This is a read-only operation.

  Following are URL safe characters. All others are unsafe:

  - Alpha-numeric characters: a-z, A-Z, 0-9
  - Asterix: "*"
  - Ampersand: "&"
  - At-sign: "@"
  - Colon: ":"
  - Comma: ","
  - Dollar: "$"
  - Dot: "."
  - Equals: "="
  - Exclamation mark: "!"
  - Hyphen: "-"
  - Open and close parentheses: "(", ")"
  - Percent: "%"
  - Plus: "+"
  - Semicolon: ";"
  - Single quote: "'"
  - Slash: "/"
  - Question mark: "?"
  - Tilde: "~"
  - Underscore: "_"
- **\<text\>.MARK_SAFE:**

  Marks the text as safe without applying any type of data transformation.
- **\<text\>.SET_TEXT_MODE(URLENCODED|NOURLENCODED)**

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Transforms all %HH encoding in the byte stream. This operation works with characters (not bytes). By default, a single byte represents a character in ASCII encoding. However, if you specify URLENCODED mode, three bytes can represent a character.

In the following example, a PREFIX(3) operation selects the first 3 characters in a target.

```
http.req.url.hostname.prefix(3)
```

In the following example, the NetScaler can select up to 9 bytes from the target:

```
http.req.url.hostname.set_text_mode(urlencoded).prefix(3)
```

- **\<text\>.SET_TEXT_MODE(PLUS_AS_SPACE|NO_PLUS_AS_SPACE):**

  Specifies how to treat the plus character (+). The PLUS_AS_SPACE option replaces a plus character with white space. For example, the text "hello+world" becomes "hello world." The NO_PLUS_AS_SPACE option leaves plus characters as they are.

- **\<text\>.SET_TEXT_MODE(BACKSLASH_ENCODED|NO_BACKSLASH_ENCODED):**

  Specifies whether or not backslash decoding is performed on the text object represented by \<text\>.

  If BACKSLASH_ENCODED is specified, the SET_TEXT_MODE operator performs the following operations on the text object:

  - All occurrences of "\XXX" will be replaced with the character "Y" (where XXX represents a number in the octal system and Y represents the ASCII equivalent of XXX). The valid range of octal values for this type of encoding is 0 to 377. For example, the encoded text "http\72//" and http\072//" will both be decoded to `<http://>`, where the colon (:) is the ASCII equivalent of the octal value "72".
  - All occurrences of "\xHH" will be replaced with the character "Y" (HH represents a number in the hexadecimal system and Y denotes the ASCII equivalent of HH. For example, the encoded text "http\x3a//" will be decoded to `<http://>`, where the colon (:) is the ASCII equivalent of the hexadecimal value "3a".
  - All occurrences of "\\uWWXX" will be replaced with the character sequence "YZ" (Where WW and XX represent two distinct hexadecimal values and Y and Z represent their ASCII equivalents of WW and XX respectively. For example, the encoded text "http%u3a2f/" and "http%u003a//" will both be decoded to `<http://>`, where "3a" and "2f" are two hexadecimal values and the colon (:) and forward slash ("/") represent their ASCII equivalents respectively.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- All occurrences of "\b", "\n", "\t", "\f", and "\r" are replaced with the corresponding ASCII characters.

If NO_BACKSLASH_ENCODED is specified, backslash decoding is not performed on the text object.

- **\<text\>.SET_TEXT_MODE(BAD_ENCODE_RAISE_UNDEF| NO_BAD_ENCODE_RAISE_UNDEF):**

  Performs the associated undefined action if either the URLENCODED or the BACKSLASH_ENCODED mode is set and bad encoding corresponding to the specified encoding mode is encountered in the text object represented by \<text\>.

  If NO_BAD_ENCODE_RAISE_UNDEF is specified, the associated undefined action will not be performed when bad encoding is encountered in the text object represented by\<text\>.

Expressions for TCP, UDP, and VLAN data

TCP and UDP data take the form of a string or a number. For expression prefixes that return string values for TCP and UDP data, you can apply any text-based operations. For more information, see Advanced policy expressions: Evaluating text.

For expression prefixes that return numeric value, such as a source port, you can apply an arithmetic operation. For more information, see Basic operations on expression prefixes and Compound operations for numbers.

The following table describes prefixes that extract TCP and UDP data from client.

GET OPERATION	DESCRIPTION
CLIENT.TCP.PAYLOAD(`<integer>`)	Returns TCP payload data as a string, starting with the first character in the payload and continuing for the number of characters in the `<integer>` argument. You can apply any text-based operation to this prefix.
CLIENT.TCP.SRCPORT	Returns the ID of the current packet's source port as a number.
CLIENT.TCP.DSTPORT	Returns the ID of the current packet's destination port as a number.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

GET OPERATION	DESCRIPTION
CLIENT.TCP.OPTIONS	Returns the TCP options set by the client. Examples of TCP options are Maximum Segment Size (MSS), Window Scale, Selective Acknowledgements (SACK), and Time Stamp Option. The COUNT, TYPE(<type>), and TYPE_NAME(<m>) operators can be used with this prefix. For the TCP options set by the server, see the SERVER.TCP.OPTIONS prefix.
CLIENT.TCP.OPTIONS.COUNT	Returns the number of TCP options that the client has set.
CLIENT.TCP.OPTIONS.TYPE(<type>)	Returns the value of the TCP option whose type (or option kind) is specified as the argument. The value is returned as a string of bytes in big endian format (or network byte order). Parameters: type - Type value
CLIENT.TCP.OPTIONS.TYPE_NAME(<m>)	Returns the value of the TCP option whose enumeration constant is specified as the argument. The enumeration constants that you can pass as the argument are REPEATER, TIMESTAMP, SACK_PERMITTED, WINDOW, and MAXSEG. To specify the TCP option kind instead of these enumeration constants, use CLIENT.TCP.OPTIONS.TYPE(<type>). For other TCP options, you must use CLIENT.TCP.OPTIONS.TYPE(<type>). Parameters: m - TCP option enumeration constant
CLIENT.TCP.REPEATER_OPTION.EXISTS	Returns a Boolean TRUE if Repeater TCP options exist.
CLIENT.TCP.REPEATER_OPTION.IP	Returns the branch repeater's IPv4 address from the Repeater TCP options.
CLIENT.TCP.REPEATER_OPTION.MAC	Returns the branch repeater's MAC address from the Repeater TCP options.
CLIENT.UDP.DNS.DOMAIN	Returns the DNS domain name.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

GET OPERATION	DESCRIPTION
CLIENT.UDP.DNS.DOMAIN.EQ("<hostname>")	Returns a Boolean TRUE if the domain name matches the <hostname> argument. The comparison is case insensitive. Following is an example: client.udp.dns.domain.eq("www.mycompany.com")
CLIENT.UDP.DNS.IS_AAAAREC	Returns a Boolean TRUE if the record type is AAAA. These types of records indicate an IPv6 address in forward lookups.
CLIENT.UDP.DNS.IS_ANYREC	Returns a Boolean TRUE if it is of any record type.
CLIENT.UDP.DNS.IS_AREC	Returns a Boolean TRUE if the record is type A. Type A records provide the host address.
CLIENT.UDP.DNS.IS_CNAMEREC	Returns a Boolean TRUE if the record is of type CNAME. In systems that use multiple names to identify a resource, there is one canonical name and a number of aliases. The CNAME provides the canonical name.
CLIENT.UDP.DNS.IS_MXREC	Returns a Boolean TRUE if the record is of type MX (mail exchanger). This DNS record describes a priority and a host name. The MX records for the same domain name specify the email servers in the domain and the priority for each server.
CLIENT.UDP.DNS.IS_NSREC	Returns a Boolean TRUE if the record is of type NS. This is a name server record that includes a host name with an associated A record. This enables locating the domain name that is associated with the NS record.
CLIENT.UDP.DNS.IS_PTRREC	Returns a Boolean TRUE if the record is of type PTR. This is a domain name pointer and is often used to associate a domain name with an IPv4 address.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

GET OPERATION	DESCRIPTION
CLIENT.UDP.DNS.IS_SOAREC	Returns a Boolean TRUE if the record is of type SOA. This is a start of authority record.
CLIENT.UDP.DNS.IS_SRVREC	Returns a Boolean TRUE if the record is of type SRV. This is a more general version of the MX record.
CLIENT.UDP.DSTPORT	Returns the numeric ID of the current packet's UDP destination port.
CLIENT.UDP.SRCPORT	Returns the numeric ID of the current packet's UDP source port.
CLIENT.UDP.LENGTH	Returns the numeric ID of the current packet's UDP length.
CLIENT.UDP.CHECKSUM	Returns the numeric ID of the current packet's UDP checksum.
CLIENT.UDP.PAYLOAD	Returns current packet's UDP payload.
CLIENT.UDP.RADIUS	Returns RADIUS data for the current packet.
CLIENT.UDP.RADIUS.ATTR_TYPE(<type>)	Returns the value for the attribute type specified as the argument.
CLIENT.UDP.RADIUS.USERNAME	Returns the RADIUS user name.
CLIENT.TCP.MSS	Returns the maximum segment size (MSS) for the current connection as a number.
CLIENT.VLAN.ID	Returns the numeric ID of the VLAN through which the current packet entered the NetScaler.

The following table describes prefixes that extract TCP and UDP data from server.

GET OPERATION	DESCRIPTION
SERVER.TCP.DSTPORT	Returns the numeric ID of the current packet's destination port.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

GET OPERATION	DESCRIPTION
SERVER.TCP.SRCPORT	Returns the numeric ID of the current packet's source port.
SERVER.TCP.OPTIONS	Returns the TCP options set by the server. Examples of TCP options are Maximum Segment Size (MSS), Window Scale, Selective Acknowledgements (SACK), and Time Stamp Option. The COUNT, TYPE(<type>), and TYPE_NAME(<m>) operators can be used with this prefix. For the TCP options set by the client, see the CLIENT.TCP.OPTIONS prefix.
SERVER.TCP.OPTIONS.COUNT	Returns the number of TCP options that the server has set.
SERVER.TCP.OPTIONS.TYPE(<type>)	Returns the value of the TCP option whose type (or option kind) is specified as the argument. The value is returned as a string of bytes in big endian format (or network byte order). Parameters: type - Type value
SERVER.TCP.OPTIONS.TYPE_NAME(<m>)	Returns the value of the TCP option whose enumeration constant is specified as the argument. The enumeration constants that you can pass as the argument are REPEATER, TIMESTAMP, SACK_PERMITTED, WINDOW, and MAXSEG. To specify the TCP option kind instead of these enumeration constants, use CLIENT.TCP.OPTIONS.TYPE(<type>). For other TCP options, you must use CLIENT.TCP.OPTIONS.TYPE(<type>). Parameters: m - TCP option enumeration constant
SERVER.VLAN	Operates on the VLAN through which the current packet entered the NetScaler.
SERVER.UDP.DSTPORT	Returns the numeric ID of the current packet's UDP destination port.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

GET OPERATION	DESCRIPTION
SERVER.UDP.SRCPORT	Returns the numeric ID of the current packet's UDP source port.
SERVER.UDP.LENGTH	Returns the numeric ID of the current packet's UDP length.
SERVER.UDP.CHECKSUM	Returns the numeric ID of the current packet's UDP checksum.
SERVER.UDP.PAYLOAD	Returns current packet's UDP payload.
SERVER.VLAN.ID	Returns the numeric ID of the VLAN through which the current packet entered the NetScaler.

Expressions for evaluating a DNS message and identifying its carrier protocol

You can evaluate DNS requests and responses by using expressions that begin with DNS.REQ and DNS.RES, respectively. You can also identify the transport layer protocol that is being used to send the DNS messages.

The following functions return the contents of a DNS query.

FUNCTION	DESCRIPTION
DNS.REQ.QUESTION.DOMAIN	Return the domain name (the value of the QNAME field) in the question section of the DNS query. The domain name is returned as a text string, which can be passed to EQ(), NE(), and any other functions that work with text.
DNS.REQ.QUESTION.TYPE	Return the query type (the value of the QTYPE field) in the DNS query. The field indicates the type of resource record (for example, A, NS, or CNAME) for which the name server is being queried. The returned value can be compared to one of the following values by using the EQ() and NE()functions: A, AAAA, NS, SRV, PTR, CNAME, SOA, MX, and ANY. Note: You can use only the EQ() and NE() functions with

© 1997–2026 Citrix Systems, Inc. All rights reserved.

FUNCTION	DESCRIPTION
	the TYPE function. Example: DNS.REQ.QUESTION.TYPE.EQ(MX)

The following functions return the contents of a DNS response.

FUNCTION	DESCRIPTION
DNS.RES.HEADER.RCODE	Return the response code (the value of the RCODE field) in the header section of the DNS response. You can use only the EQ() and NE() functions with the RCODE function. Following are the possible values: NOERROR, FORMERR, SERVFAIL, NXDOMAIN, NOTIMP, and REFUSED.
DNS.RES.QUESTION.DOMAIN	Return the domain name (the value of the QNAME field) in the question section of the DNS response. The domain name is returned as a text string, which can be passed to EQ(), NE(), and any other functions that work with text.
DNS.RES.QUESTION.TYPE	Return the query type (the value of the QTYPE field) in the question section of the DNS response. The field indicates the type of resource record (for example, A, NS, or CNAME) that is contained in the response. The returned value can be compared to one of the following values by using the EQ()and NE() functions: A, AAAA, NS, SRV, PTR, CNAME, SOA, MX, and ANY. You can use only the EQ() and NE() functions with the TYPE function. Example: DNS.RES.QUESTION.TYPE.EQ(SOA)

The following functions return the transport layer protocol name.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

FUNCTION	DESCRIPTION
DNS.REQ.TRANSPORT	Return the name of the transport layer protocol that was used to send the DNS query. Possible values returned are TCP and UDP. You can use only the EQ() and NE() functions with the TRANSPORT function. Example: DNS.REQ.TRANSPORT.EQ(TCP)
DNS.RES.TRANSPORT	Return the name of the transport layer protocol that was used for the DNS response. Possible values returned are TCP and UDP. You can use only the EQ() and NE() functions with the TRANSPORT function. Example: DNS.RES.TRANSPORT.EQ(TCP)

The following functions return the name of the matched location when the query contains or does not contain the DNS ECS option.

FUNCTION	DESCRIPTION
DNS.REQ.OPT.ECS.IP.MATCHES_LOCATION	Return the name of the matched location that was used in the query with the DNS ECS option. Example: (DNS.REQ.OPT.ECS.IP.MATCHES_LOCATION(".CH.....")
client.IP.SRC.MATCHES_LOCATION	Return the name of the matched location that was used in the query without the DNS ECS option. Example: (client.IP.SRC.MATCHES_LOCATION(".CH.....")
DNS.REQ.OPT.ECS.IP.MATCHES_LOCATION OR client.IP.SRC.MATCHES_LOCATION	Common expression to be used in the policy when the DNS traffic may or may not have ECS option in the query. Example: "(((DNS.REQ.OPT.ECS.IP.MATCHES_LOCATION(".CH.....").typecast_text_t) ALT (client.IP.SRC.MATCHES_LOCATION(".CH.....").typecast_text_t)).eq("true"))"

XPath and HTML, XML, or JSON expressions

The Advanced policy infrastructure supports expressions for evaluating and retrieving data from HTML, XML, and JavaScript Object Notation (JSON) files. This enables you to find specific nodes in an HTML, XML, or JSON document, determine if a node exists in the file, locate nodes in XML contexts (for example, nodes that have specific parents or a specific attribute with a given value), and return the contents of such nodes. Also, you can use XPath expressions in rewrite expressions.

The Advanced policy expression implementation for XPath comprises an Advanced policy expression prefix (such as "HTTP.REQ.BODY") that designates HTML or XML text, and the XPATH operator that takes the XPath expression as its argument.

HTML files are a largely free-form collection of tags and text elements. You can use the XPATH_HTML operator, which takes an XPath expression as its argument, to process HTML files. JSON files are either a collection of name/value pairs or an ordered list of values. You can use the XPATH_JSON operator, which takes an XPath expression as its argument, to process JSON files.

- **\<text\>.XPATH(xpathex):**

  Operate on an XML file and return a Boolean value.

  For example, the following expression returns a Boolean TRUE if a node called "creator" exists under the node "Book" within the first 1000 bytes of the XML file.

  ```
  HTTP.REQ.BODY(1000).XPATH(xp%boolean(//Book/creator)%)
  ```

  Parameters:

  xpathex - XPath Boolean expression

- **\<text\>.XPATH(xpathex):**

  Operate on an XML file and return a value of data type "double."

  For example, the following expression converts the string "36" (a price value) to a value of data type "double" if the string is in the first 1000 bytes of the XML file:

  ```
  HTTP.REQ.BODY(1000).XPATH(xp%number(/Book/price)%)
  ```

  Parameters:

  xpathex - XPath numeric expression

  Example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
<Book>

<creator>

    <Person>

        <name>Milton</name>

    </Person>

</creator>

<title>Paradise Lost</title>

</Book>
```

- **\<text\>.XPATH(xpathex):**

  Operate on an XML file and return a node-set or a string. Node-sets are converted to corresponding strings by using the standard XPath string conversion routine.

  For example, the following expression selects all the nodes that are enclosed by "/Book/creator" (a node-set) in the first 1000 bytes of the body:

  `HTTP.REQ.BODY(1000).XPATH(xp%/Book/creator%)`

  Parameters:

  xpathex - XPath expression

- **\<text\>.XPATH_HTML(xpathex)**

  Operate on an HTML file and return a text value.

  For example, the following expression operates on an HTML file and returns the text enclosed in `<title\></title\>` tags if the title HTML element is found in the first 1000 bytes:

  `HTTP.REQ.BODY(1000).XPATH_HTML(xp%/html/head/title%)`

  Parameters:

  xpathex - XPath text expression

- **<text\>.XPATH_HTML_WITH_MARKUP(xpathex)**

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Operate on an HTML file and return a string that contains the entire selected portion of the document, including markup such as including the enclosing element tags.

The following expression operates on the HTML file and selects all content within the <\title> tag, including markup.

```
HTTP.REQ.BODY(1000).XPATH_HTML_WITH_MARKUP( xp%/html/head/title%)
```

The portion of the HTML body that is selected by the expression is marked for further processing.

Parameters:

xpathex - XPath expression

- **<text\>.XPATH_JSON(xpathex)**

  Operate on a JSON file and return a Boolean value.

  For example, consider the following JSON file:

  { "Book":{ "creator":{ "person":{ "name":'<name\>' } }, "title":'<title\>' } }

  The following expression operates on the JSON file and returns a Boolean TRUE if the JSON file contains a node named "creator," whose parent node is "Book," in the first 1000 bytes:

  ```
  HTTP.REQ.BODY(1000).XPATH_JSON(xp%boolean(/Book/creator)%)
  ```

  Parameters:

  xpathex - XPath Boolean expression

- **<text\>.XPATH_JSON(xpathex)**

  Operate on a JSON file and return a value of data type "double."

  For example, consider the following JSON file:

  { "Book":{ "creator":{ "person":{ "name":'<name\>' } }, "title":'<title\>', "price":"36" } }

  The following expression operates on the JSON file and converts the string "36" to a value of data type "double" if the string is present in the first 1000 bytes of the JSON file.

  ```
  HTTP.REQ.BODY(1000).XPATH_JSON(xp%number(/Book/price)%)
  ```

  Parameters:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

xpathex - XPath numeric expression

- **\<text\>.XPATH_JSON(xpathex)**

  Operate on a JSON file and return a node-set or a string. Node-sets are converted to corresponding strings by using the standard XPath string conversion routine.

  For example, consider the following JSON file:

  { "Book":{ "creator":{ "person":{ "name":'\<name\>' } }, "title":'\<title\>' } }

  The following expression selects all the nodes that are enclosed by "/Book" (a node-set) in the first 1000 bytes of the body of the JSON file and returns the corresponding string value, which is "<name\><title\>":

  `HTTP.REQ.BODY(1000).XPATH_JSON(xp%/Book%)`

  Parameters:

  xpathex - XPath expression

  Example:

  With the following input:

```
{
  "Book": {
    "creator": {
      "person": {
        "name": "my_name"
      }
    },
    "title": "my_title"
  }
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
}
```

The result of the expression `HTTP.REQ.BODY(1000).XPATH_JSON(xp%/Book%)` is: `my_namemy_title`

- **\<text\>.XPATH_JSON_WITH_MARKUP(xpathex)**

  Operate on an XML file and return a string that contains the entire portion of the document for the result node, including markup such as including the enclosing element tags.

  For example, consider the following JSON file:

  {"Book":{ "creator":{ "person":{ "name":'\<name\>' } }, "title":'\<title\>' } }

  The following expression operates on the JSON file and selects all the nodes that are enclosed by "/Book/creator" in the first 1000 bytes of the body, which is "creator:{ person: { name:'\<name\>' } }."

  `HTTP.REQ.BODY(1000).XPATH_JSON_WITH_MARKUP(xp%/Book/creator%)`

  The portion of the JSON body that is selected by the expression is marked for further processing.

  Parameters:

  xpathex - XPath expression

  Example:

  With the following input:

```
{
  "Book": {
    "creator": {
      "person": {
        "name": "my_name"
      }
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
    },
    "title": "my_title"
  }
}
```

The result of the expression `HTTP.REQ.BODY(1000).XPATH_JSON_WITH_MARKUP(xp%/Book/creator%)` is:

```
"creator":{ "person":

{ "name":"my_name" }
}
```

- **\<text\>.XPATH_WITH_MARKUP(xpathex):**

  Operate on an XML file and return a string that contains the entire portion of the document for the result node, including markup such as including the enclosing element tags.

  For example, the following expression operates on an XML file and selects all the nodes enclosed by "/Book/creator" in the first 1000 bytes of the body.

  `HTTP.REQ.BODY(1000).XPATH_WITH_MARKUP(xp%/Book/creator%)`

  The portion of the JSON body that is selected by the expression is marked for further processing.

  Parameters:

  xpathex - XPath expression

Encrypt and decrypt XML payloads

You can use the XML_ENCRYPT() and XML_DECRYPT() functions in Advanced policy expressions to encrypt and decrypt, respectively, XML data. These functions conform to the W3C XML Encryption standard defined at "`<http://www.w3.org/TR/2001/PR-xmldsig-core-20010820/>`." XML_ENCRYPT() and XML_DECRYPT() support a subset of the XML

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Encryption specification. In the subset, data encryption uses a bulk cipher method (RC4, DES3, AES128, AES192, or AES256), and an RSA public key is used to encrypt the bulk cipher key.

Note: If you want to encrypt and decrypt text in a payload, you must use the ENCRYPT and DECRYPT functions. For more information about these functions, see Encrypt and decrypt text.

The XML_ENCRYPT() and XML_DECRYPT() functions are not dependent on the encryption/decryption service that is used by the ENCRYPT and DECRYPT commands for text. The cipher method is specified explicitly as an argument to the XML_ENCRYPT() function. The `XML_DECRYPT()` function obtains the information about the specified cipher method from the `<xenc:EncryptedData>` element. Following are synopses of the XML encryption and decryption functions:

- `XML_ENCRYPT(<certKeyName>, <method> [, <flags>])**. Returns an <xenc:EncryptedData>` element that contains the encrypted input text and the encryption key, which is itself encrypted by using RSA.
- `XML_DECRYPT(<certKeyName>)`. Returns the decrypted text from the input `<xenc:EncryptedData>` element, which includes the cipher method and the RSA-encrypted key.

Note: The `<xenc:EncryptedData>` element is defined in the W3C XML Encryption specification.

Following are descriptions of the arguments:

- **certKeyName:** Selects an X.509 certificate with an RSA public key for XML_ENCRYPT() or an RSA private key for XML_DECRYPT(). The certificate key must have been previously created by an `add ssl certKey` command.
- **method:** Specifies which cipher method to use for encrypting the XML data. Possible values: RC4, DES3, AES128, AES192, AES256.
- **flags:** A bitmask specifying the following optional key information (`<ds:KeyInfo>`) to be included in the `<xenc:EncryptedData>` element that is generated by `XML_ENCRYPT()`:
  - **1** - Include a KeyName element with the certKeyName. The element is `<ds:KeyName>`.
  - **2** - Include a KeyValue element with the RSA public key from the certificate. The element is `<ds:KeyValue>`.
  - **4** - Include an X509IssuerSerial element with the certificate serial number and issuer DN. The element is `<ds:X509IssuserSerial>`.
  - **8** - Include an X509SubjectName element with the certificate subject DN. The element is `<ds:X509SubjectName>`.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **16** - Include an X509Certificate element with the entire certificate. The element is `<ds:X509Certificate>`.

Use the XML_ENCRYPT() and XML_DECRYPT() functions in expressions

The XML encryption feature uses SSL certificate-key pairs to provide X.509 certificates (with RSA public keys) for key encryption and RSA private keys for key decryption. Therefore, before you use the XML_ENCRYPT() function in an expression, you must create an SSL certificate-key pair. The following command creates an SSL certificate-key pair, my-certkey, with the X.509 certificate, my-cert.pem, and the private key file, my-key.pem.

`add ssl certKey my-certkey -cert my-cert.pem -key my-key.pem -passcrypt kxPeMRYnitY=`

The following CLI commands create rewrite actions and policies for encrypting and decrypting XML content.

```
add rewrite action my-xml-encrypt-action replace
"HTTP.RES.BODY(10000).XPATH_WITH_MARKUP(xp%/%)"
"HTTP.RES.BODY(10000).XPATH_WITH_MARKUP(xp%/%).XML_ENCRYPT("my-certkey",
AES256, 31)"

add rewrite action my-xml-decrypt-action replace
"HTTP.REQ.BODY(10000).XPATH_WITH_MARKUP(xp%//xenc:EncryptedData%)"
"HTTP.REQ.BODY(10000).XPATH_WITH_MARKUP(xp%//
xenc:EncryptedData%).XML_DECRYPT("my-certkey")"

add rewrite policy my-xml-encrypt-policy "HTTP.REQ.URL.CONTAINS("xml-
encrypt")" my-xml-encrypt-action

add rewrite policy my-xml-decrypt-policy
"HTTP.REQ.BODY(10000).XPATH(xp%boolean(//xenc:EncryptedData)%)" my-xml-
decrypt-action

bind rewrite global my-xml-encrypt-policy 30
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
bind rewrite global my-xml-decrypt-policy 30
```

In the above example, the rewrite action my-xml-encrypt-action encrypts the entire XML document (XPATH_WITH_MARKUP(xp%/%)) in the request by using the AES-256 bulk encryption method and the RSA public key from my-certkey to encrypt the bulk encryption key. The action replaces the document with an `<xenc:EncryptedData>` element containing the encrypted data and an encrypted key. The flags represented by 31 include all of the optional `<ds:KeyInfo>` elements.

The action my-xml-decrypt-action decrypts the first `<xenc:EncryptedData>` element in the response (XPATH_WITH_MARKUP(xp%//xenc:EncryptedData%)). This requires the prior addition of the xenc XML namespace by use of the following CLI command:

```
add ns xmlnamespace xenc http://www.w3.org/2001/04/xmlenc#
```

The my-xml-decrypt-action action uses the RSA private key in my-certkey to decrypt the encrypted key and then uses the bulk encryption method specified in the element to decrypt the encrypted contents. Finally, the action replaces the encrypted data element with the decrypted content.

The rewrite policy my-xml-encrypt-policy applies my-xml-encrypt-action to requests for URLs containing xml-encrypt. The action encrypts the entire response from a service configured on the NetScaler appliance.

The rewrite policy my-xml-decrypt-policy applies my-xml-decrypt-action to requests that contain an `<xenc:EncryptedData>` element ((XPATH(xp%//xenc:EncryptedData%) returns a non-empty string). The action decrypts the encrypted data in requests that are bound for a service configured on the NetScaler appliance.

Advanced policy expressions: parsing SSL

There are advanced policy expressions to parse SSL certificates and SSL client hello messages.

Parse SSL certificates

You can use advanced policy expressions to evaluate X.509 Secure Sockets Layer (SSL) client certificates. A client certificate is an electronic document that can be used to authenticate a user's identity. A client certificate contains (at a minimum) version information, a serial number, a signature algorithm ID, an issuer name, a validity period, a subject (user) name, a public key, and signatures.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

You can examine both SSL connections and data in client certificates. For example, you might want to send SSL requests that use low-strength ciphers to a particular load balancing virtual server farm. The following command is an example of a Content Switching policy that parses the cipher strength in a request and matches cipher strengths that are less than or equal to 40:

```
add cs policy p1 -rule "client.ssl.cipher_bits.le(40)"
```

As another example, you can configure a policy that determines whether a request contains a client certificate:

```
add cs policy p2 -rule "client.ssl.client_cert exists"
```

Or, you can configure a policy that examines particular information in a client certificate. For example, the following policy verifies that the certificate has one or more days before expiration:

```
add cs policy p2 -rule "client.ssl.client_cert exists &&
client.ssl.client_cert.days_to_expire.ge(1)"
```

An example for JA3 fingerprint usage:

```
add ssl policy ja3_pol -rule
"CLIENT.SSL.JA3_FINGERPRINT.EQ(bb4c15a90e93a25ddc16274395bce4c6)" -action reset
```

Or, an example for JA3 fingerprint usage with patset:

```
add policy patset pat1

bind policy patset pat1 bb4c15a90e93a25ddc16274395bce4c6 -index 1

bind policy patset pat1 cd3c15a90e93a25ddc16274395bce6b4 -index 2

add ssl policy ssl_ja3_pol -rule
CLIENT.SSL.JA3_FINGERPRINT.contains_any(\"pat1\") -action reset
```

NOTE

For information on parsing dates and times in a certificate, see Format of Dates and Times in an Expression and Expressions for SSL Certificate Dates.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Prefixes for text-based SSL and certificate data

The following table describes expression prefixes that identify text-based items in SSL transactions and client certificates.

Table 1. Prefixes That Return Text or Boolean Values for SSL and Client Certificate Data

PREFIX	DESCRIPTION
CLIENT.SSL.CLIENT_CERT	Returns the SSL client certificate in the current SSL transaction.
CLIENT.SSL.CLIENT_CERT.TO_PEM	Returns the SSL client certificate in binary format.
CLIENT.SSL.CIPHER_EXPORTABLE	Returns a Boolean TRUE if the SSL cryptographic cipher is exportable.
CLIENT.SSL.CIPHER_NAME	Returns the name of the SSL Cipher if invoked from an SSL connection, and a NULL string if invoked from a non-SSL connection.
CLIENT.SSL.IS_SSL	Returns a Boolean TRUE if the current connection is SSL-based.
CLIENT.SSL.JA3_FINGERPRINT	Returns a Boolean TRUE if the configured JA3 fingerprint matches the JA3 fingerprint in the client hello message. **Note:** This expression is available in release 13.1 build 12.x and later.

Prefixes for numeric data in SSL certificates

The following table describes prefixes that evaluate numeric data other than dates in SSL certificates. These prefixes can be used with the operations that are described in Basic Operations on Expression Prefixes and Compound Operations for Numbers.

Table 2. Prefixes That Evaluate Numeric Data Other Than Dates in SSL Certificates

PREFIX	DESCRIPTION
CLIENT.SSL.CLIENT_CERT.DAYS_TO_EXPIRE	Returns the number of days that the certificate is valid, or returns -1 for expired certificates.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

PREFIX	DESCRIPTION
CLIENT.SSL.CLIENT_CERT.PK_SIZE	Returns the size of the public key used in the certificate.
CLIENT.SSL.CLIENT_CERT.VERSION	Returns the version number of the certificate. If the connection is not SSL-based, returns zero (0).
CLIENT.SSL.CIPHER_BITS	Returns the number of bits in the cryptographic key. Returns 0 if the connection is not SSL-based.
CLIENT.SSL.VERSION	Returns a number that represents the SSL protocol version, as follows: 0. The transaction is not SSL-based: 0x002. The transaction is SSLv2: 0x300. The transaction is SSLv3: 0x301. The transaction is TLSv1: 0x302. The transaction is TLS 1.1: 0x303. The transaction is TLS 1.2: 0x304. The transaction is TLS 1.3.

NOTE

For expressions related to expiration dates in a certificate, see Expressions for SSL Certificate Dates.

Expressions for SSL certificates

You can parse SSL certificates by configuring expressions that use the following prefix:

CLIENT.SSL.CLIENT_CERT

This section discusses the expressions that you can configure for certificates, except expressions that examine certificate expiration. Time-based operations are described in Advanced Policy Expressions: Working with Dates, Times, and Numbers.

The following table describes the operations that you can specify for the CLIENT.SSL.CLIENT_CERT prefix.

Table 3. Operations That Can Be Specified with the CLIENT.SSL.CLIENT_CERT Prefix

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SSL CERTIFICATE OPERATION	DESCRIPTION
`<certificate>.EXISTS`	Returns a Boolean TRUE if the client has an SSL certificate.
`<certificate>.ISSUER`	Returns the Distinguished Name (DN) of the Issuer in the certificate as a name-value list. An equals sign ("=") is the delimiter for the name and the value, and the slash ("/") is the delimiter that separates the name-value pairs. Following is an example of the returned DN: `/C=US/O=myCompany/ OU=www.mycompany.com/ CN=www.mycompany.com/ emailAddress=myuserid@mycompany.com`
`<certificate>.ISSUER. IGNORE_EMPTY_ELEMENTS`	Returns the Issuer and ignores the empty elements in a name-value list. For example, consider the following: `Cert-Issuer: / c=in/st=kar//l=bangelore // o=mycompany/ou=sales/ / emailAddress=myuserid@mycompany.com`. The following Rewrite action returns a count of 6 based on the preceding Issuer definition: `sh rewrite action insert_ssl_header Name: insert_ssl Operation: insert_http_header Target:Cert-Issuer Value:CLIENT.SSL.CLIENT_CERT.ISSUER.COUNT`. However, if you change the value to the following, the returned count is 9: `CLIENT.SSL.CLIENT_CERT.ISSUER.IGNORE_EMPTY_ELEMENTS.COUNT`
`<certificate>. SERIALNUMBER`	Returns the serial number of the certificate as an upper case hexadecimal string with no leading zeroes. For example, if the serial number of the certificate is 04daa1e44bd2e7769638a0058b4964bd, the following expression helps match the serial number `CLIENT.SSL.CLIENT_CERT.SERIALNUMBER.S`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SSL CERTIFICATE OPERATION	DESCRIPTION
	`ET_TEXT_MODE(IGNORECASE).CONTAINS(\"4daa1e44bd2e7769638a0058b4964bd\")`

Parse SSL client hello

You can parse the SSL client hello message by configuring expressions that use the following prefix:

PREFIX	DESCRIPTION
CLIENT.SSL.CLIENT_HELLO.CIPHERS.HAS_HEXCODE	Matches the hex code provided in the expression with the hex codes of cipher suites received in the client hello message.
CLIENT.SSL.CLIENT_HELLO.CLIENT_VERSION	Version received in the client hello message header.
CLIENT.SSL.CLIENT_HELLO.IS_RENEGOTIATE	Returns true if a client or server initiates session renegotiation.
CLIENT.SSL.CLIENT_HELLO.IS_REUSE	Returns true if the appliance reuses the SSL session based on the non-zero session-ID received in the client-hello message.
CLIENT.SSL.CLIENT_HELLO.IS_SCSV	Returns true if Signaling Cipher Suite Value (SCSV) capability is advertised in the client hello message. The hex code for fallback SCSV is 0x5600.
CLIENT.SSL.CLIENT_HELLO.IS_SESSION_TICKET	Returns true if session ticket extension with non-zero length is advertised in the client-hello message.
CLIENT.SSL.CLIENT_HELLO.LENGTH	Length received in the client hello message header.
CLIENT.SSL.CLIENT_HELLO.SNI	Returns the server name received in the Server Name extension of the client hello message.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

PREFIX	DESCRIPTION
CLIENT.SSL.CLIENT_HELLO.ALPN.HAS_NEXTPROTOCOL	Returns true if the application protocol in the ALPN extension received in the client hello message matches the protocol provided in the expression.

These expressions can be used at the CLIENTHELLO_REQ bind point. For more information, see SSL policy binding.

Advanced policy expressions: IP and MAC addresses, throughput, VLAN IDs

You can use Advanced policy expression prefixes that return IPv4 and IPv6 addresses, MAC addresses, IP subnets, useful client and server data such as the throughput rates at the interface ports (Rx, Tx, and RxTx), and the IDs of the VLANs through which packets are received. You can then use various operators to evaluate the data that is returned by these expression prefixes.

Expressions for IP addresses and IP subnets

You can use Advanced policy expressions to evaluate addresses and subnets that are in Internet Protocol version 4 (IPv4) or Internet Protocol version 6 (IPv6) format. Expression prefixes for IPv6 addresses and subnets include IPv6 in the prefix. Expression prefixes for IPv4 addresses and subnets include IP in the prefix. Following is an example of an expression that identifies whether a request has originated from a particular IPv4 subnet.

```
client.ip.src.in_subnet(147.1.0.0/16)
```

Following are two examples of Rewrite policies that examine the subnet from which the packet is received and perform a rewrite action on the Host header. With these two policies configured, the rewrite action that is performed depends on the subnet in the request. These two policies evaluate IP addresses that are in the IPv4 address format.

```
- add rewrite action URL1-rewrite-action replace
"http.req.header(\"Host\")" "\"www.mycompany1.com\""

- add rewrite policy URL1-rewrite-policy
"http.req.header(\"Host\").contains(\"www.test1.com\") &&
client.ip.src.in_subnet(147.1.0.0/16)" URL1-rewrite-action
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
- add rewrite action URL2-rewrite-action replace
"http.req.header(\"Host\")" "\"www.mycompany2.com\""

- add rewrite policy URL2-rewrite-policy
"http.req.header(\"Host\").contains(\"www.test2.com\") &&
client.ip.src.in_subnet(10.202.0.0/16)" URL2-rewrite-action
```

NOTE

The preceding examples are commands that you type at the NetScaler command-line interface (CLI) and, therefore, each quotation mark must be preceded by a backslash (\\). For more information, see Configuring advanced policy expressions in a policy."

Prefixes for IPV4 addresses and IP subnets

The following table describes prefixes that return IPv4 addresses and subnets, and segments of IPv4 addresses. You can use numeric operators and operators that are specific to IPv4 addresses with these prefixes. For more information about numeric operations, see "Basic Operations on Expression Prefixes" and "Compound Operations for Numbers."

Table 1. Prefixes That Evaluate IP and MAC Addresses

PREFIX	DESCRIPTION
CLIENT.IP.SRC	Returns the source IP of the current packet as an IP address or as a number.
CLIENT.IP.DST	Returns the destination IP of the current packet as an IP address or as a number.
SERVER.IP.SRC	Returns the source IP of the current packet as an IP address or as a number.
SERVER.IP.DST	Returns the destination IP of the current packet as an IP address or as a number.

Operations for IPV4 Addresses

The Prefix for IPV4 operations table describes the operators that can be used with prefixes that return an IPv4 address.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

About IPv6 expressions

The IPv6 address format allows more flexibility than the older IPv4 format. IPv6 addresses are in the hexadecimal format (RFC 2373). In the following examples, Example 1 is an IPv6 address, Example 2 is a URL that includes the IPv6 address, and Example 3 includes the IPv6 address and a port number.

Example 1:

```
9901:0ab1:22a2:88a3:3333:4a4b:5555:6666
```

Example 2:

```
http://[9901:0ab1:22a2:88a3:3333:4a4b:5555:6666]/
```

Example 3:

```
https://[9901:0ab1:22a2:88a3:3333:4a4b:5555:6666]:8080/
```

In Example 3, the brackets separate the IP address from the port number (8080).

Note that you can only use the '+' operator to combine IPv6 expressions with other expressions. The output is a concatenation of the string values that are returned from the individual expressions. You cannot use any other arithmetic operator with an IPv6 expression. The following syntax is an example:

```
client.ipv6.src + server.ip.dst
```

For example, if the client source IPv6 address is `ABCD:1234::ABCD`, and the server destination IPv4 address is `10.100.10.100`, the preceding expression returns `"ABCD:1234::ABCD10.100.10.100"`.

Note that when the NetScaler appliance receives an IPv6 packet, it assigns a temporary IPv4 address from an unused IPv4 address range and changes the source address of the packet to this temporary address. At response time, the outgoing packet's source address is replaced with the original IPv6 address.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE

You can combine an IPv6 expression with any other expression except an expression that produces a Boolean result.

Expression prefixes for IPv6 addresses

The IPv6 addresses that are returned by the expression prefixes in the following table can be treated as text data. For example, the prefix client.ipv6.dst returns the destination IPv6 address as a string that can be evaluated as text.

The following table describes expression prefixes that return an IPv6 address.

Table 3. IPv6 Expression Prefixes That Return Text

PREFIX	DESCRIPTION
CLIENT.IPV6	Operates on the IPv6 address in with the current packet.
CLIENT.IPV6.DST	Returns the IPv6 address in the destination field of the IP header.
CLIENT.IPV6.SRC	Returns the IPv6 address in the source field of the IP header. Following are examples: `client.ipv6.src.in_subnet(2007::2008/64)` `client.ipv6.src.get1.le(2008)`
SERVER.IPV6	Operates on the IPv6 address in with the current packet.
SERVER.IPV6.DST	Returns the IPv6 address in the destination field of the IP header.
SERVER.IPV6.SRC	Returns the IPv6 address in the source field of the IP header. Following are examples: `server.ipv6.src.in_subnet(2007::2008/64)` `server.ipv6.src.get1.le(2008)`

Operations for IPv6 prefixes

The following table describes the operators that can be used with prefixes that return an IPv6 address:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Table 4. Operations That Evaluate IPv6 Addresses

IPV6 OPERATION	DESCRIPTION
`<ipv6>.EQ(<IPv6_address>`	Returns a Boolean TRUE if the IP address value is same as the `<IPv6_address>` argument. Following is an example: `client.ipv6.dst.eq(ABCD:1234::ABCD)`
`<ipv6>.GET1. . .GET8`	Returns a segment of an IPv6 address as a number. The following example expressions retrieve segments from the ipv6 address 1000:1001:CD10:0000:0000:89AB:4567:CDEF : `client.ipv6.dst.get5 extracts 0000`, which is the fifth set of bits in the address. `client.ipv6.dst.get6 extracts 89AB.` `client.ipv6.dst.get7 extracts 4567.` You can perform numeric operations on these segments. Note that you cannot perform numeric operations when you retrieve an entire IPv6 address. This is because expressions that return an entire IPv6 address, such as CLIENT.IPV6.SRC, return the address in text format.
`<ipv6>.IN_SUBNET(<subnet>)`	Returns a Boolean TRUE if the IPv6 address value is in the subnet specified by the `<subnet>` argument. Following is an example: `client.ipv6.dst.eq(1000:1001:CD10:0000:0000:89AB:4567:CDEF/60)`
`<ipv6>.IS_IPV4`	Returns a Boolean TRUE if this is an IPv4 client, and returns a Boolean FALSE if it is not.
`<ipv6>.SUBNET(<n>)`	Returns the IPv6 address after applying the subnet mask specified as the argument. The subnet mask can take values between 0 and 128. For example: `CLIENT.IPV6.SRC.SUBNET(24)`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Expressions for MAC addresses

A MAC address consists of colon-delimited hexadecimal values in the format ##:##:##:##:##:##, where each “#” represents either a number from 0 through 9 or a letter from A through F. DAdvanced policy expression prefixes and operators are available for evaluating source and destination MAC addresses.

Prefixes for MAC addresses

The following table describes prefixes that return MAC addresses.

Table 5. Prefixes That Evaluate MAC Addresses

PREFIX	DESCRIPTION
`client.ether.dstmac`	Returns the MAC address in the destination field of the Ethernet header.
`client.ether.srcmac`	Returns the MAC address in the source field of the Ethernet header.

Operations for MAC addresses

The following table describes the operators that can be used with prefixes that return a MAC address.

Table 6. Operations on MAC Addresses

PREFIX	DESCRIPTION
`<mac address>.EQ(<address>)`	Returns a Boolean TRUE if the MAC address value is same as the `<address>` argument.
`<mac address>.GET1. . .GET4`	Returns a numeric value extracted from the segment of the MAC address that is specified in the GET operation. For example, if the MAC address is 12:34:56:78:9a:bc, the following returns 34: `client.ether.dstmac.get2`

Expressions for numeric client and server data

The following table describes prefixes for working with numeric client and server data, including throughput, port numbers, and VLAN IDs.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Table 7. Prefixes that evaluate numeric client and server data

PREFIX	DESCRIPTION
client.interface.rxthroughput	Returns an integer representing the raw received traffic throughput in kilobytes per second (KBps) for the previous seven seconds.
client.interface.txthroughput	Returns an integer representing the raw transmitted traffic throughput in KBps for the previous seven seconds.
client.interface.rxtxthroughput	Returns an integer representing the raw received and transmitted traffic throughput in KBps for the previous seven seconds.
server.interface.rxthroughput	Returns an integer representing the raw received traffic throughput in KBps for the previous seven seconds.
server.interface.txthroughput	Returns an integer representing the raw transmitted traffic throughput in KBps for the previous seven seconds.
server.interface.rxtxthroughput	Returns an integer representing the raw received and transmitted traffic throughput in KBps for the previous seven seconds.
server.vlan.id	Returns a numeric ID of the VLAN through which the current packet entered the NetScaler.
client.vlan.id	Returns a numeric ID for the VLAN through which the current packet entered the NetScaler.

Advanced policy expressions: stream analytics functions

Stream Analytics expressions begin with the ANALYTICS.STREAM(\<identifier_name\>) prefix. The following list describes the functions that can be used with this prefix.

- **COLLECT_STATS**

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Collect statistical data from the requests that are evaluated against the policy and create a record for each request.

- **REQUESTS**

  Return the number of requests that exist for the specified record grouping. The value returned is of type unsigned long.

- **BANDWIDTH**

  Return the bandwidth statistic for the specified record grouping. The value returned is of type unsigned long.

- **RESPTIME**

  Return the response time statistic for the specified record grouping. The value returned is of type unsigned long.

- **CONNECTIONS**

  Return the number of concurrent connections that exist for the specified record grouping. The value returned is of type unsigned long.

- **IS_TOP(n)**

  Return a Boolean TRUE if the statistical value for the specified record grouping is one among the top n groups. Otherwise, return a Boolean FALSE.

- **CHECK_LIMIT**

  Return a Boolean TRUE if the statistic for the specified record grouping has hit the preconfigured limit. Otherwise, return a Boolean FALSE.

Advanced policy expressions: DataStream

The policy infrastructure on the NetScaler appliance includes expressions that you can use to evaluate and process database server traffic when the appliance is deployed between a farm of application servers and their associated database servers.

This topic includes the following sections:

- Expressions for the MySQL Protocol
- Expressions for Evaluating Microsoft SQL Server Connections

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Expressions for the MySQL protocol

The following expressions evaluate traffic associated with MySQL database servers. You can use the request-based expressions (expressions that begin with MYSQL.CLIENT and MYSQL.REQ) in policies to make request switching decisions at the content switching virtual server bind point and the response-based expressions (expressions that begin with MYSQL.RES) to evaluate server responses to user-configured health monitors.

- **MYSQL.CLIENT.** Operates on the client properties of a MySQL connection.
- **MYSQL.CLIENT.CAPABILITIES.** Returns the set of flags that the client has set in the capabilities field of the handshake initialization packet during authentication. Examples of the flags that are set are CLIENT_FOUND_ROWS, CLIENT_COMPRESS, and CLIENT_SSL.
- **MYSQL.CLIENT.CHAR_SET.** Returns the enumeration constant assigned to the character set that the client uses. The EQ(\<m\>) and NE(\<m\>) operators, which return Boolean values to indicate the result of a comparison, are used with this prefix. Following are the character set enumeration constants:
    - LATIN2_CZECH_CS
    - DEC8_SWEDISH_CI
    - CP850_GENERAL_CI
    - GREEK_GENERAL_CI
    - LATIN1_GERMAN1_CI
    - HP8_ENGLISH_CI
    - KOI8R_GENERAL_CI
    - LATIN1_SWEDISH_CI
    - LATIN2_GENERAL_CI

- **MYSQL.CLIENT.DATABASE.** Returns the name of the database specified in the authentication packet that the client sends to the database server. This is the databasename attribute.
- MYSQL.CLIENT.USER. Returns the user name (in the authentication packet) with which the client is attempting to connect to the database. This is the user attribute.
- **MYSQL.REQ.** Operates on a MySQL request.
- **MYSQL.REQ.COMMAND.** Identifies the enumeration constant assigned to the type of command in the request. The EQ(\<m\>) and NE(\<m\>) operators, which return Boolean values to indicate the result of a comparison, are used with this prefix. Following are the enumeration constant values:

  - SLEEP
  - QUIT
  - INIT_DB
  - QUERY
  - FIELD_LIST
  - CREATE_DB
  - DROP_DB
  - REFRESH
  - SHUTDOWN
  - STATISTICS
  - PROCESS_INFO

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- CONNECT
- PROCESS_KILL
- DEBUG
- PING
- TIME
- DELAYED_INSERT
- CHANGE_USER
- BINLOG_DUMP
- TABLE_DUMP
- CONNECT_OUT
- REGISTER_SLAVE
- STMT_PREPARE
- STMT_EXECUTE
- STMT_SEND_LONG_DATA
- STMT_CLOSE
- STMT_RESET
- SET_OPTION
- STMT_FETCH

- **MYSQL.REQ.QUERY.** Identifies the query in the MySQL request.
- **MYSQL.REQ.QUERY.COMMAND.** Returns the first keyword in the MySQL query.
- **MYSQL.REQ.QUERY.SIZE.** Returns the size of the request query in integer format. The SIZE method is similar to the CONTENT_LENGTH method that returns the length of an HTTP request or response.
- **MYSQL.REQ.QUERY.TEXT.** Returns a string covering the entire query.
- **MYSQL.REQ.QUERY.TEXT(\<n\>).** Returns the first n bytes of the MySQL query as a string. This is similar to HTTP.BODY(\<n\>).

  Parameters:

  n - Number of bytes to be returned
- **MYSQL.RES.** Operates on a MySQL response.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **MYSQL.RES.ATLEAST_ROWS_COUNT(<i>).** Checks whether the response has at least i number of rows and returns a Boolean TRUE or FALSE to indicate the result.

  Parameters:

  i - Number of rows
- **MYSQL.RES.ERROR.** Identifies the MySQL error object. The error object includes the error number and the error message.
- **MYSQL.RES.ERROR.MESSAGE.** Returns the error message that is retrieved from the server's error response.
- **MYSQL.RES.ERROR.NUM.** Returns the error number that is retrieved from the server's error response.
- **MYSQL.RES.ERROR.SQLSTATE.** Returns the value of the SQLSTATE field in the server's error response. The MySQL server translates error number values to SQLSTATE values.
- **MYSQL.RES.FIELD(<i>).** Identifies the packet that corresponds to the ith individual field in the server's response. Each field packet describes the properties of the associated column. The packet count (i) begins at 0.

  Parameters:

  i - Packet number
- **MYSQL.RES.FIELD(<i>).CATALOG.** Returns the catalog property of the field packet.
- **MYSQL.RES.FIELD(<i>).CHAR_SET.** Returns the character set of the column. The EQ(\<m\>) and NE(\<m\>) operators, which return Boolean values to indicate the result of a comparison, are used with this prefix.
- **MYSQL.RES.FIELD(<i>).DATATYPE.** Returns an enumeration constant that represents the data type of the column. This is the type (also called enum_field_type) attribute of the column. The EQ(\<m\>) and NE(\<m\>) operators, which return Boolean values to indicate the result of a comparison, are used with this prefix. The possible values for the various data types are:
  - DECIMAL
  - TINY
  - SHORT
  - LONG
  - FLOAT
  - DOUBLE

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- NULL
- TIMESTAMP
- LONGLONG
- INT24
- DATE
- TIME
- DATETIME
- YEAR
- NEWDATE
- VARCHAR (new in MySQL 5.0)
- BIT (new in MySQL 5.0)
- NEWDECIMAL (new in MySQL 5.0)
- ENUM
- SET
- TINY_BLOB
- MEDIUM_BLOB
- LONG_BLOB
- BLOB
- VAR_STRING
- STRING
- GEOMETRY

- **MYSQL.RES.FIELD(<i>).DB.** Returns the database identifier (db) attribute of the field packet.
- **MYSQL.RES.FIELD(<i>).DECIMALS.** Returns the number of positions after the decimal point if the type is DECIMAL or NUMERIC. This is the decimals attribute of the field packet.
- **MYSQL.RES.FIELD(<i>).FLAGS.** Returns the flags property of the field packet. Following are the possible hexadecimal flag values:
  - 0001: NOT_NULL_FLAG
  - 0002: PRI_KEY_FLAG
  - 0004: UNIQUE_KEY_FLAG
  - 0008: MULTIPLE_KEY_FLAG

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- 0010: BLOB_FLAG
- 0020: UNSIGNED_FLAG
- 0040: ZEROFILL_FLAG
- 0080: BINARY_FLAG
- 0100: ENUM_FLAG
- 0200: AUTO_INCREMENT_FLAG
- 0400: TIMESTAMP_FLAG
- 0800: SET_FLAG

- **MYSQL.RES.FIELD(<i>).LENGTH.** Returns the length of the column. This is the value of the length attribute of the field packet. The value that is returned might be larger than the actual value. For example, an instance of a VARCHAR(2) column might return a value of 2 even when it contains only one character.
- **MYSQL.RES.FIELD(<i>).NAME.** Returns the column identifier (the name after the AS clause, if any). This is the name attribute of the field packet.
- **MYSQL.RES.FIELD(<i>).ORIGINAL_NAME.** Returns the original column identifier (before the AS clause, if any). This is the org_name attribute of the field packet.
- **MYSQL.RES.FIELD(<i>).ORIGINAL_TABLE.** Returns the original table identifier of the column (before the AS clause, if any). This is the org_table attribute of the field packet.
- **MYSQL.RES.FIELD(<i>).TABLE.** Returns the table identifier of the column (after the AS clause, if any). This is the table attribute of the field packet.
- **MYSQL.RES.FIELDS_COUNT.** Returns the number of field packets in the response (the field_count attribute of the OK packet).
- **MYSQL.RES.OK.** Identifies the OK packet sent by the database server.
- **MYSQL.RES.OK.AFFECTED_ROWS.** Returns the number of rows affected by an INSERT, UPDATE, or DELETE query. This is the value of the affected_rows attribute of the OK packet.
- **MYSQL.RES.OK.INSERT_ID.** Identifies the unique_id attribute of the OK packet. If an auto-increment identity is not generated by the current MySQL statement or query, the value of unique_id, and hence the value returned by the expression, is 0.
- **MYSQL.RES.OK.MESSAGE.** Returns the message property of the OK packet.
- **MYSQL.RES.OK.STATUS.** Identifies the bit string in the server_status attribute of the OK packet. Clients can use the server status to check whether the current command is a part of a

© 1997–2026 Citrix Systems, Inc. All rights reserved.

running transaction. The bits in the server_status bit string correspond to the following fields (in the given order):

- IN TRANSACTION
- AUTO_COMMIT
- MORE RESULTS
- MULTI QUERY
- BAD INDEX USED
- NO INDEX USED
- CURSOR EXISTS
- LAST ROW SEEN
- DATABASE DROPPED
- NO BACKSLASH ESCAPES

- **MYSQL.RES.OK.WARNING_COUNT.** Returns the warning_count attribute of the OK packet.
- **MYSQL.RES.ROW(<i>).** Identifies the packet that corresponds to the ith individual row in the database server's response.

  Parameters:

  i - Row number
- **MYSQL.RES.ROW(<i>).DOUBLE_ELEM(\<j\>).** Checks whether the jth column of the ith row of the table is NULL. Following C conventions, both indexes i and j start from 0. Therefore, row i and column j are actually the $(i+1)^{th}$ row and the $(j+1)^{th}$ column, respectively.

  Parameters:

  i - Row number

  j - Column number
- **MYSQL.RES.ROW(<i>).IS_NULL_ELEM(j).** Checks whether the jth column of the ith row of the table is NULL. Following C conventions, both indexes i and j start from 0. Therefore, row i and column j are actually the $(i+1)^{th}$ row and the $(j+1)^{th}$ column, respectively.

  Parameters:

  i - Row number

  j - Column number

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **MYSQL.RES.ROW(<i>).NUM_ELEM(\<j\>).** Returns an integer value from the jth column of the ith row of the table. Following C conventions, both indexes i and j start from 0. Therefore, row i and column j are actually the $(i+1)^{th}$ row and the $(j+1)^{th}$ column, respectively.

  Parameters:

  i - Row number

  j - Column number

- **MYSQL.RES.ROW(<i>).TEXT_ELEM(j).** Returns a string from the jth column of the ith row of the table. Following C conventions, both indexes i and j start from 0. Therefore, row i and column j are actually the $(i+1)^{th}$ row and the $(j+1)^{th}$ column, respectively.

  Parameters:

  i - Row number

  j - Column number

- **MYSQL.RES.TYPE.** Returns an enumeration constant for the response type. Its values can be ERROR, OK, and RESULT_SET. The EQ(\<m\>) and NE(\<m\>) operators, which return Boolean values to indicate the result of a comparison, are used with this prefix.

Expressions for evaluating Microsoft SQL server connections

The following expressions evaluate traffic associated with Microsoft SQL Server database servers. You can use the request-based expressions (expressions that begin with MSSQL.CLIENT and MSSQL.REQ) in policies to make request switching decisions at the content switching virtual server bind point and the response-based expressions (expressions that begin with MSSQL.RES) to evaluate server responses to user-configured health monitors.

EXPRESSION	DESCRIPTION
MSSQL.CLIENT.CAPABILITIES	Returns the OptionFlags1, OptionFlags2, OptionFlags3, and TypeFlags fields of the LOGIN7authentication packet, in that order, as a 4-byte integer. Each field is 1 byte long and specifies a set of client capabilities.
MSSQL.CLIENT.DATABASE	Returns the name of the client database. The value returned is of type text.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

EXPRESSION	DESCRIPTION
MSSQL.CLIENT.USER	Returns the user name with which the client authenticated. The value returned is of type text.
MSSQL.REQ.COMMAND	Returns an enumeration constant that identifies the type of command in the request sent to a Microsoft SQL Server database server. The value returned is of type text. Examples of the values of the enumeration constant are QUERY, RESPONSE, RPC, and ATTENTION. The EQ(<m>) and NE(<m>) operators, which return Boolean values to indicate the result of a comparison, are used with this expression.
MSSQL.REQ.QUERY.COMMAND	Returns the first keyword in the SQL query. The value returned is of type text.
MSSQL.REQ.QUERY.SIZE	Returns the size of the SQL query in the request. The value returned is a number.
MSSQL.REQ.QUERY.TEXT	Returns the entire SQL query as a string. The value returned is of type text.
MSSQL.REQ.QUERY.TEXT(<n>)	Returns the first n bytes of the SQL query. The value returned is of type text. Parameters: n - Number of bytes
MSSQL.REQ.RPC.NAME	Returns the name of the procedure that is being called in a remote procedure call (RPC) request. The name is returned as a string.
MSSQL.REQ.RPC.IS_PROCID	Returns a Boolean value that indicates whether the remote procedure call (RPC) request contains a procedure ID or an RPC name. A return value of TRUEindicates that the request contains a procedure ID and a return value of FALSE indicates that the request contains an RPC name.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

EXPRESSION	DESCRIPTION
MSSQL.REQ.RPC.PROCID	Returns the procedure ID of the remote procedure call (RPC) request as an integer.
MSSQL.REQ.RPC.BODY **Note:** Not available for releases before 10.1.	Returns the body of the SQL request as a string in the form of parameters represented as "a=b" clauses separated by commas, where "a" is the RPC parameter name and "b" is its value.
MSSQL.REQ.RPC.BODY(n) **Note:** Not available for releases before 10.1.	Returns part of the body of the SQL request as a string in the form of parameters represented as "a=b" clauses separated by commas, where "a" is the RPC parameter name and "b" is its value. Parameters are returned from only the first "n" bytes of the request, skipping the SQL header. Only complete name-value pairs are returned.
MSSQL.RES.ATLEAST_ROWS_COUNT(i)	Checks whether the response has at least i number of rows. The value returned is a Boolean TRUE or FALSEvalue. Parameters: i - Number of rows
MSSQL.RES.DONE.ROWCOUNT	Returns a count of the number of rows affected by an INSERT, UPDATE, or DELETE query. The value returned is of type unsigned long.
MSSQL.RES.DONE.STATUS	Returns the status field from the DONE token sent by a Microsoft SQL Server database server. The value returned is a number.
MSSQL.RES.ERROR.MESSAGE	Returns the error message from the ERROR token sent by a Microsoft SQL Server database server. This is the value of the MsgText field in the ERROR token. The value returned is of type text.
MSSQL.RES.ERROR.NUM	Returns the error number from the ERROR token sent by a Microsoft SQL Server database server. This is the value of the

© 1997–2026 Citrix Systems, Inc. All rights reserved.

EXPRESSION	DESCRIPTION
	Number field in the ERROR token. The value returned is a number.
MSSQL.RES.ERROR.STATE	Returns the error state from the ERROR token sent by a Microsoft SQL Server database server. This is the value of the State field in the ERROR token. The value returned is a number.
MSSQL.RES.FIELD(<i>).DATATYPE	Returns the data type of the ith field in the server response. The EQ(<m>) and NE(<m>) functions, which return Boolean values to indicate the result of a comparison, are used with this prefix. For example, the following expression returns a Boolean TRUE if the DATATYPE function returns a value of datetime for the third field in the response: MSSQL.RES.FIELD(<2>).DATATYPE.EQ(date time) Parameters: i - Row number
MSSQL.RES.FIELD(<i>).LENGTH	Returns the maximum possible length of the ith field in the server response. The value returned is a number. Parameters: i - Row number
MSSQL.RES.FIELD(<i>).NAME	Returns the name of the ith field in the server response. The value returned is of type text. Parameters: i - Row number
MSSQL.RES.ROW(<i>).DOUBLE_ELEM(<j>)	Returns a value of type double from the jth column of the ith row of the table. If the value is not a double value, an UNDEF condition is raised. Following C conventions, both indexes i and j start from 0 (zero). Therefore, row i and column j are actually the (i + 1)th row and the (j + 1)th column, respectively. Parameters: i - Row number j - Column number
MSSQL.RES.ROW(<i>).NUM_ELEM(j)	Returns an integer value from the jth column of ith row of the table. If the value is not an integer value, an UNDEF condition is raised. Following C conventions, both indexes i and j

© 1997–2026 Citrix Systems, Inc. All rights reserved.

EXPRESSION	DESCRIPTION
	start from 0 (zero). Therefore, row i and column j are actually the (i + 1)th row and the (j + 1)th column, respectively. Parameters: i - Row number j - Column number
MSSQL.RES.ROW(<i>).IS_NULL_ELEM(j)	Checks whether the jth column of the ith row of the table is NULL and returns a Boolean TRUE or FALSE to indicate the result. Following C conventions, both indexes i and j start from 0 (zero). Therefore, row iand column j are actually the (i + 1)th row and the (j + 1)th column, respectively. Parameters: i - Row number j - Column number
MSSQL.RES.ROW(<i>).TEXT_ELEM(j)	Returns a text string from the jth column of ith row of the table. Following C conventions, both indexes i and j start from 0 (zero). Therefore, row i and column j are actually the (i + 1)th row and the (j + 1)th column, respectively. Parameters: i - Row number j - Column number
MSSQL.RES.TYPE	Returns an enumeration constant that identifies the response type. Following are the possible return values: ERROR, OK, and RESULT_SET. The EQ(<m>) and NE(<m>) operators, which return Boolean values to indicate the result of a comparison, are used with this expression.

Typecasting data

You can extract data of one type (for example, text or an integer) from requests and responses and transform it to data of another type. For example, you can extract a string and transform the string to time format. You can also extract a string from an HTTP request body and treat it like an HTTP header or extract a value from one type of request header and insert it in a response header of a different type.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

After typecasting the data, you can apply any operation that is appropriate for the new data type. For example, if you typecast text to an HTTP header, you can apply any operation that is applicable to HTTP headers to the returned value.

For more information about typecasting data, see the Typecasting Operations pdf.

Regular Expressions

When you want to perform string matching operations that are more complex than the operations that you perform with the CONTAINS(`"<string>"`) or EQ(`"<string>"`) operators, you use regular expressions. The policy infrastructure on the Citrix NetScaler appliance includes operators to which you can pass regular expressions as arguments for text matching. The names of the operators that work with regular expressions include the string REGEX. The regular expressions that you pass as arguments must conform to the regular expression syntax that is described in `"`http://www.pcre.org/pcre.txt`."` You can learn more about regular expressions at `"`http://www.regular-expressions.info/quickstart.html`"` and at `"`http://www.silverstones.com/thebat/Regex.html`."`

The target text for an operator that works with regular expressions can be either text or the value of an HTTP header. Following is the format of a Advanced policy expression that uses a regular expression operator to operate on text:

```
<text>.<regex_operator>(re<delimiter><regex_pattern><delimiter>)
```

The string `<text>` represents the Advanced policy expression prefix that identifies a text string in a packet (for example, HTTP.REQ.URL). The string `<regex_operator>` represents the regular expression operator. The regular expression always begins with the string re. A pair of matching delimiters, represented by `<delimiter>`, enclose the string `<regex_pattern>`, which represents the regular expression.

The following example expression checks whether the URL in an HTTP packet contains the string `*.jpeg` (where `*` is a wildcard) and returns a Boolean TRUE or FALSE to indicate the result. The regular expression is enclosed within a pair of slash marks (/), which act as delimiters.

```
http.req.url.regex_match(re/.<asterisk>\.jpeg/)
```

Regular expression operators can be combined to define or refine the scope of a search. For example, `<text>.AFTER_REGEX(reregex_pattern1).BEFORE_REGEX(reregex_pattern2)` specifies that the target for string matching is the text between the patterns regex_pattern1 and regex_pattern2. You can use a text operator on the scope that is defined by the regular expression

© 1997–2026 Citrix Systems, Inc. All rights reserved.

operators. For example, you can use the CONTAINS(`"<string>"`) operator to check whether the defined scope contains the string abc:

```
<text>.AFTER_REGEX(re/regex_pattern1).BEFORE_REGEX(re/
regex_pattern2/).CONTAINS("abc")
```

NOTE

The process of evaluating a regular expression inherently takes more time than that for an operator such as CONTAINS (`"<string>"`) or EQ(`"<string>"`), which work with simple string arguments. You should use regular expressions only if your requirement is beyond the scope of other operators.

Basic characteristics of regular expressions

Following are notable characteristics of regular expressions as defined on the NetScaler appliance:

- A regular expression always begins with the string “re” followed by a pair of delimiting characters (called delimiters) that enclose the regular expression that you want to use.

For example, re#\<regex_pattern\># uses the number sign (#) as a delimiter.

- A regular expression cannot exceed 1499 characters.
- Digit matching can be done by using the string \d (a backslash followed by d).
- White space can be represented by using \s (a backslash followed by s).
- A regular expression can contain white spaces.

Following are the differences between the NetScaler syntax and the PCRE syntax:

- The NetScaler does not allow back references in regular expressions.
- You should not use recursive regular expressions.
- The dot meta-character also matches the newline character.
- Unicode is not supported.
- The operation SET_TEXT_MODE(IGNORECASE) overrides the (?i) internal option in the regular expression.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Operations for regular expressions

The following table describes the operators that work with regular expressions. The operation performed by a regular expression operator in a given Advanced policy expression depends on whether the expression prefix identifies text or HTTP headers. Operations that evaluate headers override any text-based operations for all instances of the specified header type. When you use an operator, replace \<text\> with the Advanced policy expression prefix that you want to configure for identifying text.

REGULAR EXPRESSION OPERATION	DESCRIPTION
<text>.BEFORE_REGEX(<regular expression>)	Selects the text that precedes the string that matches the <regular expression> argument. If the regular expression does not match any data in the target, the expression returns a text object of length 0. The following expression selects the string "text" from "text/plain". http.res.header("content-type").before_regex(re#/#)
<text>.AFTER_REGEX(<regular expression>)	Selects the text that follows the string that matches the <regular expression> argument. If the regular expression does not match any text in the target, the expression returns a text object of length 0. The following expression extracts "Example" from "myExample": http.req.header("etag").after_regex(re/my/)
<text>.REGEX_SELECT(<regular expression>)	Selects a string that matches the <regular expression> argument. If the regular expression does not match the target, a text object of length 0 is returned. The following example extracts the string "NS-CACHE-9.0: 90" from a Via header: http.req.header("via").regex_select(re!NS-CACHE-\d.\d:\s*\d{1,3}!)
<text>.REGEX_MATCH(<regular expression>)	Returns TRUE if the target matches a <regular expression> argument of up to 1499 characters. The regular expression must be of the following format: re<delimiter>regular expression< delimiter> Both delimiters must be the same. Additionally, the regular expression

© 1997–2026 Citrix Systems, Inc. All rights reserved.

REGULAR EXPRESSION OPERATION	DESCRIPTION
	must conform to the Perl-compatible (PCRE) regular expression library syntax. For more information, go to `<http://www.pcre.org/pcre.txt>`. In particular, see the pcrepattern man page. However, note the following: Back-references are not allowed. Recursive regular expressions are not recommended. The dot metacharacter also matches the newline character. The Unicode character set is not supported. SET_TEXT_MODE(IGNORECASE) overrides the (?i) internal option specified in the regular expression. The following are examples: http.req.hostname.regex_match(re/[[:alpha:]]+(abc){2,3}/) and http.req.url.set_text_mode(urlencoded).regex_match(re#(a*b+c*)#) The following example matches ab and aB: http.req.url.regex_match(re/a(?i)b/) The following example matches ab, aB, Ab and AB: http.req.url.set_text_mode(ignorecase).regex_match(re/ab/) The following example performs a case-insensitive, multiline match in which the dot meta-character also matches a newline character: http.req.body.regex_match(re/(?ixm)(\^ab (.*) cd$) /)

Summary examples of Advanced policy expressions and policies

The following table provides examples of Advanced policy expressions that you can use as the basis for your own Advanced policy expressions.

Table 1. Examples of Advanced policy Expressions

EXPRESSION TYPE	SAMPLE EXPRESSIONS
Look at the method used in the HTTP request.	`http.req.method.eq(post)` `http.req.method.eq(get)`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

EXPRESSION TYPE	SAMPLE EXPRESSIONS
Check the Cache-Control or Pragma header value in an HTTP request (req) or response (res).	`http.req.header("Cache-Control").contains("no-store")` `http.req.header("Cache-Control").contains("no-cache")` `http.req.header("Pragma").contains("no-cache")` `http.res.header("Cache-Control").contains("private")` `http.res.header("Cache-Control").contains("public")` `http.res.header("Cache-Control").contains("must-revalidate")http.res.header("Cache-Control").contains ("proxy-revalidate")` `http.res.header("Cache-Control").contains("max-age")`
Check for the presence of a header in a request (req) or response (res).	`http.req.header("myHeader").exists` `http.res.header("myHeader").exists`
Look for a particular file type in an HTTP request based on the file extension.	`http.req.url.contains(".html")` `http.req.url.contains(".cgi")http.req.url.contains(".asp")` `http.req.url.contains(".exe")` `http.req.url.contains(".cfm")` `http.req.url.contains(".ex")` `http.req.url.contains(".shtml")` `http.req.url.contains(".htx")` `http.req.url.contains("/cgi-bin/")` `http.req.url.contains("/exec/")` `http.req.url.contains("/bin/")`
Look for anything that is other than a particular file type in an HTTP request.	`http.req.url.contains(".gif").not;` `http.req.url.contains(".jpeg").not`
Check the type of file that is being sent in an HTTP response based on the Content-Type header.	`http.res.header("Content-Type").contains("text")` `http.res.header("Content-Type").contains "application/msword")` `http.res.header("Content-Type").contains("vnd.ms-excel")`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

EXPRESSION TYPE	SAMPLE EXPRESSIONS
	`http.res.header("Content-Type").contains("application/vnd.ms-powerpoint");` `http.res.header("Content-Type").contains("text/css");` `http.res.header("Content-Type").contains("text/xml");` `http.res.header("Content-Type").contains("image/")`
Check whether this response contains an expiration header.	`http.res.header("Expires").exists`
Check for a Set-Cookie header in a response.	`http.res.header("Set-Cookie").exists`
Check the agent that sent the response.	`http.res.header("User-Agent").contains("Mozilla/4.7")` `http.res.header("User-Agent").contains("MSIE")`
Check if the first 1024 bytes of the body of a request starts with the string "some text".	`http.req.body(1024).contains("some text")`

The following table shows examples of policy configurations and bindings for commonly used functions.

Table 2. Examples of Advanced policy Expressions and Policies

PURPOSE	EXAMPLE	
Use the rewrite feature to replace occurrences of `http:// with https://` in the body of an HTTP response.	`add rewrite action httpRewriteAction replace_all http.res.body(50000) "\"https://\"" -search http:// add rewrite policy demo_rep34312 "http.res.body(50000).contains(\"http://\")" httpRewriteAction`	

© 1997–2026 Citrix Systems, Inc. All rights reserved.

PURPOSE	EXAMPLE	
Replace all occurrences of "abcd" with "1234" in the first 1000 bytes of the HTTP body.	`add rewrite action abcdTo1234Action replace_all "http.req.body(1000)" "\"1234\"" -search abcd add rewrite policy abcdTo1234Policy "http.req.body(1000).contains(\"abcd\")" abcdTo1234Action bind rewrite global abcdTo1234Policy 100 END -type REQ_OVERRIDE`	
Downgrade the HTTP version to 1.0 to prevent the server from chunking HTTP responses.	`add rewrite action downgradeTo1.0Action replace http.req.version.minor "\"0\"" add rewrite policy downgradeTo1.0Policy "http.req.version.minor.eq(1)" downgradeTo1.0Action bind lb vserver myLBVserver -policyName downgradeTo1.0Policy -priority 100 -gotoPriorityExpression NEXT -type REQUEST`	
Remove references to the HTTP or HTTPS protocol in all responses, so that if the user's connection is HTTP, the link is opened by using HTTP, and if the user's connection is HTTPS, the link is opened by using HTTPS.	`add rewrite action remove_http_https replace_all "http.res.body(1000000).set_text_mode(ignorecase)" ""//"" -search "re~https?://	HTTPS?://~" add rewrite policy remove_http_https true remove_http_https bind lb vserver test_vsr -policyName remove_http_https -priority 20 -gotoPriorityExpression NEXT -type RESPONSE`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

PURPOSE	EXAMPLE	
Rewrite instances of http: to https: in all URLs.	`add responder action httpToHttpsAction redirect "\"https://\" + http.req.hostname + http.req.url" add responder policy httpToHttpsPolicy "!CLIENT.SSL.IS_SSL" httpToHttpsAction bind responder global httpToHttpsPolicy 1 END -type OVERRIDE`	
Modify a URL to redirect from URL A to URL B. In this example, "file5.html" is appended to the path.	`add responder action appendFile5Action redirect \"http://\" + http.req.hostname + http.req.url + \"/file5.html\"" add responder policy appendFile5Policy "http.req.url.eq(\"/testsite\")" appendFile5Action bind responder global appendFile5Policy 1 END -type OVERRIDE`	
Redirect an external URL to an internal URL.	`add rewrite action act_external_to_internal REPLACE 'http.req.hostname.server' '"www.my.host.com"' add rewrite policy pol_external_to_internal 'http.req.hostname.server.eq("www.external.host.com")' act_external_to_internal bind rewrite global`	

© 1997–2026 Citrix Systems, Inc. All rights reserved.

PURPOSE	EXAMPLE	
	`pol_external_to_internal 100 END -type REQ_OVERRIDE`	
Redirect requests to www.example.com that have a query string to www.Webn.example.com. The value n is derived from a server parameter in the query string, for example, server=5.	`add rewrite action act_redirect_query REPLACE q#http.req.header("Host").before_str(".example.com")' '"Web" + http.req.url.query.value("server")# add rewrite policy pol_redirect_query q#http.req.header("Host").eq("www.example.com") && http.req.url.contains("?")' act_redirect_query#`	
Limit the number of requests per second from a URL.	`add ns limitSelector ip_limit_selector http.req.url "client.ip.src" add ns limitIdentifier ip_limit_identifier -threshold 4 -timeSlice 3600 -mode request_rate -limitType smooth -selectorName ip_limit_selector add responder action my_Web_site_redirect_action redirect "\"http://www.mycompany.com/\"" add responder policy ip_limit_responder_policy "http.req.url.contains(\"myasp.asp\") &&`	

© 1997–2026 Citrix Systems, Inc. All rights reserved.

PURPOSE	EXAMPLE	
	`sys.check_limit (\"ip_limit_identifier\" )" my_Web_site_redirect_action bind responder global ip_limit_responder_policy 100 END -type default`	
Check the client IP address but pass the request without modifying the request.	`add rewrite policy check_client_ip_policy 'HTTP.REQ.HEADER ("x-forwarded-for").EXISTS HTTP.REQ.HEADER ("client-ip").EXISTS' NOREWRITE bind rewrite global check_client_ip_policy 100 END`	
Remove old headers from a request and insert an NS-Client header.	`add rewrite action del_x_forwarded_for delete_http_header x-forwarded-for add rewrite action del_client_ip delete_http_header client-ip add rewrite policy check_x_forwarded_for_policy 'HTTP.REQ.HEADER("x-forwarded-for").EXISTS' del_x_forwarded_for add rewrite policy check_client_ip_policy 'HTTP.REQ.HEADER("client-ip").EXISTS' del_client_ip add rewrite action`	

© 1997–2026 Citrix Systems, Inc. All rights reserved.

PURPOSE	EXAMPLE	
	`insert_ns_client_header insert_http_header NS-Client 'CLIENT.IP.SRC' add rewrite policy insert_ns_client_policy 'HTTP.REQ.HEADER("x-forwarded-for").EXISTS HTTP.REQ.HEADER("client-ip").EXISTS' insert_ns_client_header bind rewrite global check_x_forwarded_for_policy 100 200 bind rewrite global check_client_ip_policy 200 300 bind rewrite global insert_ns_client_policy 300 END`	
Remove old headers from a request, insert an NS-Client header, and then modify the "insert header" action so that the value of the inserted header contains the client IP values from the old headers and the NetScaler appliance's connection IP address. Note that this example repeats the previous example, with the exception of the final set rewrite action.	`add rewrite action del_x_forwarded_for delete_http_header x-forwarded-for add rewrite action del_client_ip delete_http_header client-ip add rewrite policy check_x_forwarded_for_policy 'HTTP.REQ.HEADER("x-forwarded-for").EXISTS' del_x_forwarded_for add rewrite policy check_client_ip_policy 'HTTP.REQ.HEADER("client-ip").EXISTS' del_client_ip add rewrite action insert_ns_client_header insert_http_header NS-Client 'CLIENT.IP.SRC' add rewrite policy insert_ns_client_policy 'HTTP.REQ.HEADER("x-	

© 1997–2026 Citrix Systems, Inc. All rights reserved.

PURPOSE	EXAMPLE	
	forwarded-for").EXISTS HTTP.REQ.HEADER("client-ip").EXISTS' insert_ns_client_header bind rewrite global check_x_forwarded_for_policy 100 200 bind rewrite global check_client_ip_policy 200 300 bind rewrite global insert_ns_client_policy 300 END set rewrite action insert_ns_client_header -stringBuilderExpr 'HTTP.REQ.HEADER("x-forwarded-for").VALUE(0) + " " + HTTP.REQ.HEADER("client-ip").VALUE(0) + " " + CLIENT.IP.SRC'	

References

For complete syntax details of Advanced Policy Expressions, see the NetScaler Advanced Policy Expression.

Tutorial examples of Advanced policy policies for rewrite

With the rewrite feature, you can modify any part of an HTTP header, and, for responses, you can modify the HTTP body. You can use this feature to accomplish several useful tasks, such as removing unnecessary HTTP headers, masking internal URLs, redirecting webpages, and redirecting queries or keywords.

In the following examples, you first create a rewrite action and a rewrite policy. Then you bind the policy globally.

This document includes the following details:

- Redirecting an External URL to an Internal URL
- Redirecting a Query
- Rewriting HTTP to HTTPS

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Removing Unwanted Headers
- Reducing Web Server Redirects
- Masking the Server Header
- Converting plain text to URL encoded string and the opposite way

For more information about the commands and syntax descriptions, see Rewrite Command Reference page.

Redirecting an external URL to an internal URL

This example describes how to create a rewrite action and rewrite policy that redirects an external URL to an internal URL. You create an action, called act_external_to_internal, that performs the rewrite. Then you create a policy called pol_external_to_internal.

To redirect an external URL to an internal URL by using the CLI

- To create the rewrite action, at the command prompt, type:

```
add rewrite action act_external_to_internal REPLACE “http.req.hostname.server” “\”host_name_of_internal_Web_server\””
```

- To create the rewrite policy, at the NetScaler command prompt, type:

```
add rewrite policy pol_external_to_internal "http.req.hostname.server.eq(\"host_name_of_external_Web_server\")" act_external_to_internal
```

- Bind the policy globally.

To redirect an external URL to an internal URL by using the configuration utility

1. Navigate to **AppExpert** > **Rewrite** > **Actions**.
2. In the details pane, click **Add**.
3. In the **Create Rewrite Action** dialog box, enter the name act_external_to_internal.
4. To replace the HTTP server host name with the internal server name, choose **Replace** from the Type list box.
5. In the header name field, type **Host**.
6. In the string expression for a replacement text field, type the internal host name of your Web server.
7. Click **Create** and then click **Close**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

8. In the navigation pane, click **Policies**.
9. In the details pane, click **Add**.
10. In the Name field, type pol_external_to_internal. This policy detects connections to the Web server.
11. In the **Action** drop-down menu, choose the action act_external_to_internal.
12. In the Expression editor, construct the following expression:

```
HTTP.REQ.HOSTNAME.SERVER.EQ("www.example.com")
```

1. Bind your new policy globally.

Redirecting a query

This example describes how to create a rewrite action and rewrite policy that redirects a query to the proper URL. The example assumes that the request contains a Host header set to `**www.example.com**` and a GET method with the **string /query.cgi?server=5**. The redirect extracts the domain name from the host header and the number from the query string, and redirects the user's query to the server **Web5.example.com**, where the rest of the user's query is processed.

NOTE:

Although the following commands appear on multiple lines, you must enter them on a single line without line breaks.

To redirect a query to the appropriate URL using the CLI

- To create a rewrite action named act_redirect_query that replaces the HTTP server host name with the internal server name, type:

```
add rewrite action act_redirect_query REPLACE
http.req.header("Host").before_str(".example.com") '"Web" +
http.req.url.query.value("server")'
```

- To create a rewrite policy named pol_redirect_query, type the following commands at the NetScaler command prompt. This policy detects connections, to the Web server, that contain a query string. Do not apply this policy to connections that do not contain a query string:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add rewrite policy pol_redirect_query
'http.req.header("Host").eq(www.example.com) && http.req.url.contains("?")'
act_redirect_query
```

- Bind your new policy globally.

Because this rewrite policy is highly specific and must be run before any other rewrite policies, it is advisable to assign it a high priority. If you assign it a priority of 1, it is evaluated first.

Rewriting HTTP to HTTPS

This example describes how to rewrite Web server responses to find all URLs that begin with the string “HTTP” and replace that string with “https.” You can use it to avoid having to update webpages after moving a server from HTTP to HTTPS.

To redirect HTTP URLs to HTTPS by using the CLI

- To create a rewrite action named act_replace_http_with_https that replaces all instances of the string “HTTP” with the string “https,” enter the following command:

```
add rewrite action act_replace_http_with_https replace_all 'http.res.body(100)'
'"https"' -search text("http")
```

- To create a rewrite policy named pol_replace_http_with_https that detects connections to the Web server, enter the following command:

```
add rewrite policy pol_replace_http_with_https TRUE act_replace_http_with_https
NOREWRITE
```

- Bind your new policy globally.

To troubleshoot this rewrite operation, see "Case Study: Rewrite Policy for Converting HTTP Links to HTTPS not Working."

Removing Unwanted Headers

This example explains how to use a Rewrite policy to remove unwanted headers. Specifically, the example shows how to remove the following headers:

- **Accept Encoding header.** Removing the Accept Encoding header from HTTP responses prevents compression of the response.
- **Content Location header.** Removing the Content Location header from HTTP responses prevents your server from providing a hacker with information that might allow a security breach.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To delete headers from HTTP responses, you create a rewrite action and a rewrite policy, and you bind the policy globally.

To create the appropriate Rewrite action by using the CLI

At the command prompt, type one of the following commands to either remove the Accept Encoding header and prevent response compression or remove the Content Location header:

- `add rewrite action "act_remove-ae" delete_http_header "Accept-Encoding"`
- `add rewrite action "act_remove-cl" delete_http_header "Content-Location"`

To create the appropriate Rewrite policy by using the CLI

At the command prompt, type one of the following commands to remove either the Accept Encoding header or the Content Location header:

- `add rewrite policy "pol_remove-ae" true "act_remove-ae"`
- `add rewrite policy "pol_remove-cl" true "act_remove-cl"`

To bind the policy globally by using the CLI

At the command prompt, type one of the following commands, as appropriate, to globally bind the policy that you have created:

- `bind rewrite global pol_remove_ae 100`
- `bind rewrite global pol_remove_cl 200`

Reducing Web Server Redirects

This example explains how to use a Rewrite policy to modify connections to your home page and other URLs that end with a forward slash (/) to the default index page for your server, preventing redirects and reducing load on your server.

To modify directory-level HTTP requests to include the default home page by using the CLI

- To create a Rewrite action named action-default-homepage that modifies URLs that end in a forward slash to include the default home page index.html, type:

```
add rewrite action "action-default-homepage" replace http.req.url.path "\"/index.html\""
```

- To create a Rewrite policy named policy-default-homepage that detects connections to your home page and applies your new action, type:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add rewrite policy "policy-default-homepage" q&num;http.req.url.path.EQ("/")
"action-default-homepage"&num;
```

- Globally bind your new policy to put it into effect.

Masking the Server Header

This example explains how to use a Rewrite policy to mask the information in the Server header in HTTP responses from your Web server. That header contains information that hackers can use to compromise your website. While masking the header will not prevent a skilled hacker from finding out information about your server, it makes hacking your Web server more difficult and encourage hackers to choose less well protected targets.

To mask the Server header in responses from the CLI

1. To create a Rewrite action named act_mask-server that replaces the contents of the Server header with an uninformative string, type:

```
add rewrite action "act_mask-server" replace "http.RES.HEADER(\"Server\")"
"\"Web Server 1.0\""
```

1. To create a Rewrite policy named pol_mask-server that detects all connections, type:

```
add rewrite policy "pol_mask-server" true "act_mask-server"
```

1. Globally bind your new policy to put it into effect.

How to convert plain text to URL encoded string and the opposite way

The following expressions convert plain text to URL encoded string and the opposite way:

1. URL_RESERVED_CHARS_SAFE (string to URL ENCODED).

Example:

```
("abc def&123").URL_RESERVED_CHARS_SAFE

Output will be

“abc%20def%26123” which is url encoded.
```

1. SET_TEXT_MODE(URLENCODED).DECODE_USING_TEXT_MODE. (URL ENCODED to string)

Example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
("abc%20def%26123").SET_TEXT_MODE(URLENCODED).DECODE_USING_TEXT_MODE

Output will be

“abc def&123”
```

Rewrite and responder policy examples

Following are some examples for rewrite and responder policies:

Example 1: To add a local Client-IP header by using the command line interface

```
add rewrite action act_ins_client insert_http_header NS-Client
'CLIENT.IP.SRC'

add rewrite policy pol_ins_client http.req.is_valid act_ins_client

bind rewrite global pol_ins_client 300 END

namem@obelix:~$ curl -v http://10.10.10.10/testsite/file5.html

* Hostname was NOT found in DNS cache

*   Trying 10.10.10.10...

* Connected to 10.10.10.10 (10.10.10.10) port 80 (#0)

> GET /testsite/file5.html HTTP/1.1

> User-Agent: curl/7.35.0

Example 4: Respond with a message which can be any expression or a text

```
add responder action act123 respondwith "\"Please reach out to
administrator\""

add responder policy pol1 "HTTP.REQ.URL.CONTAINS(\"file\")" act123

bind responder global pol1 100 END

name@obelix:~$ curl -v http://10.10.10.10/testsite/file5.html

* Hostname was NOT found in DNS cache

*   Trying 10.10.10.10..Responder Action and Policy:

>add responder action Redirect-Action redirect "\"https://xyz.abc.com/
dispatcher/SAML2AuthService?siteurl=wmav\"" -responseStatusCode 302

>add responder policy Redirect-Policy
"HTTP.REQ.HOSTNAME.CONTAINS(\"abc\")" Redirect-Action

Binding to LB Virtual Server:

>bind lb vserver Test1_SF -policyName Redirect-Policy -priority 100
-gotoPriorityExpression END -type REQUEST.

* Connected to 10.10.10.10 (10.10.10.10) port 80 (#0)

> GET /testsite/file5.html HTTP/1.1

> User-Agent: curl/7.35.0

> Host: 10.10.10.10
```

```
> Accept: */*

>

* Connection #0 to host 10.10.10.10 left intact

Please reach out to administratort_name@obelix:~$
```

Example 5: Respond with an HTML imported page

```
import responder htmlpage http://10.10.10.10)/testsite/file5.html  page112

add responder action act1 respondwithHtmlpage page1

add responder policy pol1 true act1

bind responder global pol1 100

name@obelix:~$ curl -v http://10.10.10.10)/testsite/file5.html

* Hostname was NOT found in DNS cache

*   Trying 10.10.10.10...

* Connected to 10.10.10.10 (10.10.10.10)) port 80 (#0)

> GET /testsite/file5.html HTTP/1.1

> User-Agent: curl/7.35.0

> Host: 10.102.58.140

> Accept: */*

>

< HTTP/1.1 200 OK

< Content-Length: 5
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
< Content-Type: text/html

<

* Connection #0 to host 10.10.10.10 left intact

JLEwxt_name@obelix:~$
```

Example 6: Redirect URL based on HOSTNAME using Responder Policy

```
Responder Action and Policy:

>add responder action Redirect-Action redirect "\"https://xyz.abc.com/
dispatcher/SAML2AuthService?siteurl=wmav\"" -responseStatusCode 302

>add responder policy Redirect-Policy
"HTTP.REQ.HOSTNAME.CONTAINS(\"abc\")" Redirect-Action

Binding to LB Virtual Server:

>bind lb vserver Test1_SF -policyName Redirect-Policy -priority 100
-gotoPriorityExpression END -type REQUEST
```

Configure advanced policy infrastructure

You can create advanced policies for various NetScaler features, including DNS, Rewrite, Responder, and Integrated Caching, and the clientless access function in the NetScaler Gateway. Policies control the behavior of these features.

When you create a policy, you assign it a name, a rule (an expression), feature-specific attributes, and an action that is taken when data matches the policy. After creating the policy, you determine

© 1997–2026 Citrix Systems, Inc. All rights reserved.

when it is invoked by binding it globally or to either request-time or response-time processing for a virtual server.

Policies that share the same bind point are known as a *policy bank*. For example, all policies that are bound to a virtual server constitute the policy bank for the virtual server. When binding the policy, you assign it a priority level to specify when it is invoked relative to other policies in the bank. In addition to assigning a priority level, you can configure an arbitrary evaluation order for policies in a bank by specifying Goto expressions.

In addition to policy banks that are associated with a built-in bind point or a virtual server, you can configure *policy labels*. A policy label is a policy bank that is identified by an arbitrary name. You invoke a policy label, and the policies in it, from a global or virtual-server-specific policy bank. A policy label or a virtual-server policy bank can be invoked from multiple policy banks.

For some features, you can use the policy manager to configure and bind policies.

Bind policies using advanced policy

After defining a policy, you indicate when the policy is to be activated by binding the policy to a bind point. Then specify a priority level.

Bind a policy to only one bind point. A bind point can be global. The global bind point applies to the virtual servers that is configured. Or, a bind point can be specific to a particular virtual server; either a load balancing or a content switching virtual server. Not all bind points are available for all features.

The order in which policies are evaluated determines the order in which the policies are applied. The features typically evaluate various policy banks in a particular order.

Sometimes, other features can affect the order of evaluation within a policy bank. The order of evaluation depends on the values of parameters configured in the policies. Most features apply actions associated with policies whose evaluation results in a match with the data that is being processed. The integrated caching feature is an exception.

Feature-specific differences in policy bindings

You can bind policies to built-in, global bind points (or banks), to virtual servers, or to policy labels.

However, the NetScaler features differ for the types of bindings that are available. The following table summarizes how you use policy bindings in various NetScaler features that use policies.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

FEATURE NAME	VIRTUAL SERVERS CONFIGURED IN THE FEATURE	POLICIES CONFIGURED IN THE FEATURE	BIND POINTS CONFIGURED FOR THE POLICIES	USE OF POLICIES IN THE FEATURE
DNS	none	DNS policies	Global	To determine how to perform DNS resolution for requests.
Content Switching (Note: This feature can support Advanced policies, but not both.)	Content Switching (CS)	Content Switching policies	Content switching or cache redirection virtual server; Policy label	To determine what server or group of servers is responsible for serving responses, based on characteristics of an incoming request. Request characteristics include device type, language, cookies, HTTP method, content type, and associated cache server.
Integrated Caching	none	Caching policies	Global override, Global default, Policy label, load balancing, content switching, or SSL offload virtual server	To determine whether HTTP responses can be stored in, and served from, the NetScaler appliance's integrated cache.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

FEATURE NAME	VIRTUAL SERVERS CONFIGURED IN THE FEATURE	POLICIES CONFIGURED IN THE FEATURE	BIND POINTS CONFIGURED FOR THE POLICIES	USE OF POLICIES IN THE FEATURE
Responder	none	Responder policies	Global override, Global default, Policy label, load balancing, content switching, or SSL offload virtual server	To configure the behavior of the Responder function.
Rewrite	none	Rewrite policies	Global override, Global default, Policy label, load balancing, content switching, or SSL offload virtual server	To identify HTTP data that you want to modify before serving. The policies provide rules for modifying the data. For example, you can modify HTTP data to redirect a request to a selected server. This modification is based on the address of the incoming request. Or, to mask server information in a response for security purposes.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

FEATURE NAME	VIRTUAL SERVERS CONFIGURED IN THE FEATURE	POLICIES CONFIGURED IN THE FEATURE	BIND POINTS CONFIGURED FOR THE POLICIES	USE OF POLICIES IN THE FEATURE
URL Transform function in the Rewrite feature	none	Transformation policies	Global override, Global default, Policy label	To identify URLs in HTTP transactions and text files in evaluating whether a URL must be altered.
NetScaler Gateway (clientless VPN functions only)	VPN server	Clientless Access policies	VPN Global, VPN server	To determine how the NetScaler Gateway does: authentication, authorization, auditing, and other functions, and to define rewrite rules for general Web access using the NetScaler Gateway.

Bind points and order of evaluation

For a policy to take effect, you must confirm that the policy is activated at some point during processing. To do so, you associate the policy with a bind point. The collection of policies that is bound to a bind point is known as a policy bank.

Following are the bind points that the NetScaler evaluates, listed in the typical order of evaluation within a policy bank

1. **Request-time override.** When a request flows through a feature, the NetScaler first evaluates request-time override policies for the feature.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. **Request-time Load Balancing virtual server.** If the policy evaluation is incomplete after the request-time override policy evaluation, the NetScaler processes request-time policies for load balancing virtual servers.
3. **Request-time Content Switching virtual server.** If policy evaluation is incomplete after the request-time policies for load balancing virtual servers evaluation, the NetScaler processes request-time policies for content switching virtual servers.
4. **Request-time default.** If policy evaluation cannot be completed after all request-time, virtual server-specific policies have been evaluated, the NetScaler processes request-time Advanced policies.
5. **Response-time override.** At response time, the NetScaler starts with policies that are bound to the response-time override bind point.
6. **Response-time Load Balancing virtual server.** If policy evaluation cannot be completed after all response-time override policies have been evaluated, the NetScaler process the response-time policies for load balancing virtual servers.
7. **Response-time Content Switching virtual server.** If a policy evaluation is incomplete after the policy evaluation for load balancing virtual servers, the NetScaler process the response-time policies for content switching virtual servers.
8. **Response-time default.** If policy evaluation cannot be completed after all response-time, virtual-server-specific policies have been evaluated, the NetScaler processes response-time Advanced policies.

Policy evaluation across features

If a policy is bound to a content switching virtual server. In-addition to the policy evaluation within a feature. The policies are evaluated before other policies.

Binding a policy to a content switching vserver produces a different result in NetScaler versions 9.0.x and later than in 8.x versions. In NetScaler 9.0 and later versions, evaluation occurs as follows:

- Content switching policies are evaluated before other policies. If a content switching policy evaluates to TRUE, the target load balancing vserver is selected.
- If all content switching policies evaluate to FALSE, the default load balancing vserver under the content switching VIP is selected.

After a target load balancing vserver is selected by the content switching process, policies are evaluated in the following order:

1. Policies that are bound to the global override bind point.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. Policies that are bound to the default load balancing vserver.
3. Policies that are bound to the target content switching vserver.
4. Policies that are bound to the global default bind point.

To be sure that the policies are evaluated in the intended order, follow these guidelines:

- Make sure that the default load balancing vserver is not directly reachable from the outside; for example, the vserver IP address can be 0.0.0.0.
- To prevent exposing internal data on the load balancing default vserver, configure a policy to respond with a “503 Service Unavailable” status and bind it to the default load balancing vserver.

Entries in a policy bank

Each entry in a policy bank has, at minimum, a policy and a priority level. You can also configure entries that change the priority-based evaluation order, and you can configure entries that invoke external policy banks.

The following table summarizes each entry in a policy bank.

POLICY NAME	PRIORITY	GOTO EXPRESSION	INVOCATION TYPE	POLICY BANK TO BE INVOKED
The policy name, or a “dummy” policy named NOPOLICY. The NOPOLICY entry controls evaluation flow without processing a rule.	An integer.	Optional. Identifies the next policy in the bank to evaluate, or ends any further evaluation	Optional. Indicates that an external policy bank will be invoked. This field restricts the choices to a global policy label or a virtual server.	Optional. Used with Invocation Type. This is the label for a policy bank or a virtual server name. The NetScaler returns to the current bank after processing the external bank.

If the policy evaluates to TRUE, the NetScaler stores the action that is associated with the policy. If the policy evaluates to FALSE, the NetScaler evaluates the next policy. If the policy is neither TRUE nor FALSE, the NetScaler uses the associated Undef (undefined) action.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Evaluation order within a policy bank

Within a policy bank, the evaluation order depends on the following items:

- **A priority.**

  The most minimal amount of information about evaluation order is a numeric priority level. The lower the number, the higher the priority.

- **A Goto expression.**

  If supplied, the Goto expression indicates the next policy to be evaluated, typically within the same policy bank.. Goto expressions can only proceed forward in a bank. To prevent looping, a policy bank configuration is not valid if a Goto statement points backwards in the bank.

- **Invocation of other policy banks.**

  Any entry can invoke an external policy bank. The NetScaler provides a built-in entity named NOPOLICY that does not have a rule. You can add a NOPOLICY entry in a policy bank when you want to invoke another policy bank, but do not want to process any other rules prior to the invocation. You can have multiple NOPOLICY entries in multiple policy banks.

Values for a Goto expression are as follows:

- **NEXT.**

  This keyword selects the policy with the next higher priority level in the current policy bank. The Policies are evaluated in priority order from lower numbered priority to higher numbered priority.

- **An integer.**

  If you supply an integer, it must match the priority level of another policy in the current policy bank.

- **END.**

  This keyword stops evaluation after processing the current policy, and no additional policies in this bank are processed.

- **Blank.**

  If the Goto expression is empty, it is the same as specifying END.

- **A numeric expression.**

  This is an advanced policy expression that resolves to a priority number for another policy in the current bank.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **USE_INVOCATION_RESULT.**

  This phrase can be used only if you are invoking an external policy bank. Entering this phrase causes the NetScaler to perform one of the following actions:

  - If the final Goto in the invoked policy bank has a value of END or is empty, the invocation result is END, and evaluation stops.
  - If the final Goto expression in the invoked policy bank is anything other than END, the NetScaler performs a NEXT.

The following table illustrates a policy bank that uses Goto statements and policy bank invocations.

POLICY NAME	PRIORITY	GOTO	INVOCATION	POLICY BANK TO BE INVOKED
ClientCertificate Policy (rule: does the request contain a client certificate?)	100	300	None	None
SubnetPolicy (rule: is the client from a private subnet?)	200	NEXT	None	None
NOPOLICY	300	USE INVOCATION RESULT	Request vserver	My_Request_VServer
NOPOLICY	350	USE INVOCATION RESULT	Policy Label	My_Policy_Label
WorkingHoursPolicy (rule: is it working hours?)	400	END	None	None

Table 3. Example of a Policy Bank That Uses Gotos and External Bank Invocations

© 1997–2026 Citrix Systems, Inc. All rights reserved.

How policy evaluation ends

Evaluation of a policy bank ends when one of the following takes place:

- A policy evaluates to TRUE and its Goto statement value is END.

  No further policies or policy banks in this feature are evaluated.

- An external policy bank is invoked, its evaluation returns an END, and the Goto statement uses a value of USE_INVOCATION_RESULT or END.

  Evaluation continues with the next policy bank for this feature. For example, if the current bank is the request-time override bank, the NetScaler next evaluates request-time policy banks for the virtual servers.

- The NetScaler has walked through all the policy banks in this feature, but has not encountered an END.

  If this is the last entry to be evaluated in this policy bank, the NetScaler proceeds to the next feature.

How features use actions after policy evaluation

After evaluating all relevant policies for a particular data point (for example, an HTTP request), the NetScaler stores all the actions that are associated with any policy that matched the data.

For most features, all the actions from matching policies are applied to a traffic packet as it leaves the NetScaler. The Integrated Caching feature only applies one action: CACHE or NOCACHE. This action is associated with the policy with the lowest priority value in the “highest priority” policy bank (for example, request-time override policies are applied before virtual server-specific policies).

Bind a policy globally

The following binding procedures are typical. However, refer to the documentation for the feature of interest to you for complete instructions.

BIND AN INTEGRATED CACHING POLICY GLOBALLY BY USING THE CLI

At the command prompt, type the following commands to bind an Integrated Caching policy and verify the configuration:

```
-  bind cache global <policy> -priority <positiveInteger> [-type
REQ_OVERRIDE | REQ_DEFAULT | RES_OVERRIDE | RES_DEFAULT]
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
-  show cache global
```

Example:

```
> bind cache global _nonPostReq -priority 100 -type req_default

     Done

> show cache global

    1)      Global bindpoint: REQ_DEFAULT

            Number of bound policies: 2

    2)      Global bindpoint: RES_DEFAULT

            Number of bound policies: 1

Done
```

The type argument is optional to maintain backward compatibility. If you omit the type, the policy is bound to REQ_DEFAULT or RES_DEFAULT, depending on whether the policy rule is a response-time or a request-time expression.

BIND A REWRITE POLICY GLOBALLY BY USING THE CLI

At the command prompt, type the following commands to bind a Rewrite policy and verify the configuration:

```
-  bind rewrite global <policyName> <priority> [-type REQ_OVERRIDE |
REQ_DEFAULT | RES_OVERRIDE | RES_DEFAULT]

-  show rewrite global
```

Example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
bind rewrite global pol_remove-pdf 100

Done

> show rewrite global

    1)      Global bindpoint: REQ_DEFAULT

            Number of bound policies: 1

    2)      Global bindpoint: REQ_OVERRIDE

            Number of bound policies: 1

Done
```

The type argument is optional for globally bound policies, to maintain backward compatibility. If you omit the type, the policy is bound to REQ_DEFAULT or RES_DEFAULT, depending on whether the policy rule is a response-time or a request-time expression.

BIND A COMPRESSION POLICY GLOBALLY BY USING THE CLI

At the command prompt, type the following commands to bind a compression policy and verify the configuration:

```
-  bind cmp global <policyName> -priority <positiveInteger> [-type
REQ_OVERRIDE | REQ_DEFAULT | RES_OVERRIDE | RES_DEFAULT]

-  show cmp global
```

Example:

```
> bind cmp global cmp_pol_1 -priority 100

Done
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
> show cmp policy cmp_pol_1

            Name: cmp_pol_1

            Rule: HTTP.REQ.URL.SUFFIX.EQ("BMP")

            Response Action: COMPRESS

            Hits: 0

            Policy is bound to following entities

            1) GLOBAL REQ_DEFAULT

            Priority: 100

            GotoPriorityExpression: END

Done
```

BIND A RESPONDER POLICY GLOBALLY BY USING THE CLI

At the command prompt, type the following commands to bind a Responder policy and verify the configuration:

```
-  bind responder global <policyName> <priority> [-type OVERRIDE |
DEFAULT ]

-  show responder global
```

Example:

```
bind responder global pol404Error1 200

Done

> show responder global
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
    1)      Global bindpoint: REQ_DEFAULT

            Number of bound policies: 1

Done
```

BIND A DNS POLICY GLOBALLY BY USING THE CLI

At the command prompt, type the following commands to bind a DNS policy and verify the configuration:

```
-  bind dns global <policyName> <priority>

-  show dns global
```

Example:

```
> bind dns global pol_ddos_drop1 150

Done

> show dns global

    Policy name : pol_ddos_drop

            Priority : 100

            Goto expression : END

    Policy name : pol_ddos_drop1

            Priority : 150

Done
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

BIND AN INTEGRATED CACHING, RESPONDER, REWRITE, OR COMPRESSION POLICY GLOBALLY BY USING THE GUI

1. In the navigation pane, click the name of the feature for which you want to bind the policy.
2. In the details pane, click \<Feature Name\> policy manager.
3. In the Policy Manager dialog box, select the bind point to which you want to bind the policy (for example, for Integrated Caching, Rewrite, or Compression, you could select Request and Default Global). The Responder does not differentiate between request-time and response-time policies.
4. Click Insert Policy and, from the Policy Name pop-up menu, select the policy name. A priority is assigned automatically to the policy, but you can click the cell in the Priority column and drag it anywhere within the dialog box if you want the policy to be evaluated after other policies in this bank. The priority is automatically reset. Note that priority values within a policy bank must be unique.
5. Click Apply Changes.
6. Click Close. A message in the status bar indicates that the policy is bound successfully.

BIND A DNS POLICY GLOBALLY BY USING THE GUI

1. Navigate to Traffic Management > DNS > Policies.
2. In the details pane, click Global Bindings.
3. In the global bindings dialog box, click Insert Policy, and select the policy that you want to bind globally.
4. Click in the Priority field and enter the priority level.
5. Click OK. A message in the status bar indicates that the policy is bound successfully.

Bind a policy to a virtual server

A globally bound policy applies to all load balancing and content switching virtual servers.

Note that when binding a policy to a virtual server, you must identify it as a request-time or a response-time policy.

BIND A POLICY TO A LOAD BALANCING OR CONTENT SWITCHING VIRTUAL SERVER BY USING THE CLI

At the command prompt, type the following commands to bind a policy to a load balancing or content switching virtual server and verify the configuration:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
-  bind lb|cs vserver <virtualServerName> -policyName <policyName>
-priority <positiveInteger> -type REQUEST|RESPONSE

-  show lb vserver <name>
```

Example:

```
> bind lb vserver lbvip -policyName ns_cmp_msapp -priority 50

Done

> show lb vserver lbvip

            lbvip (8.7.6.6:80) - HTTP       Type: ADDRESS

            State: DOWN

            Last state change was at Wed Jul 15 05:54:24 2009 (+226 ms)

            Time since last state change: 28 days, 01:57:26.350

            Effective State: DOWN

            Client Idle Timeout: 180 sec

            Down state flush: ENABLED

            Disable Primary Vserver On Down : DISABLED

            Port Rewrite : DISABLED

            No. of Bound Services :  0 (Total)       0 (Active)

            Configured Method: LEASTCONNECTION

            Mode: IP

            Persistence: NONE

            Vserver IP and Port insertion: OFF
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
            Push: DISABLED  Push VServer:

            Push Multi Clients: NO

            Push Label Rule: none

    1)      Policy : ns_cmp_msapp Priority:50

    2)      Policy : cf-pol Priority:1      Inherited

Done
```

BIND A POLICY TO AN SSL OFFLOAD VIRTUAL SERVER BY USING THE CLI

At the command prompt, type the following commands to bind a policy to an SSL offload virtual server and verify the configuration:

`bind ssl vserver <vServerName>@ -policyName <policyName> -priority <positiveInteger>`

BIND A POLICY TO A VIRTUAL SERVER BY USING THE GUI

1. In the navigation pane, expand Traffic Management > Load Balancing, Traffic Management > Content Switching, Traffic Management > SSL Offload, Security > AAA- Application Traffic, or NetScaler Gateway, and then click Virtual Servers.
2. In the details pane, double-click the virtual server to which you want to bind the policy, and then click Open.
3. On the Policies tab, click the icon for the type of policy that you want to bind (the choices are feature-specific), and then click the name of the policy. Note that for some features, you can bind both policies to the virtual server.
4. If you are binding a policy to a Content Switching virtual server, in the Target field select a load balancing virtual server to which traffic that matches the policy is sent.
5. Click OK. A message in the status bar indicates that the policy is bound successfully.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Rate limiting

The rate limiting feature enables you to define the maximum load for a given network entity or virtual entity on the NetScaler appliance. The feature enables you to configure the appliance to monitor the rate of traffic associated with the entity and take preventive action, in real time, based on the traffic rate. This feature is particularly useful when the network is under attack from a hostile client that is sending the appliance a flood of requests. You can mitigate the risks that affect the availability of resources to clients, and you can improve the reliability of the network and the resources that the appliance manages.

You can monitor and control the rate of traffic that is associated with virtual and user-defined entities, including virtual servers, URLs, domains, and combinations of URLs and domains. You can throttle the rate of traffic if it is too high, base information caching on the traffic rate, and redirect traffic to a given load balancing virtual server if the traffic rate exceeds a predefined limit. You can apply rate-based monitoring to HTTP, TCP, and DNS requests.

To monitor the rate of traffic for a given scenario, you configure a *rate limit identifier*. A rate limit identifier specifies numeric thresholds such as the maximum number of requests or connections (of a particular type) that are permitted in a specified time period called a *time slice*.

Optionally, you can configure filters, known as *stream selectors*, and associate them with rate limit identifiers when you configure the identifiers. After you configure the optional stream selector and the limit identifier, you must invoke the limit identifier from a Advanced policy. You can invoke identifiers from any feature in which the identifier may be useful, including rewrite, responder, DNS, and integrated caching.

You can globally enable and disable SNMP traps for rate limit identifiers. Each trap contains cumulative data for the rate limit identifier's configured data collection interval (time slice), unless you specified multiple traps to be generated per time slice. For more information about configuring SNMP traps and managers, see SNMP.

Configuring a Stream Selector

A traffic stream selector is an optional filter for identifying an entity for which you want to throttle access. The selector is applied to a request or a response and selects data points (keys) that can be analyzed by a rate stream identifier. These data points can be based on almost any characteristic of the traffic, including IP addresses, subnets, domain names, TCP or UDP identifiers, and particular strings or extensions in URLs.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

A stream selector consists of individual Advanced policy expressions called selectlets. Each selectlet is a non-compound Advanced policy expression. A traffic stream selector can contain up to five non-compound expressions called selectlets. Each selectlet is considered to be in an AND relationship with the other expressions. Following are some examples of selectlets:

```
http.req.url

http.res.body(1000>after_str("car_model").before_str("made_in")"

"client.ip.src.subnet(24)"
```

The order in which you specify parameters is significant. For example, if you configure an IP address and a domain (in that order) in one selector, and then specify the domain and the IP address (in the reverse order) in another selector, the NetScaler considers these values to be unique. This can lead to the same transaction being counted twice. Also, if multiple policies invoke the same selector, the NetScaler, again, can count the same transaction more than once.

Note: If you modify an expression in a stream selector, you may get an error if any policy that invokes it is bound to a new policy label or bind point. For example, suppose that you create a stream selector named myStreamSelector1, invoke it from myLimitID1, and invoke the identifier from a DNS policy named dnsRateLimit1. If you change the expression in myStreamSelector1, you might receive an error when binding dnsRateLimit1 to a new bind point. The workaround is to modify these expressions before creating the policies that invoke them.

To configure a traffic stream selector by using the command line interface

At the command prompt, type:

```
add stream selector <name> <rule> ...
```

Example:

```
add stream selector myStreamSel HTTP.REQ.URL CLIENT.IP.SRC
```

To configure a stream selector by using the configuration utility

Navigate to AppExpert > Rate Limiting > Selectors, click Add and specify the relevant details.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configuring a Traffic Rate Limit Identifier

A rate limit identifier checks if the amount of traffic exceeds a specified value, within a particular time interval. The identifier returns a "Boolean TRUE" if the amount of traffic exceeds a limit within a particular time interval. When you include a limit identifier in the compound dAdvanced policy expression in a policy rule, you must include a stream selector. If you do not specify, the limit identifier is applied to all requests or responses identified by the compound expressions.

NOTE:

The maximum length for storing string results (for example, HTTP.REQ.URL) is 60 characters. If the string (for example, URL) is 1000 characters long, out of which 50 characters are long enough to uniquely identify a string, you can use an expression to extract required 50 characters.

To configure a traffic limit identifier from the command line interface

At the command prompt, type:

```
add ns limitIdentifier <limitIdentifier> -threshold <positive_integer>
-timeSlice <positive_integer> -mode <mode> -limitType ( BURSTY | SMOOTH )
-selectorName <string> -maxBandwidth <positive_integer> -trapsInTimeSlice
<positive_integer>
```

Argument description

limitIdentifier. Name for a rate limit identifier. Must begin with an ASCII letter or underscore (_) character, and must consist only of ASCII alphanumeric or underscore characters. Reserved words must not be used. This is a mandatory argument. Maximum Length: 31

threshold. A maximum number of requests that are allowed in the given timeslice when requests (mode is set as REQUEST_RATE) are tracked per timeslice. When connections (mode is set as CONNECTION) are tracked, it is the total number of connections that would be let through. Default value: 1 Minimum value: 1 Maximum Value: 4294967295

timeSlice. Time interval, in milliseconds, specified in multiples of 10, during which requests are tracked to check if they cross the threshold. This argument is needed only when the mode is set to REQUEST_RATE. Default value: 1000 Minimum value: 10 Maximum Value: 4294967295

mode. Defines the type of traffic to be tracked.

1. REQUEST_RATE. Tracks requests/timeslice.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. CONNECTION. Tracks active transactions.

limitType. Defines the type of limit.

- **Smooth**: Spreads the load evenly across each time slice of the set time frame. Use for application traffic that is consistent.
- **Bursty**: Allows the requests to pass through if the load is below the set threshold. Use for application traffic that is sporadic. It is helpful if the load peaks anytime within the set time frame.

  For example, the set maximum requests are 100 and the time frame is 10 seconds. If your application receives 80 requests in the first second, these limit types behave differently. The bursty limit type allows the requests to pass through because the load is below the set threshold. However, the smooth limit type allows only 10 requests per second. So, it applies the configured action for the excess load.

selectorName. Name of the rate limit selector. If this argument is NULL, rate limiting will be applied on all traffic received by the virtual server or the NetScaler (depending on whether the limit identifier is bound to a virtual server or globally) without any **filtering. Maximum Length: 31**

maxBandwidth. Maximum bandwidth permitted, in kbps. Minimum value: 0 Maximum value: 4294967287

Example:

Configuring traffic rate limit identifier in BURSTY mode:

```
add ns limitIdentifier 100_request_limit -threshold 100 -timeSlice 1000
-mode REQUEST_RATE -limitType BURSTY -selectorName
limit_100_requests_selector -trapsInTimeSlice 30
```

Configuring traffic rate limit identifier in SMOOTH mode:

```
add ns limitidentifier limit_req -mode request_rate -limitType smooth
-timeslice 1000 -Threshold 2000 -trapsInTimeSlice 200
```

To configure a traffic limit identifier by using the configuration utility

Navigate to AppExpert > Rate Limiting > Limit Identifiers, click Add and specify the relevant details.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configuring and binding a traffic rate policy

You implement rate-based application behavior by configuring a policy in an appropriate NetScaler feature. The feature must support Advanced policies. The policy expression must contain the following expression prefix to enable the feature to analyze the traffic rate:

```
sys.check_limit(<limit_identifier>)
```

Where limit_identifier is the name of a limit identifier.

The policy expression must be a compound expression that contains at least two components:

- An expression that identifies traffic to which the rate limit identifier is applied. For example:

```
http.req.url.contains("my_aspx.aspx").
```

- An expression that identifies a rate limit identifier, for example, sys.check_limit("my_limit_identifier"). This must be the last expression in the policy expression.

To configure a rate-based policy by using the command line interface

At the command prompt, type the following command to configure a rate-based policy and verify the configuration:

```
add cache|dns|rewrite|responder policy <policy_name> -rule expression &&
sys.check_limit("<LimitIdentifierName>") [<feature-specific information>]
```

Following is a complete example of a rate-based policy rule. Note that this example assumes that you have configured the responder action, send_direct_url, that is associated with the policy. Note that the sys.check_limit parameter must be the last element of the policy expression:

```
add responder policy responder_threshold_policy
"http.req.url.contains("myindex.html") &&
sys.check_limit("my_limit_identifier")" send_direct_url
```

For information about binding a policy globally or to a virtual server, see "Binding Advanced policy Policies."

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To configure a rate-based policy by using the configuration utility

1. In the navigation pane, expand the feature in which you want to configure a policy (for example, Integrated Caching, Rewrite, or Responder), and then click Policies.
2. In the details pane, click Add. In Name, enter a unique name for the policy.
3. Under Expression, enter the policy rule, and make sure that you include the sys.check_limit parameter as the final component of the expression. For example:

   ```
   http.req.url.contains("my_aspx.aspx") &&
   sys.check_limit("my_limit_identifier")
   ```

4. Enter feature-specific information about the policy.

   For example, you may be required to associate the policy with an action or a profile. For more information, see the feature-specific documentation.
5. Click Create, and then click Close.
6. Click Save.

Viewing the Traffic Rate

If traffic through one or more virtual servers matches a rate-based policy, you can view the rate of this traffic. The rate statistics are maintained in the limit identifier that you named in the rule for the rate-based policy. If more than one policy uses the same limit identifier, you can view the traffic rate as defined by hits to all of the policies that use the particular limit identifier.

To view the traffic rate by using the command line interface

At the command prompt, type the following command to view the traffic rate:

```
show ns limitSessions <limitIdentifier>
```

Example:

```
sh limitsession myLimitSession
```

To view the traffic rate by using the configuration utility

1. Navigate to AppExpert > Rate Limiting > Limit Identifiers.
2. Select a limit identifier whose traffic rate you want to view.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. Click the Show Sessions button. If traffic through one or more virtual servers has matched a rate limiting policy that uses this limit identifier (and the hits are within the configured time slice for this identifier), the Session Details dialog box appears. Otherwise, you receive a “No session exists” message.

Testing a Rate-Based Policy

To test a rate-based policy, you can send traffic to any virtual server to which a rate-based policy is bound.

Task overview: Testing a rate-based policy

1. Configure a stream selector (optional) and a rate limit identifier (required). For example:

```
add stream selector sel_subnet Q.URL "CLIENT.IP.SRC.SUBNET(24)"

add ns limitIdentifier k_subnet -Threshold 4 -timeSlice 3600 -mode
REQUEST_RATE  -limittype smooth  -selectorName sel_subnet  -
trapsInTimeSlice 8
```

2. Configure the action that you want to associate with the policy that uses the rate limit identifier. For example:

```
add responder action resp_redirect redirect "\"http://
response_site.com/\""
```

3. Configure a policy that uses the sys.check_limit expression prefix to call the rate limit identifier. For example, the policy can apply a rate limit identifier to all requests arriving from a particular subnet, as follows:

```
add responder policy resp_subnet "SYS.CHECK_LIMIT(\"k_subnet\")"
resp_redirect
```

4. Bind the policy globally or to a virtual server. For example:

```
bind responder global resp_subnet 6 END -type DEFAULT
```

5. In a browser address bar, send a test HTTP query to a virtual server. For example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
http://<IP of a vserver>/testsite/test.txt
```

6. At the NetScaler command prompt, type:

```
show ns limitSessions \<limitIdentifier\>
```

Example

```
> sh limitsession k_subnet

1)      Time Remaining:       98 secs  Hits: 2
 Action Taken: 0

        Total Hash:    1718618  Hash String: /test.txt

        IPs gathered:

                1) 10.217.253.0

        Active Transactions: 0

 Done

>
```

7. Repeat the query and check the limit identifier statistics again to verify that the statistics are being updated correctly.

Examples of rate-based policies

This topic lists some examples of rate-based policies.

Limit the number of requests from a URL

Run the following commands to limit the number of requests per second from a URL:

```
add stream selector ipStreamSelector http.req.url "client.ip.src"

add ns limitIdentifier ipLimitIdentifier -threshold 4 -timeSlice 1000
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
-mode request_rate -limitType smooth -selectorName ipStreamSelector

add responder action myWebSiteRedirectAction redirect "\"http: //
www.mycompany .com/\""

add responder policy ipLimitResponderPolicy "http.req-
url.contains(\"myasp.asp\") && sys.check_limit(\"ipLimitIdentifier\")"
myWebSiteRedirectaction

bind responder global ipLimitResponderPolicy 100 END -type default
```

Cache a response for the request URL

Run the following commands to cache a response if the request URL rate is more than 5 per 20000 milliseconds:

```
add stream selector cacheStreamSelector http.req.url

add ns limitidentifier cacheRateLimitIdentifier -threshold 5 -timeSlice
2000 -selectorName cacheStreamSelector

add cache policy cacheRateLimitPolicy -rule "http req.method.eq(get) &&
sys.check_limit \"cacheRateLimitIdentifier\")" -action cache

bind cache global cacheRateLimitPolicy -priority 10
```

Drop a connection based on cookies

Run the following commands to drop a connection based on the cookies when the following conditions are met:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- cookies are received in requests from `www.mycompany.com`
- the number of requests are more than the rate limit

```
add stream selector reqCookieStreamSelector "http req.cookie
«value(\"mycookie\")" "client.ip.src.subnet(24)"

add ns limitIdentifier myLimitIdentifier -Threshold 2 -timeSlice 3000
-selectorName reqCookieStreamSelector

add responder action sendRedirectUrl redirect '\"http://
www.mycompany.com\" + http.req.url' -bypassSafetyCheck YES

add responder policy rateLimitCookiePolicy "http.
req.url.contains(\"www.yourcompany.com\") && sys
check_limit(\"myLimitIdentifier\")" sendRedirectUrl
```

Drop a DNS packet from a particular IP address

Run the following commands to drop a DNS packet if the requests from a particular client IP address and DNS domain are more than the rate limit:

```
add stream selector dropDNSStreamSelector client udp.dns.domain
client.ip.src

add ns limitIdentifier dropDNSRateIdentifier -timeslice 20000 -mode
request_rate -selectorName dropDNSStreamSelector -maxBandwidth 1
-trapsintimeslice 20

add dns policy dnsDropOnClientRatePolicy "sys check_limit
(\"dropDNSRateIdentifier\")" -drop yes
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Limit the number of HTTP requests from the same host

Run the following commands to restrict the number of HTTP requests that:

- Originate from the same host
- Use a subnet mask of 32
- Are directed to the same destination IP address

```
add stream selector ipv6_sel CLIENT.IPv6.SRC.SUBNET(32) CLIENT.IPv6.DST
HTTP.REQ.URL

add ns limitIdentifier ipv6_id -timeSlice 20000 -selectorName ipv6_sel

add lb vserver ipv6_vip HTTP 3ffe::209 80 -persistenceType NONE
-cltTimeout 180

add responder action redirect_page redirect "\"http://redirectpage.com/\""

add responder policy ipv6_resp_pol "SYS.CHECK_LIMIT(\"ipv6_id\")"
redirect_page

bind responder global ipv6_resp_pol 5 END -type DEFAULT
```

Sample Use Cases for Rate-Based Policies

The following scenarios describe two uses of rate-based policies in global server load balancing (GSLB):

- The first scenario describes the use of a rate-based policy that sends traffic to a new data center if the rate of DNS requests exceed 1000 per second.
- In the second scenario, if more than five DNS requests arrive for a local DNS (LDNS) client within a particular period, the additional requests are dropped.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Redirecting Traffic on the Basis of Traffic Rate

In this scenario, you configure a proximity-based load balancing method, and a rate-limiting policy that identifies DNS requests for a particular region. In the rate-limiting policy, you specify a threshold of 1000 DNS requests per second. A DNS policy applies the rate limiting policy to DNS requests for the region "Europe.GB.17.London.UK-East.ISP-UK." In the DNS policy, DNS requests that exceed the rate limiting threshold, starting with request 1001 and continuing to the end of the one-second interval, are to be forwarded to the IP addresses that are associated with the region "North America.US.TX.Dallas.US-East.ISP-US."

The following configuration demonstrates this scenario:

```
add stream selector DNSSelector1 client.udp.dns.domain

add ns limitIdentifier DNSLimitIdentifier1 -threshold 5 -timeSlice 1000
-selectorName DNSSelector1

add dns policy DNSLimitPolicy1
"client.ip.src.matches_location(\"Europe.GB.17.London.*.*\") &&

sys.check_limit(\"DNSLimitIdentifier1\")" -preferredLocation "North
America.US.TX.Dallas.*.*"

bind dns global DNSLimitPolicy1 5
```

Dropping DNS Requests on the Basis of Traffic Rate

In the following example of global server load balancing, you configure a rate limiting policy that permits a maximum of five DNS requests in a particular interval, per domain, to be directed to an LDNS client for resolution. Any requests that exceed this rate are dropped. This type of policy can help protect the NetScaler from resource exploitation. For example, in this scenario, if the time to live (TTL) for a connection is five seconds, this policy prevents the LDNS from requerying a domain. Instead, it uses data that is cached on the NetScaler.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add stream selector LDNSSelector1 client.udp.dns.domain client.ip.src

add ns limitIdentifier LDNSLimitIdentifier1 -threshold 5 -timeSlice 1000
-selectorName LDNSSelector1

add dns policy LDNSPolicy1 "client.udp.dns.domain.contains(\".\") &&
sys.check_limit(\"LDNSLimitIdentifier1\")" -drop YES

bind dns global LDNSPolicy1 6

show gslb vserver gvip

Rate Limiting for Traffic Domains

You can configure rate limiting for traffic domains. The following expression in the NetScaler expressions language for identifies traffic associated with traffic domains.

- client.traffic_domain.id

You can configure rate limiting for traffic associated with a particular traffic domain, a set of traffic domains, or all traffic domains.

For more information on how to configure IP rate limiting with NetScaler, see the following video:

<iframe src="https://www.youtube.com/embed/b0t8OqqRn5I" width="720px" height="480px" frameborder="0" title="YouTube video player" allowfullscreen=""> </iframe>
For configuring rate limiting for traffic domains, you perform the following steps on a NetScaler appliance by using the configuration utility or the NetScaler command line:

1. Configure a stream selector that uses the client.traffic_domain.id expression for identifying the traffic, associated with traffic domains, to be rate limited.
2. Configure a rate limit identifier that specifies parameters such as maximum threshold for traffic to be rate limited. You also associate a stream selector to the rate limiter in this step.
3. Configure an action that you want to associate with the policy that uses the rate limit identifier.
4. Configure a policy that uses the sys.check_limit expression prefix to call the rate limit identifier, and associate the action with this policy.
5. Bind the policy globally.

Consider an example in which two traffic domains, with IDs 10 and 20, are configured on NetScaler NS1. On traffic domain 10, LB1-TD-1 is configured to load balance servers S1 and S2; LB2-TD1 is configured to load balance servers S3 and S4.

On traffic domain 20, LB1-TD-2 is configured to load balance servers S5 and S6; LB2-TD2 is configured to load balance servers S7 and S8.

The following table lists some examples of rate limiting policies for traffic domains in the example setup.

PURPOSE	CLI COMMANDS
Limit the number of requests to 10 per second for each of the traffic domains.	add stream selector tdratelimit-1 CLIENT.TRAFFIC_DOMAIN.ID add ns limitIdentifier limitidf-1 -threshold 10

© 1997–2026 Citrix Systems, Inc. All rights reserved.

PURPOSE	CLI COMMANDS
	-selectorName tdratelimit-1 -trapsInTimeSlice 0 add responder policy ratelimit-pol "sys.check_limit(\"limitidf-1\")" DROP bind responder global ratelimit-pol 1
Limit the number of requests to 5 per client per second for each of the traffic domains.	add stream selector tdandclientip CLIENT.IP.SRC,CLIENT.TRAFFIC_DOMAIN.ID add ns limitIdentifier td_limitidf -threshold 5 -selectorName tdandclientip -trapsInTimeSlice 5 add responder policy tdratelimit-pol "sys.check_limit(\"td_limitidf\")" DROP bind responder global tdratelimit-pol 2
Limit the number of requests sent for a particular traffic domain (for example traffic domain 10) to 30 requests every 3 seconds.	add stream selector tdratelimit CLIENT.TRAFFIC_DOMAIN.ID add ns limitIdentifier td10_limitidf -threshold 30 -timeSlice 3000 -selectorName tdratelimit -trapsInTimeSlice 5 add responder policy td10ratelimit "client.traffic_domain.id==10 && sys.check_limit(\"td10_limitidf\")" DROP bind responder global td10ratelimit 3
Limit the number of connections to 5 per client per second for a particular traffic domain (for example traffic domain 20).	add stream selector tdandclientip CLIENT.IP.SRC CLIENT.TRAFFIC_DOMAIN.ID add ns limitIdentifier td20_limitidf -threshold 5 -mode CONNECTION -selectorName tdandclientip -trapsInTimeSlice 5 add responder policy td20_ratelimit "client.traffic_domain.id==20 && sys.check_limit(\"td20_limitidf\")" DROP bind responder global td20_ratelimit 4

Configure rate limit at packet level

You can configure a stream selector and a responder policy to collect statistics at the packet level flowing through all the connections identified by the selector. If the number of packets per second exceed the configured threshold, the policy applies the configured action (RESET or DROP). You can configure these policies for all types of virtual servers. Packets of all sizes are considered.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To configure rate limiting at packet level, perform the following tasks

1. Enable load balancing
2. Add stream selector
3. Add stream identifier
4. Add responder policy
5. Add load balancing virtual server
6. Bind responder policy

To enable load balancing feature

At the command prompt, type:

```
enable ns feature lb
```

To add a stream selector

At the command prompt, type:

```
add stream selector packetlimitselector client.ip.src client.tcp.srcport
client.ip.dst client.tcp.dstport
```

To add a stream identifier

At the command prompt, type:

```
add stream identifier packetlimitidentifier packetlimitselector -interval
1
```

To enable tracking of ACK only packets

At the command prompt, type:

```
set stream identifier packetlimitidentifier –trackAckOnlyPackets ENABLED
```

To add a responder policy

At the command prompt, type:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add responder policy packet_rate_sessionpolicy
"ANALYTICS.STREAM(\"packetlimitidentifier\").COLLECT_STATS(\"PACKET_LIMIT\
", <max_threshold_PPS>, ACTION, 0/1)" NOOP
```

Where,

- \<max_threshold_PPS\> is the maximum number of packets allowed through the connection per second.
- ACTION can be DROP or RESET.
- 0 or 1 represents the limit type; 0 represents the BURSTY limit type and 1 represents the SMOOTH limit type.

Example:

```
add responder policy packet_rate_sessionpolicy
"ANALYTICS.STREAM(\"packetlimitidentifier\").COLLECT_STATS(\"PACKET_LIMIT\
", 40, RESET, 0)" NOOP
```

To add a load balancing virtual server

At the command prompt, type:

```
add lb vserver <name> <serviceType> <ip> <port>

add lb vserver Vserver-lb-1 HTTP 10.102.20.200 80
```

To bind a responder policy

After the selector and the responder policy are configured, the policy can be bound globally or to the specific virtual server.

At the command prompt, type either of the following commands:

```
bind responder global <policyName> <priority> [<gotoPriorityExpression>]
[-type <type>] [-invoke  (<labelType>  <labelName>) ]
```

OR

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
bind lb vserver <name>@  (-policyName <string>@ [-priority
<positive_integer>]
```

Examples:

```
bind responder global packet_rate_sessionpolicy 101 END -type REQ_DEFAULT

bind responder global packet_rate_sessionpolicy 102 END -type

bind lb vserver v1 -policyname packet_rate_sessionpolicy -priority 10
```

Responder

WARNING

Filter features using classic policies are deprecated and as an alternative Citrix® recommends you to use the rewrite and responder features with advanced policy infrastructure.

Today's complex Web configurations often require different responses to HTTP requests that appear, on the surface, to be similar. When users request a webpage, you may want to provide a different page depending on the user geographical location, browser specification, or languages the browser accepts and the order of preference. You might want to drop the connection if the request is coming from an IP range that has been generating DDoS attacks or initiating hacking attempts.

Responder supports protocols such as TCP, DNS (UDP), and HTTP. With responder enabled on your appliance, server responses can be based on who sends the request, where it is sent from, and other criteria with security and system management implications. The feature is simple and quick to use. By avoiding the invocation of more complex features, it reduces CPU cycles and time spent in handling requests that do not require complex processing.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

For handling sensitive data such as financial information, if you want to ensure that the client uses a secure connection to browse a site, you can redirect the request to a secure connection by using `https://` instead of `http://`.

To use a responder, do the following:

- Enable a responder feature on the appliance.
- Configure a responder action. The action can be to generate a custom response, redirect a request to a different webpage, or reset a connection.
- Configure a responder policy. The policy determines the requests (traffic) on which an action has to be taken.
- Bind each policy to a bind point put it into effect. A bind point refers to an entity at which the NetScaler appliance examines the traffic to see if it matches a policy. For example, a bind point can be a load balancing virtual server.

You can specify a default action for requests that do not match any policy, and you can bypass the safety check for actions that would otherwise generate error messages.

The Rewrite feature of NetScaler helps in rewriting some information in the requests or responses handled by NetScaler. The following section shows some differences between the two features.

Comparison between Rewrite and Responder options

The main difference between the rewrite feature and the responder feature is as follows:

Responder cannot be used for response or server-based expressions. Responder can be used only for the following scenarios depending on client parameters:

- Redirecting an HTTP request to new websites or webpages
- Responding with some custom response
- Dropping or resetting a connection at request level

If there is a responder policy, the NetScaler examines the request from the client, takes action according to the applicable policies, sends the response to the client, and closes the connection with the client.

If there is a rewrite policy, the NetScaler examines the request from the client or response from the server, takes action according to the applicable policies, and forwards the traffic to the client or the server.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

In general, it is recommended to use a responder if you want the appliance to reset or drop a connection based on a request-based parameter. Use a responder to redirect traffic, or respond with custom messages. Use rewrite for manipulating data on HTTP requests and responses.

Enabling the Responder Feature

To use the Responder feature, you must first enable it.

To enable the responder feature by using the NetScaler CLI:

At the command prompt, type the following commands to enable the responder feature and verify the configuration:

- `enable ns feature <feature>`
- `show ns feature`

Example:

```
enable ns feature Responder

 Done

> show ns feature

        Feature                         Acronym             Status

        -------                         -------             ------

 1)     Web Logging                     WL                  ON

 2)     Surge Protection                SP                  ON

 .

 .

 .

 19)     Responder                       RESPONDER           ON

 20)     NetScaler Push                  push                OFF
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
 Done

>
```

To enable the responder feature by using the GUI:

1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, under **Modes** and **Features**, click **Change advanced features**.
3. In the **Configure Advanced Features** dialog box, select the **Responder** check box, and then click **OK**.
4. In the **Enable/Disable Feature(s)?** dialog box, click **YES**. A message appears in the status bar, stating that the feature has been enabled.

Configure responder action

After enabling the responder feature, you must configure one or more actions for handling requests. The responder supports the following types of actions:

- **Respond with**. Sends the response defined by the Target expression without forwarding the request to a web server. (The NetScaler appliance substitutes for and acts as a web server.) Use this type of action to manually define a simple HTML-based response. Normally the text for a Respond with action consists of a web server error code and brief HTML page.
- **Respond with SQL OK**. Sends the designated SQL OK response defined by the Target expression. Use this type of action to send an SQL OK response to an SQL query.
- **Respond with SQL Error**. Sends the designated SQL Error response defined by the Target expression. Use this type of action to send an SQL Error response to an SQL query.
- **Respond with HTML page**. Sends the designated HTML page as the response. You can choose from a drop-down list of HTML pages that were previously uploaded, or upload a new HTML page. Use this type of action to send an imported HTML page as the response. The appliance responds with a custom header in the responsewithhtmlpage responder action. You can configure up to eight custom headers. The imported HTML page is stored in the `/var/download/responder` directory.
- **Redirect**. Redirects the request to a different webpage or web server. A Redirect action can redirect requests originally sent to a "dummy" website that exists in DNS, but for which there is no actual web server, to an actual website. It can also redirect search requests to an appropriate URL. Normally, the redirection target for a Redirect action consists of a complete URL.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure a responder action by using the CLI:

Displays the current settings for the specified responder action. If no action name is provided, display a list of all responder actions currently configured on the NetScaler appliance, with abbreviated settings.

At the command prompt, type the following commands to configure a responder action and verify the configuration:

- `add responder action <name> <type> <target>`
- `show responder action`

Parameters:

- **Name**. Name of the responder action. Maximum Length: 127
- **type**. Type of responder action. It can be: (respondwith).
- **target**. An expression specifying what to respond with.
- **htmlpage**. Option specifying to respond with an html page.
- **hits**. The number of times the action has been taken.
- **referenceCount**. The number of references to the action.
- **undefHits**. The number of times the action resulted in UNDEF.
- **comment**. Any type of information about this responder action.
- **builtin**. Flag to determine whether responder action is built in or not.

Example:

```
Create a responder action that displays a “Not Found” error page for URLs
that do not exist:

> add responder action act404Error respondWith '"HTTP/1.1 404 Not
Found\r\n\r\n"+ HTTP.REQ.URL.HTTP_URL_SAFE + " does not exist on the web
server."'

Done
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
> show responder action

1) Name: act404Error

Operation: respondwith

Target: "HTTP/1.1 404 Not Found" + HTTP.REQ.URL.HTTP_URL_SAFE + " does not
exist on the web server."

Hits: 0

Undef Hits: 0

Action Reference Count: 0

Done
```

Create a responder action that displays a “Not Found” error page for URLs that do not exist:

```
add responder action act404Error respondWith '"HTTP/1.1 404 Not
Found\r\n\r\n"+ HTTP.REQ.URL.HTTP_URL_SAFE + " does not exist on the web
server."'

Done

> show responder action

1) Name: act404Error

Operation: respondwith

Target: "HTTP/1.1 404 Not Found" + HTTP.REQ.URL.HTTP_URL_SAFE + " does not
exist on the web server."
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Hits: 0

Undef Hits: 0

Action Reference Count: 0

Done
```

Modify an existing responder action by using the CLI:

At the command prompt, type the following command to modify an existing responder action and verify the configuration:

- `set responder action <name> -target <string>`
- `show responder action`

Example:

```
set responder action act404Error  -target '"HTTP/1.1 404 Not
Found\r\n\r\n"+ HTTP.REQ.URL.HTTP_URL_SAFE + " does not exist on the web
server."'

 Done

> show responder action

1)      Name: act404Error

        Operation: respondwith

        Target: "HTTP/1.1 404 Not Found" + HTTP.REQ.URL.HTTP_URL_SAFE + "
does not exist on the web server."

        Hits: 0

        Undef Hits: 0
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
        Action Reference Count: 0

 Done
```

Remove a responder action by using the CLI:

At the command prompt, type the following command to remove a responder action and verify the configuration:

- `rm responder action <name>`
- `show responder action`

Example:

```
rm responder action act404Error

 Done

> show responder action

 Done
```

Add custom headers in responsewithhtmlpage responder action by using the CLI:

A NetScaler appliance can now respond with custom headers in the responsewithhtmlpage responder action. You can configure up to eight custom headers. Previously, the appliance responded only with `Content-type:text/html` and `Content-Length:<value>` static headers.

NOTE:

In the custom header configuration, you can also over-write the "Content-Type" header value.

At the command prompt, type the following command:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add responder action <name> <type> (<target> | <htmlpage>) [-comment <string>] [-responseStatusCode <positive_integer>] [-reasonPhrase <expression>] [-headers <name(value)> ...]
```

Where,

name: Name for the responder action. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#),space ( ), at (@), equals (=), colon (:), and underscore characters. Can be changed after the responder policy is added.

Type: Type of responder action. Available settings function as follows:

1. **respondwith** `<target>` - Respond to the request with the expression specified as the target.
2. **respondwithhtmlpage** - Respond to the request with the uploaded HTML page object specified as the target.
3. **redirect** - Redirect the request to the URL specified as the target.
4. **sqlresponse_ok** - Send an SQL OK response.
5. **sqlresponse_error** - Send an SQL ERROR response. This is a mandatory argument. Possible values: `noop`, `respondwith`, `redirect`, `respondwithhtmlpage`, `sqlresponse_ok`, `sqlresponse_error`

Target: Expression specifying what to respond with. Typically a URL for redirect policies or a default-syntax expression. In addition to NetScaler default-syntax expressions that refer to information in the request, a string builder expression can contain text and HTML, and simple escape codes that define new lines and paragraphs. Enclose each string builder expression element (either a NetScaler default-syntax expression or a string) in double quotation marks. Use the plus (+) character to join the elements.

htmlpage: For `respondwithhtmlpage` policies, name of the HTML page object to use as the response. You must first import the page object. Maximum Length: 31

Comment: Any type of information about this responder action. Maximum Length: 255

responseStatusCode: HTTP response status code, for example 200, 302, 404, and so forth The default value for the `redirect action` type is 302 and for `respondwithhtmlpage` is 200 Minimum value: 100 Maximum value: 599

© 1997–2026 Citrix Systems, Inc. All rights reserved.

reasonPhrase: Expression specifying the reason phrase of the HTTP response. The reason phrase may be a string literal with quotes or a PI expression. For example: `"Invalid URL: " + HTTP.REQ.URL Maximum Length: 8191`

Headers: One or more headers to insert into the HTTP response. Each header is specified as `"name(expr),"` where expr is an expression that is evaluated at runtime to provide the value for the named header. You can configure a maximum of eight headers for a responder action.

Configure a responder action by using the GUI:

1. Navigate to **AppExpert > Responder > Actions**.
2. In the details pane, do one of the following:
   - To create an action, click **Add**.
   - To modify an existing action, select the action, and then click **Open**.
3. Click **Create** or **OK**, depending on whether you are creating an action or modifying an existing action.
4. Click **Close**. A message appears in the status bar, stating that the feature has been enabled.
5. To delete a responder action, select the action, and then click **Remove**. A message appears in the status bar, stating that the feature has been disabled.

Add an expression by using the **Add Expression** dialog box

1. In the **Create Responder Action** or **Configure Responder Action** dialog box, click **Add**.
2. In the **Add Expression** dialog box, in the first list box choose the first term for your expression.
   - HTTP. The HTTP protocol. Choose this if you want to examine some aspect of the request that pertains to the HTTP protocol.
   - SYS. One or more protected websites. Choose this if you want to examine some aspect of the request that pertains to the recipient of the request.
   - CLIENT. The computer that sent the request. Choose this if you want to examine some aspect of the sender of the request.
   - ANALYTICS. The analytics data associated with the request. Choose this if you want to examine request metadata.
   - SIP. A SIP request. Choose this if you want to examine some aspect of a SIP request. When you make your choice, the rightmost list box lists appropriate terms for the next part of your expression.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. In the second list box, choose the second term for your expression. The choices depend upon which choice you made in the previous step, and are appropriate to the context. After you make your second choice, the Help window below the Construct Expression window (which was blank) displays help describing the purpose and use of the term you just chose.
4. Continue choosing terms from the list boxes that appear to the right of the previous list box, or typing strings or numbers in the text boxes that appear to prompt you to enter a value, until your expression is finished.

Configuring the Global HTTP Action

You can configure the global HTTP action to invoke a responder action when an HTTP request times out. To configure this feature, you must first create the responder action that you want to invoke. Then, configure the global HTTP timeout action to respond to a timeout with that responder action.

Configure the global HTTP action by using the CLI:

At the command prompt, type the following command:

- `set ns httpProfile -reqTimeoutAction <responder action name>`
- `save ns config`

For `<responder action name>`, replace the name of the responder action.

Configure an HTML page import

When a NetScaler appliance responds with a custom message, we can respond with an HTML file. You can import the file using the `import responder htmlpage` command and then use this file in `add responder action <act name> respondwithhtmlpage <file name>` command. You can also import the file through the NetScaler GUI. You can import a desired HTML page into the appliance folder and upload the page during responder run time.

Import an HTML page by using the CLI

At the command prompt, type:

`import responder htmlpage [<src>] <name> [-comment <string>] [-overwrite][-CAcertFile <string>]`

Example:

`import responder htmlpage http://www.example.com/page.html my-responder-page -CAcertFile my_root_ca_cert`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

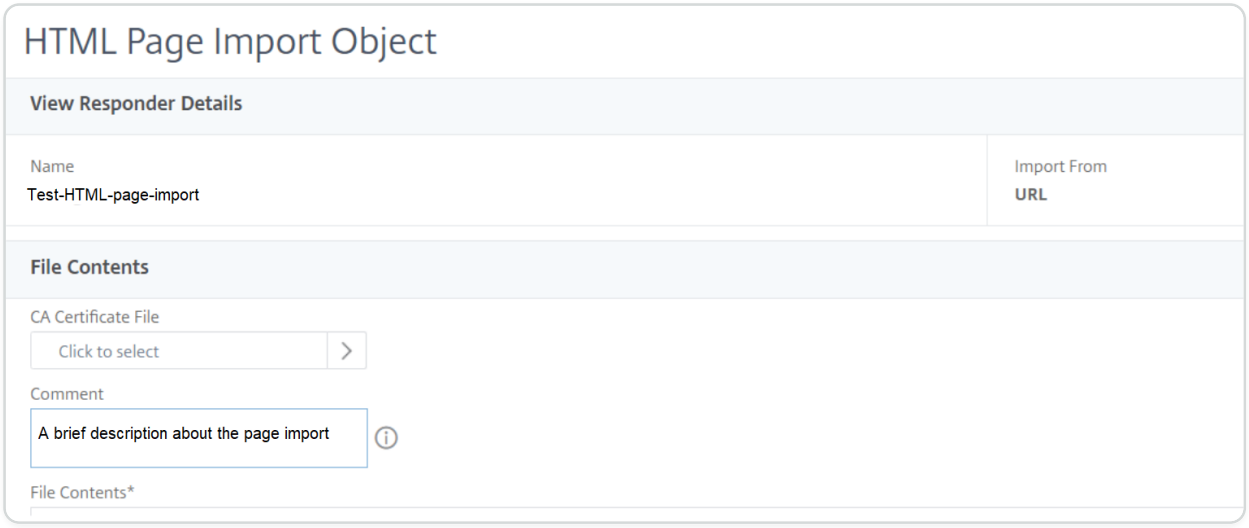
Where, A CA certificate is used for verifying the client certificate. The certificate has to be imported using the `import ssl certfile` CLI command or equivalent through an API or GUI. If a certificate name is not configured, then default root CA certificates are used for the certificate verification.

Import an HTML page from the local filesystem

You can also import an HTML page from the local filesystem. To import, copy the file using SCP or any other way to the /var/tmp/ directory and then import it using the "local:" keyword. For example:

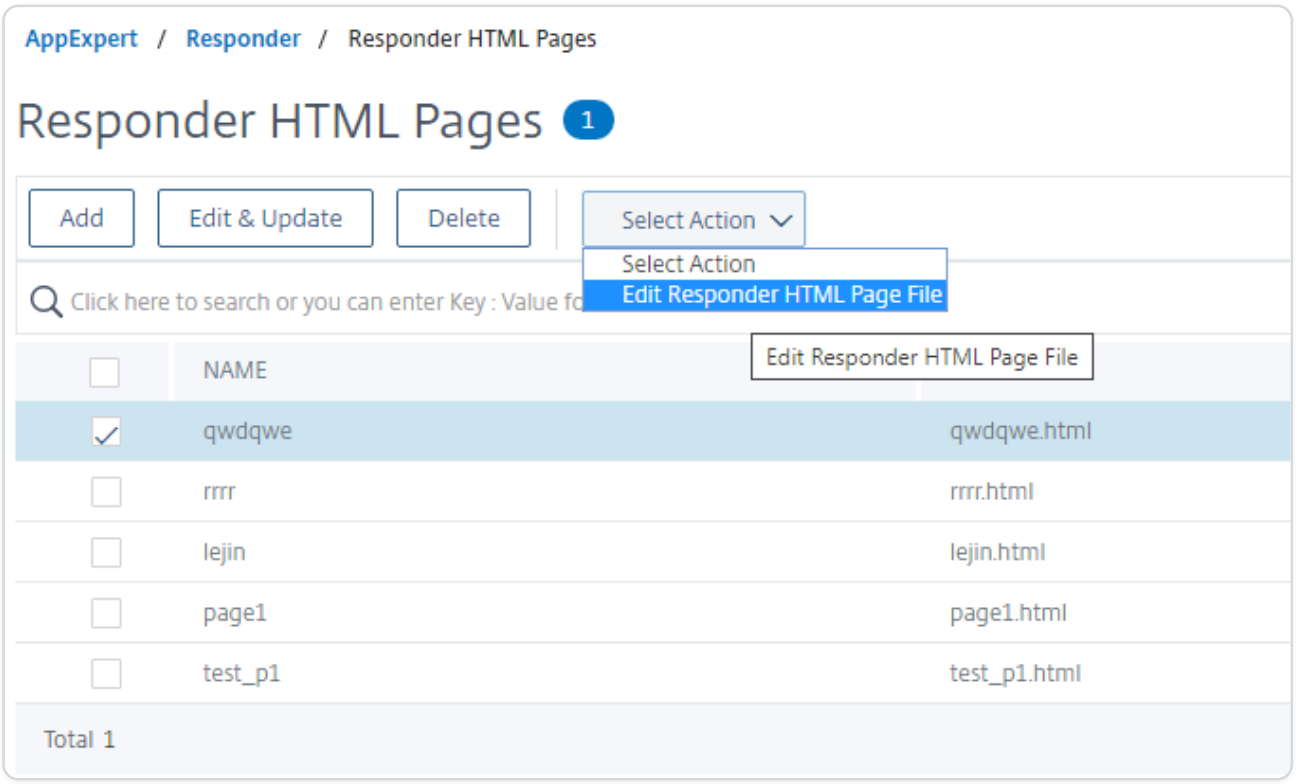
```
import responder htmlpage local:my_local_file.html my_local_file
```

Where `my_local_file.html` is present at "/var/tmp/" directory.



NOTE

"local:" keyword only searches the file in the "/var/tmp/" directory. For non-default partitions, you need to copy the file into the partition specific tmp directory that is present at `/var/partitions/<partition name>/tmp`.



Import an HTML page by using the GUI

1. Navigate to **AppExpert** > **Responder** > **HTML Page Imports**.
2. In the **Responder HTML Imports** details pane, click **Add**.
3. In the **HTML Page Import Object** page, set the following parameters:
    a. Name. Name of the HTML page.
    b. Import From. Imported from file, text, or text.
    c. URL. Select to enter the URL location of the HTML file.
    d. File. Select the HTML file from the appliance directory.
    e. Text. Select the HTML file as a text.
4. Click **Continue**.
5. Verify responder HTML page details.
6. Click **Done**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To edit an HTML page, you can select a file and click **Edit Responder HTML Page File** from the **Select Action** drop-down list.

Configuring a responder policy

After you configure a responder action, you must next configure a responder policy to select the requests to which the NetScaler appliance should respond. A responder policy is based on a rule, which consists of one or more expressions. The rule is associated with an action, which is performed if a request matches the rule.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE:

For creating and managing responder policies, the GUI provides assistance that is not available at the CLI.

Configure a responder policy by using the CLI

At the command prompt, type:

- `add responder policy <name> <expression> <action> [<undefaction>]-appFlowaction <actionName>`
- `show responder policy <name>`

Example:

```
> add responder policyThree "CLIENT.IP.SRC.IN_SUBNET(222.222.0.0/16)"
RESET

 Done

> show responder policy policyThree

        Name: policyThree

        Rule: CLIENT.IP.SRC.IN_SUBNET(222.222.0.0/16)

        Responder Action: RESET

        UndefAction: Use Global

        Hits: 0

        Undef Hits: 0

 Done
```

Modify an existing responder policy by using the CLI

At the command prompt, type:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- `set responder policy <name> [-rule <expression>] [-action <string>] [-undefAction <string>]`
- `show responder policy <name>`

Remove a responder policy by using the CLI

At the command prompt, type:

- `rm responder policy <name>`
- `show responder policy`

Example:

```
>rm responder policy pol404Error
 Done

> show responder policy
 Done
```

Configure a responder policy by using the GUI

1. Navigate to **AppExpert > Responder > Policies**.
2. In the details pane, do one of the following:
   - To create a policy, click **Add**.
   - To modify an existing policy, select the policy, and then click **Open**.
3. Click **Create** or **OK**, depending on whether you want to create a policy or modify an existing policy.
4. Click **Close**. A message appears in the status bar, stating that the feature has been configured.

NOTE:

The HTTP.REQ based expressions don't work with the SSL_BRIDGE protocol type.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Binding a Responder Policy

To put a policy into effect, you must bind it either globally, so that it applies to all traffic that flows through the NetScaler, or to a specific virtual server, so that the policy applies only to requests whose destination IP address is the VIP of that virtual server.

When you bind a policy, you assign a priority to it. The priority determines the order in which the policies you define are evaluated. You can set the priority to any positive integer.

In the NetScaler operating system, policy priorities work in reverse order—the higher the number, the lower the priority. For example, if you have three policies with priorities of 10, 100, and 1000, the policy assigned a priority of 10 is performed first, then the policy assigned a priority of 100, and finally the policy assigned an order of 1000. The responder feature implements only the first policy that a request matches, not any additional policies that it might also match, so policy priority is important for getting the results you intend.

You can leave yourself plenty of room to add other policies in any order, and still set them to evaluate in the order you want, by setting priorities with intervals of 50 or 100 between each policy when you globally bind it. You can then add more policies at any time without having to reassign the priority of an existing policy.

For additional information about binding policies on the NetScaler, see Policies and Expressions.

NOTE:

Responder policies are bound to TCP-based virtual servers.

To globally bind a responder policy by using the NetScaler command line:

At the command prompt, type the following command to globally bind a responder policy and verify the configuration:

- `bind responder global <policyName> <priority> [<gotoPriorityExpression> [-type <type>] [-invoke (<labelType> <labelName>)]`
- `show responder global`

Example:

```
> bind responder global poliError 100

 Done
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
> show responder global

1)      Global bindpoint: REQ_DEFAULT

        Number of bound policies: 1

 Done
```

To bind responder policy to a specific virtual server by using the NetScaler command line:

At the command prompt, type:

- `bind lb vserver <name> -policyname <policy_name> -priority <priority>`
- `show lb vserver vs-loadbal <name>`

Example:

```
> bind lb vserver vs-loadbal -policyName policyTwo -priority 100

 Done

> show lb vserver

1)      vs-loadbal (10.102.29.20:80) - HTTP     Type: ADDRESS

        State: OUT OF SERVICE

        Last state change was at Wed Aug 19 09:05:47 2009 (+211 ms)

        Time since last state change: 2 days, 00:58:03.260

        Effective State: DOWN

        Client Idle Timeout: 180 sec

        Down state flush: ENABLED

        Disable Primary Vserver On Down : DISABLED

        Port Rewrite : DISABLED
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
        No. of Bound Services :  0 (Total)       0 (Active)

        Configured Method: LEASTCONNECTION

        Mode: IP

        Persistence: NONE

        Vserver IP and Port insertion: OFF

        Push: DISABLED  Push VServer:

        Push Multi Clients: NO

        Push Label Rule: none

2)      vs-cont-sw (0.0.0.0:0) - TCP    Type: ADDRESS

        State: DOWN

        Last state change was at Wed Aug 19 10:03:46 2009 (+213 ms)

        Time since last state change: 2 days, 00:00:04.260

        Effective State: DOWN

        Client Idle Timeout: 9000 sec

        Down state flush: ENABLED

        Disable Primary Vserver On Down : DISABLED

        No. of Bound Services :  0 (Total)       0 (Active)

        Configured Method: LEASTCONNECTION

        Mode: IP

        Persistence: NONE

        Connection Failover: DISABLED
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Done
```

To globally bind a responder policy by using the GUI:

1. Navigate to **AppExpert** > **Responder** > **Policies**.
2. On the **Responder Policies** page, select a responder policy, and then click **Policy Manager**.
3. In the **Responder Policy Manager** dialog box Bind Points menu, select Default Global.
4. Click **Insert Policy** to insert a new row and display a drop-down list of all unbound responder policies.
5. Click one of the policies on the list. That policy is inserted into the list of globally bound responder policies.
6. Click **Apply Changes**.
7. Click **Close**. A message appears in the status bar, stating that the configuration has been successfully completed.

To bind a responder policy to a specific virtual server by using the GUI:

1. Navigate to **Traffic Management** > **Load Balancing** > **Virtual Servers**.
2. On the **Load Balancing Virtual Servers** page, select the virtual server to which you want to bind the responder policy, and then click **Open**.
3. In the **Configure Virtual Server** (Load Balancing) dialog box, select the **Policies** tab, which displays a list of all policies configured on your NetScaler appliance.
4. Select the check box next to the name of the policy you want to bind to this virtual server.
5. Click **OK**. A message appears in the status bar, stating that the configuration has been successfully completed.

Setting the Default Action for a Responder Policy

The NetScaler appliance generates an undefined event (UNDEF event) when a request does not match a responder policy. The appliance then performs the default action assigned to undefined events. By default, the action forwards the request to the next feature such as load balancing, content filtering and so forth. This default behavior ensures the requests do not require any specific responder action to be sent to your Web servers. Also, the clients receive access to the content that they have requested.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

If one or more websites your NetScaler appliance protects receive a significant number of invalid or malicious requests, however, you might want to change the default action to either reset the client connection or drop the request. In this type of configuration, you would write one or more responder policies that would match any legitimate requests, and simply redirect those requests to their original destinations. Your NetScaler appliance would then block any other requests as specified by the default action you configured.

You can assign any one of the following actions to an undefined event:

- **NOOP**. The NOOP action aborts responder processing but does not alter the packet flow. So that the appliance continues to process requests that do not match any responder policy, and eventually forwards them to the requested URL unless another feature intervenes and blocks or redirects the request. This action is appropriate for normal requests to your Web servers and is the default setting.
- **RESET**. If the undefined action is set to RESET, the appliance resets the client connection, informing the client that it must re-establish its session with the Web server. The action is appropriate for repeat requests for webpages that do not exist, or for connections that might be attempts to hack or probe your protected websites.
- **DROP**. If the undefined action is set to DROP, the appliance silently drops the request without responding to the client in any way. This action is appropriate for requests that appear to be part of a DDoS attack or other sustained attack on your servers.

Note: UNDEF events are triggered only for client requests. No UNDEF events are triggered for responses.

To set the undefined action by using the NetScaler command line:

At the command prompt, type the following command to set the undefined action and verify the configuration:

- `set responder param -undefAction (RESET|DROP|NOOP) [-timeout <msecs>]`
- `show responder param`

Where,

timeout - Maximum time in milliseconds to allow for processing all the policies and their selected actions without interruption. If the timeout is reached then the evaluation causes an UNDEF to be raised and no further processing is performed.

Minimum value: 1

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Maximum value: 5000

Example:

```
>set responder param -undefAction RESET -timeout 3900

 Done

> show responder param

Action Name: RESET

Timeout: 3900

 Done

>
```

Set the undefined action by using the GUI

1. Navigate to **AppExpert** > **Responder**, and then under **Settings**, click the **Change Responder Settings** link.
2. In the **Set Responder Params** page, set the following parameters:
   a. Global Undefined-Result Action. Undefined-result action is preferred in an unhandled processing exception in the responder policies and actions. Select **NOOP**, **RESET**, or **DROP**.
   b. Timeout. Maximum time in milliseconds to allow for processing all the policies and their selected actions without interruption. If the timeout is reached then the evaluation causes an UNDEF to be raised and no further processing is performed.
3. Click **OK**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

.

Responder Action and Policy Examples

Responder actions and policies are powerful and complex, but you can get started with relatively simple applications.

Example: Blocking Access from Specified IPs

The following procedures block access to your protected website(s) for clients originating from the CIDR 222.222.0.0/16. The responder sends an error message stating that the client is not authorized to access the requested URL.

To block access by using the NetScaler command line:

At the command prompt, type the following commands to block access:

- add responder action act_unauthorized respond with "HTTP/1.1 403 Forbidden\r\n\r\n" + "Client: " + CLIENT.IP.SRC + " is not authorized to access URL:" + "HTTP.REQ.URL.HTTP_URL_SAFE"'
- add responder policy pol_un "CLIENT.IP.SRC.IN_SUBNET (222.222.0.0/16)" act_unauthorized
- bind responder global pol_un 10

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To block access by using the GUI:

1. In the navigation pane, expand **Responder**, and then click **Actions**.
2. In the details pane, click **Add**.
3. In the **Create Responder Action** dialog box, do the following:
    a. In the **Name** text box, type act_unauthorized.
    b. Under Type, select Respond with.
    c. In the Target text area, type the following string: "HTTP/1.1 403 Forbidden\r\n\r\n" + "Client: " + CLIENT.IP.SRC + " is not authorized to access URL:" + HTTP.REQ.URL.HTTP_URL_SAFE
    d. Click **Create**, and then click **Close**. The responder action you configured, named act_unauthorized, now appears in the **Responder Actions** page.
4. In the navigation pane, click **Policies**.
5. In the details pane, click **Add**.
6. In the **Create Responder Policy** dialog box, do the following:
    a. In the Name text box, type pol_unauthorized.
    b. Under **Action**, select act_unauthorized.
    c. In the **Expression** window, type the following rule: CLIENT.IP.SRC.IN_SUBNET(222.222.0.0/16)
    d. Click **Create**, then click **Close**. The responder policy you configured, named pol_unauthorized, now appears in the **Responder Policies** page.
7. Globally bind your new policy, pol_unauthorized, as described in Binding a Responder Policy.

Example: Redirecting a client to a new URL

The following procedures redirect clients who access your protected Web site(s) from within the CIDR 222.222.0.0/16 to a specified URL.

To redirect clients by using the NetScaler command line:

At the command prompt, type the following commands to redirect clients and verify the configuration:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add responder action act_redirect redirect "\"<http://www.example.com/
404.html>\""

show responder action act_redirect

add responder policy pol_redirect
"CLIENT.IP.SRC.IN_SUBNET(222.222.0.0/16)" act_redirect

show responder policy pol_redirect

bind responder global pol_redirect 10
```

Example:

```
add responder action act_redirect redirect "\"<http://www.example.com/
404.html>\""

add responder policy pol_redirect
"CLIENT.IP.SRC.IN_SUBNET(222.222.0.0/16)" act_redirect
```

To redirect clients by using the GUI:

1. Navigate to **AppExpert** > **Responder** > **Actions**.
2. In the details pane, click **Add**.
3. In the **Create Responder Action** dialog box, do the following:
   a. In the **Name** text box, type act_redirect.
   b. Under Type, select **Redirect**.
   c. In the **Target** text area, type the following string: `"` http://www.example.com/404.html `"`
   d. Click **Create**, then click **Close**. The responder action you configured, named act_redirect, now appears in the **Responder Actions** page.
4. In the navigation pane, click **Policies**.
5. In the details pane, click **Add**.
6. In the **Create Responder Policy** dialog box, do the following:
   a. In the **Name** text box, type pol_redirect.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

b. Under **Action**, select act_redirect.

c. In the **Expression** window, type the following rule:
CLIENT.IP.SRC.IN_SUBNET(222.222.0.0/16)

d. Click **Create**, then click **Close**. The responder policy you configured, named pol_redirect, now appears in the **Responder Policies** page.

7. Globally bind your new policy, pol_redirect, as described in Binding a Responder Policy.

Diameter Support for Responder

The Responder feature now supports the Diameter protocol. You can configure Responder to respond to Diameter requests as it does HTTP and TCP requests. For example, you could configure Responder to respond to requests from a specific Diameter origin with a redirect to a web page enhanced for mobile devices. A number of NetScaler expressions have been added that support examination of the Diameter header and the attribute-value pairs (AVPs). These expressions support lookup of specific AVPs by index, ID or name, examine the information in each AVP, and send an appropriate response.

To configure Responder to respond to a Diameter request:

At the command prompt, type the following commands:

- `add responder action <actname> RESPONDWITH "DIAMETER.NEW_REDIRECT(\"aaa://host.example.com\")"`

  For `<actname>`, substitute a name for your new action. The name can consist of from one to 127 characters in length, and can contain letters, numbers, and the hyphen (-) and underscore (_) symbols. For `aaa://host.example.com`, substitute the URL of the diameter host to which you want to redirect connections.

- add responder policy `<polname>` "diameter.req.avp(264).value.eq(\"host1.example.net\")" `<actname>`

  For `<polname>`, substitute a name for your new policy. As with `<actname>`, the name can consist of from one to 127 characters in length, and can contain letters, numbers, and the hyphen (-) and underscore (_) symbols. For host1.example.net, substitute the name of the originating host of the requests that you want to redirect. For `<actname>`, substitute the name of the action that you just created.

- `bind lb vserver <vservername> -policyName <polname> -priority <priority> -type REQUEST`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

For `<vservername>`, substitute the name of the load balancing virtual server to which you want to bind the policy. For `<polname>`, substitute the name of the policy you just created. For `<priority>`, substitute a priority for the policy.

Example:

To create a Responder action and policy to respond to Diameter requests that originate from "host1.example.net" with a redirect to "host.example.com", you could add the following action and policy, and bind the policy as shown.

```
> add responder action act_resp-dm-redirect RESPONDWITH
"DIAMETER.NEW_REDIRECT(\"aaa://host.example.com\")"

Done

> add responder pol_resp-dm-redirect
"diameter.req.avp(264).value.eq(\"host1.example.net\")" act_resp-dm-
redirect

Done

> bind lb vserver vs1 -policyName pol_resp-dm-redirect -priority 10 -type
REQUEST

Done
```

RADIUS Support for Responder

The NetScaler expressions language contains expressions that can extract information from and manipulate RADIUS requests. These expressions enable you to use the Responder feature to respond to RADIUS requests. Your responder policies and actions can use any expression that is appropriate or relevant to a RADIUS request. The available expressions enable you to identify the RADIUS message type, extract any attribute-value pair (AVP) from the connection, and send different responses on the basis of that information. You can also create policy labels that invoke all responder policies for RADIUS connections.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

You can use RADIUS expressions to construct simple responses that do not require communication with the RADIUS server to which the request was sent. When a responder policy matches a connection, the NetScaler constructs and sends the appropriate RADIUS response without contacting the RADIUS authentication server. For example, if the source IP address of a RADIUS request is from a subnet that is specified in the responder policy, the NetScaler can reply to that request with an access-reject message, or can simply drop the request.

You can also create policy labels to route specific types of RADIUS requests through a series of policies that are appropriate to those requests.

Note: The current RADIUS expressions do not work with RADIUS IPv6 attributes.

The NetScaler documentation for expressions that support RADIUS assumes familiarity with the basic structure and purpose of RADIUS communications. If you need more information about RADIUS, see your RADIUS server documentation or search online for an introduction to the RADIUS protocol.

Configuring Responder Policies for RADIUS

The following procedure uses the NetScaler command line to configure a responder action and policy, and bind the policy to a RADIUS-specific global bind point.

To configure a Responder action and policy, and bind the policy:

At the command prompt, type the following commands:

- `add responder action <actName> <actType>`
- `add responder policy <polName> <rule> <actName>`
- `bind responder policy <polName> <priority> <nextExpr> -type <bindPoint>` where `<bindPoint>` represents one of the RADIUS-specific global bind points.

RADIUS Expressions for Responder

In a responder configuration, you can use the following NetScaler expressions to refer to various portions of a RADIUS request.

Identifying the Type of Connection:

- RADIUS.IS_CLIENT. Returns TRUE if the connection is a RADIUS client (request) message.
- RADIUS.IS_SERVER. Returns TRUE if the connection is a RADIUS server (response) message.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Request Expressions:

- `RADIUS.REQ.CODE`. Returns the number that corresponds to the RADIUS request type. A derivative of the num_at class. For example, a RADIUS access request would return 1 (one). A RADIUS accounting request would return 4.
- `RADIUS.REQ.LENGTH`. Returns the length of the RADIUS request, including the header. A derivative of the num_at class.
- `RADIUS.REQ.IDENTIFIER`. Returns the RADIUS request identifier, a number assigned to each request that allows the request to be matched to the corresponding response. A derivative of the num_at class.
- `RADIUS.REQ.AVP(<AVP Code No>).VALUE`. Returns the value of first occurrence of this AVP as a string of type text_t.
- `RADIUS.REQ.AVP(<AVP code no>).INSTANCE(instance number)`. Returns the specified instance of the AVP as a string of type RAVP_t. A specific RADIUS AVP can occur multiple times in a RADIUS message. INSTANCE (0) returns the first instance, INSTANCE (1) returns second instance, and so on, up to sixteen instances.
- `RADIUS.REQ.AVP(<AVP code no>).VALUE(instance number)`. Returns the value of specified instance of the AVP as a string of type text_t.
- `RADIUS.REQ.AVP(<AVP code no>).COUNT`. Returns the number of instances of a specific AVP in a RADIUS connection, as an integer.
- `RADIUS.REQ.AVP(<AVP code no>).EXISTS`. Returns TRUE if the specified type of AVP exists in the message, or FALSE if it does not.

Response Expressions:

RADIUS response expressions are identical to RADIUS request expressions, except that RES replaces REQ.

Typecasts of AVP Values:

The ADC supports expressions to typecast RADIUS AVP values to the text, integer, unsigned integer, long, unsigned long, ipv4 address, ipv6 address, ipv6 prefix and time data types. The syntax is the same as for other NetScaler typecast expressions.

Example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The ADC supports expressions to typecast RADIUS AVP values to the text, integer, unsigned integer, long, unsigned long, ipv4 address, ipv6 address, ipv6 prefix and time data types. The syntax is the same as for other NetScaler typecast expressions.

```
RADIUS.REQ.AVP(8).VALUE(0).typecast_ip_address_at
```

AVP Type Expressions:

The NetScaler supports expressions to extract RADIUS AVP values by using the assigned integer codes described in RFC2865 and RFC2866. You can also use text aliases to accomplish the same task. Some examples follow.

- RADIUS.REQ.AVP (1).VALUE or RADIUS.REQ.USERNAME.value. Extracts the RADIUS username value.
- RADIUS.REQ.AVP (4). VALUE or RADIUS.REQ. ACCT_SESSION_ID.value. Extracts the Acct-Session-ID AVP (code 44) from the message.
- RADIUS.REQ.AVP (26). VALUE or RADIUS.REQ.VENDOR_SPECIFIC.VALUE. Extracts the vendor-specific value.

The values of most commonly-used RADIUS AVPs can be extracted in the same manner.

RADIUS Bind Points:

Four global bind points are available for policies that contain RADIUS expressions.

- RADIUS_REQ_OVERRIDE. Priority/override request policy queue.
- RADIUS_REQ_DEFAULT. Standard request policy queue.
- RADIUS_RES_OVERRIDE. Priority/override response policy queue.
- RADIUS_RES_DEFAULT. Standard response policy queue.

RADIUS Responder-Specific Expressions:

- RADIUS_RESPONDWITH. Respond with the specified RADIUS response. The response is created with NetScaler expressions, both RADIUS expressions and any others that are applicable.
- RADIUS.NEW_ANSWER. Sends a new RADIUS answer to the user.
- RADIUS.NEW_ACCESSREJECT. Rejects the RADIUS request.
- RADIUS.NEW_AVP. Adds the specified new AVP to the response.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Use Cases

Following are use cases for RADIUS with responder.

Blocking RADIUS Requests from a Specific Network

To configure the responder feature to block authentication requests from a specific network, begin by creating a responder action that rejects requests. Use the action in a policy that selects requests from the networks that you want to block. Bind the responder policy to a RADIUS-specific global bind point, specifying:

- The priority
- END as the nextExpr value, to ensure that policy evaluation stops when this policy is matched
- RADIUS_REQ_OVERRIDE as the queue to which you assign the policy, so that it is evaluated before policies assigned to the default queue

To configure Responder to block logons from a specific network**

- `add responder action <actName> <actType>`
- `add responder policy <polName> <rule> <actName>`
- `bind responder global <polName> <priority> <nextExpr> -type <bindPoint>`

Example:

```
> add responder action rspActRadiusReject respondwith
radius.new_accessreject

Done

> add responder policy rspPolRadiusReject
client.ip.src.in_subnet(10.224.85.0/24) rspActRadiusReject

Done

> bind responder global rspPolRadiusReject 1 END -type RADIUS_REQ_OVERRIDE
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

DNS Support for the Responder Feature

You can configure the responder feature to respond to DNS requests as it does to HTTP and TCP requests. For example, you could configure it to send DNS responses over UDP and ensure that the DNS requests from the client are sent over TCP. A number of NetScaler expressions support examination of the DNS header in the request. These expressions examine specific header fields and send an appropriate response.

- **DNS Expressions**. In a responder configuration, you can use the following NetScaler expressions to refer to various portions of a DNS request:

EXPRESSIONS	DESCRIPTIONS
DNS.NEW_RESPONSE	Creates a new empty DNS response based on the request.
DNS.NEW_RESPONSE `<AA, TC, rcode>`	Creates a new DNS response based on the specified parameters.

- **DNS Bind Points**. The following global bind points are available for policies that contain DNS expressions.

BIND POINTS	DESCRIPTIONS
DNS_REQ_OVERRIDE	Priority/override request policy queue.
DNS_REQ_DEFAULT	Standard request policy queue.

  In addition to the default bind points, you can create policy labels of type DNS and bind DNS policies to them.

Configuring Responder Policies for DNS

The following procedure uses the NetScaler command line to configure a responder action and policy and bind the policy to a responder-specific global bind point.

To configure Responder to respond to a DNS request:

At the command prompt, type the following commands:

1. `add responder action <actName> <actType>`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

For `<actname>`, substitute a name for your new action. The name can be 1 to 127 characters in length, and can contain letters, numbers, hyphen (-), and underscore (_) symbols. For `<actType>`, substitute a responder action type, *respondWith*.

2. `add responder policy <polName> <rule> <actName>`

   For `<polname>`, substitute a name for your new policy. For `<actname>`, the name can be 1 to 127 characters in length, and can contain letters, numbers, hyphen (-), and underscore (_) symbols. For `<actname>`, substitute the name of the action that you just created.

3. `bind responder policy <polName> <priority> <nextExpr> -type <bindPoint>`

   For `<bindPoint>`, specify one of the responder-specific global bind points. For `<polName>`, substitute the name of the policy that you just created. For `<priority>`, specify the priority of the policy.

Sample configuration - Enforce all DNS request over TCP:

To enforce all the DNS requests over TCP, create a responder action that will set the TC bit and rcode as NOERROR.

```
> add responder action resp_act_set_tc_bit respondwith
DNS.NEW_RESPONSE(true, true, NOERROR)

Done

> add responder policy enforce_tcp  dns.REQ.TRANSPORT.EQ(udp)
 resp_act_set_tc_bit

Done

>bind lb vserver dns_udp –policyName  enforce_tcp   -type request –
priority 100

Done
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

MQTT support for responder

The Responder feature supports the MQTT protocol. You can configure responder policies to take an action based on the parameters in the incoming MQTT message.

The action responds with any of the following to a new connection:

- DROP
- RESET
- NOOP
- A responder action to initiate a new MQTT CONNACK response.

Configuring responder policies for MQTT

After enabling the responder feature, you must configure one or more actions for handling MQTT requests. Then, configure a responder policy. You can bind the responder policies globally, or to a specific load balancing virtual server or content switching virtual server.

The following bind points are available to bind the responder policies globally:

- MQTT_REQ_DEFAULT
- MQTT_REQ_OVERRIDE
- MQTT_JUMBO_REQ_DEFAULT
- MQTT_JUMBO_REQ_OVERRIDE

The following bind points are available to bind the responder policies to a content switching or load balancing virtual server:

- REQUEST
- MQTT_JUMBO_REQ (this bind point is used only for Jumbo packets)

To configure the responder to respond to an MQTT request by using CLI

At the command prompt, type the following commands:

Configure a responder action.

```
add responder action <actName> <actType>
```

- For `actname`, substitute a name for your new action. The name can be 1–127 characters in length, and can contain letters, numbers, hyphen (-), and underscore (_) symbols.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- For `actType`, substitute a responder action type, respondwith.

Example:

```
add responder action mqtt_connack_unsup_ver respondwith
MQTT.NEW_CONNACK(132)
```

Configure a responder policy. The NetScaler appliance responds to the MQTT requests that are selected by this responder policy.

```
add responder policy <polName> <rule> <actname>
```

- For `polname`, substitute a name for your new policy.
- For `actname`, substitute the name of the action that you created.

Example:

```
add responder policy reject_lower_version "MQTT.HEADER.COMMAND.EQ(CONNECT)
&& MQTT.VERSION.LT(3)" mqtt_connack_unsup_ver
```

Bind the responder policy to a specific load balancing virtual server or content switching virtual server. The policy applies only to the MQTT requests whose destination IP address is the VIP of that virtual server.

```
bind lb vserver <name> -policyName <policy_name> -priority <priority>

bind cs vserver <name> -policyName <policy_name> -priority <priority>
```

- For `policy_name`, substitute the name of the policy that you have created.
- For `priority`, specify the priority of the policy.

Example:

```
bind lb vserver lb1 -policyName reject_lower_version -priority 50
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
bind cs vserver mqtt_frontend_cs -policyName reject_lower_version
-priority 5
```

Use case1: Filter clients based on the user name or client ID

The administrator can configure an MQTT responder policy to reject the connection based on the user name or client ID in the MQTT CONNECT message.

Sample configuration for filtering clients based on the client ID

```
add policy patset filter_clients

bind policy patset filter_clients client1

add responder action mqtt_connack_invalid_client respondwith
MQTT.NEW_CONNACK(2)

add responder policy reject_clients "MQTT.HEADER.COMMAND.EQ(CONNECT) &&
mqtt.connect.clientid.equals_any(\"filter_clients\")"
mqtt_connack_invalid_client

bind cs vserver mqtt_frontend_cs -policyName reject_clients -priority 5
```

Use case2: Limit the maximum message length of MQTT messages to handle jumbo packets

The administrator can configure an MQTT responder policy to drop the client connection if the length of the message exceeds a certain threshold, or take necessary action based on the requirement.

To handle jumbo packets, the responder policies with any of the following rule patterns are bound to the jumbo bind point:

- MQTT.MESSAGE_LENGTH
- MQTT.COMMAND

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- MQTT.FROM_CLIENT
- MQTT.FROM_SERVER

Policies bound to jumbo bind points are evaluated only for jumbo packets.

Sample configuration for limiting the maximum message length of MQTT messages

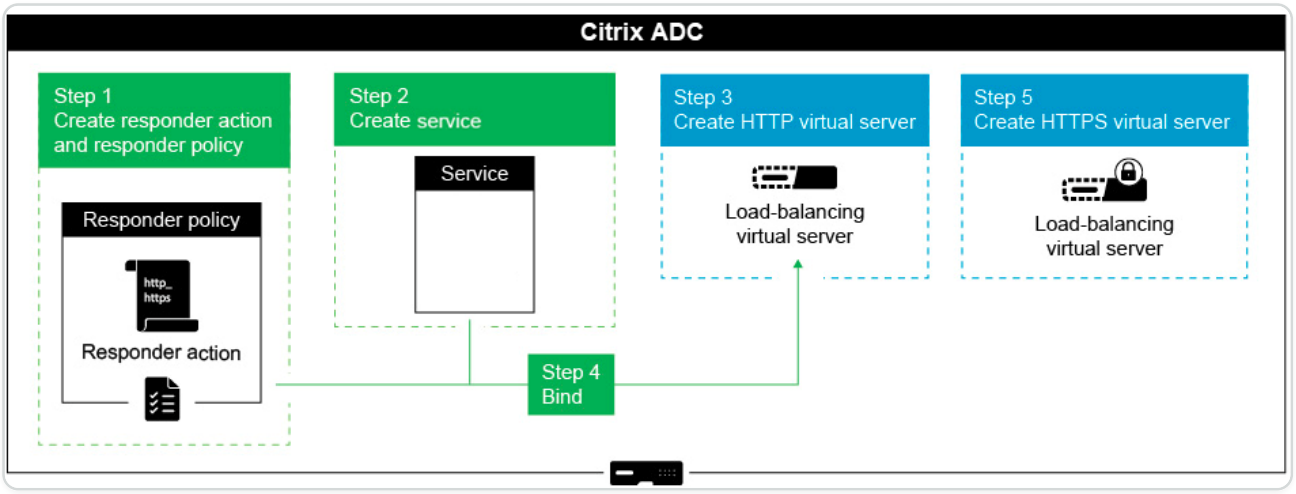
```
set lb parameter -dropmqttjumbomessage no

add responder policy drop_large_message MQTT.MESSAGE_LENGTH.GT(100000)
reset

bind cs vserver mqtt_frontend_cs -policyName drop_large_message -priority
10
```

In this example, the `dropmqttjumbomessage` parameter is set to NO. Therefore, the ADC appliance processes the messages with length greater than 64,000 bytes and less than 1,00,000 bytes. The messages with length greater than 1,00,000 bytes are reset.

How to redirect HTTP request to HTTPS using responder



This article explains how to configure the responder feature with a load balancing virtual server IP addresses and redirect client requests from HTTP to HTTPS.

Consider a scenario where a user might attempt to access a secure website by sending an HTTP request. Instead of dropping the request, you might want to redirect the request to a secure website. You can use the responder feature to redirect the request to the secure website without changing the path and the URL query, which the user attempts to access.

How NetScaler responder redirects a request from HTTP to HTTPS

The following illustration shows a step by step flow of how the appliance redirects a request.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To configure the Responder feature with the Load Balancing VIP addresses of a NetScaler® appliance, follow these steps. This setup redirects client requests from HTTP to HTTPS.

Enable the responder feature on the appliance

To enable the responder feature on the appliance, navigate to **System** > **Settings** > **Configure Advanced Features** and select **Responder**.

Create a responder action

To create a responder action, perform the following steps:

1. Navigate to **AppExpert** > **Responder** > **Actions** and click **Add**.
2. Specify an appropriate name, such as http_to_https_actn, in the **Name** field.
3. Select **Redirect** as **Type**.
4. In the **Expression** field, type the following expression:

   `"https://" + HTTP.REQ.HOSTNAME.HTTP_URL_SAFE + HTTP.REQ.URL.PATH_AND_QUERY.HTTP_URL_SAFE`.
5. Click **Create**.

Create responder policy

To create a responder policy, perform the following steps:

1. Navigate to **AppExpert** > **Responder** > **Policies** and click **Add**.
2. Specify an appropriate name, such as http_to_https_pol, in the **Name** field.
3. From the **Action** list, select the action name that you have created.
4. From the **Undefined Action list**, select RESET.
5. Type the **HTTP.REQ.IS_VALID** expression in the **Expression** field as shown in the following screenshot.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Create a service

To create a service, perform the following steps:

1. Navigate to **Load Balancing** > **Services** and click **Add**.
2. Specify an appropriate name, such as Always_UP_service, in the **Name** field.
3. Specify a non-existent IP address in the **Server** field.
4. Specify 80 in the **Port** field.

Create a Load Balancing Virtual Server

1. Navigate to **Load Balancing** > **Services** and then click **Add**.
2. Specify an appropriate name in the **Name** field.
3. Specify the IP address of the website in the **IP Address** field.
4. Select HTTP from the **Protocol** list.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

5. Type 80 in the Port field.
6. Click the **Policies** tab.
7. Bind the Responder policy that you created to the HTTP Load Balancing VIP address of the website.
8. Create a secure Load Balancing virtual server that has the IP address of the website and port as 443.

To create a configuration similar to the preceding procedure from the command line interface of the appliance, run the following commands:

```
enable ns feature responder

add responder action http_to_https_actn redirect "\"https://\" +
http.req.hostname.HTTP_URL_SAFE +
http.REQ.URL.PATH_AND_QUERY.HTTP_URL_SAFE"

add responder policy http_to_https_pol HTTP.REQ.IS_VALID
http_to_https_actn RESET

add service Always_UP_service 1.2.3.4 HTTP 80 -gslb NONE -maxClient 0
-maxReq 0 -cip ENABLED dummy -usip NO -sp OFF -cltTimeout 180 -svrTimeout
360 -CKA NO -TCPB NO -CMP YES

add lb vserver http_site.com HTTP 10.217.96.238 80 -persistenceType
COOKIEINSERT -timeout 0 -cltTimeout 180

bind lb vserver http_site.com Always_UP_service

bind lb vserver http_site.com -policyName http_to_https_pol -priority 1
-gotoPriorityExpression END
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTES:

- The status of the port 80 Load Balancing Redirect virtual server must be UP for the redirect to work.
- Web browsers might not redirect correctly if the HTTPS virtual server is not active.
- This redirect setup allows for situations where multiple domains are bound to the same IP address.
- If the client sends an invalid HTTP request to the redirect virtual server, then the appliance sends a RESET message code.

Troubleshooting

If the responder feature does not work as expected after you have configured it, you can use some common tools to access NetScaler resources and diagnose the problem.

Resources for Troubleshooting

For best results, use the following resources to troubleshoot an integrated cache issue on a NetScaler appliance:

- The ns.conf file
- The relevant trace files from the client and the NetScaler appliance

In addition to the above resources, the following tools expedite troubleshooting:

- The iehttpheaders or a similar utility
- The Wireshark application customized for the NetScaler trace files

Troubleshooting Responder Issues

- **Issue**

  The Responder feature is configured, but the responder action is not working.

  Resolution

  - Verify that the feature is enabled.
  - Check the hit counters of any of the policies to see if the counters are getting incremented.
  - Verify that the policies and actions are configured correctly.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Verify that the actions and policies are bound appropriately.
- Record the packet traces on the client and the NetScaler appliance, and analyze the them to get some pointer to the issue.
- Record the iehttpHeaters packet traces on the client and verify the HTTP requests and responses to get some pointer to the issue.

- **Issue**

  You need to create a maintenance page.

  Resolution

1. Configure the services and virtual Server.
2. Configure a backup virtual server with a service bound to it. This ensures that the status of the Web site is always displayed as UP.
3. Configure the primary virtual server to use the backup virtual server as a backup.
4. Create a responder action with an appropriate target. Following is an example for your reference:

   ```
   add responder action sorry_page respondwith q{"HTTP/1.0 200 OK" +"\r\n\r\n" +
   "<html><body>Sorry, this page is not available\</body>\</html>" + "\r\n"}
   ```

5. Create a responder policy and bind the action to it.
6. Bind the responder policy to the backup virtual Server.

Rewrite

WARNING:

Filter features using classic policies are deprecated and as an alternative Citrix® recommends you to use the rewrite and responder features with advanced policy infrastructure.

Rewrite refers to the rewriting of some information in the requests or responses handled by the NetScaler appliance. Rewriting can help in providing access to the requested content without exposing unnecessary details about the website's actual configuration. A few situations in which the rewrite feature is useful are as follows:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- To improve security, the NetScaler can rewrite all the `http://links` to `https://` in the response body.
- In the SSL offload deployment, the insecure links in the response have to be converted into secure links. Using the rewrite option, you can rewrite all the `http://links` to `https://` for making sure that the outgoing responses from NetScaler to the client have the secured links.
- If a website has to show an error page, you can show a custom error page instead of the default 404 Error page. For example, if you show the home page or site map of the website instead of an error page, the visitor remains on the site instead of moving away from the website.
- If you want to launch a new website, but use the old URL, you can use the Rewrite option.
- When a topic in a site has a complicated URL, you can rewrite it with a simple, easy-to-remember URL (also referred to as 'cool URL').
- You can append the default page name to the URL of a website. For example, if the default page of a company's website is `http://www.abc.com/index.php`, when the user types 'abc.com' in the address bar of the browser, you can rewrite the URL to 'abc.com/index.php'.

When you enable the rewrite feature, NetScaler can modify the headers and body of HTTP requests and responses.

To rewrite HTTP requests and responses, you can use protocol-aware NetScaler policy expressions in the rewrite policies you configure. The virtual servers that manage the HTTP requests and responses must be of type HTTP or SSL. In HTTP traffic, you can take the following actions:

- Modify the URL of a request
- Add, modify, or delete headers
- Add, replace, or delete any specific string within the body or headers.

To rewrite TCP payloads, consider the payload as a raw stream of bytes. Each of the virtual servers that managing the TCP connections must be of type TCP or SSL_TCP. The term TCP rewrite is used to refer to the rewrite of TCP payloads that are not HTTP data. In TCP traffic, you can add, modify, or delete any part of the TCP payload.

For examples to use the rewrite feature, see Rewrite Action and Policy Examples.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Comparison between Rewrite and Responder options

The main difference between the rewrite feature and the responder feature is as follows:

Responder cannot be used for response or server-based expressions. Responder can be used only for the following scenarios depending on client parameters:

- Redirecting an HTTP request to new websites or webpages
- Responding with some custom response
- Dropping or resetting a connection at request level

If there is a responder policy, the NetScaler examines the request from the client, takes action according to the applicable policies, sends the response to the client, and closes the connection with the client.

If there is a rewrite policy, the NetScaler examines the request from the client or response from the server, takes action according to the applicable policies, and forwards the traffic to the client or the server.

In general, it is recommended to use a responder if you want the NetScaler to reset or drop a connection based on a client or request-based parameter. Use the responder to redirect traffic, or respond with custom messages. Use rewrite for manipulating data on HTTP requests and responses.

How rewrite works

A rewrite policy consists of a rule and action. The rule determines the traffic on which rewrite is applied and the action determines the action to be taken by the NetScaler. You can define multiple rewrite policies. For each policy, specify the bind point and priority.

A bind point refers to a point in the traffic flow at which the NetScaler examines the traffic to verify whether any rewrite policy can be applied to it. You can bind a policy to a specific load balancing or content switching virtual server, or make the policy global if you want the policy to be applied to the entire traffic handled by the NetScaler. These policies are referred to as global policies.

In addition to the user-defined policies, the NetScaler has some default policies. You cannot modify or delete a default policy.

For evaluating the policies, NetScaler follow these order:

- Global policies
- Policies bound to specific virtual servers

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Default policies

NOTE:

NetScaler can apply a rewrite policy only when it is bound to a point.

NetScaler implements the rewrite feature in the following steps:

- The NetScaler appliance checks for global policies and then checks for policies at individual bind points.
- If multiple policies are bound to a bind point, the NetScaler evaluates the policies in the order of their priority. The policy with the highest priority is evaluated first. After evaluating each policy, if the policy is evaluated to TRUE, it adds the action associated with the policy the associated action is performed. A match occurs when the characteristics specified in the policy rule match the characteristics of the request or response being evaluated.
- For any policy, in addition to the action, you can specify the policy that must be evaluated after the current policy is evaluated. This policy is referred to as the 'Go to Expression'. For any policy, if a Go to Expression (gotoPriorityExpr) is specified, the NetScaler evaluates the Go to Expression policy. It ignores the policy with the next highest priority.

  You can specify the priority of the policy to indicate the Go to Expression policy; you cannot use the name of the policy. If you want the NetScaler to stop evaluating other policies after evaluating a particular policy, you can set the Go to Expression to 'END'.
- After all the policies are evaluated or when a policy has the Go to Expression set as END, the NetScaler starts performing the actions according to the list of actions.

For more information about configuring rewrite policies, see Configuring a Rewrite Policy and about binding rewrite policies, see Binding a Rewrite Policy.

The following figure illustrates how NetScaler processes a request or response when the rewrite feature is used.

Figure 1. The Rewrite Process

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Policy Evaluation

The policy with the highest priority is evaluated first. NetScaler does not stop the evaluation of rewrite policies when it finds a match. It evaluates all the rewrite policies configured on the NetScaler.

- If a policy evaluates to TRUE, the NetScaler follows the procedure below:
  - If the policy has the Go to Expression set to END, the NetScaler stops evaluating all the other policies and starts performing the rewrite.
  - The gotoPriorityExpression can be set to 'NEXT', 'END', some integer or 'INVOCATION_LIST'. The value determines the policy with the next priority. The following table shows the action taken by NetScaler for each value of the expression.

    | **Value of the expression** | **Action** | |---|--| | NEXT | The policy with the next priority gets evaluated.| | END | Evaluation of policies stops.| | `<an integer>` | Policy with specified priority gets evaluated.| | INVOCATION_LIST| Goto NEXT or END is applied based on the result of the invocation list. |

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- If a policy evaluates to FALSE, the NetScaler continues the evaluation in the order of priority.
- If a policy evaluates to UNDEFINED (cannot be evaluated on the received traffic due to an error), the NetScaler performs the action assigned to the UNDEFINED condition (referred to as undefAction) and stops further evaluation of policies.

The NetScaler starts the actual rewriting only after the evaluation is complete. It refers to the list of actions identified by policies that are evaluated to TRUE, and starts the rewriting. After implementing all the actions in the list, the NetScaler forwards the traffic as required.

NOTE:

Ensure that the policies do not specify conflicting or overlapping actions on the same part of the HTTP header or body, or TCP payload. When such a conflict occurs, the NetScaler encounters an undefined situation and aborts the rewrite.

Rewrite Actions

On the NetScaler appliance, specify the actions to be taken such as adding, replacing, or deleting text within the body, or adding, modifying, or deleting headers, or any changes in the TCP payload as rewrite actions. For more information about rewrite actions, see Configuring a Rewrite Action.

The following table describes the steps the NetScaler can take when a policy evaluates to TRUE.

ACTION	RESULT
Insert	The rewrite action specified for the policy is carried out.
NOREWRITE	The request or response is not rewritten. NetScaler forwards the traffic without rewriting any part of the message.
RESET	The connection is aborted at the TCP level.
DROP	The message is dropped.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE

.

For any policy, you can configure the underaction (action to be taken when the policy evaluates to UNDEFINED) as NOREWRITE, RESET, or DROP.

To use the Rewrite feature, take the following steps:

- Enable the feature on the NetScaler.
- Define rewrite actions.
- Define rewrite policies.
- Bind the policies to a bind point to bring a policy into effect.

Enable rewrite

Enable the rewrite feature on the NetScaler appliance if you want to rewrite the HTTP or TCP requests or responses. If the feature is enabled, NetScaler takes rewrite action according to the specified policies. For more information, see How rewrite works.

To enable the rewrite feature by using the command line interface

At the command prompt, type the following commands to enable the rewrite feature and verify the configuration:

- enable ns feature REWRITE
- show ns feature

Example:

```
> enable ns feature REWRITE

 Done

> show ns feature

        Feature                         Acronym             Status

        -------                         -------             ------
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
1)     Web Logging                    WL                  OFF

2)     Surge Protection               SP                  ON

.

.

.

1)     Rewrite                        REWRITE             ON

.

.

1)     NetScaler Push                 push                OFF

Done
```

To enable the rewrite feature by using the GUI

1. In the navigation pane, click **System**, and then click **Settings**.
2. In the details pane, under Modes and Features, click **Configure basic features**.
3. In the **Configure Basic Features** dialog box, select the Rewrite check box, and then click **OK**.
4. In the **Enable/Disable Feature(s)** dialog box, click **Yes**. A message appears in the status bar, stating that the selected feature was enabled.

Configuring a Rewrite Action

WARNING

The Pattern function in a rewrite action is deprecated from NetScaler 12.0 build 56.20 onwards and as an alternative, Citrix recommends you to use the Search rewrite action parameter.

A rewrite action indicates changes made to a request or response prior to sending it to a server or client.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Expressions define the following:

- Rewrite action type.
- Location of the rewrite action.
- Rewrite action configuration type.

For Example, a DELETE action only uses a target expression. A REPLACE action uses a target expression and an expression to configure the replacement text.

After enabling the rewrite feature, you need to configure one or more actions unless a built-in rewrite action is sufficient. All of the built-in actions have names beginning with the string ns_cvpn, followed by a string of letters and underscore characters. Built-in actions perform useful and complex tasks such as decoding parts of a clientless VPN request or response or modifying JavaScript or XML data. The built-in actions can be viewed, enabled, and disabled, but cannot be modified or deleted.

Note:

> Action types that can be used only for HTTP rewrite are identified in the **Rewrite Action Type** column.

For more information, see **Type parameter**.

Create a rewrite action by using the command line interface

At the command prompt, type the following commands to create a rewrite action and verify the configuration:

- `add rewrite action <name> <type> <target> [<stringBuilderExpr>] [-search <expression>] [refineSearch <expression>] [-comment<string>]`
- `show rewrite action <name>`

For more information, see the Rewrite Action Types and their Arguments table.

The rewrite feature has the following built-in actions:

- NOREWRITE-Sends the request or response to the user without rewriting it.
- RESET - Resets the connection and notifies the user's browser, so that the user can resend the request.
- DROP - Drops the connection without sending a response to the user.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

One of the following flow types is implicitly associated with every action:

- Request - Action applies to the request.
- Response - Action applies to the response.
- Neutral - Action applies to both requests and responses.

Name

Name for the user-defined rewrite action. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Can be changed after the rewrite policy is added.

Type parameter

The **Type** parameter shows the type of user-defined rewrite action.

Following are the values of the **Type** parameter:

- `REPLACE <target> <string_builder_expr>`. Replaces the target string with the string-builder expression.

Example:

```
> add rewrite action replace_http_act replace http.res.body(100)
'"new_replaced_data"'

Done

> sh rewrite action replace_http_act

Name: replace_http_act

Operation: replace

Target:http.res.body(100)

Value:"new_replaced_data"

Hits: 0

Undef Hits: 0
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Action Reference Count: 0

Done
```

- `REPLACE_ALL <target> <string_builder_expr1> -(search) <s>` - In the request or response specified by `<target>`, replaces all occurrences of the string defined by `<pattern_to_search>` with the string defined by `<string_builder_expr>`. You can use the search option to find the strings to be replaced.

Example:

```
> add policy patset pat_list_2

Done

> bind policy patset pat_list_2 "www.abc.com"

Done

> bind policy patset pat_list_2 "www.def.com"

Done

> add rewrite action refineSearch_act_31 replace_all
"HTTP.RES.BODY(100000)" "\"https://\""-search "patset(\"pat_list_2\")"
-refineSearch "EXTEND(7,0).REGEX_SELECT(re#http://#)"

Done

> sh rewrite action refineSearch_act_31

Name: refineSearch_act_31

Operation: replace_all

Target:HTTP.RES.BODY(100000)

Refine Search:EXTEND(7,0).REGEX_SELECT(re#http://#)
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Value:"https://"

Search: patset("pat_list_2")

Hits: 0

Undef Hits: 0

Action Reference Count: 0

Done
```

- `REPLACE_HTTP_RES <string_builder_expr>`. Replaces the complete HTTP response with the string defined by the string-builder expression.

Example:

```
> add rewrite action replace_http_res_act replace_http_res '"HTTP/1.1 200
OK\r\n\r\nSending from ADC"'

 Done

> sh rewrite action replace_http_res_act

Name: replace_http_res_act

Operation: replace_http_res

Target:"HTTP/1.1 200 OK

Sending from ADC"

Hits: 0

Undef Hits: 0

Action Reference Count: 0

Done
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- `REPLACE_SIP_RES <target>`. Replaces the complete SIP response with the string specified by `<target>`.

Example:

```
> add rewrite action replace_sip_res_act replace_sip_res '"HTTP/1.1 200
OK\r\n\r\nSending from ADC"'

Done

> sh rewrite action replace_sip_res_act

Name: replace_sip_res_act

Operation: replace_sip_res

Target:"HTTP/1.1 200 OK

Sending from ADC"

Hits: 0

Undef Hits: 0

Action Reference Count: 0

Done
```

- `INSERT_HTTP_HEADER <header_string> <contents_string_builder_expr>`. Inserts the HTTP header specified by `header_string` and header contents specified by `contents_string_builder_expr`.

Example:

```
> add rewrite action ins_cip_header insert_http_header "CIP"
"CLIENT.IP.SRC"

Done

> sh rewrite action ins_cip_header
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Name: ins_cip_header

Operation: insert_http_header

Target:CIP

Value:CLIENT.IP.SRC

Hits: 0

Undef Hits: 0

Action Reference Count: 0

Done
```

- `DELETE_HTTP_HEADER <target>`. Deletes the HTTP header specified by `<target>`

Example:

```
> add rewrite action del_true_client_ip_header delete_http_header "True-
Client-IP"

Done

> sh rewrite action del_true_client_ip_header

Name: del_true_client_ip_header

Operation: delete_http_header

Target:True-Client-IP

Hits: 0

Undef Hits: 0

Action Reference Count: 0

Done
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- `CORRUPT_HTTP_HEADER <target>`. Replaces the header name of all occurrences of the HTTP header specified by `<target>` with a corrupted name, so that it will not be recognized by the receiver Example: MY_HEADER is changed to MHEY_ADER.

Example:

```
> add rewrite action corrupt_content_length_hdr corrupt_http_header
"Content-Length"

Done

> sh rewrite action corrupt_content_length_hdr

Name: corrupt_content_length_hdr

Operation: corrupt_http_header

Target:Content-Length

Hits: 0

Undef Hits: 0

Action Reference Count: 0

Done
```

- `INSERT_BEFORE <string_builder_expr1> <string_builder_expr1>`. Finds the string specified in `<string_builder_expr1>` and inserts the string in `<string_builder_expr2>` before it.

```
> add rewrite action insert_before_ex_act insert_before http.res.body(100)
'"Add this string in the starting"'

Done

> sh rewrite action insert_before_ex_act
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Name: insert_before_ex_act

Operation: insert_before

Target:http.res.body(100)

Value:"Add this string in the starting"

Hits: 0

Undef Hits: 0

Action Reference Count: 0

Done
```

- `INSERT_BEFORE_ALL <target> <string_builder_expr1> -(search) <string_builder_expr2>`. In the request or response specified by `<target>`, locates all occurrences of the string specified in <string_builder_expr2> and inserts the string specified in <string_builder_expr1> before it. You can use the search option to find the strings.

Example:

```
> add policy patset pat

 Done

> bind policy patset pat abcd

 Done

> add rewrite action refineSearch_act_1 insert_before_all
http.res.body(10) 'target.prefix(10) + "refineSearch_testing"' -search
patset("pat") -refineSearch extend(10,10)

 Done

> sh rewrite action refineSearch_act_1
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Name: refineSearch_act_1

Operation: insert_before_all

Target:http.res.body(10)

Refine Search:extend(10,10)

Value:target.prefix(10) + "refineSearch_testing"

Search: patset("pat")

Hits: 0

Undef Hits: 0

Action Reference Count: 0

Done
```

- `INSERT_AFTER <string_builder_expr1> <string_builder_expr2>`. Inserts the string specified by `string_builder_expr2` after the string `string_builder_expr1`.

Example:

```
> add rewrite action insert_after_act insert_after http.req.body(100)
'"add this string after 100 bytes"'

Done

> sh rewrite action insert_after_act

Name: insert_after_act

Operation: insert_after

Target:http.req.body(100)

Value:"add this string after 100 bytes"

Hits: 0
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Undef Hits: 0

Action Reference Count: 0

Done
```

- `INSERT_AFTER_ALL <target> <string_builder_expr1> -(search) <string_builder_expr2>`. In the request or response specified by `<target>`, locates all occurrences of the string specified by `<string_builder_expr2>` and inserts the string specified by `<string_builder_expr1>` after it. You can use the search facility to find the strings.

Example:

```
> add rewrite action refineSearch_act_2 insert_after_all
http.res.body(100) '"refineSearch_testing"' -search text("abc")
-refineSearch extend(0, 10)

Done

> sh rewrite action refineSearch_act_2

Name: refineSearch_act_2

Operation: insert_after_all

Target:http.res.body(100)

Refine Search:extend(0, 10)

Value:"refineSearch_testing"

Search: text("abc")

Hits: 0

Undef Hits: 0
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Action Reference Count: 0

Done
```

- `DELETE <target>`. Deletes the string specified by target.

Example:

```
> add rewrite action delete_ex_act delete http.req.header("HDR")

Done

> sh rewrite action delete_ex_act

Name: delete_ex_act

Operation: delete

Target:http.req.header("HDR")

Hits: 0

Undef Hits: 0

Action Reference Count: 0

Done
```

- `DELETE_ALL <target> -(search) <string_builder_expr>`. In the request or response specified by `<target>`, locates and deletes all occurrences of the string specified by `<string_builder_expr>`. You can use the search facility to find the strings.

Example:

```
>add rewrite action refineSearch_act_4 delete_all "HTTP.RES.BODY(50000)"
-search text("Windows Desktops") -refineSearch
"EXTEND(40,40).REGEX_SELECT(re#\\s`*`<AppData>.`*`\\s`*`<\\/AppData>#)"
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Done

> show REWRITE action refineSearch_act_4

Name: refineSearch_act_4

Operation: delete_all

Target:HTTP.RES.BODY(50000)

Refine Search:EXTEND(40,40).REGEX_SELECT(re#\s`*`<AppData>.`*`\s`*`<\/
AppData>#)

Search: text("Windows Desktops")

Hits: 0

Undef Hits: 0

Action Reference Count: 0

Done
```

- `REPLACE_DIAMETER_HEADER_FIELD <target> <field value>`. In the request or responses modify the header field specified by `<target>`. Use `Diameter.req.flags.SET(<flag>)` or `Diameter.req.flags.UNSET<flag>` as `stringbuilderexpression` to set or unset flags.

Example:

```
> add rewrite action replace_diameter_field_ex_act
 replace_diameter_header_field diameter.req.flags
diameter.req.flags.set(PROXIABLE)

Done

> sh rewrite action replace_diameter_field_ex_act

Name: replace_diameter_field_ex_act
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Operation: replace_diameter_header_field

Target:diameter.req.flags

Value:diameter.req.flags.set(PROXIABLE)

Hits: 0

Undef Hits: 0

Action Reference Count: 0

Done
```

- `REPLACE_DNS_HEADER_FIELD <target>`. In the request or response modifies the header field specified by `<target>`.

Example:

```
> add rewrite action replace_dns_hdr_act replace_dns_header_field
dns.req.header.flags.set(AA)

Done

> sh rewrite action replace_dns_hdr_act

Name: replace_dns_hdr_act

Operation: replace_dns_header_field

Target:dns.req.header.flags.set(AA)

Hits: 0

Undef Hits: 0

Action Reference Count: 0

Done
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- `REPLACE_DNS_ANSWER_SECTION <target>`. Replace the DNS answer section in the response. This is applicable for A and AAAA records only. Use `DNS.NEW_RRSET_A` and `NS.NEW_RRSET_AAAA` expressions to configure the new answer section.

Example:

```
> add rewrite action replace_dns_ans_act replace_dns_answer_section
 DNS.NEW_RRSET_A("1.1.1.1", 10)

Done

> sh rewrite action replace_dns_ans_act

Name: replace_dns_ans_act

Operation: replace_dns_answer_section

Target:DNS.NEW_RRSET_A("1.1.1.1", 10)

Hits: 0

Undef Hits: 0

Action Reference Count: 0

Done
```

- `CLIENTLESS_VPN_DECODE<target>`. Decodes the pattern specified by the target In clientless VPN format.

Example:

```
> add rewrite action cvpn_decode_act_1 clientless_vpn_decode
http.req.body(100)
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Done

> sh rewrite action cvpn_decode_act_1

Name: cvpn_decode_act_1

Operation: clientless_vpn_decode

Target:http.req.body(100)

Hits: 0

Undef Hits: 0

Action Reference Count: 0

Done
```

- `CLIENTLESS_VPN_DECODE_ALL<target>-search<expression>`. Decodes ALL the patterns specified by search parameter In clientless VPN format.

Example:

```
> add rewrite action act1 clientless_vpn_decode_all http.req.body(100)
-search text("abcd")

Done

> sh rewrite action act1

Name: act1

Operation: clientless_vpn_decode_all

Target:http.req.body(100)

Search: text("abcd")

Hits: 0
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Undef Hits: 0

Action Reference Count: 0

Done
```

- `CLIENTLESS_VPN_ENCODE<target>`. Encodes the pattern specified by target in clientless VPN format.

Example:

```
> add rewrite action cvpn_encode_act_1 clientless_vpn_encode
http.req.body(100)

Done

> sh rewrite action cvpn_encode_act_1

Name: cvpn_encode_act_1

Operation: clientless_vpn_encode

Target:http.req.body(100)

Hits: 0

Undef Hits: 0

Action Reference Count: 0

Done
```

- `CLIENTLESS_VPN_ENCODE_ALL<target>-search<expression>`. Encodes ALL the patterns specified search parameter in clientless VPN format.

Example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
> add rewrite action act2 clientless_vpn_encode_all http.req.body(100)
-search text("abcd")

Done

> sh rewrite action act2

Name: act1

Operation: clientless_vpn_encode_all

Target:http.req.body(100)

Search: text("abcd")

Hits: 0

Undef Hits: 0

Action Reference Count: 0

Done
```

- `CORRUPT_SIP_HEADER<target>`. Replaces the header name of all occurrences of the SIP header specified by `<target>` with a corrupted name, so that the receiver doesn't recognize it.

Example:

```
> add rewrite action corrupt_sip_hdr_act corrupt_sip_header SIP_HDR

Done

> sh rewrite action corrupt_sip_hdr_act

Name: corrupt_sip_hdr_act
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Operation: corrupt_sip_header

Target:SIP_HDR

Hits: 0

Undef Hits: 0

Action Reference Count: 0

Done
```

- `INSERT_SIP_HEADER <header_string_builder_expr> <contents_string_builder_expr>`. Inserts the SIP header specified by `<header_string_builder_expr>` and header contents specified by `<contents_string_builder_expr>`.

Example:

```
> add rewrite action insert_sip_hdr_act insert_sip_header SIP_HDR
'"inserting_sip_header"'

 Done

>sh rewrite action insert_sip_hdr_act

Name: insert_sip_hdr_act

Operation: insert_sip_header

Target:SIP_HDR

Value:"inserting_sip_header"

Hits: 0

Undef Hits: 0
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Action Reference Count: 0

Done
```

- `DELETE_SIP_HEADER<target>`. Deletes the SIP header specified by `<target>`

Example:

```
> add rewrite action delete_sip_hdr delete_sip_header  SIP_HDR

Done

> sh rewrite action delete_sip_hdr

Name: delete_sip_hdr

Operation: delete_sip_header

Target:SIP_HDR

Hits: 0

Undef Hits: 0

Action Reference Count: 0

Done
```

Target parameter

The Target parameter Is an expression that specifies which part of the request or response to rewrite.

StringBuilderExpr

The StringBuilderExpr Is an expression that specifies the content that Is to be Inserted into the request or response at the specified location. This expression replaces a specified string.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Example 1. Inserting an HTTP Header With the Client IP:

```
> add rewrite action insertact INSERT_HTTP_HEADER "client-IP"
CLIENT.IP.SRC

Done

> show rewrite action insertact

Name: insertact

Operation: insert_http_header

Target:Client-IP

Value:CLIENT.IP.SRC

BypassSafetyCheck : NO

Hits: 0

Undef Hits: 0

Action Reference Count: 0

Done
```

Example 2. Replacing Strings in a TCP Payload (TCP Rewrite):

```
> add rewrite action client_tcp_payload_replace_all REPLACE_ALL

  'client.tcp.payload(1000)' '"new-string"' -search text("old-string")

Done

> show rewrite action client_tcp_payload_replace_all
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Name: client_tcp_payload_replace_all

Operation: replace_all

Target:client.tcp.payload(1000)

Value:"new-string"

Search: text("old-string")

BypassSafetyCheck : NO

Hits: 0

Undef Hits: 0

Action Reference Count: 0

Done

>
```

Search a part of the request or response to rewrite

The Search functionality helps to find all the Instances of the required pattern in the request or response.

The Search functionality is required to be used in the following Action types:

- INSERT_BEFORE_ALL
- INSERT_AFTER_ALL
- REPLACE_ALL
- DELETE_ALL
- CLIENTLESS_VPN_ENCODE_ALL
- CLIENTLESS_VPN_DECODE_ALL

The Search functionality cannot be used with the following Action types:

- INSERT_HTTP_HEADER
- INSERT_BEFORE

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- INSERT_AFTER
- REPLACE
- DELETE
- DELETE_HTTP_HEADER
- CORRUPT_HTTP_HEADER
- REPLACE_HTTP_RES
- CLIENTLESS_VPN_ENCODE
- CLIENTLESS_VPN_DECODE
- INSERT_SIP_HEADER
- DELETE_SIP_HEADER
- CORRUPT_SIP_HEADER
- REPLACE_DIAMETER_HEADER_FIELD
- REPLACE_DNS_ANSWER_SECTION
- REPLACE_DNS_HEADER_FIELD
- REPLACE_SIP_RES

The following Search types are supported:

- Text - a literal string Example: -search text ("hello")
- Regular Expression - pattern that is used to match multiple strings in the request or response Example: -search regex(re~\^hello*~)
- XPATH - An XPATH expression to search XML. Example: -search xpath(xp%/a/b%)
- JSON - An XPATH expression to search JSON. Example: -search xpath_json(xp%/a/b%) HTML - An XPATH expression to search HTML Example: -search xpath_html(xp%/html/body%) Patset - This searches all the patterns bound to the patset entity. Example: -search patset("patset1")
- Datset - This searches all the patterns bound to the datset entity. Example: -search dataset("dataset1")
- AVP - AVP number that is used to match multiple AVPs in a Diameter/Radius Message Example: -search avp(999)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Refine the search results

You can use the Refine Search functionality to specify the additional criteria to refine the search results. Refine Search functionality can only be used if Search functionality is used. The Refine search parameter always starts with the "extend(m,n)" operation, where 'm' specifies some bytes to the left of the search result and 'n' specifies several bytes to the right of the search result to extend the selected area.

If the configured rewrite action is:

```
> add rewrite action test_refine_search replace_all http.res.body(10)
'”testing_refine_search”' -search text("abc") -refineSearch extend(1,1)

And the HTTP response body is abcxxxx456.
```

Then, the search parameter finds pattern "abc" and since the refineSearch parameter is also configured to check an extra 1 byte to the left and an extra one byte to the right of the matched pattern. The resultant replaced text is: abcx. So, the output of this action is `testing_refine_searchxxx456`.

Example 1:Using the Refine search functionality in INSERT_BEFORE_ALL action type.

```
> add policy patset pat

Done

> bind policy patset pat abcd

Done

> add rewrite action refineSearch_act_1 insert_before_all
http.res.body(10) 'target.prefix(10) + "refineSearch_testing"' -search
patset("pat") -refineSearch extend(10,10)

Done

> sh rewrite action refineSearch_act_1
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Name: refineSearch_act_1

Operation: insert_before_all

Target:http.res.body(10)

Refine Search:extend(10,10)

Value:target.prefix(10) + "refineSearch_testing"

Search: patset("pat")

Hits: 0

Undef Hits: 0

Action Reference Count: 0

Done
```

Example 2: Using the Refine search functionality in INSERT_AFTER_ALL action type.

```
> add rewrite action refineSearch_act_2 insert_after_all
http.res.body(100) '"refineSearch_testing"' -search text("abc")
-refineSearch extend(0, 10)

Done

> sh rewrite action refineSearch_act_2

Name: refineSearch_act_2

Operation: insert_after_all

Target:http.res.body(100)

Refine Search:extend(0, 10)

Value:"refineSearch_testing"
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Search: text("abc")

Hits: 0

Undef Hits: 0

Action Reference Count: 0

Done
```

Example 3: Using the Refine search functionality in REPLACE_ALL action type.

```
> add policy patset pat_list_2

Done

> bind policy patset pat_list_2 "www.abc.com"

Done

> bind policy patset pat_list_2 "www.def.com"

Done

> add rewrite action refineSearch_act_31 replace_all
"HTTP.RES.BODY(100000)" "\"https://\"" -search "patset(\"pat_list_2\")"
-refineSearch "EXTEND(7,0).REGEX_SELECT(re#http://#)"

Done

> sh rewrite action refineSearch_act_31

Name: refineSearch_act_31

Operation: replace_all

Target:HTTP.RES.BODY(100000)

Refine Search:EXTEND(7,0).REGEX_SELECT(re#http://#)
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Value:"https://"

Search: patset("pat_list_2")

Hits: 0

Undef Hits: 0

Action Reference Count: 0

Done
```

Example 4: Using the Refine search functionality in DELETE_ALL action type.

```
>add rewrite action refineSearch_act_4 delete_all "HTTP.RES.BODY(50000)"
-search text("Windows Desktops") -refineSearch
"EXTEND(40,40).REGEX_SELECT(re#\\s*<AppData>.*\\s*<\\/AppData>#)"

> show REWRITE action refineSearch_act_4

Name: refineSearch_act_4

Operation: delete_all

Target:HTTP.RES.BODY(50000)

Modify an existing rewrite action by using the command line interface

At the command prompt, type the following commands to modify an existing rewrite action and verify the configuration:

- `set rewrite action <name> [-target <expression>] [-stringBuilderExpr <expression>] [-search <expression>] [-refineSearch <expression>] [-comment <string>]`

At the command prompt, type the following commands to verify the modified configuration

- `show rewrite action <name>`

Example:

```
> set rewrite action insertact -target "Client-IP"
 Done
> show rewrite action insertact

Name: insertact
Operation: insert_http_header   Target:Client-IP
Value:CLIENT.IP.SRC
Hits: 0
Undef Hits: 0
Action Reference Count: 0
Done
```

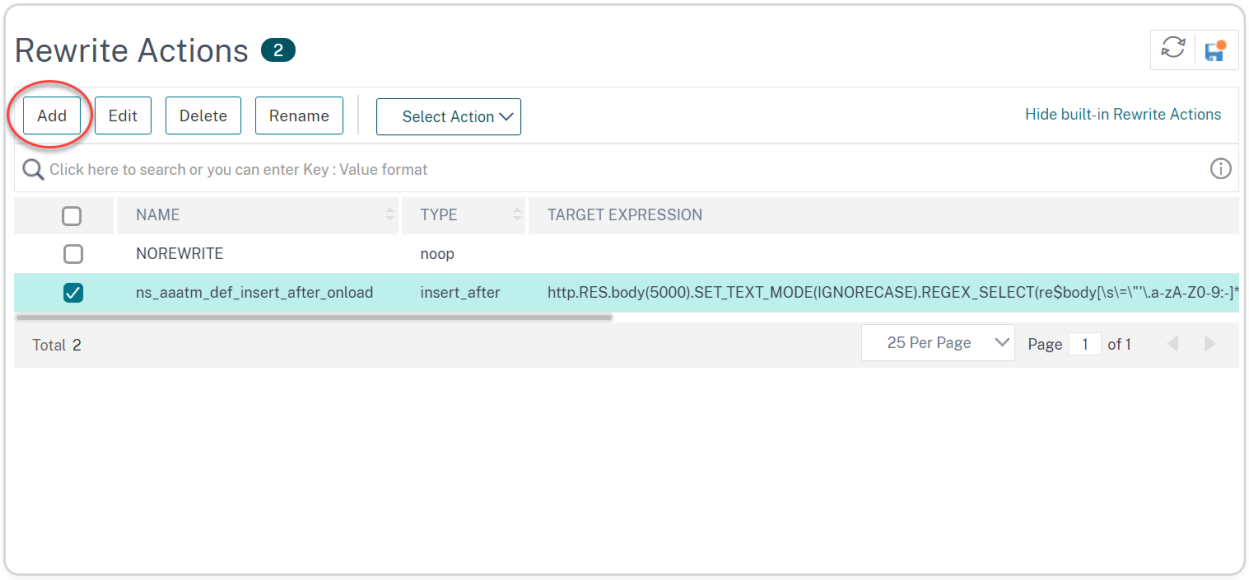
© 1997–2026 Citrix Systems, Inc. All rights reserved.

Remove a rewrite action by using the command line interface

At the command prompt, type the following commands to remove a rewrite action:

`rm rewrite action <name>`

Example:



```
> rm rewrite action insertact

Done
```

Configure a rewrite action by using the configuration utility

1. Navigate to **AppExpert > Rewrite > Actions**.
2. In the details pane, do one of the following:
   - To create an action, click **Add**.
   - To modify an existing action, select the action, and then click **Edit**.
3. Click **Create** or **OK**. A message appears in the status bar, stating that the Action has been configured successfully.
4. Repeat steps 2 through 4 to create or modify as many rewrite actions as you want.
5. Click **Close**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Add an expression by using the Add Expression dialog box

1. In the **Create Rewrite Action** or **Configure Rewrite Action** dialog box, under the text area for the type argument you want to enter, click **Add**.
2. In the **Add Expression** dialog box, in the first list box choose the first term for your expression.
   - HTTP. The HTTP protocol. Choose this if you want to examine some aspect of the request that pertains to the HTTP protocol.
   - SYS. The protected websites. Choose this if you want to examine some aspect of the request that pertains to the recipient of the request.
   - CLIENT. The computer that sent the request. Choose this if you want to examine some aspect of the sender of the request.

When you make your choice, the rightmost list box lists appropriate terms for the next part of your expression.

1. In the second list box, choose the second term for your expression. The choices depend upon which choice you made in the previous step, and are appropriate to the context. After you make your second choice, the Help window below the Construct Expression window (which was blank) displays help describing the purpose and use of the term you just chose.
2. Continue choosing terms from the list boxes that appear to the right of the previous list box, or typing strings or numbers in the text boxes that appear to prompt you to enter a value, until your expression is finished. For more information about the PI expressions language and creating expressions for responder policies, see "Policies and Expressions."

If you want to test the effect of a rewrite action when used on sample HTTP data, you can use the Rewrite Expression Evaluator.

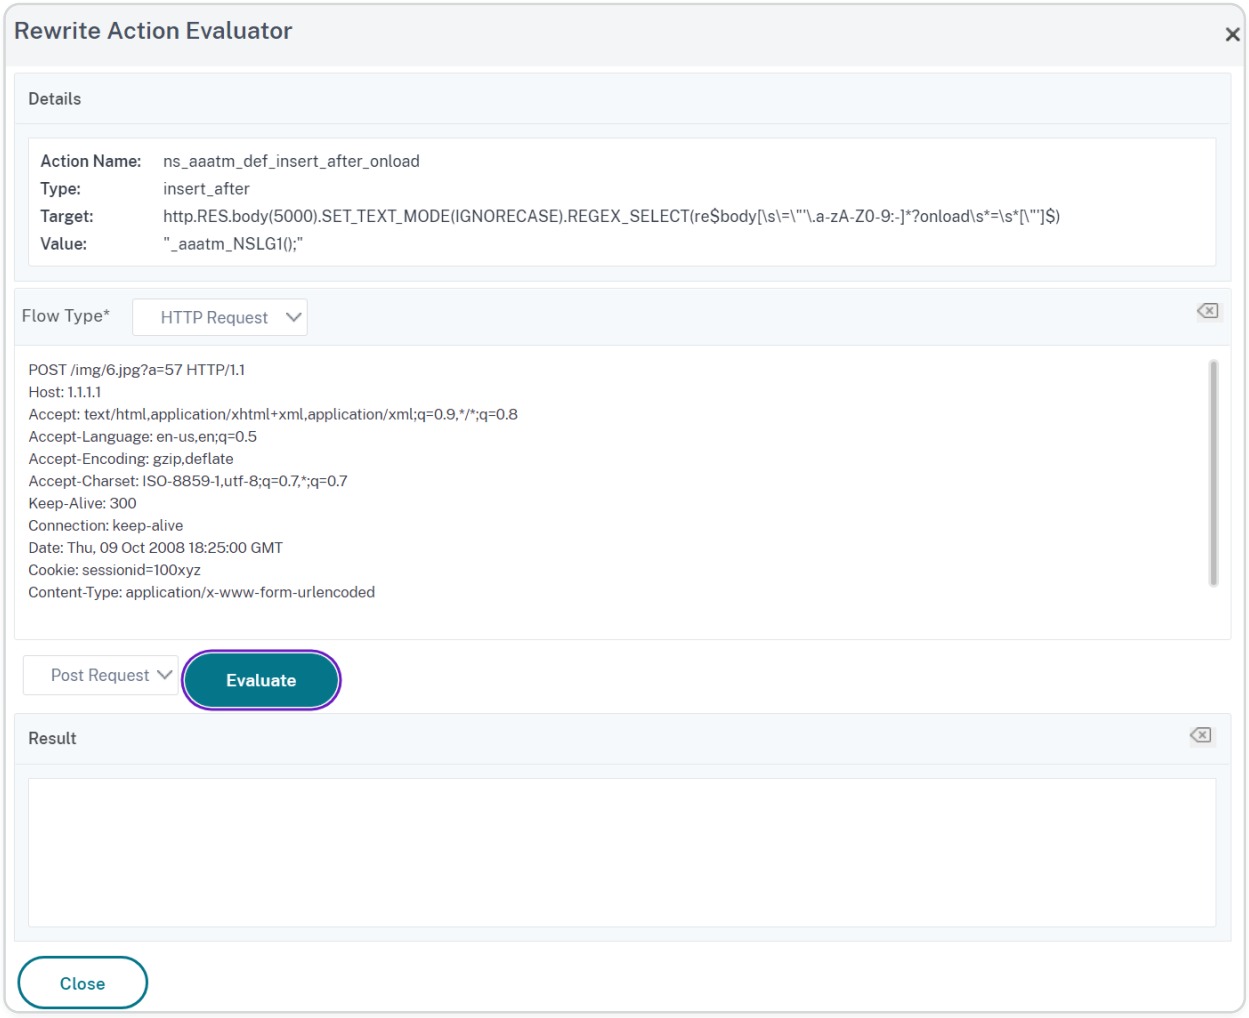
© 1997–2026 Citrix Systems, Inc. All rights reserved.

Rewrite TCP payloads

Target expressions in actions for TCP rewrite must begin with one of the following expression prefixes:

- **CLIENT.TCP.PAYLOAD.** For rewriting TCP payloads in client requests. For example, CLIENT.TCP.PAYLOAD(10000).AFTER_STR("string1").
- **SERVER.TCP.PAYLOAD.** For rewriting TCP payloads in server responses. For example, SERVER.TCP.PAYLOAD(1000).B64DECODE.BETWEEN("string1","string2").

Evaluate a rewrite action by using the Rewrite Action Evaluator dialog box



1. In the **Rewrite Actions** details pane, select the rewrite action that you want to evaluate, and then click **Evaluate**.
2. In the Rewrite Expression Evaluator dialog box, specify values for the following parameters. (An asterisk indicates a required parameter.)

   Rewrite Action—If the rewrite action you want to evaluate is not already selected, select it from the drop-down list. After you select a Rewrite action, the Details section displays the details of the selected Rewrite action. New—Select New to open the Create Rewrite Action dialog box and create a rewrite action. Modify—Select Modify to open the Configure Rewrite Action dialog box and modify the selected rewrite action. Flow Type—Specifies whether to test the selected rewrite action with HTTP Request data or HTTP Response data. The default is Request. If you want to test with Response data, select Response. HTTP Request/Response Data*—Provides a space for you to provide the HTTP data that the Rewrite Action Evaluator is used for testing. You can paste the data directly into the window, or click Sample to insert some sample HTTP headers. Show end-of-line—Specifies whether to show UNIX-style end-of-line characters (\\n) at the end of each line of sample HTTP data. Sample—Inserts sample HTTP data into the HTTP Request/Response Data window. You can choose either GET or POST data. Browse—Opens a local browse window so that you can choose a file containing sample HTTP data from a local or network location. Clear—Clears the current sample HTTP data from the HTTP Request/Response Data window.
3. Click Evaluate. The **Rewrite Action Evaluator** evaluates the effect of the Rewrite action on the sample data that you chose, and displays the results as modified by the selected **Rewrite** action in the **Results** window. Additions and deletions are highlighted as indicated in the legend in the lower left-hand corner of the dialog box.
4. Continue evaluating Rewrite actions until you have determined that all of your actions have the effect that you wanted.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- You can modify the selected rewrite action and test the modified version by clicking **Modify** to open the **Configure Rewrite Action** dialog box, making and saving your changes, and then clicking Evaluate again.
- You can evaluate a different rewrite action using the same request or response data by selecting it from the **Rewrite Action** drop-down list, and then clicking **Evaluate** again.

5. Click **Close** to close the **Rewrite Expression Evaluator** and return to the **Rewrite Actions** pane.
6. To delete a rewrite action, select the rewrite action you want to delete, then click **Remove** and, when prompted, confirm your choice by clicking **OK**.

Configure rewrite policy

After you create any needed rewrite actions, you must create at least one rewrite policy to select the requests that you want the NetScaler appliance to rewrite.

A rewrite policy consists of a rule, which itself consists of one or more expressions, and an associated action that is performed if a request or response matches the rule. Policy rules for

© 1997–2026 Citrix Systems, Inc. All rights reserved.

evaluating HTTP requests and responses can be based on almost any part of a request or response.

Even though you cannot use TCP rewrite actions to rewrite data other than the TCP payload, you can base the policy rules for TCP rewrite policies on the information in the transport layer and the layers below the transport layer.

If a configured rule matches a request or response, the corresponding policy is triggered and the action associated with it is carried out.

NOTE:

You can use either the command line interface or the GUI to create and configure rewrite policies. Users who are not thoroughly familiar with the command line interface and the NetScaler Policy expression language will usually find using the GUI much easier.

To add a new rewrite policy by using the command line interface

At the command prompt, type the following commands to add a new rewrite policy and verify the configuration:

- `<add rewrite policy <name> <expression> <action> [<undefaction>]`
- `<show rewrite policy <name>`

Example 1. Rewriting HTTP Content

```
> add rewrite policyNew "HTTP.RES.IS_VALID" insertact NOREWRITE
 Done
> show rewrite policyNew
        Name: policyNew
        Rule: HTTP.RES.IS_VALID
        RewriteAction: insertact
        UndefAction: NOREWRITE
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
        Hits: 0

        Undef Hits: 0

 Done
```

Example 2. Rewriting a TCP Payload (TCP Rewrite):

```
> add rewrite policy client_tcp_payload_policy
CLIENT.IP.SRC.EQ(172.168.12.232) client_tcp_payload_replace_all

 Done

> show rewrite policy client_tcp_payload_policy

        Name: client_tcp_payload_policy

        Rule: CLIENT.IP.SRC.EQ(172.168.12.232)

        RewriteAction: client_tcp_payload_replace_all

        UndefAction: Use Global

        LogAction: Use Global

        Hits: 0

        Undef Hits: 0

 Done

>
```

To modify an existing rewrite policy by using the command line interface

At the command prompt, type the following commands to modify an existing rewrite policy and verify the configuration:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- `<set rewrite policy <name> -rule <expression> -action <action> [<undefaction>]`
- `<show rewrite policy <name>`

Example:

```
> set rewrite policyNew -rule "HTTP.RES.IS_VALID" -action insertaction
 Done

> show rewrite policyNew
        Name: policyNew
        Rule: HTTP.RES.IS_VALID
        RewriteAction: insertaction
        UndefAction: NOREWRITE
        Hits: 0
        Undef Hits: 0

 Done
```

To remove a rewrite policy by using the command line interface

At the command prompt, type the following command to remove a rewrite policy:

`rm rewrite policy <name>`

Example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
> rm rewrite policyNew

Done
```

To configure a rewrite policy by using the GUI

1. Navigate to **AppExpert > Rewrite > Policies**.
2. In the details pane, do one of the following:
   - To create a policy, click Add.
   - To modify an existing policy, select the policy, and then click Open.
3. Click **Create** or **OK**. A message appears in the status bar, stating that the Policy has been configured successfully.
4. Repeat steps 2 through 4 to create or modify as many rewrite actions as you want.
5. Click **Close**. To delete a rewrite policy, select the rewrite policy you want to delete, then click **Remove** and, when prompted, confirm your choice by clicking **OK**.

Bind rewrite policy

After creating a rewrite policy, you must bind it to put it into effect. You can bind your policy to Global if you want to apply it to all traffic that passes through your NetScaler, or you can bind your policy to a specific virtual server or bind point to direct only that virtual server or bind the point's incoming traffic to that policy. If an incoming request matches a rewrite policy, the action associated with that policy is carried out.

Rewrite policies for evaluating HTTP requests and responses can be bound to virtual servers of type HTTP or SSL, or they can be bound to the REQ_OVERRIDE, REQ_DEFAULT, RES_OVERRIDE, and RES_DEFAULT bind points. Rewrite policies for TCP rewrite can be bound only to virtual servers of type TCP or SSL_TCP, or to the OTHERTCP_REQ_OVERRIDE, OTHERTCP_REQ_DEFAULT, OTHERTCP_RES_OVERRIDE, and OTHERTCP_RES_DEFAULT bind points.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE:

The term OTHERTCP is used in the context of the NetScaler appliance to refer to all TCP or SSL_TCP requests and responses that you want to treat as a raw stream of bytes regardless of the protocols that the TCP packets encapsulate.

When you bind a policy, you assign it a priority. The priority determines the order in which the policies you define are evaluated. You can set the priority to any positive integer.

In the NetScaler operating system, policy priorities work in reverse order - the higher the number, the lower the priority. For example, if you have three policies with priorities of 10, 100, and 1000, the policy assigned a priority of 10 is applied first, then the policy assigned a priority of 100, and finally the policy assigned an order of 1000.

Unlike most other features in the NetScaler operating system, the rewrite feature continues to evaluate and implement policies after a request matches a policy. However, the effect of a particular action policy on a request or response will often be different depending on whether it is performed before or after another action. Priority is important to get the results you intended.

You can leave yourself plenty of room to add other policies in any order, and still set them to evaluate in the order you want, by setting priorities with intervals of 50 or 100 between each policy when you bind it. If you do this, you can add more policies at any time without having to reassign the priority of an existing policy.

When binding a rewrite policy, you also have the option of assigning a goto expression (gotoPriorityExpression) to the policy. A goto expression can be any positive integer that matches the priority assigned to a different policy that has a higher priority than the policy that contains the goto expression. If you assign a goto expression to a policy, and a request or response matches the policy, the NetScaler will immediately go to the policy whose priority matches the goto expression. It skips over any policies with priority numbers that are lower than that of the current policy, but higher than the priority number of the goto expression, and not evaluate those policies.

To globally bind a rewrite policy by using the command line interface

At the command prompt, type the following commands to globally bind a rewrite policy and verify the configuration:

- `bind rewrite global <policyName> <priority> [<gotoPriorityExpression>] [-type <type>] [-invoke (<labelType> <labelName>)]`
- `show rewrite global`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Example:

```
>bind rewrite global policyNew 10
 Done

> show rewrite global
1)      Global bindpoint: RES_DEFAULT
        Number of bound policies: 1

2)      Global bindpoint: REQ_OVERRIDE
        Number of bound policies: 1

 Done
```

To bind rewrite policy to a specific virtual server by using the command line interface

At the command prompt, type the following commands to bind the rewrite policy to a specific virtual server and verify the configuration:

- `bind lb vserver <name>@ (<serviceName>@ [-weight <positive_integer>]) | <serviceGroupName>@ | (-policyName <string>@ [-priority <positive_integer>] [-gotoPriorityExpression <expression>] [-type ( REQUEST | RESPONSE )] [-invoke (<labelType> <labelName>)] )`
- `show lb vserver <name>`

Example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
> bind lb vserver lbvip -policyName ns_cmp_msapp -priority 50

 Done

>

> show lb vserver lbvip

        lbvip (8.7.6.6:80) - HTTP       Type: ADDRESS

        State: DOWN

        Last state change was at Wed Jul 15 05:54:24 2009 (+226 ms)

        Time since last state change: 28 days, 01:57:26.350

        Effective State: DOWN

        Client Idle Timeout: 180 sec

        Down state flush: ENABLED

        Disable Primary Vserver On Down : DISABLED

        Port Rewrite : DISABLED

        No. of Bound Services :  0 (Total)       0 (Active)

        Configured Method: LEASTCONNECTION

        Mode: IP

        Persistence: NONE

        Vserver IP and Port insertion: OFF

        Push: DISABLED  Push VServer:

        Push Multi Clients: NO

        Push Label Rule: none
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
1)      Policy : ns_cmp_msapp Priority:50

2)      Policy : cf-pol Priority:1      Inherited

 Done
```

To bind a rewrite policy to a bind point by using the GUI

1. Navigate to **AppExpert** >**Rewrite** > **Policies**.
2. In the details pane, select the rewrite policy you want to globally bind, and then click **Policy Manager**.
3. In the **Rewrite Policy Manager** dialog box, in the **Bind Points** menu, do one of the following:
    a. If you want to configure bindings for HTTP rewrite policies, click **HTTP**, and then click either **Request** or **Response**, depending on whether you want to configure request-based rewrite policies or response-based rewrite policies.
    b. If you want to configure bindings for TCP rewrite policies, click **TCP**, and then click either **Client** or **Server**, depending on whether you want to configure client-side TCP rewrite policies or server-side TCP rewrite policies.
4. Click the bind point to which you want to bind the rewrite policy. The **Rewrite Policy Manager** dialog box displays all the rewrite policies that are bound to the selected bind point.
5. Click **Insert Policy** to insert a new row and display a drop-down list with all available, unbound rewrite policies.
6. Click the policy you want to bind to the bind point. The policy is inserted into the list of rewrite policies bound to the bind point.
7. In the **Priority** column, you can change the priority to any positive integer. For more information about this parameter, see priority in "Parameters for binding a rewrite policy."
8. If you want to skip over policies and go directly to a specific policy if the current policy is matched, change the value in the Goto Expression column to equal the priority of the next policy to be applied.. For more information about this parameter, see gotoPriorityExpression in "Parameters for binding a rewrite policy."
9. To modify a policy, click the policy, and then click **Modify Policy**.
10. To unbind a policy, click the policy, and then click **Unbind Policy**.
11. To modify an action, in the Action column, click the action you want to modify, and then click **Modify Action**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

12. To modify an invoke label, in the **Invoke** column, click the invoke label you want to modify, and then click **Modify Invoke Label**.
13. To regenerate the priorities of all the policies that are bound to the bind point you are currently configuring, click **Regenerate Priorities**. The policies retain their existing priorities relative to the other policies, but the priorities are renumbered in multiples of 10.
14. Click **Apply Changes**.
15. Click **Close**. A message appears in the status bar, stating that the Policy has been configured successfully.

To bind a rewrite policy to a specific virtual server by using the GUI

1. Navigate to **Traffic Management** > **Load Balancing** > **Virtual Servers**.
2. In the details pane list of virtual servers, select the virtual server to which you want to bind the rewrite policy, and then click **Open**.
3. In the **Configure Virtual Server (Load Balancing)** dialog box, select the **Policies** tab. All policies configured on your NetScaler appear on the list.
4. Select the check box next to the name of the policy you want to bind to this virtual server.
5. Click **OK**. A message appears in the status bar, stating that the Policy has been configured successfully.

Configure rewrite policy labels

If you want to build a more complex policy structure than is supported by single policies, you can create policy labels and then bind them as you would policies. A policy label is a user-defined point to which policies are bound. When a policy label is invoked, all the policies bound to it are evaluated in the order of the priority you configured. A policy label can include one or multiple policies, each of which can be assigned its own result. A match on one policy in the policy label can result in proceeding to the next policy, invoking a different policy label or appropriate resource, or an immediate end to policy evaluation and the return of control to the policy that invoked the policy label.

A rewrite policy label consists of a name, a transform name that describes the type of policy included in the policy label, and a list of policies bound to the policy label. Each policy that is bound to the policy label contains all of the elements described in Configuring a Rewrite Policy.

Note: You can use either the command line interface or the GUI to create and configure rewrite policy labels. Users who are not thoroughly familiar with the command line interface and the NetScaler Policy Infrastructure (PI) language usually find using the GUI much easier.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To configure a rewrite policy label by using the command line interface

To add a rewrite policy label, at the command prompt, type the following command:

```
add rewrite policylabel <labelName> <transform>
```

For example, to add a rewrite policy label named polLabelHTTPResponses to group all policies that work on HTTP responses, you would type the following:

```
add rewrite policy label polLabelHTTPResponses http_res
```

To modify an existing rewrite policy label, at the **NetScaler** command prompt, type the following command:

```
set rewrite policy <name> <transform>
```

NOTE:

The set rewrite policy command takes the same options as the add rewrite policy command.

To remove a rewrite policy label, at the **NetScaler** command prompt, type the following command:

```
rm rewrite policy<name>
```

For example, to remove a rewrite policy label named polLabelHTTPResponses, you would type the following:

```
rm rewrite policy polLabelHTTPResponses
```

To configure a rewrite policy label by using the GUI

1. Navigate to **AppExpert** > **Rewrite** > **Policy Labels**.
2. In the details pane, do one of the following:
   - To create a policy label, click **Add**.
   - To modify an existing policy label, select the policy, and then click **Open**.
3. Add or remove policies from the list that is bound to the policy label.
   - To add a policy to the list, click **Insert Policy**, and choose a policy from the drop-down list. You can create a policy and add it to the list by choosing New Policy in the list, and following the instructions in Configuring a Rewrite Policy.
   - To remove a policy from the list, select that policy, and then click Unbind Policy.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. Modify the priority of each policy by editing the number in the Priority column. You can also automatically renumber policies by clicking Regenerate Priorities.
5. Click **Create** or **OK**, and then click **Close**. To remove a policy label, select it, and then click **Remove**. To rename a policy label, select it and then click **Rename**. Edit the name of the policy, and then click **OK** to save your changes.

Content-Length header behavior in a streaming rewrite action

Content-Length header is one of the ways to indicate the length of the message (in bytes) in an HTTP request or response. Apart from the Content-Length header, you can also specify the length of the message by using one of the following ways:

- Chunked encoding
- FIN Termination

In a streaming process, the NetScaler® sends data continuously after processing the rewrite action. As the data is sent continuously and not held by the NetScaler, the actual length of the message that would be sent to the client is unknown. Therefore, the correct value of the Content-Length header cannot be mentioned in the response.

To support the streaming process, the rewrite feature of NetScaler converts the way to indicate the length of the message from the Content-Length header to the FIN termination. As part of the conversion, the NetScaler corrupts the Content-Length header by rearranging the first four characters of the header name.

In HTTP, the client is expected to ignore headers that it does not understand. So the client does not understand the corrupted Content-Length header name and therefore ignores the header. To improve the performance of the NetScaler, the header is corrupted instead of deleted. Corrupting the header name instead of deleting avoids recomputing the checksum because the checksum is not changed if the same bytes are in a different order.

For example, consider the following HTTP request:

```
GET / HTTP/1.1

Accept: application/x-ms-application, image/jpeg, application/xaml+xml,
image/gif, image/pjpeg, application/x-ms-xbap, application/vnd.ms-excel,
application/vnd.ms-powerpoint, application/msword, /

Accept-Language: en-GB
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
User-Agent: Mozilla/4.0 (compatible; MSIE 7.0; Windows NT 6.1; WOW64;
Trident/7.0; SLCC2; .NET CLR 2.0.50727; .NET CLR 3.5.30729; .NET CLR
3.0.30729; Media Center PC 6.0; .NET4.0C; .NET4.0E; CMDTDF; MS-RTC LM 8)

Accept-Encoding: gzip, deflate

Host: test.example.net

Connection: Keep-Alive
```

In a working scenario, the response between NetScaler and the back-end server for this HTTP request is as follows:

```
HTTP/1.1 200 OK

Content-Length: 10967

Connection: close

var SERVER_URL = 'https\x3a\x2f\x2ftest.example.net\x2f';

var WEB_SERVER_HOST = 'test.example.net';
```

But the response received by the client from NetScaler in a non-working scenario is as follows. The `Content-Length` header is renamed to `ntcoent-Length`.

```
HTTP/1.1 200 OK

ntCoent-Length: 10967

nnCoection: close

var SERVER_URL = 'https\x3a\x2f\x2ftest.example.net\x2f';

var WEB_SERVER_HOST = 'test.example.net';
```

In general, the client applications support all the three ways of transaction - Content-Length header, Chunked encoding, and FIN Termination. So, the conversion from Content-Length header to FIN Termination must not cause any issue. But, if the application doesn't work because of this modification, then you must Disable the streaming process.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

How to disable the streaming process in a rewrite policy

You can disable the streaming process in a rewrite policy using one of the following ways:

1. Add a non-streaming action associated with a rewrite policy that is bound at a higher priority. The action must be in such a way that it doesn't modify the response.

   For example:

   `add rewrite action non_stream_act replace_all HTTP.RES.BODY(1000000) HTTP.RES.FULL_HEADER -search text("pattern_which_will_not_match_in_body")`

   The value of the body in this rewrite action must be more than the value on which the current streaming action is working.

2. Instead of the streaming configuration, use the non-streaming configuration.

   NOTE:

   Moving from streaming to non-streaming processing might impact the performance of the NetScaler.

   For example, a streaming configuration can be converted to a non-streaming configuration as follows:

   Streaming Configuration:

```
add rewrite action rw_act_1 replace_all HTTP.RES.BODY(1000) "\"http\""
-search text("http")

add policy patset pat_list

bind policy patset pat_list abcd

bind policy patset pat_list defg

add rewrite action rw_act_2 replace_all HTTP.RES.BODY(1000)
"\"replaced_data\"" -search patset("pat_list")
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Non-streaming configuration:

```
add rewrite action rw_act_1 replace_all HTTP.RES.BODY(1000) "\"http\""
-search regex(re/http/)

add rewrite action rw_act_1 replace_all HTTP.RES.BODY(1000) "\"http\""
-search regex(re/abcd|defg/)
```

Rewrite Action and Policy Examples

The examples in this section demonstrate how to configure rewrite to perform various useful tasks. The examples occur in the server room of Example Manufacturing Inc., a mid-sized manufacturing company that uses its Web site to manage a considerable portion of its sales, deliveries, and customer support.

Example Manufacturing has two domains: example.com for its Web site and email to customers, and example.net for its intranet. Customers use the Example Web site to place orders, request quotes, research products, and contact customer service and technical support.

As an important part of Example's revenue stream, the Web site must respond quickly and keep customer data confidential. Example therefore has several Web servers and uses NetScaler appliances to balance the Web site load and manage traffic to and from its Web servers.

The Example system administrators use the rewrite features to perform the following tasks:

Example 1: Delete old X-Forwarded-For and Client-IP Headers

Example Inc. removes old X-Forwarded-For and Client-IP HTTP headers from incoming requests.

Example 2: Adding a Local Client-IP Header

Example Inc. adds a new, local Client-IP header to incoming requests.

Example 3: Tagging Secure and Insecure Connections

Example Inc. tags incoming requests with a header that indicates whether the connection is a secure connection.

Example 4: Mask the HTTP Server Type

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Example Inc. modifies the HTTP Server: header so that unauthorized users and malicious code cannot use that header to determine the HTTP server software it uses.

Example 5: Redirect an External URL to an Internal URL

Example Inc. hides information about the actual names of its Web servers and the configuration of its server room from users, to make URLs on its Web site shorter and easier to remember and to improve security on its site.

Example 6: Migrating Apache Rewrite Module Rules

Example Inc. moved its Apache rewrite rules to a NetScaler appliance, translating the Apache PERL-based script syntax to the NetScaler rewrite rule syntax.

Example 7: Marketing Keyword Redirection

The marketing department at Example Inc. sets up simplified URLs for certain predefined keyword searches on the company's Web site.

Example 8: Redirect Queries to the Queried Server.

Example Inc. redirects certain query requests to the appropriate server.

Example 9: Home Page Redirection

Example Inc. recently acquired a smaller competitor, and it now redirects requests to the acquired company's home page to a page on its own Web site.

Example 10: Policy-based RSA Encryption

Example Inc. encrypt HTTP predefined and user-defined header or body content by using PEM RSA public key.

Each of these tasks requires that the system administrators create rewrite actions and policies and bind them to a valid bind point on the NetScaler.

Example 1: Delete Old X-Forwarded-For and Client-IP Headers

Example Inc. wants to remove old X-Forwarded-For and Client-IP HTTP headers from incoming requests, so that the only X-Forwarded-For headers that appear are the ones added by the local server. This configuration can be done through the NetScaler command line or the configuration utility. The Example Inc. system administrator is an old-school networking engineer and prefers to

© 1997–2026 Citrix Systems, Inc. All rights reserved.

use a CLI where possible, but wants to be sure he understands the configuration utility interface so that he can show new system administrators on the team how to use it.

The examples below demonstrate how to perform each configuration with both the CLI and the configuration utility. The procedures are abbreviated on the assumption that users will already know the basics of creating rewrite actions, creating rewrite policies, and binding policies.

- For more detailed information about creating rewrite actions, see Configuring a Rewrite Action.
- For more detailed information about creating rewrite policies, see Configuring a Rewrite Policy.
- For more detailed information about binding rewrite policies, see Binding a Rewrite Policy.

To delete old X-Forwarded and Client-IP headers from a request by using the command line interface

At the command prompt, type the following commands in the order shown:

```
add rewrite action act_del_xfor delete_http_header x-forwarded-for

add rewrite action act_del_cip delete_http_header client-ip

add rewrite policy pol_check_xfor 'HTTP.REQ.HEADER("x-forwarded-
for").EXISTS' act_del_xfor

add rewrite policy pol_check_cip 'HTTP.REQ.HEADER("client-ip").EXISTS'
act_del_cip

bind rewrite global pol_check_xfor 100 200

bind rewrite global pol_check_cip 200 300
```

To delete old X-Forwarded and Client-IP headers from a request by using the configuration utility

In the Create Rewrite Action dialog box, create two rewrite actions with the following descriptions.

NAME	TYPE	ARGUMENT(S)
act_del_xfor	delete_http_header	x-forwarded-for
act_del_cip	delete_http_header	client-ip

In the Create Rewrite Policy dialog box, create two rewrite policies with the following descriptions.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NAME	EXPRESSION	ACTION
pol_check_xfor	'HTTP.REQ.HEADER("x-forwarded-for").EXISTS'	act_del_xfor
pol_check_cip	'HTTP.REQ.HEADER("client-ip").EXISTS'	act_del_cip

Bind both policies to global, assigning the priorities and goto expression values shown below.

NAME	PRIORITY	GOTO EXPRESSION
pol_check_xfor	100	200
pol_check_cip	200	300

All old X-Forwarded-For and Client-IP HTTP headers are now deleted from incoming requests.

Example 2: Adding a Local Client-IP Header

Example Inc. wants to add a local Client-IP HTTP header to incoming requests. This example contains two slightly different versions of the same basic task.

To add a local Client-IP header by using the command line interface

At the command prompt, type the following commands in the order shown:

```
add rewrite action act_ins_client insert_http_header NS-Client
'CLIENT.IP.SRC'

add rewrite policy pol_ins_client 'HTTP.REQ.HEADER("x-forwarded-
for").EXISTS || HTTP.REQ.HEADER("client-ip").EXISTS' act_ins_client

bind rewrite global pol_ins_client 300 END
```

To add a local Client-IP header by using the configuration utility

In the Create Rewrite Action dialog box, create a rewrite action with the following description.

NAME	TYPE	ARGUMENT(S)
act_ins_client	insert_http_header	NS-Client 'CLIENT.IP.SRC'

© 1997–2026 Citrix Systems, Inc. All rights reserved.

In the Create Rewrite Policy dialog box, create a rewrite policy with the following description.

NAME	EXPRESSION	ACTION
pol_ins_client	'HTTP.REQ.HEADER("x-forwarded-for").EXISTS || HTTP.REQ.HEADER("client-ip").EXISTS'	act_ins_client

Bind policy to global, assigning the priorities and goto expression values shown below.

NAME	PRIORITY	GOTO EXPRESSION
pol_ins_client	100	Next

Example 3: Tagging Secure and Insecure Connections

Example Inc. wants to tag incoming requests with a header that indicates whether or not the connection is a secure connection. This helps the server keep track of secure connections after the NetScaler has decrypted the connections.

To implement this configuration, you would begin by creating rewrite actions with the values shown in the following tables. These actions label connections to port 80 as insecure connections, and connections to port 443 as secure connections.

ACTION NAME	TYPE OF REWRITE ACTION	HEADER NAME	VALUE
Action-Rewrite-SSL_YES	INSERT_HTTP_HEADER	SSL	YES

ACTION NAME	TYPE OF REWRITE ACTION	HEADER NAME	VALUE
Action-Rewrite-SSL_NO	INSERT_HTTP_HEADER	SSL	NO

You would then create a rewrite policy with the values shown in the following tables. These policies check incoming requests to determine which requests are directed to port 80 and which are directed to port 443. The policies then add the correct SSL header.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

POLICY NAME	ACTION NAME	UNDEFINED ACTION	EXPRESSION
Policy-Rewrite-SSL_YES	Action-Rewrite-SSL_YES	NOREWRITE	CLIENT.TCP.DSTPORT.EQ(443)
Policy-Rewrite-SSL_NO	Action-Rewrite-SSL_NO	NOREWRITE	CLIENT.TCP.DSTPORT.EQ(80)

Finally, you would bind the rewrite policies to NetScaler, assigning the first policy a priority of 200, and the second a priority of 300, and setting the goto expression of both policies to END.

Each incoming connection to port 80 now has an SSL:NO HTTP header added to it and each incoming connection to port 443 has an SSL:YES HTTP header added to it.

Example 4: Mask the HTTP Server Type

Example Inc. wants to modify the HTTP Server: header so that unauthorized users and malicious code cannot use the header to identify the software that the HTTP server uses.

To modify the HTTP Server: header, you would create a rewrite action and a rewrite policy with the values in the following tables.

ACTION NAME	TYPE OF REWRITE ACTION	EXPRESSION TO CHOOSE TARGET REFERENCE	STRING EXPRESSION FOR REPLACEMENT TEXT
Action-Rewrite-Server_Mask	REPLACE	HTTP.RES.HEADER("Server")	"Web Server 1.0"

POLICY NAME	ACTION NAME	UNDEFINED ACTION	EXPRESSION
Policy-Rewrite-Server_Mask	Action-Rewrite-Server_Mask	NOREWRITE	HTTP.RES.IS_VALID

Example commands:

```
> add rewrite action Action-Rewrite-Server_Mask REPLACE
HTTP.RES.HEADER("Server") "\"Web Server 1.0\""
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
> add rewrite policy-Rewrite-Server_Mask HTTP.RES.IS_VALID Action-Rewrite-Server_Mask NOREWRITE
```

You would then globally bind the rewrite policy, assigning a priority of 100 and setting the Goto Priority Expression of the policy to END.

The HTTP Server: header is now modified to read “Web Server 1.0,” masking the actual HTTP server software used by the Example Inc. Web site.

Example 5: Redirect an external URL to an internal URL

Example Inc. wants to hide its actual server room configuration from users to improve security on its Web servers.

To improve security, you would create a rewrite action with the values as shown in the following tables. For request headers, the action in the table modifies `www.example.com` to web.hq.example.net. For response headers, the action does the opposite, translating `web.hq.example.net` to `www.example.com`.

ACTION NAME	TYPE OF REWRITE ACTION	EXPRESSION TO CHOOSE TARGET REFERENCE	STRING EXPRESSION FOR REPLACEMENT TEXT
Action-Rewrite-Request_Server_Replace	REPLACE	HTTP.REQ.HOSTNAME.SERVER	"Web.hq.example.net"
Action-Rewrite-Response_Server_Replace	REPLACE	HTTP.RES.HEADER ("Server")	"www.example.com"

The first policy checks incoming requests to see if they are valid. If they are valid, it performs the Action-Rewrite-Request_Server_Replace action. The second policy checks responses to see if they originate at the server `web.hq.example.net`. If they do, it performs the Action-Rewrite-Response_Server_Replace action.

Examples of rewrite action and policy for redirecting an external URL.

```
add rewrite action Action-Rewrite-Request_Server_Replace REPLACE HTTP.REQ.HOSTNAME.SERVER '"Web.hq.example.net"'
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add rewrite action Action-Rewrite-Response_Server_Replace REPLACE
HTTP.RES.HEADER("Server") '"www.example.com"'
```

```
add rewrite policy Rewrite-Request_Server_Replace
HTTP.REQ.HOSTNAME.SERVER.EQ("www.example.com") Action-Rewrite-
Request_Server_Replace NOREWRITE
```

```
add rewrite policy Rewrite-Response_Server_Replace
HTTP.REQ.HEADER("Server").EQ("Web.hq.example.net") Action-Rewrite-
Response_Server_Replace
```

Finally, you would bind the rewrite policies, assigning each a priority of 500 because they are in different policy banks and does not conflict. Set the goto expression to NEXT for both bindings.

```
bind rewrite global Policy-Rewrite-Request_Server_Replace 500 END -type
REQ_DEFAULT
```

```
bind rewrite global Policy-Rewrite-Response_Server_Replace 500 END -type
RES_DEFAULT
```

All instances of `www.example.com` in the request headers are now changed to `web.hq.example.net`, and all instances of `web.hq.example.net` in response headers are now changed to `www.example.com`.

Example 6: Migrating Apache Rewrite Module Rules

Example Inc., is currently using the Apache rewrite module to process search requests sent to its Web servers and redirect those requests to the appropriate server on the basis of information in the request URL. Example Inc. wants to simplify its setup by migrating these rules onto the NetScaler platform.

Several Apache rewrite rules that Example currently uses are shown below. These rules redirect search requests to a special results page if they do not have a SiteID string or if they have a SiteID string equal to zero (0), or to the standard results page if these conditions do not apply.

The following are the current Apache rewrite rules:

- RewriteCond %{REQUEST_FILENAME} \^/search$
- RewriteCond %{QUERY_STRING} !SiteId=
- RewriteCond %{QUERY_STRING} SiteId=0
- RewriteCond %{QUERY_STRING} CallName=DisplayResults

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- RewriteRule \^.*$ results2.html
- RewriteCond %{REQUEST_FILENAME} \^/search$
- RewriteCond %{QUERY_STRING} CallName=DisplayResults
- RewriteRule \^.*$ /results.html

To implement these Apache rewrite rules on the NetScaler, you would create rewrite actions with the values in the following tables.

ACTION NAME	TYPE OF REWRITE ACTION	EXPRESSION TO CHOOSE TARGET REFERENCE	STRING EXPRESSION FOR REPLACEMENT TEXT
Action-Rewrite-Display_Results_NulSiteID	REPLACE	HTTP.REQ.URL	"/results2.html"
Action-Rewrite-Display_Results	REPLACE	HTTP.REQ.URL	"/results2.html"

You would then create rewrite policies with the values as shown in the tables below.

POLICY NAME	ACTION NAME	UNDEFINED ACTION	EXPRESSION
Policy-Rewrite-Display_Results_NulSiteID	Action-Rewrite-Display_Results_NulSiteID	NOREWRITE	HTTP.REQ.URL.PATH.SET_TEXT_MODE(IGNORECASE).EQ("/search") && (!HTTP.REQ.URL.QUERY.CONTAINS("SiteId=") || HTTP.REQ.URL.QUERY.CONTAINS("SiteId=0") || HTTP.REQ.URL.QUERY.SET_TEXT_MODE(IGNORECASE).CONTAINS("CallName=DisplayResults"))

© 1997–2026 Citrix Systems, Inc. All rights reserved.

POLICY NAME	ACTION NAME	UNDEFINED ACTION	EXPRESSION
Policy-Rewrite-Display_Results	Action-Rewrite-Display_Results	NOREWRITE	HTTP.REQ.URL.PATH.SET_TEXT_MODE(IGNORECASE).EQ("/search") || HTTP.REQ.URL.QUERY.SET_TEXT_MODE(IGNORECASE).CONTAINS("CallName=DisplayResults"))

Finally, you would bind the rewrite policies, assigning the first a priority of 600 and the second a priority of 700, and then set the goto expression to NEXT for both bindings.

The NetScaler now handles these search requests exactly as the Web server did before the Apache rewrite module rules were migrated.

Example 7: Marketing Keyword Redirection

The marketing department at Example Inc. wants to set up simplified URLs for certain predefined keyword searches on the company's Web site. For these keywords, it wants to redefine the URL as shown below.

- External URL:

```
http://www.example.com/\<marketingkeyword\>
```

- Internal URL:

```
http://www.example.com/go/kwsearch.asp?keyword=\<marketingkeyword\>
```

To set up redirection for marketing keywords, you would create a rewrite action with the values in the following table.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

ACTION NAME	TYPE OF REWRITE ACTION	EXPRESSION TO CHOOSE TARGET LOCATION	STRING EXPRESSION FOR REPLACEMENT TEXT
Action-Rewrite-Modify_URL	INSERT_BEFORE	HTTP.REQ.URL.PATH.GET(1)	""go/kwsearch.aspkeyword="l"

You would then create a rewrite policy with the values in the following table.

POLICY NAME	ACTION NAME	UNDEFINED ACTION	EXPRESSION
Policy-Rewrite-Modify_URL	Action-Rewrite-Modify_URL	NOREWRITE	HTTP.REQ.HOSTNAME.SERVER.EQ("www.example.com")

Finally, you would bind the rewrite policy, assigning it a priority of 800. Unlike the previous rewrite policies, this policy should be the last to be applied to a request that matches its criteria. For this reason, NetScaler administrator sets its Goto Priority Expression to END.

Any request using a marketing keyword is redirected to the keyword search CGI page, whereupon a search is performed and all remaining policies are skipped.

Example 8: Redirect Queries to the Queried Server

Example Inc. wants to redirect query requests to the appropriate server, as shown here.

- `<Request: GET /query.cgi?server=5HOST: www.example.com`
- `<Redirect URL: <http://web-5.example.com/>`

To implement this redirection, you would first create a rewrite action with the values in the following table.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

ACTION NAME	TYPE OF REWRITE ACTION	EXPRESSION TO CHOOSE TARGET REFERENCE	STRING EXPRESSION FOR REPLACEMENT TEXT
Action-Rewrite-Replace_Hostheader	REPLACE	HTTP.REQ.HEADER("Host").BEFORE_STR(".example.com")	"server-" + HTTP.REQ.URL.QUERY.VALUE("web")

You would then create a rewrite policy with the values in the following table.

POLICY NAME	ACTION NAME	UNDEFINED ACTION	EXPRESSION
`Policy-Rewrite-Replace_Hostheader`	`Action-Rewrite-Replace_Hostheader`	NOREWRITE	`HTTP.REQ.HEADER("Host").EQ("www.example.com")`

Example commands:

```
> add rewrite action Action-Rewrite-Server_Mask REPLACE HTTP.RES.HEADER("Server") "\"Web Server 1.0\"" Done
```

```
> add rewrite policy-Rewrite-Server_Mask HTTP.RES.IS_VALID Action-Rewrite-Server_Mask NOREWRITE Done
```

Finally, you would bind the rewrite policy, assigning it a priority of 900. Because this policy should be the last policy applied to a request that matches its criteria, you set the goto expression to END.

Incoming requests to any URL that begins with `<http://www.example.com/query.cgi?server>=` are redirected to the server number in the query.

Example 9: Home Page Redirection

New Company, Inc. recently acquired a smaller competitor, Purchased Company, and wants to redirect the home page for Purchased Company to a new page on its own Web site, as shown here.

- Old URL: `<http://www.purchasedcompany.com/*>`
- New URL: `<http://www.newcompany.com/products/page.htm>`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To redirect requests to the Purchased Company home page, you would create rewrite actions with the values in the following table.

ACTION NAME	TYPE OF REWRITE ACTION	EXPRESSION TO CHOOSE TARGET REFERENCE	STRING EXPRESSION FOR REPLACEMENT TEXT
Action-Rewrite-Replace_URLr	REPLACE	HTTP.REQ.URL.PATH_AND_QUERY	"/products/page.htm"
Action-Rewrite-Replace_Host	REPLACE	HTTP.REQ.HOSTNAME	"www.newcompany.com"

```
add rewrite action action-Rewrite-Replace_URLr REPLACE
HTTP.REQ.URL.PATH_AND_QUERY “/products/page.htm”

add rewrite action action-Rewrite-Replace_Host REPLACE HTTP.REQ.HOSTNAME
“www.newcompany.com”
```

You would then create rewrite policies with the values in the following table.

POLICY NAME	ACTION NAME	UNDEFINED ACTION	EXPRESSION
Policy-Rewrite-Replace-None	Action-Rewrite-Replace-None	NOREWRITE	! HTTP.REQ.HOSTNAME.SERVER.EQ("www.purchasedcompany.com")
Policy-Rewrite-Replace-Host	Action-Rewrite-Replace_Host	NOREWRITE	HTTP.REQ.HOSTNAME.SERVER.EQ("www.purchasedcompany.com")

```
add rewrite policy Policy-Rewrite-Replace-None !
HTTP.REQ.HOSTNAME.SERVER.EQ(“www.purchasedcompany.com”) Action-Rewrite-
Replace-None NOREWRITE
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add rewrite policy Policy-Rewrite-Replace-Host
HTTP.REQ.HOSTNAME.SERVER.EQ(“www.purchasedcompany.com”) Action-Rewrite-
Replace_Host NOREWRITE
```

Finally, you would bind the rewrite policies globally, assigning the first a priority of 100 and the second a priority of 200.

```
bind rewrite global Policy-Rewrite-Replace-None 100

bind rewrite global Policy-Rewrite-Replace-Host 200
```

Requests to the acquired company's old Web site are now redirected to the correct page on the New Company home page.

Example 10: Policy-based RSA Encryption

The RSA algorithm uses the PKEY_ENCRYPT_PEM() function to encrypt HTTP predefined and user-defined header or body content. The function accepts only RSA public keys (not private keys) and the encrypted data cannot be longer than the length of the public key. When the data being encrypted is shorter than the key length, the algorithm uses RSA_PKCS1 padding method.

In a sample scenario, the function can be used with B64ENCODE() function in a rewrite action to replace an HTTP header value with a value encrypted by an RSA public key. The data being encrypted is then decrypted by the recipient using the RSA private key.

You can implement the feature by using a rewrite policy. To do this, you must complete the following tasks:

1. Add RSA public key as a policy expression.
2. Create rewrite action.
3. Create rewrite policy.
4. Bind rewrite policy as global.
5. Verify RSA encryption

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Policy-based RSA encryption by using NetScaler command interface

Complete the following tasks to configure policy-based RSA encryption by using the NetScaler command interface.

To add RSA public key as a policy expression by using the NetScaler command interface:

```
add policy expression pubkey '"-----BEGIN RSA PUBLIC KEY-----
MIGJAoGBAKl5vgQEj73Kxp+9yn1v5gPR1pnc4oLM2a0kaWwBOsB6rzCIy6znwnvwCY1xRvQhRl
JSAyJbloL7wZFIJ2FOR8Cz+8ZQWXU2syG+udi4EnWqLgFYowF9zK+o79az597eNPAjsHZ/
C2oL/+6qY5a/f1z8bQPrHC4GpFfAEJhh/+NnAgMBAAE=-----END RSA PUBLIC KEY-----"'
```

To add rewrite an action to encrypt an HTTP header request by using the NetScaler command interface:

```
add rewrite action encrypt_act insert_http_header encrypted_data
```

```
HTTP.REQ.HEADER("data_to_encrypt").PKEY_ENCRYPT_PEM(pubkey).B64ENCODE
```

To add rewrite policy by using the NetScaler command interface:

```
add rewrite policy encrypt_pol 'HTTP.REQ.HEADER("data_to_encrypt").EXISTS'
encrypt_act
```

To bind rewrite policy global by using the NetScaler command interface:

```
bind rewrite global encrypt_pol 10 -type RES_DEFAULT
```

To verify RSA encryption by using the NetScaler command interface:

```
>curl -v -H "data_to_encrypt: Now is the time that tries men's souls"
http://10.217.24.7/`

* About to connect() to 10.217.24.7 port 80 (#0)

*  Trying 10.217.24.7...
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
*  connected

*  Connected to 10.217.24.7 (10.217.24.7) port 80 (#0)

> GET / HTTP/1.1

> User-Agent: curl/7.24.0 (amd64-portbld-freebsd8.4) libcurl/7.24.0
OpenSSL/0.9.8y zlib/1.2.3

> Host: 10.217.24.7

> Accept: */*

> data_to_encrypt: Now is the time that tries men's souls

>

< HTTP/1.1 200 OK

< Date: Mon, 09 Oct 2017 05:22:37 GMT

< Server: Apache/2.2.24 (FreeBSD) mod_ssl/2.2.24 OpenSSL/0.9.8y DAV/2

< Last-Modified: Thu, 20 Feb 2014 20:29:06 GMT

< ETag: "6bd9f2-2c-4f2dc5b570880"

< Accept-Ranges: bytes

< Content-Length: 44

< Content-Type: text/html

< encrypted_data: UliegKBJqZd7JdaC49XMLEK1+eQN2rEfevypW91gKvBVlaKM9N9/
C2BKuztS99SE0xQaisidzN5IgeIcpQMn+CiKYVlLzPG1RuhGaqHYzIt6C8A842da7xE4OlV5SH

Policy-based RSA encryption by using the GUI

The GUI enables you to complete the following tasks:

To add RSA public key as a policy expression by using the GUI:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. Sign into the NetScaler appliance and navigate to **Configurations** > **AppExpert** > **Advanced Expressions**.
2. In the details pane, click **Add** to define an RSA public key as an advanced policy expression.
3. In Create Expression page, set the following parameters:
    a. Expression name. Name of the advanced expression.
    b. Expression. Define RSA public key as an advanced expression using the Expression Editor.
    c. Comments. A brief description of the expression.
4. Click **Create**.

To add rewrite an action to encrypt an HTTP header request by using the GUI:

1. Sign into the NetScaler appliance and navigate to **Configurations** > **AppExpert** > **Rewrite** > **Actions**.
2. In the details pane, click **Add** to add a rewrite action.
3. In the **Create Rewrite Action** screen, set the following parameters:
    a. Name. Name of the rewrite action.
    b. Type. Select action type as INSERT_HTTP_HEADER.
    c. Use the action type to insert a header. Enter the name of the HTTP header that needs to be rewritten.
    d. Expression. Name of the advanced policy expression associated to the action.
    e. Comments. A brief description of the rewrite action.
4. Click **Create**.

To add rewrite advanced policy by using the GUI:

1. Sign into the NetScaler appliance and navigate to **Configurations** > **AppExpert** > **Rewrite** > **Policies**.
2. In the **Rewrite Policies** page, click **Add** to add a rewrite policy.
3. In the **Create Rewrite Policy** page, set the following parameters:
    a. Name. Name of the rewrite policy.
    b. Action. Name of the rewrite action to perform if the request or response matches this rewrite policy.
    c. Log Action. Name of message log action to use when a request matches this policy.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

d. Undefined-Result Action. Action to perform if the result of policy evaluation is undefined.

e. Expression. Name of the advanced policy expression that triggers the action.

f. Comments. A brief description of the rewrite action.

4. Click **Create**.

To bind rewrite policy global by using the GUI:

1. Sign into the NetScaler appliance and navigate to **Configurations** > **AppExpert** > **Rewrite** > **Policies**.
2. In the **Rewrite Policies** screen, select a rewrite policy that you want to bind and click **Policy Manager**.
3. In the Rewrite Policy Manager page, in the Bind Points section, set the following parameters:

   a. Bind Point. Select the binding point as Default Global.

   b. Protocol. Select the protocol type as HTTP.

   c. Connection Type. Select the connection type as Request.

   d. Click **Continue** to view the **Policy Binding** section.

   e. In the **Policy Binding** section, select the rewrite policy and set the bind parameters.

4. Click **Bind**.

Example 11: Policy-based RSA encryption with no padding operation

The PKEY_ENCRYPT_PEM_NO_PADDING() policy function uses the RSA algorithm with no padding operation before performing RSA encryption. The policy function works just like the PKEY_ENCRYPT_PEM() function, except it uses RSA_NO_PADDING method instead of RSA_PKCS1_PADDING. The pkey parameter is a text string with a PEM-encoded RSA public key. Similar to PKEY_ENCRYPT_PEM(), you can use a policy expression for the key.

You can implement the feature by using a rewrite policy. To do this, you must complete the following tasks:

1. Add RSA public key as a policy expression.
2. Create rewrite action.

Policy-based RSA encryption by using NetScaler command interface

Complete the following tasks to configure policy-based RSA encryption by using the NetScaler command interface.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To add RSA public key with no padding policy expression by using the NetScaler command interface:

```
add expression rsa_pub_key_4096 '"-----BEGIN RSA PUBLIC KEY-----" +
"MIICCgKCAgEArrwBldKd48xrpOSRPMrg+eNAO0ODU6t5b/WYQLdElqNv7WpefBrA" +
\"nwI2s619gEU1r4zoLqL7l5ALtt5Z+F0JBYfOzBzOky0GtEJ5iX5GP4QxT65J3nHH" +
"4MTF3acmjvXxclmaKXEFlaVIzW7FTr3Luw/CnOjflAB403Q6F9VBVvQmOVYWnqoI" +
\"+0q1VIg6Q1pAcvdKBiOf85BBofE5EIbZ/1Jt0CdbsV568l+8ve7BnSUncFHoRR3O" + "/
VfSsDuNWZf7n3RNMzxEuIA72UGPzNYFQzvcPOdzd0aN7jAXw0mgC/NSvKzGKHlo" +
\"mUYYBzlVQdDMZWnd6jSzsBRXSXxsNEy/RuXwplrA5epo7JdCoMkfeI4vUXm6MNr8" +
"TQdFqIc1pdnOsbRf9ec62XbcfR7P8CDTsmLSaagx3rjenPdB+LTWKw2VUF+YONIg" +
\"jM3fyFef9ovVhLhS5HvMqFGs8P75W+d7BOIbIu3EngACiEJOpYSsETD4WgPK6Iyv" +
"j6cxsLeYMtElTb0fBIIqysCHdmjF3M1lqdqp4dKs3+W798GJZYM5MxZKUzrBi0Xu" +
\"e7GtSh2aimsfQureUD+0z0RN2umeDsYcA1ghXMclDP+jLS1lnrv0Yvo+TKcm9b8G" + "uR/
drbCrCsGyWFW+bsAu3AWz9S6TePurP5unRmNNvXpH5DRgsYl3d50CAwEAAQ==" + \"-----
END RSA PUBLIC KEY-----\"
```

To add rewrite action for no padding policy expression by using the NetScaler command interface:

```
add rewrite action rsa_encrypt_act insertHttpHeader encrypted
'HTTP.REQ.HEADER("plaintext").PKEY_ENCRYPT_PEM_NO_PADDING(rsa_pub_key_4096)
```

Policy-based RSA encryption with no padding option by using the GUI

The GUI enables you to complete the following tasks:

To add RSA public key for no padding operation as a policy expression by using the GUI:

1. Sign into the NetScaler appliance and navigate to **Configurations** > **AppExpert** > **Advanced Expressions**.
2. In the details pane, click **Add** to define an RSA public key as an advanced policy expression.
3. In Create Expression page, set the following parameters:
   a. Expression name. Name of the advanced expression.
   b. Expression. Define RSA public key as an advanced expression using the Expression Editor. **Note**: The maximum string length is of 255 characters in a policy expression. For any key longer than 1024-bits, you have to break the key into smaller chunks and concatenate the chunks together as "chunk1" + "chunk2" + …
   c. Comments. A brief description of the expression.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. Click **Create**.

To add rewrite an action by using the GUI:

1. Sign into the NetScaler appliance and navigate to **Configurations** > **AppExpert** > **Rewrite** > **Actions**.
2. In the details pane, click **Add** to add a rewrite action.
3. In the **Create Rewrite Action** screen, set the following parameters:
    a. Name. Name of the rewrite action.
    b. Type. Select action type as INSERT_HTTP_HEADER.
    c. Use the action type to insert a header. Enter the name of the HTTP header that needs to be rewritten.
    d. Expression. Name of the advanced policy expression associated to the action.
    e. Comments. A brief description of the rewrite action.
4. Click **Create**.

Example 12: Configure rewrite to change the host name and URL in client request on NetScaler appliance

Rewrite feature on a NetScaler appliance is used to convert the URL available in the client request to another URL that the back end server can understand. You can achieve the following benefits by using the rewrite feature:

- Enhances the security by hiding the actual URL to the resource, which is requested by the client.
- Prevents the unauthorized user access from gaining access to the network resources.

Consider an example where your current organization is acquired by another organization. It becomes a difficult job for admins to inform about the new web address to every user of the acquired organization. In this scenario, using rewrite feature becomes convenient to change the host name and URL in the client requests for the website of the acquired organization. You can use rewrite to change the URLs in the client request temporarily when the website is under maintenance.

The following section describes the procedure to change the host name and URL in a client request using rewrite feature.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Consider an example where the user enters a `http://www.example.com` URL in the web browser. The website administrator wants the NetScaler appliance to convert the preceding URL in the client request as `http://myexample.example.net.in/resource/inventory/s?t=112`.

In the preceding example, the website administrator wants the NetScaler appliance to replace the "example.com" domain name with "myexample.example.net.in" and the URL with "resource/inventory/s?t=112".

Perform the following by using the CLI

1. Log on to the NetScaler appliance using SSH.
2. Add rewrite actions.
   - `add rewrite action rewrite_domain_url_replace_act replace HTTP.REQ.URL "\"http://myexample.example.net.in/resource/inventory/s?t=112\""`
3. Add rewrite policies for the rewrite actions.
   - `add rewrite policy rewrite_domain_url_pol HTTP.REQ.HOSTNAME.EQ("www.example.com") rewrite_domain_url_replace_act`
4. Bind the rewrite policies to a virtual server.
   - `bind lb vserver rewrite_LB -policyName rewrite_domain_url_pol -priority 100 -gotoPriorityExpression END -type REQUEST`

URL Transformation

The URL transformation feature provides a method for modifying all URLs in designated requests from an external version seen by outside users to an internal URL seen only by your Web servers and IT staff. You can redirect user requests seamlessly, without exposing your network structure to users. You can also modify complex internal URLs that users may find difficult to remember into simpler, more easily remembered external URLs.

NOTE

Before you can use the URL transformation feature, you must enable the Rewrite feature. To enable the Rewrite feature, see Enabling the Rewrite Feature.

URL transform feature rewrites URLs in HTML response body and is not applied to JavaScript and other variables.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To begin configuring URL transformation, you create profiles, each describing a specific transformation. Within each profile, you create one or more actions that describe the transformation in detail. Next, you create policies, each of which identifies a type of HTTP request to transform, and you associate each policy with an appropriate profile. Finally, you globally bind each policy to put it into effect.

Configuring URL Transformation Profiles

A profile describes a specific URL transformation as a series of actions. The profile functions primarily as a container for the actions, determining the order in which the actions are performed. Most transformations transform an external hostname and optional path into a different, internal hostname and path. Most useful transformations are simple and require only a single action, but you can use multiple actions to perform complex transformations.

You cannot create actions and then add them to a profile. You must create the profile first, and then add actions to it. In the CLI, creating an action and configuring the action are separate steps. Creating a profile and configuring the profile are separate steps in both the CLI and the configuration utility.

To create a URL transformation profile by using the NetScaler command line

At the NetScaler command prompt, type the following commands, in the order shown, to create a URL transformation profile and verify the configuration. You can then repeat the second and third commands to configure additional actions:

- `add transform profile <profileName> -type URL [-onlyTransformAbsURLinBody (ON|OFF)] \[-comment <comment>]`
- `add transform action <name> <profileName> <priority>`
- `set transform action <name> [-priority <priority>] [-reqUrlFrom <expression>] [-reqUrlInto <expression>] [-resUrlFrom <expression>] [-resUrlInto <expression>] [-cookieDomainFrom <expression>] [-cookieDomainInto <expression>] [-state (ENABLED|DISABLED)] [-comment "<string>"]`
- `show transform profile <name>`

Example:

```
> add transform profile shoppingcart -type URL

 Done
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
> add transform action actshopping shoppingcart 1000

 Done

> set transform action actshopping -priority 1000 -reqUrlFrom
'shopping.example.com' -reqUrlInto 'www.example.net/shopping' -resUrlFrom
'www.example.net/shopping' -resUrlInto 'shopping.example.com'
-cookieDomainFrom 'example.com' -cookieDomainInto 'example.net' -state
ENABLED -comment 'URL transformation for shopping cart.'

 Done

> show transform profile shoppingcart

        Name: shoppingcart

                Type: URL       onlyTransformAbsURLinBody: OFF

        Comment:

        Actions:

1)              Priority 1000   Name: actshopping       ENABLED

 Done
```

To modify an existing URL transformation profile or action by using the NetScaler command line

At the NetScaler command prompt, type the following commands to modify an existing URL transformation profile or action and verify the configuration:

Note: Use a set transform profile or set transform action command, respectively. The set transform profile command takes the same arguments as does the add transform profile command, and set transform action is the same command that was used for initial configuration.

- `set transform action <name> [-priority <priority>] [-reqUrlFrom <expression>] [-reqUrlInto <expression>] [-resUrlFrom <expression>] [-resUrlInto <expression>] [-cookieDomainInto <expression>] [-state (ENABLED|DISABLED)] [-comment "<string>"]`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- `show transform profile <name>`

Example:

```
> set transform action actshopping -priority 1000 -reqUrlFrom
'searching.example.net' -reqUrlInto 'www.example.net/searching'
-resUrlFrom 'www.example.net/searching' -resUrlInto
'searching.example.com' -cookieDomainInto 'example.net' -state ENABLED
-comment 'URL transformation for searching cart.'

 Done

> show transform profile shoppingcart

        Name: shoppingcart

                Type: URL       onlyTransformAbsURLinBody: OFF

        Comment:

        Actions:

1)              Priority 1000   Name: actshopping       ENABLED

 Done
```

To remove a URL transformation profile and actions by using the NetScaler command line

First remove all actions associated with that profile by typing the following command once for each action:

- rm transform action `<name>` After you have removed all actions associated with a profile, remove the profile as shown below.
- rm transform profile `<name>`

To create a URL transformation profile by using the configuration utility

1. In the navigation pane, expand **Rewrite**, expand URL Transformation, and then click **Profiles**.
2. In the details pane, click **Add**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. In the **Create URL Transformation Profile** dialog box, type or select values for the parameters. The contents of the dialog box correspond to the parameters described in "Parameters for configuring URL transformation profiles" as follows (asterisk indicates a required parameter):

    - Name*—name
    - Comment—comment
    - Only transform absolute URLs in response body—onlyTransformAbsURLinBody

4. Click **Create**, and then click **Close**. A message appears in the status bar, stating that the Profile has been configured successfully.

To configure a URL transformation profile and actions by using the configuration utility

1. In the navigation pane, expand **Rewrite**, expand URL Transformation, and then click **Profiles**.
2. In the details pane, select the profile you want to configure, and then click **Open**.
3. In the **Configure URL Transformation Profile** dialog box, do one of the following.

    - To create a new action, click **Add**.
    - To modify an existing action, select the action, and then click **Open**.

4. Fill in the **Create URL Transformation Action** or **Modify URL Transformation Action** dialog box by typing or selecting values for the parameters. The contents of the dialog box correspond to the parameters described in "Parameters for configuring URL transformation profiles" as follows (asterisk indicates a required parameter):

    - Action Name*—name
    - Comments—comment
    - Priority*—priority
    - Request URL from—reqUrlFrom
    - Request URL into—reqUrlInto
    - Response URL from—resUrlFrom
    - Response URL into—resUrlInto
    - Cookie Domain from—cookieDomainFrom
    - Cookie Domain into—cookieDomainInto
    - Enabled—state

5. Save your changes.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- If you are creating a new action, click **Create**, and then **Close**.
- If you are modifying an existing action, click **OK**. A message appears in the status bar, stating that the Profile has been configured successfully.

6. Repeat step 3 through step 5 to create or modify any additional actions.
7. To delete an action, select the action, and then click Remove. When prompted, click OK to confirm the deletion.
8. Click **OK** to save your changes and close the Modify URL Transformation Profile dialog box.
9. To delete a profile, in the details pane select the profile, and then click **Remove**. When prompted, click **OK** to confirm the deletion.

Configuring URL Transformation Policies

After you create a URL transformation profile, you next create a URL transformation policy to select the requests and responses that the NetScaler should transform by using the profile. URL transformation considers each request and the response to it as a single unit, so URL transformation policies are evaluated only when a request is received. If a policy matches, the NetScaler transforms both the request and the response.

Note: The URL transformation and rewrite features cannot both operate on the same HTTP header during request processing. Because of this, if you want to apply a URL transformation to a request, you must make sure that none of the HTTP headers it will modify are manipulated by any rewrite action.

To configure a URL transformation policy by using the NetScaler command line

You must create a new policy. On the command line, an existing policy can only be removed. At the NetScaler command prompt, type the following commands to configure a URL transformation policy and verify the configuration:

- `<add transform policy <name> <rule> <profileName>`
- `<show transform policy <name>`

Example:

```
> add transform policy polsearch  HTTP.REQ.URL.SUFFIX.EQ("Searching")
prosearching

 Done

> show transform policy polsearch
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
1)      Name: polsearch

        Rule: HTTP.REQ.URL.SUFFIX.EQ("Searching")

        Profile: prosearching

        Priority: 0

        Hits: 0

 Done
```

To remove a URL transformation policy by using the NetScaler command line

At the NetScaler command prompt, type the following command to remove a URL transformation policy:

`rm transform policy <name>`

Example:

```
> rm transform policy polsearch

Done
```

To configure a URL transformation policy by using the configuration utility

1. In the navigation pane, expand **Rewrite**, expand URL Transformation, and then click **Policies**.
2. In the details pane, do one of the following:
   - To create a new policy, click **Add**.
   - To modify an existing policy, select the policy, and then click **Open**.
3. In the **Create URL Transformation Policy** or **Configure URL Transformation Policy** dialog box, type or select values for the parameters. The contents of the dialog box correspond to the parameters described in "Parameters for configuring URL transformation policies" as follows (asterisk indicates a required parameter):
   - Name*—name (Cannot be changed for a previously configured policy.)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Profile*—profileName
- Expression—rule

If you want help with creating an expression for a new policy, you can either hold down the Control key and press the space bar while your cursor is in the Expression text box. To create the expression, you can type it directly as described below, or you can use the Add Expression dialog box.

4. Click **Prefix**, and choose the prefix for your expression.

   Your choices are:

   - HTTP—The HTTP protocol. Choose this if you want to examine some aspect of the request that pertains to the HTTP protocol.
   - SYS—The protected Web site(s). Choose this if you want to examine some aspect of the request that pertains to the recipient of the request.
   - CLIENT—The computer that sent the request. Choose this if you want to examine some aspect of the sender of the request.
   - SERVER—The computer to which the request was sent. Choose this if you want to examine some aspect of the recipient of the request.
   - URL—The URL of the request. Choose this if you want to examine some aspect of the URL to which the request was sent.
   - TEXT—Any text string in the request. Choose this if you want to examine a text string in the request.
   - TARGET—The target of the request. Choose this if you want to examine some aspect of the request target.

   After you choose a prefix, the NetScaler displays a two-part prompt window that displays the possible next choices at the top, and a brief explanation of what the selected choice means at the bottom. The choices depend on which prefix you chose.

5. Select your next term.

If you chose HTTP as your prefix, your choices are REQ, which specifies HTTP requests, and RES, which specifies HTTP responses. If you chose another prefix, your choices are more varied. For help on a specific choice, click that choice once to display information about it in the lower prompt window.

When you are certain which choice you want, double-click it to insert it into the Expression window.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. Type a period, and then continue selecting terms from the list boxes that appear to the right of the previous list box. You type the appropriate text strings or numbers in the text boxes that appear to prompt you to enter a value, until your expression is finished.
2. Click **Create** or **OK**, depending on whether you are creating a new policy or modifying an existing policy.
3. Click **Close**. A message appears in the status bar, stating that the Policy has been configured successfully.

To add an expression by using the Add Expression dialog box

1. In the **Create Responder Action** or **Configure Responder Action** dialog box, click **Add**.
2. In the **Add Expression** dialog box, in the first list box choose the first term for your expression.
    - HTTP. The HTTP protocol. Choose this if you want to examine some aspect of the request that pertains to the HTTP protocol.
    - SYS. The protected Web site(s). Choose this if you want to examine some aspect of the request that pertains to the recipient of the request.
    - CLIENT. The computer that sent the request. Choose this if you want to examine some aspect of the sender of the request.
    - SERVER. The computer to which the request was sent. Choose this if you want to examine some aspect of the recipient of the request.
    - URL. The URL of the request. Choose this if you want to examine some aspect of the URL to which the request was sent.
    - TEXT. Any text string in the request. Choose this if you want to examine a text string in the request.
    - TARGET. The target of the request. Choose this if you want to examine some aspect of the request target. When you make your choice, the rightmost list box lists appropriate terms for the next part of your expression.
3. In the second list box, choose the second term for your expression. The choices depend upon which choice you made in the previous step, and are appropriate to the context. After you make your second choice, the Help window below the Construct Expression window (which was blank) displays help describing the purpose and use of the term you just chose.
4. Continue choosing terms from the list boxes that appear to the right of the previous list box, or typing strings or numbers in the text boxes that appear to prompt you to enter a value, until your expression is finished.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Globally Binding URL Transformation Policies

After you have configured your URL transformation policies, you bind them to Global or a bind point to put them into effect. After binding, any a request or response that matches a URL transformation policy is transformed by the profile associated with that policy.

When you bind a policy, you assign a priority to it. The priority determines the order in which the policies you define are evaluated. You can set the priority to any positive integer. In the NetScaler OS, policy priorities work in reverse order - the higher the number, the lower the priority.

Because the URL transformation feature implements only the first policy that a request matches, not any additional policies that it might also match, policy priority is important for achieving the results that you intend. If you give your first policy a low priority (such as 1000), you tell the NetScaler to perform it only if other policies with a higher priority do not match a request. If you give your first policy a high priority (such as 1), you tell the NetScaler to perform it first, and skip any other policies that might also match. You can leave yourself plenty of room to add other policies in any order, without having to reassign priorities, by setting priorities with intervals of 50 or 100 between each policy when you globally bind your policies.

Note: URL transformation policies cannot be bound to TCP-based virtual servers.

To bind a URL transformation policy by using the NetScaler command line

At the NetScaler command prompt, type the following commands to globally bind a URL transformation policy and verify the configuration:

- `bind transform global <policyName> <priority>`
- `show transform global`

Example:

```
> bind transform global polisearching 100
 Done
> show transform global
1)      Policy Name: polisearching
        Priority: 100
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Done
```

To bind a URL transformation policy by using the configuration utility

1. In the navigation pane, expand Rewrite, then expand URL Transformation, and then click **Policies.
2. In the details pane, click **Policy Manager**.
3. In the **Transform Policy Manager** dialog box, choose the bind point to which you want to bind the policy**. The choices are:
   - **Override Global.** Policies that are bound to this bind point process all traffic from all interfaces on the NetScaler appliance, and are applied before any other policies.
   - **LB Virtual Server.** Policies that are bound to a load balancing virtual server are applied only to traffic that is processed by that load balancing virtual server, and are applied before any Default Global policies. After selecting LB Virtual Server, you must also select the specific load balancing virtual server to which you want to bind this policy.
   - **CS Virtual Server.** Policies that are bound to a content switching virtual server are applied only to traffic that is processed by that content switching virtual server, and are applied before any Default Global policies. After selecting CS Virtual Server, you must also select the specific content switching virtual server to which you want to bind this policy.
   - **Default Global.** Policies that are bound to this bind point process all traffic from all interfaces on the NetScaler appliance.
   - **Policy Label.** Policies that are bound to a policy label process traffic that the policy label routes to them. The policy label controls the order in which policies are applied to this traffic.
4. Select Insert Policy to insert a new row and display a drop-down list with all available, unbound URL transformation policies.
5. Select the policy you want to bind, or select New Policy to create a new policy. The policy that you selected or created is inserted into the list of globally bound URL transformation policies.
6. Make any additional adjustments to the binding.
   - To modify the policy priority, click the field to enable it, and then type a new priority. You can also select Regenerate Priorities to renumber the priorities evenly.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- To modify the policy expression, double click that field to open the Configure Transform Policy dialog box, where you can edit the policy expression.
- To set the Goto Expression, double click field in the Goto Expression column heading to display the drop-down list, where you can choose an expression.
- To set the Invoke option, double click field in the Invoke column heading to display the drop-down list, where you can choose an expression.

7. Repeat steps 3 through 6 to add any additional URL transformation policies you want to globally bind.
8. Click **OK** to save your changes. A message appears in the status bar, stating that the Policy has been configured successfully.

RADIUS support for the rewrite feature

The NetScaler expressions language includes expressions that can extract information from and manipulate RADIUS messages in requests and responses. These expressions enable you to use the rewrite feature to modify portions of a RADIUS message before sending it to its destination. Your rewrite policies and actions can use any expression that is appropriate or relevant to a RADIUS message. The available expressions enable you to identify the RADIUS message type, extract any attribute-value pair (AVP) from the connection, and modify RADIUS AVPs. You can also create policy labels for RADIUS connections.

You can use the new RADIUS expressions in Rewrite rules for a number of purposes. For example, you could:

- Remove the domain\\ portion of the RADIUS user-name AVP to simplify single sign-on (SSO).
- Insert a vendor-specific AVP, such as the MSISDN field used in telephone company operations to contain subscriber information.

You can also create policy labels to route specific types of RADIUS requests through a series of policies that are appropriate to those requests.

NOTE

.

RADIUS for Rewrite has the following limitations:

- The NetScaler does not re-sign rewritten RADIUS requests or responses. If the RADIUS authentication server requires signed RADIUS messages, authentication will fail.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- The currently available RADIUS expressions do not work with RADIUS IPv6 attributes.

The NetScaler documentation for expressions that support RADIUS assumes familiarity with the basic structure and purpose of RADIUS communications. If you need more information about RADIUS, see your RADIUS server documentation or search online for an introduction to the RADIUS protocol.

Configuring Rewrite Policies for RADIUS

The following procedure uses the NetScaler command line to configure a rewrite action and policy and bind the policy to a rewrite-specific global bind point.

To configure a Rewrite action and policy, and bind the policy:

At the command prompt, type the following commands:

- `add rewrite action <actName> <actType>`
- `add rewrite policy <polName> <rule> <actName>`
- `bind rewrite policy <polName> <priority> <nextExpr> -type <bindPoint>` where `<bindPoint>` represents one of the rewrite-specific global bind points.

RADIUS Expressions for Rewrite

In a rewrite configuration, you can use the following NetScaler expressions to refer to various portions of a RADIUS request or response.

Identifying the Type of Connection:

- `RADIUS.IS_CLIENT`

  Returns TRUE if the connection is a RADIUS client (request) message.
- `RADIUS.IS_SERVER`

  Returns TRUE if the connection is a RADIUS server (response) message.

Request Expressions:

- `RADIUS.REQ.CODE`

  Returns the number that corresponds to the RADIUS request type. A derivative of the num_at class. For example, a RADIUS access request would return 1 (one). A RADIUS accounting request would return 4.
- `RADIUS.REQ.LENGTH`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Returns the length of the RADIUS request, including the header. A derivative of the num_at class.

- `RADIUS.REQ.IDENTIFIER`

  Returns the RADIUS request identifier, a number assigned to each request that allows the request to be matched to the corresponding response. A derivative of the num_at class.

- `RADIUS.REQ.AVP(<AVP Code No>).VALUE`

  Returns the value of first occurrence of this AVP as a string of type text_t.

- `RADIUS.REQ.AVP(<AVP code no>).INSTANCE(instance number)`

  Returns the specified instance of the AVP as a string of type RAVP_t. A specific RADIUS AVP can occur multiple times in a RADIUS message. INSTANCE (0) returns the first instance, INSTANCE (1) returns second instance, and so on, up to sixteen instances.

- `RADIUS.REQ.AVP(<AVP code no>).VALUE(instance number)`

  Returns the value of specified instance of the AVP as a string of type text_t.

- `RADIUS.REQ.AVP(<AVP code no>).COUNT`

  Returns the number of instances of a specific AVP in a RADIUS connection, as an integer.

- `RADIUS.REQ.AVP(<AVP code no>).EXISTS`

  Returns TRUE if the specified type of AVP exists in the message, or FALSE if it does not.

Response Expressions:

RADIUS response expressions are identical to RADIUS request expressions, except that RES replaces REQ.

Typecasts of AVP Values:

The ADC supports expressions to typecast RADIUS AVP values to the text, integer, unsigned integer, long, unsigned long, ipv4 address, ipv6 address, ipv6 prefix and time data types. The syntax is the same as for other NetScaler typecast expressions.

Example:

The ADC supports expressions to typecast RADIUS AVP values to the text, integer, unsigned integer, long, unsigned long, ipv4 address, ipv6 address, ipv6 prefix and time data types. The syntax is the same as for other NetScaler typecast expressions.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
RADIUS.REQ.AVP(8).VALUE(0).typecast_ip_address_at
```

AVP Type Expressions:

The NetScaler supports expressions to extract RADIUS AVP values by using the assigned integer codes described in RFC2865 and RFC2866. You can also use text aliases to accomplish the same task. Some examples follow.

- `RADIUS.REQ.AVP (1).VALUE or RADIUS.REQ.USERNAME.value`

  Extracts the RADIUS user-name value.

- `RADIUS.REQ.AVP (4). VALUE or RADIUS.REQ. ACCT\_SESSION\_ID.value`

  Extracts the Acct-Session-ID AVP (code 44) from the message.

- `RADIUS.REQ.AVP (26). VALUE or RADIUS.REQ.VENDOR\_SPECIFIC.VALUE`

  Extracts the vendor-specific value.

The values of most commonly-used RADIUS AVPs can be extracted in the same manner.

RADIUS Bind Points:

Four global bind points are available for policies that contain RADIUS expressions.

- `RADIUS_REQ_OVERRIDE`

  Priority/override request policy queue.

- `RADIUS_REQ_DEFAULT`

  Standard request policy queue.

- `RADIUS_RES_OVERRIDE`

  Priority/override response policy queue.

- `RADIUS_RES_DEFAULT`

  Standard response policy queue.

RADIUS Rewrite-Specific Expressions:

- `RADIUS.NEW_AVP`

  Returns the specified RADIUS AVP as a string.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- `RADIUS.NEW_AVP_INTEGER32`

  Returns the specified RADIUS AVP as an integer.

- `RADIUS.NEW_AVP_UNSIGNED32`

  Returns the specified RADIUS AVP as an unsigned integer.

- `RADIUS.NEW_VENDOR_SPEC_AVP(<ID>, <definition>)`

  Adds the specified extended vendor specific AVPs to the connection. For `<ID>`, substitute a long number. For `<definition>`, substitute a string that contains the data for the AVP.

- `RADIUS.REQ.AVP_START`

  Returns the location between the end of the RADIUS header and the start of the AVPs. Used in rewrite actions.

  Example:

```
add rewrite action insert1 insert_after radius.req.avp_start
radius.new_avp(33, "NEW AVP")
```

- `RADIUS.REQ.AVP_END`

  Returns the location at the end of radius message (or in other words end of all AVPs) in radius message. Used when performing rewrite actions.

  Example:

```
add rewrite action insert2 insert_before radius.req.avp_end
"radius.new_avp(33, \"NEW AVP\")"
```

- `RADIUS.REQ.AVP_LIST`

  Returns the location at the start of the AVPs in a RADIUS message, and the length of the RADIUS message, excluding the header. In other words, returns all AVPs in a RADIUS message. Used to perform Rewrite actions.

  Example:

```
add rewrite action insert3 insert_before_all radius.req.avp_list
"radius.new_avp(33, \"NEW AVP\")" -search "avp(33)"
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Valid Rewrite-Action Types for RADIUS:

The Rewrite action types that can be used with RADIUS expressions are:

- INSERT_AFTER
- INSERT_BEFORE
- INSERT_AFTER_ALL
- INSERT_BEFORE_ALL
- DELETE
- DELETE_ALL
- REPLACE
- REPLACE_ALL

All `INSERT_ actions` can be used to insert a RADIUS AVP into a RADIUS connection.

Use Cases

Following are use cases for RADIUS with rewrite.

Rewriting the User-Name AVP

To configure the rewrite feature to remove the Domain\\ string from the RADIUS user-name AVP, begin by creating a rewrite REPLACE action as shown in the example below. Use the action in a Rewrite policy that selects all RADIUS requests. Bind the policy to a global bind point. When you do so, set the priority the appropriate level to allow any block or reject policies to take effect first, but ensure that all requests that are not blocked or rejected are rewritten. Set the Goto Expression (gotoPriorityExpr) to NEXT to continue policy evaluation, and attach the policy to the RADIUS_REQ_DEFAULT queue.

Example:

```
add rewrite action rwActRadiusDomainDel replace radius.req.user_name q/
RADIUS.NEW_AVP(1,RADIUS.REQ.USER_NAME.VALUE.AFTER_STR(" "))/

add rewrite policy RadiusRemoveDomainPol true rwActRadiusDomainDel
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE

.

The rewrite policy for RADIUS is not applicable to a gateway virtual server. If a gateway virtual server is used a load balancing then RADIUS needs to be configured and the rewrite policy needs to be bound to a RADIUS load balancing virtual server.

Inserting a Vendor-Specific AVP

To configure Rewrite action to insert a Vendor-Specific AVP containing the contents of the MSISDN field, begin by creating a rewrite INSERT action that inserts the MSISDN field into the request. Use the action in a Rewrite policy that selects all RADIUS requests. bind the policy to global, setting the priority to an appropriate level and the other parameters as shown in the following example.

Example:

```
add rewrite action rwActRadiusInsMSISDN insert_after radius.req.avp_start
RADIUS.NEW_VENDOR_SPEC_AVP(<VENDOR ID>, "RADIUS.NEW_AVP(<Attribute Code>,
<MSISDN>)")

add rewrite policy rwPolRadiusInsMSISDN true rwActRadiusInsMSISDN

bind rewrite global rwPolRadiusInsMSISDN 100 NEXT -type RADIUS_REQ_DEFAULT
```

Diameter Support for Rewrite

The Rewrite feature now supports the Diameter protocol. You can configure Rewrite to modify Diameter requests and response as you would HTTP or TCP requests and responses, allowing you to use Rewrite to manage the flow of Diameter requests and make necessary modifications. For example, if the "Origin-Host" value in a Diameter request is inappropriate, you can use Rewrite to replace it with a value that is acceptable to the Diameter server.

To configure Rewrite to modify a Diameter request

To configure the Rewrite feature to replace the Origin-Host in a diameter request with a different value, at the command prompt, type the following commands:

- <add rewrite action \<actname\> replace "DIAMETER.REQ.AVP(264,\ \"NetScaler.example.net\\")" For \<actname\>, substitute a name for your new action. The name can consist of from one to 127 characters in length, and can contain letters, numbers,

© 1997–2026 Citrix Systems, Inc. All rights reserved.

and the hyphen (-) and underscore (_) symbols. For NetScaler.example.net, substitute the Host-Origin that you want to use instead of the original Host-Name.

- add rewrite policy \<polname\> "diameter.req.avp(264).value.eq(\\"host.example.com\\")" \<actname\> For \<polname\>, substitute a name for your new policy. As with \<actname\>, the name can consist of from one to 127 characters in length, and can contain letters, numbers, and the hyphen (-) and underscore (_) symbols. For host.example.com, substitute the name of the Host-Origin that you want to change. For \<actname\>, substitute the name of the action that you just created.
- bind lb vserver \<vservername\> -policyName \<polname\> -priority \<priority\> -type REQUEST For \<vservername\>, substitute the name of the load balancing virtual server to which you want to bind the policy. For \<polname\>, substitute the name of the policy you just created. For \<priority\>, substitute a priority for the policy.

Example:

To create a Rewrite action and policy to modify all Diameter Host-Origins of "host.example.com" to "NetScaler.example.net", you could add the following action and policy, and bind the policy as shown.

```
> add rewrite action rw_act_replace_avp replace "diameter.req.avp(264)"
"diameter.new.avp(264,\"NetScaler.example.net\")"

> add rewrite policy rw_diam_pol
"diameter.req.avp(264).value.eq(\"client.realm2.net\")" rw_act_replace_avp

> bind lb vserver vs1 -policyName rw_diam_pol -priority 10 -type REQUEST

Done
```

DNS Support for the Rewrite Feature

You can configure the rewrite feature to modify DNS requests and responses, as you would for HTTP or TCP requests and responses. You can use rewrite to manage the flow of DNS requests, and make necessary modifications in the header, or in the answer section. For example, if the DNS response does not have the AA bit set in the header flag, you can use rewrite to set the AA bit in the DNS response and send it to the client.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

DNS Expressions

In a rewrite configuration, you can use the following NetScaler expressions to refer to various portions of a DNS request or response:

See Expressions and Descriptions

DNS Bind Points

The following global bind points are available for policies that contain DNS expressions.

BIND POINTS	DESCRIPTION
DNS_REQ_OVERRIDE	Override request policy queue.
DNS_REQ_DEFAULT	Standard request policy queue.
DNS_RES_OVERRIDE	Override response policy queue.
DNS_RES_DEFAULT	Standard response policy queue.

In addition to the default bind points, you can create policy labels of type DNS_REQ or DNS_RES and bind DNS policies to them.

Rewrite Action Types for DNS

- **replace_dns_answer_section**—This action replaces the DNS answers section with the defined expression in the DNS policy.
- **replace_dns_header_field**—Checks the opcode type in the DNS request. Returns True or False, indicating whether the opcode type in the DNS request matches the specified opcode type. This action replaces the DNS header section with the defined expression in the DNS policy.

Configuring Rewrite Policies for DNS

The following procedure uses the NetScaler command line to configure a rewrite action and policy and bind the policy to a rewrite-specific global bind point.

Configure Rewrite action and policy, and bind the policy for DNS

At the command prompt, type the following commands:

1. `add rewrite action <actName> <actType>`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

For `<actname>`, substitute a name for your new action. The name can be 1 to 127 characters in length, and can contain letters, numbers, hyphen (-), and underscore (_) symbols. For `<actType>`, specify the rewrite action types provided for DNS expressions.

2. `add rewrite policy <polName> <rule> <actName>`

   For `<polname>`, substitute a name for your new policy. For `<actname>`, the name can be 1 to 127 characters in length, and can contain letters, numbers, hyphen (-), and underscore (_) symbols. For `<actname>`, substitute the name of the action that you just created.

3. `bind rewrite global <polName> <priority> <gotoPriorityExpression> -type <bindPoint>`

   For `<polName>`, substitute the name of the policy that you just created. For `<priority>`, specify the priority of the policy. For `<bindPoint>`, substitute one of the rewrite -specific global bind points.

Example:

Set the AA bit of DNS request to load balance virtual server.

The following commands configure the NetScaler appliance to act as an authoritative DNS server for all the queries that it serves.

```
add rewrite action set_aa replace_dns_header_field
dns.req.header.flags.set(aa)

add rewrite policy pol !dns.req.header.flags.is_set(aa)  set_aa

bind rewrite global  pol  100  -type dns_res_override
```

Modify the response answer and header section.

If the server responds with an NX domain, you can set the rewrite action to replace the response with specified IP address. A NOPOLICY-REWRITE enables you to invoke an external bank without processing an expression (a rule). This entry is a dummy policy that does not contain a rule but directs the entry to a policy label or virtual server specific policy banks.

```
add rewrite action set_aa_res replace_dns_header_field
"dns.res.header.flags.set(aa)"

add rewrite action modify_nxdomain_res replace_dns_answer_section
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
"dns.new_rrset_a(\"10.102.218.160\",300)"

add rewrite policy set_res_aa true set_aa_res

add add rewrite policy modify_answer "dns.RES.HEADER.RCODE.EQ(nxdomain) &&
dns.RES.QUESTION.TYPE.EQ(A)"

modify_nxdomain_res

add rewrite policylabel MODIFY_NODATA dns_res

bind rewrite policylabel MODIFY_NODATA modify_answer 10 END

bind rewrite policylabel MODIFY_NODATA set_res_aa 11 END

bind lb vserver v1 -policyName NOPOLICY-REWRITE -priority 11
-gotoPriorityExpression END -type

RESPONSE -invoke policylabel MODIFY_NODATA
```

Limitations:

- Rewrite policies are evaluated only if the NetScaler appliance is configured as a DNS proxy server and there is a cache miss.
- If the Recursion Available (RA) flag in the header is set to YES, the RA flag will not be modified in the rewrites.
- If the RA flag in the header is set to YES, the CD flag in the header is modified regardless of any rewrite action.

MQTT Support for Rewrite

The rewrite feature supports the MQTT protocol. You can configure rewrite policies to take actions based on the parameters in the MQTT client requests and server responses.

Rewrite action for MQTT

The rewrite action for MQTT indicates the changes made to the MQTT request or response before sending it to a server or client.

Expression:

```
add rewrite action <name> <rewrite_type> <target> <rewrite_action>
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Rewrite type for MQTT

Depending on the type of rewrite expression rule that is used, the following MQTT rewrite types are supported:

- `replace_mqtt`
- `insert_before_mqtt`
- `insert_after_mqtt`
- `delete_mqtt`
- `insert_mqtt`

Rewrite target for MQTT

In the following sample examples, the MQTT rewrite feature uses policy expressions to indicate the part of the request to be modified (target) and the modification to be performed (string expression):

- Rewrite a client ID in the connect packet using the `replace_mqtt` action type.

  ```
  add rewrite action rwact1 replace_mqtt MQTT.CONNECT.CLIENTID "\"xyz\""
  ```

- Rewrite a topic in the publish request using the `replace_mqtt` action type.

  ```
  add rewrite action rwact1 replace_mqtt MQTT.PUBLISH.TOPIC "\"testing/test123\""
  ```

- Rewrite to insert a property using the insert_mqtt action type.

  ```
  add rewrite action rwact1 insert_mqtt MQTT.NEW_PROPERTY("prop1", "test")
  ```

- Delete a topic using the delete_mqtt action type.

  ```
  add rewrite action rwact2 delete_mqtt MQTT.SUBSCRIBE.TOPIC_FILTERS.TOPIC(1)
  ```

Rewrite action for MQTT

The following are the predefined rewrite actions for MQTT:

- `MQTT.NEW_KEEPALIVE(interval)`
- `MQTT.NEW_PACKET_IDENTIFIER(packetID)`
- `MQTT.NEW_REASON_CODE(retCode)`
- `MQTT.NEW_PUBLISH(topic_name, payload)`
- `MQTT.NEW_CONNECT_USERNAME(username)`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- `MQTT.NEW_CONNECT_WILL_MESSAGE(will_topic, will_payload, will_Qos, will_retain)`
- `MQTT.NEW_TOPIC(topic, qos)`
- `MQTT.NEW_TOPIC(topic)`
- `MQTT.NEW_PROPERTY(key, value)`

Example for the predefined rewrite action:

```
add rewrite action rwact1 replace_mqtt MQTT.CONNECT.KEEPALIVE MQTT.NEW_KEEPALIVE(90)
```

Example for the user defined rewrite action:

```
add rewrite action rwact1 replace_mqtt MQTT.CONNECT.USERNAME "\"user1\""
```

Rewrite policy for MQTT

A rewrite policy for MQTT consists of a rule and action. The rule determines the MQTT traffic on which rewrite is applied and the action determines the action to be taken by the NetScaler appliance.

Expression:

```
add rewrite policy <name> <rewrite_rule> <rewrite_action>
```

Example:

```
add rewrite action insert_mqtt_username insert_mqtt MQTT.NEW_CONNECT_USERNAME("user1")
```

```
add rewrite policy rewrite_mqtt_username "MQTT.COMMAND.EQ(CONNECT) && MQTT.CONNECT.USERNAME.LENGTH.EQUALS(0) insert_mqtt_username
```

Bind points for MQTT

You can bind a rewrite policy globally, or to a specific load balancing virtual server or content switching virtual server. The following are the global bind points:

- `MQTT_REQ_DEFAULT`
- `MQTT_REQ_OVERRIDE`
- `MQTT_RES_DEFAULT`
- `MQTT_RES_OVERRIDE`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Expression:

- `bind rewrite global <policyName> <priority> [-type MQTT_REQ_OVERRIDE | MQTT_REQ_DEFAULT | MQTT_RES_OVERRIDE | MQTT_RES_DEFAULT]`
- `bind lb|cs vserver <virtualServerName> -policyName <policyName> -priority <positiveInteger> -type REQUEST|RESPONSE`

Example:

- `bind rewrite global pol1 10 -type MQTT_REQ_DEFAULT`
- `add/bind lb vserver v1 -policyName pol1 -type reqUEST -priority 10`

Configure a rewrite policy for MQTT

To configure a rewrite policy, follow the steps and type the commands at the command prompt:

1. Enable the rewrite feature on the NetScaler appliance.

   ```
   enable ns feature REWRITE
   ```

2. Add a rewrite action.

   ```
   add rewrite action rwact1 replace_mqtt MQTT.CONNECT.KEEPALIVE MQTT.NEW_KEEPALIVE(10)
   ```

3. Add a rewrite policy.

   ```
   add rewrite policy pol1 MQTT.COMMAND.EQ(CONNECT) rwact1
   ```

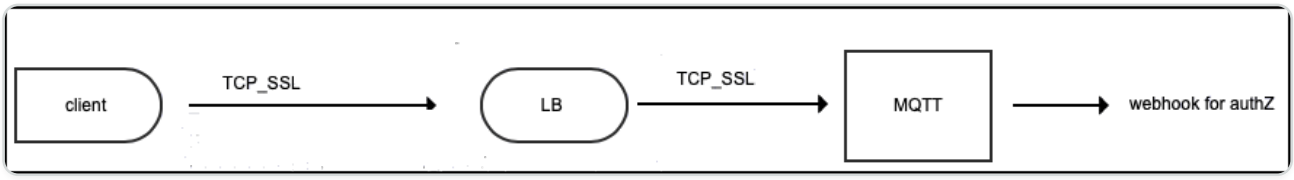
4. Configure an MQTT load balancing virtual server.

   ```
   add lb vserver v1 MQTT 1.1.1.1 1883
   ```

5. Bind the rewrite policy globally, or to a specific load balancing virtual server.

   ```
   bind rewrite global pol1 10 -type MQTT_REQ_DEFAULT
   ```

   ```
   add/bind lb vserver v1 -policyName pol1 -type REQUEST -priority 10
   ```



Use case 1: Replace the user name in the MQTT CONNECT message with the certificate name

The administrator can configure an MQTT rewrite policy to replace the user name with the client's certificate name.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Let us consider an example. The client request has an `MQTT CONNECT` message, which contains the user name as "admin". This user name must be replaced with the serial number (16 digit) that is extracted from the client certificate (cert name).

The following figure shows the workflow:

1. A Transport Control Protocol (TCP) request is sent to the load balancer.
2. In the load balancer, the user name is replaced with the certificate name.
3. The request is forwarded to the MQTT broker.
4. This new user name is used for authorization through the webhook payload.

Sample Configuration:

```
add rewrite action mqtt_rw_unameact1 replace_mqtt MQTT.CONNECT.USERNAME CLIENT.SSL.CLIENT_CERT.SERIALNUMBER
```

```
add rewrite policy mqtt_rw_uname_pol1 "MQTT.COMMAND.EQ(CONNECT)" mqtt_rw_unameact1
```

```
bind cs vserver mqtt_frontend_cs -policyName mqtt_rw_uname_pol1 -priority 10 -gotoPriorityExpression END -type REQUEST
```

Use case 2: Provide subscription to a new TOPIC

The administrator can provide a subscription to a new TOPIC. Let us consider an example. A client request has subscription to TOPIC 1. The administrator can configure a rewrite policy to provide subscription to a new TOPIC 2. The subscription can be inserted before or after.

Sample Configuration:

- `add rewrite action act2 insert_before_mqtt MQTT.TOPIC_FILTERS.TOPIC(1) MQTT.NEW_TOPIC(topic2, 2)`
- `add rewrite policy policy2 “MQTT.COMMAND.EQ(SUBSCRIBE) && MQTT.SUBSCRIBE.TOPIC_FILTERS.TOPIC.CONTAINS(\"test\")" act2`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

String maps

You can use string maps to perform pattern matching in all NetScaler features that use the default policy syntax. A string map is a NetScaler entity that consists of key-value pairs. The keys and values are strings in either ASCII or UTF-8 format. String comparison uses two new functions, `MAP_STRING(<string_map_name>)` and `IS_STRINGMAP_KEY(<string_map_name>)`.

A policy configuration that uses string maps performs better than one that does string matching through policy expressions, and you need fewer policies to perform string matching with a large number of key-value pairs. String maps are also intuitive, simple to configure, and result in a smaller configuration.

How String Maps Work

String maps are similar in structure to pattern sets (a pattern set defines a mapping of index values to strings; a string map defines a mapping of strings to strings) and the configuration commands for string maps (commands such as add, bind, unbind, remove, and show) are syntactically similar to configuration commands for pattern sets. Also, as with index values in a pattern set, each key in a string map must be unique across the map. The following table illustrates a string map called url_string_map, which contains URLs as keys and values.

KEY	VALUE
/url_1.html	`http://www.redirect_url_1.com/url_1.html`
/url_2.html	`http://www.redirect_url_2.com/url_2.html`
/url_3.html	`http://www.redirect_url_1.com/url_1.html`

Table 1. String Map "url_string_map"

The following table describes the two functions that have been introduced to enable string matching with keys in a string map. String matching is always performed with the keys. Additionally, the following functions perform a comparison between the keys in the string map and the complete string that is returned by the expression prefix. The examples in the descriptions refer to the preceding example.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

For completed information about the two functions introduced for enabling string matching with keys in a string map, see String Map Function table pdf.

Configuring a String Map

You first create a string map and then bind key-value pairs to it. You can create a string map from the command line interface (CLI) or the configuration utility.

To configure a string map by using the command line interface

At the command prompt, do the following:

1. Create a string map.

```
add policy stringmap <name> -comment <string>
```

1. Bind a key-value pair to the string map.

```
bind policy stringmap <name> <key> <value> [-comment <string>]
```

Example:

```
bind policy stringmap url_string_map1 "/url_1.html" "http://
www.redirect_url_1.com/url_1.html"
```

To configure a string map by using the NetScaler GUI

Navigate to **AppExpert** > **String Maps**, click **Add** and specify the relevant details.

Example: responder policy with a redirect action

The following use case involves a responder policy with a redirect action. In the example below, the first four commands create the string map url_string_map and bind the three key-value pairs used in the earlier example. After creating the map and binding the key-value pairs, you create a responder action (act_url_redirects) that redirects the client to the corresponding URL in the string map or to www.default.com. You also configure a responder policy (pol_url_redirects) that checks whether requested URLs match any of the keys in url_string_map and then performs the configured action. Finally, you bind the responder policy to the content switching virtual server that receives the client requests that are to be evaluated.

```
add stringmap url_string_map
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

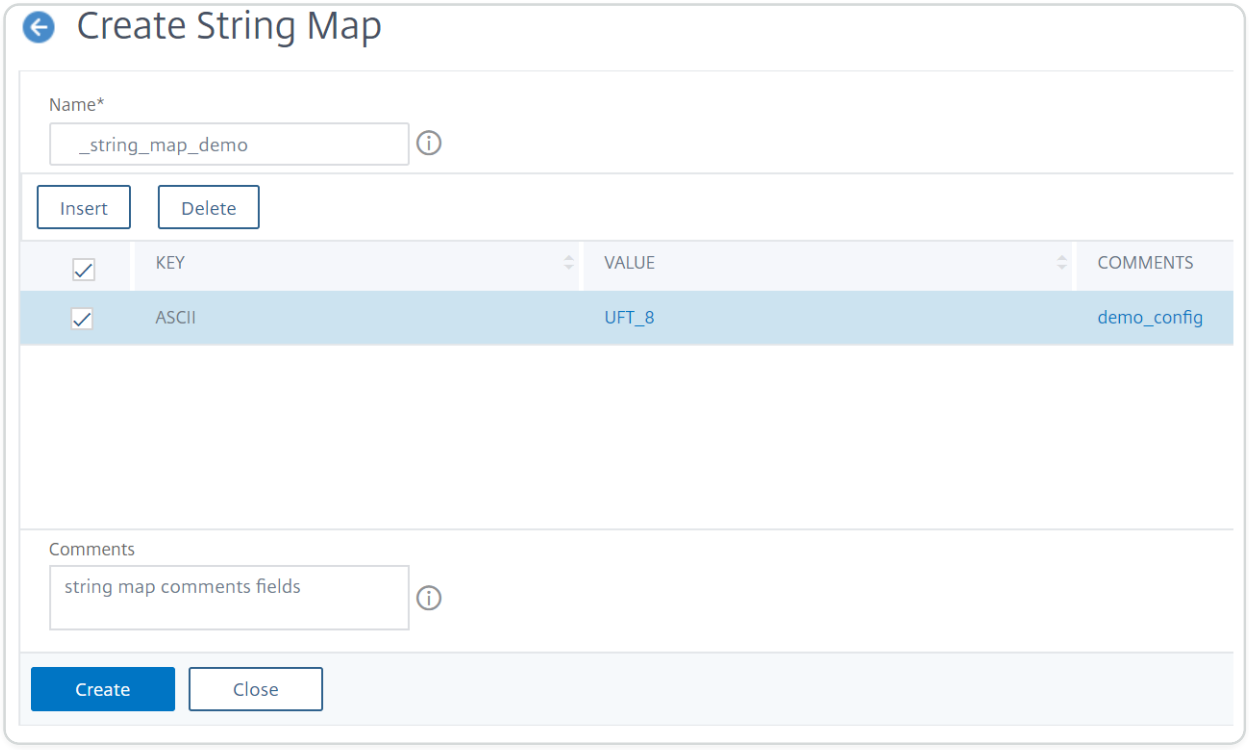
```
bind stringmap url_string_map /url_1.html http://www.redirect_url_1.com/
url_1.html
```

```
bind stringmap url_string_map /url_2.html http://www.redirect_url_2.com/
url_2.html
```

```
bind stringmap url_string_map /url_3.html http://www.redirect_url_1.com/
url_1.html
```

`add responder action act_url_redirects redirect 'HTTP.REQ.URL.MAP_STRING("url_string_map") ALT "www.default.com"'

```
add responder policy pol_url_redirects TRUE act_url_redirects
```



```
bind cs vserver csw_redirect -policyname pol_url_redirects -priority 1 -type
request
```

To configure a string map by using the NetScaler GUI

Follow the procedure given below to configure a string map.

1. On the navigation pane, expand **AppExpert** and click **String Maps**.
2. On the details pane, click **Add**.
3. In the **Create String Map** page, set the following parameters:
   - Name. Name of the string map.
   - Configure key value. ASCII based key value entry bound to the string map
   - Comments. A short description about the key values bound to the string map.
4. Click **Create** and **Close**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

URL Sets

This feature enables you to blacklist one million URLs. The section includes the following topics:

- Getting Started
- Using Advanced Policy Expressions for URL Evaluation
- Configuring a URL Set
- URL Pattern Semantics
- Blacklisted URL Categories

Getting Started

To prevent access to restricted websites, a NetScaler appliance uses a specialized URL matching algorithm. The algorithm uses a URL set that can contain a list of URLs up to 1 million (1,000,000) blocked entries. The global limit is 1 million entries. You can either add one URL set with 1 million entries or multiple URL sets containing 1 million entries in total.

NOTE:

Avoid using many URL sets. We recommend you to use limited number of URL sets based on the memory available for the URL set.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Each entry can include metadata that defines URL categories and category groups as indexed patterns. The appliance can also periodically download highly sensitive URL sets managed by internet enforcement agencies (with government websites) or internet organizations. Once the URL set is downloaded from a website and imported into the appliance, the appliance encrypts the URL sets (as required by these agencies). The encrypted URL sets are kept confidential and the entries are not tampered.

The NetScaler appliance uses advanced policies to determine whether an incoming URL must be blocked, allowed, or redirected. These policies use advanced expressions to evaluate incoming URLs against blacklisted entries. An entry can include metadata. For entries that have no metadata, you can use an expression that evaluates the URL based on an exact string match. For other URLs, you can use an expression that evaluates the URL's metadata, in addition to an expression that checks for an exact string match.

Use Case for Safe Internet Access Policies for ISPs/Telcos

A URL set enables an ISP (ISP) or a Telco customer to enforce government mandated safe internet access policies such as:

1. Block access to illegal internet sites (child abuse, drugs, and so on)
2. Safe browsing for children

A NetScaler appliance enables you to periodically download URL sets managed by internet enforcement agencies or independent internet organizations. The appliance periodically downloads the list and updates it securely. The list is stored as confidential URL sets so that it is not tampered or human readable. The periodically downloaded URL set functions as a blacklisted set for URL evaluation purposes.

If you have a private URL set and the contents of the list are kept confidential and the network administrator does not know about the blacklisted URLs present in the list. To make sure the policy is configured correctly and the correct list is referenced, you must configure the Canary URL and add it to the URL set. Using the Canary URL, the administrator can request through the appliance uses the private URL set to ensure it is looked up for every URL request.

Advanced Policy Expressions for URL Evaluation

The following table describes the expressions you can use to evaluate incoming URLs with entries in an URL set.

Note: HTTP.REQ.URL is generalized to be used as `<URL expression>`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

EXPRESSION	OPERATION
`<URL expression>`.URLSET_MATCHES_ANY	Evaluates to TRUE if the URL exactly matches any entry in the URL set.
`<URL expression>`.GET_URLSET_METADATA(`<URLSET>`)	The GET_URLSET_METADATA() expression returns the associated metadata if the URL exactly matches any pattern within the URL set. An empty string is returned if there was no match.
`<URL expression>`.GET_URLSET_METADATA(`<URLSET>`).EQ(`<METADATA>`)	Evaluates to TRUE if the matched metadata is equal to `<METADATA>`.
`<URL expression>`.GET_URLSET_METADATA(`<URLSET>`).TYPECAST_LIST_T(‘,’).GET(0).EQ(`<CATEGORY>`)	Evaluates to TRUE if the matched metadata is at the beginning of the category. This pattern can be used to encode separate fields within metadata, but match only the 1st field.
HTTP.REQ.HOSTNAME.APPEND(HTTP.REQ.URL)	Joins the host and URL parameters, which can then be used as a `<URL expression>` for matching.

Configuring URL Set

You can perform the following tasks to configure a URL set and restrict URLs on a NetScaler platform:

1. Import a URL set (download and encrypt it). Importing a URL set in a NetScaler appliance allows you:

- To download the URL file.
- To add the file to the appliance.
- To encrypt the file. Until you add the URL set to the system, it is not visible to the user.

You can download a set in the following ways:

- Download a URL set once from a remote server and specify it as `http://myserver.com/file_with_urlset.csv`
- add a file under the `/var/tmp/` path inside ADC and use the command, as in the example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
> shell cat /var/tmp/test_urlset.csv

example.com

google.com

> import policy urlset top10

k -url local:test_urlset.csv -delimiter "," -rowSeparator "n" -interval 10
-privateSet -canaryUrl http://www.in.gr

Done
```

The imported URL set is further categorized into different categories and category groups in the database. This is valid only if categories exist in the metadata of the URL set file.

Note: There can be a chance that you might have URL patterns without metadata.

Once you have imported the file, you can update, delete, or display file properties. After the file is pushed into the appliance, you can modify the entries by more adding rows.

The imported set is then stored in an encrypted file format on the NetScaler directory. The imported list contains millions of URL entries. To the following 'The imported list can contain up to 1 million URL entries. Otherwise, the appliance returns an error message saying that the value exceeds the limit. If the imported URL set has blacklisted entries with metadata, the metadata it is detected by the appliance when it is imported.

Once you import a URL set and add it into the appliance, the URL set is available for advanced policies to identify the correct URL set during incoming URL evaluation.
`HTTP.REQ.HOSTNAME.APPEND(HTTP.REQ.URL).URLSET_MATCHES_ANY(<URL set name>)`

1. Updating a URL set on the NetScaler appliance. Once you have pushed the file into the appliance, at this interval you can manually update a URL file by using command line interface.
2. Exporting a URL set. If you prefer a backup of the URL set, you can export the list of URL patterns and save a copy of it to a destination URL. Before you export, check whether the URL set is marked as private. If is marked private, the URL set cannot be exported. Export functionality does not work with private set. So a new url set `myurl` would be imported without private set defined, and then it would be exported to another file in a local path, as below:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
> shell touch /var/tmp/test_urlset_export.csv

Done

> shell cat /var/tmp/test_urlset_export.csv

Done

> shell cat /var/tmp/test_urlset.csv

example.com

google.com

Done

> export urlset myurl -url local:test_urlset_export.csv

> import urlset myurl -url local:test_urlset.csv

Done

(a non-private urlset is imported)
```

1. Removing a URL set. If you want to delete a URL set of blacklisted entries, you can use the remove command to delete the URL set from the NetScaler appliance.
2. Displaying a URL set. You can display the properties of a URL set by using the show command.

NOTE:

URLs with query part are removed during import.

Example:

```
show urlset

Name: top100 PatternCount: 100 Delimiter:  RowSeparator: Interval: 0
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Done
```

Import a URL set with meta by using the command line interface

At command prompt, type:

```
import urlset <name> [-overwrite] [–delimiter <character>] [-rowSeparator
<character>] [-url] <url> [-interval <seconds>] [-privateSet] [-canaryUrl
<URL>]
```

Where,

Delimiter is a CSV file record with default value set as 44.

rowSeparator is a CSV file row separator with default value set as 10.

Interval is the time interval in secs, rounded to the nearest 15 minutes at which the update of the url set occurs.

CanaryURL is a URL used for testing when the contents of the url set is kept confidential.

Example

`import policy urlset -url local:test_urlset.csv -delimiter "," -rowSeparator "n" -interval 10 -privateSet -canaryUrl http://www.in.gr`

Perform explicit subdomain match for an imported URL set

You can now perform an explicit subdomain match for an imported URL set. A new parameter, "subdomainExactMatch" is added to the "import policy URLset" command. When you enable the parameter, the URL Filtering algorithm performs an explicit subdomain match. For example, if the incoming URL is "news.example.com" and if the entry in the URL set is "example.com," the algorithm does not match the URLs.

At the command prompt, type: `import policy urlset <name> [-overwrite] [-delimiter <character>][-rowSeparator <character>] -url <URL> [-interval <secs>] [-privateSet][-subdomainExactMatch] [-canaryUrl <URL>]`

Example:

`import policy urlset forth_urlset -url local:test_urlset.csv -interval 3600 -subdomainExactMatch`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To show the URL set by using the command line interface

At the command prompt, type:

```
show urlset <name>
```

Example:

At the command prompt, type:

```
        URLset     Count

        ------     -----

1)      top1k      100

 Done

> show urlset top1k

        Count      Delimiter  Interval   RowSeparator

        -----      ---------  --------   ------------

        100              ,        0         0x0a

 Done

>
```

To show the URL set imported by using the command line interface

At the command prompt, type:

```
show urlset -imported
```

Example:

At the command prompt, type:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
        URLset

        ------

1)      top1k

 Done
```

To show URL set <urlset_name> by using the command line interface

At the command prompt, type:

```
show urlset <name>
```

To export a URL set by using the command line interface

At the command prompt, type:

```
export urlset <name> <url>
```

To add a URL set by using the command line interface

At the command prompt, type:

```
add urlset <urlset_name>
```

To update a URL set by using the command line interface

At the command prompt, type:

```
update urlset <name>
```

To remove a URL set command by using the command line interface

At the command prompt, type:

```
remove urlset <name>
```

Example:

Note:

> Before you import or export a URLset, you must make sure the `test_urlset_export.csv` and `test_urlset.csv` files are created and available under the `/var/tmp` directory.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
import policy urlset -url local:test_urlset.csv -delimiter ","
-rowSeparator "n" -interval 10 -privateSet -overwrite –canaryUrl http://
www.in.gr

add policy urlset top10k

update policy urlset top10k

sh policy urlset

sh policy urlset top10k

export policy urlset urlset1 -url local:test_urlset_export.csv

import policy urlset top10k -url local:test_urlset.csv –privateSet

add policy urlset top10k

update policy urlset top10k

show policy urlset top10k
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Display imported URL sets

You can now display imported URL sets in addition to added URL sets. To do this, a new parameter "imported" is added to the "show url set" command. If you enable this option, the appliance displays all imported URL sets and distinguishes the imported URL sets from the added URL sets.

At the command prompt, type:

```
show policy urlset [<name>] [-imported]
```

Example:

```
show policy urlset -imported
```

To import a URL set by using the GUI

Navigate to **AppExpert** > **URL Sets**, click **Import** to download the URL set.

To add a URL set by using the GUI

Navigate to **AppExpert** > **URL Sets**, click **Add** to create a URL set file for the downloaded URL set.

To edit a URL set by using the GUI

Navigate to **AppExpert** > **URL Sets**, select a URL set and click **Edit** to modify.

To Update a URL set by using the GUI

Navigate to **AppExpert** > **URL Sets,** select a URL set and click **Update URL Set** to update the URL set with the latest modifications made to the file.

To Export a URL set by using the GUI

Navigate to **AppExpert > URL Sets**, select a URL set, and click **Export URL Set** to export the URL patterns in a set to a destination URL and save it in that location.

URL Pattern Semantics

The following table shows the URL patterns used for specifying the list of pages you to want to filter. For example, the URL pattern, `http://www.example.com/bar` matches a single page `http://www.example.com/bar`. To cover all the pages where the URL starts with www.example.com/bar, you must explicitly add a '*' at the end.

For more information, see URL pattern metadata mapping table.

AppFlow®

The NetScaler appliance is a central point of control for all application traffic in the data center. It collects flow and user-session level information valuable for application performance monitoring, analytics, and business intelligence applications. It also collects webpage performance data and database information. AppFlow transmits the information by using the Internet Protocol Flow Information eXport (IPFIX) format, which is an open Internet Engineering Task Force (IETF) standard defined in RFC 5101. IPFIX (the standardized version of Cisco's NetFlow) is widely used to monitor network flow information. AppFlow defines new Information Elements to represent application-level information, webpage performance data, and database information.

Using UDP as the transport protocol, AppFlow transmits the collected data, called *flow records*, to one or more IPv4 collectors. The collectors aggregate the flow records and generate real-time or historical reports.

AppFlow provides visibility at the transaction level for HTTP, SSL, TCP, SSL_TCP flows, and HDX™ Insight flows. You can sample and filter the flow types that you want to monitor.

NOTE

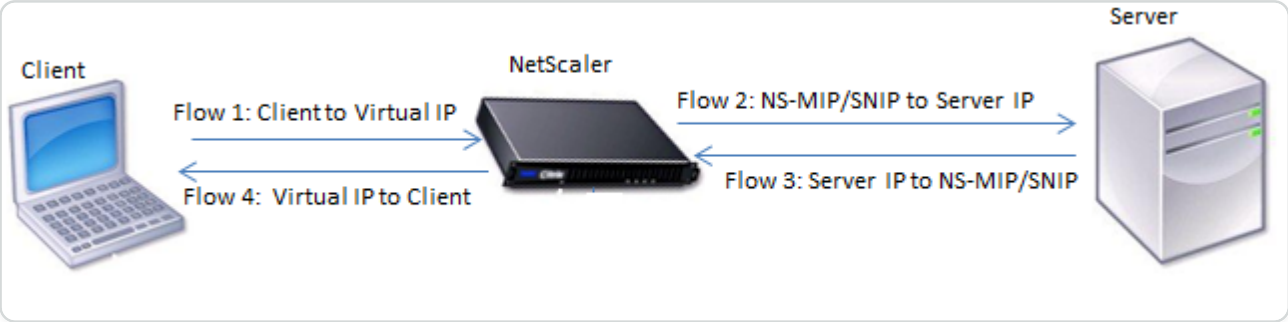
For more information on HDX Insight, see HDX Insight.

AppFlow use actions and policies to send records for a selected flow to specific set of collectors. An AppFlow action specifies which set of collectors receive the AppFlow records. Policies, which are based on Advanced expressions can be configured to select flows for which flow records are sent to the collectors specified by the associated AppFlow action.

To limit the types of flows, you can enable AppFlow for a virtual server. AppFlow can also provide statistics for the virtual server.

You can also enable AppFlow for a specific service, representing an application server, and monitor the traffic to that application server.

Note: This feature is supported only on NetScaler nCore builds.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

How AppFlow Works

In the most common deployment scenario, inbound traffic flows to a Virtual IP address (VIP) on the NetScaler appliance and is load balanced to a server. Outbound traffic flows from the server to a mapped or subnet IP address on the NetScaler and from the VIP to the client. A flow is a unidirectional collection of IP packets identified by the following five tuples: sourceIP, sourcePort, destIP, destPort, and protocol.

The following figure describes how the AppFlow feature works.

Figure 1. NetScaler Flow Sequence

As shown in the figure, the network flow identifiers for each leg of a transaction depend on the direction of the traffic.

The different flows that form a flow record are:

Flow1: `<Client-IP, Client-Port, VIP-IP, VIP-port, Protocol>`

Flow2: `<NS-MIP/SNIP, NS-port, Server-IP, Server-Port, Protocol>`

Flow3: `<Server-IP, Server-Port, NS-MIP/SNIP, NS-Port, Protocol>`

Flow4: `<VIP-IP, VIP-port, Client-IP, Client-Port, Protocol>`

To help the collector link all four flows in a transaction, AppFlow adds a custom transactionID element to each flow. For application-level content switching, such as HTTP, it is possible for a single client TCP connection to be load balanced to different back end TCP connections for each request. AppFlow provides a set of records for each transaction.

Flow Records

AppFlow records contain standard NetFlow or IPFIX information, such as time stamps for the beginning and end of a flow, packet count, and byte count. AppFlow records also contain application-level information (such as HTTP URLs, HTTP request methods and response status codes, server response time, and latency). Webpage performance data (such as page load time,

© 1997–2026 Citrix Systems, Inc. All rights reserved.

page render time, and time spent on the page). And database information (such as database protocol, database response status, and database response size). IPFIX flow records are based on templates that need to be sent before sending flow records.

Templates

AppFlow defines a set of templates, one for each type of flow. Each template contains a set of standard Information Elements (IEs) and Enterprise-specific Information Elements (EIEs). IPFIX templates define the order and sizes of the Information Elements (Internet Explorer) in the flow record. The templates are sent to the collectors at regular intervals, as described in RFC 5101.

A template can include the following EIEs:

- transactionID

  An unsigned 32-bit number identifying an application-level transaction. For HTTP, it corresponds to a request and response pair. All flow records that correspond to this request and response pair have the same transaction ID. In the most common case, there are four `uniflow` records that correspond to this transaction. If the NetScaler generates the response by itself (served from the integrated cache or by a security policy), there might be only two flow records for this transaction.

- connectionID

  An unsigned 32-bit number identifying a layer-4 connection (TCP or UDP). The NetScaler flows are bidirectional, with two separate flow records for each direction of the flow. This information element can be used to link the two flows.

  For the NetScaler, a connectionID is an identifier for the connection data structure to track the progress of a connection. In an HTTP transaction, for instance, a given connectionID might have multiple transactionID elements corresponding to multiple requests that were made on that connection.

- tcpRTT

  The round trip time, in milliseconds, as measured on the TCP connection. It can be used as a metric to determine the client or server latency on the network.

- httpRequestMethod

  An 8-bit number indicating the HTTP method used in the transaction. An options template with the number-to-method mapping is sent along with the template.

- httpRequestSize

© 1997–2026 Citrix Systems, Inc. All rights reserved.

An unsigned 32-bit number indicating the request payload size.

- httpRequestURL

  The HTTP URL requested by the client.

- httpUserAgent

  The source of incoming requests to the Web server.

- httpResponseStatus

  An unsigned 32-bit number indicating the response status code.

- httpResponseSize

  An unsigned 32-bit number indicating the response size.

- httpResponseTimeToFirstByte

  An unsigned 32-bit number indicating the time taken to receive the first byte of the response.

- httpResponseTimeToLastByte

  An unsigned 32-bit number indicating the time taken to receive the last byte of the response.

- flowFlags

  An unsigned 64-bit flag used to indicate different flow conditions.

EIEs for webpage performance data

- clientInteractionStartTime

  Time at which the browser receives the first byte of the response to load any objects of the page such as images, scripts, and style sheets.

- clientInteractionEndTime

  Time at which the browser received the last byte of response to load all the objects of the page such as images, scripts, and style sheets.

- clientRenderStartTime

  Time at which the browser starts to render the page.

- clientRenderEndTime

  Time at which a browser finished rendering the entire page, including the embedded objects.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

EIEs for database information

- dbProtocolName

  An unsigned 8-bit number indicating the database protocol. Valid values are 1 for MS SQL and 2 for MySQL.

- dbReqType

  An unsigned 8-bit number indicating the database request method used in the transaction. For MS SQL, valid values are 1 is for QUERY, 2 is for TRANSACTION, and 3 is for RPC. For valid values for MySQL, see the MySQL documentation.

- dbReqString

  Indicates the database request string without the header.

- dbRespStatus

  An unsigned 64-bit number indicating the status of the database response received from the web server.

- dbRespLength

  An unsigned 64-bit number indicating the response size.

- dbRespStatString

  The response status string received from the web server.

Configuring the AppFlow® feature

You can configure AppFlow in the same manner as most other policy-based features. First, you enable the AppFlow feature. Then you specify the collectors to which the flow records are sent. After that, you define actions, which are sets of configured collectors. Then you configure one or more policies and associate an action to each policy. The policy instructs the NetScaler appliance to select requests the flow records of which are sent to the associated action. Finally, you bind each policy either globally or to the specific virtual server to put it into effect.

You can further set AppFlow parameters to specify the template refresh interval and to enable the exporting of httpURL, httpCookie, and httpReferer information. On each collector, you must specify the NetScaler IP address as the address of the exporter.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE

For information about configuring the NetScaler as an exporter on the collector, see the documentation for the specific collector.

The configuration utility provides tools that help users define the policies and actions. It determines exactly how the NetScaler appliance export records for a particular flow to a set of collectors(action.) The command line interface provides a corresponding set of CLI-based commands for experienced users who prefer a command line.

Enabling AppFlow

To be able to use the AppFlow feature, you must first enable it.

NOTE

AppFlow can be enabled only on nCore NetScaler appliances.

Enable the AppFlow feature by using the command line interface

At the command prompt, type one of the following commands:

```
enable ns feature AppFlow
```

Enable the AppFlow feature by using the configuration utility

Navigate to **System > Settings**, click **Configure Advanced Features**, and select the **AppFlow** option.

Specifying a Collector

A collector receives AppFlow records generated by the NetScaler appliance. To send the AppFlow records, you must specify at least one collector. By default, the collector listens to IPFIX messages on UDP port 4739. You can change the default port, when configuring the collector. Similarly, by default, NSIP is used as the source IP for AppFlow traffic. You can change this default source IP to a SNIP address when configuring a collector. You can also remove unused collectors.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Specify a collector by using the command line interface

IMPORTANT

Starting from NetScaler release 12.1 build 55.13, you can specify the type of collector that you want to use. A new parameter “Transport” is introduced in the `add appflow collector` command. By default, the collector listens to IPFIX messages. You can change the type of collector to either `logstream` or `ipfix` by using “Transport” parameter. For more information on configuration, see the example.

At the command prompt, type the following commands to add a collector and verify the configuration:

```
-  add appflow collector <name> -IPAddress <ipaddress> -port <port_number>
-netprofile <netprofile_name> -Transport <Transport>

-  show appflow collector <name>
```

Example

```
add appflow collector col1 -IPaddress 10.102.29.251 -port 8000 -netprofile
n2 -Transport ipfix
```

Specify multiple collectors by using the command line interface

At the command prompt, type the following commands to add and send same data to multiple collectors:

```
add appflow collector <collector1> -IPAddress <IP>
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add appflow collector <collector2> -IPAddress <IP>

add appflow action <action> -collectors <collector1> <collector2>

add appflow policy <policy> true <action>

bind lbvserver <lbvserver> -policy <policy> -priority <priority>
```

Specify one or more collectors by using the configuration utility

Navigate to **System > AppFlow > Collectors**, and create the AppFlow collector.

Configure an AppFlow Action

An AppFlow action is a set collector, to which the flow records are sent if the associated AppFlow policy matches.

Configure an AppFlow action by using the command line interface

At the command prompt, type the following commands to configure an AppFlow action and verify the configuration:

```
add appflow action <name> --collectors <string> ... [-
clientSideMeasurements (Enabled|Disabled) ] [-comment <string>]

show appflow action
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Example

```
add appflow action apfl-act-collector-1-and-3 -collectors collector-1
collecter-3
```

Configure an AppFlow action by using the configuration utility

Navigate to **System > AppFlow > Actions**, and create the AppFlow action.

Configure an AppFlow Policy

After you configure an AppFlow action, you must next configure an AppFlow policy. An AppFlow policy is based on a rule, which consists of one or more expressions.

NOTE

For creating and managing AppFlow policies, the configuration utility provides assistance that is not available at the command line interface.

Configure an AppFlow policy by using the command line interface

At the command prompt, type the following command to add an AppFlow policy and verify the configuration:

```
add appflow policy <name> <rule> <action>

show appflow policy <name>
```

Example

```
add appflow policy apfl-pol-tcp-dsprt client.TCP.DSTPORT.EQ(22) apfl-act-
collector-1-and-3
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure an AppFlow policy by using the configuration utility

Navigate to **System > AppFlow > Policies**, and create the AppFlow policy.

Add an expression by using the Add Expression dialog box

1. In the Add Expression dialog box, in the first list box choose the first term for your expression.

   - HTTP The HTTP protocol. Choose the option if you want to examine some aspect of the request that pertains to the HTTP protocol.
   - SSL

     The protected websites. Choose the option if you want to examine some aspect of the request that pertains to the recipient of the request.
   - CLIENT

     The computer that sent the request. Choose the option if you want to examine some aspect of the sender of the request. When you make your choice, the rightmost list box lists appropriate terms for the next part of your expression.
2. In the second list box, choose the second term for your expression. The choices depend upon which choice you made in the previous step, and are appropriate to the context. After you make your second choice, the Help window below the Construct Expression window (which was blank) displays help describing the purpose and use of the term you just chose.
3. Continue choosing terms from the list boxes that appear to the right of the previous list box, or typing strings or numbers in the text boxes that appear to prompt you to enter a value, until your expression is finished.

Bind an AppFlow Policy

To put a policy into effect, you must bind it either globally, so that it applies to all traffic that flows through the NetScaler, or to a specific virtual server, so that the policy applies only to the traffic related to that virtual server.

When you bind a policy, you assign it a priority. The priority determines the order in which the policies you define are evaluated. You can set the priority to any positive integer.

In the NetScaler operating system, policy priorities work in reverse order—the higher the number, the lower the priority. For example, if you have three policies with priorities of 10, 100, and 1000,

© 1997–2026 Citrix Systems, Inc. All rights reserved.

the policy assigned a priority of 10 is performed first. Later, the policy assigned with a priority of 100, and finally the policy assigned an order of 1000.

You can leave yourself plenty of a room to add other policies in any order, and still set them to evaluate in the order you want. You can achieve by setting priorities with intervals of 50 or 100 between each policy when you globally bind it. You can then add more policies at any time without having to change the priority of an existing policy.

Globally bind an AppFlow policy by using the command line interface

At the command prompt, type the following command to globally bind an AppFlow policy and verify the configuration:

```
bind appflow global <policyName> <priority> [<gotoPriorityExpression [-
type <type>] [-invoke (<labelType> <labelName>)]

show appflow global
```

Example

```
bind appflow global af_policy_lb1_10.102.71.190 1 NEXT -type REQ_OVERRIDE
-invoke vserver google
```

Bind an AppFlow policy to a specific virtual server by using the command line interface

At the command prompt, type the following command to bind an AppFlow policy to a specific virtual server and verify the configuration:

```
bind lb vserver <name> -policyname <policy_name> -priority <priority>
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Example

```
bind lb vserver google -policyname af_policy_google_10.102.19.179
-priority 251
```

Globally bind an AppFlow policy by using the configuration utility

Navigate to **System > AppFlow**, click **AppFlow policy Manager**, and select the relevant Bind Point (Default Global) and Connection Type, and then bind the AppFlow policy.

Bind an AppFlow policy to a specific virtual server by using the configuration utility

Navigate to **Traffic Management > Load Balancing > Virtual Servers**, select the virtual server, and click **Policies**, and bind the AppFlow policy.

Enable AppFlow for Virtual Servers

If you want to monitor only the traffic through certain virtual servers, enable AppFlow specifically for those virtual servers. You can enable AppFlow for load balancing, content switching, cache redirection, SSL VPN, GSLB, and authentication virtual servers.

Enable AppFlow for a virtual server by using the command line interface

At the command prompt, type:

```
set cs vserver <name> <protocol> <IPAddress> <port> -appflowLog ENABLED
```

Example

```
set cs vserver Vserver-CS-1 HTTP 10.102.29.161 80 -appflowLog ENABLED
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Enable AppFlow for a virtual server by using the configuration utility

Navigate to **Traffic Management > Content Switching > Virtual Servers**, select the virtual server, and enable AppFlow Logging option.

Enable AppFlow for a Service

You can enable AppFlow for services that are to be bound to the load balancing virtual servers.

Enable AppFlow for a service by using the command line interface

At the command prompt, type:

```
set service <name> -appflowLog ENABLED
```

Example

```
set service ser -appflowLog ENABLED
```

Enable AppFlow for a service by using the configuration utility

Navigate to **Traffic Management > Load Balancing > Services**, select the service, and enable AppFlow Logging option.

Set the AppFlow Parameters

You can set AppFlow parameters to customize the exporting of data to the collectors.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Set the AppFlow Parameters by using the command line interface

IMPORTANT

- Starting from NetScaler release 12.1 build 55.13, you can use the NSIP to send `Logstream` records instead of the SNIP. A new parameter “logstreamOverNSIP” is introduced in the `set appflow param` command. By default, the “logstreamOverNSIP” parameter is DISABLED, you must “ENABLE” it. For more information on configuration, see the example.
- Starting from NetScaler release 13.0 build 58.x release, you can enable the Web SaaS application option in AppFlow feature. It can be enabled to receive the data usage of Web or SaaS applications from the Citrix Gateway service. For more information on configuration, see the example.

At the command prompt, type the following commands to set the AppFlow parameters and verify the settings:

```
-  set appflow param [-templateRefresh <secs>] [-appnameRefresh <secs>] [-
flowRecordInterval <secs>] [-udpPmtu <positive_integer>] [-httpUrl
( **ENABLED** | **DISABLED** )] [-httpCookie ( **ENABLED** |
**DISABLED** )] [-httpReferer ( **ENABLED** | **DISABLED** )] [-httpMethod
( **ENABLED** | **DISABLED** )] [-httpHost ( **ENABLED** | **DISABLED** )]
[-httpUserAgent ( **ENABLED** | **DISABLED** )] [-httpXForwardedFor
( **ENABLED** | **DISABLED** )][-clientTrafficOnly ( **YES** | **NO**)] [-
webSaaSAppUsageReporting ( **ENABLED** | **DISABLED** )] [-
logstreamOverNSIP ( **ENABLED** | **DISABLED** )]

-  show appflow Param
```

Example

```
set appflow Param -templateRefresh 240 -udpPmtu 128 -httpUrl enabled
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
-webSaaSAppUsageReporting ENABLED -logstreamOverNSIP ENABLED
```

Set the AppFlow parameters by using the configuration utility

Navigate to **System > AppFlow**, click **Change AppFlow Settings**, and specify relevant AppFlow parameters.

Support for subscriber ID obfuscation

Starting from NetScaler release 13.0 build 35.xx, the AppFlow configuration is enhanced to support “subscriberIdObfuscation” algorithm for obfuscating MSISDN in layer 4 or layer 7, AppFlow records. However, before configuring the algorithm as MD5 or SHA256, you must first enable it as an AppFlow parameter. The parameter is disabled by default.

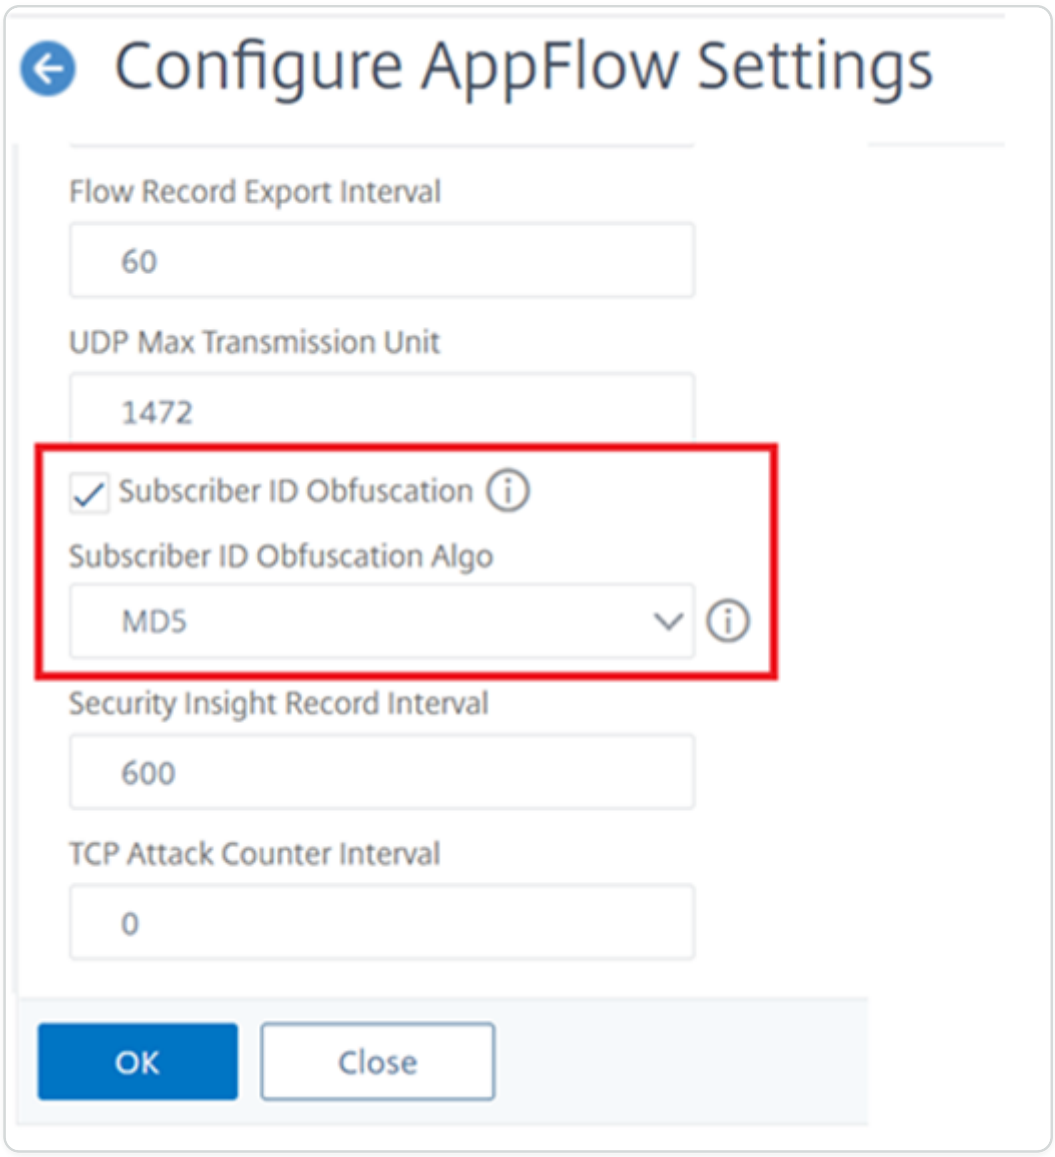
Configure the subscriber ID obfuscation algorithm by using the CLI

At the command prompt, type:

```
set appflow param [-subscriberIdObfuscation ( ENABLED | DISABLED )  [-
subscriberIdObfuscationAlgo ( MD5 | SHA256 )]]
```

Example

```
set appflow param –subscriberIdObfuscation ENABLED –
subscriberIdObfuscationAlgo SHA256
```



Configure the subscriber ID obfuscation algorithm by using the GUI

1. Navigate to **System > AppFlow**.
2. In the AppFlow detailed pane, click **Change AppFlow Setting** under **Settings**.
3. In Configure AppFlow Settings page, set the following parameters:
    - **Subscriber ID Obfuscation.** Enable the option for obfuscation MSISDN in L4/L7 AppFlow records.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Subscriber ID Obfuscation Algo.** Select algorithm type as MD5 or SHA256.

4. Click **OK** and **Close**.

Example: Configure AppFlow for DataStream

The following example illustrates the procedure for configuring AppFlow for DataStream using the command line interface.

```
enable feature appflow

add db user sa password freebsd
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add lbvserver lb0 MSSQL 10.102.147.97 1433 -appflowLog ENABLED

add service sv0 10.103.24.132 MSSQL 1433 -appflowLog ENABLED

bind lbvserver lb0 sv0

add appflow collector col0 -IPAddress 10.102.147.90

add appflow action act0 -collectors col0

add appflow policy pol0 "mssql.req.query.text.contains("select")" act0

bind lbvserver lb0 -policyName pol0 -priority 10
```

When the NetScaler appliance receives a database request, the appliance evaluates the request against a configured policy. If a match is found, the details are sent to the AppFlow collector configured in the policy.

Configure the metrics collector

Metrics collector is a service that you can enable on NetScaler to collect and export metrics from NetScaler to various endpoints. You can export metrics in two formats: Avro and Prometheus. The exported metrics can be processed and visualized to get meaningful insights. By default, the metrics collector supports the export of time-series analytics data every 30 seconds. However, you can configure it as a value from 30 to 300 seconds so that you can decide the interval for exporting the time-series analytics profile data.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Do the following to configure a metrics collector using the CLI.

1. Configure a collector service with IP address, protocol, and port using the following command.

```
add service &lt;metrics_service_name> &lt;ip-address> &lt;protocol>
&lt;port>
```

Example:

```
add service metrics_service1 192.168.1.1 HTTP 5563
```

2. Configure the analytics time series profile to send metrics data to the collector service. Specify the collector service, frequency for exporting metrics, and output mode.

```
set analytics profile ns_analytics_time_series_profile -collectors
&lt;metrics_service_name> -type timeseries -metrics ENABLED
metricsExportFrequency <30-300> -outputMode &lt;avro/prometheus>
```

Example:

```
set analytics profile ns_analytics_time_series_profile -collectors
metrics_service1 -type timeseries -metrics Enabled
metricsExportFrequency 90 -outputMode prometheus --serveMode PUSH
```

NOTE:

This example uses the default time series profile `ns_analytics_time_series_profile`. If you want to create a time series profile, you can use the `add analytics profile` command.

In this example, metrics export frequency is set as 90 seconds and export mode is specified as Prometheus.

Verify the metrics collector configuration using the `show analytics profile <analytics-profile-name>` command:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
show analytics profile ns_analytics_time_series_profile

    Name: ns_analytics_time_series_profile

    Collector: metrics_service1

    Profile-type: timeseries

        Output Mode: Prometheus

        Metrics: ENABLED

          Schema File: schema.json

          Metrics Export Frequency: 90

        Events: DISABLED

        Auditlog: DISABLED

        Serve mode: Pull

    Reference Count: 0
```

Debugging metrics collector

The required debugging logs are stored at `/var/nslog/metricscollector.log` location.

Metrics File generation

The `metrics_<format>_log.*` files are generated under the `/var/nslog/` folder location.

Dynamic schema support in metrics collector

With the support of dynamic schema counters, a schema file containing a list of counters can be updated at run time based on the requirement. By default, `/var/metrics_conf/schema.json` file is configured with a list of counters.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE:

The metrics collector default schema file `/var/metrics_conf/schema.json` can be installed on a NetScaler appliance by installns procedure.

Configure the metrics collector to subscribe counters using the CLI

Start the metrics export by configuring a collector service.

At the command prompt, type:

```
set analytics profile ns_analytics_time_series_profile -metrics ENABLED
-collectors <collector_name> -schemaFile  schema.json -outputMode <avro |
prometheus>
```

NOTE:

`schema.json` is the default schemaFile configuration.

A new schema file with a required set of counters can be configured using the CLI command for the metrics collector to export. The schema file must be present at the `/var/metrics_conf/` location.

The schema file containing all the list of counters (reference_schema.json) supported by stats infra is present in the `/var/metrics_conf/` location. This file can be used as a reference to build a custom list of counters.

Configure a schema file using the CLI

```
set analytics profile ns_analytics_time_series_profile -metrics ENABLED
-collectors <collector name> -schemaFile <schema file_name> -outputMode
<avro | prometheus>
```

A new schema file with the required counters can be added and configured using the preceding CLI command for metrics collector to export.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The reference schema file with all the list of counters (reference_schema.json) supported by stats infra are present in `/var/metrics_conf/` location. This file can be used as a reference to build a custom list of counters.

Check the CLI configuration output at the command prompt:

```
show analytics profile ns_analytics_time_series_profile

    Name: ns_analytics_time_series_profile

    Collector: <collector_name>

    Profile-type: timeseries

    Output Mode: avro

    Metrics: ENABLED

    Schema File: schema.json

    Events: ENABLED

    Auditlog: DISABLED

    Serve mode: Push

    Reference Count: 0
```

Steps to update the list of counters exported

The following procedure describes the steps to update the list of exported counters:

1. Update the custom/new schema file.
2. Disable or enable metrics using the `-metrics` option shown in the CLI configuration for the updated schema file to be used.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Multiple time-series profile support

The metrics collector supports up to three time-series profile configurations on the NetScaler appliance. You can configure each time series to have the following.

- Collector.
- Schema file containing the required set of counters to be exported.
- The data format in which the metrics are to be exported.
- The option to enable or disable metrics audit logs and events.

With the multiple time-series profile support, the metrics collector can simultaneously export a different set (based on the schema file configured) of metrics to different collectors in different formats (AVRO, Prometheus, Influx).

Add time-series profile using the CLI

At the command prompt, type:

```
add analytics profile <profile_name> -type timeseries
```

Configure time-series profile using the CLI

At the command prompt, type:

```
set analytics profile <profile_name> -metrics <DISABLED|ENABLED>
-auditlogs <DISABLED|ENABLED> -events <DISABLED|ENABLED> -collectors
<collector_name> -schemaFile schema.json -outputMode <avro | influx |
prometheus>
```

Log file-naming conventions with multiple time-series profile support

- Avro log files are generated as `metrics_avro_<profile_name>_log.*`.
- Prometheus log files are generated as `metrics_prom_<profile_name>.log`.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTES:

- Even though metrics can be enabled on all the configured time-series profiles, events and audit logs can be enabled only on one profile.
- The dynamic schema feature is supported from version 13.1 build 23.16 onwards.
- The multiple time-series profile is supported from version 13.1 build 33.6 onwards.

Exporting performance data of webpages to AppFlow® collector

The EdgeSight Monitoring application provides webpage monitoring data with which you can monitor the performance of various Web applications served in a NetScaler environment. You can now export this data to AppFlow collectors to get an in-depth analysis of the webpage applications. AppFlow, which is based on the IPFIX standard, provides more specific information about web application performance than does EdgeSight monitoring alone.

You can configure both load balancing and content switching virtual servers to export EdgeSight® Monitoring data to AppFlow collectors. Before configuring a virtual server for AppFlow export, associate an AppFlow action with the EdgeSight Monitoring responder policy.

The following webpage performance data is exported to AppFlow:

- **Page Load Time**. Elapsed time, in milliseconds, from when the browser starts to receive the first byte of a response until the user starts to interact with the page. At this stage, all the page content might not be loaded.
- **Page Render Time**. Elapsed time, in milliseconds, from when the browser receives the first byte of response until either all page content has been rendered or the page load action has timed out.
- **Time Spent on the Page**. Time spent by users on a page. Represents the time from one page request to the next one.

AppFlow transmits the performance data by using the Internet Protocol Flow Information eXport (IPFIX) format, which is an open Internet Engineering Task Force (IETF) standard defined in RFC 5101. The AppFlow templates use the following enterprise-specific Information Elements (EIEs) to export the information:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Client Load End Time**. Time at which the browser received the last byte of a response to load all the objects of the page such as images, scripts, and style sheets.
- **Client Load Start Time**. Time at which the browser receives the first byte of the response to load any objects of the page such as images, scripts, and Style sheets.
- **Client Render End Time**. Time at which a browser finished rendering the entire page, including the embedded objects.
- **Client Render Start Time**. Time at which the browser started rendering the page.

Prerequisites for exporting performance data of webpages to AppFlow collectors

Before associating the AppFlow action with the AppFlow policy, verify that the following prerequisites have been met:

- The AppFlow feature has been enabled and configured.
- The Responder feature has been enabled.
- The EdgeSight Monitoring feature has been enabled.
- EdgeSight Monitoring has been enabled on the load balancing or content switching virtual servers bound to the services of applications for which you want to collect the performance data.

Associating an AppFlow action with the EdgeSight monitoring responder policy

To export the webpage performance data to the AppFlow collector, you must associate an AppFlow action with the EdgeSight Monitoring responder policy. An AppFlow action specifies which set of collectors receive the traffic.

To associate an AppFlow action with the EdgeSight Monitoring Responder policy by using the CLI

At the command prompt, type:

```
set responder policy <name> -appflowAction <action_Name>
```

Example

```
set responder policy pol -appflowAction actn
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To associate an AppFlow action with the EdgeSight Monitoring Responder policy by using the GUI

1. Navigate to **AppExpert** > **Responder** > **Policies**.
2. In the details pane, select an EdgeSight Monitoring responder policy, and then click **Open**.
3. In the **Configure Responder Policy** dialog box, in the **AppFlow Action** drop-down list, select the AppFlow action associated with the collectors to which you want to send the webpage performance data.
4. Click **OK**.

Configuring a virtual server to export EdgeSight statistics to AppFlow collectors

To export EdgeSight statistics information from a virtual server to the AppFlow collector, you must associate an AppFlow action with the virtual server.

To associate an AppFlow action with a Load Balancing or Content Switching virtual server by using the GUI

1. Navigate to **Traffic Management** > **Load Balancing** > **Virtual Servers**. You can also navigate to **Traffic Management** > **Content Switching** > **Virtual Servers**.
2. In the details pane, select a virtual server, or multiple virtual servers, and then click **Enable EdgeSight Monitoring**.
3. In the Enable EdgeSight Monitoring dialog box, select the **Export EdgeSight statistics to Appflow** check box.
4. From the AppFlow Action drop-down list, select the **AppFlow** action. The AppFlow action defines the list of AppFlow collectors to which it exports EdgeSight Monitoring statistics. If you have selected multiple load balancing virtual servers, the same AppFlow Action is associated with the responder policies bound to them. You can later change the AppFlow Action configured for each of the selected Load Balancing virtual server individually, if necessary.
5. Click **OK**.

Session reliability on NetScaler high availability pair

When a network disruption or a device failover occurs during an ICA® session, session reconnection can use one of two mechanisms: session reliability or Auto Client Reconnect.

Session reliability. The preferred mode, is a smooth experience for the user. The disruption is barely noticeable for brief network interruptions.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Auto client reconnect. The fallback option, involves restarting the client. This mechanism is disruptive for the user and is not always supported.

Receivers can reconnect their ICA sessions seamlessly using the ICA session reliability feature, when HDX™ Insight is enabled. This feature works both in standalone and in a NetScaler HA pair configuration, and even when a NetScaler failover happens.

NOTE:

- NetScaler appliances must be running on software version 11.1 build 49.16 or later.
- You must not enable or disable session reliability mode when the NetScaler appliances have active connections.
- Enabling or disabling the feature when connections are still active causes HDX Insight to stop parsing those sessions after a failover occurs. It results in the loss of information about the sessions.
- Session reliability on a high availability setup is disabled by default for NetScaler software version 11.1 49.16 or later. Session reliability is supported on a high availability setup only if both the nodes of the setup run the same build (for example, release 11.1 build 53). In other words, session reliability is not supported on a high availability setup if both the nodes run different builds (for example, one node has release 11.1 build 53 whereas the other has release 11.1 build 56). Session reliability for SSL VDA is supported if the following conditions are met:
  - The “EnableSRonHAFailover” parameter in the `set ica parameter` command must be YES.
  - The HTTPS must be used instead of HTTP while configuring the virtual server.
- When HDX Insight is enabled, basic encryption applications and desktops reconnect after high availability failover even if the EnableSRonHAFailover parameter is disabled.

To configure Session reliability by using CLI:

1. At the command line, use the default system administrator credentials to log on to the system.
2. To enable session reliability on HA failover, at the prompt, type: `set ica parameter EnableSRonHAFailover YES`
3. To disable session reliability on HA failover, at the prompt, type: `set ica parameter EnableSRonHAFailover NO`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To Enable Session reliability on HA failover by using GUI:

1. In a web browser, type the IP address of the primary NetScaler instance in the HA pair (for example, `<http://192.168.100.1>`).
2. In **User Name** and **Password**, enter the administrator credentials.
3. On the **Configuration** tab, navigate to **System** > **Settings**, and click **Change ICA Parameters**.
4. In the **Change ICA Parameters** section, select **Session Reliability on HA Failover**.
5. Click **OK**.

Limitations

- Enabling this feature results in increased bandwidth consumption which is due to ICA compression being turned off by the feature. And the extra traffic between the primary and secondary nodes to keep them in sync.
- This feature is supported in Active-Passive mode only. Active-Active mode is not currently supported.
- When HDX Insight is enabled, and session reliability on the HA knob is set to NO, only ACR reconnect mode is supported in the NetScaler high availability failover scenario. The HA knob does not disable session reliability if HDX Insight is disabled.

The **Session Reconnect Semantics** table is as follows:

Session reconnects semantics

STATUS	ENABLESRONHAFAILOVER YES	ENABLESRONHAFAILOVER NO (DEFAULT)
HDX Insight enabled	Session reconnect for ICA Session works	Session reconnect for ICA Sessions does not work
HDX Insight disabled	Session reconnect for ICA Session works	Session reconnect for ICA Sessions works

POINTS TO NOTE

- Session reliability for ICA sessions works out of the box with NetScaler Gateway.
- Session reliability for ICA sessions does not work when both the following conditions are met:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

    - HDX Insight is enabled
    - EnableSRonHAFailover is set to NO

- Setting the EnableSRonHAFailover knob to either YES or NO does not make any difference, when HDX Insight is disabled.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

API security

API security plays an important role in protecting sensitive data by enforcing access controls, authentication, and encryption on the API traffic and ensuring that only authorized entities can access and transmit confidential information securely.

NetScaler® allows you to secure the API traffic by validating the incoming API traffic against the imported API specification. An API specification defines the design of an API, including endpoints, methods, parameters, and data formats.

Perform the following configuration to secure the API traffic:

- Import API Specification
- API specification validation

Starting from NetScaler release 13.1 build 53.x, you can protect the authentication and VPN endpoint URLs hosted by NetScaler using a built-in API specification. NetScaler checks the URL traffic to ensure that it is not a potential attack. By default, this feature is disabled. For information on how to enable it, see Authentication methods.

NOTE:

The Web App firewall protection for authentication and Gateway endpoint is not supported on Linux based CPX and BLX deployments.

Import API Specification

API specification defines the design of an API, including endpoints, methods, parameters, and data formats. The import API specification capability allows you to import the open API specification, which is generally used to describe the REST API. When the Web App Firewall performs a validation check on a user's request for an API-based web service, it validates the request against the schema specified in the API specification file for that web service. NetScaler® supports schema validations for a REST API with payload being application JSON and ProtoBuf for gRPC API requests.

NetScaler supports the following specification formats:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Open API - Swagger 2.0, OAS 3.0,3.1
- ProtoBuf - v3 and v2

Manage API specification files

You can validate incoming API traffic against the imported API specification by assigning it to a profile and setting a relaxation rule to either block or allow the traffic. Importing an API specification consists of two steps:

1. Import the API specification - Import an API specification to NetScaler through a URL or from the system.
2. Add the API specification to NetScaler - When you add an API specification to NetScaler, the file is validated, converted into an internal format, and an API specification entity is created. The API specification entity created will be used in policy expressions and Web App Firewall profiles.

NOTE:

Ensure that the uploaded Open API Swagger 2.0, OAS 3.0, and 3.1 specification files do not contain any references to external files. If you need to use details from an external file, consolidate the information into a single file using open-source tools and then upload it.

Manage API specification files using the CLI

The following parameters are used in the CLI commands:

- Name - Name of the API specification file that is uploaded.
- Source - URL (protocol, host, path, and name) for the location to store the imported specification file.
- Spec Name - The name of the entity that is created from the uploaded API specification.
- Type - Input format of the API specification. Default Value: OAS

To import an API specification file, type:

```
import api specFile <name> <src>
```

Example:

```
import apispec testapispec.json http://www.example.com/testapispec.json
```

To add an API specification file, type:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add api spec <Name> -File <string> -Type <string>
```

Example:

```
add api spec testapispec -File testapispec.json -Type OAS
```

To update an API specification file, import a new specification file that needs to be updated.

At the command prompt, type:

```
update api spec <specName> -File <string> -Type <string>
```

Example:

```
update api spec testapispec -File testapispec.json -Type OAS
```

NOTE:

If the type attribute is not specified, OAS is the default type.

To view all the endpoints, type:

```
show api spec <specName>
```

Example:

```
show api spec testapispec
```

To delete the API specification, type:

```
rm api spec <specName>
```

Example:

```
rm api spec testapispec
```

NOTE:

Before removing the API specification, make sure it is not being used by any profile or policy.

Manage API specification files using the GUI

1. Navigate to **Security > NetScaler Web App Firewall > Imports**.
2. On the **Imports** page, select the **API Spec Import Page** tab, and then click **Add**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. On the **API Spec Import Object** page, select any one of the following options for the **Import From** parameter:

   a. URL: A web URL on a website accessible to the appliance.

   b. File: A file on a local or networked hard disk or other storage device.

4. Click **Continue**.

5. On the **API Spec Import Object** page, enter the following details:

   a. API Spec Name – The name of the entity that is created from the uploaded API specification. Note: Both the API file name and the API Spec Name entered should be the same.

   b. API Spec Type – Select the type of specification.

      Types: REST (OpenAPI/Swagger), and gRPC(PROTO).

      Default Type: REST (OpenAPI/Swagger)

   c. Click **Done**.

The newly added entity is listed in the **Imports** page under the **API Spec Import Page tab.**

View the statistics of API specification and API endpoints

You can view the following statistics for all the API specifications and API endpoints:

- API specifications hits - Requests matching any endpoint of the API specification.
- API specification successful validations - Requests matching any endpoint of the API specification and in conformance with the API schema.
- API specification unmatched requests - Requests not matching any endpoint of the API specification.
- API endpoints hits - Requests matching a specific endpoint.
- API endpoints successful validations - Requests matching a specific endpoint and in conformance with the API schema.

View API specifications and API endpoint statistics using the CLI

At the command prompt, type:

```
stat apispec <apispec name>
```

Example

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
stat apispec testapispec
```

View API specifications and API endpoint statistics using the GUI

1. Navigate to **Security > NetScaler Web App Firewall > Imports**.
2. On the Imports page, select the **API Spec Import tab**, and then click **Statistics**.

   The API specification summary is displayed.
3. To view the endpoint summary, click any of the API specifications.

   The API endpoint summary is displayed for the selected API specification.

API specification validation

API specification ensures seamless data transfer between systems through an API (Application Programming Interface). It guarantees that the data exchanged follows a predefined structure or format, thereby enhancing the overall reliability and security of the system.

An API specification defines the endpoint, schema, and parameters. Schema validation is a process that allows you to check if the incoming traffic adheres to the schema you provided in the API specification. By associating an API specification to a Web App Firewall profile, you can specify which incoming traffic is allowed, and which is either blocked or logged. Validating incoming traffic against the imported API specifications helps to ensure that network traffic is secure and compliant.

There are several API types that are commonly used in software development. These types determine how data is structured and exchanged between different software systems. NetScaler® supports the following API types:

- Representational State Transfer (REST)
- Google Remote Procedure Call (gRPC)

API specifications define the design of an API, including endpoints, methods, parameters, and data formats. These specifications ensure consistency, interoperability, and ease of use when developing and consuming APIs. NetScaler supports the following specification formats:

- Open API (formerly known as Swagger)
- ProtoBuf (Protocol Buffers)

Note: You can import, add, update, and delete API specification files using the GUI or the CLI. For more information, see Imports.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Assign API Spec to a profile using CLI

Configure a Web App Firewall profile with an API specification file to validate the traffic. You can configure an action used when the validation fails using the restAction (for REST APIs) or grpcAction (for gRPC APIs) parameter.

At the command prompt, type: `set appfw profile <Profile Name> -apispec <API spec entity name>`

```
-  Profile name - The name of the profile.

-  API spec entity name - The name of the entity that is created from the uploaded API specification.
```

Assign API Spec to a profile using GUI

1. Navigate to **Security > NetScaler Web App Firewall > Profiles** and click **Add**.
2. Select the required file for an API Spec Schema and click **Ok**

Assign API Spec to an existing profile using GUI

1. Navigate to **Security > NetScaler Web App Firewall > Profiles**
2. Select a user-defined profile and click **Edit**.
3. On the **NetScaler Web App Firewall Profile** page, click the **Edit** icon.
4. Select the required file for an API Spec Schema and click **Ok**.

Configure REST and gRPC API schema validation using CLI

At the command prompt, type:

```
set appfw profile <profile name> -restAction [block log   none  stats]

set appfw profile <profile name> -grpcAction [block log   none  stats]
```

Configure REST and gRPC API schema validation using GUI

To configure or modify the REST and gRPC API schema validation:

1. Navigate to **Se**curity > NetScaler Web App Firewall > Profiles**.
2. Select a user-defined profile and click **Edit**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. On the **NetScaler Web App Firewall Profile** page, Under the **Advanced Settings** section, click **Security Checks**.
4. In the **Security Checks** section, select **REST API Schema Validation** or **gRPC API Schema Validation** and Click **Action Settings**.
5. In the **Actions** page, set the **Action parameter**. You can either select or clear the option.
6. Click **Ok**.

NOTE:

Unselect the Start URL option before configuring the security check for API Schema Validation.

Configure relaxation rule for API schema validation using CLI

Configure a relaxation rule to bypass certain traffic from being validated against the schema specified in the API specification linked with the web App Firewall profile.

To configure the relaxation rule for REST API schema validation, at the command prompt, type:

```
bind appfw profile <profile name> -restValidation <REST relaxation pattern> -ruleAction <Log|None>
```

- REST relaxation pattern - The URL pattern for which the relaxation is applied. Patterns can include variables as well as wildcard definitions, as described in proto of Google APIs Current link: `<https://github.com/googleapis/googleapis/blob/master/google/api/http.proto>`

  The URL specified is not required to be part of the API specification.

  Note: The prefix of the pattern should have an HTTP method (ie. GET, PUT, POST, DELETE, PATCH) followed by a colon (:). **Example:**

  - GET:/v1/{name=messages/*} - Allows three segment URLs starting with /v1/messages and the method is GET.
  - PATCH:/v1/messages/{message_id=**} - Allows anything with /v1/messages prefix and the method is PATCH.
  - POST:/v1/lists/** - Allows anything with /v1/lists prefix and the method is POST.
  - ://engineering/**- Allows any URL that has the second segment as engineering regardless of the method.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Log or None - Specifies whether logs are generated for bypassed traffic matching the rule. When action is set to log, relaxed URLs and corresponding rules are dumped into system logs. When the action is set to log, the relaxed URLs and the corresponding rule are recorded in the system logs.

To configure the relaxation rule for gRPC API schema validation, at the command prompt, type:

```
bind appfw profile <profile name> -grpcValidation <gRPC pattern> -ruleAction <Log|None>
```

- gRPC pattern - The pattern of gRPC endpoint(s) for which the relaxation is applied. The gRPC method specified is not required to be part of the API specification.

  Example:

  - citrix.api.doc.AddBook - Allows the RPC AddBook in package citrix.api.doc.
  - test.api.** - Allows all RPCs in packages, starting with test.api.
  - *.engineering.** - Allows all RPCs that have engineering as the second segment of the package name.

- Log|None - Specifies whether logs are generated for bypassed traffic matching the rule.

Configure relaxation rule for API schema validation using GUI

REST API schema validation

1. Navigate to **Security > NetScaler Web App Firewall > Profiles**.
2. Select a user-defined profile and click **Edit**.
3. On the **NetScaler Web App Firewall Profile** page, Under the **Advanced Settings** section, click **Relaxation Rule**.
4. Select the **REST API Schema Validation** and click **Edit**.
5. In the **REST API Schema Validation Relaxation Rules** page, click **Add**.
6. In the **REST API Schema Validation Relaxation Rule** page, specify the following details:

   a. Enabled - Select the option to enable the relaxation rule.

   b. Rest URL Pattern - Enter the URL pattern for which the relaxation is applied.

   c. REST URL Relaxation Action - Select an action.

   d. Comments- Description of the expression.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

e. Resource ID - Unique ID to identify the resource.

f. Click **Create**. The newly added REST API schema validation relaxation rule is listed on the REST API Schema Validation Relaxation Rules page.

gRPC API schema validation

1. Navigate to **Security > NetScaler Web App Firewall > Profiles**.
2. On the **Profiles** page, select a profile and click **Edit**.
3. On the **NetScaler Web App Firewall Profile** page, under the **Advanced Settings** section, click **Relaxation Rule**.
4. Select the **gRPC API Schema Validation** and click **Edit**.
5. In the **gRPC API Schema Validation Relaxation Rules** page, click **Add**.
6. In the **gRPC API Schema Validation Relaxation Rule** page, specify the following details:

   a. Enabled - Select the option to enable the relaxation rule.

   b. gRPC Method Pattern - Enter the gRPC Method pattern for which the relaxation is applied

   c. REST URL Relaxation Action - Select any one of the actions.

   d. Comments- Description of the expression.

   e. Resource ID - Unique ID to identify the resource.

   f. Click **Create**. The newly added gRPC API schema validation relaxation rule is listed in the gRPC API Schema Validation Relaxation Rules page.

NetScaler Web App Firewall

The NetScaler Web App Firewall offers easy to configure options to meet a wide range of application security requirements. Web App Firewall profiles, which consist of sets of security checks, can be used to protect both the requests and the responses by providing deep packet-level inspections. Each profile includes an option to select basic protections or advanced protections. Some protections might require use of other files. For example, xml validation checks might require WSDL or schema files. The profiles can also use other files, such as signatures or error objects. These files can be added locally, or they can be imported ahead of time and saved on the appliance for future use.

Each policy identifies a type of traffic, and that traffic is inspected for the security check violations specified in the profile that is associated with the policy. The policies can have different bind points, which determine the scope of the policy. For example, a policy that is bound to a specific virtual server is invoked and evaluated for only the traffic flowing through that virtual server. The policies are evaluated in the order of their designated priorities, and the first one that matches the request or response is applied.

- Quick Deployment of Web App Firewall Protection

  You can use the following procedure for quick deployment of Web App Firewall security:

  a. Add a Web App Firewall profile and select the appropriate type (html, xml, JSON) for the security requirements of the application.
  b. Select the required level of security (basic or advanced).
  c. Add or import the required files, such as signatures or WSDL.
  d. Configure the profile to use the files, and make any other necessary changes to the default settings.
  e. Add a Web App Firewall policy for this profile.
  f. Bind the policy to the target bind point and specify the priority.

- Web App Firewall entities

  Profile—An Web App Firewall profile specifies what to look for and what to do. It inspects both the request and the response to determine which potential security violations must be checked and what actions must be taken when processing a transaction. A profile can protect an HTML,

© 1997–2026 Citrix Systems, Inc. All rights reserved.

XML, or HTML and XML payload. Depending on the security requirements of the application, you can create either a basic or an advanced profile. A basic profile can protect against known attacks. If higher security is required, you can deploy an advanced profile to allow controlled access to the application resources, blocking zero day attacks. However, a basic profile can be modified to offer advanced protections, and conversely. Multiple action choices (for example, block, log, learn, and transform) are available. Advanced security checks might use session cookies and hidden form tags for controlling and monitoring the client connections. Web App Firewall profiles can learn the triggered violations and suggest the relaxation rules.

Basic Protections—A basic profile includes a preconfigured set of Start URL and Deny URL relaxation rules. These relaxation rules determine which requests must be allowed and which must be denied. Incoming requests are matched against these lists and the configured actions are applied. This allows the user to be able to secure applications with minimal configuration for relaxation rules. The Start URL rules protect against forceful browsing. Known web server vulnerabilities that are exploited by hackers can be detected and blocked by enabling a set of default Deny URL rules. Commonly launched attacks, such as Buffer Overflow, SQL, or Cross-site scripting can also be easily detected.

Advanced Protections—As the name indicates, advanced protections are used for applications that have higher security requirements. Relaxation rules are configured to allow access to only specific data and block the rest. This positive security model mitigates unknown attacks, which might not be detected by basic security checks. In addition to all the basic protections, an advanced profile keeps track of a user session by controlling the browsing, checking for cookies, specifying input requirements for various form fields, and protecting against tampering of forms or cross-site request forgery attacks. Learning, which observes the traffic and deploys the appropriate relaxations, is enabled by default for many security checks. Although easy to use, advanced protections require due consideration, because they offer tighter security but also require more processing and do not allow use of caching, which can affect performance.

Import—Import functionality is useful when Web App Firewall profiles must use external files, that is, files hosted on an external or internal web server, or that have to be copied from a local machine. Importing a file and storing it on the appliance is useful, especially in situations where you have to control access to external websites, or where compilation takes a long time, large files have to be synced across HA deployments, or you can reuse a file by copying it across multiple devices. For example:

- WSDLs hosted on external web servers can be imported locally before blocking access to external websites.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Large signature files generated by an external scan tool such as Cenzic can be imported and precompiled, using schema on the NetScaler® ADC appliance.
- A customized HTML or XML error page can be imported from an external web server or copied from a local file.

Signatures—Signatures are powerful, because they use pattern matching to detect malicious attacks and can be configured to check both the request and the response of a transaction. They are a preferred option when a customizable security solution is needed. Multiple choices (for example, block, log, learn, and transform) are available for the action to take when a signature match is detected. The Web App Firewall has a built-in default signature object consisting of more than 1,300 signature rules, with an option to get the latest rules by using the auto-update feature. Rules created by other scan tools can also be imported. The signature object can be customized by adding new rules, which can work with the other security checks specified in the Web App Firewall profile. A signature rule can have multiple patterns and can flag a violation only when all the patterns are matched, thereby avoiding false positives. Careful selection of a literal `fastmatch` pattern for a rule can significantly optimize processing time.

Policies—Web App Firewall Policies are used to filter and separate the traffic into different types. This provides the flexibility to implement different levels of security protections for the application data. Access to highly sensitive data can be directed to advanced security-check inspections, while less sensitive data is protected by basic-level security inspections. Policies can also be configured to bypass security-check inspection for harmless traffic. Higher security requires more processing, so careful design of the policies can provide desired security along with optimized performance. The priority of the policy determines the order in which it is evaluated, and its bind point determines the scope of its application.

Highlights

1. Ability to secure a wide range of applications by protecting different types of data, implementing the right level of security for different resources, and still getting maximum performance.
2. Flexibility to add or modify a security configuration. You can tighten or relax security checks by enabling or disabling basic and advanced protections.
3. Option to convert an HTML profile to an XML or Web2.0 (HTML+XML) profile and conversely, providing the flexibility to add security for different types of payload.
4. Easily deployed actions to block attacks, monitor them in logs, collect statistics, or even transform some attack strings to render them harmless.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

5. Ability to detect attacks by inspecting incoming requests, and to prevent leakage of sensitive data by inspecting the responses sent by the servers.
6. Capability to learn from the traffic pattern to get recommendations for easily editable relaxation rules that can be deployed to allow exceptions.
7. Hybrid security model that applies the power of customizable signatures to block attacks that match specified patterns, and provides the flexibility to use the positive-security-model checks for basic or advanced security protections.
8. Availability of comprehensive configuration reports, including information about PCI-DSS compliance.

FAQs and Deployment Guide

Q: Why is NetScaler Web App Firewall the preferred choice for securing applications?

With the following features, the NetScaler Web App Firewall offers a comprehensive security solution:

- **Hybrid security model:** NetScaler hybrid security model allows you to take advantage of both a positive security model and a negative security model to come up with a configuration ideally suited for your applications.
    - **Positive security model** protects against Buffer Overflow, CGI-BIN Parameter Manipulation, Form/Hidden Field Manipulation, Forceful Browsing, Cookie or Session Poisoning, Broken ACLs, Cross-Site Scripting (cross-site scripting), Command Injection, SQL Injection, Error Triggering Sensitive Information Leak, Insecure Use of Cryptography, Server Misconfiguration, Back Doors and Debug Options, Rate-Based Policy Enforcement, Well Known Platform Vulnerabilities, Zero-Day Exploits, Cross Site Request Forgery (CSRF), and leakage of Credit Card and other sensitive data.
    - **Negative security model** uses a rich set signatures to protect against L7 and HTTP application vulnerabilities. The Web App Firewall is integrated with several third party scanning tools, such as those offered by Cenzic, Qualys, Whitehat, and IBM. The built-in XSLT files allow easy importation of rules, which can be used in conjunction with the native-format Snort based rules. An auto-update feature gets the latest updates for new vulnerabilities.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The positive security model might be the preferred choice for protecting applications that have a high need for security, because it gives you the option to fully control who can access what data. You allow only what you want and block the rest. This model includes a built-in security check configuration, which is deployable with few clicks. However, keep in mind that the tighter the security, the greater the processing overhead.

The negative security model might be preferable for customized applications. The signatures allow you to combine multiple conditions, and a match and the specified action are triggered only when all the conditions are satisfied. You block only what you don’t want and allow the rest. A specific fast-match pattern in a specified location can significantly reduce processing overhead to optimize performance. The option to add your own signature rules, based on the specific security needs of your applications, gives you the flexibility to design your own customized security solutions.

- **Request as well as response side detection and protection:** You can inspect the incoming requests to detect any suspicious behavior and take appropriate actions, and you can check the responses to detect and protect against leakage of sensitive data.
- **Rich set of built-in protections for HTML, XML and JSON payloads:** The Web App Firewall offers 19 different security checks. Six of them (such as Start URL and Deny URL) apply to both HTML and XML data. Five checks (such as Field Consistency and Field Format) are specific to HTML, and eight (such as XML Format and Web Service Interoperability) are specific to XML payloads. This feature includes a rich set of actions and options. For example, URL Closure enables you to control and optimize the navigation through your website, to safeguard against forceful browsing without having to configure relaxation rules to allow each and every legitimate URL. You have the option to remove or x-out the sensitive data, such as credit-card numbers, in the response. Be it SOAP Array attack protection, XML denial of Service (XDoS), WSDL scan prevention, Attachment check, or any number of other XML attacks, you have the comfort of knowing that you have an ironclad shield protecting your data when your applications are protected by the Web App Firewall. The signatures allow you to configure rules using XPATH-Expressions to detect violations in the body as well as the header of a JSON payload.
- **GWT:** Support for protecting Google Web Toolkit applications to safeguard against SQL, cross-site scripting and Form Field Consistency check violations.
- **Java-free, user friendly graphical user interface (GUI):** An intuitive GUI and preconfigured security checks make it easy to deploy security by clicking a few buttons. A wizard prompts and guides you to create the required elements, such as profiles, policies, signatures, and bindings. The HTML5 based GUI is free of any Java dependency. It’s performance is significantly better than that of the older, Java based versions.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Easy to Use and automatable CLI:** Most of the configuration options that are available in GUI are also available in the command line interface (CLI). The CLI commands can be executed by a batch file and are easy to automate.
- **Support for REST API:** The NetScaler NITRO protocol supports a rich set of REST API's to automate Web App Firewall configuration and collect pertinent statistics for ongoing monitoring of security violations.
- **Learning:** The Web App Firewall's ability to learn by monitoring traffic to fine tune security is very user friendly. The learning engine recommends rules, which makes it easy to deploy relaxations without proficiency in regular expressions.
- **RegEx editor support:** Regular expression offer an elegant solution to the dilemma of wanting to consolidate rules and yet optimize search. You can capitalize on the power of regular expressions to configure URLs, field names, signature patterns, and so on. The rich built-in GUI RegEx editor offers you a quick reference for the expressions and provides a convenient way to validate and test your RegEx for accuracy.
- **Customized error page:** Blocked requests can be redirected to an error URL. You also have the option to display a customized error object that uses supported variables and NetScaler® advanced policy (advanced PI expressions) to embed troubleshooting information for the client.
- **PCI-DSS, stats, and other violation reports:** The rich set of reports makes it easy to meet the PCI-DSS compliance requirement, gather stats about traffic counters, and view violation reports for all profiles or just one profile.
- **Logging and click-to-rule from log:** Detailed logging is supported for native as well as CEF format. The Web App Firewall offers you the ability to filter targeted log messages in the syslog viewer. You can select a log message and deploy a corresponding relaxation rule by a simple click of a button. You have the flexibility to customize log messages and also have support for generating web logs. For additional details, see Web App Firewall Logs topic.
- **Include violation logs in trace records:** The ability to include log messages in the trace records makes it very easy to debug unexpected behavior such as reset and block.
- **Cloning:** The useful Import/Export profile option allows you to clone the security configuration from one NetScaler appliance to others. Export learned data options make it easy to export the learned rules to an Excel file. You can then get them reviewed and approved by application owner before applying them.
- **An AppExpert template** (a set of configuration settings) can be designed to provide appropriate protection for your websites. You can simplify and expedite the process of deploying similar protection on other appliances by exporting these cookie-cutter templates to a template.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Sessionless security checks:** Deploying sessionless security checks can help you reduce the memory footprint and expedite the processing.
- **Interoperability with other NetScaler features:** The Web App Firewall works seamlessly with other NetScaler features, such as rewrite, URL transformation, integrated caching, CVPN, and rate limiting.
- **Support of PI expressions in policies:** You can leverage the power of advanced PI expressions to design policies to implement different levels of security for different parts of your application.
- **Support for IPv6:** The Web App Firewall supports both IPv4 and IPv6 protocols.
- **Geolocation based security protection:** You have the flexibility of using NetScaler advanced policy (PI Expressions) for configuring location based policies, which can be used in conjunction with a built-in location database to customize firewall protection. You can identify the locations from which malicious requests originate, and enforce the desired level of security-check inspections for requests that originate from a specific geographical location.
- **Performance:** Request-side **streaming** significantly improves performance. As soon as a field is processed, the resulting data is forwarded to the back end while evaluation continues for the remaining fields. The improvement in processing time is especially significant when handling large posts.
- **Other security features:** The Web App Firewall has several other security settings that can help ensure the security of your data. For example, the **Confidential Field** lets you block leakage of sensitive information in the log messages, and **Strip HTML Comment** allows you to remove the HTML comments from the response before forwarding it to the client. **Field Types** can be used to specify what inputs are allowed in the forms submitted to your application.

Q: What do I need to do to configure Web App Firewall?

Do the following:

- Add an Web App Firewall profile and select the appropriate type (html, xml, web2.0) for the security requirements of the application.
- Select the required level of security (basic or advanced).
- Add or import the required files, such as signatures or WSDL.
- Configure the profile to use the files, and make any other necessary changes to the default settings.
- Add an Web App Firewall policy for this profile.
- Bind the policy to the target bind point and specify the priority.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Q: How do I know what profile type to choose?

The Web App Firewall profile offers protection for both HTML and XML payloads. Depending on the need of your application, you can choose either a HTML profile or XML profile. If your application supports both HTML and XML data, you can choose a Web2.0 profile.

Q: What is the difference between basic and advanced profiles? How do I decide which one I need?

The decision to use a basic or an advance profile depends on the security need of your application. A basic profile includes a preconfigured set of Start URL and Deny URL relaxation rules. These relaxation rules determine which requests are allowed and which are denied. Incoming requests are matched with the preconfigured rules, and the configured actions are applied. The user can secure applications with minimal configuration of relaxation rules. The Start URL rules protect against forceful browsing. Known web server vulnerabilities that are exploited by hackers can be detected and blocked by enabling a set of default Deny URL rules. Commonly launched attacks, such as Buffer Overflow, SQL, or Cross-Site Scripting can also be easily detected.

As the name indicates, advanced protections are for applications that have higher security requirements. Relaxation rules are configured to allow access to only specific data and block the rest. This positive security model mitigates unknown attacks, which might not be detected by basic security checks. In addition to all the basic protections, an advanced profile keeps track of a user session by controlling the browsing, checking for cookies, specifying input requirements for various form fields, and protecting against tampering of forms or Cross-Site Request Forgery attacks. Learning, which observes the traffic and recommends the appropriate relaxations, is enabled by default for many security checks. Although easy to use, advanced protections require due consideration, because they offer tighter security but also require more processing. Some advance security checks do not allow use of caching, which can affect performance.

Keep the following points in mind when deciding whether to use basic or advanced profiles:

- Basic and advanced profiles are just starting templates. You can always modify the basic profile to deploy advanced security features, and vice versa.
- Advanced security checks require more processing and can affect performance. Unless your application needs advanced security, you might want to start with a basic profile and tighten the security as required for your application.
- You do not want to enable all security checks unless your application needs it.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Q: What is a policy? How do I select the bind point and set the priority?

Web App Firewall policies can help you sort your traffic into logical groups for configuring different levels of security implementation. Carefully select the bind points for the policies to determine which traffic is matched against which policy. For example, if you want every incoming request to be checked for SQL/cross-site scripting attacks, you can create a generic policy and bind it globally. Or, if you want to apply more stringent security checks to the traffic of a virtual server hosting applications that contain sensitive data, you can bind a policy to that virtual server.

Careful assignment of priorities can enhance the traffic processing. You want to assign higher priorities to more specific policies and lower priorities to generic policies. Note that the higher the number, the lower the priority. A policy with a priority of 10 is evaluated before a policy that has a priority of 15.

You can apply different levels of security for different kinds of contents, e.g. requests for static objects like images and text can be by-passed by using one policy and requests for other sensitive contents can be subjected to a much stringent check by using a second policy.

Q: How do I go about configuring the rules to secure my application?

The Web App Firewall makes it very easy to design the right level of security for your web-site. You can have multiple Web App Firewall policies, bound to different Web App Firewall profiles, to implement different levels of security-check inspections for your applications. You can initially monitor the logs to observe what security threats are being detected and which violations are being triggered. You can either manually add the relaxation rules or take advantage of the Web App Firewall's recommended learned rules to deploy the required relaxations to avoid false positives.

The NetScaler Web App Firewall offers **visualizer** support in GUI, which makes rule management very easy. You can easily view all the data on one screen, and take action on several rules with one click. The biggest advantage of the visualizer is that it recommends regular expressions to consolidate several rules. You can select a subset of the rules, basing your selection on the delimiter and Action URL. Visualizer support is available for viewing 1) learned rules and 2) relaxation rules.

1. The visualizer for learned rules offers the option to edit the rules and deploy them as relaxations. You can also skip (ignore) rules.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. The visualizer for deployed relaxations offers you the option to add a new rule or edit an existing one. You can also enable or disable a group of rules by selecting a node and clicking the **Enable** or **Disable** button in the relaxation visualizer.

Q: What are signatures? How do I know which signatures to use?

A signature is an object that can have multiple rules. Each rule consists of one or more patterns that can be associated with a specified set of actions. The Web App Firewall has a built-in default signature object consisting of more than 1,300 signature rules, with an option to get the latest rules by using the **auto-update** feature to get protection against new vulnerabilities. Rules created by other scan tools can also be imported.

Signatures are very powerful because they use pattern matching to detect malicious attacks and can be configured to check both the request and the response of a transaction. They are a preferred option when a customizable security solution is needed. Multiple action choices (for example, block, log, learn, and transform) are available for when a signature match is detected. The default signatures cover rules to protect different types of applications, such as web-cgi, web-coldfusion, web-frontpage, web-iis, web-php, web-client, web-activex, web-shell-shock, and web-struts. To match the needs of your application, you can select and deploy the rules belonging to a specific category.

Signature-usage tips:

- You can just make a copy of the default signature object and modify it to enable the rules you need and configure the actions you want.
- The signature object can be customized by adding new rules, which can work in conjunction with other signature rules.
- The signature rules can also be configured to work in conjunction with the security checks specified in the Web App Firewall profile. If a match indicating a violation is detected by a signature as well as a security check, the more restrictive action is the one that gets enforced.
- A signature rule can have multiple patterns and be configured to flag a violation only when all the patterns are matched, thereby avoiding false positives.
- Careful selection of a literal fast-match pattern for a rule can significantly optimize processing time.

Q: Does the Web App Firewall work with other NetScaler features?

The Web App Firewall is fully integrated into the NetScaler appliance and works seamlessly with other features. You can configure maximum security for your application by using other NetScaler

© 1997–2026 Citrix Systems, Inc. All rights reserved.

security features in conjunction with the Web App Firewall. For example, **AAA-TM** can be used to authenticate the user, check the user's authorization to access the content, and log the accesses, including invalid login attempts. **Rewrite** can be used to modify the URL or to add, modify or delete headers, and **Responder** can be used to deliver customized content to different users. You can define the maximum load for your website by using **Rate Limiting** to monitor the traffic and throttle the rate if it is too high. **HTTP Denial-of-Service (DoS)** protection can help distinguish between real HTTP clients and malicious DoS clients. You can narrow the scope of security-check inspection by binding the Web App Firewall policies to virtual servers, while still optimizing the user experience by using the **Load Balancing** feature to manage heavily used applications. Requests for static objects such as images or text can bypass security check inspection, taking advantage of **integrated caching** or **compression** to optimize the bandwidth usage for such content.

Q: How is the payload processed by the Web App Firewall and the other NetScaler features?

A diagram showing details of the L7 packet flow in a NetScaler appliance is available in the Processing Order of Features section.

Q: What is the recommended workflow for Web App Firewall deployment?

Now that you know the advantages of using the state-of-the-art security protections of the NetScaler Web App Firewall, you might want to collect additional information that can help you design the optimal solution for your security needs. Citrix recommends that you do the following:

- **Know your environment:** Knowing your environment will help you to identify the best security protection solution (signatures, security checks, or both) for your needs. Before you begin configuration, you must gather the following information.
  - **OS:** What kind of OS (MS Windows, Linux, BSD, Unix, others) do you have?
  - **Web Sever:** What web server (IIS, Apache or NetScaler Enterprise Server) are you running?
  - **Application:** What type of applications are running on your application server (for example, ASP.NET, PHP, Cold Fusion, ActiveX, FrontPage, Struts, CGI, Apache Tomcat, Domino, and WebLogic)?
  - Do you have customized applications or off-the-shelf (for example, Oracle, SAP) applications? What version you are using?
  - **SSL:** Do you require SSL? If so, what key size (512, 1024, 2048, 4096) is used for signing certificates?

© 1997–2026 Citrix Systems, Inc. All rights reserved.

    - **Traffic Volume:** What is the average traffic rate through your applications? Do you have seasonal or time-specific spikes in the traffic?
    - **Server Farm:** How many servers do you have? Do you need to use load balancing?
    - **Database:** What type of database (MS-SQL, MySQL, Oracle, Postgres, SQLite, nosql, Sybase, Informix and so forth.) do you use?
    - **DB Connectivity:** What kind of data base connectivity do you have (DSN, per-file connection string, single file connection string) and what drivers are used?

- **Identify your security needs:** You might want to evaluate which applications or specific data need maximum security protection, which ones are less vulnerable, and the ones for which security inspection can safely be bypassed. This will help you in coming up with an optimal configuration, and in designing appropriate policies and bind points to segregate the traffic. For example, you might want to configure a policy to bypass security inspection of requests for static web content, such as images, MP3 files, and movies, and configure another policy to apply advanced security checks to requests for dynamic content. You can use multiple policies and profiles to protect different contents of the same application.
- **License requirement:** NetScaler offers a unified solution to optimize the performance of your application by taking advantage of a rich set of features such as load balancing, content switching, caching, compression, responder, rewrite, and content filtering, to name a few. Identifying the features that you want can help you decide which license you need.
- **Install and baseline a NetScaler appliance:** Create a virtual server and run test traffic through it to get an idea of the rate and amount of traffic flowing through your system. This information will help you to identify your capacity requirement and select the right appliance (VPX, MPX, or SDX).
- **Deploy the Web App Firewall:** Use the Web App Firewall wizard to proceed with a simple security configuration. The wizard walks you through several screens and prompts you to add a profile, policy, signature, and security checks.

    - **Profile:** Select a meaningful name and the appropriate type (HTML, XML or WEB 2.0) for your profile. The policy and signatures will be auto-generated using the same name.
    - **Policy:** The auto-generated policy has the default Expression (true), which selects all traffic and is bound globally. This is a good starting point unless you have in mind a specific policy that you want to use.
    - **Protections:** The wizard helps you take advantage of the hybrid security model, in which you can use the default signatures offering a rich set of rules to protect different types of applications. **Simple** edit mode allows you to view the various categories (CGI, Cold

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Fusion, PHP, and so forth.). You can select one or more categories to identify a specific set of rules applicable to your application. Use the **Action** option to enable all the signature rules in the selected categories. Make sure that blocking is disabled, so that you can monitor the traffic before tightening the security. Click **Continue**. In the **Specify Deep protections** pane, you can make changes as needed to deploy the security check protections. In most cases, basic protections are sufficient for initial security configuration. Run the traffic for a while to collect a representative sample of the security-inspection data.

- **Tightening the security:** After deploying Web App Firewall and observing the traffic for a while, you can start tightening the security of your applications by deploying relaxations and then enabling blocking. **Learning**, **Visualizer**, and **Click to deploy rules** are useful features that make it very easy to tweak your configuration to come up with just the right level of relaxation. At this point, you can also change the policy expression and/or configure additional policies and profiles to implement desired levels of security for different types of content.
- **Debugging:** If you see unexpected behavior of your application, the Web App Firewall offers various options for easy debugging:
  - **Log**. If legitimate requests are getting blocked, your first step is to check the ns.log file to see if any unexpected security-check violation is being triggered.
  - **Disable feature.** If you do not see any violations but are still seeing unexpected behavior, such as an application resetting or sending partial responses, you can disable the Web App Firewall feature for debugging. If the issue persists, it rules out the Web App Firewall as a suspect.
  - **Trace records with log messages.** If the issue appears to be Web App Firewall related and needs closer inspection, you have the option to include security violation messages in an nstrace. You can use “Follow TCP stream” in the trace to view the details of the individual transaction, including headers, payload, and the corresponding log message, together on the same screen. Details of how to use this functionality are available at Appendixes.

Introduction to NetScaler Web App Firewall

The NetScaler Web App Firewall prevents security breaches, data loss, and possible unauthorized modifications to websites that access sensitive business or customer information. It does so by filtering both requests and responses, examining them for evidence of malicious activity, and blocking requests that exhibit such activity. Your site is protected not only from common types of attacks, but also from new, as yet unknown attacks. In addition to protecting web servers and

© 1997–2026 Citrix Systems, Inc. All rights reserved.

websites from unauthorized access, the Web App Firewall protects against vulnerabilities in legacy CGI code or scripts, web frameworks, web server software, and other underlying operating systems.

The NetScaler Web App Firewall is available as a stand-alone appliance, or as a feature on a NetScaler virtual appliance (VPX). In the Web App Firewall documentation, the term NetScaler refers to the platform on which the Web App Firewall is running, regardless of whether that platform is a dedicated firewall appliance, a NetScaler on which other features have also been configured, or a NetScaler VPX.

To use the Web App Firewall, you must create at least one security configuration to block connections that violate the rules that you set for your protected websites. The number of security configurations that you might want to create depends on the complexity of your website. Sometimes, a single configuration is sufficient. In other cases, particularly those that include interactive websites, websites that access database servers, online stores with shopping carts, you might need several different configurations to best protect sensitive data without wasting significant effort on content that is not vulnerable to certain types of attacks. You can often leave the defaults for the global settings, which affect all security configurations, unchanged. However, you can change the global settings if they conflict with other parts of your configuration or you prefer to customize them.

Web application security

Web application security is network security for computers and programs that communicate by using the HTTP and HTTPS protocols. This is a broad area in which security flaws and weaknesses abound. Operating systems on both servers and clients have security issues and are vulnerable to attack. Web server software and website enabling technologies such as CGI, Java, JavaScript, PERL, and PHP have underlying vulnerabilities. Browsers and other client applications that communicate with web-enabled applications also have vulnerabilities. Websites that use any technology but the simplest of HTML, including any site that allows interaction with visitors, often have vulnerabilities of their own.

In the past, a breach in security was often just an annoyance, but today that is seldom the case. For example, attacks in which a hacker gained access to a web server and made unauthorized modifications to (defaced) a website used to be common. They were usually launched by hackers who had no motivation beyond demonstrating their skills to fellow hackers or embarrassing the targeted person or company. Most current security breaches, however, are motivated by a desire for money. The majority attempt to accomplish one or both of the following goals: to obtain

© 1997–2026 Citrix Systems, Inc. All rights reserved.

sensitive and potentially valuable private information, or to obtain unauthorized access to and control of a website or web server.

Certain forms of web attacks focus on obtaining private information. These attacks are often possible even against websites that are secure enough to prevent an attacker from taking full control. The information that an attacker can obtain from a website can include customer names, addresses, phone numbers, social security numbers, credit card numbers, medical records, and other private information. The attacker can then use this information or sell it to others. Much of the information obtained by such attacks is protected by law, and all of it by custom and expectation. A breach of this type can have serious consequences for customers whose private information is compromised. At best, these customers have to exercise vigilance to prevent others from abusing their credit cards, opening unauthorized credit accounts in their name, or appropriating their identities outright (identity theft). At worst, the customers may face ruined credit ratings or even be blamed for criminal activities in which they had no part.

Other web attacks are aimed at obtaining control of (or *compromising*) a website or the server on which it operates, or both. A hacker who gains control of a website or server can use it to host unauthorized content, act as a proxy for content hosted on another web server, provide SMTP services to send unsolicited bulk email, or provide DNS services to support such activities on other compromised web servers. Most websites that are hosted on compromised web servers promote questionable or outright fraudulent businesses. For example, most phishing websites and child exploitation websites are hosted on compromised web servers.

Protecting your websites and web services against these attacks requires a multilayered defense capable of both blocking known attacks with identifiable characteristics and protecting against unknown attacks, which can often be detected because they look different from the normal traffic to your websites and web services.

For more information on security check, see Overview of security checks.

Known web attacks

The first line of defense for your websites is protection against the large number of attacks that are known to exist and have been observed and analyzed by web security experts. Common types of attacks against HTML-based websites include:

- **Buffer overflow attacks.** Sending a long URL, long cookie, or long information to a web server causes the system to hang, crash, or provide unauthorized access to the underlying operating system. A buffer overflow attack can be used to gain access to unauthorized information, to compromise a web server, or both.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Cookie security attacks.** Sending a modified cookie to a web server, usually in hopes of obtaining access to unauthorized content by using falsified credentials.
- **Forceful browsing.** Accessing URLs on a website directly, without navigating to the URLs with hyperlinks on the home page or other common start URLs on the website. Individual instances of forceful browsing might indicate a user who bookmarked a page on your website, but repeated attempts to access nonexistent content, or content that users must never access directly, often represent an attack on website security. Forceful browsing is normally used to gain access to unauthorized information, but can also be combined with a buffer overflow attack in an attempt to compromise your server.
- **Web form security attacks.** Sending inappropriate content to your website in a web form. Inappropriate content can include modified hidden fields, HTML, or code in a field intended for alphanumeric data only, an overly long string in a field that accepts only a short string, an alphanumeric string in a field that accepts only an integer, and a wide variety of other data that your website does not expect to receive in that web form. A web form security attack can be used either to obtain unauthorized information from your website or to compromise the website outright, usually when combined with a buffer overflow attack.

Two specialized types of attacks on web form security deserve special mention:

- **SQL injection attacks.** Sending an active SQL command or commands in a web form or as part of a URL, with the goal of causing an SQL database to run the command or commands. SQL injection attacks are normally used to obtain unauthorized information.
- **Cross-site scripting attacks.** Using a URL or a script on a webpage to violate the same-origin policy, which forbids any script from obtaining properties from or modifying any content on a different website. Since scripts can obtain information and modify files on your website, allowing a script access to content on a different website can provide an attacker the means to obtain unauthorized information, to compromise a web server, or both.

Attacks against XML-based web services normally fall into at least one of the following two categories: attempts to send inappropriate content to a web service, or attempts to breach security on a web service. Common types of attacks against XML-based web services include:

- **Malicious code or objects.** XML requests that contain code or objects that can either directly obtain sensitive information or can give an attacker control of the web service or underlying server.
- **Badly-formed XML requests.** XML requests that do not conform to the W3C XML specification, and that can therefore breach security on an insecure web service

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Denial of service (DoS) attacks.** XML requests that are sent repeatedly and in high volume, with the intent of overwhelming the targeted web service and denying legitimate users access to the web service.

In addition to standard XML-based attacks, XML web services and Web 2.0 sites are also vulnerable to SQL injection and cross-site scripting attacks, as described below:

- **SQL injection attacks.** Sending an active SQL command or commands in an XML-based request, with the goal of causing an SQL database to run that command or commands. As with HTML SQL injection attacks, XML SQL injection attacks are normally used to obtain unauthorized information.
- **Cross-site scripting attacks.** Using a script included in an XML based application to violate the same-origin policy, which does not allow any script to obtain properties from or modify any content on a different application. Since scripts can obtain information and modify files by using your XML application, allowing a script access to content belonging to a different application can give an attacker the means to obtain unauthorized information, to compromise the application, or both

Known web attacks can usually be stopped by filtering website traffic for specific characteristics (signatures) that always appear for a specific attack and must never appear in legitimate traffic. This approach has the advantages of requiring relatively few resources and posing relatively little risk of false positives. Therefore, it is a valuable tool in fighting attacks on websites and web services, and configuring basic signature protection.

Unknown web attacks

The greatest threat against websites and applications does not come from known attacks, but from unknown attacks. Most unknown attacks fall into one of two categories: newly launched attacks for which security firms have not yet developed an effective defense (zero-day attacks), and carefully targeted attacks on a specific website or web service rather than many websites or web services (spear attacks). These attacks, like known attacks, are intended to obtain sensitive private information, compromise the website or web service and allow it to be used for further attacks, or both of those goals.

Zero-day attacks are a major threat to all users. These attacks are usually of the same types as known attacks; zero-day attacks often involve injected SQL, a cross-site script, a cross-site request forgery, or another type of attack similar to known attacks. Usually, they target vulnerabilities that the developers of the targeted software, website, or web service either are unaware of or have learned about. Security firms have therefore not developed defenses against these attacks, and even if they have, users have not obtained and installed the patches or performed the workarounds

© 1997–2026 Citrix Systems, Inc. All rights reserved.

necessary to protect against these attacks. The time between discovery of a zero-day attack and availability of a defense (the vulnerability window) is shrinking, but perpetrators can still count on hours or even days in which many websites and web services lack any specific protection against the attack.

Spear attacks are a major threat, but to a more select group of users. A common type of spear attack, a spear phishes, is targeted at customers of a specific bank or financial institution, or (less commonly) at employees of a specific company or organization. Unlike other phishes, which are often crudely written forgeries that a user with any familiarity with the actual communications of that bank or financial institution can recognize, spear phishes are letter perfect and convincing. They can contain information specific to the individual that, at first look, no stranger must know or be able to obtain. The spear phisher is therefore able to convince the target to provide the requested information, which the phisher can then use to loot accounts, to process illegitimately obtained money from other sources, or to gain access to other, even more sensitive information.

Both of these types of attack have certain characteristics that can usually be detected, although not by using static patterns that look for specific characteristics, as do standard signatures. Detecting these types of attacks requires more sophisticated and more resource-intensive approaches, such as heuristic filtering and positive security model systems. Heuristic filtering looks, not for specific patterns, but for patterns of behaviors. Positive security model systems model the normal behavior of the website or web service that they are protecting, and then block connections that do not fit within that model of normal use. URL based and web-form based security checks profile normal use of your websites, and then control how users interact with your websites, using both heuristics and positive security to block anomalous or unexpected traffic. Both heuristic and positive security, properly designed and deployed, can catch most attacks that signatures miss. However, they require considerably more resources than do signatures, and you must spend some time configuring them properly to avoid false positives. They are therefore used, not as the primary line of defense, but as backups to signatures or other less resource-intensive approaches.

By configuring these advanced protections in addition to signatures, you create a hybrid security model, which enables the Web App Firewall to provide comprehensive protection against both known and unknown attacks.

How NetScaler Web App Firewall works

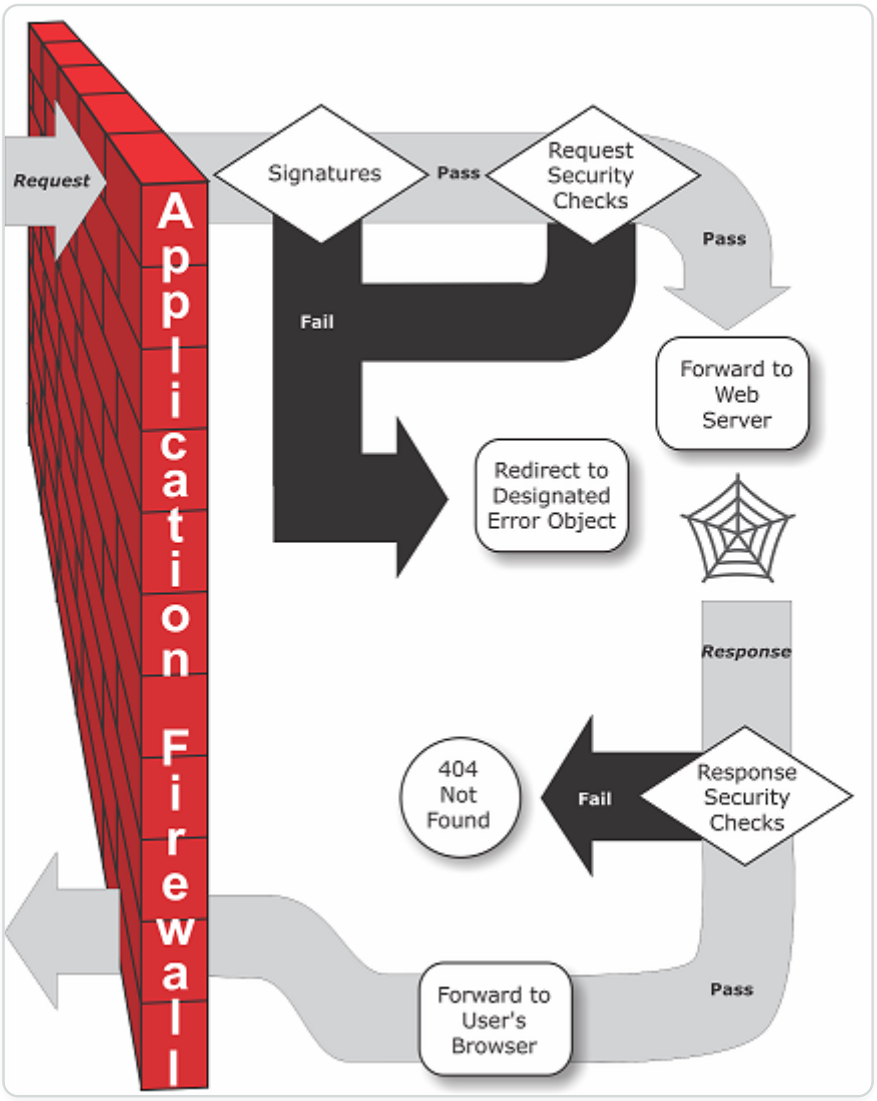
When you install the Web App Firewall, you create an initial security configuration, which consists of a policy, a profile, and a signatures object. The policy is a rule that identifies the traffic to be filtered, and the profile identifies the patterns and types of behavior to allow or block when the

© 1997–2026 Citrix Systems, Inc. All rights reserved.

traffic is filtered. The simplest patterns, which are called signatures, are not specified within the profile, but in a signatures object that is associated with the profile.

A signature is a string or pattern that matches a known type of attack. The Web App Firewall contains over a thousand signatures in seven categories, each directed at attacks on specific types of web servers and web content. NetScaler® updates the list with new signatures as new threats are identified. During configuration, you specify the signature categories that are appropriate for the web servers and content that you need to protect. Signatures provide good basic protection with low processing overhead. If your applications have special vulnerabilities or you detect an attack against them for which no signature exists, you can add your own signatures.

The more advanced protections are called security checks. A security check is a more rigorous, algorithmic inspection of a request for specific patterns or types of behavior that might indicate an attack or constitute a threat to your protected websites and web services. It can, for example, identify a request that attempts to perform a certain type of operation that might breach security, or a response that includes sensitive private information such as a social security number or credit card number. During configuration, you specify the security checks that are appropriate for the web servers and content that you need to protect. The security checks are restrictive. Many of them can block legitimate requests and responses if you do not add the appropriate exceptions (relaxations) when configuring them. Identifying the needed exceptions is not difficult if you use the adaptive learning feature, which observes normal use of your website and creates recommended exceptions.



The Web App Firewall can be installed as either a Layer 3 network device or a Layer 2 network bridge between your servers and your users, usually behind your company’s router or firewall. It must be installed in a location where it can intercept traffic between the web servers that you want to protect and the hub or switch through which users access those web servers. You then configure the network to send requests to the Web App Firewall instead of directly to your web servers, and responses to the Web App Firewall instead of directly to your users. The Web App Firewall filters that traffic before forwarding it to its final destination, using both its internal rule set and your additions and modifications. It blocks or renders harmless any activity that it detects as harmful, and then forwards the remaining traffic to the web server. The following figure provides an overview of the filtering process.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE:

The figure omits the application of a policy to incoming traffic. It illustrates a security configuration in which the policy is to process all requests. Also, in this configuration, a signatures object has been configured and associated with the profile, and security checks have been configured in the profile.

Figure 1. A Flowchart of Web App Firewall Filtering

As the figure shows, when a user requests a URL on a protected website, the Web App Firewall first examines the request to ensure that it does not match a signature. If the request matches a signature, the NetScaler Web App Firewall either displays the error object (a webpage located on the Web App Firewall appliance and which you can configure by using the imports feature) or forwards the request to the designated error URL (the error page). Signatures do not require as many resources as do security checks, so detecting and stopping attacks that are detected by a signature before running any of the security checks reduces the load on the server.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

If a request passes signature inspection, the Web App Firewall applies the request security checks that have been enabled. The request security checks verify that the request is appropriate for your website or web service and does not contain material that might pose a threat. For example, security checks examine the request for signs indicating that it might be of an unexpected type, request unexpected content, or contain unexpected and possibly malicious web form data, SQL commands, or scripts. If the request fails a security check, the Web App Firewall either sanitizes the request and then sends it back to the NetScaler appliance (or NetScaler virtual appliance), or displays the error object. If the request passes the security checks, it is sent back to the NetScaler appliance, which completes any other processing and forwards the request to the protected web server.

When the website or web service sends a response to the user, the Web App Firewall applies the response security checks that have been enabled. The response security checks examine the response for leaks of sensitive private information, signs of website defacement, or other content that must not be present. If the response fails a security check, the Web App Firewall either removes the content that must not be present or blocks the response. If the response passes the security checks, it is sent back to the NetScaler appliance, which forwards it to the user.

NetScaler Web App Firewall features

The basic Web App Firewall features are policies, profiles, and signatures, which provide a hybrid security model as described in Known Web Attacks, Unknown Web Attacks, and How the Web App Firewall Works. Of special note is the learning feature, which observes traffic to your protected applications and recommends appropriate configuration settings for certain security checks.

The imports feature manages files that you upload to the Web App Firewall. These files are then used by the Web App Firewall in various security checks, or when responding to a connection that matches a security check.

You can use the logs, statistics, and reports features to evaluate the performance of the Web App Firewall and identify possible needs for more protections.

How NetScaler Web App Firewall modifies application traffic

The NetScaler Web App Firewall affects the behavior of a web application it protects by modifying the following:

- Cookies
- HTTP Headers
- Forms/Data

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NetScaler Web App Firewall session cookie

To maintain the state of the session, NetScaler Web App Firewall generates its own session cookie. This cookie is passed only between the web browser and the NetScaler Web Application Firewall and not to the web server. If a hacker tries to modify the session cookie, Web App Firewall drops the cookie before forwarding the request to the server and treats the request as a new user session. The session cookie is present as long as the web browser is open. When the web browser is closed, the Application Firewall session cookie becomes invalid. The state of the session maintains the information of the URLs and forms visited by the client.

The configurable Web App Firewall session cookie is `citrix_ns_id`.

Starting from NetScaler build 12.1 54 and 13.0, the cookie consistency is sessionless, and adding the session cookie `citrix_ns_id` generated by the appliance is not enforced. For more information on configuring cookies, see Engine settings.

NetScaler Web App Firewall cookies

Many web applications generate cookies to track user or session specific information. This information can be user preferences or shopping cart items. A web application cookie can be one of the following two types:

- **Persistent Cookies** - These cookies are stored locally on the computer and used again the next time you visit the site. This type of cookie usually contains information about the user, such as, logon, password, or preferences.
- **Session or Transient Cookies** - These cookies are used only during the session and are destroyed after the session is terminated. This type of cookie contains application state information, such as, shopping cart items or session credentials.

Hackers can attempt to modify or steal application cookies to hijack a user session or masquerade as a user. The Application Firewall prevents such attempts by hashing the application cookies and then adding more cookies with the digital signatures. By tracking the cookies, the Application Firewall ensures that the cookies are not modified or compromised between the client browser and the Application Firewall. The Application Firewall does not modify the application cookies.

The NetScaler Web App Firewall generates the following default cookies to track the application cookies:

- **Persistent Cookies**: `citrix_ns_id_wlf`. Note: wlf stands for will live forever.
- **Session or Transient Cookies**: `citrix_ns_id_wat`. Note: wat stands for will act transiently. To track the application cookies, the Application Firewall groups the persistent or session

© 1997–2026 Citrix Systems, Inc. All rights reserved.

application cookies together and then hash and sign all the cookies together. Thus, the Application Firewall generates one `wlf` cookie to track all persistent application cookies and one `wat` cookie to track all application session cookies.

The following table shows the number and types of cookies generated by the Application Firewall based on the cookies generated by the web application:

BEFORE NETSCALER WEB APP FIREWALL	TO
One persistent cookie	Persistent cookie: `citix_ns_id_wlf`
One transient cookie	Transient cookie: `citix_ns_id_wat`
Multiple persistent cookies, Multiple transient cookies	One Persistent cookie: `citrix_ns_id_wlf`, One Transient cookie: `citix_ns_id_wat`

NetScaler Web App Firewall allows encrypting the application cookie. Application Firewall also provides an option to proxy the session cookie sent by the application, by storing it with the rest of the Application Firewall session data and not sending it to the client. When a client sends a request to the application that includes an Application Firewall session cookie, Application Firewall inserts the application sent cookie back into the request before sending the request on to the origin application. Application Firewall also allows adding the HTTPOnly and/or Secure flags to cookies.

How the application firewall affects HTTP headers

Both HTTPs requests and HTTPs responses use headers to send information about one or more HTTPs' message. A header is a series of lines with each line containing a name followed by a colon and a space, and a value. For example, the Host header has the following format:

```
Host: www.citrix.com
```

Some header fields are used in both request and response headers, while others are appropriate only for either a request or a response. The Application Firewall might add, modify, or delete some headers in one or more HTTPs request or response to maintain the security of the application.

Request headers dropped by the NetScaler Web App Firewall

Many of the request headers related to caching is dropped to view every request within the context of a session. Similarly, if the request includes an encoding header to allow the web server to send compressed responses, the Application Firewall deletes this header so the contents in the

© 1997–2026 Citrix Systems, Inc. All rights reserved.

uncompressed server response is inspected by the Web App Firewall to prevent any leakage of sensitive data to the client.

The Application Firewall drops the following request headers:

- Range – Used to recover from a failed or partial file transfers.
- If-Range – Allows a client to retrieve a partial object when it contains a part of that object in its cache already (conditional GET).
- If-Modified-Since – If the requested object is not modified since the time specified in this field, an entity is not returned from the server. You get an HTTP 304 not modified error.
- If-None-Match – Allows efficient updates of cached information with a minimum amount of overhead.
- Accept-Encoding – What encoding methods are allowed for a particular object, such as gzip.

Request header modified by the NetScaler Web App Firewall

If a web browser uses the HTTP/1.0 or earlier protocols, the browser continually opens and closes the TCP socket connection after receiving each response. This adds overhead to the web server and prevents maintaining session state. The HTTP/1.1 protocol allows the connection to remain open during the session. The Application Firewall modifies the following request header to use HTTP/1.1 between the Application Firewall and the web server regardless of the protocol used by the web browser: Connection: keep-alive

Request headers added by the NetScaler Web App Firewall

The Application Firewall acts as a reverse proxy and replaces the original source IP address of the session with the IP address of the Application Firewall. Therefore, all requests logged in the web server log indicate that the requests are sent from the Application Firewall.

Response header dropped by the NetScaler Web App Firewall

The Application Firewall might block or modify content such as removing credit card numbers or stripping comments, and this might result in a mismatch in size. To prevent such a scenario, the Application Firewall drops the following header:

Content-Length – Indicates the size of the message sent to the recipient. Response Headers Modified by the Application Firewall

Many of the response headers modified by the Application Firewall are related to caching. Caching headers in HTTP(S) responses must be modified to force the web browser to always send a request to the web server for the latest data and not use the local cache. However, some ASP applications use separate plug-ins to display dynamic contents and might require the ability to

© 1997–2026 Citrix Systems, Inc. All rights reserved.

cache the data temporarily in the browser. To allow temporary caching of data when Advanced Security protections such as FFC, URL closure, or CSRF checks are enabled, Application Firewall adds or modifies the cache-control headers in the server response using the following logic:

- If Server sends Pragma: no-cache, then the Application Firewall does not do any modification.
- If Client Request is HTTP 1.0, then Application Firewall inserts Pragma: no-cache.
- If Client Request is HTTP 1.1 and has Cache-control: no-store, then Application Firewall does not make any modification.
- If Client Request is HTTP 1.1 and Server Response has Cache-Control header with no store or no cache directive, then Application Firewall does not make any modification.
- If Client Request is HTTP 1.1 and Server Response has either No Cache-control Header or Cache-Control header does not have no store or no-cache directive, the Application Firewall completes the following tasks:

1. Inserts Cache-control: max-age=3, must-revalidate,private.
2. Inserts X-Cache-Control-orig = Original value of Cache-Control Header.
3. Deletes Last-Modified header.
4. Replaces Etag.
5. Inserts X-Expires-Orig=Original value of the Expire Header sent by the server.
6. Modifies the Expires Header and sets the expiration date of the webpage to the past, so it is always picked up again.
7. Modifies Accept-Ranges and sets it to none.

To replace temporarily cached data in the client browser when Application Firewall changes the response such as, for StripComments, X-out/Remove SafeObject, xout or remove Credit Card or URL Transform, Application Firewall takes the following actions:

1. Deletes Last-Modified from server before forwarding to client.
2. Replaces Etag with a value determined by Application Firewall.

Response headers added by the NetScaler Web App Firewall

- `Transfer-Encoding`: Chunked. This header streams information back to a client without having to know the total length of the response before sending the response. This header is required because the content-length header is removed.
- `Set-Cookie`: The cookies added by the Application Firewall.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- `Xet-Cookie`: If the session is valid and if the response is not expired in cache, you can serve from cache and do not have to send a new cookie because the session is still valid. In such a scenario, the Set-Cookie is changed to Xet-Cookie. For the web browser.

How form data is affected

The Application Firewall protects against attacks that attempt to modify the content of the original form sent by the server. It can also protect against Cross-site Request forgery attacks. The Application Firewall accomplishes by inserting the hidden form tag as_fid in the page.

Example: `<input type="hidden" name="as_fid" value="VRgWq0I196Jmg/+LOY7C" />`

The hidden field as_fid is used for field consistency. This field is used by Application Firewall to track all fields of the form including the hidden field name/value pairs and to ensure that none of the fields of the form sent by the server are changed on the client side. The CSRF check also uses this unique form tag as_fid to ensure that the forms submitted by the user were served to the user in this session and no hacker is attempting to hijack the user session.

Sessionless form check

Application Firewall also offers an option to protect form data using sessionless field consistency. This is useful for applications where the forms might have large number of dynamic hidden fields that lead to high memory allocation per session by the Application Firewall. The sessionless field consistency check is accomplished by inserting another hidden field as_ffc_field for only POST requests or for both GET and POST requests based on the configured setting. The Application Firewall changes the method GET to POST when it forwards the form to the client. The appliance then reverts the method to GET when submitting it back to the server. The as_ffc_field value can be large because it contains the encrypted digest of the form being served. The following is an example of the sessionless form check:

```
<input type="hidden" name="as_ffc_field" value="CwAAAAVIGLD/
luRRi1Wu1rbYrFYargEDcO5xVAxsEnMP1megXuQfiDTGbwk0fpgndMHqfMbzfAFdjwR+TOm1oT

+u+Svo9+NuloPhtnbkxGtNe7gB/o8GlxEcK9ZkIIVv3oIL/
nIPSRWJljgpWgafzVx7wtugNwnn8/GdnhneLCJTaYU7ScnC6LexJDLisI1xsEeONWt8Zm

+vJTa3mTebDY6LVyhDpDQfBgI1XLgfLTexAUzSNWHYyloqPruGYfnRPw+DIGf6gGwn1BYLEsRH
KNbjJBrKpOJo9JzhEqdtZ1g3bMzEF9PocPvM1Hpvi5T6VB

/YFunUFM4f+bD7EAVcugdhovzb71CsSQX5+qcC1B8WjQ==" />
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

HTML comment stripping

The Application Firewall also offers an option to strip all HTML comments in the responses before sending them to the client. This affects not only forms, but all response pages. The Application Firewall locates and removes any text embedded between "<!-" and "->" comment tags. The tags remain to indicate that a comment existed in that location of the HTML source code. Any text embedded within any other HTML or JavaScript tags is ignored. Some applications might not work correctly if they have JavaScript incorrectly embedded within comment tags. A comparison of the page source code before and after the comments were stripped by Application Firewall can help in identifying if any of the stripped comments had the required JavaScript embedded in them.

Credit card protection

The Application Firewall offers an option to inspect the headers and body of the response and either removes or x-outs the Credit Card numbers before forwarding the response to the client. Currently Application Firewall offers protection for the following major credit cards: American Express, Diners Club, Discover, JCB, MasterCard, and Visa. The x-out action works independent of the Block action.

Safe object protection

Similar to Credit Card numbers, leakage of other sensitive data can also be prevented by using Application Firewall Safe Object security check to either remove or x-out the sensitive content in the response.

Cross-site scripting transforms action

When the transform is enabled for cross-site scripting, the Web App Firewall changes `"<" into "%26lt;" and ">" into "%26gt;"` in the requests. If the checkRequestHeaders setting in the Web App Firewall is enabled, then the Web App Firewall inspects the Request Headers and transforms these characters in Header and cookies also. The transform action does not block or transform values that were originally sent by the server. There is a set of default attributes and tags for cross-site scripting which the Web App Firewall allows. A default list of denied cross-site scripting patterns is also provided. These can be customized by selecting the signatures object and clicking the **Manage SQL/cross-site scripting Patterns dialogue** in the GUI.

Transforming SQL special characters

Application Firewall has the following default transformation rules for SQL special characters:

FROM	TO	TRANSFORMATION
' (single quote that is, %27)	''	Another single quote

© 1997–2026 Citrix Systems, Inc. All rights reserved.

FROM	TO	TRANSFORMATION
\ (backslash that is %5C)		Another backslash added
; (semicolon that is %3B)	Dropped	

When the transformation of special characters is enabled and the checkRequestHeaders is set to ON, then the transformation of special characters happens in Headers and cookies also. Note: Some request headers such as User-Agent, Accept-Encoding usually contain semicolons and might be impacted by SQL transformation.

NetScaler Web App Firewall behavior wherein it corrupts the EXPECT header

1. Whenever NetScaler receives an HTTP request with the EXPECT header in it, NetScaler sends the EXPECT: 100 -continue response to client on behalf of the back end server.
2. This behavior is because Application Firewall protections must be run on the entire request before forwarding the request to the server, NetScaler must get the entire request from the client.
3. On receiving a `100 continue` response, the client sends the remaining portion of request that completes the request.
4. NetScaler then runs all the protections and then forwards the request to the server.
5. Now as NetScaler is forwarding the complete request the EXPECT header that came in the initial request becomes obsolete as a result NetScaler corrupts this header and sends it to the server.
6. Server on receiving the request ignores any header which is corrupted.

Configuring the Web App Firewall

You can configure the NetScaler Web App Firewall (Web App Firewall) by using any of the following methods:

- **Web App Firewall Wizard.** A dialog box consisting of a series of screens that step you through the configuration process.
- **NetScaler® Web Interface AppExpert Template.** A AppExpert template (a set of configuration settings) that are designed to provide appropriate protection for websites. This AppExpert template contains appropriate Web App Firewall configuration settings for protecting many websites.
- **NetScaler GUI.** The web-based configuration interface.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **NetScaler Command Line Interface.** The command line configuration interface.

Citrix recommends that you use the Web App Firewall Wizard. Most users will find it the easiest method to configure the Web App Firewall, and it is designed to prevent mistakes. If you have a new NetScaler or VPX that you will use primarily to protect websites, you may find the Web Interface AppExpert template a better option because it provides a good default configuration, not just for the Web App Firewall, but for the entire appliance. Both the GUI and the command line interface are intended for experienced users, primarily to modify an existing configuration or use advanced options.

The Web App Firewall Wizard

The Web App Firewall wizard is a dialog box that consists of several screens that prompt you to configure each part of a simple configuration. The Web App Firewall then creates the appropriate configuration elements from the information that you give it. This is the simplest and, for most purposes, the best way to configure the Web App Firewall.

To use the wizard, connect to the GUI with the browser of your choice. When the connection is established, verify that the Web App Firewall is enabled, and then run the Web App Firewall wizard, which prompts you for configuration information. You do not have to provide all of the requested information the first time you use the wizard. Instead, you can accept default settings, perform a few relatively straightforward configuration tasks to enable important features, and then allow the Web App Firewall to collect important information to help you complete the configuration.

For example, when the wizard prompts you to specify a rule for selecting the traffic to be processed, you can accept the default, which selects all traffic. When it presents you with a list of signatures, you can enable the appropriate categories of signatures and turn on the collection of statistics for those signatures. For this initial configuration, you can skip the advanced protections (security checks). The wizard automatically creates the appropriate policy, signatures object, and profile (collectively, the security configuration), and binds the policy to global. The Web App Firewall then begins filtering connections to your protected websites, logging any connections that match one or more of the signatures that you enabled and collecting statistics about the connections that each signature matches. After the Web App Firewall processes some traffic, you can run the wizard again and examine the logs and statistics to see if any of the signatures that you have enabled are matching legitimate traffic. After determining which signatures are identifying the traffic that you want to block, you can enable blocking for those signatures. If your website or web service is not complex, does not use SQL, and does not have access to sensitive private information, this basic security configuration will probably provide adequate protection.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

You may need additional protection if, for example, your website is dynamic. Content that uses scripts may need protection against cross-site scripting attacks. Web content that uses SQL—such as shopping carts, many blogs, and most content management systems—may need protection against SQL injection attacks. Websites and web services that collect sensitive private information such as social security numbers or credit card numbers may require protection against unintentional exposure of that information. Certain types of web-server or XML-server software may require protection from types of attacks tailored to that software. Another consideration is that specific elements of your websites or web services may require different protection than do other elements. Examining the Web App Firewall logs and statistics can help you identify the additional protections that you might need.

After deciding which advanced protections are needed for your websites and web services, you can run the wizard again to configure those protections. Certain security checks require that you enter exceptions (relaxations) to prevent the check from blocking legitimate traffic. You can do so manually, but it is usually easier to enable the adaptive learning feature and allow it to recommend the necessary relaxation. You can use the wizard as many times as necessary to enhance your basic security configuration and/or create additional security configurations.

The wizard automates some tasks that you would have to perform manually if you did not use the wizard. It automatically creates a policy, a signatures object, and a profile, and assigns them the name that you provided when you were prompted for the name of your configuration. The wizard also adds your advanced-protection settings to the profile, binds the signatures object to the profile, associates the profile with the policy, and puts the policy into effect by binding it to Global.

A few tasks cannot be performed in the wizard. You cannot use the wizard to bind a policy to a bind point other than Global. If you want the profile to apply to only a specific part of your configuration, you must manually configure the binding. You cannot configure the engine settings or certain other global configuration options in the wizard. While you can configure any of the advanced protection settings in the wizard, if you want to modify a specific setting in a single security check, it may be easier to do so on the manual configuration screens in the GUI.

For more information on using the Web App Firewall Wizard, see The Web App Firewall Wizard.

The NetScaler Web Interface AppExpert Template

AppExpert Templates are a different and simpler approach to configuring and managing complex enterprise applications. The AppExpert display in the GUI consists of a table. Applications are listed in the left-most column, with the NetScaler features that are applicable to that application appearing each in its own column to the right. (In the AppExpert interface, those features that are associated with an application are called *application units*.) In the AppExpert interface, you

© 1997–2026 Citrix Systems, Inc. All rights reserved.

configure the interesting traffic for each application, and turn on rules for compression, caching, rewrite, filtering, responder and the Web App Firewall, instead of having to configure each feature individually.

The Web Interface AppExpert Template contains rules for the following Web App Firewall signatures and security checks:

- Deny URL check**.** Detects connections to content that is known to pose a security risk, or to any other URLs that you designate.
- Buffer Overflow check**.** Detects attempts to cause a buffer overflow on a protected web server.
- Cookie Consistency check**.** Detects malicious modifications to cookies set by a protected website.
- Form Field Consistency check**.** Detects modifications to the structure of a web form on a protected website.
- CSRF Form Tagging check**.** Detects cross-site request forgery attacks.
- Field Formats check**.** Detects inappropriate information uploaded in web forms on a protected website.
- HTML SQL Injection check**.** Detects attempts to inject unauthorized SQL code.
- HTML Cross-Site Scripting check**.** Detects cross-site scripting attacks.

The GUI

The GUI is a web-based interface that provides access to all configuration options for the Web App Firewall feature, including advanced configuration and management options that are not available from any other configuration tool or interface. Specifically, many advanced Signatures options can be configured only in the GUI. You can review recommendations generated by the learning feature only in the GUI. You can bind policies to a bind point other than Global only in the GUI.

For a description of the GUI, see The Web App Firewall Configuration Interfaces. For more information on using the GUI to configure the Web App Firewall, see Manual Configuration By Using the GUI.

For instructions on configuring the Web App Firewall by using the GUI, see Manual Configuration By Using the GUI. For information on the citrix-adc GUI, see The Web App Firewall Configuration Interfaces.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The NetScaler command line interface

The NetScaler command line interface is a modified UNIX shell based on the FreeBSD bash shell. To configure the Web App Firewall from the command line interface, you type commands at the prompt and press the Enter key, just as you do with any other Unix shell. You can configure most parameters and options for the Web App Firewall by using the NetScaler command line. Exceptions are the signatures feature, many of whose options can be configured only by using the GUI or the Web App Firewall wizard, and the learning feature, whose recommendations can only be reviewed in the GUI.

For instructions on configuring the Web App Firewall by using the NetScaler command line, see Manual Configuration By Using the Command Line Interface.

Enable NetScaler Web App Firewall

Before you can create a security configuration, you must enable the NetScaler Web App Firewall feature on the appliance.

Points to remember

- If you are configuring a dedicated NetScaler Web App Firewall appliance or upgrading an existing appliance, the feature is already enabled. You do not have to perform either of the procedures described here.
- If you have a new NetScaler or VPX, you must enable the NetScaler Web App Firewall feature before you configure it.
- If you are upgrading a NetScaler or VPX from a previous version, you must first enable the NetScaler Web App Firewall feature before you configure it.

NOTE:

If you are upgrading a NetScaler or VPX from a previous version, you might need to update the licenses on your appliance before you enable NetScaler Web App Firewall. Check with your NetScaler representative or reseller to obtain the correct license.

Enable NetScaler Web App Firewall by using the command interface

At the command prompt, type the following command:

```
enable ns feature AppFW
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Enable the Web App Firewall by using the GUI

1. Navigate to **System** > **Settings**.
2. In the details pane, click **Configure Advanced Features**.
3. In the **Configure Advanced Features** page, select **NetScaler Web App Firewall**.
4. Click **OK**.

The Web App Firewall wizard

Unlike most wizards, the NetScaler Web App Firewall Wizard is designed not just to simplify the initial configuration process, but also to modify previously created configurations and to maintain your Web App Firewall setup. A typical user runs the wizard multiple times, skipping some of the screens each time.

The Web App Firewall Wizard automatically creates profiles, policies, and signatures.

Opening the wizard

To run the Web App Firewall Wizard, open the GUI and follow these steps:

1. Navigate to **Security** > **Application Firewall**.
2. In the details pane, under **Getting Started**, click **Application Firewall Wizard**. The wizard opens.

For more information about the GUI, see The Web App Firewall Configuration Interfaces.

The Wizard screens

The Web App Firewall wizard displays the following screens on a tabular page:

1. Specify Name: on this screen, when creating a new security configuration, specify a meaningful name and the appropriate type (HTML, XML or WEB 2.0) for your profile. The default policy and signatures are auto-generated by using the same name.

Profile Name

The name can begin with a letter, number, or the underscore symbol, and can consist of from 1 to 31 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore (_) symbols. Choose a name that makes it easy for others to tell what content your new security configuration protects.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE:

Because the wizard uses this name for both the policy and the profile, it is limited to 31 characters. Manually created policies can have names up to 127 characters in length.

When modifying an existing configuration, you select Modify Existing Configuration and then, in the Name drop-down list, select the name of the existing configuration that you want to modify.

NOTE:

Only policies that are bound to global or to a bind point appear in this list; you cannot modify an unbound policy by using the Application Firewall wizard. You must either manually bind it to Global or a bind point, or modify it manually. (For manual modification, in the GUI) **Application Firewall** > **Policies** > **Firewall** pane, select the policy and click **Open**.

Profile Type

You also select a profile type on this screen. The profile type determines the types of advanced protection (security checks) that can be configured. Because certain kinds of content are not vulnerable to certain types of security threats, restricting the list of available checks saves time during configuration. The types of Web App Firewall profiles are:

- Web Application (HTML). Any HTML-based website that does not use XML or Web 2.0 technologies.
- XML Application (XML, SOAP). Any XML-based Web service.
- Web 2.0 Application (HTML, XML, REST). Any Web 2.0 site that combines HTML and XML-based content, such as an ATOM-based site, a blog, an RSS feed, or a wiki.

Note: If you are unsure which type of content is used on your website, you can choose Web 2.0 Application to ensure that you protect all types of web application content.

2. Specify Rule: on this screen, you specify the policy rule (expression) that defines the traffic the current configuration examines. If you create an initial configuration to protect your websites and web services, you can accept the default value, **true**, which selects all web traffic .

If you want this security configuration to examine, not all HTTP traffic that is routed through the appliance, but specific traffic, you can write a policy rule specifying the traffic that you want it to

© 1997–2026 Citrix Systems, Inc. All rights reserved.

examine. Rules are written in NetScaler expressions language, which is a fully functional object-oriented programming language.

Note: In addition to the default expressions syntax, for backward compatibility the NetScaler operating system supports the NetScaler classic expressions syntax on NetScaler Classic and nCore appliances and virtual appliances. Classic expressions are not supported on NetScaler Cluster appliances and virtual appliances. Current users who want to migrate their existing configurations to the NetScaler cluster must migrate any policies that contain classic expressions to the default expressions syntax.

- For a simple description of using the NetScaler expressions syntax to create Web App Firewall rules, and a list of useful rules, see Firewall Policies.
- For a detailed explanation of how to create policy rules in NetScaler expressions syntax, see Policies and Expressions.

4. Select Signatures: on this screen, you select the categories of signatures that you want to use to protect your websites and web services.

This is not a mandatory step, and you can skip it if you want to and go to the **Specify Deep Protections** screen. If the Select Signatures screen is skipped, only a profile and associated policies are created, and the signatures are not created.

You can select **Create New Signature** or **Select Existing Signature**.

If you are creating a new security configuration, the signature categories that you select are enabled, and by default they are recorded in a new signatures object. The new signatures object is assigned the same name that you entered on the Specify name screen as the name of the security configuration.

If you have previously configured signatures objects and want to use one of them as the signatures object associated with the security configuration that you are creating, click **Select Existing Signature** and select a signatures object from the Signatures list.

If you are modifying an existing security configuration, you can click Select Existing Signature and assign a different signatures object to the security configuration.

If you click Create New Signature, you can choose the edit mode as **Simple** or **Advanced**. 5. **Specify Signature Protections (Simple mode)**

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The simple mode allows for easy configuration of the signature, with a preset list of protection definitions for common applications such as IIS (Internet Information Server), PHP and ActiveX. The default categories in Simple mode are:

- CGI. Protection against attacks on websites that use CGI scripts in any language, including PERL scripts, Unix shell scripts, and Python scripts.
- Cold Fusion. Protection against attacks on websites that use the Adobe Systems ColdFusion Web development platform.
- FrontPage. Protection against attacks on websites that use the Microsoft FrontPage Web development platform.
- PHP. Protection against attacks on websites that use the PHP open-source Web development scripting language.
- Client side. Protection against attacks on client-side tools used to access your protected websites, such as Microsoft Internet Explorer, Mozilla Firefox, the Opera browser, and the Adobe Acrobat Reader.
- Microsoft IIS. Protection against attacks on websites that run the Microsoft Internet Information Server (IIS)
- Miscellaneous. Protection against attacks on other server-side tools, such as Web servers and database servers.

On this screen, you select the actions associated with the signature categories that you selected on the Select Signatures screen. The actions that you can configure are:

- Block
- Log
- Stats

By default the Log and Stats actions are enabled but not the Block action. To configure actions, click **Settings**. You can change the action settings of all the selected categories by using the **Action** drop-down list. 6. **Specify Signature Protections (Advanced mode)**

The advanced mode allows for more granular control over the signature definitions and provides significantly more information. Use the advanced mode if you want complete control over signature definition.

The contents of this screen are the same as the contents of the Modify Signatures Object dialog box, as described in Configuring or Modifying a Signatures Object. In this screen, you can

© 1997–2026 Citrix Systems, Inc. All rights reserved.

configure actions either by clicking the **Actions** drop-down list or the actions menu, which appears as a cirle with three dots.

7. Specify Deep Protections: on this screen, you choose the advanced protections (also called security checks or simply checks) that you want to use to protect your websites and web services. Which checks are available depends on the profile type that you chose on the Specify Name screen. All checks are available for Web 2.0 Application profiles.

For more information, see Overview of Security Checksand see Advanced Form Protections Checks.

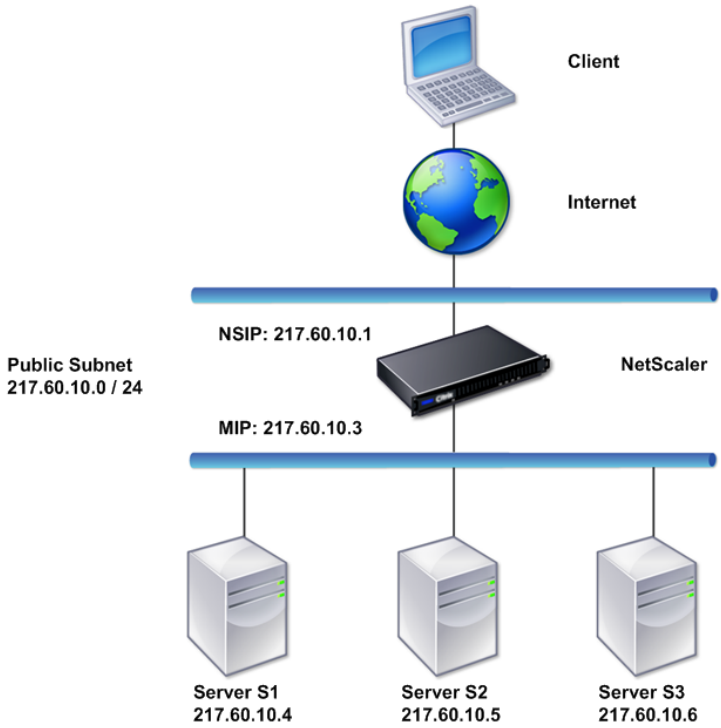
You configure the actions for the advanced protections that you have enabled.The actions that you can configure are:

- Block: blocks connections that match the signature. Disabled by default.
- Log: logs connections that match the signature for later analysis. Enabled by default.
- Stats: maintains statistics, for each signature, that show how many connections it matched and provide certain other information about the types of connections that were blocked. Disabled by default.
- Learn. Observe traffic to this website or web service, and use connections that repeatedly violate this check to generate recommended exceptions to the check, or new rules for the check. Available only for some checks. For more information about the learning feature see Configuring and Using the Learning Feature, and how learning works and how to configure exceptions (relaxations) or deploy learned rules for a check, see Manual Configuration By Using the GUI.

To configure actions, select the protection by clicking the check box, and then click **Action Settings** to select the required actions. Select other parameters, if required, and then click **OK** to close the Action Settings window.

To view all logs for a specific check, select that check, and then click **Logs** to display the Syslog Viewer, as described in Web App Firewall Logs. If a security check is blocking legitimate access to your protected website or web service, you can create and implement a relaxation for that security check by selecting a log that shows the unwanted blocking, and then clicking **Deploy**.

After you completing specifying Action Settings, click **Finish** to complete the wizard.



Following are four procedures that show how to perform specific types of configuration by using the Web App Firewall wizard.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Create a new configuration

Follow these steps to create a new firewall configuration and signature objects, by using the Applicaiton Firewall wizard.

1. Navigate to **Security** > **Application Firewall**.
2. In the details pane, under **Getting Started**, click **Application Firewall. The wizard opens.

3. On the **Specify Name** screen, select **Create New Configuration.
4. In the **Name** field, type a name, and then click **Next**.
5. In the **Specify Rule** screen, click **Next** again.
6. In the **Select Signatures** screen, select **Create New Signature** and **Simple** as the edit mode, and then click **Next**.
7. In the **Specify Signature Protections** screen, configure the required settings. For more information about which signatures to consider for blocking and how to determine when you can safely enable blocking for a signature, see Signatures.
8. In the **Specify Deep Protections** screen configure the required actions and parameters in **Action Settings**.
9. When you complete, click **Finish** to close the Application Firewall wizard.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Modify an existing configuration

Follow these steps to modify an existing configuration and existing signature categories.

1. Navigate to **Security** > **Application Firewall**.
2. In the details pane, under **Getting Started**, click **Application Firewall Wizard**. The wizard opens.
3. On the **Specify Name** screen, select Modify Existing Configuration and, in the **Name** drop-down list, choose the security configuration that you created during new configuration, and then click **Next**.
4. In the **Specify Rule** screen, click Next to keep the default value "true." If you want to modify the rule, follow the steps described in Configure a Custom Policy Expresssion.
5. In the **Select Signatures** screen, click **Select Existing Signature**. From the **Existing Signature** drop-down list, select the appropriate option, and then click **Next**. The advanced signature protection screen appears. **Note:** If you select an existing signature, the default edit mode for signature protected is advanced.
6. In the Specify Signature Protections screen, configure the required settings and click **Next**. For more information about which signatures to consider for blocking and how to determine when you can safely enable blocking for a signature, see Signatures.
7. In the **Specify Deep Protections** screen, configure the settings and click **Next**.
8. After you complete, click **Finish** to close the **Web App Firewall Wizard**.

Create a new configuration without signatures

Follow these steps to use the Application Firewall Wizard to skip the Select Signatures screen and create a new configuration with just the profile and the associated policies but without any signatures.

1. Navigate to **Security** > **Application Firewall**.
2. In the details pane, under **Getting Started**, click **Application Firewall Wizard**. The wizard opens.
3. On the **Specify Name** screen, select **Create New Configuration**.
4. In the **Name** field, type a name, and then click **Next**.
5. In the **Specify Rule** screen, click **Nex**t again.
6. In the **Select Signatures** screen, click **Skip.**
7. In the **Specify Deep Protections** screen configure the required actions and parameters in **Action Settings**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

8. When you complete, click **Finish** to close the Application Firewall Wizard.

Configure a custom policy expression

Follow these steps to use the Application Firewall Wizard to create a specialized security configuration to protect only specific content. In this case, you create a new security configuration instead of modifying the initial configuration. This type of security configuration requires a custom rule, so that the policy applies the configuration to only the selected Web traffic.

1. Navigate to **Security** > **Application Firewall**.
2. In the details pane, under **Getting Started**, click **Application Firewall Wizard**.
3. On the Specify Name screen, type a name for your new security configuration in the Name text box, select the type of security configuration from the Type drop-down list, and then click **Next**.
4. On the **Specify Rule** screen, enter a rule that matches only that content that you want this web application to protect. Use the **Frequently Used Expressions** drop-down list and the **Expression Editor** to create a custom expression. When you complete, click **Next**.
5. In the **Select Signatures** screen, select the edit mode, and then click **Next**.
6. In the **Specify Signature Protections** screen, configure the required settings.
7. In the **Specify Deep Protections** screen configure the required actions and parameters in **Action Settings**.
8. When you complete, click **Finish** to close the **Application Firewall Wizard**.

Manual configuration

If you want to bind a profile to a bind point other than Global, you must manually configure the binding. Also, certain security checks require that you either manually enter the necessary exceptions or enable the learning feature to generate the exceptions that your websites and Web services need. Some of these tasks cannot be performed by using the Web App Firewall wizard.

If you are familiar with how the Web App Firewall works and prefer manual configuration, you can manually configure a signatures object and a profile, associate the signatures object with the profile, create a policy with a rule that matches the web traffic that you want to configure, and associate the policy with the profile. You then bind the policy to Global, or to a bind point, to put it into effect, and you have created a complete security configuration.

For manual configuration, you can use the GUI (a graphical interface) or the command line. Citrix® recommends that you use the GUI. Not all configuration tasks can be performed at the command line. Certain tasks, such as enabling signatures and reviewing learned data, must be done in the GUI. Most other tasks are easier to perform in the GUI.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Replicating configuration

When you use the GUI (GUI) or the command line interface (CLI) to manually configure the Web App Firewall, the configuration is saved in the /nsconfig/ns.conf file. You can use the commands in that file to replicate the configuration on another appliance. You can cut and paste the commands into the CLI one by one, or you can save multiple commands in a text file in the /var/tmp folder and run them as a batch file. Following is an example of running a batch file containing commands copied from the /nsconfig/ns.conf file of a different appliance:

```
> batch -f /var/tmp/appfw_add.txt
```

WARNING:

Import commands are not saved in the ns.conf file. Before running commands from the ns.conf file to replicate the configuration on another appliance, you must import all the objects used in the configuration (for example, signatures, error page, WSDL, and Schema) to the appliance on which you replicate the configuration. The add command to add a Web App Firewall profile saved in an ns.conf file might include the name of an imported object, but such a command might fail when run on another appliance if the referenced object does not exist on that appliance.

For more information on import or export details for replicating configuration, see Signature export, and Common import export topics.

Manual configuration by using the NetScaler GUI

If you need to manually configure the Web App Firewall feature, Citrix recommends you to use the NetScaler GUI procedure.

To create and configure signatures object

Before you can configure the signatures, you must create a signatures object from the appropriate default signatures object template. Assign the copy a new name, and then configure the copy. You cannot configure or modify the default signatures objects directly. The following procedure provides basic instructions for configuring a signatures object. For more detailed instructions, see Manually Configuring the Signatures Feature.

1. Navigate to **Security > NetScaler Web App Firewall > Signatures**.
2. In the details pane, select the signatures object that you want to use as a template, and then click **Add**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Your choices are:

- **Default Signatures.** Contains the signatures rules, the SQL injection rules, and the cross-site scripting rules.
- **XPath Injection.** Contains all of the items in the Default Signatures, and in addition, contains the XPath injection rules.

3. In the **Add Signatures Object** dialog box, type a name for your new signatures object, click OK, and then click **Close**. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 31 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), and underscore (_) symbols.
4. Select the signatures object that you created, and then click **Open**.
5. In the **Modify Signatures Object** dialog box, set the **Display Filter Criteria** options at the left to display the filter items that you want to configure.

   As you modify these options, the results that you specify are displayed in the Filtered Results window at the right. For more information about the categories of signatures, see Signatures.
6. In the **Filtered Results** area, configure the settings for a signature by selecting and clearing the appropriate check boxes.
7. When finished, finished, click **Close**.

To create a Web App Firewall profile by using the GUI

Creating a Web App Firewall profile requires that you specify only a few configuration details.

1. Navigate to **Security > NetScaler Web App Firewall > Profiles**.
2. In the details pane, click **Add**.
3. In the **Create Web App Firewall** Profile dialog box, type a name for your profile.

   The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 31 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore (_) symbols.
4. Choose the profile type from the drop-down list.
5. Click **Create**, and then click **Close**.

To configure a Web App Firewall profile by using the GUI

1. Navigate to **Security > NetScaler Web App Firewall > Profiles**.
2. In the details pane, select the profile that you want to configure, and then click **Edit**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. In the **Configure Web App Firewall Profile** dialog box, on the **Security Checks** tab, configure the security checks.

   - To enable or disable an action for a check, in the list, select or clear the check box for that action.
   - To configure other parameters for those checks that have them, in the list, click the blue chevron to the far right of that check. In the dialog box that appears, configure the parameters. These vary from check to check.

     You can also select a check and, at the bottom of the dialog box, click Open to display the Configure Relaxation dialog box or Configure Rule dialog box for that check. These dialog boxes also vary from check to check. Most of them include a Checks tab and a General tab. If the check supports relaxations or user-defined rules, the Checks tab includes an Add button, which opens yet another dialog box, in which you can specify a relaxation or rule for the check. (A relaxation is a rule for exempting specified traffic from the check.) If relaxations have already been configured, you can select one and click Open to modify it.
   - To review learned exceptions or rules for a check, select the check, and then click Learned Violations. In the Manage Learned Rules dialog box, select each learned exception or rule in turn.
     - To edit the exception or rule, and then add it to the list, click **Edit & Deploy**.
     - To accept the exception or rule without modification, click **Deploy**.
     - To remove the exception or rule from the list, click **Skip**.
   - To refresh the list of exceptions or rules to be reviewed, click **Refresh**.
   - To open the **Learning Visualizer** and use it to review learned rules, click **Visualizer**.
   - To review the log entries for connections that matched a check, select the check, and then click **Logs**. You can use this information to determine which checks are matching attacks so that you can enable blocking for those checks. You can also use this information to determine which checks are matching legitimate traffic, so that you can configure an appropriate exemption to allow those legitimate connections. For more information about the logs, see Logs, Statistics, and Reports.
   - To completely disable a check, in the list, clear all of the check boxes to the right of that check.

4. On the **Settings** tab, configure the profile settings.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- To associate the profile with the set of signatures that you previously created and configured, under **Common Settings**, choose that set of signatures in the Signatures drop-down list.

  NOTE:

  You may must use the scroll bar on the right of the dialog box to scroll down to display the Common Settings section.

- To configure an HTML or XML Error Object, select the object from the appropriate drop-down list.

  NOTE:

  You must first upload the error object that you want to use in the Import pane.

- To configure the default XML Content Type, type the content type string directly into the Default Request and Default Response text boxes, or click Manage Allowed Content Types to manage the list of allowed content types.

5. If you want to use the learning feature, click Learning, and configure the learning settings for the profile. For more information, see Configure and Learning feature.
6. Click **OK** to save your changes and return to the Profiles pane.

Configuring a Web App Firewall rule or relaxation

You configure two different types of information in this dialog box, depending upon which security check you are configuring. In most cases, you configure an exception (or relaxation) to the security check. If you are configuring the Deny URL check or the Field Formats check, you configure an addition (or rule). The process for either of these is the same.

To configure a relaxation rule by using the NetScaler GUI

1. Navigate to **Security** > **NetScaler Web App Firewall** > **Profiles**.
2. In the **Profiles** pane, select the profile you want to configure, and then click **Edit**.
3. In the **Configure Web App Firewall Profile** page, click **Relaxation Rule** from **Advanced Settings** section. The **Relaxation Rule** section contains the complete list of Web App Firewall relaxation rules.
4. Click a security rule that you want to configure, and then click **Edit**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

5. The URL Relaxation Rules page contains a list of actions and that you can configure for this rule and a list of existing relaxations or rules. The list might be empty if you have not either manually added any relaxations or approved any relaxations that were recommended by the learning engine. Beneath the list is a row of buttons that allow you to add, modify, delete, enable, or disable the relaxations on the list.
6. To add or modify a relaxation or a rule, do one of the following:

   - To add a new relaxation, click **Add**.
   - To modify an existing relaxation, select the relaxation that you want to modify, and then click **Open**.

   The **Start URL Relaxation Rule** page is displayed. Except for the title, these dialog boxes are identical.
7. Fill in the dialog box as described below. The dialog boxes for each check are different. The list below covers all elements that might appear in any dialog box.

   - **Enabled check box**—Select to place this relaxation or rule in active use; clear to deactivate it.
   - **Attachment Content Type**—The Content-Type attribute of an XML attachment. In the text area, enter a regular expression that matches the Content-Type attribute of the XML attachments to allow.
   - **Action URL**—In the text area, enter a PCRE-format regular expression that defines the URL to which data entered into the web form is delivered.
   - **Cookie**—In the text area, enter a PCRE-format regular expression that defines the cookie.
   - **Field Name**—A web form field name element may be labeled Field Name, Form Field, or another similar name. In the text area, enter a PCRE-format regular expression that defines the name of the form field.
   - **From Origin URL**—In the text area, enter a PCRE-format regular expression that defines the URL that hosts the web form.
   - **From Action URL**—In the text area, enter a PCRE-format regular expression that defines the URL to which data entered into the web form is delivered.
   - **Name**—An XML element or attribute name. In the text area, enter a PCRE-format regular expression that defines the name of the element or attribute.
   - **URL**—A URL element may be labeled Action URL, Deny URL, Form Action URL, Form Origin URL, Start URL, or simply URL. In the text area, enter a PCRE-format regular expression that defines the URL.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Format**—The format section contains multiple settings that include list boxes and text boxes. Any of the following can appear:
  - **Type**—Select a field type in the Type drop-down list. To add a new field type definition, click Manage—
  - **Minimum Length**—Type a positive integer that represents the minimum length in characters if you want to force users to fill in this field. Default: 0 (Allows field to be left blank.)
  - **Maximum length**—To limit the length of data in this field, type a positive integer that represents the maximum length in characters. Default: 65535
- **Location**—Choose the element of the request that your relaxation applies to from the drop-down list. For HTML security checks, the choices are:
  - FORMFIELD—Form fields in web forms.
  - HEADER—Request headers.
  - COOKIE—Set-Cookie headers.

  For XML security checks, the choices are:
  - ELEMENT—XML element.
  - ATTRIBUE—XML attribute.
- **Maximum Attachment Size**—The maximum size in bytes allowed for an XML attachment.
- **Comments**—In the text area, type a comment. Optional.

Note: For any element that requires a regular expression, you can type the regular expression, use the Regex Tokens menu to insert regular expression elements and symbols directly into the text box, or click **Regex Editor** to open the **Add Regular Expression** dialog box, and use it to construct the expression.

8. To remove a relaxation or rule, select it, and then click **Delete**.
9. To enable a relaxation or rule, select it, and then click **Enable**.
10. To disable a relaxation or rule, select it, and then click **Disable**.
11. To configure the settings and relationships of all existing relaxations in an integrated interactive graphic display, click **Visualizer**, and use the display tools.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE:

The **Visualizer** button does not appear on all check relaxation dialog boxes.

12. To review learned rules for this check, click Learning and perform the steps in To configure and use the Learning feature
13. Click **OK**.

To configure the Learned Rules by using the NetScaler GUI

1. Navigate to **Security** > **NetScaler Web App Firewall** > **Profiles**.
2. In the **Profiles** pane, select the profile, and then click **Edit**.
3. In the **NetScaler Web App Firewall Profile** page, click **Learned Rules** from **Advanced Settings**. In the **Learned Rules** section you can see a list of security checks that are available in the current profile and that support the learning feature.
4. To configure the learning thresholds, select a security check, and click **Settings**.
5. In the **Dynamic Profiling and Learning Rules Settings** page, you can set the settings. For more information, see Dynamic profile settings

    - **Minimum number threshold.** Depending on which security check's learning settings you are configuring, the minimum number threshold might refer to the minimum number of total user sessions that must be observed, the minimum number of requests that must be observed, or the minimum number of times a specific form field must be observed, before a learned relaxation is generated. Default: 1
    - **Percentage of times threshold.** Depending on which security check's learning settings you are configuring, the percentage of times threshold might refer to the percentage of total observed user sessions that violated the security check, the percentage of requests, or the percentage of times a form field matched a particular field type, before a learned relaxation is generated. Default: 0

6. To remove all learned data and reset the learning feature, so that it must start its observations again from the beginning, select **Remove All Learned Data** action.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE:

This button removes only learned recommendations that have not been reviewed and either approved or skipped. It does not remove learned relaxations that have been accepted and deployed.

7. To restrict the learning engine to traffic from a specific set of IPs, click **Trusted Learning Clients**, and add the IP addresses that you want to use to the list.
    a. To add an IP address or IP address range to the Trusted Learning Clients list, click **Add**.
    b. In the **AppFirewall Profile to Trusted Clint Binding** page, click **Add**.
    c. Select the **Enabled** check box to enable the feature.
    d. In Trusted Learning Client** box, type the IP address or an IP address range in CIDR format.
    e. In the **Comments** text area, type a comment that describes this IP address or range.
    f. Click **Create** and **Close**.
8. To modify an existing IP address or range, click the IP address or range, and then click **Edit**. Except for the name, the dialog box that appears is identical to the Add Trusted Learning Clients dialog box.
9. To disable or enable an IP address or range, but leave it on the list, click the IP address or range, and then click **Disable** or **Enable**, as appropriate.
10. To remove an IP address or range completely, click the IP address or range, and then click **Delete**.
11. Click **Close** to return to the **NetScaler Web App Firewall Profile** page.

To create a NetScaler Web App Firewall policy by using the NetScaler GUI

1. Navigate to **Security** > **NetScaler Web App Firewall** > **Policies**.
2. In the **Policies** page, click **NetScaler Web App Firewall Policy** link.
3. In the NetScaler Web App Firewall Policies page, click **Add**.
4. In the Create NetScaler Web App Firewall Policy page, set the following parameters.
    a. Name. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 128 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore (_) symbols.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

b. Profile. Select the profile that you want to associate with this policy from the Profile drop-down list. You can create a profile to associate with your policy by clicking New, and you can modify an existing profile by clicking **Modify**.

c. Expression. In the Expression text area, create a rule for your policy.

d. Log Action. Add a log action or you can modify an existing log action.

e. Comments. A brief description about the policy.

5. Click **Create** or **OK**, and then click **Close**.

To create or configure a Web App Firewall rule (expression)

The policy rule, also called the *expression*, defines the web traffic that the Web App Firewall filters by using the profile associated with the policy. Like other NetScaler policy rules (or *expressions*), Web App Firewall rules use NetScaler expressions syntax. This syntax is powerful, flexible, and extensible. It is too complex to describe completely in this set of instructions. You can use the following procedure to create a simple firewall policy rule, or you can read it as an overview of the policy creation process.

1. If you have not already done so, navigate to the appropriate location in the Web App Firewall wizard or the NetScaler GUI to create your policy rule:

   - If you are configuring a policy in the Web App Firewall wizard, in the navigation pane, click **NetScaler Web App Firewall Wizard**, then in the details pane click **NetScaler Web App Firewall Wizard**, and then navigate to the **Specify Rule** tab page.
   - In the **Specify Rule** page, choose the prefix for your expression from the drop-down list. Your choices are:
   - **HTTP.** The HTTP protocol. Choose this if you want to examine some aspect of the request that pertains to the HTTP protocol.
   - **SYS.** One or more protected websites. Choose this if you want to examine some aspect of the request that pertains to the recipient of the request.
   - **CLIENT.** The computer that sent the request. Choose this if you want to examine some aspect of the sender of the request.
   - **SERVER.** The computer to which the request was sent. Choose this if you want to examine some aspect of the recipient of the request.

   After you choose a prefix, the Web App Firewall displays a two-part prompt window that displays the possible next choices at the top, and a brief explanation of what the selected choice means at the bottom.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. Choose your next term.

   If you chose HTTP as your prefix, your only choice is REQ, which specifies the Request/Response pair. (The Web App Firewall operates on the request and response as a unit instead of on each separately.) If you chose another prefix, your choices are more varied. For help on a specific choice, click that choice once to display information about it in the lower prompt window.

   When you have decided which term you want, double-click it to insert it into the Expression window.

3. Type a period after the term you just chose. You are then prompted to choose your next term, as described in the previous step. When a term requires that you type a value, fill in the appropriate value. For example, if you choose HTTP.REQ.HEADER(""), type the header name between the quotation marks.
4. Continue choosing terms from the prompts and filling in any values that are needed, until your expression is finished.

   Following are some examples of expressions for specific purposes.

   - **Specific web host.** To match traffic from a particular web host:

```
HTTP.REQ.HEADER("Host").EQ("shopping.example.com")
```

For shopping.example.com, substitute the name of the web host that you want to match.

- **Specific web folder or directory.** To match traffic from a particular folder or directory on a Web host:

```
HTTP.REQ.URL.STARTSWITH("https//www.example.com/folder")
```

For www.example.com, substitute the name of the web host. For folder, substitute the folder or path to the content that you want to match. For example, if your shopping cart is in a folder called /solutions/orders, you substitute that string for folder.

- **Specific type of content: GIF images.** To match GIF format images:

```
HTTP.REQ.URL.ENDSWITH(".gif")
```

To match other format images, substitute another string in place of .gif.

- **Specific type of content: scripts.** To match all CGI scripts located in the CGI-BIN directory:

```
HTTP.REQ.URL.STARTSWITH("https//www.example.com/CGI-BIN")
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To match all JavaScripts with .js extensions:

```
HTTP.REQ.URL.ENDSWITH(".js")
```

For more information about creating policy expressions, see Policies and Expressions.

NOTE:

If you use the command line to configure a policy, remember to escape any double quotation marks within NetScaler expressions. For example, the following expression is correct if entered in the GUI:

```
HTTP.REQ.HEADER("Host").EQ("shopping.example.com")
```

If entered at the command line, however, you must type this instead:

```
HTTP.REQ.HEADER("Host").EQ("shopping.example.com")
```

```
![Policy expression configuration](/content/dam/netscaler/us/en/citrix-adc/media/waf-rule.png)
```

To add a firewall rule (expression) by using the Add Expression dialog box

The **Add Expression** dialog box (also referred to as the Expression Editor) helps users who are not familiar with the NetScaler expressions language to construct a policy that matches the traffic that they want to filter.

1. If you have not already done so, navigate to the appropriate location in the Web App Firewall wizard or the NetScaler GUI:
   - If you are configuring a policy in the **Web App Firewall** wizard, in the navigation pane, click **Web App Firewall**, then in the details pane click **Web App Firewall** Wizard, and then navigate to the **Specify Rule** screen.
   - If you are configuring a policy manually, in the navigation pane, expand **Web App Firewall**, then **Policies**, and then **Firewall**. In the details pane, to create a policy, click **Add**. To modify an existing policy, select the policy, and then click **Open**.
2. On the **Specify Rule** screen, in the **Create Web App Firewall Profile** dialog box, or in the **Configure Web App Firewall Profile** dialog box, click **Add**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. In the **Add Expression** dialog box, in the Construct Expression area, in the first list box, choose one of the following prefixes:

    - **HTTP.** The HTTP protocol. Choose this if you want to examine some aspect of the request that pertains to the HTTP protocol. The default choice.
    - **SYS.** One or more protected websites. Choose this if you want to examine some aspect of the request that pertains to the recipient of the request.
    - **CLIENT.** The computer that sent the request. Choose this if you want to examine some aspect of the sender of the request.
    - **SERVER.** The computer to which the request was sent. Choose this if you want to examine some aspect of the recipient of the request.

4. In the second list box, choose your next term. The available terms differ depending on the choice you made in the previous step, because the dialog box automatically adjusts the list to contain only those terms that are valid for the context. For example, if you selected HTTP in the previous list box, the only choice is REQ, for requests. Because the Web App Firewall treats requests and associated responses as a single unit and filters both, you do not need to specific responses separately. After you choose your second term, a third list box appears to the right of the second. The Help window displays a description of the second term, and the Preview Expression window displays your expression.
5. In the third list box, choose the next term. A new list box appears to the right, and the Help window changes to display a description of the new term. The Preview Expression window updates to display the expression as you have specified it to that point.
6. Continue choosing terms, and when prompted filling in arguments, until your expression is complete. If you make a mistake or want to change your expression after you have already selected a term, you can simply choose another term. The expression is modified, and any arguments or more terms that you added after the term that you modified is cleared.
7. When you have finished constructing your expression, click OK to close the Add Expression dialog box. Your expression is inserted into the Expression text area.

To bind a Web App Firewall policy by using the NetScaler GUI

1. Do one of the following:

    - Navigate to **Security** > **Web App Firewall**, and in the details pane, click **application firewall policy manager**.
    - Navigate to **Security** > **NetScaler Web App Firewall** > **Policies** > **Firewall**, and in the "NetScaler Web App Firewall Policies" pane, click **Policy Manager**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. In the **Application Firewall Policy Manager** dialog, choose the bind point to which you want to bind the policy from the drop-down list. The choices are:

    - **Override Global.** Policies that are bound to this bind point process all traffic from all interfaces on the NetScaler appliance, and are applied before any other policies.
    - **LB Virtual Server.** Policies that are bound to a load balancing virtual server are applied only to traffic that is processed by that load balancing virtual server, and are applied before any Default Global policies. After selecting LB Virtual Server, you must also select the specific load balancing virtual server to which you want to bind this policy.
    - **CS Virtual Server.** Policies that are bound to a content switching virtual server are applied only to traffic that is processed by that content switching virtual server, and are applied before any Default Global policies. After selecting CS Virtual Server, you must also select the specific content switching virtual server to which you want to bind this policy.
    - **Default Global.** Policies that are bound to this bind point process all traffic from all interfaces on the NetScaler appliance.
    - **Policy Label.** Policies that are bound to a policy label process traffic that the policy label routes to them. The policy label controls the order in which policies are applied to this traffic.
    - **None.** Do not bind the policy to any bind point.

3. Click **Continue**. A list of existing Web App Firewall policies appears.
4. Select the policy you want to bind by clicking it.
5. Make any additional adjustments to the binding.

    - To modify the policy priority, click the field to enable it, and then type a new priority. You can also select **Regenerate Priorities** to renumber the priorities evenly.
    - To modify the policy expression, double-click that field to open the **Configure Web App Firewall Policy** dialog box, where you can edit the policy expression.
    - To set the Goto Expression, double-click field in the **Goto Expression** column heading to display the drop-down list, where you can choose an expression.
    - To set the Invoke option, double-click field in the Invoke column heading to display the drop-down list, where you can choose an expression.

6. Repeat steps 3 through 6 to add any additional Web App Firewall policies you want to globally bind.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

7. Click **OK**. A message appears in the status bar, stating that the policy has been successfully bound.

Manual configuration By using the command line interface

NOTE:

If you need to manually configure the Web App Firewall feature, Citrix recommends you to use the NetScaler GUI procedure.

You can configure the Web App Firewall features from the **NetScaler** command interface. However, there are important exceptions. You cannot enable signatures from the command interface. There are around 1,000 default signatures in seven categories and the task is too complex for the command interface. You can enable or disable features and configure parameters from the command line, but cannot configure manual relaxations. While you can configure the adaptive learning feature and enable learning from the command line, you cannot review learned relaxations or learned rules and approve or skip them. The command line interface is intended for advanced users who are familiar in using the NetScaler appliance and Web App Firewall.

To manually configure the Web App Firewall by using the NetScaler command line, use a telnet or secure shell client of your choice to log on to the NetScaler command line.

To create a profile by using the command line interface

At the command prompt, type the following commands:

- `add appfw profile <name> [-defaults ( basic | advanced )]`
- `set appfw profile <name> -type ( HTML | XML | HTML XML )`
- `save ns config`

Example

The following example adds a profile named pr-basic, with basic defaults, and assigns a profile type of HTML. This is the appropriate initial configuration for a profile to protect an HTML website.

```
add appfw profile pr-basic -defaults basic

set appfw profile pr-basic -type HTML
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
save ns config
```

To configure a profile by using the command line interface

At the command prompt, type the following commands:

- `set appfw profile <name> <arg1> [<arg2> ...]` where `<arg1>` represents a parameter and `<arg2>` represents either another parameter or the value to assign to the parameter represented by `<arg1>`. For descriptions of the parameters to use when configuring specific security checks, see Advanced Protections and its subtopics. For descriptions of the other parameters, see "Parameters for Creating a Profile."
- `save ns config`

Example

The following example shows how to configure an HTML profile created with basic defaults to begin protecting a simple HTML-based website. This example turns on logging and maintenance of statistics for most security checks, but enables blocking only for those checks that have low false positive rates and require no special configuration. It also turns on transformation of unsafe HTML and unsafe SQL, which prevents attacks but does not block requests to your websites. With logging and statistics enabled, you can later review the logs to determine whether to enable blocking for a specific security check.

```
set appfw profile -startURLAction log stats

set appfw profile -denyURLAction block log stats

set appfw profile -cookieConsistencyAction log stats

set appfw profile -crossSiteScriptingAction log stats

set appfw profile -crossSiteScriptingTransformUnsafeHTML ON

set appfw profile -fieldConsistencyAction log stats

set appfw profile -SQLInjectionAction log stats

set appfw profile -SQLInjectionTransformSpecialChars ON

set appfw profile -SQLInjectionOnlyCheckFieldsWithSQLChars ON
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
set appfw profile -SQLInjectionParseComments checkall

set appfw profile -fieldFormatAction log stats

set appfw profile -bufferOverflowAction block log stats

set appfw profile -CSRFtagAction log stats

save ns config
```

To create and configure a policy

At the command prompt, type the following commands:

- `add appfw policy <name> <rule> <profile>`
- `save ns config`

Example

The following example adds a policy named pl-blog, with a rule that intercepts all traffic to or from the host blog.example.com, and associates that policy with the profile pr-blog.

```
add appfw policy pl-blog "HTTP.REQ.HOSTNAME.DOMAIN.EQ("blog.example.com")"
pr-blog
```

To bind a Web App Firewall policy

At the command prompt, type the following commands:

- `bind appfw global <policyName> <priority>`
- `save ns config`

Example

The following example binds the policy named pl-blog and assigns it a priority of 10.

```
bind appfw global pl-blog 10

save ns config
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To configure session limit per PE

At the command prompt, type the following commands:

- `set appfw settings <session limit>`

Example

The following example configures the session limit per PE.

```
> set appfw settings -sessionLimit 500000`

Done

Default value:100000   Max value:500000 per PE
```

Signatures

The Web App Firewall signatures provide specific, configurable rules to simplify the task of protecting your websites against known attacks. A signature represents a pattern that is a component of a known attack on an operating system, web server, website, XML-based web service, or other resource. A rich set of preconfigured Web App Firewall built-in or native rules offers an easy to use security solution, applying the power of pattern matching to detect attacks and protect against application vulnerabilities.

You can create your own signatures or use signatures in the built-in templates. The Web App Firewall has two built-in templates:

- **Default Signatures**: This template contains a preconfigured list of over 1,300 signatures, in addition to a complete list of SQL injection keywords, SQL special strings, SQL transform rules, and SQL wildchar characters. It also contains denied patterns for cross-site scripting, and allowed attributes and tags for cross-site scripting. This is a read-only template. You can view the contents, but you cannot add, edit, or delete anything in this template. To use it, you must make a copy. In your own copy, you can enable the signature rules that you want to apply to your traffic, and specify the actions to be taken when the signature rules match the traffic.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The Web App Firewall signatures are derived from the rules published by Snort, which is an open source intrusion prevention system capable of performing real-time traffic analysis to detect various attacks and probes.

- ***Xpath Injection Patterns**: This template contains a preconfigured set of literal and PCRE keywords and special strings that are used to detect XPath (XML Path Language) injection attacks.

Blank Signatures: In addition to making a copy of the built-in *Default Signatures template, you can use a blank signatures template to create a signature object. The signature object that you create with the blank signatures option does not have any native signature rules, but, just like the *Default template, it has all the SQL/cross-site scripting built-in entities.

External-Format Signatures: The Web App Firewall also supports external format signatures. You can import the third party scan report by using the XSLT files that are supported by the NetScaler Web App Firewall. A set of built-in XSLT files is available for the following scan tools to translate external format files to native format:

- Cenzic
- Deep Security for Web Apps
- IBM AppScan Enterprise
- IBM AppScan Standard.
- Qualys
- Qualys Cloud
- Whitehat
- Hewlett Packard Enterprise WebInspect
- Rapid7 Appspider
- Acunetix

Security protection for your application

Tighter security increases processing overhead. Signatures provide the following deployment options to help you to optimize the protection of your applications:

- **Negative Security Model**: With the negative security model, you use a rich set of preconfigured signature rules to apply the power of pattern matching to detect attacks and protect against application vulnerabilities. You block only what you don’t want and allow the

© 1997–2026 Citrix Systems, Inc. All rights reserved.

rest. You can add your own signature rules, based on the specific security needs of your applications, to design your own customized security solutions.

- **Hybrid security Model**: In addition to using signatures, you can use positive security checks to create a configuration ideally suited for your applications. Use signatures to block what you don’t want, and use positive security checks to enforce what is allowed.

To protect your application by using signatures, you must configure one or more profiles to use your signatures object. In a hybrid security configuration, the SQL injection and cross-site scripting patterns, and the SQL transformation rules, in your signatures object are used not only by the signature rules, but also by the positive security checks configured in the Web App Firewall profile that is using the signatures object.

The Web App Firewall examines the traffic to your protected websites and web services to detect traffic that matches a signature. A match is triggered only when every pattern in the rule matches the traffic. When a match occurs, the specified actions for the rule are invoked. You can display an error page or error object when a request is blocked. Log messages can help you to identify attacks being launched against your application. If you enable statistics, the Web App Firewall maintains data about requests that match a Web App Firewall signature or security check.

If the traffic matches both a signature and a positive security check, the more restrictive of the two actions are enforced. For example, if a request matches a signature rule for which the block action is disabled, but the request also matches an SQL Injection positive security check for which the action is block, the request is blocked. In this case, the signature violation might be logged as `<not blocked>`, although the request is blocked by the SQL injection check.

Customization: If necessary, you can add your own rules to a signatures object. You can also customize the SQL/cross-site scripting patterns. The option to add your own signature rules, based on the specific security needs of your applications, gives you the flexibility to design your own customized security solutions. You block only what you don’t want and allow the rest. A specific fast-match pattern in a specified location can significantly reduce processing overhead to optimize performance. You can add, modify, or remove SQL injection and cross-site scripting patterns. Built-in RegEx and expression editors help you configure your patterns and verify their accuracy.

Auto-update: You can manually update the signature object to get the latest signature rules, or you can apply the auto-update feature so that the Web App Firewall can automatically update the signatures from the cloud-based Web App Firewall updates service.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE:

If new signature rules are added during auto-update, they are disabled by default. You must periodically review the updated signatures and enable the newly added rules that are pertinent for protecting your applications.

You must configure CORS to host signatures on IIS servers.
Signature auto update feature does not work on the local web server when you access the URL from the NetScaler GUI.

Getting started

Using Citrix® signatures to protect your application is easy and can be accomplished in a few simple steps:

1. Add a signature object.

- You can use the Wizard that prompts you to create the entire Web App Firewall configuration, including adding the profile and policy, selecting and enabling signatures, and specifying actions for signatures and positive security checks. The signatures object is created automatically.
- You can create a copy of the signatures object from the *Default Signatures template, use a blank template to create a signature with your own customized rules, or add an external format signature. Enable the rules and configure the actions that you want to apply.

1. Configure the target Web App Firewall profile to use this signatures object.
2. Send traffic to validate the functionality

Highlights

- The Default signatures object is a template. It cannot be edited or deleted. To use it, you must create a copy. In your own copy, you can enable the rules and the desired action for each rule as required for your application. To protect the application, you must configure the target profile to use this signature.
- Processing signature patterns has overhead. Try to enable only those signatures that are applicable for protecting your application, rather than enabling all signature rules.
- Every pattern in the rule must match to trigger a signature match.
- You can add your own customized rules to inspect incoming requests to detect various types of attacks, such as SQL injection or cross-site scripting attacks. You can also add rules to inspect

© 1997–2026 Citrix Systems, Inc. All rights reserved.

the responses to detect and block leakage of sensitive information such as credit card numbers.

- You can make a copy of an existing signature object and tweak it, by adding or editing rules and SQL/cross-site scripting patterns, to protect another application.
- You can use auto-update to download the latest version of the Web App Firewall default rules without need for ongoing monitoring to check for the availability of the new update.
- A signature object can be used by more than one profile. Even after you have configured one or more profiles to use a signature object, you can still enable or disable signatures or change the action settings. You can manually create and modify your own custom signature rules. The changes apply to all the profiles that are currently configured to use this signature object.
- You can configure signatures to detect violations in various types of payloads, such as HTML, XML, JSON, and GWT.
- You can export a configured signatures object and import it to another NetScaler appliance for easy replication of your customized signature rules.

Signatures are patterns that are associated with a known vulnerability. You can use signature protection to identify the traffic that attempts to exploit these vulnerabilities, and take specific actions.

Signatures are organized into categories. You can optimize the performance and reduce the processing overhead by enabling only the rules in the categories that are appropriate for protecting your application.

Manually configuring the signatures feature

To use signatures to protect your websites, you must review the rules, and enable and configure the ones that you want to apply. The rules are disabled by default. Citrix® recommends that you enable all rules that are applicable to the type of content that your website uses.

To manually configure the signatures feature, use a browser to connect to the GUI. Then, create a signatures object from a built-in template, an existing signatures object, or by importing a file. Next, configure the new signatures object as explained in Configuring or Modifying a Signatures Object.

Adding or removing a signature object

You can add a new signature object to the Web App Firewall by:

- Copying a built-in template.
- Copying an existing signatures object.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Importing a signatures object from an external file.

The signature file includes CPU usage, latest applicable year, and severity level details. You can see the CPU usage, latest year, and CVE severity level every time a signature file is modified and uploaded periodically. After observing these values, you can decide to enable or disable the signature on the appliance.

You must use the GUI to copy a template or existing signatures object. You can use either the GUI or the command line to import a signatures object. You can also use either the GUI or the command line to remove a signatures object.

To create a signatures object from a template

1. Navigate to **Security > NetScaler Web App Firewall > Signatures**.
2. In the details pane, select the signatures object that you want to use as a template.

   Your choices are:

   - **Default Signatures.** Contains the signatures rules, the SQL injection rules, and the cross-site scripting rules.
   - **XPath Injection.** Contains the XPath injection patterns.
   - **Any existing signatures object.**

   ATTENTION:

   If you do not choose a signatures type to use as a template, the Web App Firewall prompts you to create signatures from scratch.

3. Click **Add**.
4. In the Add Signatures Object dialog box, type a name for your new signatures object, and then click OK. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 31 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), and underscore (_) symbols.
5. Click **Close**.

To create a signatures object by importing a file

1. Navigate to **Security > NetScaler Web App Firewall > Signatures**.
2. In the details pane, click **Add**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. In the **Add Signatures Object** dialog box, select the format of the signatures you want to import.
   - To import a NetScaler format signatures file, select the **Native Format** tab.
   - To import an external signatures format file, select the **External Format** tab.
4. Choose the file that you want to use to create your signatures object.
   - To import a native NetScaler format signatures file, in the Import section select either Import from Local File or Import from URL, then type or browse to the path or URL to the file.
   - To import a Cenzic, IBM AppScan, Qualys, or Whitehat format file, in the XSLT section select Use Built-in XSLT File, Use Local File, or Reference from URL. Next, if you chose Use Built-in XSLT File, select the appropriate file format from the list. If you chose Use Local File or Reference from URL, then type or browse to the path or URL to the file.
5. Click **Add**, and then click **Close**.

To create a signatures object by importing a file by using the command line

At the command prompt, type the following commands:

- `import appfw signatures <src> <name> [-xslt <string>] [-comment <string>] [-overwrite] [-merge] [-sha1 <string>]`
- `save ns config`

Example #1

The following example creates a signatures object from a file named signatures.xml and assigns it the name MySignatures.

```
import appfw signatures local:signatures.xml MySignatures

save ns config
```

To add individual signatures by using CLI

You can select signatures by their IDs or category and then set actions. At the command prompt, run the following command:

```
import appfw signature <source> <name> [-sigRuleId| -sigCategory] [Rule-IDs | Category name] -Enabled [ON | OFF] [-Action LOG BLOCK]
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Examples to use signature IDs**

  The following example enables the signatures by their rule IDs and sets the log and block actions:

  ```
  import appfw signature DEFAULT object_name -sigRuleId 1001 9882 2000
  1250 810 -Enabled ON -Action LOG BLOCK
  ```

  The following example adds the signature by its ID without enabling it:

  ```
  import appfw signature DEFAULT object_name -sigRuleId 810 -Enabled OFF
  ```

- **Examples to use signature category**

  The following example enables the signatures by the `web-misc` category and sets the log and block actions:

  ```
  import appfw signature DEFAULT object_name -sigCategory web-misc
  -Enabled ON -Action LOG BLOCK
  ```

  The following example adds the signatures by the `web-misc` category without enabling it:

  ```
  import appfw signature DEFAULT object_name -sigCategory web-misc
  -Enabled OFF
  ```

To remove a signatures object by using the GUI

1. Navigate to **Security > NetScaler Web App Firewall > Signatures**.
2. In the details pane, select the signatures object that you want to remove.
3. Click **Remove**.

To remove a signatures object by using the command line

At the command prompt, type the following commands:

- `rm appfw signatures <name>`
- `save ns config`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configuring or modifying a signatures object

You configure a signatures object after creating it, or modify an existing signatures object, to enable or disable signature categories or specific signatures, and configure how the Web App Firewall responds when a signature matches a connection.

To configure or modify a signatures object

1. Navigate to **Security > NetScaler Web App Firewall > Signatures**.
2. In the details pane, select the signatures object that you want to configure, and then click **Open**.
3. In the **Modify Signatures Object** dialog box, set the **Display Filter Criteria** options at the left to display the filter items that you want to configure.

   As you modify these options, the results that you requested are displayed in the Filtered Results window at the right.

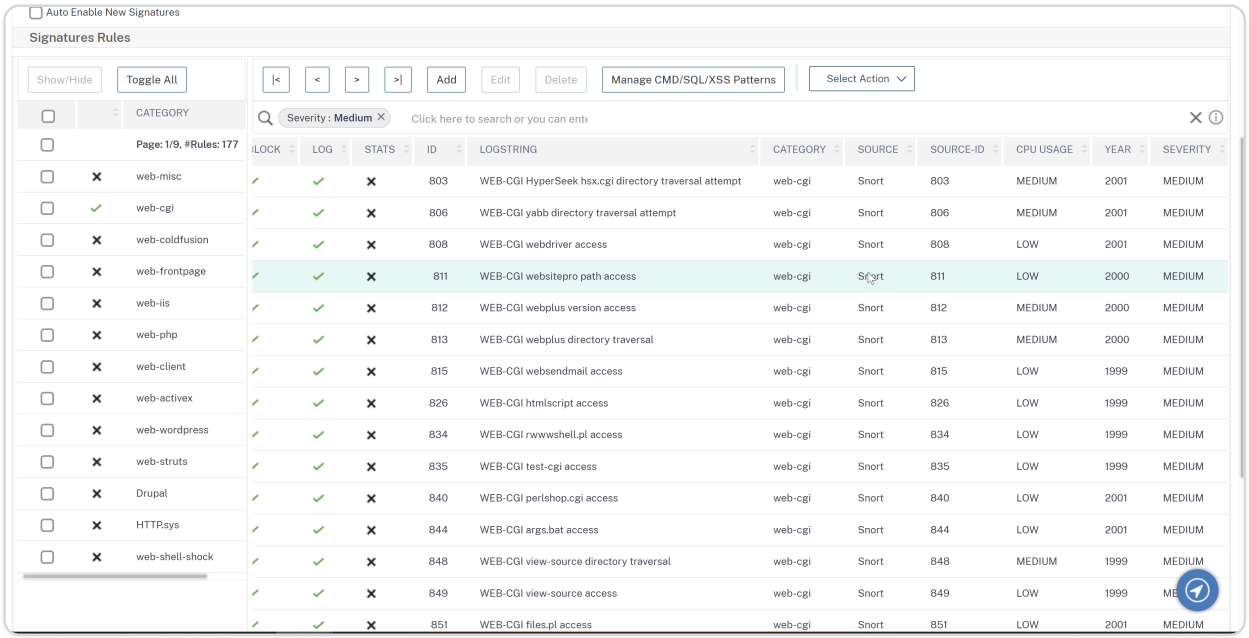
   - To display only selected categories of signatures, check or clear the appropriate signature-category check boxes. From release 13.1 build 48.x, you can use CVE on the left panel to view the vulnerabilities published for the selected year. The signature categories are:

NAME	TYPE OF ATTACK THAT THIS SIGNATURE PROTECTS AGAINST
cgi	CGI scripts. Includes Perl and UNIX shell scripts.
client	Browsers and other clients.
coldfusion	websites that use the Adobe Systems ColdFusion application server.
frontpage	websites that use Microsoft’s FrontPage server.
iis	websites that use the Microsoft Internet Information Server (IIS).
misc	Miscellaneous attacks.
php	websites that use PHP
web-activex	websites that contain ActiveX controls.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NAME	TYPE OF ATTACK THAT THIS SIGNATURE PROTECTS AGAINST
web-struts	websites that contain Apache struts, which are java-ee based applets.
CVE	Lists the CVEs that are published for the selected year.

- To display only signatures that have specific check actions enabled, select the ON check box for each of those actions, clear the ON check boxes for the other actions, and clear all of the OFF check boxes. To display only signatures that have a specific check action disabled, select their respective OFF check boxes and clear all of the ON check boxes. To display signatures regardless of whether they have a check action enabled or disabled, select or clear both the ON and the OFF check boxes for that action. The check actions are:



CRITERION	DESCRIPTION
Enabled	The signature is enabled. The Web App Firewall checks only for signatures that are enabled when it processes traffic.
Block	Connections that match this signature are blocked.
Log	A log entry is produced for any connection that matches this signature.
Stats	The Web App Firewall includes any connection that matches this signature in the statistics that it generates for that check.

- To further filter the details that are displayed in the result window, use the search bar above the result window and perform the following steps:
  - Select the properties that you want to filter in the search bar.
  - Type the value, and press the enter button.

  It further filters the content that are already displayed in the result window and lists the details based on the entered value.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Example: In the following image, web-CGI is selected as a category in the Display Filter Criteria options at the left. The web-CGI signature details are listed in the result window at the right. To further filter the details based on the severity, in the search bar, severity is selected as a property and medium is entered as a value. The web-CGI signature with medium severity are listed in the result window.

- To reset all display filter criteria to the default settings and display all signatures, click Show All.

NOTE

The number of items listed in the filtered result window is 20. The pagination is available above the Display Filter Criteria options on the left.

1. For information about a specific signature, select the signature, and then click the blue double arrow in the More field. The Signature Rule Vulnerability Detail message box appears. It contains information about the purpose of the signature and provides links to external web-based information about the vulnerability or vulnerabilities that this signature addresses. To access an external link, click the blue double arrow to the left of the description of that link.
2. Configure the settings for a signature by selecting the appropriate check boxes.
3. If you want to add a local signature rule to the signatures object, or modify an existing local signature rule, see The Signatures Editor.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. If you have no need for SQL injection, cross-site scripting, or Xpath injection patterns, click OK, and then click Close. Otherwise, in the lower left-hand corner of the details pane, click Manage SQL/cross-site scripting Patterns.
5. In the Manage SQL/cross-site scripting Patterns dialog box, Filtered Results window, navigate to the pattern category and pattern that you want to configure. For information about the SQL injection patterns, see HTML SQL Injection Check. For information about the cross-site scripting patterns, see HTML Cross-Site Scripting Check.
6. To add a new pattern:
    a. Select the branch to which you want to add the new pattern.
    b. Click the **Add** button directly below the lower section of the **Filtered Results** window.
    c. In the Create Signature Item dialog box, fill in the Element text box with the pattern that you want to add. If you are adding a transformation pattern to the transform rules branch, under Elements, fill in the From text box with the pattern that you want to change and the To text box with the pattern to which you want to change the previous pattern.
    d. Click **OK**.
7. To modify an existing pattern:
    a. In the **Filtered Results** window, select the branch that contains the pattern that you want to modify.
    b. In the detail window beneath the **Filtered Results** window, select the pattern that you want to modify.
    c. Click **Modify**.
    d. In the **Modify Signature Item** dialog box, **Element** text box, modify the pattern. If you are modifying a transformation pattern, you can modify either or both patterns under Elements, in the From and the To text boxes.
    e. Click **OK**.
8. To remove a pattern, select the pattern that you want to remove, then click the **Remove** button below the details pane beneath the **Filtered Results** window. When prompted, confirm your choice by clicking **Close**.
9. To add the patterns category to the cross-site scripting branch:
    a. Select the branch to which you want to add the patterns category.
    b. Click the **Add** button directly below the **Filtered Results** window.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Note: Currently you can add only one category, named patterns, to the cross-site scripting branch, so after you click **Add**,you must accept the default choice, which is patterns.

c. Click **OK**.

10. To remove a branch, select that branch, and then click the Remove button directly below the **Filtered Results** window. When prompted, confirm your choice by clicking **OK**.

NOTE:

If you remove a default branch, you remove all of the patterns in that branch. Doing so can disable the security checks that use that information.

11. When you are finished modifying the SQL injection, cross-site scripting, and XPath injection patterns, click **OK**, and then click **Close** to return to the **Modify Signatures Object** dialog box.
12. Click **OK** at any point to save your changes, and when you are finished configuring the signatures object, click **Close**.

Protecting JSON applications using signatures

JavaScript Object Notation (JSON) is a text-based open standard derived from the JavaScript scripting language. JSON is preferred for human readable representation of simple data structures and associative arrays, called objects. It serves as an alternative to XML and is primarily used to transmit serialized data structures for communicating with web applications. The JSON files are typically saved with a .json extension.

The JSON payload is typically sent with the MIME type specified as **application/json**. The other “standard” content types for JSON are:

- **application/x-javascript**
- **text/javascript**
- **text/x-javascript**
- **text/x-json**

Using the NetScaler Web App Firewall signatures to protect JSON applications

To allow JSON requests, the appliance is preconfigured with the JSON content type as shown in the following show-command output:

```
> sh appfw jsonContentType

1)      JSONContenttypevalue:  "^application/json$" IsRegex:  REGEX
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Done
```

The NetScaler Web App Firewall processes the post body for the following content-types only:

- **application/x-www-form-urlencoded**
- **multipart/form-data**
- **text/x-gwt-rpc**

The requests that are received with other content-type headers including application/json (or any other allowed content type) are forwarded to the backend after header inspection. The post body in such requests is not inspected for security check violations even when the profile's security checks such as SQL or cross-site scripting are enabled.

In order to protect JSON applications and detect violations, Web App Firewall signatures can be used. All requests that contain the allowed content-type header are processed by the Web App Firewall for signature match. You can add your own customized signature rules to process JSON payload to perform various security check inspections (for example, cross-site scripting, SQL, and Field Consistency), to detect violations in the headers as well as the post body, and take specified actions.

TIP

Unlike the other built-in defaults, the preconfigured JSON content type can be edited or removed by using the CLI or the GUI (GUI). If legitimate requests for JSON applications are getting blocked and triggering content-type violations, check to make sure that the content type value is configured accurately. For additional details regarding how Web App Firewall processes content-type header, see Content type protection

To add or remove JSON content-type by using the command line interface

At the command prompt, type one of the following commands:

```
add appfw jsonContentType \^application/json$ IsRegEx REGEX
```

```
rm appfw JSONContentType "\^application/json$"
```

To managing JSON content types by using the GUI

Navigate to **Security** > **Web App Firewall** and, in the **Settings** section, select **Manage JSON Content Types**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

In the **Configure Web App Firewall JSON Content Type** panel, add, edit, or delete JSON content types to suit the needs of your applications.

Configuring signature protection to detect attacks in JSON payload

In addition to a valid JSON content type, you need to configure signatures to specify the pattern(s) that, when detected in a JSON request, indicate a security breach. The specified actions, such as block and log, are taken when an incoming request triggers a match for all the target patterns in the signature rule.

To add a customized signature rule, Citrix® recommends that you use the GUI. Navigate to **System** > **Security** > **Web App Firewall** > **Signatures**. Double click the target signature object to access the **Edit Web App Firewall Signatures** panel. Click on the **Add** button to configure the actions, category, log string, rule patterns and so on. Although Web App Firewall inspects all allowed content-type payload for signature match, you can optimize the processing by specifying the JSON expression in the rule. When you **Add** a new rule pattern, select **Expression** in the drop-down options for **Match** and provide the target match expression from your JSON payload to identify the specific requests that need to be inspected. An expression must begin with a **TEXT.** prefix. You can add other rule patterns to specify additional match patterns to identify the attack.

The following example shows a signature rule. If any cross-site script tag is detected in the POST body of the JSON payload that matches the specified XPATH_JSON expression, a signature match is triggered.

Example of a signature to detect cross-site scripting in JSON payload

```
<SignatureRule actions="log,stats" category="JSON" enabled="ON"
id="1000001" severity="" source="" type="" version="1">

  <PatternList>

    <RequestPatterns>

      <Pattern>
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
        <Location area="HTTP_POST_BODY"/>

        <Match type="Expression">TEXT.XPATH_JSON(xp%/glossary/
title%).CONTAINS("example glossary")</Match>

      </Pattern>

      <Pattern>

        <Location area="HTTP_METHOD"/>

        <Match type="LITERAL">POST</Match>

      </Pattern>

      <Pattern>

        <Location area="HTTP_POST_BODY"/>

        <Match type="CrossSiteScripting"/>

       </Pattern>
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
    </RequestPatterns>

  </PatternList>

  <LogString>Cross-site scripting violation detected in json payload</
LogString>

  <Comment/>

</SignatureRule>
```

Example of the payload

The following payload triggers the signature match, because it includes the cross-site scripting tag **<Gotcha!!>**.

```
{"glossary": {"title": "example glossary","GlossDiv": {"title":
"S","GlossList": {"GlossEntry": {"ID": "SGML","SortAs":
"SGML","GlossTerm": "Standard Generalized Markup Language","Acronym":
"SGML","Abbrev": "ISO 8879:1986","GlossDef": {"para": "A meta-markup
language, used to create markup languages **<Gotcha!!>** such as
DocBook.","GlossSeeAlso": ["GML", "XML"]},"GlossSee": "markup"}}}}}
```

Example of the log message

```
Aug 21 12:21:42 <local0.info> 10.217.31.239 08/21/2015:23:21:42 GMT ns 0-
PPE-1 : APPFW APPFW_SIGNATURE_MATCH 1471 0 :  10.217.253.62 990-PPE0
NtJnVMNnvPeQJnaUzXYW/GTvAQsA010 prof1 http://10.217.31.212/FFC/
login_post.php Signature violation rule ID 1000001: cross-site scripting
violation detected in json payload  <not blocked>
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE

If you send the same payload after removing the cross-site script tag (**<Gotcha!!>**), the signature rule match is not triggered.

Highlights

- To protect JSON payload, use Web App Firewall signatures to detect cross-site scripting, SQL and other violations.
- Verify that the JSON content type is configured on the appliance as the allowed content type.
- Make sure that the content type in the payload matches the configured JSON content type.
- Make sure that all the patterns configured in the signature rule match for the signature violation to be triggered.
- When you add a signature rule, it MUST have at least one Rule pattern to match the Expression in the JSON payload. All the PI expressions in signature rules must start with the prefix TEXT. and must be Boolean.

Protect application or JSON content-type with SQL and cross-site scripting encoded payload using policies and signatures

NetScaler Web App Firewall can protect application or JSON content type using policies and signatures.

Inspect application or JSON content type for SQL injection using policies

You must add the following policies and bind it to virtual server globally for supporting SQL injection.

```
add appfw policy sqli_1
HTTP.REQ.BODY(10000).SET_TEXT_MODE(IGNORECASE).SET_TEXT_MODE(URLENCODED).DECODE_USING_TEXT_
\A)|(?<=[\^a-zA-Z0-9_])))(select|insert|delete|update|drop|create|alter|grant|
revoke|commit|rollback|shutdown|union|intersect|minus|case|decode|where|group|
begin|join|exists|distinct|add|modify|constraint|null|like|exec|execute|char|or|
and|sp_sdidebug)((Z)|(?=[\^a-zA-Z0-9_]))#) APPFW_BLOCK
```

```
add appfw policy sqli_2
HTTP.REQ.BODY(10000).SET_TEXT_MODE(IGNORECASE).SET_TEXT_MODE(URLENCODED).DECODE_USING_TEXT_
\A)|(?<=[\^a-zA-Z0-9_]))(xp_availablemedia|xp_cmdshell|xp_deletemail|xp_dirtree|
xp_dropwebtask|xp_dsninfo|xp_enumdsn|xp_enumerrorlogs|xp_enumgroups|
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
xp_enumqueuedtasks|xp_eventlog|xp_findnextmsg|xp_fixeddrives|xp_getfiledetails|
xp_getnetname|xp_grantlogin|xp_logevent|xp_loginconfig|xp_logininfo|
xp_makewebtask|xp_msver|xp_regread|xp_perfend|xp_perfmonitor|xp_perfsample|
xp_perfstart|xp_readerrorlog|xp_readmail|xp_revokelogin|xp_runwebtask|
xp_schedulersignal|xp_sendmail|xp_servicecontrol|xp_snmp_getstate|
xp_snmp_raisetrap|xp_sprintf|xp_sqlinventory|xp_sqlregister|xp_sqltrace|
xp_sscanf|xp_startmail|xp_stopmail|xp_subdirs|xp_unc_to_drive)((Z)|(?=[\^a-zA-
Z0-9_]))#) APPFW_BLOCK
```

```
add appfw policy sqli_3
HTTP.REQ.BODY(10000).SET_TEXT_MODE(IGNORECASE).SET_TEXT_MODE(URLENCODED).DECODE_USING_TEXT_
\A)|(?<=[\^a-zA-Z0-9_]))(sysobjects|syscolumns|MSysACEs|MSysObjects|MSysQueries|
MSysRelationships)((Z)|(?=[\^a-zA-Z0-9_]))#) APPFW_BLOCK
```

```
add appfw policy sqli_4
HTTP.REQ.BODY(10000).SET_TEXT_MODE(IGNORECASE).SET_TEXT_MODE(URLENCODED).DECODE_USING_TEXT_
\A)|(?<=[\^a-zA-Z0-9_]))(SYS\.USER_OBJECTS|SYS\.TAB|SYS\.USER_TABLES|
SYS\.USER_VIEWS|SYS\.ALL_TABLES|SYS\.USER_TAB_COLUMNS|SYS\.USER_CONSTRAINTS|
SYS\.USER_TRIGGERS|SYS\.USER_CATALOG|SYS\.ALL_CATALOG|SYS\.ALL_CONSTRAINTS|
SYS\.ALL_OBJECTS|SYS\.ALL_TAB_COLUMNS|SYS\.ALL_TAB_PRIVS|SYS\.ALL_TRIGGERS|
SYS\.ALL_USERS|SYS\.ALL_VIEWS|SYS\.USER_ROLE_PRIVS|SYS\.USER_SYS_PRIVS|
SYS\.USER_TAB_PRIVS)((Z)|(?=[\^a-zA-Z0-9_]))#) APPFW_BLOCK
```

Inspect application or JSON content type using signatures

You can add the following signature rules to the signature object in the application firewall profile to support SQL injection for JSON content-type.

NOTE:

Post body signatures are cpu-intensive.

```
<?xml version="1.0" encoding="UTF-8"?>

<!-- Copyright 2013-2018 Citrix Systems, Inc. All rights reserved. -->

<SignaturesFile schema_version="6" version="0" minor_schema_version="0">

    <Signatures>
```

```
</SignaturesFile>
```

Updating a signature object

You must update your signatures objects frequently to ensure that your Web App Firewall is providing protection against current threats. You must regularly update both the default Web App Firewall signatures and any signatures that you import from a supported vulnerability scanning tool.

NetScaler® regularly updates the default signatures for the Web App Firewall. You can update the default signatures manually or automatically. In either case, ask your NetScaler representative or NetScaler reseller for the URL to access the updates. You can enable automatic updates of the NetScaler native format signatures in the "Engine Settings" and "Signature Auto Update Settings" dialog boxes.

Most makers of vulnerability scanning tools regularly update the tools. Most websites also change frequently. You must update your tool and rescan your websites regularly, exporting the resulting signatures to a file and importing them into your Web App Firewall configuration.

TIP

When you update the Web App Firewall signatures from the NetScaler command line, you must first update the default signatures, and then issue more update commands to update each custom signatures file that is based on the default signatures. If you do not update the default signatures first, a version mismatch error prevents updating of the custom signatures files.

Note

The following applies to merging a third-party signature object with a user-defined signature object with Native rules and user-added rules:
When a version 0 signatures is merged with a new imported file, the resultant signatures remain as version 0.
This means all native (or built-in) rules in the imported file will be ignored after the merge. This is to ensure that the version 0 signatures are maintained as is after a merge.
To include the native rules in the imported file for merge, you must update the existing signatures from version 0 first before the merge. This means you need to abandon the version 0 nature of the existing signatures.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

When there is a NetScaler release upgrade, the file "default_signatures.xml" is added to the new build and the file "updated_signature.xml" is removed from the older build. After the upgrade, if the signature auto update feature is enabled, the appliance updates the existing signature to the latest version of the build and generates the "updated_signature.xml" file.

To update the Web App Firewall signatures from the source by using the command line

At the command prompt, type the following commands:

- `update appfw signatures <name> [-mergedefault]`
- `save ns config`

Example

The following example updates the signatures object named MySignatures from the default signatures object, merging new signatures in the default signatures object with the existing signatures. This command does not overwrite any user-created signatures or signatures imported from another source, such as an approved vulnerability scanning tool.

```
update appfw signatures MySignatures -mergedefault

save ns config
```

Updating a signatures object from a NetScaler format file

NetScaler regularly updates the signatures for the Web App Firewall. You must regularly update the signatures on your Web App Firewall to ensure that your Web App Firewall is using the most current list. Ask your NetScaler representative or NetScaler reseller for the URL to access the updates.

To update a signatures object from a NetScaler format file by using the command line

At the command prompt, type the following commands:

- `update appfw signatures <name> [-mergeDefault]`
- `save ns config`

To update a signatures object from a NetScaler format file by using the GUI

1. Navigate to **Security** > **Web App Firewall** > **Signatures**.
2. In the details pane, select the signatures object that you want to update.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. In the **Action** drop-down list, select **Merge**.
4. In the **Update Signatures Object** dialog box, choose one of the following options.
   - **Import from URL**—Choose this option if you download signature updates from a web URL.
   - **Import from Local File**—Choose this option if you import signature updates from a file on your local hard drive, network hard drive, or other storage device.
5. In the text area, type the URL, or type or browse to the local file.
6. Click **Update**. The update file is imported, and the Update Signatures dialog box changes to a format nearly identical to that of the **Modify Signatures Object** dialog box. The **Update Signatures Object** dialog box displays all branches with new or modified signature rules, SQL injection or cross-site scripting patterns, and XPath injection patterns if there are any.
7. Review and configure the new and modified signatures.
8. When you are finished, click **OK**, and then click **Close**.

Updating a signatures object from a supported vulnerability scanning tool

NOTE:

Before you update a signatures object from a file, you must create the file by exporting signatures from the vulnerability scanning tool.

To import and update signatures from a vulnerability scanning tool

1. Navigate to **Security** > **Web App Firewall** > **Signatures**.
2. In the details pane, select the signatures object that you want to update, and then click **Merge**.
3. In the **Update Signatures Object** dialog box, on the **External Format** tab, Import section, choose one of the following options.
   - **Import from URL**—Choose this option if you download signature updates from a Web URL.
   - **Import from Local File**—Choose this option if you import signature updates from a file on your local or a network hard drive or other storage device.
4. In the text area, type the URL, or browse or type the path to the local file.
5. In the XSLT section, choose one of the following options.
   - **Use Built-in XSLT File**—Choose this option if you want to use a built-in XSLT file.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Use Local XSLT File**—Choose this option to use an XSLT file on your local computer.
- **Reference XSLT from URL**—Choose this option to import an XSLT file from a web URL.

6. If you chose Use Built-in XSLT File, in the Built-In XSLT drop-down list select the file that you want to use from the following options:
   - **Cenzic.**
   - **Deep_Security_for_Web_Apps.**
   - **Hewlett_Packard_Enterprise_WebInspect.**
   - **IBM-AppScan-Enterprise.**
   - **IBM-AppScan-Standard.**
   - **Qualys.**
   - **Whitehat.**
7. Click **Update**. The update file is imported, and the Update Signatures dialog box changes to a format nearly identical to that of the Modify Signatures Object dialog box, which is described in Configuring or Modifying a Signatures Object. The **Update Signatures Object** dialog box displays all branches with new or modified signature rules, SQL injection or cross-site scripting patterns, and XPath injection patterns if there are any.
8. Review and configure the new and modified signatures.
9. When you are finished, click **OK**, and then click **Close**.

Signature auto update

The Signature Auto Update functionality in the Web Application Firewall allows the user to get the latest signatures to protect the web application against new vulnerabilities. The auto update feature provides better protection without the need for ongoing manual intervention to get the latest updates.

The signatures are auto updated on an hourly basis and do not require regular check for the availability of the most recent update. Once you enable Signature Auto Update, then the NetScaler appliance connects to the server hosting the signatures to check if a newer version is available.

Customizable location

The latest Application Firewall signatures are hosted on Amazon which is configured as the default Signature URL to check for the latest update.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

However, the user has an option to download these signature mapping files to their internal server. User can then configure a different Signature URL path to download the signature mapping files from a local server. For the auto update feature to work, you might need to configure the DNS server to access the external site.

Update signatures

All the user defined signature objects which are created using the appfw default signature object have a version greater than zero. If you enable Signature Auto Update, then all the signatures are updated automatically.

If the user has imported signatures with the external format such as Cenzic or Qualys, then the signatures are imported with the version as zero. Similarly, if the user has created a signature object using the blank template, then it is created as a zero version signature. These signatures are not automatically updated, because the user might not be interested in the overhead of managing the default signatures that is not used.

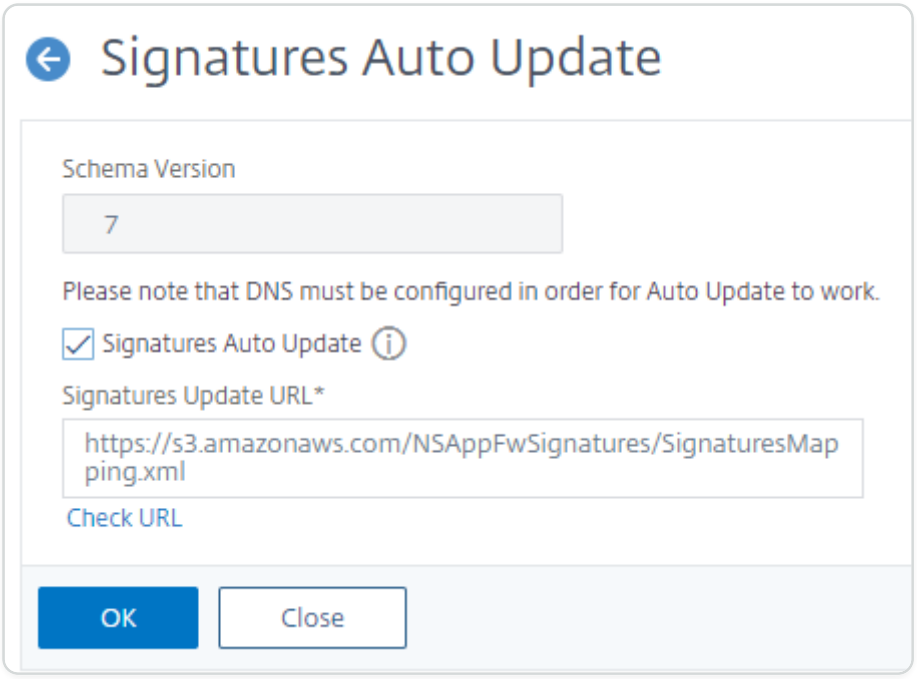
However, Web Application Firewall also allows the user the flexibility to manually select these signatures and update them to add the default signature rules to the existing rules. After the signatures are manually updated, the version changes and then the signatures will also get auto updated along with the other signatures.

Configure the signature auto update

To configure the signature auto update feature using the CLI:

At the command prompt, type:

```
set appfw settings SignatureAutoUpdate on



set appfw settings SignatureUrl https://s3.amazonaws.com/
NSAppFwSignatures/SignaturesMapping.xml
```

To configure the signature auto update using the GUI:

1. Navigate to **Security > NetScaler Web App Firewall > Signatures**.
2. Select **Auto Update Settings** from **Action**.
3. Enable the **Signatures Auto Update** option.
4. You can specify a customized path for the signature update URL, if necessary. Click **Reset** to reset to the default `s3.amazonaws.com server`.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

5. Click **OK**.

Update signatures manually

To manually update a zero version signature or any other user defined signature, you must first get the latest update for the default signatures and then use this for updating the target user defined signature.

Run the following commands from the CLI to update a signature file:

```
update appfw signatures "*Default Signatures"

update appfw signatures cenzic –mergedefault
```

NOTE:

`Default Signatures` Is case sensitive. Cenzic in the preceding command is the name of the signature file that is updated.

Import default signatures without internet access

It is recommended to configure a proxy server to point to Amazon (AWS) server to get the latest update. However, if the NetScaler® appliance does not have an internet connection to the external sites, then the user can store the updated signature files on a local server. The appliance can then download the signatures from the local server. In this scenario, the user must constantly check the **Amazon site** to get the latest updates. You can download and verify the signature file against the

© 1997–2026 Citrix Systems, Inc. All rights reserved.

corresponding sha1 file which were created by using the **Citrix® public** key to protect against tampering.

To copy the Signatures files to a local server, complete the following procedure:

1. Create a local directory such as `<MySignatures>` on a local server.
2. Open the AWS site.
3. Copy the `SignaturesMapping.xml` file to the `<MySignatures>` folder.

If you open the `SignaturesMapping.xml` file, you can see all the xml files for signatures and their corresponding sha1 files for different supported versions. One such pair is highlighted in the following screenshot:

1. Create a subdirectory `<sigs>` in the `<MySignatures>` folder.
2. Copy all pairs of the `*.xml files listed in the <file>` tags and the `*.xml.sha1` files listed in the corresponding `<sha1>` tags of the `SignaturesMapping.xml` file to the `<sigs>` folder. The following are a few sample files that is copied to the `<sigs>` folder:

`https://s3.amazonaws.com/NSAppFwSignatures/sigs/sig-r10.1b86v3s3.xml` `https://s3.amazonaws.com/NSAppFwSignatures/sigs/sig-r10.1b86v3s3.xml.sha1` `https://s3.amazonaws.com/NSAppFwSignatures/sigs/sig-r10.1b0v3s2.xml` `https://s3.amazonaws.com/NSAppFwSignatures/sigs/sig-r10.1b0v3s2.xml.sha1`

NOTE:

You can give any name to the `<MySignatures>` folder and it can be in any location but the subdirectory `<sigs>` must be a subdirectory in the `<MySignatures>` folder where the mapping file is copied. In addition, ensure that as shown in the SignaturesMapping.xml, the subdirectory name `<sigs>` must have the exact name and is case sensitive. All Signature files and their corresponding sha1 files should be copied under this `<sigs>` directory.

After mirroring the contents from the hosted Amazon web server to the local server, change the path to the new local web server to set it as the SignatureUrl for auto update. For example, run the following command from the command line interface of the appliance:

```
set appfw settings SignatureUrl https://myserver.example.net/MySignatures/
SignaturesMapping.xml
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The update operation can take several minutes, depending on the number of signatures to be updated. Allow sufficient time for the update operation to complete.

If you face an error "Error in accessing URL!" while configuring, follow the steps to resolve it.

1. Add the url `https://myserver.example.net` to `/netscaler/ns_gui/admin_ui/php/application/controllers/utils.php` so that Content Security Policy (CSP) security does not block the url access. Please note that these settings do not persists in an upgrade. User has to add it again after the upgrade.

```
$configuration_view_connect_src = "connect-src 'self' https://app.pendo.io
https://s3.amazonaws.com https://myserver.example.net;";
```

1. User must configure the webserver `https://myserver.example.net` such that it responds to the following CORS headers for `https://myserver.example.net/MySignatures/SignaturesMapping.xml`

```
Access-Control-Allow-Methods: GET

Access-Control-Allow-Origin: *

Access-Control-Max-Age: 3000
```

Guidelines to update signatures

Following guidelines are used when updating signatures:

- The signatures are updated when the Signature update URL has a signature object which has the same or newer version.
- Each Signature Rule is associated with a rule ID and version number. For example: `<SignatureRule id="803" version="16" …>`
- Signature Rule from the incoming Signatures file with the same ID and version number as the existing one is ignored even if it has different patterns or log string.
- Signature Rule with a new ID is added. All the actions and enabled flag are used from the new file.

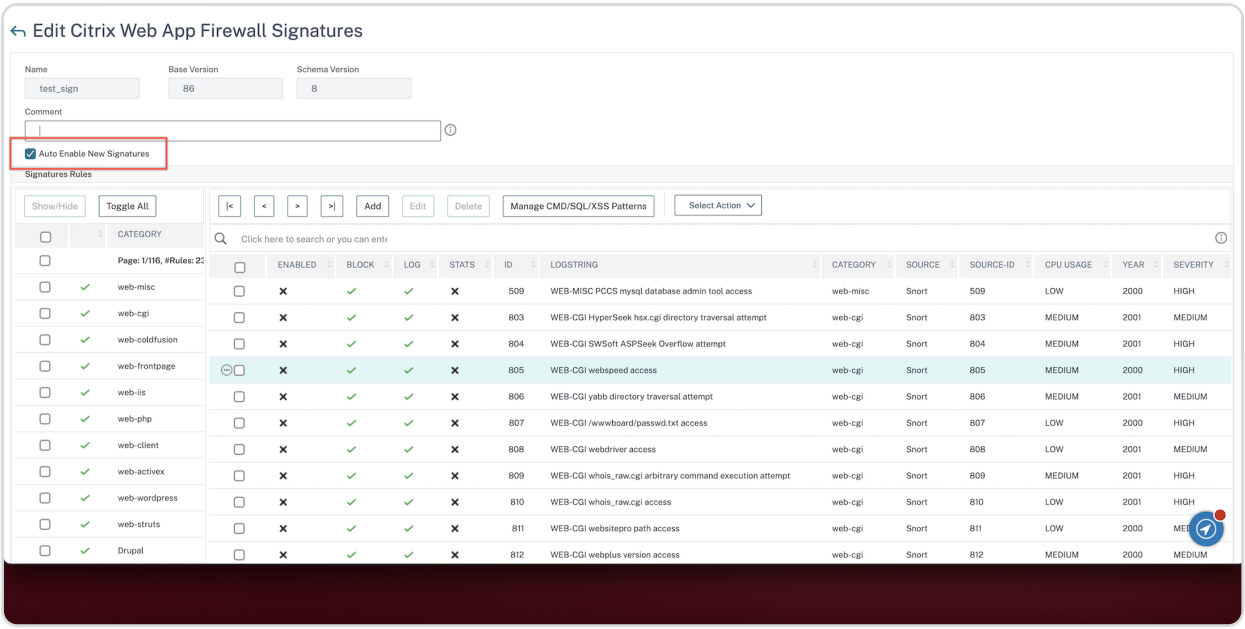
© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE:

You must review the updated signatures periodically to enable the newly added rules and change other action settings as per the requirements of the application.

- Rules with the same ID but with a newer version number replace the existing one. All the actions and enabled flag from the existing rule is preserved.

TIP:



When you update the signatures from the CLI, you must first update the default signatures. You must then add update commands to update each custom signature file that is based on the default signatures. If you do not update the default signatures first, a version mismatch error prevents custom signatures file update.

Auto-enable new signatures

From release 13.1 buid 27.x and later, you can select **Auto Enable New Signatures** to allow new WAF signature default rules to be auto-enabled after an update.

Auto-enable new signatures using the GUI

1. Navigate to **Security > NetScaler Web App Firewall > Signatures**.
2. Select a signature and click **Edit**.
3. Select **Auto Enable New Signatures**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Auto-enable new signatures using the CLI

At the command prompt, type:

```
import appfw signatures <src> <name> [-xslt <string>] [-comment <string>] [-overwrite] [-merge [-preservedefactions]] [-sha1 <string>] [-VendorType Snort] [-autoEnableNewSignatures ( ON | OFF )]
```

Example:

```
import signatures http://www.example.com/ns/signatures.xml my-signature -autoEnableNewSignatures ON
```

Snort rule integration

With malicious attacks on web applications, it is important to protect your internal network. Malicious data not only affect your web applications at the interface level but malicious packets also reach the application layer. To overcome such attacks, it is important to configure an intrusion detection and prevention system that examines your internal network.

Snort rules are integrated into the appliance for examine malicious attacks in data packets at the application layer. You can download the snort rules and convert it into WAF signatures rules. The signatures have rule-based configuration that can detect malicious activities such as DOS attacks, buffer overflows, stealth port scans, CGI attacks, SMB probes, and OS Fingerprinting attempts. By integrating Snort rules, you can strengthen your security solution at the interface and at the application level.

Configure snort rules

The configuration begins by first downloading the Snort rules and then importing it into WAF signature rules. Once you have converted the rules into WAF signatures, the rules can be used as WAF security checks. The snort based signature rules examine the incoming data packet to detect if there are malicious attacks on your network.

A new parameter, “VendorType” is added to the import command to convert Snort rules to WAF signatures.

The parameter “VendorType” is set on SNORT only for Snort rules.

Download snort rules by using the command interface

You can download the Snort rules as a text file from the below URL:

```
https://www.snort.org/downloads/community/snort3-community-rules.tar.gz
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Import snort rules by using the command interface

After you download, you can import the Snort rules into your appliance.

At the command prompt, type:

```
import appfw signatures <src> <name> [-xslt <string>] [-comment <string>] [-overwrite] [-merge [-preservedefactions]] [-sha1 <string>] [-VendorType Snort]
```

Example:

```
import appfw signatures http://www.example.com/ns/signatures.xml sig-snort –comment “signatures from snort rules” –VendorType snort
```

Arguments:

Src. URL (protocol, host, path, and file name) for the location at which to store the imported signatures object.

NOTE:

The import fails if the object to be imported is on an HTTPS server that requires client certificate authentication for access. Mandatory argument of maximum length: 2047

Name. Name to assign to the signatures object on the NetScaler. Mandatory argument of maximum length: 31

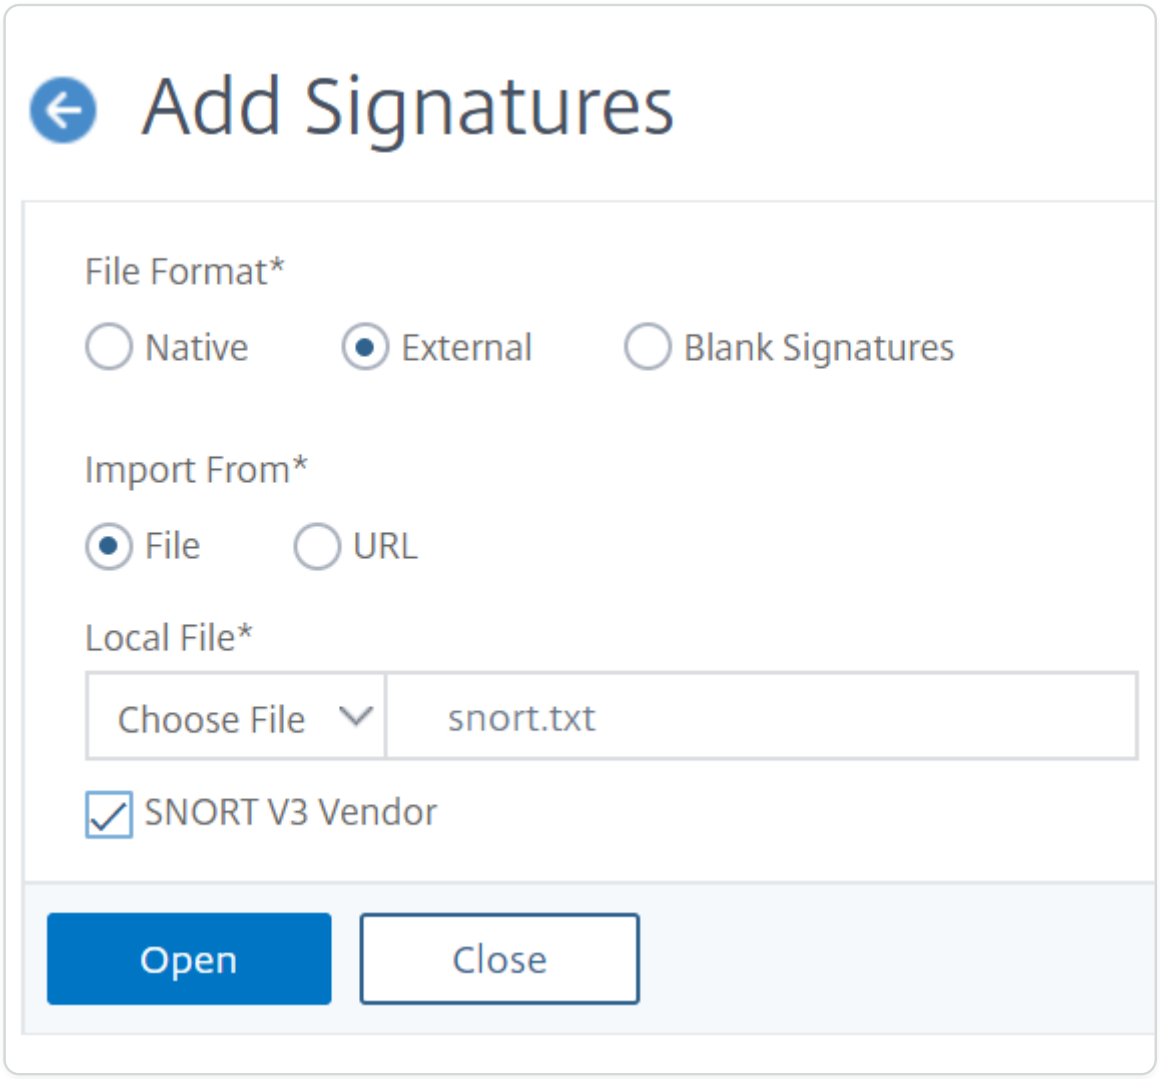
Comment. Description of how to preserve information about the signatures object. Maximum Length: 255 overwrite. Overwrite any existing signatures object of the same name.

Merge. Merges existing Signature with new signature rules.

Preservedefactions. Preserves def actions of signature rules.

VendorType. Third-party vendor to generate the WAF signatures. Possible values: Snort.

Configure snort rules by using the NetScaler GUI

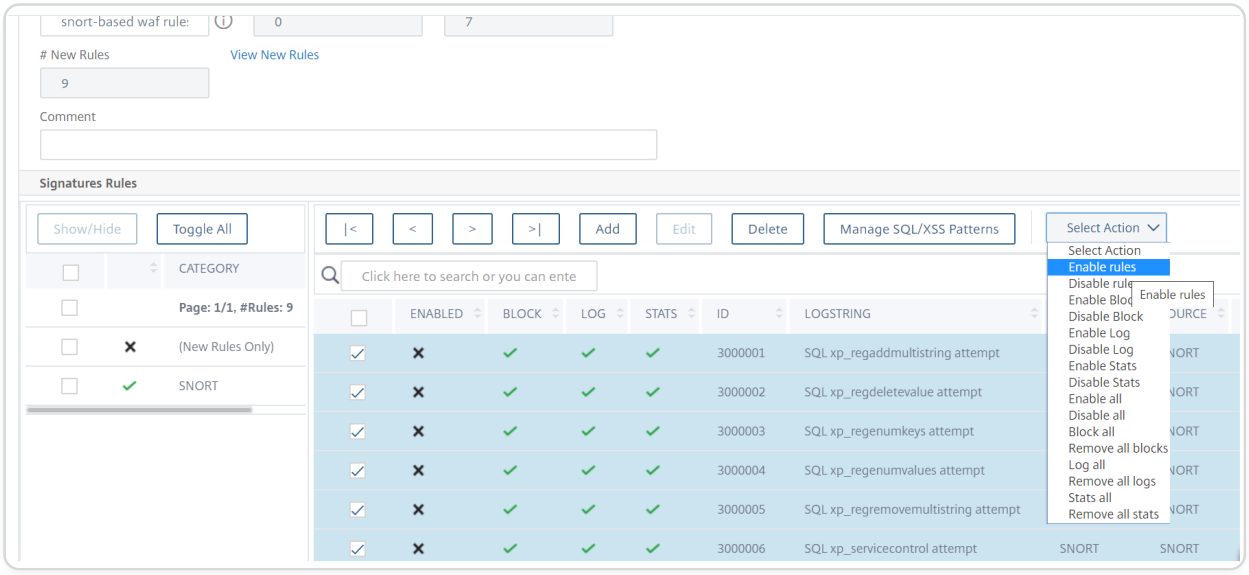


The GUI configuration for Snort rules is similar to configuring other external web application scanners like Cenzic, Qualys, Whitehat.

Follow the steps below to configure Snort:

1. Navigate to **Configuration > Security > NetScaler Web App Firewall > Signatures**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



2. In the **Signatures** page, click **Add**.
3. In the **Add Signatures** page, set the following parameters to configure Snort rules.
   a. File format. Select the file format as external.
   b. Import from. Select the import option as a snort file or URL to enter the URL.
   c. Snort V3 Vendor. Select the check box to import Snort rules from a file or from a URL.
4. Click **Open**.

The appliance imports the Snort rules as snort-based WAF signature rules.

As a best practice, you must use filter actions to enable snort rules that you prefer to import as WAF signature rules on the appliance.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

5. To confirm, click **Yes**.
6. The selected rules are enabled on the appliance.
7. Click **OK**.

Exporting a signatures object to a file

You export a signatures object to a file so that you can import it to another NetScaler.

To export a signatures object to a file

1. Navigate to **Security > NetScaler Web App Firewall > Signatures**.
2. In the details pane, select the signatures object that you want to configure.
3. In the **Actions** drop-down list, select **Export**.
4. In the **Export Signatures Object** dialog box, **Local File** text box, type the path and name of the file to which you want to export the signatures object, or use the **Browse** dialog to designate a path and name.
5. Click **OK**.

Edit signatures to add or modify rules

You can edit the user-defined signatures to add or modify a rule. A local signature rule has the same attributes as a default signature rule from Citrix®, and it functions in the same way. You enable or disable it, and configure the signature actions for it, just as you do for a default signature.

Add a local rule if you need to protect your websites and services from a known attack that the existing signatures do not match. For example, you might discover a new type of attack and

© 1997–2026 Citrix Systems, Inc. All rights reserved.

determine its characteristics by examining the logs on your web server, or you might obtain third-party information about a new type of attack.

At the heart of a signature rule are the rule *patterns*, which collectively describe the characteristics of the attack that the rule is designed to match. Each pattern can consist of a simple string, a PCRE-format regular expression, or the built-in SQL injection or cross-site scripting patterns.

You might want to modify a signature rule by adding a new pattern or modifying an existing pattern to match an attack. For example, you might find out about changes to an attack, or you might determine a better pattern by examining the logs on your web server, or from third-party information.

Add or modify a local signature rule

1. Navigate to **Security > NetScaler Web App Firewall > Signatures**.
2. In the details pane, select the user-defined signatures that you want to edit, and then click **Edit**.
3. In the **Signature Rules** section, click **Add**. The **Signature Rule** pane appears.
4. Configure the actions for a signature by selecting the appropriate check boxes.

    - **Enabled.** Enables the new signature rule. If you do not select this, this new signature rule is added to your configuration, but is inactive.
    - **Block.** Blocks connections that violate this signature rule.
    - **Log.** Logs violations of this signature rule to the NetScaler log.
    - **Stat.** Includes violations of this signature rule in the statistics.
    - **Remove.** Strips information that matches the signature rule from the response. (Applies only to response rules.)
    - **X-Out.** Masks information that matches the signature rule with the letter X. (Applies only to response rules.)
    - **Allow Duplicates.** Allows duplicates of this signature rule in this signatures object.

5. Choose a category for the new signature rule from the **Category** drop-down list.

    If you want to create a category, click **Add**. For more information, see Add a signature rule category.

6. In the **LogString** text box, type a brief description of the signature rule to be used in the logs.
7. In the **Comment** text box, type a comment. (Optional)
8. Click **More** to modify the advanced options.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

a. To strip HTML comments before applying this signature rule, in the Strip Comments drop-down list choose All or Exclude Script Tag.
b. To set CSRF Referrer Header checking, in the CSRF Referrer Header checking radio button array, select either the If Present or Always radio button.
c. To manually modify the Rule ID assigned to this local signature rule, modify the number in the Rule ID text box. The ID must be a positive integer between 1000000 and 1999999 that has not already been assigned to a local signature rule.
d. To assign a version number to the new signature rule, modify the number in the Version Number text box.
e. To assign a Source ID, modify the string in the Source ID text box.
f. To specify the source, choose Local or Snort from the Source drop-down list, or click the Add icon to the right of the list and add a new source.
g. To assign a harm score to violations of this local signature rule, type a number between 1 and 10 in the Harm Score text box.
h. To assign a severity rating to this local signature rule, in the Severity drop-down list choose High, Medium, or Low, or click the Add icon to the right of the list and add a new severity rating.
i. To assign a violation type to this local signature rule, in the Type drop-down list choose Vulnerable or Warning, or click the Add icon to the right of the list and add a new violation type.

9. In **Rule Patterns**, click **Add** to add a pattern. You can also edit the existing patterns to do so click **Edit**.

   For more information about adding or editing patterns, see Signature Rule Patterns.

10. Click **OK**.

Add a signature rule category

Putting signature rules into a category enables you to configure the actions for a group of signatures instead of for each individual signature. You might want to do so for the following reasons:

- **Ease of selection.** For example, assume that all of the signature rules in a particular group protect against attacks on a specific type of web server software or technology. If your protected websites use that software or technology, you want to enable them all. If they do not, you do not want to enable any of them.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Ease of initial configuration.** It is easiest to set defaults for a group of signatures as a category, instead of one-by-one. You can then make any changes to the individual signatures as needed.
- **Ease of ongoing configuration.** It is easier to configure signatures if you can display only those that meet specific criteria, such as belonging to a specific category.

Add a signature rule category

Adding signature rules to a category enables you to configure the actions for a group of signatures instead of for each individual signature. You might want to do so for the following reasons:

- **Ease of selection.** For example, assume that all of signature rules in a particular group protect against attacks on a specific type of web server software or technology. If your protected websites use that software or technology, you want to enable them all. If they do not, you do not want to enable any of them.
- **Ease of initial configuration.** It is easiest to set defaults for a group of signatures as a category, instead of one-by-one. You can then make any changes to individual signatures as needed.
- **Ease of ongoing configuration.** It is easier to configure signatures if you can display only those that meet specific criteria, such as belonging to a specific category.

1. Navigate to **Security** > **Web App Firewall** > **Signatures**.
2. In the details pane, select that signatures object that you want to configure, and then click **Open**.
3. In the **Modify Signatures Object** dialog box, in the middle of the screen, beneath the **Filtered Results** window, click **Add**.
4. In the **Add Local Signature Rule** dialog box, click the icon to the right of the Category drop-down list.
5. In the **Add Signature Rule Category** dialog box, **New Category** text box, type a name for your new signature category. The name can consist of from one to 64 characters.
6. Click **OK**.

Add signature rule patterns

You can add a pattern or modify an existing pattern to specify a string or expression that characterizes an attack if the signature matches. To detect the patterns an attack exhibits, you can examine the logs on your web server. You can use a tool to observe connection data in real time, or obtain the string or expression from a third-party report about the attack.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

IMPORTANT

A new pattern that you add to a signature rule is in an AND relationship with the existing patterns. Do not add a pattern to an existing signature rule if you do not want a potential attack to have to match all patterns to match the signature.

Each pattern can consist of a simple string, a PCRE-format regular expression, or the built-in SQL injection or cross-site scripting pattern. Before you attempt to add a pattern that is based on a regular expression, you must make sure that you understand PCRE-format regular expressions. PCRE expressions are complex and powerful. If you do not understand how they work, you can unintentionally create a pattern that matches something that you did not want (a *false positive*) or that fails to match something that you did want (a *false negative*).

Custom signature pattern for non-default content types

The NetScaler Web App Firewall (WAF) now supports new location to inspect canonicalized content. By default, WAF does not block encoded payload with non-default content types. When these content types are whitelisted, and no configured action is applied, the SQL and cross-site scripting protection check do not filter SQL or cross-site scripting attacks in the encoded payloads. To resolve the issue, a user can create a custom signature rule with this new location (HTTP_CANON_POST_BODY) that examines the encoded payloads for non-default content-types and if there is any SQL or cross-site scripting attack, it blocks the traffic after canonicalization of the post body.

NOTE:

That support is applicable only for HTTP requests.

If you are not already familiar with PCRE-format regular expressions, you can use the following resources to learn the basics, or for help with some specific issue:

- "Mastering Regular Expressions," Third Edition. Copyright (c) 2006 by Jeffrey Friedl. O'Reilly Media, ISBN: 9780596528126.
- "Regular Expressions Cookbook". Copyright (c) 2009 by Jan Goyvaerts and Steven Levithan. O'Reilly Media, ISBN: 9780596520687
- PCRE Man page/Specification
- PCRE Man Page/Specification
- Wikipedia PCRE entry

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- PCRE Mailing List

If you need to encode non-ASCII characters in a PCRE-format regular expression, the NetScaler platform supports the encoding of hexadecimal UTF-8 codes. For more information, see PCRE Character Encoding Format.

Configure a signature rule pattern

When you are editing a signature, you can add or edit the rule pattern. To add or modify the signature rules, see Edit signatures to add or modify rules.

- **Type** - Select the type of connection that the pattern is intended to match.
  - **Request** - It matches the request elements or features such as injected SQL code, attacks on web forms, cross-site scripts, or inappropriate URLs.
  - **Response** - It matches the response elements or features such as credit card numbers or safe objects.
- **Location** - Select an **Area** to examine with this pattern. The area describes what elements of the HTTP request or response to examine for this pattern. Based on the selected pattern type, the options appear in the **Area** list. depend upon the chosen pattern type.

  For the **Request** pattern type, items relevant to HTTP requests appear.
  - **HTTP_ANY**. All parts of the HTTP connection.
  - **HTTP_COOKIE**. All cookies in the HTTP request headers after any cookie transformations are performed.

    NOTE

    Does not search HTTP response "Set-Cookie:" headers.
  - **HTTP_FORM_FIELD**. Form fields and their contents, after URL decoding, percent decoding, and removal of excess whitespace. You can use the `<Location>` tag to further restrict the list of form field names to be searched.
  - **HTTP_HEADER**. The value portions of the HTTP header after any cross-site scripting or URL decoding transformations.
  - **HTTP_METHOD**. The HTTP request method.
  - **HTTP_URL**. The value portion of the URL in the HTTP headers, excluding any query or fragment ports, after conversion to the UTF-* character set, URL decoding, stripping of

© 1997–2026 Citrix Systems, Inc. All rights reserved.

whitespace, and conversion of relative URLs to absolute. Does not include HTML entity decoding.

- **HTTP_ORIGIN_URL**. The origin URL of a web form.
- **HTTP_POST_BODY**. The HTTP post body and the web form data that it contains.
- **HTTP_RAW_COOKIE**. All HTTP request cookie, including the "Cookie:" name portion. Note: Does not search HTTP response "Set-Cookie:" headers.
- **HTTP_RAW_HEADER**. The entire HTTP header, with individual headers separated by linefeed characters (\n) or carriage return/line-feed strings (\r\n).

For the **Response** type, items relevant to HTTP responses appear.

- **HTTP_RAW_RESP_HEADER**. The entire response header, including the name and value parts of the response header after URL transformation has been done, and the complete response status. As with HTTP_RAW_HEADER, individual headers are separated by linefeed characters (\n) or carriage return/line-feed strings (\r\n).
- **HTTP_RAW_SET_COOKIE**. The entire Set-Cookie header after any URL transformations have been performed

  NOTE

  URL transformation can change both the domain and path parts of the Set-Cookie header.

- **HTTP_RAW_URL**. The entire request URL before any URL transformations is performed, including any query or fragment parts.
- **HTTP_RESP_HEADER**. The value part of the complete response headers after any URL transformations have been performed.
- **HTTP_RESP_BODY**. The HTTP response body
- **HTTP_SET_COOKIE**. All "Set-Cookie" headers in the HTTP response headers.
- **HTTP_STATUS_CODE**. The HTTP status code.
- **HTTP_STATUS_MESSAGE**. The HTTP status message.

When you select an option from the **Area** list, it dynamically changes options for the selected area.

- **Any.** Checks field names or URLs.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Literal**. Checks field names or URLs that contain a literal string. After you select Literal, a text box is displayed. Type the literal string that you want in the text box.
- **PCRE**. Checks field names or URLs that match a PCRE-format regular expression. After you select this choice, the regular expression window is displayed. Type the regular expression in the window. You can use the **Regex Tokens** to insert common regular expression elements at the cursor, or you can click Regex Editor to display the Regular Expression Editor dialog box, which provides more assistance in constructing the regular expression that you want.
- **Expression**. Checks field names or URLs that match a NetScaler default expression.

- **Pattern** - A pattern is a literal string or PCRE-format regular expression that defines the pattern that you want to match. Select the **Match** type from the list.
  - **Literal**. A literal string.
  - **PCRE**. A PCRE-format regular expression.

    NOTE

    When you choose PCRE, the regular expression tools beneath the Pattern window are enabled. These tools are not useful for most other types of patterns.

  - **Expression**. An expression in the NetScaler default expressions language is the same expression language for creating Web App Firewall policies on the NetScaler appliance. Although the NetScaler expressions language was originally developed for policy rules, it is a highly flexible general purpose language that can also be used to define a signature pattern.

    When you choose Expression, the NetScaler Expression Editor appears beneath the Pattern window. For more information about the Expression Editor and instructions on how to use it, see To add a firewall rule (expression) by using the Add Expression dialog box
  - **SQL Injection**. Directs the Web App Firewall to look for injected SQL in the specified location.
  - **CrossSiteScripting**. Directs the Web App Firewall to look for cross-site scripts in the specified location.
  - **CommandInjection**. Directs the NetScaler Web App Firewall to look for any injected malicious commands in the specified location.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **SQLInjectionGrammar**. Directs the NetScaler Web App Firewall to look for injected SQL grammar in the specified location. Especially when commonly used words such as `Select` and `From` are used in an HTTP request.
- **CommandInjectionGrammar**. Directs the NetScaler Web App Firewall to look for injected malicious command grammar in the specified location. Especially, when a commonly used word such as “Exit” is used in an HTTP request.

If you want to configure more settings, specify the following:

- **Offset**. The number of characters to skip over before starting to match on this pattern. You use this field to start examining a string at some point other than the first character.
- **Depth**. How many characters from the starting point to examine for matches. You use this field to limit searches of a large string to a specific number of characters.
- **Min-Length**. The string to be searched must be at least the specified number of bytes in length. Shorter strings are not matched.
- **Max-Length**. The string to be searched must be no longer than the specified number of bytes in length. Longer strings are not matched.
- **Search method**. A check box labeled `fastmatch`. You can enable `fastmatch` only for a literal pattern, to improve performance.

NOTE

Until you click **OK** in the **Signature Rule Pattern** pane, your changes are not saved. Do not close either of these dialog boxes without clicking **OK** unless you want to discard your changes.

Import and merge rules

When using the signature editor to perform an import and merge operation from the GUI, you can now see the new, updated, duplicate, and invalid rules.

The signature editor displays the following four new rows:

1. New Rules
2. Updated Rules
3. Duplicate Rules
4. Invalid Rules

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The output of the New Rules Only and Updated Rules Only filters also appears in the Category filter pane of the Edit window in signature editor.

You will need to import the files from GUI to see the corresponding links for New, duplicate, invalid and updated rules.

Procedure to import signature rules:

1. In the NetScaler web GUI, go to **Configuration > Security > NetScaler Web App Firewall Signatures**. In the Signatures window, click **Add**. Then select **File Format** > **Native**, **Import From** > **URL** and in the URL field, add the above link. If you are unable to access the URL, you can download the XML data.
2. After you click **Open**, the signature file will open and you can see links for new rule and invalid rules.
3. If you import a `3<sup>rd</sup>` party signature rule, you can see 90 new rules and 9 duplicate rules in the imported .xml file. If you are unable to access the URL, you can download the XML data.

Signature updates in high availability deployment and build upgrades

The signature update occurs on the primary node. While the signatures are updated on the primary node, in parallel the updated files are simultaneously synchronized with the secondary node.

The Default signature is always updated first and then the rest of the user-defined signatures are updated.

Connecting to Amazon AWS

The default route NSIP is used to connect to the Amazon AWS. If there is a specific use case scenario where SNIP is used, and if there are multiple SNIPs, the first one to receive the ARP response from the hosting site will hold the route.

Signature updates during version upgrades

In case of an upgrade, if the NS has an older base version for the signatures, *Default signature is automatically updated if a newer signature version is available.

If the schema has changed, the schema version of all the signature objects gets updated when the version is upgraded.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

However, for the base version of the user-defined signatures, the behavior is different in release 10.5 versus release 11.0.

In release 10.5, only the default signature was updated and the base version of the rest of the signatures remained unchanged after the build upgrade.

In release 11.0, this behavior has changed. When the appliance is upgraded to install a new build, not only the *Default signature object but all the other user-defined signatures that currently exist in the appliance are also updated and will have the same version after the build upgrade.

In both 10.5 and 11.0 release builds, if auto-update is configured, the *Default Signatures as well as all non-zero version signatures get auto-updated to the latest released signature version and will have the same base version.

Overview of security checks

The Web App Firewall advanced protections (security checks) are a set of filters designed to catch complex or unknown attacks on your protected websites and web services. The security checks use heuristics, positive security, and other techniques to detect attacks that may not be detected by signatures alone. You configure the security checks by creating and configuring an Web App Firewall profile, which is a collection of user-defined settings that tell the Web App Firewall which security checks to use and how to handle a request or response that fails a security check. A profile is associated with a signatures object and with a policy to create a security configuration.

The Web App Firewall provides twenty security checks, which differ widely in the types of attacks that they target and how complex they are to configure. The security checks are organized into the following categories:

- **Common security checks.** Checks that apply to any aspect of web security that either does not involve content or is equally applicable to all types of content.
- **HTML security checks.** Checks that examine HTML requests and responses. These checks apply to HTML-based websites and to the HTML portions of Web 2.0 sites, which contain mixed HTML and XML content.
- **XML security checks.** Checks that examine XML requests and responses. These checks apply to XML-based web services and to the XML portions of Web 2.0 sites.

The security checks protect against a wide range of types of attack, including attacks on operation system and web server software vulnerabilities, SQL database vulnerabilities, errors in the design

© 1997–2026 Citrix Systems, Inc. All rights reserved.

and coding of websites and web services, and failures to secure sites that host or can access sensitive information.

All security checks have a set of configuration options, the check actions, which control how the Web App Firewall handles a connection that matches a check. Three check actions are available for all security checks. They are:

- **Block.** Block connections that match the signature. Disabled by default.
- **Log.** Log connections that match the signature, for later analysis. Enabled by default.
- **Stats.** Maintain statistics, for each signature, that show how many connections it matched and provide certain other information about the types of connections that were blocked. Disabled by default.

A fourth check action, **Learn**, is available for more than half of the check actions. It observes traffic to a protected website or web service and uses connections that repeatedly violate the security check to generate recommended exceptions (relaxations) to the check, or new rules for the check. In addition to the check actions, certain security checks have parameters that control the rules that the check uses to determine which connections violate that check, or that configure the Web App Firewall's response to connections that violate the check. These parameters are different for each check, and they are described in the documentation for each check.

To configure security checks, you can use the Web App Firewall wizard, as described in The Web App Firewall Wizard, or you can configure the security checks manually, as described in Manual Configuration By Using the GUI. Some tasks, such as manually entering relaxations or rules or reviewing learned data, can be done only by using the GUI, not the command line. Using the wizard is usually best configuration method, but in some cases manual configuration might be easier if you are thoroughly familiar with it and simply want to adjust the configuration for a single security check.

Regardless of which method you use to configure the security checks, each security check requires that certain tasks be performed. Many checks require that you specify exceptions (relaxations) to prevent blocking of legitimate traffic before you enable blocking for that security check. You can do this manually, by observing the log entries after a certain amount of traffic has been filtered and then creating the necessary exceptions. However, it is usually much easier to enable the learning feature and let it observe the traffic and recommend the necessary exceptions.

Web App Firewall uses packet engines (PE) during processing the transactions. Each packet engine has a limit of 100K sessions which is sufficient for most deployment scenarios. However, when Web App Firewall is processing heavy traffic and the session timeout is configured at a

© 1997–2026 Citrix Systems, Inc. All rights reserved.

higher value, the sessions might get accumulated. If the number of alive Web App Firewall sessions exceed the 100K per PE limit, the Web App Firewall security check violations might not be sent to the Security Insight appliance. Lowering the session timeout to a smaller value, or using sessionless mode for the security checks with sessionless URL closure or sessionless field consistency might help in preventing the sessions getting accumulated. If this is not a viable option in scenarios where transactions might require longer sessions, upgrading to a higher-end platform with more packet engine is recommended.

Support for cached AppFirewall is added, and the max session setting through the CLI per core is set to 50K sessions.

Request and response security checks

The following are the list of security checks:

Request checks

The following are the request security checks:

- Start URL
- Deny URL
- Cookie Consistency
- Cookie Hijacking
- Butter Overflow
- Post Body Limit
- Content-type
- Infer Content Type XML Payload
- File Upload Types
- Form Field Consistency
- Field Formats
- CSRF Form Tagging
- HTML Cross-Site Scripting
- HTML SQL Injection
- HTML Command Injection
- Block Keyword - XML
- XML Format

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- XML Denial of Service
- XML Cross-Site Scripting
- XML SQL Injection
- XML Attachement
- XML Message Validation
- JSON Denial of Service
- JSON Cross-Site Scripting
- JSON SQL Injection
- JSON Command Injection
- Block Keyword - JSON

Response checks

The following are the response security checks:

- Credit Card
- Safe Object
- XML SOAP Fault Filtering
- Some of Web Service Interoperability

Top level protections

Four of the Web App Firewall protections are especially effective against common types of Web attacks, and are therefore more commonly used than any of the others. They are:

- **HTML Cross-Site Scripting.** Examines requests and responses for scripts that attempt to access or modify content on a different website than the one on which the script is located. When this check finds such a script, it either renders the script harmless before forwarding the request or response to its destination, or it blocks the connection.
- **HTML SQL Injection.** Examines requests that contain form field data for attempts to inject SQL commands into an SQL database. When this check detects injected SQL code, it either blocks the request or renders the injected SQL code harmless before forwarding the request to the Web server.

  Note: If both of the following conditions apply to your configuration, you must make certain that your Web App Firewall is correctly configured:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

    - If you enable the HTML Cross-Site Scripting check or the HTML SQL Injection check (or both), and
    - Your protected websites accept file uploads or contain Web forms that can contain large POST body data.

  For more information about configuring the Web App Firewall to handle this case, see Configuring the Application Firewall.

- **Buffer Overflow.** Examines requests to detect attempts to cause a buffer overflow on the Web server.
- **Cookie Consistency.** Examines cookies returned with user requests to verify that they match the cookies your Web server set for that user. If a modified cookie is found, it is stripped from the request before the request is forwarded to the Web server.

The Buffer Overflow check is simple; you can usually enable blocking for it immediately. The other three top-level checks are considerably more complex and require configuration before you can safely use them to block traffic. NetScaler® strongly recommends that, rather than attempting to configure these checks manually, you enable the learning feature and allow it to generate the necessary exceptions.

HTML cross-site scripting check

The HTML Cross-Site Scripting (cross-site scripting) check examines both the headers and the POST bodies of user requests for possible cross-site scripting attacks. If it finds a cross-site script, it either modifies (*transforms*) the request to render the attack harmless, or blocks the request.

NOTE:

The HTML Cross-Site Scripting (cross-site scripting) check works only for content type, content length, and so forth. Also ensure to have the 'checkRequestHeaders' option enabled in your Web Application Firewall profile.

You can prevent misuse of the scripts on your protected websites by using the HTML Cross-Site Scripting scripts that violate the *same origin rule*, which states that scripts must not access or modify content on any server but the server on which they are located. Any script that violates the same origin rule is called a cross-site script, and the practice of using scripts to access or modify content on another server is called cross-site scripting. The reason cross-site scripting is a security issue is that a web server that allows cross-site scripting can be attacked with a script that is not on that web server, but on a different web server, such as one owned and controlled by the attacker.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Unfortunately, many companies have a large installed base of JavaScript-enhanced web content that violates the same origin rule. If you enable the HTML Cross-Site Scripting check on such a site, you have to generate the appropriate exceptions so that the check does not block legitimate activity.

The Web App Firewall offers various action options for implementing HTML Cross-Site Scripting protection. In addition to the **Block**, **Log**, **Stats** and **Learn** actions, you also have the option to **Transform cross-site scripts** to render an attack harmless by the entity encoding the script tags in the submitted request. You can configure Check complete URLs for cross-site scripting parameter to specify if you want to inspect not just the query parameters but the entire URL to detect cross-site scripting attack. You can configure the **InspectQueryContentTypes** parameter to inspect the request query portion for the cross-site scripting attack for the specific content-types.

You can deploy relaxations to avoid false positives. The Web App Firewall learning engine can provide recommendations for configuring relaxation rules.

To configure an optimized HTML Cross-Site Scripting protection for your application, configure one of the actions:

- **Block**—If you enable block, the block action is triggered if the cross-site scripting tags are detected in the request.
- **Log**—If you enable the log feature, the HTML Cross-Site Scripting check generates log messages indicating the actions that it takes. If block is disabled, a separate log message is generated for each header or form field in which the cross-site scripting violation was detected. However, only one message is generated when the request is blocked. Similarly, 1 log message per request is generated for the transform operation, even when cross-site scripting tags are transformed in multiple fields. You can monitor the logs to determine whether responses to legitimate requests are getting blocked. A large increase in the number of log messages can indicate attempts to launch an attack.
- **Stats**—If enabled, the stats feature gathers statistics about violations and logs. An unexpected surge in the stats counter might indicate that your application is under attack. If legitimate requests are getting blocked, you might have to revisit the configuration to see if you must configure the new relaxation rules or modify the existing ones.
- **Learn**—If you are not sure which relaxation rules might be ideally suited for your application, you can use the learn feature to generate HTML Cross-Site Scripting rule recommendations based on the learned data. The Web App Firewall learning engine monitors the traffic and provides learning recommendations based on the observed values. To get optimal benefit

© 1997–2026 Citrix Systems, Inc. All rights reserved.

without compromising performance, you might want to enable the learn option for a short time to get a representative sample of the rules, and then deploy the rules and disable learning.

- **Transform cross-site scripts**—If enabled, the Web App Firewall makes the following changes to requests that match the HTML Cross-Site Scripting check:
  - Left angle bracket (<) to HTML character entity equivalent (<)
  - Right angle bracket (>) to HTML character entity equivalent (>)

This ensures that browsers do not interpret unsafe html tags, such as `<script>`, and thereby run malicious code. If you enable both request-header checking and transformation, any special characters found in request headers are also modified. If the scripts on your protected website contain cross-site scripting features, but your website does not rely upon those scripts to operate correctly, you can safely disable blocking and enable transformation. This configuration ensures that no legitimate web traffic is blocked, while stopping any potential cross-site scripting attacks.

- **Check complete URLs for cross-site scripting**. If checking of complete URLs is enabled, the Web App Firewall examines entire URLs for HTML cross-site scripting attacks instead of checking just the query portions of URLs.
- **Check Request headers**. If Request header checking is enabled, the Web App Firewall examines the headers of requests for HTML cross-site scripting attacks, instead of just URLs. If you use the GUI, you can enable this parameter in the Settings tab of the Web App Firewall profile.
- **InspectQueryContentTypes**. If Request query inspection is configured, the App Firewall examines the query of requests for cross-site scripting attacks for the specific content-types. If you use the GUI, you can configure this parameter in the Settings tab of the App Firewall profile.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

IMPORTANT:

As part of the streaming changes, the Web App Firewall processing of the cross-site scripting tags has changed. This change is applicable to 11.0 builds onwards. This change is also pertinent for the enhancement builds of 10.5.e that support request side streaming. In earlier releases, the presence of either open bracket (<), or close bracket (>), or both open and close brackets (<>) was flagged as cross-site scripting Violation. The behavior has changed in the builds that include support for request side streaming. Only the close bracket character (>) is no longer considered as an attack. Requests are blocked even when an open bracket character (<) is present, and is considered as an attack. The Cross-site scripting attack gets flagged.

Cross-site scripting Fine grained Relaxations

The Web App Firewall gives you an option to exempt a specific form field, header, or Cookie from the cross-site scripting inspection check. You can completely bypass the inspection for one or more of these fields by configuring the relaxation rules.

The Web App Firewall allows you to implement tighter security by fine-tuning the relaxation rules. An application might require the flexibility to allow specific patterns, but configuring a relaxation rule to bypass the security inspection might make the application vulnerable to attacks, because the target field is exempted from inspection for any cross-site scripting attack patterns. Cross-site scripting fine grained relaxation provides the option to allow specific attributes, tags, and patterns. The rest of the attributes, tags, and patterns are blocked. For example, the Web App Firewall currently has a default set of more than 125 denied patterns. Because hackers can use these patterns in Cross-site script attacks, the Web App Firewall flags them as potential threats. You can relax one or more patterns that are considered safe for the specific location. The rest of the potentially dangerous cross-site scripting patterns are still checked for the target location and continue to trigger the security check violations. You now have much tighter control.

The commands used in relaxations have optional parameters for **Value Type** and **Value Expression**. The value type can be left blank or you have an option to select **Tag** or **Attribute** or **Pattern**. If you leave the value type blank, the configured field of the specified URL is exempted from the Cross-Site Scripting check inspection. If you select a value type, you must provide a value expression. You can specify whether the value expression is a regular expression or a literal string. When the input is matched against the allowed and denied list, only the specified expressions configured in the relaxation rules are exempted.

The Web App Firewall has the following cross-site scripting built-in lists:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. **cross-site scripting Allowed Attributes**: There are 52 defaults allowed attributes, such as, **abbr**, **accesskey**, **align**, **alt**, **axis**, **bgcolor**, **border**, **cell padding**, **cell spacing**, **char**, **charoff**, **charset** and so forth
2. **cross-site scripting Allowed Tags**: There are 47 defaults allowed tags, such as, **address**, **basefont**, **bgsound**, **big**, **blockquote**, **bg**, **br**, **caption**, **center**, **cite**, **dd**, **del** and so forth
3. **cross-site scripting Denied Patterns**: There are 129 defaults denied patterns, such as, **FSCommand**, **javascript:**, **onAbort**, **onActivate** and so forth

WARNING

Web App Firewall action URLs are regular expressions. When configuring HTML cross-site scripting relaxation rules, you can specify **Name**, and **Value Expression** to be literal or RegEx. Regular expressions are powerful. Especially if you are not thoroughly familiar with PCRE-format regular expressions, double-check any regular expressions you write. Make sure that they define exactly the rule that you want to add as an exception, and nothing else. Careless use of wildcards, and especially of the dot-asterisk (.*) metacharacter or the wildcard combination, can have results that you do not want, such as blocking access to web content that you did not intend to block or allowing an attack that the HTML Cross-Site Scripting check would otherwise have blocked.

Points to Consider:

- Value expression is an optional argument. A field name might not have any value expression.
- A field name can be bound to multiple value expressions.
- Value expressions must be assigned a value type. The cross-site scripting value type can be: 1) Tag, 2) Attribute, or 3) Pattern.
- You can have multiple relaxation rules per field name/URL combination
- The form field names and the action URLs are not case sensitive.

Using the Command Line to Configure the HTML Cross-Site Scripting check

To configure HTML Cross-Site Scripting check actions and other parameters by using the command line

If you use the command-line interface, you can enter the following commands to configure the HTML Cross-Site Scripting Check:

- set appfw profile topic.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- `<name> -crossSiteScriptingAction (([block] [learn] [log] [stats]) | [**none**])`
- [set appfw profile topic.
- `<name> **-crossSiteScriptingTransformUnsafeHTML** (ON | OFF)`
- set appfw profile topic.
- `<name> -crossSiteScriptingCheckCompleteURLs (ON | OFF)`
- set appfw profile topic.
- `<name> - checkRequestHeaders (ON | OFF)`
- `<name> - CheckRequestQueryNonHtml (ON | OFF)`

To configure an HTML Cross-Site Scripting check relaxation rule by using the command line

Use the bind or unbind command to add or delete binding, as follows:

- `bind appfw profile <name> -crossSiteScripting <String> [isRegex (REGEX | NOTREGEX)] <formActionURL> [-location <location>] [-valueType (Tag|Attribute|Pattern) [<valueExpression>] [-isValueRegex (REGEX | NOTREGEX) ]]`
- `unbind appfw profile <name> -crossSiteScripting <String> <formActionURL> [-location <location>] [-valueType (Tag |Attribute|Pattern) [<valueExpression>]]`

Using the GUI to configure the HTML cross-site scripting check

In the GUI, you can configure the HTML Cross-Site Scripting check in the pane for the profile associated with your application.

To configure or modify the HTML Cross-Site Scripting check by using the GUI

1. Navigate to **Application Firewall** > **Profiles**, highlight the target profile, and click **Edit**.
2. In the **Advanced Settings** pane, click **Security Checks**.

The security check table displays the currently configured action settings for all the security checks. You have 2 options for configuration:

a. If you want to enable or disable **Block**, **Log**, **Stats**, and **Learn** actions for the HTML Cross-Site Scripting, you can select or clear check boxes in the table, click **OK**, and then click **Save and Close** to close the **Security Check** pane.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

b. If you want to configure more options for this security check, double-click **HTML Cross-Site Scripting**, or select the row and click **Action Settings**, to display the following options:

Transform cross-site scripts—Transform unsafe script tags.

Check complete URLs for Cross-site scripting—Instead of checking just the query part of the URL, check the complete URL for cross-site script violations.

After changing any of the above settings, click **OK** to save the changes and return to the Security Checks table. You can proceed to configure other security checks if needed. Click **OK** to save all the changes you have made in the **Security Checks** section, and then click **Save and Close** to close the **Security Check** pane.

To enable or disable the **Check request Header** setting, in the **Advanced Settings** pane, click **Profile Settings**. In **Common Settings**, Select or clear the **Check Request Headers** check box. Click **OK**. You can either use the **X** icon at the top right hand side of the **Profile Settings** pane to close this section or, if you have finished configuring this profile, you can click **Done** to return to the **Application Firewall** > **Profile**.

To enable or disable the **Check request Query Non HTML** setting, in the **Advanced Settings** pane, click **Profile Settings**. In **Common Settings**, Select or clear the **Check request Query Non HTML** check box. Click **OK**. You can either use the X icon at the top right hand side of the **Profile Settings** pane to close this section or, if you have finished configuring this profile, you can click **Done** to return to the **App Firewall > Profile**.

To configure an HTML Cross-Site Scripting relaxation rule by using the GUI

1. Navigate to **Application Firewall** > **Profiles**, highlight the target profile, and click **Edit**.
2. In the **Advanced Settings** pane, click **Relaxation Rules**.
3. In the Relaxation Rules table, double-click the **HTML Cross-Site Scripting** entry, or select it and click **Edit**.
4. In the **HTML Cross-Site Scripting Relaxation Rules** dialogue box, perform **Add**, **Edit**, **Delete**, **Enable**, or **Disable** operations for relaxation rules.

NOTE

When you add a new rule, the **Value Expression** field is not displayed unless you select **Tag** or **Attribute** or **Pattern** option in the **Value Type** Field.

To manage HTML Cross-Site Scripting relaxation rules by using the visualizer

© 1997–2026 Citrix Systems, Inc. All rights reserved.

For a consolidated view of all the relaxation rules, you can highlight the **HTML Cross-Site Scripting** row in the Relaxation Rules table, and click **Visualizer**. The visualizer for deployed relaxations offers you the option to **Add** a new rule or **Edit** an existing one. You can also **Enable** or **Disable** a group of rules by selecting a node and clicking the corresponding buttons in the relaxation visualizer.

To view or customize the Cross-Site Scripting patterns by using the GUI

You can use the GUI to view or customize the default list of cross-site scripting allowed attributes or allowed tags. You can also view or customize the default list of cross-site scripting denied Patterns.

The default lists are specified in **Application Firewall** > **Signatures** > **Default Signatures**. If you do not bind any signature object to your profile, the default cross-site scripting allowed and denied list specified in the Default Signatures object will be used by the profile for the Cross-Site Scripting security check processing. The Tags, Attributes, and Patterns, specified in the default signatures object, are read-only. You cannot edit or modify them. If you want to modify or change these, make a copy of the Default Signatures object to create a User-Defined signature object. Make changes in the allowed or denied lists in the new User-defined signature object and use this signature object in your profile that is processing the traffic for which you want to use these customized allowed and denied lists.

1. To view default cross-site scripting patterns:

a. Navigate to **Application Firewall** > **Signatures**, select **Default Signatures**, and click **Edit**. Then click **Manage SQL/cross-site scripting Patterns**.

The **Manage SQL/cross-site scripting Paths** table shows the following three rows pertaining to cross-site scripting:

`xss/allowed/attribute`

`xss/allowed/tag`

`xss/denied/pattern`

b. Select a row and click **Manage Elements** to display the corresponding cross-site scripting Elements (Tag, Attribute, Pattern) used by the Web App Firewall **Cross-Site Scripting** check.

1. **To customize cross-site scripting Elements**: You can edit the User-Defined signature object to customize the allowed Tag, allowed Attributes, and denied Patterns. You can add new entries or remove the existing ones.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

a. Navigate to **Application Firewall** > **Signatures**, highlight the target User-defined signature, and click **Edit**. Click **Manage SQL/cross-site scripting Patterns** to display the **Manage SQL/cross-site scripting paths** table.

b. Select the target cross-site scripting row.

i. Click **Manage Elements**, to **Add**, **Edit** or **Remove** the corresponding cross-site scripting element.

ii. Click **Remove** to remove the selected row.

WARNING:

You must be careful before you remove or modify any default cross-site scripting element, or delete the cross-site scripting path to remove the entire row. The signature rules and the Cross-Site Scripting security check rely on these elements for detecting attacks to protect your applications. Customizing the cross-site scripting Elements can make your application vulnerable to Cross-Site Scripting attacks if the required pattern is removed during editing.

Learn HTML Cross-Site Scripting (cross-site scripting) violations

With learning enabled, the NetScaler Web App Firewall learning engine monitors the traffic and learns the cross-site scripting URL violations. You can periodically inspect cross-site scripting URL rules and deploy it for false positive scenarios.

NOTE:

In a cluster configuration, all nodes must be of the same version to deploy the cross-site scripting URL rules.

As part of the learning configuration, the Web App Firewall offers fine grained HTML Cross-Site Scripting learning. The learning engine makes recommendations regarding the observed Value Type (Tag, Attribute, Pattern) and the corresponding Value expression observed in the input fields. In addition to checking the blocked requests to determine whether the current rule is too restrictive and needs to be relaxed, you can review the rules generated by the learning engine to determine which value type and value expressions are triggering violations and need to be addressed in the relaxation rules.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE:

The Web App Firewall's learning engine can distinguish only the first 128 bytes of the name. If a form has multiple fields with names that match for the first 128 bytes, the learning engine might not be able to distinguish between them. Similarly, the deployed relaxation rule might inadvertently relax all such fields from HTML Cross-Site Scripting inspection.

Tip:
Cross-site scripting tags which are longer than 12 characters are not learned or logged correctly. If you need a larger tag length for learning, you can add a large non-appearing tag in the **AS_cross-site scripting_ALLOWED_TAGS_LIST** for length 'x'.
The HTML Cross-Site Scripting learning process reduces false positives in cross-site scripting attacks. With learning enabled, you can learn all violations in a request and potentially apply relaxation to multiple tags, attributes, or patterns without the need of repetition.

For example, if there are 15 custom tags in a payload each resulting in a violation, you can apply the fine grain relaxation for all tags that are flagged as a violation, instead of repeating the process to apply relaxation for one tag at a time.

Scenario 1: Learning enabled, and block enabled: In this scenario, the NetScaler appliance learns all the violations in custom tags/attributes/patterns, and the request is blocked and each violation is logged. The behavior is consistent for violations identified in form field, header, or cookie.

Scenario 2: Learning enabled and block disabled: In this scenario, the NetScaler appliance learns the violations in custom tags/attributes/patterns and each of the violations is logged. The request is not blocked. The behavior is consistent for violations identified in form field, header, or cookie.

To view or use learned data by using the command line interface

At the command prompt, type one of the following commands:

- `show appfw learningdata <profilename> crossSiteScripting`
- `rm appfw learningdata <profilename> -crossSiteScripting <string> <formActionURL> [<location>] [<valueType> <valueExpression>]`
- `export appfw learningdata <profilename> **crossSiteScripting*`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure cross-site scripting fine grain relaxation to bypass custom tags

You can configure cross-site scripting relaxation in the web app firewall profile to bypass custom tags/attributes/patterns not present in the allow list. At the command prompt, type:

```
bind appfw profile p1 -crossSiteScripting <string> <formActionURL> -valueType <valueType> <value expression>
```

Example:

```
bind appfw profile profile1 -crossSiteScripting formfield1 http://1.1.1.1 -valueType Tag tag1
```

To view or use learned data by using the GUI

1. Navigate to **Application Firewall** > **Profiles**, highlight the target profile, and click **Edit**.
2. In the **Advanced Settings** pane, click **Learned Rules**. You can select the **HTML Cross-Site Scripting** entry in the Learned Rules table and double-click it to access the learned rules. The table displays the **Field Name**, A**ction URL**, **Value Type**, **Value**, and **Hits** columns. You can deploy the learned rules or edit a rule before deploying it as a relaxation rule. To discard a rule, you can select it and click the **Skip** button. You can edit only one rule at a time, but you can select multiple rules to deploy or skip.

You also have the option to show a summarized view of the learned relaxations by selecting the **HTML Cross-Site Scripting** entry in the Learned Rules table and clicking **Visualizer** to get a consolidated view of all the learned violations. The visualizer makes it easy to manage the learned rules. It presents a comprehensive view of the data on one screen and facilitates taking action on a group of rules with one click. The biggest advantage of the visualizer is that it recommends regular expressions to consolidate multiple rules. You can select a subset of these rules, based on the delimiter and Action URL. You can display 25, 50, or 75 rules in the visualizer, by selecting the number from a drop-down list. The visualizer for learned rules offers the option to edit the rules and deploy them as relaxations. Or you can skip the rules to ignore them.

Using the log feature with the HTML Cross-Site Scripting check

When the log action is enabled, the HTML Cross-Site Scripting security check violations are logged in the audit log as **APPFW_cross-site scripting** violations. The Web App Firewall supports both Native and CEF log formats. You can also send the logs to a remote syslog server.

To access the log messages by using the command line

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Switch to the shell and tail the ns.logs in the `/var/log/` folder to access the log messages pertaining to the HTML Cross-Site Scripting violations:

`Shell` `tail -f /var/log/ns.log | grep APPFW_cross-site scripting`

Example of a Cross-Site Scripting security check violation log message in CEF log format:

```
Jul 11 00:45:51 <local0.info> 10.217.31.98 CEF:0|Citrix|NetScaler|NS11.0|
APPFW|**APPFW_cross-site scripting**|6|src=10.217.253.62
geolocation=Unknown spt=4840 method=GET request=http://aaron.stratum8.net/
FFC/CreditCardMind.html?abc\=%3Cdef%3E msg=**Cross-site script check
failed for field abc=\"Bad tag: def"** cn1=133 cn2=294 cs1=pr_ffc cs2=PPE1
cs3=eUljypvLa0BbabwfGVE52Sewg9U0001 cs4=ALERT cs5=2015 act=**not blocked**
```

Example of a Cross-Site Scripting security check violation log message in Native log format showing transform action

```
Jul 11 01:00:28 <local0.info> 10.217.31.98 07/11/2015:01:00:28 GMT ns 0-

l62WINwRMrKsEDil-FC4llF **Cross-site script special characters seen in
fields <transformed>**
```

Access the log messages by using the GUI

The GUI includes a useful tool (Syslog Viewer) for analyzing the log messages. You have multiple options for accessing the Syslog Viewer:

- Navigate to the **Application Firewall** > **Profiles**, select the target profile, and click **Security Checks**. Highlight the **HTML Cross-Site Scripting** row and click **Logs**. When you access the logs directly from the HTML Cross-Site Scripting check of the profile, the GUI filters out the log messages and displays only the logs pertaining to these security check violations.
- You can also access the Syslog Viewer by navigating to **NetScaler** > **System** > **Auditing**. In the **Audit Messages** section, click the **Syslog messages** link to display the Syslog Viewer, which displays all log messages, including other security check violation logs. This is useful for debugging when multiple security check violations might be triggered during request processing.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Navigate to **Application Firewall** > **policies** > **Auditing**. In the Audit Messages section, click the **Syslog messages** link to display the Syslog Viewer, which displays all log messages, including other security check violation logs.

The HTML based Syslog Viewer provides various filter options for selecting only the log messages that are of interest to you. To select log messages for the **HTML Cross-Site Scripting** check, filter by selecting **APPFW** in the drop-down list options for **Module**. The **Event Type** list offers a rich set of options to further refine your selection. For example, if you select the **APPFW_cross-site scripting** check box and click the **Apply** button, only log messages pertaining to the **HTML Cross-Site Scripting security** check violations appear in the Syslog Viewer.

If you place the cursor in the row for a specific log message, multiple options, such as **Module**, **Event Type**, **Event ID**, **Client IP** and so forth appear below the log message. You can select any of these options to highlight the corresponding information in the log message.

Click to Deploy functionality is available only in the GUI. You can use the Syslog Viewer to not only view the logs but also to deploy the HTML Cross-Site Scripting relaxation rules based on the log messages for the Web App Firewall security check violations. The log messages must be in CEF log format for this operation. Click to deploy functionality is available only for log messages that are generated by the block (or not block) action. You cannot deploy a relaxation rule for a log message about the transform operation.

To deploy a relaxation rule from the Syslog Viewer, select the log message. A check box appears in the upper right corner of the **Syslog Viewer** box of the selected row. Select the check box, and then select an option from the **Action** list to deploy the relaxation rule. **Edit & Deploy**, **Deploy**, and **Deploy All** are available as **Action** options.

The HTML Cross-Site Scripting rules that are deployed by using the **Click to Deploy** option do not include the fine grain relaxation recommendations.

Configure click to deploy feature by using the GUI

1. In the Syslog Viewer, select **APPFW** in the **Module** options.
2. Select the **APP_cross-site scripting** as the **Event Type** to filter corresponding log messages.
3. Select the check box to identify the rule to deploy.
4. Use the **Action** drop-down list of options to deploy the relaxation rule.
5. Verify that the rule appears in the corresponding relaxation rule section.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Statistics for the HTML Cross-Site Scripting violations

When the stats action is enabled, the counter for the HTML Cross-Site Scripting check is incremented when the Web App Firewall takes any action for this security check. The statistics are collected for Rate and Total count for Traffic, Violations, and Logs. The size of an increment of the log counter can vary depending on the configured settings. For example, if the block action is enabled, the request for a page that contains 3 HTML Cross-Site Scripting violations increments the stats counter by one, because the page is blocked when the first violation is detected. However, if the block is disabled, processing the same request increments the statistics counter for violations and the logs by three, because each violation generates a separate log message.

To display HTML Cross-Site Scripting check statistics by using the command line

At the command prompt, type:

```
> sh appfw stats
```

To display stats for a specific profile, use the following command:

```
> **stat appfw profile** <profile name>
```

Display HTML Cross-Site Scripting statistics by using the GUI

1. Navigate to **Security** > **Application Firewall > Profiles > Statistics**.
2. In the right pane, access the **Statistics** Link.
3. Use the scroll bar to view the statistics about HTML Cross-Site Scripting violations and logs. The statistics table provides real-time data and is updated every 7 seconds.

Highlights

- **Built-in Support for HTML Cross-Site Scripting attack Protection**—The NetScaler Web App Firewall protects against Cross-Site Scripting attacks by monitoring a combination of allowed attributes and tags, and denied patterns in the received payload. All the built-in default allowed tags, allowed attributes and denied patterns used by the cross-site scripting check are specified in the /netscaler/default_custom_settings.xml file.
- **Customizatio**n—You can change the default list of tags, attributes, and patterns to customize the Cross-Site Scripting security check inspection for the specific needs of your application. Make a copy of the default signature object, modify existing entries, or add new ones. Bind this signature object to your profile to make use of the customized configuration.
- **Hybrid Security Model**—Both signatures and deep security protections use the SQL/cross-site scripting patterns specified in the signature object that is bound to the profile. If no

© 1997–2026 Citrix Systems, Inc. All rights reserved.

signature object is bound to the profile, the SQL/cross-site scripting patterns present in the default signature object are used.

- **Transform**—Note the following about the transform operation:

The transform operation works independently of the other Cross-Site Scripting action settings. If transform is enabled and block, log, stats, and learn are all disabled, cross-site scripting tags are transformed.

If the block action is enabled, it takes precedence over the transform action.

- **Fine Grained Relaxation and Learning**. Fine-tune the relaxation rule to relax a subset of cross-site scripting elements from security check inspection but detect the rest. The learning engine recommends a specific value type and value expressions based on the observed data.
- **Click to Deploy**—Select one, or multiple cross-site scripting violation log messages in the syslog viewer and deploy them as relaxation rules.
- **Charset**—The default charset for the profile must be set based on the need of the application. By default, the profile charset is set to English US (ISO-8859-1). If a request is received without the specified charset, the Web App Firewall processes the request as if it is ISO-8859-1. The open bracket character (<) or the close bracket character (>) will not get interpreted as cross-site scripting tags if these characters are encoded in other charsets. For example, if a request contains a UTF-8 character string "**%uff1cscript%uff1e**" but the charset is not specified on the request page, the cross-site scripting violation might not get triggered unless the default charset for the profile is specified as Unicode.

HTML SQL injection check

Many web applications have web forms that use SQL to communicate with relational database servers. Malicious code or a hacker can use an insecure web form to send SQL commands to the web server. The Web App Firewall HTML SQL Injection check provides special defenses against injection of unauthorized SQL code that might break security. If the Web App Firewall detects unauthorized SQL code in a user request, it either transforms the request, to render the SQL code inactive, or blocks the request. The Web App Firewall examines the request payload for injected SQL code in three locations: 1) POST body, 2) headers, and 3) cookies. To examine a query portion in requests for injected SQL code, please configure an application firewall profile setting 'InspectQueryContentTypes' for the specific content-types.

A default set of keywords and special characters provides known keywords and special characters that are commonly used to launch SQL attacks. You can add new patterns, and you can edit the default set to customize the SQL check inspection. The Web App Firewall offers various action

© 1997–2026 Citrix Systems, Inc. All rights reserved.

options for implementing SQL Injection protection. In addition to the **Block**, **Log**, **Stats** and **Learn** actions, the Web App Firewall profile also offers the option to **transform SQL special characters** to render an attack harmless.

In addition to actions, there are several parameters that can be configured for SQL injection processing. You can check for **SQL wildcard characters**. You can change the SQL Injection type and select one of the 4 options (**SQLKeyword**, **SQLSplChar**, **SQLSplCharANDKeyword**, **SQLSplCharORKeyword**) to indicate how to evaluate the SQL keywords and SQL special characters when processing the payload. The **SQL Comments Handling parameter** gives you an option to specify the type of comments that need to be inspected or exempted during SQL Injection detection.

You can deploy relaxations to avoid false positives. The Web App Firewall learning engine can provide recommendations for configuring relaxation rules.

The following options are available for configuring an optimized SQL Injection protection for your application:

Block—The block action is triggered only if the input matches the SQL injection type specification. For example, if **SQLSplCharANDKeyword** is configured as the SQL injection type, a request is not blocked if it contains no key words, even if SQL special characters are detected in the input. Such a request is blocked if the SQL injection type is set to either **SQLSplChar**, or **SQLSplCharORKeyword**.

Log—If you enable the log feature, the SQL Injection check generates log messages indicating the actions that it takes. If the block action is disabled, a separate log message is generated for each input field in which the SQL violation was detected. However, only one message is generated when the request is blocked. Similarly, one log message per request is generated for the transform operation, even when SQL special characters are transformed in multiple fields. You can monitor the logs to determine whether responses to legitimate requests are getting blocked. A large increase in the number of log messages can indicate attempts to launch an attack.

Stats—If enabled, the stats feature gathers statistics about violations and logs. An unexpected surge in the stats counter might indicate that your application is under attack. If legitimate requests are getting blocked, you might have to revisit the configuration to see if you need to configure new relaxation rules or modify the existing ones.

Learn—If you are not sure which SQL relaxation rules might be ideally suited for your application, you can use the learn feature to generate recommendations based on the learned data. The Web App Firewall learning engine monitors the traffic and provides SQL learning recommendations

© 1997–2026 Citrix Systems, Inc. All rights reserved.

based on the observed values. To get optimal benefit without compromising performance, you might want to enable the learn option for a short time to get a representative sample of the rules, and then deploy the rules and disable learning.

Transform SQL special characters—The Web App Firewall considers three characters, Single straight quote ('), Backslash `(\)`, and Semicolon (;) as special characters for SQL security check processing. The SQL Transformation feature modifies the SQL Injection code in an HTML request to ensure that the request is rendered harmless. The modified HTML request is then sent to the server. All default transformation rules are specified in the /netscaler/default_custom_settings.xml file.

The transform operation renders the SQL code inactive by making the following changes to the request:

- Single straight quote (') to double straight quote ('').
- Backslash `(\)` to double backslash `(\)`.
- Semicolon (;) is dropped completely.

These three characters (special strings) are necessary to issue commands to an SQL server. Unless an SQL command is prefaced with a special string, most SQL servers ignore that command. Therefore, the changes that the Web App Firewall performs when transformation is enabled prevent an attacker from injecting active SQL. After these changes are made, the request can safely be forwarded to your protected website. When web forms on your protected website can legitimately contain SQL special strings, but the web forms do not rely on the special strings to operate correctly, you can disable blocking and enable transformation to prevent blocking of legitimate web form data without reducing the protection that the Web App Firewall provides to your protected websites.

The transform operation works independently of the **SQL Injection Type** setting. If transform is enabled and the SQL Injection type is specified as the SQL keyword, SQL special characters are transformed even if the request does not contain any keywords.

TIP

You normally enable either transformation or blocking, but not both. If the block action is enabled, it takes precedence over the transform action. If you have blocking enabled, enabling transformation is redundant.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Check for SQL Wildcard Characters—Wild card characters can be used to broaden the selections of a SQL (SQL-SELECT) statement. These wild card operators can be used with **LIKE** and **NOT LIKE** operators to compare a value to similar values. The percent (%), and underscore (_) characters are frequently used as wild cards. The percent sign is analogous to the asterisk (*) wildcard character used with MS-DOS and to match zero, one, or multiple characters in a field. The underscore is similar to the MS-DOS question mark (?) wildcard character. It matches a single number or character in an expression.

For example, you can use the following query to do a string search to find all customers whose names contain the D character.

SELECT * from customer WHERE name like "%D%":

The following example combines the operators to find any salary values that have 0 in the second and third place.

SELECT * from customer WHERE salary like '_00%':

Different DBMS vendors have extended the wildcard characters by adding extra operators. The NetScaler Web App Firewall can protect against attacks that are launched by injecting these wildcard characters. The 5 default Wildcard characters are percent (%), underscore (_), caret (\^), opening bracket (). This protection applies to both HTML and XML profiles.

The default wildcard chars are a list of literals specified in the ***Default Signatures**:

- `<wildchar type=”LITERAL”>%</wildchar>`
- `<wildchar type=”LITERAL”>_</wildchar>`
- `<wildchar type=”LITERAL”>\^</wildchar>`
- `<wildchar type=”LITERAL”>[</wildchar>`
- `<wildchar type=”LITERAL”>]</wildchar>`

Wildcard characters in an attack can be PCRE, like . The Web App Firewall also supports PCRE wildcards, but the literal wildcard chars above are sufficient to block most attacks.

NOTE:

The SQL wildcard character check is different from the SQL special character check. This option must be used with caution to avoid false positives.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Check Request Containing SQL Injection Type—The Web App Firewall provides 4 options to implement the desired level of strictness for SQL Injection inspection, based on the individual need of the application. The request is checked against the injection type specification for detecting SQL violations. The 4 SQL injection type options are:

- **SQL Special Character and Keyword**—Both an SQL keyword and an SQL special character must be present in the input to trigger SQL violation. This least restrictive setting is also the default setting.
- **SQL Special Character**—At least one of the special characters must be present in the input to trigger SQL violation.
- **SQL key word**—At least one of the specified SQL keywords must be present in the input to trigger an SQL violation. Do not select this option without due consideration. To avoid false positives, make sure that none of the keywords are expected in the inputs.
- **SQL Special Character or Keyword**—Either the key word or the special character string must be present in the input to trigger the security check violation.

TIP:

If you configure the Web App Firewall to check for inputs that contain an SQL special character, the Web App Firewall skips web form fields that do not contain any special characters. Since most SQL servers do not process SQL commands that are not preceded by a special character, enabling this option can significantly reduce the load on the Web App Firewall and speed up processing without placing your protected websites at risk.

SQL comments handling—By default, the Web App Firewall checks all SQL comments for injected SQL commands. Many SQL servers ignore anything in a comment, however, even if preceded by an SQL special character. For faster processing, if your SQL server ignores comments, you can configure the Web App Firewall to skip comments when examining requests for injected SQL. The SQL comments handling options are:

- **ANSI**—Skip ANSI-format SQL comments, which are normally used by UNIX-based SQL databases. For example:
  - -- (Two Hyphens) - This is a comment that begins with two hyphens and ends with end of line.
  - {} - Braces (Braces enclose the comment. The { precedes the comment, and the } follows it. Braces can delimit single- or multiple-line comments, but comments cannot be nested)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- `/* */ : C style comments (Does not allow nested comments). Please note /*! <comment that begin with slash followed by asterisk and exclamation mark is not a comment > */`
- MySQL Server supports some variants of C-style comments. These enable you to write code that includes MySQL extensions, but is still portable, by using comments of the following form: `/*! MySQL-specific code */`
- . #: Mysql comments: This is a comment that begins with # character.

- **Nested**—Skip nested SQL comments, which are normally used by Microsoft SQL Server. For example; -- (Two Hyphens), and / / (Allows nested comments)
- **ANSI/Nested**—Skip comments that adhere to both the ANSI and nested SQL comment standards. Comments that match only the ANSI standard, or only the nested standard, are still checked for injected SQL.
- **Check all Comments**—Check the entire request for injected SQL without skipping anything. This is the default setting.

TIP

Usually, you must not choose the Nested or the ANSI/Nested option unless your back-end database runs on Microsoft SQL Server. Most other types of SQL server software do not recognize nested comments. If nested comments appear in a request directed to another type of SQL server, they might indicate an attempt to breach security on that server.

Check Request headers—Enable this option if, in addition to examining the input in the form fields, you want to examine the request headers for HTML SQL Injection attacks. If you use the GUI, you can enable this parameter in the **Advanced Settings** -> **Profile Settings** pane of the Web App Firewall profile.

NOTE:

If you enable the Check Request header flag, you might have to configure a relaxation rule for the **User-Agent** header. Presence of the SQL keyword **like** and SQL special character semi-colon (**;**) might trigger false positive and block requests that contain this header. **Warning**

If you enable both request header checking and transformation, any SQL special characters found in the headers are also transformed. The Accept, Accept-Charset, Accept-Encoding, Accept-

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Language, Expect, and User-Agent headers normally contain semicolons (;). Enabling both Request header checking and transformation simultaneously might cause errors.
InspectQueryContentTypes — Configure this option if you want to examine the request query portion for SQL Injection attacks for the specific content-types. If you use the GUI, you can configure this parameter in the **Advanced Settings** -> **Profile Settings** pane of the App Firewall profile.

SQL Fine grained Relaxations

The Web App Firewall gives you an option to exempt a specific form field, header, or Cookie from the SQL Injection inspection check. You can completely bypass the inspection for one or more of these fields by configuring the relaxation rules for the SQL Injection check.

The Web App Firewall allows you to implement tighter security by fine-tuning the relaxation rules. An application might require the flexibility to allow specific patterns, but configuring a relaxation rule to bypass the security inspection might make the application vulnerable to attacks, because the target field is exempted from inspection for any SQL attack patterns. SQL fine grained relaxation provides the option to allow specific patterns and block the rest. For example, the Web App Firewall currently has a default set of more than 100 SQL keywords. Because hackers can use these keywords in SQL Injection attacks, the Web App Firewall flags them as potential threats. You can relax one or more keywords that are considered safe for the specific location. The rest of the potentially dangerous SQL keywords are still checked for the target location and continue to trigger the security check violations. You now have much tighter control.

The commands used in relaxations have optional parameters for **Value Type** and **Value Expression**. You can specify whether the value expression is a regular expression or a literal string. The value type can be left blank or you have an option to select **Keyword** or **SpecialString** or **WildChar**.

WARNING:

Regular expressions are powerful. Especially if you are not thoroughly familiar with PCRE-format regular expressions, double-check any regular expressions you write. Make sure that they define exactly the URL that you want to add as an exception, and nothing else. Careless use of wildcards, and especially of the dot-asterisk (.*) metacharacter or wildcard combination, can have results that you do not want, such as blocking access to web content that you did not intend to block or allowing an attack that the HTML SQL Injection check would otherwise have blocked.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Points to Consider:

- Value expression is an optional argument. A field name might not have any value expression.
- A field name can be bound to multiple value expressions.
- Value expressions must be assigned a value type. The SQL value type can be: 1) Keyword, 2) SpecialString, or 3) WildChar.
- You can have multiple relaxation rules per field name/URL combination.

Using the Command Line to Configure the SQL Injection Check

To configure SQL Injection actions and other parameters by using the command line:

In the command line interface, you can use either the **set appfw profile** command or the **add appfw profile** command to configure the SQL Injection protections. You can enable the block, learn, log, stats actions and specify whether you want to transform the special characters used in SQL Injection attack strings to disable the attack. Select the type of SQL attack pattern (key words, wildcard characters, special strings) you want to detect in the payloads, and indicate whether you want the Web App Firewall to also inspect the request Headers for SQL Injection violations. Use the **unset appfw profile** command to revert the configured settings back to their defaults. Each of the following commands sets only one parameter, but you can include multiple parameters in a single command:

- set application firewall profile "Parameter descriptions provided at the bottom of the page."
- `<name> -SQLInjectionAction (([block] [learn] [log] [stats]) | [none])`
- set application firewall profile "Parameter descriptions provided at the bottom of the page."
- `<name> -SQLInjectionTransformSpecialChars (**ON** | OFF)`
- set application firewall profile "Parameter descriptions provided at the bottom of the page."
- `<name> -**SQLInjectionCheckSQLWildChars** (**ON** |**OFF**)`
- set application firewall profile "Parameter descriptions provided at the bottom of the page."
- `**<name> -**SQLInjectionType** ([**SQLKeyword**] | [**SQLSplChar**] | [**SQLSplCharANDKeyword**] | [**SQLSplCharORKeyword**])`
- **set application firewall profile** "Parameter descriptions provided at the bottom of the page."
- `<name> -**SQLInjectionParseComments** ([**checkall**] | [**ansi|nested**] | [**ansinested**])`
- **set application firewall profile "Parameter descriptions provided at the bottom of the page."

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- `<name> -CheckRequestHeaders (ON | OFF)` Parameter descriptions provided at the bottom of the page.
- `<name> - CheckRequestQueryNonHtml (ON | OFF)` Parameter descriptions provided at the bottom of the page.

To configure a SQL Injection relaxation rule by using the command interface

Use the bind or unbind command to add or delete binding, as follows:

- `bind appfw profile <name> -SQLInjection <String> [isRegex(REGEX| NOTREGE)] <formActionURL> [-location <location>] [-valueType (Keywor|SpecialString| Wildchar) [<valueExpression>][-isValueRegex (REGEX | NOTREGEX) ]]`
- `unbind appfw profile <name> -SQLInjection <String> <formActionURL> [-location <location>] [-valueTyp (Keyword|SpecialString|Wildchar) [<valueExpression>]]`

NOTE:

You can find the list of SQL keywords from the default signature file contents by viewing the view signature object, which has list of SQL key words and SQL special characters.

Using the GUI to Configure the SQL Injection Security Check

In the GUI, you can configure the SQL Injection security check in the pane for the profile associated with your application.

To configure or modify the SQL Injection check by using the GUI

1. Navigate to **Application Firewall > Profiles**, highlight the target profile, and click **Edit**.
2. In the **Advanced Settings** pane, click **Security Checks**.

The security check table displays the currently configured action settings for all the security checks. You have 2 options for configuration:

a. If you want to enable or disable Block, Log, Stats, and Learn actions for HTML SQL Injection, you can select or clear check boxes in the table, click **OK**, and then click **Save and Close** to close the **Security Check** pane.

b. If you want to configure more options for this security check, double click HTML SQL Injection, or select the row and click **Action Settings**, to display the following options:

Transform SQL Special character—Transform any SQL Special characters in the request.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Check for SQL Wildcard Characters—Consider SQL Wildcard characters in the payload to be attack patterns.

Check Request Containing—Type of SQL injection (SQLKeyword, SQLSplChar, SQLSplCharANDKeyword, or SQLSplCharORKeyword) to check.

SQL Comments Handling—Type of comments (Check All Comments, ANSI, Nested, or ANSI/Nested) to check.

After changing any of the above settings, click **OK** to save the changes and return to the Security Checks table. You can proceed to configure other security checks if needed. Click **OK** to save all the changes you have made in the Security Checks section, and then click **Save and Close** to close the Security Check pane.

To configure an SQL Injection relaxation rule by using the GUI

- Navigate to **Application Firewall** > **Profiles**, highlight the target profile, and click **Edit**.
- In the **Advanced Settings** pane, click **Relaxation Rules**.
- In the Relaxation Rules table, double-click the **HTML SQL Injection** entry, or select it and click **Edit**.
- In the **HTML SQL Injection Relaxation Rules** dialogue box, perform **Add**, **Edit**, **Delete**, **Enable**, or **Disable** operations for relaxation rules.

NOTE

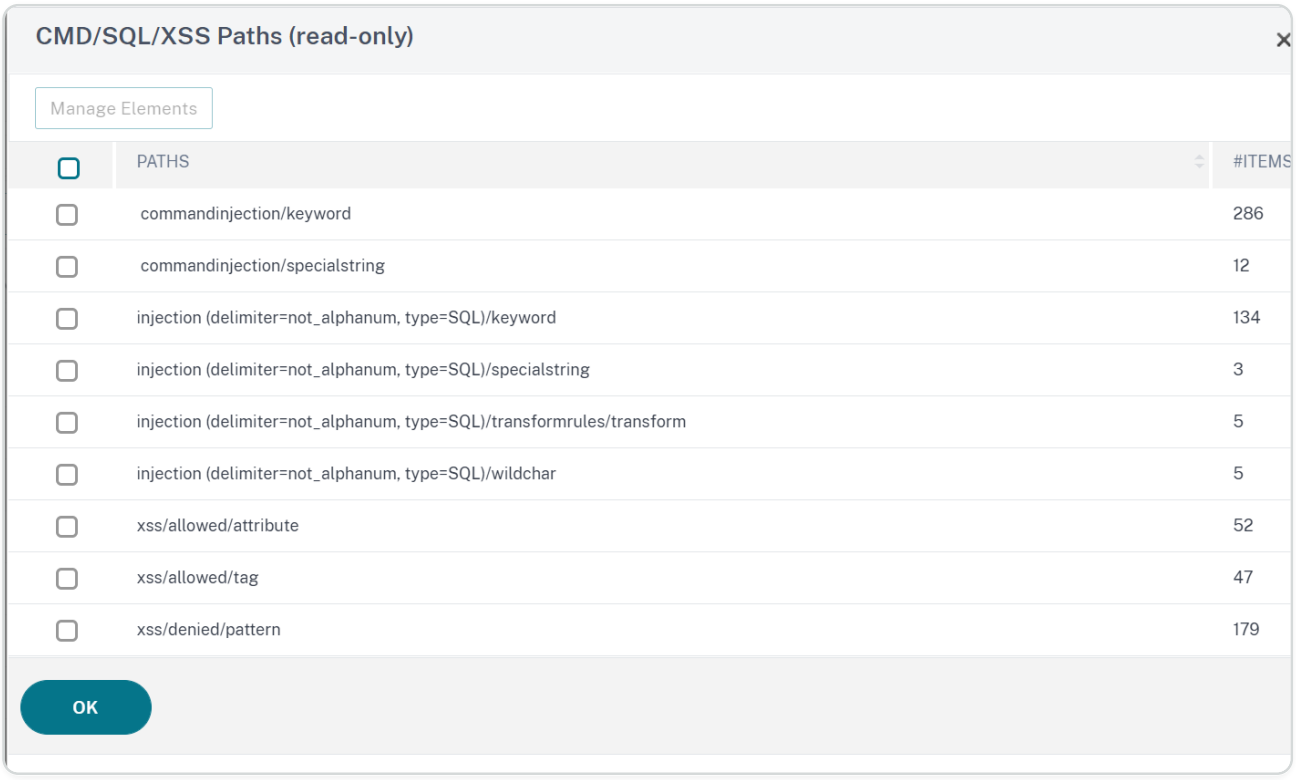
When you add a new rule, the **Value Expression** field is not displayed unless you select **Keyword** or **SpecialString** or **WildChar** option in the **Value Type** Field.

To manage SQL injection relaxation rules by using the visualizer

For a consolidated view of all the relaxation rules, you can highlight the **HTML SQL Injection** row and click **Visualizer**. The visualizer for deployed relaxations offers you the option to **Add** a new rule or **Edit** an existing one. You can also **Enable** or **Disable** a group of rules by selecting a node and clicking the corresponding buttons in the relaxation visualizer.

View or customize injection patterns by using the GUI

You can use the GUI to view or customize the injection patterns.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

The default SQL patterns are specified in the default signatures file. If you do not bind any signature object to your profile, the default Injection patterns specified in the default signatures object will be used by the profile for the command injection security check processing. The rules and patterns, specified in the default signatures object, are read-only. You cannot edit or modify them. If you want to modify or change these patterns, make a copy of the default sSignatures object to create a User-Defined signature object. Make changes in the command injection patterns in the new User-defined signature object and use this signature object in your profile that is processing the traffic for which you want to use these customized patterns.

For more information, see Signatures

To view the default injection patterns by using the GUI:

1. Navigate to **Application Firewall > Signatures**, select ***Default Signatures**, and click **Edit**.
2. Click **Manage CMD/SQL/XSS patterns**. The **Manage SQL/cross-site scripting paths** table shows patterns pertaining to CMD/SQL/XS injection:

1. Select a row and click **Manage Elements** to display the corresponding injection patterns (keywords, special strings, transformation rules or the wildcard characters) used by the Web App Firewall command injection check.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Using the Learn Feature with the SQL Injection Check

When the learn action is enabled, the Web App Firewall learning engine monitors the traffic and learns the triggered violations. You can periodically inspect these learned rules. After due consideration, you can deploy the learned rule as an SQL Injection relaxation rule.

SQL Injection Learning enhancement—An Web App Firewall learning enhancement was introduced in release 11.0 of the NetScaler software. To deploy fine grained SQL Injection relaxation, the Web App Firewall offers fine grained SQL Injection learning. The learning engine makes recommendations regarding the observed Value Type (keyword, SpecialString, Wildchar) and the corresponding Value expression observed in the input fields. In addition to checking the blocked requests to determine whether the current rule is too restrictive and needs to be relaxed, you can review the rules generated by the learning engine to determine which value type and value expressions are triggering violations and need to be addressed in the relaxation rules.

IMPORTANT

The Web App Firewall's learning engine can distinguish only the first 128 bytes of the name. If a form has multiple fields with names that match for the first 128 bytes, the learning engine might not be able to distinguish between them. Similarly, the deployed relaxation rule might inadvertently relax all such fields from SQL Injection inspection.

Note To bypass the SQL check-in the User-Agent header, use the following relaxation rule: `bind appfw profile your_profile_name -SQLInjection User-Agent " .*" -location HEADER`

To view or use learned data by using the command line interface

At the command prompt, type one of the following commands:

- `show appfw learningdata <profilename> SQLInjection`
- `rm appfw learningdata <profilename> -SQLInjection <string> <formActionURL> [<location>] [<valueType> <valueExpression>]`
- `export appfw learningdata <profilename> SQLInjection`

To view or use learned data by using the GUI

1. Navigate to **Application Firewall > Profiles**, highlight the target profile, and click **Edit**.
2. In the **Advanced Settings** pane, click **Learned Rules**. You can select the **HTML SQL Injection** entry in the Learned Rules table and double-click it to access the learned rules. You

© 1997–2026 Citrix Systems, Inc. All rights reserved.

can deploy the learned rules or edit a rule before deploying it as a relaxation rule. To discard a rule, you can select it and click the **Skip** button. You can edit only one rule at a time, but you can select multiple rules to deploy or skip.

You also have the option to show a summarized view of the learned relaxations by selecting the **HTML SQL Injection** entry in the Learned Rules table and clicking **Visualizer** to get a consolidated view of all the learned violations. The visualizer makes it easy to manage the learned rules. It presents a comprehensive view of the data on one screen and facilitates taking action on a group of rules with one click. The biggest advantage of the visualizer is that it recommends regular expressions to consolidate multiple rules. You can select a subset of these rules, based on the delimiter and Action URL. You can display 25, 50, or 75 rules in the visualizer, by selecting the number from a drop-down list. The visualizer for learned rules offers the option to edit the rules and deploy them as relaxations. Or you can skip the rules to ignore them.

Using the Log Feature with the SQL Injection Check

When the log action is enabled, the HTML SQL Injection security check violations are logged in the audit log as **APPFW_SQL** violations. The Web App Firewall supports both Native and CEF log formats. You can also send the logs to a remote syslog server.

To access the log messages by using the command line

Switch to the shell and tail the ns.logs in the **/var/log/** folder to access the log messages pertaining to the SQL Injection violations:

```
> Shell
```

```
# tail -f /var/log/ns.log | grep APPFW_SQL
```

Example of an HTML SQL Injection log message when the request is transformed

```

NOTE

As part of the streaming changes in 10.5.e build (enhancement builds) and 11.0 build onwards, we now process the input data in blocks. RegEx pattern matching is now restricted to 4K for contiguous character string matching. With this change, the SQL violation log messages might include different information compared to the earlier builds. The keyword and special character in the input can be separated by many bytes. We now keep track of the SQL keywords and special strings when processing the data, instead of buffering the entire input value. In addition to the field name, the log message now includes the SQL keyword, or the SQL special character, or both the SQL keyword and the SQL special character, as determined by the configured setting. The rest of the input is no longer included in the log message, as shown in the following example:

Example:

In 10.5, when the Web App Firewall detects the SQL violation, the entire input string might be included in the log message, as shown below:

`SQL Keyword check failed for field text=\"select a name from testbed1;(;)\".*<blocked>`

In the enhancement builds of 10.5.e that support request side streaming and 11.0 build onwards, we log only the field name, keyword, and special character (if applicable) in the log message, as shown below:

`SQL Keyword check failed for field **text="select(;)" <blocked>`

This change is applicable to requests that contain application/x-www-form-urlencoded, or multipart/form-data, or text/x-gwt-rpc content-types. Log messages generated during processing of **JSON** or **XML** payloads are not affected by this change.

To access the log messages by using the GUI

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The GUI includes a useful tool (**Syslog Viewer**) for analyzing the log messages. You have multiple options for accessing the Syslog Viewer:

- Navigate to the **Application Firewall** > **Profiles**, select the target profile, and click **Security Checks**. Highlight the **HTML SQL Injection** row and click **Logs**. When you access the logs directly from the HTML SQL Injection check of the profile, the GUI filters out the log messages and displays only the logs pertaining to these security check violations.
- You can also access the Syslog Viewer by navigating to **NetScaler** > **System** > **Auditing**. In the Audit Messages section, click the **Syslog messages** link to display the Syslog Viewer, which displays all log messages, including other security check violation logs. This is useful for debugging when multiple security check violations might be triggered during request processing.
- Navigate to **Application Firewall** > **policies** > **Auditing**. In the Audit Messages section, click the **Syslog messages** link to display the Syslog Viewer, which displays all log messages, including other security check violation logs.

The HTML based Syslog Viewer provides various filter options for selecting only the log messages that are of interest to you. To select log messages for the **HTML SQL Injection** check, filter by selecting **APPFW** in the drop-down list options for **Module**. The **Event Type** list offers a rich set of options to further refine your selection. For example, if you select the **APPFW_SQL** check box and click the **Apply** button, only log messages pertaining to the **SQL Injection** security check violations appear in the Syslog Viewer.

If you place the cursor in the row for a specific log message, multiple options, such as **Module**, **Event Type**, **Event ID**, **Client IP** and so forth. appear below the log message. You can select any of these options to highlight the corresponding information in the log message.

Click to Deploy functionality is available only in the GUI. You can use the Syslog Viewer to not only view the logs but also to deploy HTML SQL Injection relaxation rules based on the log messages for the Web App Firewall security check violations. The log messages must be in CEF log format for this operation. Click to deploy functionality is available only for log messages that are generated by the block (or not block) action. You cannot deploy a relaxation rule for a log message about the transform operation.

To deploy a relaxation rule from the Syslog Viewer, select the log message. A check box appears in the upper right corner of the **Syslog Viewer** box of the selected row. Select the check box, and then select an option from the Action list to deploy the relaxation rule. **Edit & Deploy**, **Deploy**, and **Deploy All** are available as **Action** options.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The SQL Injection rules that are deployed by using the Click to Deploy option do not include the fine grain relaxation recommendations.

To use Click to Deploy functionality in the GUI:

1. In the Syslog Viewer, select **Application Firewall** in the **Module** options.
2. Select the **APP_SQL** as the **Event Type** to filter corresponding log messages.
3. Select the check box to identify the rule to deploy.
4. Use the **Action** drop-down list of options to deploy the relaxation rule.
5. Verify that the rule appears in the corresponding relaxation rule section.

Statistics for the SQL Injection violations

When the stats action is enabled, the counter for the SQL Injection check is incremented when the Web App Firewall takes any action for this security check. The statistics are collected for Rate and Total count for Traffic, Violations, and Logs. The size of an increment of the log counter can vary depending on the configured settings. For example, if the block action is enabled, the request for a page that contains 3 SQL Injection violations increments the stats counter by one, because the page is blocked as soon as the first violation is detected. However, if the block is disabled, processing the same request increments the statistics counter for violations and the logs by three, because each violation generates a separate log message.

To display SQL Injection check statistics by using the command line:

At the command prompt, type:

```
SH APPFW STATS
```

To display stats for a specific profile, use the following command:

```
> stat appfw profile <profile name>
```

To display HTML SQL Injection statistics by using the GUI

1. Navigate to **System** > **Security** > **Application Firewall**.
2. In the right pane, access the **Statistics** Link.
3. Use the scroll bar to view the statistics about HTML SQL Injection violations and logs. The statistics table provides real-time data and is updated every 7 seconds.

Highlights

Note the following points about the SQL Injection check:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Built-in Support for SQL Injection Protection**—The NetScaler Web App Firewall protects against SQL Injection by monitoring a combination of SQL keywords and special characters in the form parameters. All SQL keywords, special characters, wildcard characters, and default transformation rules are specified in the /netscaler/default_custom_settings.xml file.
- **Customization**—You can change the default key words, special characters, wildcard characters, and transformation rules to customize the SQL security check inspection for the specific needs of your application. Make a copy of the default signature object, modify existing entries, or add new ones. Bind this signature object to your profile to make use of the customized configuration.
- **Hybrid Security Model**—Both signatures and deep security protections use the SQL/cross-site scripting patterns specified in the signature object that is bound to the profile. If no signature object is bound to the profile, the SQL/cross-site scripting patterns present in the default signature object are used.
- **Transform**—Note the following about the transform operation:
  - The transform operation works independently of the other SQL Injection action settings. If transform is enabled and the block, log, stats, and learn are all disabled, SQL special characters are transformed.
  - When SQL Transformation is enabled, user requests are sent to the back end servers after the SQL special characters are transformed in non-block mode. If the block action is enabled, it takes precedence over the transform action. If the injection type is specified as SQL special character and the block is enabled, the request is blocked despite the transform action.
- **Fine Grained Relaxation and Learning**—Fine-tune the relaxation rule to relax a subset of SQL elements from security check inspection but detect the rest. The learning engine recommends a specific value type and value expressions based on the observed data.
- **Click to Deploy**—Select one, or multiple SQL violation log messages in the syslog viewer and deploy them as relaxation rules.

SQL grammar-based protection for HTML and JSON payload

NetScaler Web App Firewall uses a pattern match approach for detecting SQL injection attacks in `HTTP` and `JSON` payloads. The approach uses a set of pre-defined key-words and (or) special characters to detect an attack and flag it as a violation. Although this approach is effective, it can result in many false positives resulting in adding one or more relaxation rules. Especially when commonly used words such as "Select" and “From” are used in an HTTP or JSON request. We can

© 1997–2026 Citrix Systems, Inc. All rights reserved.

reduce false positives by implementing the SQL grammar protection check for `HTML` and `JSON` payload.

In the existing pattern match approach, an SQL injection attack is identified if a pre-defined keyword and or a special character is present in an HTTP request. In this case, the statement need not be a valid SQL statement. But in the grammar-based approach, an SQL injection attack is detected only if a keyword or a special character is present in a SQL statement or is part of a SQL statement thereby reducing false positive scenarios.

SQL grammar-based protection usage scenario

Consider a statement, "Select my tickets and let's meet at union station" present in an HTTP request. Although, the statement is not a valid SQL statement, the existing pattern match approach detects the request as an SQL injection attack because the statement uses keywords such as "Select", "and" and "Union". But, in the case of the SQL grammar approach, the statement is not detected as a violation attack because the keywords are not present in a valid SQL statement or not part of a valid SQL statement.

The grammar-based approach can also be configured for detecting SQL injection attacks in `JSON` payloads. For adding a relaxation rule, you can reuse the existing relaxation rules. Fine grained relaxation rules are also applicable for SQL grammar, for rules with "valueType" "keyword". In `JSON` SQL grammar, the existing URL-based method can be reused.

Configure SQL grammar-based protection for HTML using the CLI

To implement SQL grammar based detection, you must configure the "SQLInjectionGrammar" parameter in the Web App Firewall profile. By default, the parameter is disabled. All existing SQL Injection actions are supported except learning. Any new profile created after an upgrade supports SQL injection grammar and it continues to have default type as "special character or keyword" and it must be explicitly enabled.

At the command prompt, type:

```
add appfw profile <profile-name> –SQLInjectionAction <action-name>
-SQLInjectionGrammar ON/OFF
```

Example:

```
add appfw profile profile1 –SQLInjectionAction Block –SQLInjectionGrammar ON
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure SQL pattern-match protection and grammar-based protection for HTML using the CLI

If you have enabled both grammar-based and pattern-match approaches, then the appliance performs grammar-based detection first and if there is SQL injection detection with the action type set to block, the request is blocked (without verifying detection using pattern-match).

At the command prompt, type:

```
add appfw profile <profile-name> –SQLInjectionAction <action-name>
-SQLInjectionGrammar ON –SQLInjectionType <Any action other than ‘None’:
SQLSplCharANDKeyword/ SQLSplCharORKeyword/ SQLSplChar/ SQLKeyword>
```

Example:

`add appfw profile p1 –SQLInjectionAction block – SQLInjectionGrammar ON – SQLInjectionType SQLSplChar`

Configure SQL Injection check only with grammar-based protection for HTML using the CLI

At the command prompt, type:

```
add appfw profile <profile-name> –SQLInjectionAction <action-name>
-SQLInjectionGrammar ON –SQLInjectionType None
```

Example:

`add appfw profile p1 –SQLInjectionAction block – SQLInjectionGrammar ON – SQLInjectionType None`

Bind relaxation rules for SQL grammar-based protection for HTML using the CLI

If your application requires you to bypass the `SQL` injection check for a specific "ELEMENT" or "ATTRIBUTE" in the payload, you must configure a relaxation rule.

NOTE:

Relaxation rules with valueType "keyword" are evaluated only when the appliance performs detection using `SQL` grammar.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The `SQL` command Injection inspection relaxation rules have the following syntax. At the command prompt, type:

```
bind appfw profile <name> -SQLInjection <String> [isRegex(REGEX| NOTREGE)]
<formActionURL> [-location <location>] [-valueType (Keywor|SpecialString|
Wildchar) [<valueExpression>][-isValueRegex (REGEX | NOTREGEX) ]]
```

Example:

`bind appfw profile p1 -sqlinjection abc http://10.10.10.10/` `bind appfw profile p1 –sqlinjection 'abc[0-9]+' http://10.10.10.10/ -isregex regEX` `bind appfw profile p1 –sqlinjection 'name' http://10.10.10.10/ -valueType Keyword 'selec[a-z]+' -isvalueRegex regEX`

Configure SQL grammar based protection for HTML using the GUI

Complete the GUI procedure to configure grammar based HTML SQL Injection detection.

1. On the navigation pane, navigate to **Security > Profiles**.
2. In the **Profiles** page, click **Add**.
3. In the **NetScaler Web App Firewall Profile** page, click **Security Checks** under **Advanced Settings**.
4. In the **Security Checks** section, go to **HTML SQL Injection** settings.
5. Click the executable icon near the check box.
6. Click **Action Settings** to access the **HMTL SQL Injection Settings** page.
7. Select the **Check using SQL Grammar** check box.
8. Click **OK**.

Configure SQL grammar-based protection for JSON payload using the CLI

To implement SQL grammar-based detection for the JSON payload, you must configure the "JSONSQLInjectionGrammar" parameter in the Web App Firewall profile. By default, the parameter is disabled. All existing SQL Injection actions are supported except learning. Any new profile created after an upgrade supports SQL injection grammar and it continues to have default type as “special character or keyword” and you must explicitly enable it.

At the command prompt, type:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add appfw profile <profile-name> -type JSON –JSONSQLInjectionAction
<action-name> -JSONSQLInjectionGrammar ON/OFF
```

Example:

```
add appfw profile profile1 –type JSON –JSONSQLInjectionAction Block –
JSONSQLInjectionGrammar ON
```

Configure SQL pattern match protection and grammar-based protection for JSON payload using the CLI

If you have enabled both grammar-based and pattern-match checks, then the appliance performs grammar-based detection first and if there is SQL injection detection with the action type set to block, the request is blocked (without verifying detection using pattern-match).

NOTE:

Relaxation rules with valueType “keyword” are evaluated only when the appliance performs detection using SQL grammar.

At the command prompt, type:

```
add appfw profile <profile-name> -type JSON –JSONSQLInjectionAction
<action-name> -JSONSQLInjectionGrammar ON –JSONSQLInjectionType <Any
action other than ‘None’: SQLSplCharANDKeyword/ SQLSplCharORKeyword/
SQLSplChar/ SQLKeyword>
```

Example:

```
add appfw profile p1 –type JSON –JSONSQLInjectionAction block –
JSONSQLInjectionGrammar ON –JSONSQLInjectionType SQLSplChar
```

Configure SQL Injection check only grammar-based protection for JSON payload using the CLI

At the command prompt, type:

```
add appfw profile <profile-name> -type JSON –JSONSQLInjectionAction
<action-name> -JSONSQLInjectionGrammar ON –JSONSQLInjectionType None`\
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Example:

```
add appfw profile p1 –type JSON –JSONSQLInjectionAction block –
JSONSQLInjectionGrammar ON –JSONSQLInjectionType None
```

Bind url-based relaxation rules for JSON SQL grammar-based protection for JSON payload using the CLI

If your application requires you to bypass the `JSON` command injection inspection for a specific "ELEMENT" or "ATTRIBUTE" in the payload, you can configure a relaxation rule. The `JSON` command Injection inspection relaxation rules have the following syntax. At the command prompt, type:

```
bind appfw profile <profile name> –JSONCMDURL <expression> -comment
<string> -isAutoDeployed ( AUTODEPLOYED | NOTAUTODEPLOYED ) -state
( ENABLED | DISABLED )
```

Example:

`bind appfw profile p1 -sqlinjection abc http://10.10.10.10/` `bind appfw profile p1 –sqlinjection 'abc[0-9]+' http:// 10.10.10.10/ -isregex regEX` `bind appfw profile p1 –sqlinjection 'name' http://10.10.10.10/ -valueType Keyword 'selec[a-z]+' -isvalueRegex regEX`

Configure SQL grammar based protection for JSON payload using the GUI

Complete the GUI procedure to configure grammar based JSON SQL Injection detection.

1. On the navigation pane, navigate to **Security > Profiles**.
2. In the **Profiles** page, click **Add**.
3. In the **NetScaler Web App Firewall Profile** page, click **Security Checks** under **Advanced Settings**.
4. In the **Security Checks** section, go to **JSON SQL Injection** settings.
5. Click the executable icon near the check box.
6. Click **Action Settings** to access the **JSON SQL Injection Settings** page.
7. Select the **Check using SQL Grammar** check box.
8. Click **OK**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Command injection grammar-based protection for HTML payload

NetScaler Web App Firewall uses a pattern match approach for detecting command injection attacks in HTML payloads. The approach uses a set of pre-defined keywords and (or) special characters to detect an attack and flag it as a violation. Although this approach is effective, it can result in many false positives that lead to adding one or more relaxation rules. Especially, when a commonly used word such as “Exit” is used in an HTTP request. We can reduce false positives by implementing the command injection grammar-based protection check for the HTML payload.

In the pattern-match approach, a command injection attack is identified if a pre-defined keyword and (or) a special character is present in an HTTP request. In this case, the statement need not be a valid command injection statement. But in the grammar-based approach, a command injection attack is detected only if a keyword or a special character is present in a command injection statement. Therefore, false-positive scenarios are reduced.

Command injection grammar-based protection usage scenario

Consider a statement, “Rush towards the exit!” present in an HTTP request. Although the statement is not a valid command injection statement, the pattern-match approach detects the request as a command injection attack due to the keyword “exit”. But in the command injection grammar-based approach, the statement is not detected as a violation attack because the keywords are not present in a valid command injection statement.

Configure command injection grammar-based protection parameter using the CLI

To implement command injection grammar-based detection, you must configure the “CMDInjectionGrammar” parameter in the Web App Firewall profile. By default, the parameter is disabled. All existing command injection actions are supported except learning. Any new profile created after an upgrade supports command injection grammar. The new profile continues to have the default type as “special character or keyword” and command injection grammar must be explicitly enabled.

At the command prompt, type:

```
add appfw profile <profile-name> –CMDInjectionAction <action-name>
-CMDInjectionGrammar ON/OFF
```

Example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
add appfw profile profile1 –CMDInjectionAction Block –CMDInjectionGrammar
ON
```

Configure command injection pattern-match protection and grammar-based protection using the CLI

If you have enabled both grammar-based and pattern-match approaches, then the appliance performs grammar-based detection first. If there is a command injection detected with the action type set to “block”, the request is blocked (without verifying detection using pattern-match).

At the command prompt, type:

```
add appfw profile <profile-name> –CMDInjectionAction <action-name>
-CMDInjectionGrammar ON –CMDInjectionType <Any action other than ‘None’:
CMDSplCharANDKeyword/ CMDSplCharORKeyword/ CMDSplChar/ CMDKeyword>
```

Example:

```
add appfw profile p1 –CMDInjectionAction block – CMDInjectionGrammar ON –
CMDInjectionType CMDSplChar
```

Configure command injection check only with grammar-based protection using the CLI

At the command prompt, type:

```
add appfw profile <profile-name> –CMDInjectionAction <action-name>
-CMDInjectionGrammar ON –CMDInjectionType None
```

Example:

```
add appfw profile p1 –CMDInjectionAction block – CMDInjectionGrammar ON –
CMDInjectionType None
```

Bind relaxation rules for command injection grammar-based protection using the CLI

If your application requires you to bypass the command injection check for a specific “ELEMENT” or “ATTRIBUTE” in the HTML payload, you must configure a relaxation rule.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE:

Relaxation rules with the valueType as “keyword” are evaluated only when the appliance performs detection using command injection grammar.

The command injection inspection relaxation rules have the following syntax. At the command prompt, type:

```
bind appfw profile <name> -CMDInjection <String> [isRegex(REGEX| NOTREGE)]
<formActionURL> [-location <location>] [-valueType (Keywor|SpecialString|
Wildchar) [<valueExpression>][-isValueRegex (REGEX | NOTREGEX) ]]
```

Example:

```
bind appfw profile p1 -cmdinjection abc http://10.10.10.10/

bind appfw profile p1 –cmdinjection 'abc[0-9]+' http://10.10.10.10/
-isregex regEX

bind appfw profile p1 –cmdinjection 'name' http://10.10.10.10/ -valueType
Keyword 'exi[a-z]+' -isvalueRegex regEX
```

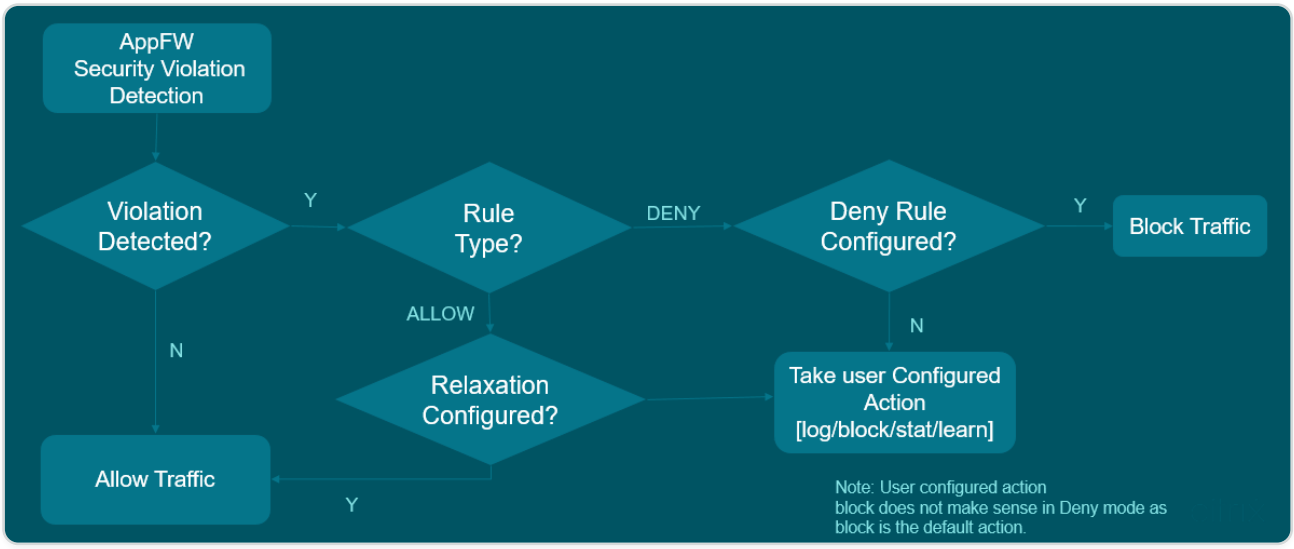
Configure command injection grammar-based protection using the GUI

Complete the following steps to configure grammar-based HTML command injection detection.

1. Navigate to **Security > NetScaler Web App Firewall Profile > Profiles**.
2. Select a profile and click **Edit**.
3. Go to the **Advanced Settings** section and click **Security Checks**.
4. Select the **HTML Command Injection** check box and click **Action Settings**.
5. Select the **Check using CMD Grammar** check box.
6. Select **None** from **Check Request Containing**.
7. Click **OK**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Relaxation and deny rules for handling HTML SQL injection attacks



When there is an incoming traffic, the violation detection logic checks for traffic violations. If no HTML SQL injection attacks are detected, the traffic is allowed to pass. But if a violation is detected, the relaxation (allow) and deny rules define how to handle the violations. If the security check is configured in the allow mode (default mode), the detected violation is blocked unless the user has explicitly configured a relaxation or allow rule.

In addition to allow mode, the security check can also be configured in deny mode and use deny rules for handling violations. If the security check is configured in this mode, the detected violations are blocked if a user has explicitly configured a deny rule. If there are no deny rules configured, then the user configured action is applied.

NOTE:

By default, the URL is a regular expression.

The following illustration explains how to allow and deny modes of operation work:

1. When a violation is detected, the relaxation (allow) and deny rules define how to handle the violations.
2. If the security check is configured in deny mode (if configured in allow mode, jump to step 5), the violation is blocked unless you have explicitly configured a deny rule.
3. If the violation matches a deny rule, the appliance blocks the traffic.
4. If the traffic violation does not match a rule, the appliance applies a user-defined action (block, reset, or drop).

© 1997–2026 Citrix Systems, Inc. All rights reserved.

5. If the security check is configured in allow mode, the Web App Firewall module checks if there are any allow rule configured.
6. If the violation matches an allow rule, the appliance allows the traffic to bypass otherwise, it is blocked.

Configure security check-in relaxation and enforcement mode using CLI

At the command prompt, type:

```
set appfw profile <name>  –SQLInjectionAction [block stats learn] –
SQLInjectionRuleType [ALLOW DENY]
```

Example:

```
set appfw profile prof1 sqlInjectionAction block -sqlInjectionRuleType ALLOW
DENY
```

Configure security check-in relaxation and enforcement mode using GUI

1. Navigate to **Security > NetScaler® Web App Firewall** and **Profiles**.
2. On the **Profiles** page, select a profile and click **Edit**.
3. On the **NetScaler Web App Firewall Profile** page, go to **Advanced Settings** section and click **Security Checks**.
4. In the **Security Checks** section, select **HTML SQL Injection Settings** and click **Action Settings**.
5. On the **HTML Command Injection Settings** page, select that actions to be performed as part of HTML command injection security check and update the parameters.
6. Click **OK**.

Bind relaxation and enforcement rules to Web Application Firewall profile using CLI

At the command prompt, type:

```
bind appfw profile <name> -SQLInjection <string> <formActionURL>
```

Example:

```
bind appfw profile p1 -SQLInjection field_f1 "/login.php" –RuleType ALLOW
```

```
bind appfw profile p2 -SQLInjection field_f1 "/login.php" –RuleType ALLOW
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Bind relaxation and enforcement rules to Web Application Firewall profile using GUI

1. Navigate to **Security > NetScaler Web App Firewall** and **Profiles**.
2. On the **Profiles** page, select a profile and click **Edit**.
3. On the **NetScaler Web App Firewall Profile** page, go to the **Advanced Settings** section and click **Relaxation Rules**.
4. In the **Relaxation Rule** section, select **HTML SQL Injection Settings** and click **Edit**.
5. On the **HTML SQL Injection Relaxation Rules** page, click **Add**.
6. Specify the required details.
7. Click **Create**.

HTML command injection protection check

The **HTML** command injection check examines if the incoming traffic has unauthorized commands that break the system security or modify the system. If the traffic has any malicious commands when detected, the appliance blocks the request or performs the configured action.

The NetScaler Web App Firewall profile is now enhanced with a new security check for command injection attacks. When the command injection security check examines the traffic and detects any malicious commands, the appliance blocks the request or performs the configured action.

In a command injection attack, the attacker aims to run unauthorized commands on the NetScaler operation system. To achieve this, the attacker injects operating system commands using a vulnerable application. A NetScaler appliance is vulnerable to injection attacks if the application passes any unsafe data (forms, cookies, or header) to the system shell.

How command injection protection works

1. For an incoming request, WAF examines the traffic for keywords or special characters. If the incoming request has no patterns that match any of the denied keywords or special characters, the request is allowed. Otherwise, the request is blocked, dropped, or redirected based on the configured action.
2. If you prefer to exempt a keyword or a special character from the list, you can apply a relaxation rule to bypass the security check under specific conditions.
3. You can enable logging to generate log messages. You can monitor the logs to determine whether responses to legitimate requests are getting blocked. A large increase in the number of log messages can indicate attempts to launch an attack.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. You can also enable the statistics feature to gather statistical data about violations and logs. An unexpected surge in the stats counter might indicate that your application is under attack. If legitimate requests are getting blocked, you might have to revisit the configuration to see if you must configure the new relaxation rule or modify the existing one.

Keywords and special characters denied for command injection check

To detect and block command injection attacks, the appliance has a set of patterns (keywords and special characters) defined in the default signature file. Following is a list of keywords blocked during command injection detection.

```
    <commandinjection>

      <keyword type="LITERAL" builtin="ON">7z</keyword>

      <keyword type="LITERAL" builtin="ON">7za</keyword>

      <keyword type="LITERAL" builtin="ON">7zr</keyword>

…

</commandinjection>
```

Special characters defined in the signature file are: `| ; & $ > < ' \ ! >> #`

Configuring command injection check by using the CLI

In the command line interface, you can use either the set the profile command or the add the profile command to configure the command injection settings. You can enable the block, log, and stats actions. You must also set the key words and string characters that you want to detect in the payloads.

At the command prompt, type:

`set appfw profile <profile-name> –cmdInjectionAction <action-name> -CMDInjectionType <CMDInjectionType>]`

NOTE:

By default, the command injection action is set as "None.” Also, the default command injection type is set as `CmdSplCharANDKeyWord`.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Example:

```
set appfw profile profile1 -cmdInjectionAction block -CMDInjectionType
CmdSplChar
```

Where, the available command injection actions are:

- None - Disable command injection protection.
- Log - Log command injection violations for the security check.
- Block - blocks traffic that violates the command injection security check.
- Stats - Generates statistics for command injection security violations.

Where, the available command injection types are:

- Cmd SplChar. Checks special characters
- CmdKeyWord. Checks command injection Keywords
- CmdSplCharANDKeyWord. Checks special characters and command injection. Keywords and blocks only if both are present.
- CmdSplCharORKeyWord. Checks special characters and command injection Keywords and blocks if either of them is found.

Configuring relaxation rules for command injection protection check

If your application requires you to bypass the command injection inspection for a specific ELEMENT or ATTRIBUTE in the payload, you can configure a relaxation rule.

The command Injection inspection relaxation rules have the following syntax:

```
bind appfw profile <profile name> –cmdInjection <string> <URL> -isregex <REGEX/
NOTREGEX>
```

Example for relaxation rule for Regex in header

```
bind appfw profile sample -CMDInjection hdr "http://10.10.10.10/" -location
heaDER -valueType Keyword '[a-z]+grep' -isvalueRegex REGEX
```

As a result, the injection exempts the command injection check allows header `hdr` containing variants of "grep."

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Example for relaxation rule with valueType as regex in cookie

```
bind appfw profile sample -CMDInjection ck_login "http://10.10.10.10/" -location cookie -valueType Keyword 'pkg[a-z]+' -isvalueRegex REGEX
```

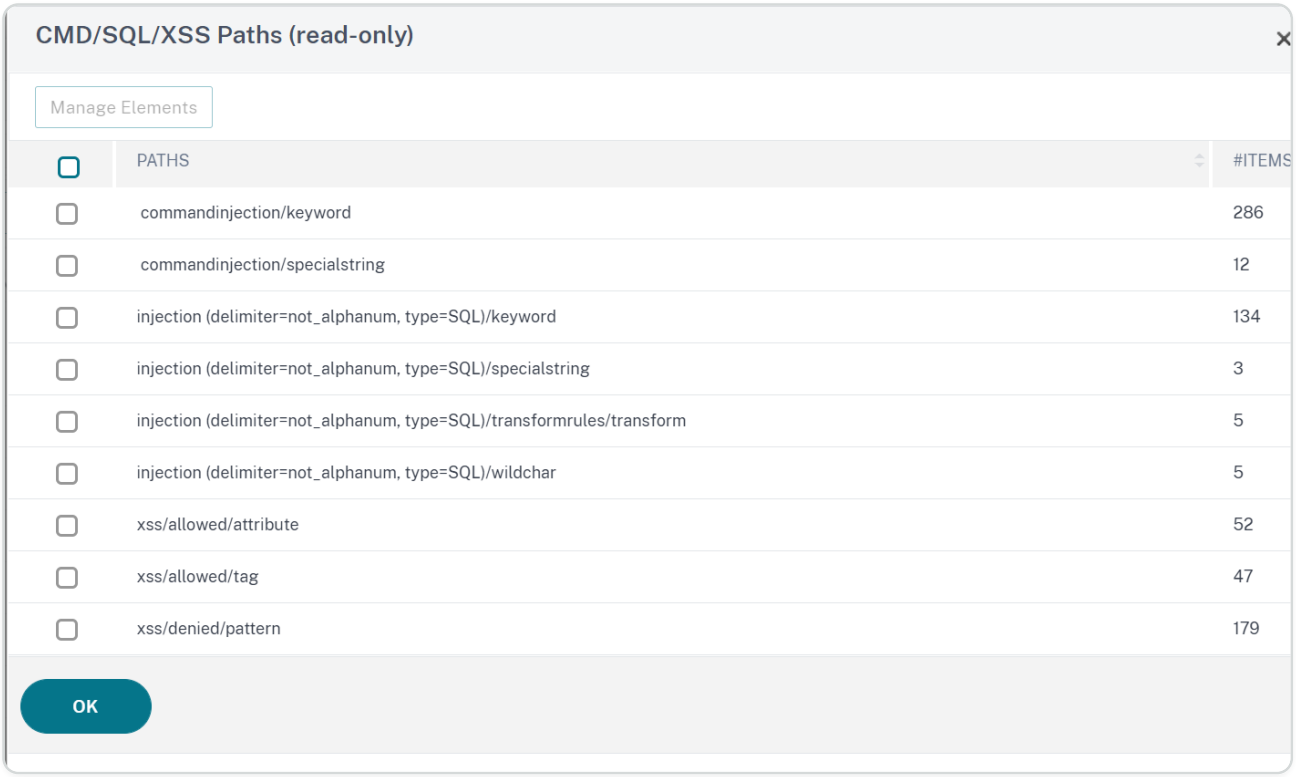
Configuring command injection check by using NetScaler GUI

Complete the following steps to configure the command injection check.

1. Navigate to **Security > NetScaler Web App Firewall and Profiles**.
2. On the **Profiles** page, select a profile and click **Edit**.
3. On the **NetScaler Web App Firewall Profile** page, go to the **Advanced Settings** section and click **Security Checks**.
4. In the **Security Checks** section, select **HTML Command Injection** and click **Action** settings.
5. In the **HTML Command Injection Settings** page, set the following parameters:
    a. Actions. Select one or more actions to perform for command injection security check.
    b. Check Request Containing. Select a command injection pattern to check if the incoming request has the pattern.
6. Click **OK**.

View or customize command injection patterns by using the GUI

You can use the GUI to view or customize the **HTML** command injection patterns.



The default command injection patterns are specified in default signatures file. If you do not bind any signature object to your profile, the default HTML command injection patterns specified in the default signatures object will be used by the profile for the command injection security check processing. The rules and patterns, specified in the default signatures object, are read-only. You cannot edit or modify them. If you want to modify or change these patterns, make a copy of the default sSignatures object to create a User-Defined signature object. Make changes in the command injection patterns in the new User-defined signature object and use this signature object in your profile that is processing the traffic for which you want to use these customized patterns.

For more information, see Signatures

To view the default command injection patterns by using the GUI:

1. Navigate to **Application Firewall > Signatures**, select ***Default Signatures**, and click **Edit**.
2. Click **Manage CMD/SQL/XSS patterns**. The **CMD/SQL/XSS Paths (read-only)** table shows patterns pertaining to `CMD/SQL/XSS` injection:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. Select a row and click **Manage Elements** to display the corresponding command injection patterns (keywords, special strings, transformation rules, or wildcard characters) used by the Web App Firewall command injection check.

To customize a command injection pattern by using the GUI

You can edit the user-defined signature object to customize the **CMD** key words, special strings, and wildcard characters. You can add new entries or remove the existing ones. You can modify the transformation rules for the command injection special strings.

1. **Navigate to Application Firewall > Signatures**, highlight the target User-defined signature, and click **Add**. Click **Manage CMD/SQL/XSS patterns**.
2. In the **Manage CMD/SQL/XSS paths** page, select the target CMD injection row.
3. Click **Manage Elements**, **Add**, or **Remove** a command injection element.

WARNING:

You must be careful before you remove or modify any default command injection element, or delete the CMD path to remove the entire row. The signature rules and the command injection security check rely on these elements for detecting command injection attacks to protect your applications. Customizing the SQL patterns can make your application vulnerable to command injection attacks if the required pattern is removed during editing.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Viewing command injection traffic and violation statistics

The **NetScaler Web App Firewall Statistics** page shows security traffic and security violation details in a tabular or graphical format.

To view security statistics by using the command interface.

At the command prompt, type:

```
stat appfw profile profile1
```

Viewing HTML command injection statistics by using the NetScaler GUI

Complete the following steps to view the command injection statistics:

1. Navigate to **Security > NetScaler Web App Firewall > Profiles**.
2. In the details pane, select a Web App Firewall profile and click **Statistics**.
3. The **NetScaler Web App Firewall Statistics** page displays the HTML command injection traffic and violation details.
4. You can select **Tabular View** or switch to **Graphical View** to display the data in a tabular or graphical format.

Custom keyword support for HTML payload

Starting from NetScaler release 13.1 build 27.xx, you can add keywords of your choice and check if these configured keywords are present in the HTML payload.

SQL injection and command injection have a predefined set of keywords or patterns that they look for in the incoming requests. These predefined sets of keywords might not cover all the keywords as per your requirement and might lead to an increase in the number of false positives. With this feature, you can add keywords that are not covered in the SQL injection and command injection checks and therefore reduce the false positives.

After adding the keywords, you can configure the NetScaler appliance to check if the added keywords are detected in the incoming requests. You can then configure the NetScaler appliance to do one of the following actions:

- **None** – No action is taken. This action is the default.
- **Log** - Log all requests that match the URL and have the configured keywords.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Block** – Block all requests that match the URL and have the configured keywords.
- **Stats** – Increment the log counter for each request that matches the URL and has the configured keywords.

Add custom keywords using the CLI

Adding a custom keyword using the CLI involves the following steps:

1. Configure a web application firewall profile and define an action when the custom keyword is detected in the incoming request.

   ```
   set appfw profile <profile-name> –blockKeywordAction (block | log |
   stats | none)
   ```

   By default, the -blockKeywordAction is set to none.

   Example:

   ```
   set appfw profile test_profile -blockKeywordAction none
   ```

2. Bind the web application firewall profile with your custom keywords.

   ```
   bind appfw profile <profile_name> -blockKeyword <keyword_name>
   -BlockKeywordType <literal|PCRE > -fieldName <field_name> -formURL
   <URL> -isFieldNameRegex <REGEX|NOTREGEX> -state <enable/disable>
   -comment <text>
   ```

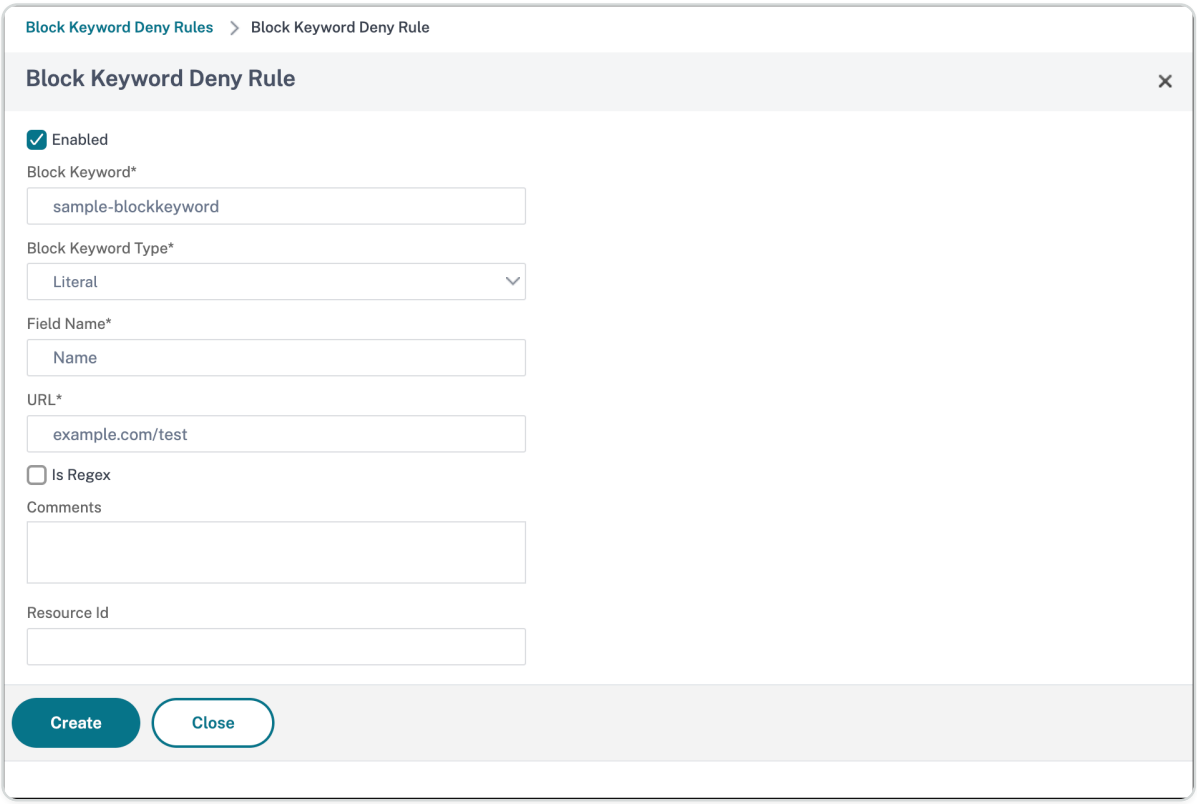
   Example:

   To add **blockword** as the custom keyword and bind it to **test_profile**, run the following command:

   ```
   bind appfw profile test_profile
   -blockKeyword "blockword" BlockKeywordType literal
   -fieldName "firstname" -formURL "/signup.php" -state enable
   ```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE:



You can enter an URL or an FQDN in the URL parameter. The FQDN supports both HTTP and HTTPS protocol.

Add custom keywords using the GUI

1. Navigate to **Security > NetScaler Web App Firewall Profile > Profiles**.
2. Select a profile and click **Edit**.
3. Go to the **Advanced Settings** section and click **Deny Rules**.
4. Select **Block Keyword** and click **Edit**.
5. Click **Add** and set the following parameters:

    - Enable
    - Block Keyword
    - Block Keyword Type
    - Field Name
    - URL
    - Is Regex
    - Comments
    - Resource ID

© 1997–2026 Citrix Systems, Inc. All rights reserved.

6. Click **Create**. The custom keyword that you added is listed in the **Block Keyword Deny Rules** page.
7. Go to the **Advanced Settings** section and click **Security Checks**.
8. Select **Block Keyword** and click **Action Settings**.
9. Select the required actions and click **OK**.

View custom keyword statistics using the CLI

To view the custom keyword statistics, type the following command at the command prompt:

```
stat appfw profile <profile name>
```

Example

```
stat appfw profile test_profile
```

View custom keyword statistics the GUI

1. Navigate to **Security > NetScaler Web App Firewall > Profiles**.
2. In the details pane, select a **Web App Firewall profile** and click **Statistics**. The **NetScaler Web App Firewall Statistics** page displays the custom keyword traffic and violation details.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. You can select **Tabular View** or switch to **Graphical View** to display the data in a tabular or graphical format.

XML external entities (XXE) Attack Protection

The XML external entities (XXE) attack protection examines if an incoming payload has any unauthorized XML input regarding entities outside the trusted domain where the web application resides. The XXE attack occurs if you have a weak XML parser that parses an XML payload with input containing references to external entities.

In a NetScaler appliance, if the XML parser is improperly configured, the impact of exploiting the vulnerability can be dangerous. It allows an attacker to read sensitive data on the web server. Perform the denial of service attack and so forth. Therefore, it is important protect the appliance from XXE attacks. Web Application Firewall is able to protect the appliance from XXE attacks as long as the content-type is identified as XML. To prevent a malicious user from bypassing this protection mechanism, WAF blocks an incoming request if the "inferred" content-type in the HTTP headers does not match with the content-type of the body. This mechanism prevents the XXE attack protection bypass when a whitelisted default or non-default content-type is used.

Some of the potential XXE threats that affect a NetScaler appliance are:

- Confidential data leaks
- Denial-of-service (DOS) attacks
- server side forgery requests
- Port scanning

Configure XML external entities (XXE) injection protection

To configure XML external entities (XXE) check by using the command interface: In the command line interface, you can add or modify the application firewall profile command to configure the **XXE** settings. You can enable the block, log, and stats actions.

At the command prompt, type:

```
set appfw profile <name> [-inferContentTypeXmlPayloadAction
<inferContentTypeXmlPayloadAction <block | log | stats | none>]
```

Note:

> By default, the XXE action is set as "none."

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Example:

```
set appfw profile profile1 -inferContentTypeXmlPayloadAction Block
```

Where, action types are:

Block: The request is blocked without any exception to the urls in the request.

Log: If a mismatch between content-type in an HTTP request header and payload occurs, information about the violating request must be contained in the log message.

Stats: If a mismatch in the content-types is detected, the corresponding statistics for this violation type is incremented.

None: No action is taken if mismatch in content-types is detected. None cannot be combined with any other action type. Default action is set to None.

Configure XXE injection check by using NetScaler GUI

Complete the following steps to configure the XXE injection check.

1. Navigate to **Security > NetScaler Web App Firewall > Profiles**.
2. On the **Profiles** page, select a profile and click **Edit**.
3. On the **NetScaler Web App Firewall Profile** page, go to the **Advanced Settings** section and click **Security Checks**.
4. In the **Security Checks** section, select **Infer Content Type XML Payload** and click **Action** settings.
5. In the Infer Content Type XML Payload Settings page, set the following parameters:
    a. Actions. Select one or more actions to perform for XXE injection security check.
6. Click **OK**.

Viewing XXE injection traffic and violation statistics

The NetScaler Web App Firewall Statistics page shows security traffic and security violation details in a tabular or graphical format.

To view security statistics by using the command interface.

At the command prompt, type:

```
stat appfw profile profile1
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Viewing XXE injection statistics by using the NetScaler GUI

Complete the following steps to view the XXE injection statistics:

1. Navigate to **Security > NetScaler Web App Firewall > Profiles**.
2. In the details pane, select a Web App Firewall profile and click **Statistics**.
3. The **NetScaler Web App Firewall Statistics** page displays the XXE command injection traffic and violation details.
4. You can select **Tabular View** or switch to **Graphical View** to display the data in a tabular or graphical format.

Buffer overflow check

The Buffer Overflow check detects attempts to cause a buffer overflow on the web server. If the Web App Firewall detects that the URL, cookies, or header are longer than the configured length, it blocks the request because it can cause a buffer overflow.

The Buffer Overflow check prevents attacks against insecure operating-system or web-server software that can crash or behave unpredictably when it receives a data string that is larger than it can handle. Proper programming techniques prevent buffer overflows by checking incoming data and either rejecting or truncating overlong strings. Many programs, however, do not check all incoming data and are therefore vulnerable to buffer overflows. This issue especially affects older versions of web-server software and operating systems, many of which are still in use.

The Buffer Overflow security check allows you to configure the **Block**, **Log**, and **Stats** actions. In addition, you can also configure the following parameters:

- **Maximum URL Length**. The maximum length the Web App Firewall allows in a requested URL. Requests with longer URLs are blocked. **Possible Values**: 0–65535. **Default**: 1024
- **Maximum Cookie Length**. The maximum length the Web App Firewall allows for all cookies in a request. Requests with longer cookies trigger the violations. **Possible Values**: 0–65535. **Default**: 4096
- **Maximum Header Length**. The maximum length the Web App Firewall allows for HTTP headers. Requests with longer headers are blocked. **Possible Values**: 0–65535. **Default**: 4096
- **Query string length**. Maximum length allowed for query string in an incoming request. Requests with longer queries are blocked. Possible Values: 0–65535. Default: 1024
- **Total request length**. Maximum request length allowed for an incoming request. Requests with longer length are blocked. Possible Values: 0–65535. Default: 24820

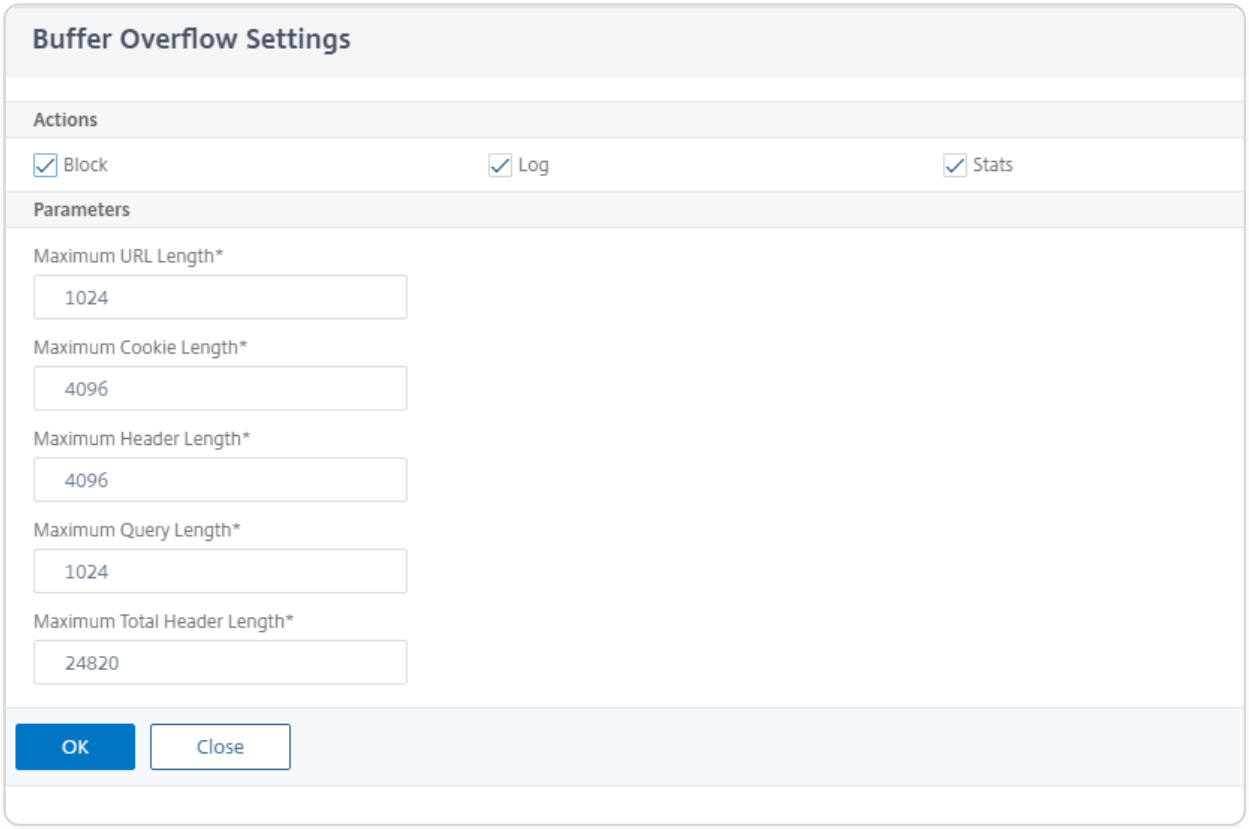
© 1997–2026 Citrix Systems, Inc. All rights reserved.

Using the command line to configure the Buffer Overflow security check

To configure Buffer Overflow security check actions and other parameters by using the command line

At the command prompt, type:

```
add appfw profile <name> -bufferOverflowMaxURLLength <positive_integer> -bufferOverflowMaxHeaderLength <positive_integer> - bufferOverflowMaxCookieLength <positive_integer> -bufferOverflowMaxQueryLength <positive_integer> -bufferOverflowMaxTotalHeaderLength <positive_integer>
```



Example:

```
add appfw profile profile1 –bufferOverflowMaxURLLength 7000 – bufferOverflowMaxHeaderLength 7250 – bufferOverflowMaxCookieLength 7100 – bufferOverflowMaxQueryLength 7300 –bufferOverflowMaxTotalHeaderLength 7300
```

Configure buffer overflow security check by using the NetScaler GUI

1. Navigate to **Security** > **Web App Firewall** and **Profiles**.
2. On the **Profiles** page, select a profile and click **Edit**.
3. On the **NetScaler Web App Firewall Profile** page, go to **Advanced Settings** section and click **Security Checks**.
4. In **Security Checks** section, select **Buffer Overflow** and click **Action Settings**.
5. In the **Buffer Overflow Settings** page, set the following parameters. a. Actions. Select one or more actions to perform for command injection security check. b. Maximum URL Length. Maximum length, in characters, for URLs on your protected websites. Requests with longer URLs are blocked. c. Maximum Cookie Length. Maximum length, in characters, for cookies sent to your protected websites. Requests with longer cookies are blocked. d. Maximum Header Length. Maximum length, in characters, for HTTP headers in requests sent to your protected websites. Requests with longer headers are blocked. e. Maximum Query Length. Maximum length, in bytes, for query string sent to your protected websites. Requests with longer query strings are blocked. f. Maximum Total Header Length. Maximum length, in bytes, for the total HTTP header length in requests sent to your protected websites. The minimum value of this and maxHeaderLen in httpProfile will be used. Requests with longer length are blocked.
6. Click **OK** and **Close**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Using the Log Feature with the Buffer Overflow Security Check

When the log action is enabled, the Buffer Overflow security check violations are logged in the audit log as **APPFW_BUFFEROVERFLOW_URL**, **APPFW_BUFFEROVERFLOW_COOKIE**, and **APPFW_BUFFEROVERFLOW_HDR** violations. The Web App Firewall supports both Native and CEF log formats. You can also send the logs to a remote syslog server.

If you use the GUI to review the logs, you can use the click-to-deploy feature to apply relaxations indicated by the logs.

To access the log messages by using the command line

Switch to the shell and tail the ns.logs in the **/var/log/** folder to access the log messages pertaining to the Buffer overflow violations:

```
> **Shell**

> **tail -f /var/log/ns.log | grep APPFW_BUFFEROVERFLOW**
```

Example of a CEF log message showing bufferOverflowMaxCookieLength violation in non-block mode

```

To access the log messages by using the GUI

The GUI includes a useful tool (**Syslog Viewer**) for analyzing the log messages. You have multiple options for accessing the Syslog Viewer:

- Navigate to the **Application Firewall** > **Profiles**, select the target profile, and click **Security Checks**. Highlight the **Buffer Overflow** row and click **Logs**. When you access the logs directly from the Buffer Overflow Security Check of the profile, the GUI filters out the log messages and displays only the logs pertaining to these security check violations.
- You can also access the Syslog Viewer by navigating to **NetScaler®** > **System** > **Auditing**. In the Audit Messages section, click the **Syslog messages** link to display the Syslog Viewer, which displays all log messages, including other security check violation logs. This is useful for

© 1997–2026 Citrix Systems, Inc. All rights reserved.

debugging when multiple security check violations might be triggered during request processing.

- Navigate to **Application Firewall** > **policies** > **Auditing**. In the **Audit Messages** section, click the **Syslog messages** link to display the Syslog Viewer, which displays all log messages, including other security check violation logs.

The XML based Syslog Viewer provides various filter options for selecting only the log messages that are of interest to you. To select log messages for the **Buffer Overflow** check, filter by selecting **APPFW** in the drop-down list options for **Module**. The **Event Type** list offers three options, **APPFW_BUFFEROVERFLOW_URL**, **APPFW_BUFFEROVERFLOW_COOKIE**, and A**PPFW_BUFFEROVERFLOW_HDR**, to view all the log messages pertaining to buffer overflow security check. You can select one or more options to further refine your selection. For example, if you select the **APPFW_BUFFEROVERFLOW_COOKIE** check box and click the **Apply** button, only log messages pertaining to the **Buffer Overflow security** check violations for the Cookie header appear in the Syslog Viewer. If you place the cursor in the row for a specific log message, multiple options, such as **Module**, **Event Type**, **Event ID**, and **Client IP**, appear below the log message. You can select any of these options to highlight the corresponding information in the log message.

Click-to-Deploy: The GUI provides click-to-deploy functionality, which is currently supported only for the buffer overflow log messages pertaining to the **URL Length** violations. You can use the Syslog Viewer to not only view the triggered violations, but also run informed decisions based on the observed lengths of the blocked messages. If the current value is too restrictive and is triggering false positives, you can select a message and deploy it to replace the current value with the URL length value seen in the message. The log messages must be in CEF log format for this operation. If the relaxation can be deployed for a log message, a check box appears at the right edge of the **Syslog Viewer** box in the row. Select the check box, and then select an option from the **Action** list to deploy the relaxation. **Edit & Deploy**, **Deploy**, and **Deploy All** are available as **Action** options. You can use the **APPFW_BUFFEROVERFLOW_URL** filter to isolate all the log messages pertaining to the configured URL length violations.

If you select an individual log message, all three action options **Edit & Deploy**, **Deploy**, and **Deploy All** are available. If you select **Edit & Deploy**, the **Buffer Overflow settings** dialogue is displayed. The new URL length that was observed in the request is inserted into the **Maximum URL length input** field. If you click **Close** without any edits, the current configured values remain unchanged. If you click the **OK** button, the new value of the Maximum URL length replaces the previous value.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE

The **block**, **log** and **stats** action check boxes are unchecked in the displayed **Buffer Overflow settings** dialogue, and need to be reconfigured if you select the **Edit & Deploy** option. Make sure to enable these check boxes before clicking **OK**, otherwise the new URL length gets configured but the actions are set to **none**.

If you select the check boxes for multiple log messages, you can use the **Deploy** or **Deploy All** option. If the deployed log messages have different URL lengths, the configured value gets replaced by the highest URL Length value observed in the selected messages. Deploying the rule results only in changing the **bufferOverflowMaxURLLength** value. Configured actions are retained and remain unchanged.

To use Click-to-Deploy functionality in the GUI

1. In the Syslog Viewer, select **APPFW** in the **Module** options.
2. Enable the **APPFW_BUFFEROVERFLOW_URL** check box as the **Event Type** to filter corresponding log messages.
3. Enable the check box to select the rule.
4. Use the **Action** drop-down list of options to deploy the relaxation.
5. Navigate to **Application Firewall** > **Profiles**, select the target profile, and click **Security Checks** to access the **Buffer Overflow** settings pane to verify that the **Maximum URL Length** value is updated.

Statistics for the Buffer Overflow violations

When the stats action is enabled, the counter for the Buffer Overflow Security Check is incremented when the Web App Firewall takes any action for this security check. The statistics are collected for Rate and Total count for Traffic, Violations, and Logs. The size of an increment of the log counter can vary depending on the configured settings. For example, if the block action is enabled, a request for a page that contains three Buffer Overflow violations increments the stats counter by one, because the page is blocked when the first violation is detected. However, if block is disabled, processing the same request increments the stat counter for violations because each violation generates a separate log message.

To display Buffer Overflow Security Check statistics by using the command line

At the command prompt, type:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
> sh appfw stats
```

To display stats for a specific profile, use the following command:

```
> stat appfw profile <profile name>
```

To display Buffer Overflow statistics by using the GUI

1. Navigate to **System** > **Security** > **Application Firewall**.
2. In the right pane, access the **Statistics** Link.
3. Use the scroll bar to view the statistics about Buffer Overflow violations and logs. The statistics table provides real-time data and is updated every 7 seconds.

Highlights

- The buffer overflow security check allows you to configure limits to enforce the maximum length of allowed URLs, Cookies, and Headers.
- **Block**, **Log** and **Stats** actions enable you to monitor the traffic and configure optimal protection for your application.
- Syslog viewer enables you to filter and view all the log messages pertaining to buffer overflow violations.
- **Click-to-Deploy** functionality is supported for the **bufferOverflowMaxURLLength** violations. You can select and deploy an individual rule, or you can select multiple log messages to tweak and relax the current configured value of the maximum allowed length of the URL. The highest value of the URL from the selected group is set as the new value, to allow all these requests that are currently flagged as violations.
- The Web App Firewall now evaluates individual cookies when inspecting the incoming request. If length of any one cookie received in the Cookie header exceeds the configured **BufferOverflowMaxCookieLength**, the Buffer Overflow violation is triggered.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

IMPORTANT

In release 10.5.e (in a few interim enhancements builds prior to 59.13xx.e build) and in the 11.0 release (in builds prior to 65.x), Web App Firewall processing of the Cookie header was changed. In those releases, every cookie is evaluated individually, and if the length of any one cookie received in the Cookie header exceeds the configured BufferOverflowMaxCookieLength, the Buffer Overflow violation is triggered. As a result of this change, requests that were blocked in 10.5 and earlier release builds might be allowed, because the length of the entire cookie header is not calculated for determining the cookie length. **** In some situations, the total cookie size forwarded to the server might be larger than the accepted value, and the server might respond with "400 Bad Request".

This change has been reverted. The behavior in the 10.5.e ->59.13xx.e and subsequent 10.5.e enhancement builds in addition to 11.0 release 65.x and subsequent builds is now similar to that of the non-enhancement builds of release 10.5. The entire raw Cookie header is now considered when calculating the length of the cookie. Surrounding spaces and the semicolon (;) characters separating the name-value pairs are also included in determining the cookie length.

Web App Firewall support for Google web toolkit

Note: This feature is available in NetScaler release 10.5.e.

Web servers following Google Web Toolkit (GWT) Remote Procedure Call (RPC) mechanisms can be secured by the NetScaler Web App Firewall without a need for any specific configuration to enable the GWT support.

What is GWT

The GWT is used for building and optimizing complex high-performance web applications by people who do not have expertise in XMLHttpRequest, and JavaScript. This open source, free development toolkit is used extensively for developing small and large scale applications and is quite frequently used for displaying browser based data such as search results for flights, hotels, and so on. The GWT provides a core set of Java APIs and widgets for writing optimized JavaScript scripts that can run on most browsers and mobile devices. The GWT RPC framework makes it easy for the client and server components of the web application to exchange Java objects over HTTP. GWT RPC services are not the same as web services based on SOAP or REST. They are simply a lightweight method for transferring data between the server and the GWT application on the client. GWT handles serialization of the Java objects exchanging the arguments in the method calls and the return value.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

For popular websites that use GWT, see

`<https://www.quora.com/What-web-applications-use-Google-Web-Toolkit-%28GWT%29>`

How a GWT request works

The GWT RPC request is pipe delimited and has variable number of arguments. It is carried as a payload of HTTP POST and has the following values:

1. Content-type = text/x-gwt-rpc. Charset can be any value.
2. Method = POST.

Both GET and POST HTTP requests are considered valid GWT requests if content-type is “text/x-gwt-rpc”. Query strings are now supported as part of GWT requests. Configure the “InspectQueryContentTypes” parameter of the App Firewall profile to “OTHER” to examine the request query portion for conent-type “text/x-gwt-rpc”.

The following example shows a valid payload for a GWT request:

```
5|0|8|http://localhost:8080/test/|16878339F02B83818D264AE430C20468|
com.test.client.TestService|testMethod|java.lang.String|java.lang.Integer|
myInput1|java.lang.Integer/3438268394|1|2|3|4|2|5|6|7|8|1|
```

The request can be divided into three parts:

a) `Header: 5|0|8|`

The first 3 digits `5|0|8|` in the above request, represent "version, subversion, and size of table", respectively. These must be positive integers.

b) String Table:

`http://localhost:8080/test/|16878339F02B83818D264AE430C20468|`
`com.test.client.TestService|testMethod|java.lang.String|java.lang.Integer|`
`myInput1| java.lang.Integer/3438268394|`

The members of the above pipe delimited string table contain the user-provided inputs. These inputs are parsed for the Web App Firewall checks and are identified as follows:

- 1st : `http://localhost:8080/test/`

  This is the Request URL.

- 2nd : `16878339F02B83818D264AE430C20468`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Unique HEX identifier. A request is considered malformed if this string has non-hex characters.

- 3rd : `com.test.client.TestService`

  Service Class name

- 4th : `testMethod`

  Service method name

- 5th onwards: `java.lang.String|java.lang.Integer|myInput1|java.lang.Integer/3438268394`

  Data-types and data. Non-primitive data-types are specified as

  `<container>.<sub-cntnr>.name/<integer><identifier>`

c) **`Payload: 1|2|3|4|2|5|6|7|8|1|`**

The payload consists of references to the elements in the string table. These integer values cannot be larger than the number of elements in the string table.

Web App Firewall protection for GWT applications

The Web App Firewall understands and interprets GWT RPC requests, inspects the payload for security check violations, and takes specified actions.

The Web App Firewall headers and cookies checks for GWT requests are similar to those for other request formats. After appropriate URL decoding and charset conversion, all the parameters in the string table are inspected. The GWT request body does not contain field names, just the field values. The input values can be validated against the specified format by using the Web App Firewall Field Format check, which can also be used to control the length of the input. The **Cross-site Scripting** and **SQL Injection** attacks in the inputs can be easily detected and thwarted by the Web App Firewall.

Learning and relaxation rules: Learning and deployment of relaxation rules are supported for GWT requests. Web App Firewall rules are in the form of \<actionURL\> \<fieldName\> mapping. The GWT request format does not have the field names and thus requires special handling. The Web App Firewall inserts dummy field names in the learned rules that can be deployed as relaxation rules. The -isRegex flag works as it does for non-GWT rules.

- Action URL:

  Multiple services responding to an RPC can be configured on the same web server. The HTTP request has the URL of the web server, not of the actual service handling the RPC. Therefore,

© 1997–2026 Citrix Systems, Inc. All rights reserved.

relaxation is not applied on the basis of the HTTP request URL, because that would relax all the services on that URL for the target field. For GWT requests, the Web App Firewall uses the URL of the actual service found in the GWT payload, in the fourth field in the string table.

- Field name:

  Since the GWT request body contains only field values, the Web App Firewall inserts dummy field names such as 1, 2, and so on when recommending learned rules.

  Example of a GWT learned rule

```
POST /abcd/def/gh HTTP/1.1

Content-type: text/x-gwt-rpc

Host: 10.217.222.75

Content-length: 157

5|0|8|http://localhost:8080/acdtest/|
16878339F02Baf83818D264AE430C20468|

com.test.client.TestService|testMethod|java.lang.String%3b|
java.lang.Integer|onblur|

  The learn data will be as follows:

> sh learningdata pr1 crossSiteScripting

Profile: pr1    SecurityCheck: crossSiteScripting

1)  Url:    http://localhost:8080/acdtest/  >> From GWT Payload.

    Field:  10

    Hits:   1

 Done
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Example of a GWT relaxation rule

```
bind appfw profile pr1 -crossSiteScripting 1 abcd -isregex NOTREGEX
```

Log Messages: The Web App Firewall generates log messages for the security check violations that are detected in the GWT requests. A log message generated by a malformed GWT request contains the string “GWT” for easy identification.

Example of a Log message for malformed GWT request:

```
Dec 5 21:48:02 <local0.notice> 10.217.31.247 12/05/2014:21:48:02 GMT ns 0-PPE-0 : APPFW Message 696 0 : "GWT RPC request with malformed payload. <blocked>”
```

Difference in processing of GWT vs non-GWT requests:

The same payload can trigger different Web App Firewall security check violations for different Content-types. Consider the following example:

```
5|0|8|http://localhost:8080/acdtest/|16878339F02Baf83818D264AE430C20468|com.test.client.TestService|testMethod|java.lang.String%3b|java.lang.Integer|select|
```

Content-type: application/x-www-form-urlencoded:

A request sent with this content type results in a SQL violation if the SQL Injection Type is configured to use any of the four available options: SQLSplCharANDKeyword, SQLSplCharORKeyword, SQLKeyword, or SQLSplChar. The Web App Firewall considers '&' to be the field separator and '=' to be the name-value separator when processing the above payload. Since neither of these characters appears anywhere in the post body, the entire content is treated as a single field name. The field name in this request contains both an SQL special character (;) and an SQL Keyword (select). Therefore violations are caught for all four SQL Injection type options.

Content-type: text/x-gwt-rpc:

A request sent with this content type triggers an SQL violation only if the SQL injection type is set to one of the following three options: SQLSplCharORKeyword,SQLKeyword, or SQLSplChar. No violation is triggered if the SQL injection type is set to SQLSplCharANDKeyword, which is the default option. The Web App Firewall considers the vertical bar `|` to be the field separator for the above payload in the GWT request. Therefore, the post body is divided into various form-field values, and form-field names are added (in accordance with the convention described earlier).

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Because of this splitting, the SQL special character and SQL keyword become parts of separate form fields.

Form field 8: `java.lang.String%3b -\> %3b is the (;) char`

Form Field 10: `select`

As a result, when SQL Injection Type is set to **SQLSplChar**, field 8 indicates the SQL violation. For **SQLKeyword**, field 10 indicates the violation. Either of these two fields can indicate a violation if the SQL Inject type is configured with the **SQLSplCharORKeyword** option, which looks for the presence of either a keyword or a special character. No violation is caught for the default **SQLSplCharANDKeyword** option, because there is no single field that has a value that contains both **SQLSplChar** and **SQLKeyword** together.

Tips:

- No special Web App Firewall configuration is needed to enable GWT support.
- The Content-type must be text/x-gwt-rpc.
- Learning and deploying of the relaxation rules for all the pertinent Web App Firewall security checks applied to GWT payload works the same as it does for the other supported content-types.
- Only POST requests are considered valid for GWT. All other request methods are blocked if the content-type is text/x-gwt-rpc.
- GWT requests are subject to the configured POST body limit of the profile.
- The sessionless setting for the security checks is not applicable and will be ignored.
- CEF log format is supported for the GWT log messages.

Cookie Protection

Cookie is a small packet data sent from a web server to a client browser. Cookies carry sensitive data such as passwords, user authentication details, and credentials over an HTTP connection and stored in a web browser. Hence it is highly important to protect cookies from attackers who steal information.

Cookie consistency check: Examines cookies returned with user requests to verify that they match the cookies your Web server set for that user. If a modified cookie is found, it is stripped from the request before the request is forwarded to the Web server. For more information, see Cookie consistency check topic.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Cookie hijacking protection: Hijacking refers to a situation where an attacker gains an unauthorized access to cookies. To protect cookie from authorized access, the NetScaler Web App Firewall (WAF) challenges the TLS connection from the client along with WAF cookie consistency validation. For every new client request, the appliance validates the TLS connection and also verifies the consistency of application and session cookie in the request. For more information, see Cookie hijacking protection topic.

SameSite cookie attribute: The `SameSite` attribute in the Set-Cookie HTTP response allows you to declare if your cookie must be restricted to a first-party or same-site context. The cookie setting mitigates attacks and provides a secured web communication. For more information, see SameSite cookie attribute topic.

Cookie consistency check

The Cookie Consistency check examines cookies returned by users to verify that they match the cookies that your website set for that user. If a modified cookie is found, it is stripped from the request before the request is forwarded to the web server. You can also configure the Cookie Consistency check to transform all of the server cookies that it processes, by encrypting the cookies, proxying the cookies, or adding flags to the cookies. This check applies to requests and responses.

An attacker would normally modify a cookie to gain access to sensitive private information by posing as a previously authenticated user, or to cause a buffer overflow. The Buffer Overflow check protects against attempts to cause a buffer overflow by using a long cookie. The Cookie Consistency check focuses on the first scenario.

If you use the wizard or GUI, in the Modify Cookie Consistency Check dialog box, on the General tab you can enable or disable the following actions:

- Block
- Log
- Learn
- Statistics
- Transform. If enabled, the Transform action modifies all cookies as specified in the following settings:
    - **Encrypt Server Cookies.** Encrypt cookies set by your web server, except for any listed in the Cookie Consistency check relaxation list, before forwarding the response to the client. Encrypted cookies are decrypted when the client sends a subsequent request, and the

© 1997–2026 Citrix Systems, Inc. All rights reserved.

decrypted cookies are reinserted into the request before it is forwarded to the protected web server. Specify one of the following types of encryption:

- **None.** Do not encrypt or decrypt cookies. The default.
- **Decrypt only.** Decrypt encrypted cookies only. Do not encrypt cookies.
- **Encrypt session only.** Encrypt session cookies only. Do not encrypt persistent cookies. Decrypt any encrypted cookies.
- **Encrypt all.** Encrypt both session and persistent cookies. Decrypt any encrypted cookies. **Note**: When encrypting cookies, the Web App Firewall adds the **HttpOnly** flag to the cookie. This flag prevents scripts from accessing and parsing the cookie. The flag therefore prevents a script-based virus or trojan from accessing a decrypted cookie and using that information to breach security. This is done regardless of the Flags to Add in Cookies parameter settings, which are handled independently of the Encrypt Server Cookies parameter settings.

- **Proxy Server Cookies.** Proxy all non-persistent (session) cookies set by your web server, except for any listed in the Cookie Consistency check relaxation list. Cookies are proxied by using the existing Web App Firewall session cookie. The Web App Firewall strips session cookies set by the protected web server and saves them locally before forwarding the response to the client. When the client sends a subsequent request, the Web App Firewall reinserts the session cookies into the request before forwarding it to the protected web server. Specify one of the following settings:
  - **None.** Do not proxy cookies. The default.
  - **Session only.** Proxy session cookies only. Do not proxy persistent cookies Note: If you disable cookie proxying after having enabled it (set this value to None after it was set to Session only), cookie proxying is maintained for sessions that were established before you disabled it. You can therefore safely disable this feature while the Web App Firewall is processing user sessions.
- **Flags to Add in Cookies**. Add flags to cookies during transformation. Specify one of the following settings:
  - **None.** Do not add flags to cookies. The default.
  - **HTTP only.** Add the HttpOnly flag to all cookies. Browsers that support the HttpOnly flag do not allow scripts to access cookies that have this flag set.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Secure**. Add the Secure flag to cookies that are to be sent only over an SSL connection. Browsers that support the Secure flag do not send the flagged cookies over an insecure connection.
- **All.** Add the HttpOnly flag to all cookies, and the Secure flag to cookies that are to be sent only over an SSL connection.

If you use the command-line interface, you can enter the following commands to configure the Cookie Consistency Check:

- `set appfw profile <name> -cookieConsistencyAction [**block**] [**learn**] [**log**] [**stats**] [**none**]`
- `set appfw profile <name> -cookieTransforms ([**ON**] | [**OFF**])`
- `set appfw profile <name> -cookieEncryption ([**none**] | [**decryptOnly**] | [**encryptSession**] | [**encryptAll**])`
- `set appfw profile <name> -cookieProxying ([**none**] | [**sessionOnly**])`
- `set appfw profile <name> -addCookieFlags ([**none**] | [**httpOnly**] | [**secure**] | [**all**])`

To specify relaxations for the Cookie Consistency check, you must use the GUI. On the Checks tab of the Modify Cookie Consistency Check dialog box, click Add to open the Add Cookie Consistency Check Relaxation dialog box, or select an existing relaxation and click Open to open the Modify Cookie Consistency Check Relaxation dialog box. Either dialog box provides the same options for configuring a relaxation.

Following are examples of Cookie Consistency check relaxations:

- **Logon Fields.** The following expression exempts all cookie names beginning with the string logon_ followed by a string of letters or numbers that is at least two characters long and no more than fifteen characters long:

```
^logon_[0-9A-Za-z]{2,15}$
```

- **Logon Fields (special characters).** The following expression exempts all cookie names beginning with the string türkçe-logon_ followed by a string of letters or numbers that is at least two characters long and no more than fifteen characters long:

```
^txC3xBCrkxC3xA7e-logon_[0-9A-Za-z]{2,15}$
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Arbitrary strings.** Allow cookies that contain the string sc-item_, followed by the ID of an item that the user has added to his shopping cart (+), a second underscore (_), and finally the number of these items he wants `([1-9][0-9]?)`, to be user-modifiable:

  ```
  ^sc-item_[0-9A-Za-z]+_[1-9][0-9]?$
  ```

Caution: Regular expressions are powerful. Especially if you are not thoroughly familiar with PCRE-format regular expressions, double-check any regular expressions you write. Make sure that they define exactly the URL you want to add as an exception, and nothing else. Careless use of wildcards, and especially of the dot-asterisk (.*) metacharacter/wildcard combination, can have results you do not want or expect, such as blocking access to web content that you did not intend to block or allowing an attack that the Cookie Consistency check would otherwise have blocked.

Cookie hijacking protection

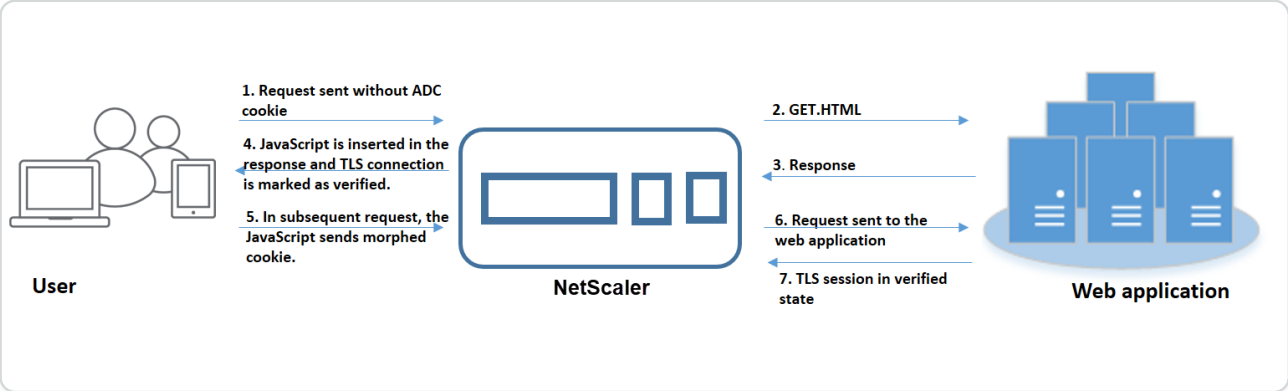
Cookie hijacking protection mitigates cookie stealing attacks from hackers. In the security attack, an attacker takes over a user session to gain unauthorized access to a web application. When a user browses a website, for example banking application, the website establishes a session with the browser. During the session, the application saves the user details such as login credentials, page visits in a cookie file. The cookie file is then sent to the client browser in the response. The browser stores the cookies to maintain active sessions. The attacker can steal these cookies either manually from the cookie store of the browser or through some rouge browser extension. The attacker then use these cookies to gain access into the user's web application sessions.

To mitigate cookie attacks, the NetScaler Web App Firewall (WAF) challenges the TLS connection from the client along with WAF cookie consistency validation. For every new client request, the appliance validates the TLS connection and also verifies the consistency of application and session cookie in the request. If an attacker tries to mix and match application cookies and session cookies stolen from the victim, the cookie consistency validation fails, and the configured cookie hijack action is applied. For more information about cookie consistency, see Cookie Consistency Check.

NOTE:

The Cookie hijacking feature supports logging and SNMP traps. For more information about logging, see ADM topic and for more information about SNMP configuration see SNMP topic.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



Limitations

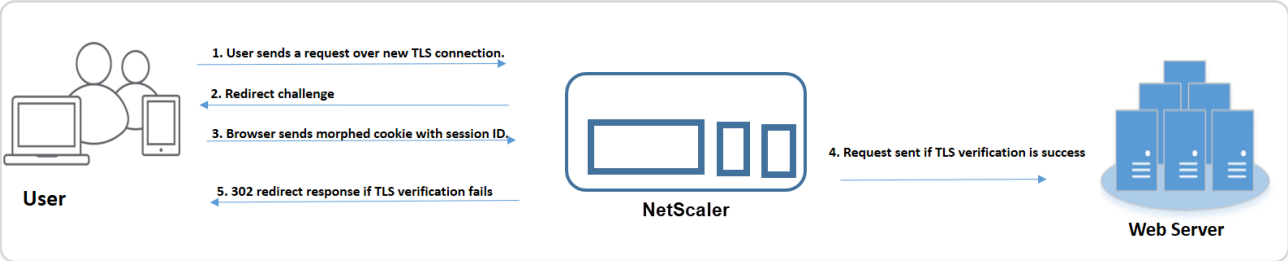
- JavaScript must be enabled in the client browser.
- Cookie Hijacking protection is not supported on TLS version 1.3.
- Limited support for the Internet Explorer (IE) browser because the browser does not reuse the SSL connections. Results in multiple redirects sent for a request eventually leading to a "MAX REDIRECTS EXCEEDED" error in the IE browser.

How cookie hijacking protection works

The following scenarios explain how cookie hijacking protection works in a NetScaler appliance.

Scenario 1: User accessing the first webpage without session cookie

1. The user attempts to authenticate into a web application and begins to access the first webpage without any ADC session cookie in the request.
2. When the request is received, the appliance creates an Application Firewall session with a session cookie ID.
3. This initiates a TLS connection for the session. Since the JavaScript is not sent and ran on the client browser, the appliance marks the TLS connection as validated and no challenge is required.

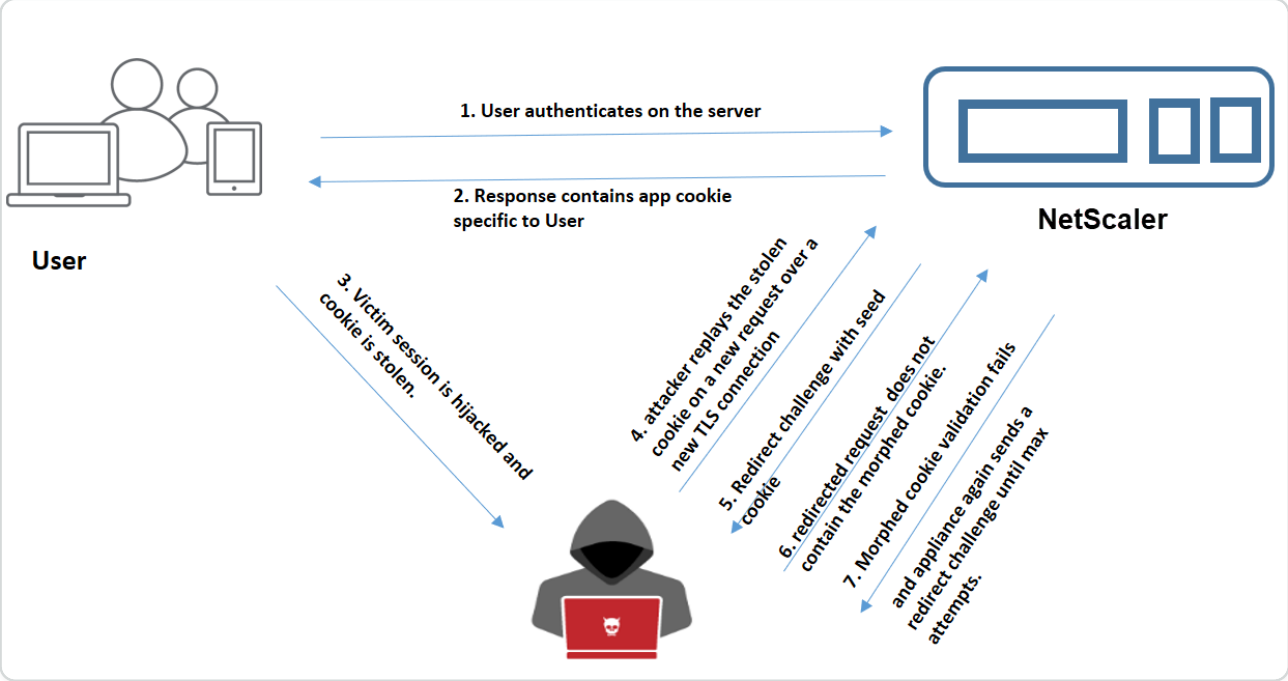


NOTE:

Even if an attacker tries to send all the app cookie IDs from a victim without sending the session cookie, the appliance detects the issue and strips off all the app cookies in the request before forwarding the request to the back-end server. The back end server considers this request without no app cookie and takes necessary as per its configuration.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

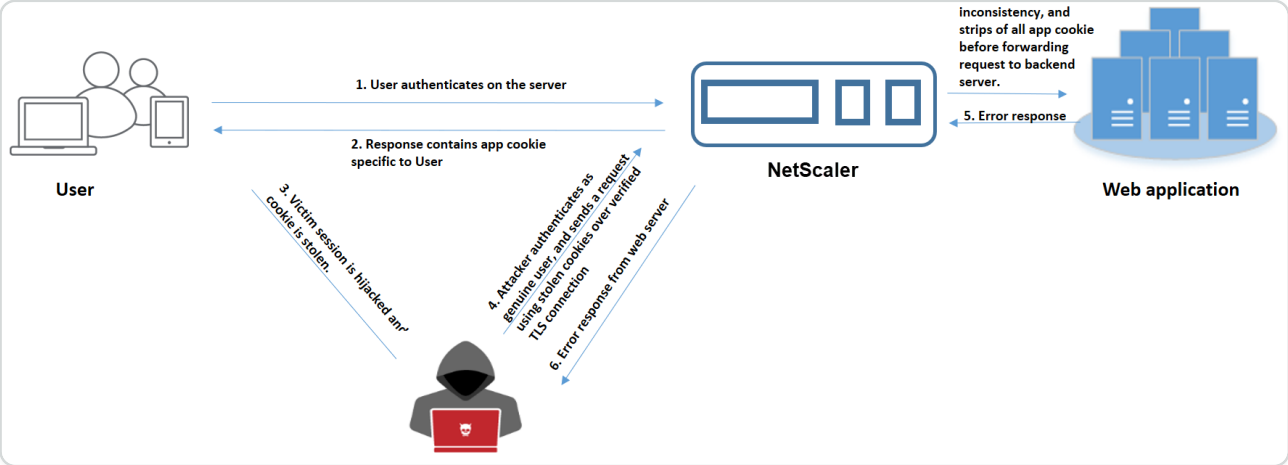
4. When the back-end server sends a response, the appliance receives the response and forwards it with a JavaScript session token and seed cookie. The appliance then marks the TLS connection as verified.
5. When the client browser receives the response, the browser runs the JavaScript and generates a morphed cookie ID using the session token and seed cookie.
6. When a user sends a subsequent request over the TLS connection, the appliance bypasses the morphed cookie validation. This is because the TLS connection is already validated.



Scenario 2: User accessing successive webpages over new TLS connection with session cookie

1. When a user sends an HTTP request for successive pages over a new TLS connection, the browser sends session cookie ID and morphed cookie ID.
2. Since this is a new TLS connection, the appliance detects the TLS connection and challenges the client with redirect response with seed cookie.
3. The client upon receiving the response from the ADC, calculates the morphed cookie using the session's token and new seed cookie.
4. The client then sends this newly calculated morphed cookie along with a session ID.
5. If the morphed cookie calculated within the ADC appliance and the one sent over the request matches, then the TLS connection is marked as verified.
6. If the calculated morphed cookie differs from the one present in the client request, then validation fails. After which, the appliance sends the challenge back to the client, to send a proper morphed cookie.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



Scenario 3: Attacker impersonating as a non-authenticated user

1. When a user authenticates into the web application, the attacker uses different techniques to steal the cookies and replay them.
2. Since this is a new TLS connection from the attacker, the ADC sends a redirect challenge along with a new seed cookie.
3. Since the attacker does not have JavaScript running, the response from the attacker for the redirected request does not contain the morphed cookie.
4. This results in morphed cookie validation failure at the ADC appliance side. The appliance again sends a redirect challenge to the client.
5. If the number of morphed cookie validation attempts exceeds the threshold limit, the appliance flags the status as cookie hijacking.
6. If the attacker tries to mix and match application cookies and session cookies stolen from the victim, the cookie consistency check fails, and the appliance applies the configured cookie hijack action.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Scenario 4: Attacker impersonating as an authenticated user

1. Attackers can also attempt to authenticate into a web application as a genuine user and replay the victim's cookies to gain access to the web session.
2. The ADC appliance detects such impersonated attackers also. Although a verified TLS connection is used by the attacker in replaying a victim's cookie, the ADC appliance still verifies if the session cookie and application cookie in the request are consistent. The appliance verifies the consistency of an application cookie using the session cookie in the request. Since the request contains an attacker's session cookie and a victim's app cookie, the cookie consistency validation fails.
3. As a result, the appliance applies the configured cookie hijack action. If the configured action is set as "block," then the appliance strips off all the application cookies and sends the request to the back-end Server.
4. The back-end server receives a request with no application cookie and so it responds an error response to the attacker, such as "User not logged in".

Configure cookie hijacking by using the CLI

You can select a specific application firewall profile and set one or more actions that prevent cookie hijacking.

At the command prompt, type:

```
set appfw profile <name> [-cookieHijackingAction <action-name> <block | log | stats | none>]
```

NOTE:

By default, the action is set to "none."

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Example:

```
set appfw profile profile1 - cookieHijackingAction Block
```

Where, action types are:

Block: Block connections that violate this security check. Log: Log violations of this security check. Stats: Generate statistics for this security check. None: Disable all actions for this security check.

Configure cookie hijacking by using the NetScaler GUI

1. Navigate to **Security > NetScaler Web App Firewall > Profiles**.
2. On the **Profiles** page, select a profile and click **Edit**.
3. On the **NetScaler Web App Firewall Profile** page, go to **Advanced Settings** section and click **Security Checks**.
4. In the **Security Checks** section, select **Cookie Hijacking** and then click **Action** settings.
5. In the **Cookie Hijacking Settings** page, select one or more actions to prevent cookie hijacking.
6. Click **OK**.

Add a relaxation rule for cookie consistency validation by using the NetScaler GUI

To handle false positives in cookie consistency validation, you can add a relaxation rule for cookies that can be exempted from cookie validation.

1. Navigate to **Security > NetScaler Web App Firewall > Profiles**.
2. On the **Profiles** page, select a profile and click **Edit**.
3. On the **NetScaler Web App Firewall Profile** page, go to **Advanced Settings** section and click **Relaxation rules**.
4. In the **Relaxation Rules** section, select **Cookie Consistency** and click **Action**.
5. In the **Cookie Consistency Relaxation Rule** page, set the following parameters.
    a. Enabled. Select if you want to enable the relaxation rule.
    b. Is Cookie Name Regex. Select if the cookie name is a regular expression.
    c. Cookie Name. Enter the name of the cookie that can be exempted from cookie validation.
    d. Regex Editor. Click this option to provide the regular expression details.
    e. Comments. A brief description about the cookie.
6. Click **Create** and **Close**.

SameSite cookie attribute

For secure web communication, Google has mandated the usage of the `SameSite` cookie attribute. By complying with Google Chrome's new `SameSite` policy, the NetScaler appliance can manage third-party cookies with the `SameSite` attribute set in the `set-cookie` header. The cookie setting mitigates attacks and provides a secured web communication.

Until February 2020, the `SameSite` attribute was not explicitly set in the cookie. The browser took the default value as "None." However, with certain browser upgrade, such as Google Chrome 80, there is a change in the default cross-domain behavior in cookies.

Setting cookie attribute value

The `SameSite` attribute is set to one of the following values and for the Google Chrome browser, the default value is set as "Lax."

None. Indicates the browser to use the cookie for requests in the cross-site context only on secure connections.

Lax. Indicates the browser to use the cookie for requests in the same-site context. In the cross-site context, only safe HTTP methods like GET request can use the cookie.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Strict. Use the cookie only when the user is requesting for the domain explicitly.

NOTE:

If set-cookies (including firewall session cookies) have the `SameSite` attribute and if the `addcookiesamesite` attribute flag is enabled in the Web Application Firewall profile, then the `SameSite` attribute is overwritten according to the value configured in the profile.

Configure the SameSite attribute in the Web App Firewall profile by using the CLI

To configure the `SameSite` attribute, you must complete the following steps:

1. Enable the `SameSite` cookie attribute.
2. Set the cookie attribute for the appfw session cookies.

Enable the `Samesite' cookie attribute

At the command prompt, type:

```
set appfw profile <profile-name> –insertCookieSameSiteAttribute ( ON | OFF)
```

Example:

```
set appfw profile p1 –insertCookieSameSiteAttribute ON
```

Set same site cookie attribute value for Web Application Firewall session cookies

At the command prompt, type:

```
set appfw profile <profile-name> – cookieSameSiteAttribute ( LAX | NONE | STRICT )
```

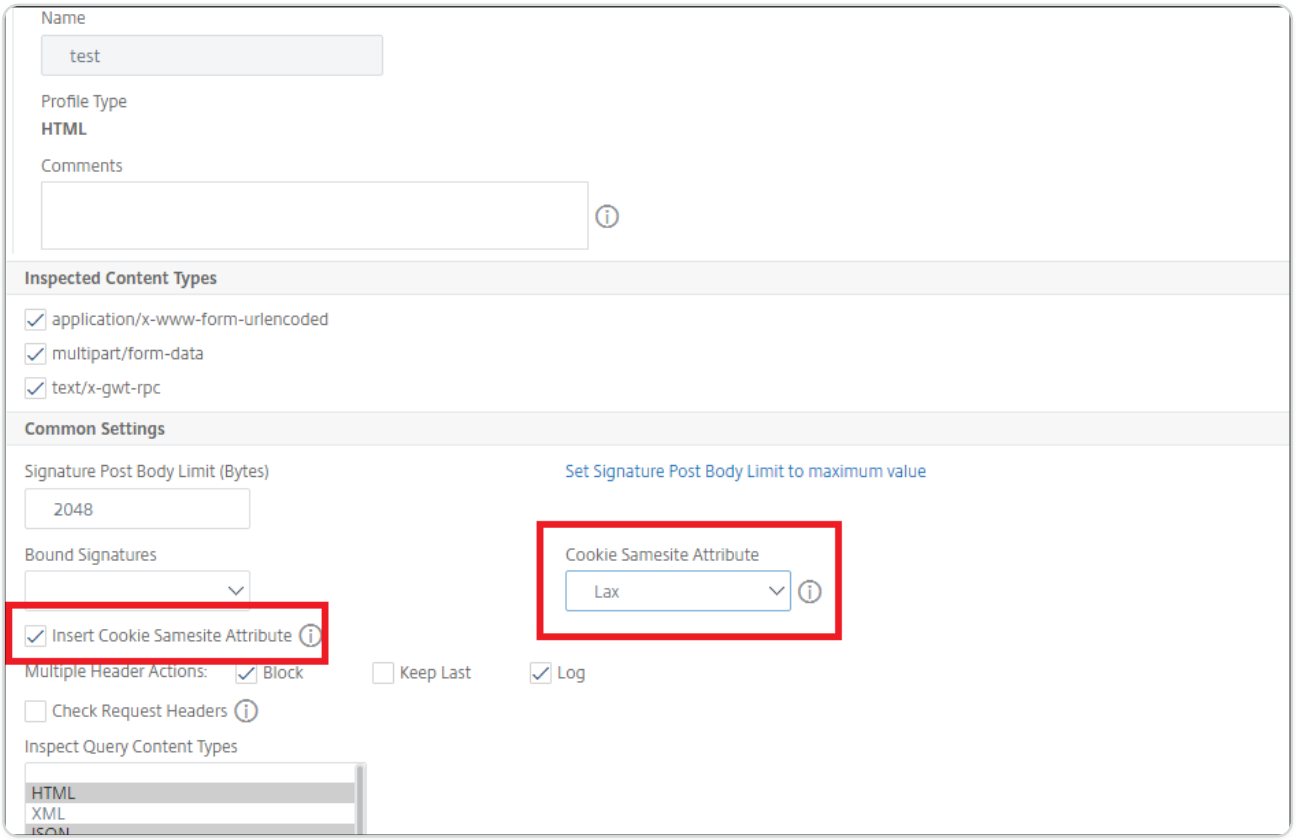
Example:

```
set appfw profile p1 – cookieSameSiteAttribute LAX
```

Where attribute types are,

None. Cookie attribute SameSite is set to “none” and marked secure for all WAF and application cookies.

Lax. Cookie attribute SameSite is set to “Lax” for all WAF and application cookies.



Strict. Cookie attribute SameSite is set to “Lax” for all WAF and application cookies.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure the SameSite cookie attribute in the Web App Firewall profile by using the GUI

1. Navigate to **Security > NetScaler Web App Firewall > Profiles**.
2. In the details pane, select a profile and click **Edit**.
3. In the **NetScaler Web App Firewall Profile** page, click **Profile Settings** under **Advanced Settings**.
4. In **Profile Settings** section set the following parameters:

   a. Insert the cookie `Samesite` attribute. Select the check box to enable the cookie `Samesite` attribute. b. Cookie Samesite Attribute. Select an option from the drop-down list to set the `Samesite` cookie value.
5. Click **OK** and **Done**.

Data leak prevention checks

The data-leak-prevention checks filter responses to prevent leaks of sensitive information, such as credit card numbers and social security numbers, to unauthorized recipients.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Credit card check

If you have an application that accepts credit cards, or your websites have access to database servers that store credit card numbers, you must use Data Leak Prevention (DLP) measures and configure protection for each type of credit card that you accept.

The NetScaler Web App Firewall Credit Card check prevents attackers from exploiting Data Leak Prevention flaws to obtain credit card numbers of your customers. By following simple configuration steps, you can enforce protection of one or more of the following credit cards: 1) Visa, 2) Master Card, 3) Discover, 4) American Express (Amex), 5) JCB, and 6) Diners Club.

The Credit Card security check examines server responses to identify instances of the target credit card numbers, and applies a specified action when such a number is found. The action can be to transform the response by X'ing out all but the last group of digits in the credit card number, or to block the response if it contains more than a specified number of credit card numbers. If you specify both, the block action takes precedence. The Maximum credit cards allowed per page setting determines when the block action is invoked. The default setting, 0 (no credit card numbers allowed on the page), is the safest, but you can allow up to 255. Depending on where the violation is detected in the response and the block action gets triggered, you might get fewer than the maximum allowed number of credit cards in the response.

To avoid false positives, you can apply relaxations to exempt specific numbers from the Credit Card check. For example, a social security number, purchase order number, or Google account number might be similar to a credit card number. You can specify individual numbers or use a regular expression to indicate the string of digits to be bypassed when processing the response URL for credit card inspection.

If you're not sure which credit card numbers to exempt, you can use the learn feature to generate recommendations based on the learned data. To get optimal benefit without compromising performance, you might want to enable this option for a short time to get a representative sample of the rules, and then deploy the relaxations and disable learning.

If you enable the log feature, the Credit Card check generates log messages indicating the actions that it takes. You can monitor the logs to determine whether responses to legitimate requests are getting blocked. A large increase in the number of log messages can indicate thwarted attempts to gain access. By default, the doSecureCreditCardLogging parameter is ON, so the credit card number is not included in the log message generated by the safe commerce (Credit Card) violation.

The stats feature gathers statistics about violations and logs. An unexpected surge in the stats counter might indicate that your application is under attack.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To configure the Credit Card security check for protecting your application, configure the profile that governs inspecting the traffic to and from this application.

NOTE

A website that does not access a SQL database usually does not have access to sensitive private information such as credit card numbers.

Using the command line to configure the credit card check

In the command line interface, you can use either the set appfw profile command or the add appfw profile command to activate credit-card checking and specify which actions to perform. You can use the unset appfw profile command to revert back to the default settings. To specify relaxations, use the bind appfw command to bind credit card numbers to the profile.

To configure a credit card check by using the command line

Use either the set appfw profile command or the add appfw profile command, as follows:

- `set appfw profile <name> -creditCardAction ( ([block][learn] [log][stats]) | [none])`
- `set appfw profile <name> -creditCard (VISA | MASTERCARD | DISCOVER | AMEX | JCB | DINERSCLUB)`
- `set appfw profile <name> -creditCardMaxAllowed <integer>`
- `set appfw profile <name> -creditCardXOut ([ON] | [OFF])<name> -doSecureCreditCardLogging ([ON] | [OFF])`
- To configure a Credit Card relaxation rule by using the command line

  Use the bind command to bind the credit card number to the profile. To remove a credit card number from a profile, use the unbind command, with the same arguments that you used for the bind command. You can use the show command to display the credit card numbers bound to a profile.

- To bind a credit card number a profile

  `bind appfw profile <profile-name> -creditCardNumber <any number/regex> “<url>”`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Example: bind appfw profile test_profile -creditCardNumber 378282246310005 `http://www.example.com/credit_card_test.html`

- To unbind a credit card number from a profile

  ```
  unbind appfw profile <profile-name> -creditCardNumber <credit card number / regex> <url>
  ```

- To show the list of credit card numbers bound to a profile.

  ```
  show appfw profile <profile>
  ```

Using the GUI to configure the credit card check

In the GUI, you configure the credit card security check in the pane for the profile associated with your application.

To add or modify the Credit Card security check by using the GUI

1. Navigate to **Web App Firewall** > **Profiles, highlight** the target profile, and click **Edit**.
2. In the **Advanced Settings** pane, click **Security Checks**.

   The security check table displays the currently configured action settings for all the security checks. You have 2 options for configuration:

   a. If you just want to enable or disable Block, Log, Stats, and Learn actions for Credit Card, you can select or clear check boxes in the table, click **OK**, and then click **Save** and **Close** to close the **Security Check** pane.

   b. If you want to configure additional options for this security check, double click Credit Card, or select the row and click **Action Settings** to display additional options as follows:

   - Out—Mask any credit card number detected in a response by replacing each digit, except the digits in the final group, with the letter “X.
   - Maximum credit cards allowed per page—Specify the number of credit cards that can be forwarded to the client without triggering a block action.
   - Protected Credit Cards. Select or clear a check box to enable or disable protection for each type of credit card.
   - You can also edit the Block, Log, Stats and Learn actions in the Credit Card Settings pane.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

After making any of the above changes, click OK to save the changes and return to the Security Checks table. You can proceed to configure other security checks if needed. Click OK to save all the changes you have made in the Security Checks section and then click Save and Close to close the Security Check pane.

3. In the **Advanced Settings** pane, click **Profile settings**. To enable or disable secure logging of credit card Numbers, select or clear the **Secure Credit Card Logging** check box. (By default, it is selected).

   Click **OK** to save the changes.

- To configure a Credit Card relaxation rule by using the GUI

  a. Navigate to **Web App Firewall** > **Profiles**, highlight the target profile, and click **Edit**.

  b. In the **Advanced Settings** pane, click **Relaxation Rules**. The Relaxation Rules table has a Credit Card entry. You can double click, or select this row and click **Edit** to access the **Credit Card Relaxation Rules** dialogue. You can perform Add, Edit, Delete, Enable, or Disable operations for relaxation rules.

Using the learn feature with the credit card check

When the learn action is enabled, the Web App Firewall learning engine monitors the traffic and learns the triggered violations. You can periodically inspect these learned rules. After due consideration, if you want to exempt a specific string of digits from the Credit Card security check, you can by deploy the learned rule as a relaxation rule.

- To view or use learned data by using the command line interface

  ```
  show appfw learningdata <profilename> creditCardNumber
  ```

  ```
  rm appfw learningdata <profilename> -creditcardNumber <credit card number> "<url>"
  ```

  ```
  export appfw learningdata <profilename> creditCardNumber
  ```

- To view or use learned data by using the GUI

  a. Navigate to **Web App Firewall** > **Profiles**, highlight the target profile, and click **Edit**.

  b. In the **Advanced Settings** pane, click **Learned Rules**. You can select the Credit Card entry in the Learned Rules table and double-click it to access the learned rules. You can deploy the learned rules or edit a rule before deploying it as a relaxation rule. To discard a rule, you

© 1997–2026 Citrix Systems, Inc. All rights reserved.

can select it and click the **Skip** button. You can edit only one rule at a time, but you can select multiple rules to deploy or skip.

You also have the option to show a summarized view of the learned relaxations by selecting the Credit Card entry in the Learned Rules table and clicking Visualizer to get a consolidated view of all the learned violations. The visualizer makes it very easy to manage the learned rules. It presents a comprehensive view of the data on one screen and facilitates taking action on a group of rules with one click. The biggest advantage of the visualizer is that it recommends regular expressions to consolidate multiple rules. You can select a subset of these rules, based on the delimiter and Action URL. You can display 25, 50, or 75 rules in the visualizer, by selecting the number from a drop-down list. The visualizer for learned rules offers the option to edit the rules and deploy them as relaxations. Or you can skip the rules to ignore them.

Using the log feature with the credit card check

When the log action is enabled, the Credit Card security check violations are logged in the audit log as APPFW_SAFECOMMERCE or APPFW_SAFECOMMERCE_XFORM violations. The Web App Firewall supports both Native and CEF log formats. You can also send the logs to a remote syslog server.

The default setting for doSecureCreditCardLogging is ON. If you change it to OFF, both credit card number and type are included in the log message.

Depending on the settings configured for the Credit Card checks, the application-firewall generated log messages might include the following information:

- Response was blocked or not blocked.
- Credit card numbers were transformed (X'd out). A separate log message is generated for each transformed credit card number, so multiple log messages might be generated during processing of a single response.
- Response contained the maximum number of potential credit card numbers.
- Credit card numbers and their corresponding types.
- To access the log messages by using the command line

  Switch to the shell and tail the ns.logs in the /var/log/ folder to access the log messages pertaining to the Credit Card violations:

  - Shell
  - tail -f /var/log/ns.log | grep SAFECOMMERCE

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- To access the log messages by using the GUI

  a. The GUI includes a very useful tool (Syslog Viewer) for analyzing the log messages. You have a couple of options for accessing the Syslog Viewer: Navigate to the **target profile** > **Security Checks**. Highlight the Credit Card row and click Logs. When you access the logs directly from the Credit Card security check of the profile, it filters out the log messages and displays only the logs pertaining to these security check violations.

  b. You can also access the Syslog Viewer by navigating to **NetScaler®** > **System** > **Auditing**. In the Audit Messages section, click the **Syslog messages** link to display the Syslog Viewer, which displays all log messages, including other security check violation logs. This is useful for debugging when multiple security check violations might be triggered during request processing.

     The HTML based Syslog Viewer provides various filter options for selecting only the log messages that are of interest to you. To access Credit Card security check violation log messages, filter by selecting APPFW in the dropdown options for Module. The Event Type displays a rich set of options to further refine your selection. For example, if you select the APPFW_SAFECOMMERCE and APPFW_SAFECOMMERCE_XFORM check boxes and click the Apply button, only log messages pertaining to the Credit Card security check violations appear in the Syslog Viewer.

     If you place the cursor in the row for a specific log message, multiple options, such as Module and EventType, appear below the log message. You can select any of these options to highlight the corresponding information in the logs.

Example of a Native format log message when the response is not blocked

Statistics for the credit card violations

When the stats action is enabled, the corresponding counter for the Credit Card check is incremented when the Web App Firewall takes any action for this security check. The statistics are collected for Rate and Total count for Traffic, Violations, and Logs. The increment of the log counter can vary depending on the configured settings. For example, if the block action is enabled and the Max Allowed credit card setting is 0, the request for a page that contains 20 credit card numbers increments the stats counter by one when the page is blocked as soon as the first credit card

© 1997–2026 Citrix Systems, Inc. All rights reserved.

number is detected. However, if block is disabled and transform is enabled, processing the same request increments the statistics counter for logs by 20, because each credit card transformation generates a separate log message.

- To display Credit Card statistics by using command line

  At the command prompt, type:

  ```
  sh appfw stats
  ```

  To display stats for a specific profile, use the following command:

  ```
  stat appfw profile <profile name>
  ```

  To display Credit Card statistics by using GUI

  a. Navigate to **System** > **Security** > **Web App Firewall**.
  b. In the right pane, access the **Statistics** Link.
  c. Use the scroll bar to view the statistics about Credit Card violations and logs. The statistics table provides real-time data and is updated every 7 seconds.

Highlights

Note the following points about the Credit Card security check:

- The Web App Firewall enables you to protect credit card information and detect any attempts to access this sensitive data.
- To use the Credit Card protection check, you must specify at least one type of credit card and an action. The check is then applied to HTML, XML, and Web 2.0 profiles.
- You can pipe the output of sh appfw profile command and grep for CreditCard to see all the Credit Card specific configuration. For example, sh appfw profile my_profile | grep CreditCard displays the configured settings of various parameters as well as the relaxation rules pertaining to the Credit Card check for the Web App Firewall profile named my_profile.
- You can exclude specific numbers from Credit Card inspection without bypassing the security check inspection for the rest of the credit card numbers.
- Relaxation is available for all Web App Firewall protected credit card patterns. In the GUI, you can use the visualizer to specify Add, Edit, Delete, Enable, or Disable operations on relaxation rules.
- The Web App Firewall learning engine can monitor the outgoing traffic to recommend rules based on observed violations. Visualizer support is also available for managing the learned

© 1997–2026 Citrix Systems, Inc. All rights reserved.

credit card rules in the GUI. You can edit and deploy the learned rules, or skip them after careful inspection.

- The setting for number of allowed credit cards applies to each response. It does not pertain to the cumulative total of credit card numbers observed during the entire user session.
- The number of X'd out digits depends on the length of the credit card numbers. Ten digits are X'd out for credit cards that have 13 through 15 digits. Twelve digits are X'd out for credit cards that have 16 digits. If your application does not require sending the entire credit card number in the response, Citrix® recommends that you enable this action to mask the digits in the credit card numbers.
- The X-out operation transforms all the credit cards and works independently of the configured settings for the maximum number of allowed credit cards. For example, if there are 4 credit cards in the response and the creditCardMaxAllowed parameter is set to 10, all 4 credit cards are X'd-out, but they are not blocked. If the credit card numbers are spread out in the document, a partial response with X'd-out numbers might be sent to the client before the response is blocked.
- Do not disable the doSecureCreditCardLogging parameter before due consideration. When this parameter is turned off, the credit card numbers are displayed and are accessible in the log messages. These numbers are not masked in the logs, even if the X-out action is enabled. If you are sending logs to a remote syslog server, and the logs are compromised, the credit card numbers can be exposed.
- When the response page is blocked because of a Credit Card violation, the Web App Firewall does not redirect to the error page.

Safe object check

The Safe Object check provides user-configurable protection for sensitive business information, such as customer numbers, order numbers, and country-specific or region-specific telephone numbers or postal codes. A user-defined regular expression or custom plug-in tells the Web App Firewall the format of this information and defines the rules to be used to protect it. If a string in a user request matches a safe object definition, the Web App Firewall either blocks the response, masks the protected information, or removes the protected information from the response before sending it to the user, depending on how you configured that particular safe object rule.

The Safe Object check prevents attackers from exploiting a security flaw in your web server software or on your website to obtain sensitive private information, such as company credit card numbers or social security numbers. If your websites do not have access to these types of information, you do not need to configure this check. If you have a shopping cart or other

© 1997–2026 Citrix Systems, Inc. All rights reserved.

application that can access such information, or your websites have access to database servers that contain such information, you must configure protection for each type of sensitive private information that you handle and store.

NOTE:

A website that does not access an SQL database usually does not have access to sensitive private information.

The safe object check is unlike that for any other check. Each safe object expression that you create is the equivalent of a separate security check, similar to the credit card check, for that type of information.

Configure the safe object check using the GUI

NOTE

You must configure the safe object check only using the GUI. The command-line interface is not supported.

To add a safe object security check using the GUI:

1. Navigate to **Security > NetScaler Web App Firewall > Profiles**.
2. Select the required profile and click **Edit**.
3. In the **Advanced Settings** pane, click **Relaxation Rules**.
4. Select **Safe Object** and click **Edit**.
5. Click **Add** and configure the following:

    - **Safe Object Name.** A name for your new safe object. The name can begin with a letter, number, or the underscore symbol. The name can consist of one to 255 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols.
    - **Actions.** Enable or disable the **Block**, **Log**, and **Statistics** actions, and the following actions:
        - **X-Out.** Mask any information that matches the safe object expression with the letter "X".
        - **Remove.** Remove any information that matches the safe object expression.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Regular Expression.** Enter a PCRE-compatible regular expression that defines the safe object. You can create the regular expression in one of following ways:
  - By typing the regular expression directly into the text box
  - By using the **Regex Tokens** menu to enter regular expression elements and symbols directly into the text box
  - By opening the Regular Expressions Editor and using it to construct the expression. The regular expression must consist of ASCII characters only. Do not cut and paste characters that are not part of the basic 128-character ASCII set. If you want to include non-ASCII characters, you must manually type those characters in PCRE hexadecimal character encoding format.

  NOTE:

  Do not use start anchors (\^) at the beginning of Safe Object expressions, or end anchors ($) at the end of Safe Object expressions. These PCRE entities are not supported in Safe Object expressions, and if used, causes your expression not to match what it was intended to match.

- **Maximum Match Length.** Enter a positive integer that represents the maximum length of the string that you want to match. For example, if you want to match U.S. social security numbers, enter the number 11 in this field. That allows your regular expression to match a string with nine numerals and two hyphens. If you want to match California driver's license numbers, enter the number eight (8).

  CAUTION:

  If you do not maximum match length, the Web App Firewall uses the default value of one (1) when filtering for strings that match your safe object expressions. As a result, most safe object expressions fail to match their target strings.

You can modify an existing express by selecting the required expression, clicking **Open** and then configuring the expression in the **Modify Safe Object** dialog box.

Following are examples of Safe Object check regular expressions:

- Look for strings that appear to be U.S. social security numbers (SSN). The SSN consists of the following characters in the mentioned order:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

    - Three numerals (the first of which must not be zero)
    - A hyphen
    - Two more numerals
    - A second hyphen
    - A string of four more numerals

```
[1-9][0-9]{3,3}-[0-9]{2,2}-[0-9]{4,4}
```

- Look for strings that appear to be California driver's license IDs, which start with a letter and are followed by a string of exactly seven numerals:

```
[A-Za-z][0-9]{7,7}
```

- Look for strings that appear to be customer IDs. The customer IDs consist of the following in the mentioned order:

    - A string of five hexadecimal characters (all the numerals and the letters A through F)
    - A hyphen
    - A three-letter code
    - A second hyphen
    - A string of 10 numerals

```
[0-9A-Fa-f]{5,5}-[A-Za-z]{3,3}-[0-9]{10,10}
```

CAUTION:

Regular expressions are powerful. If you are less familiar with PCRE-format regular expressions, double-check any regular expressions you write. Make sure that the regular expression defines exactly the type of string you want to add as a safe object definition. Careless use of wildcards, and especially of the dot-asterisk (.*) metacharacter/wildcard combination, can have results you did not want or expect, such as blocking access to web content that you did not intend to block.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Advanced form protection checks

The advanced Form Protection checks examine web form data to prevent attackers from compromising your system by modifying the web forms on your websites or sending unexpected types and quantities of data to your website in a form.

NOTE:

SQL, cross-site scripting, FFC, and FieldFormat protection checks are applied if the **Exclude Upload Files From Security Checks** is unset.

A file upload is also a form element that has control-name **name** field that is submitted as part of form submission.

Refer to this page, for more information: Forms

NOTE

Form protections will close nested forms when any form based checks are enabled. This is to ensure HTML Standard is followed.

Field formats check

The Field Formats check verifies the data that users send to your websites in web forms. It examines both the length and type of data to ensure that it is appropriate for the form field in which it appears. If the Web App Firewall detects inappropriate web form data in a user request, it blocks the request.

By preventing an attacker from sending inappropriate web form data to your website, the Field Formats check prevents certain types of attacks on your website and database servers. For example, if a particular field expects the user to enter a phone number, the Field Formats check examines the user-submitted input to ensure that the data matches the format of a phone number. If a particular field expects a first name, the Field Formats check ensures that the data in that field is of a type and length appropriate for a first name. It does the same thing for each form field that you configure it to protect.

This check applies to HTML requests only. It does not apply to XML requests. You can configure Field Format Checks in HTML profiles or Web 2.0 profiles to inspect HTML payload for protecting

© 1997–2026 Citrix Systems, Inc. All rights reserved.

your applications. The Web App Firewall also supports Field Format Check protection for Google Web Toolkit (GWT) applications.

The Field Formats check requires that you enable one or more actions. The Web App Firewall examines the submitted inputs and applies the specified actions.

NOTE

Field format rules are tightening rules. Adding them to relaxation list from learned data acts as a blocking rule.

To relax field format rules, please remove particular “fieldname” from the fieldformat relaxations list. You have the option to set the default field formats to specify Field Type and the minimum and maximum length of data expected in each form field on each web form that you want to protect. You can deploy relaxation rules to configure a Field Format for an individual field of a specific form. Multiple rules can be added to specify the field name, the action URL, and Field Formats. Specify Field Formats to accept different types of inputs in different form fields. The learning feature can provide recommendations for the relaxation rules.

Field Format Actions—You can enable Block, Log, Stats, and Learn actions. At least one of these actions must be enabled to engage the Field Format Check protection.

- **Block**. If you enable block, the block action is triggered if the input does not conform to the specified Field Format. If a rule was configured for the target field, the input is checked against the specified rule. Otherwise, it is checked against the default field format specification. Any mismatch in the Field Type or min/max length specification results in blocking the request.
- **Log**. If you enable the log feature, the Field Format check generates log messages indicating the actions that it takes. You can monitor the logs to determine whether responses to legitimate requests are getting blocked. A large increase in the number of log messages can indicate malicious attempts to launch an attack.
- **Stats**. If enabled, the stats feature gathers statistics about violations and logs. An unexpected surge in the stats counter might indicate that your application is under attack, or you might have to revisit the configuration to see if the specified field format is too restrictive.
- **Learn**. If you are not sure which Field Types or minimum and maximum length values might be ideally suited for your application, you can use the learn feature to generate recommendations based on the learned data. The Web App Firewall learning engine monitors the traffic and provides field format recommendations based on the observed values. To get optimal benefit without compromising performance, you might want to enable the learn option for a short time

© 1997–2026 Citrix Systems, Inc. All rights reserved.

to get a representative sample of the rules, and then deploy the rules and disable learning. Note: The Web App Firewall's learning engine can distinguish only the first 128 bytes of the name. If a form has multiple fields with names that match for the first 128 bytes, the learning engine might not be able to distinguish between them. Similarly, the deployed relaxation rule might inadvertently relax all such fields.

Default Field Format—In addition to configuring the actions, you can configure the default Field Format to specify the type of data expected in all the form fields for your application. A Field Type can be selected as the Field Format type. Minimum length and Maximum length parameters can be used to specify the length of the allowed inputs. As an alternative to Field Types, you can use Character Maps to specify what's allowed in a field (except in cluster deployments).

- **Field Type**—Field Types are named expression to which you assign assigned priority values. Field Type expressions specify the allowed inputs and are matched against the submitted data to determine whether the received values are consistent with the allowed values. The Field Types are checked in the order of their priority numbers. A lower number indicates a higher priority. The Web App Firewall gives you the option to add your own Field Types and assign them the priorities you want. The priority value can range from 0 through 64000. The following built-in Field Types are provided to help simplify the configuration process:

```
> sh appfw fieldtype

1)      Name:  integer           Regex:  "^[+-]?[0-9]+$"

                Priority:  30            Comment:  Integer

                Builtin:  IMMUTABLE

2)      Name:  alpha             Regex:  "^[a-zA-Z]+$"

                Priority:  40            Comment:  "Alpha characters"

             Builtin:  IMMUTABLE

3)      Name:  alphanum          Regex:  "^[a-zA-Z0-9]+$"

                Priority:  50            Comment:  "Alpha-numeric
characters"

                Builtin:  IMMUTABLE
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
4)      Name:  nohtml           Regex:  "^[^&<>]*$"

                Priority:  60           Comment:  "Not HTML"

                Builtin:  IMMUTABLE

5)      Name:  any              Regex:  "^.*$"

             Priority:  70           Comment:  Anything

                Builtin:  IMMUTABLE

    Done

>
```

NOTE:

The built-in Field Types are IMMUTABLE. They cannot be modified or removed. Any Field Types that you add are MODIFIABLE. You can edit them or remove them.

Configuring a Field Type as a default Field Format might be useful when you have a PCRE expression that can identify the valid inputs in all or most of the form fields for your application and exclude the invalid inputs. For example, if all the inputs in your application forms are expected to contain only numbers and letters, you might want to use the built-in Field Type alphanum as the default Field Type. Any non-alphanumeric character such as a backslash (\) or semicolon ; in the input will trigger a violation. You can also add your own customized Field Types and use them to configure default Field Formats. For example, if you want to make the lowercase “x”, “y”, and “z” the only allowed alpha characters, you can configure a customized Field Type with regular expression "\^+$". You can assign it a higher priority (lower priority number) then the built-in Field Types and use it as the default Field Type.

- **Minimum Length** — The default minimum data length assigned to form fields in web forms that do not have an explicit setting. This parameter is set to 0 by default, which allows the user to leave the field blank. Any higher setting forces users to fill in the field.

  Caution: If the minimum length value is 0 but the Field Type is integer, alpha, or alphanum, a request is blocked if any input field is left empty, despite the minimum length setting. That is because the regEx for these Field Types contains a + character, which means one or more characters. Distinguishing an integer from an alpha character requires at least one character.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Maximum Length**—The default maximum data length assigned to form fields in web forms that do not have an explicit setting. This parameter is set to 65535 by default.

  Note: Characters vs bytes. The minimum and the maximum lengths for the field formats represent the number of bytes, not the number of characters. Languages that have greater than one-byte character representation can cause the limit to be exceeded with fewer characters than the number configured for the maximum value. For example, with double-byte character representation, the maximum value of 9 allows no more than 4 characters. **Tip:** The GUI allows you to cut and paste UTF-8 characters directly into the GUI without having to convert them to hex.

- **Character Maps**: In addition to recommending the Field Types, the Web App Firewall learning engine offers you an additional option, Use Character Maps, to deploy the Format Check rules. A Character Map is a set of all the characters allowed in a particular form field. You can fine tune the Field format specification to allow or disallow specific characters by using Character Maps. A separate Character Map is generated for each form field. The alpha and numeric characters are treated differently in Character Maps. If any alpha character is seen in the input, all alpha characters will be allowed by the recommended PCRE expression in the Character Map. Similarly, if any digit is included, all digits will be allowed. Non-printable characters are specified by using the x construct. Only single Byte characters with values between 0-255 are considered for Character Map recommendations.

  A Character Map can be more specific than the corresponding Field Type recommendation. In some situations, Character Maps might be a better option, because they give you tighter control over the set of characters allowed as inputs. The deployed character maps are displayed as strings that start with prefix “CM” followed by digits. The priority for the Character Maps starts at 10000. As with user-added Field Types, you can add, edit or remove a Character Map. Character Maps that are currently used in deployed rules cannot be modified or removed.

  Note: Character Maps are not supported in cluster deployments.

NOTE

When you add a field formats rule with any built-in Field Type and use character map instead of Field Type and save it, the changes do not get saved and rule still shows with Field Type.

When the character map matches one of the built-in type, the field type is reused instead of creating a new character map.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Using the command line to configure the field format check

In the command line interface, you can use the add appfw fieldtype command to add a new Field Type. You can use either the set appfw profile command or the add appfw profile command to configure the Field Format check and specify which actions to perform. You can use the unset appfw profile command to revert the configured settings back to their defaults. To specify a Field Format rule, use the bind appfw command to bind a Field Type to a form Field and the action URL, along with the minimum and maximum length specifications.

To add, remove or view a Field Type by using the command line:

Use the add command to add a Field Type. You must specify the Name, Regular expression and Priority when adding a new Field Type. You also have the option to add a Comment. You can use the show command to display the configured Field Types. You can also delete a Field Type by using the remove command, which requires only the Name of the Field Type.

`add [appfw] fieldType <name> <regex> <priority> [-comment <string>]`

where:

`<regex>` is a regular expression

`<priority>` is a positive_integer

Example:

```
add fieldtype "Cust_Zipcode" "^[0-9]{5}[-][0-9]{4}$" 4

-  show [appfw] fieldType [<name>]

    Example: sh fieldtype

    sh appfw fieldtype

    sh appfw fieldtype cust_zipcode
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
-  `rm [appfw] fieldType <name>`

    Example: rm fieldtype cusT_ziPcode

    `rm appfw fieldtype cusT_ziPcode`
```

NOTE:

As shown above, use of "appfw" in the command is optional. For example, "Add FieldType" or "Add appfw fieldType" are both valid options. The names of the Field Types are case insensitive due to normalization. As shown in the above examples, Cust_Zipcode, cust_zipcode, and cUsT_ziPcode refer to the same Field Type.

To configure a Field Format check by using the command line

Use either the set appfw profile command or the add appfw profile command, as follows:

- `set appfw profile <name> -fieldFormatAction (([block] [learn] [log] [stats]) | [none])`
- `set appfw profile <name>-defaultFieldFormatType <string>`
- `set appfw profile <name> -defaultFieldFormatMinLength <integer>`
- `set appfw profile <name> -defaultFieldFormatMaxLength <integer>`

To configure a Field Format relaxation rule by using the command line

```
bind appfw profile <name> (-fieldFormat <string> <formActionURL>
 <fieldType>

[-fieldFormatMinLength <positive_integer>]  [-fieldFormatMaxLength
<positive_integer>]

[-isRegex ( REGEX | NOTREGEX )])
```

Example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
bind appfw profile pr_ffc -fieldFormat "login_name" ".*/login.php" integer
-fieldformatMinLength 3 -FieldformatMaxlength 6
```

Using the GUI to configure the field formats security check

In the GUI, you can manage the Field Types. You can also configure the Field Formats security check in the pane for the profile associated with your application.

To add, modify or remove a Field Type using the GUI

1. Navigate to Application Firewall node. In the Settings, click **Manage Field Types** to display the Configure Application Firewall Field Type dialogue box.
2. Click **Add** to add a new Field Type. Follow the instructions in this pane and click Create. You can also edit or delete any user-added Field Type if it is currently not being used by a deployed rule.

To add or modify the Field Formats security check by using the GUI

1. Navigate to **Application Firewall** > **Profiles**, highlight the target profile, and click **Edit**.
2. In the **Advanced Settings** pane, click **Security Checks**.

   The security check table displays the currently configured action settings for all the security checks. You have 2 options for configuration:

   a. If you just want to enable or disable **Block**, **Log**, **Stats**, and **Learn** actions for Field Formats, you can select or clear check boxes in the table, click **OK**, and then click **Save and Close** to close the Security Check pane.

   b. If you want to configure additional options for this security check, double click Field Formats, or select the row and click Action Settings, to display the following options for **Default Field Format**:

      - **Field Type**—Select the Field Type that you want to configure as the default Field Type. You can select the built-in and user-defined Field Types. The deployed Character Maps are also included in the list and can be selected.
      - **Minimum Length**—Specify the minimum number of characters that must be in each field. Possible values: 0-65535.
      - **Maximum Length**— Specify the maximum number of characters that must be in each field. Possible values: 1-65535.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

You can also edit the **Block**, **Log**, **Stats** and **Learn** actions in the Field Formats Settings pane.

After making any of the above changes, click **OK** to save the changes and return to the Security Checks table. You can proceed to configure other security checks if needed. Click **OK** to save all the changes you have made in the Security Checks section, and then click **Save and Close** to close the Security Check pane.

To configure a Field Formats relaxation rule by using the GUI

1. Navigate to **Application Firewall** > **Profiles**, highlight the target profile, and click **Edit**.
2. In the **Advanced Settings** pane, click **Relaxation Rules**. The Relaxation Rules table has a Field Formats entry. You can double click, or select this row and click the Edit button, to access the Field Formats Relaxation Rules dialogue. You can perform **Add**, **Edit**, **Delete**, **Enable**, or **Disable** operations for relaxation rules.

For a consolidated view of all the relaxation rules, you can highlight the Field Formats row and click Visualizer. The visualizer for deployed relaxations offers you the option to Add a new rule or Edit an existing one. You can also Enable or Disable a group of rules by selecting a node and clicking the corresponding buttons in the relaxation visualizer.

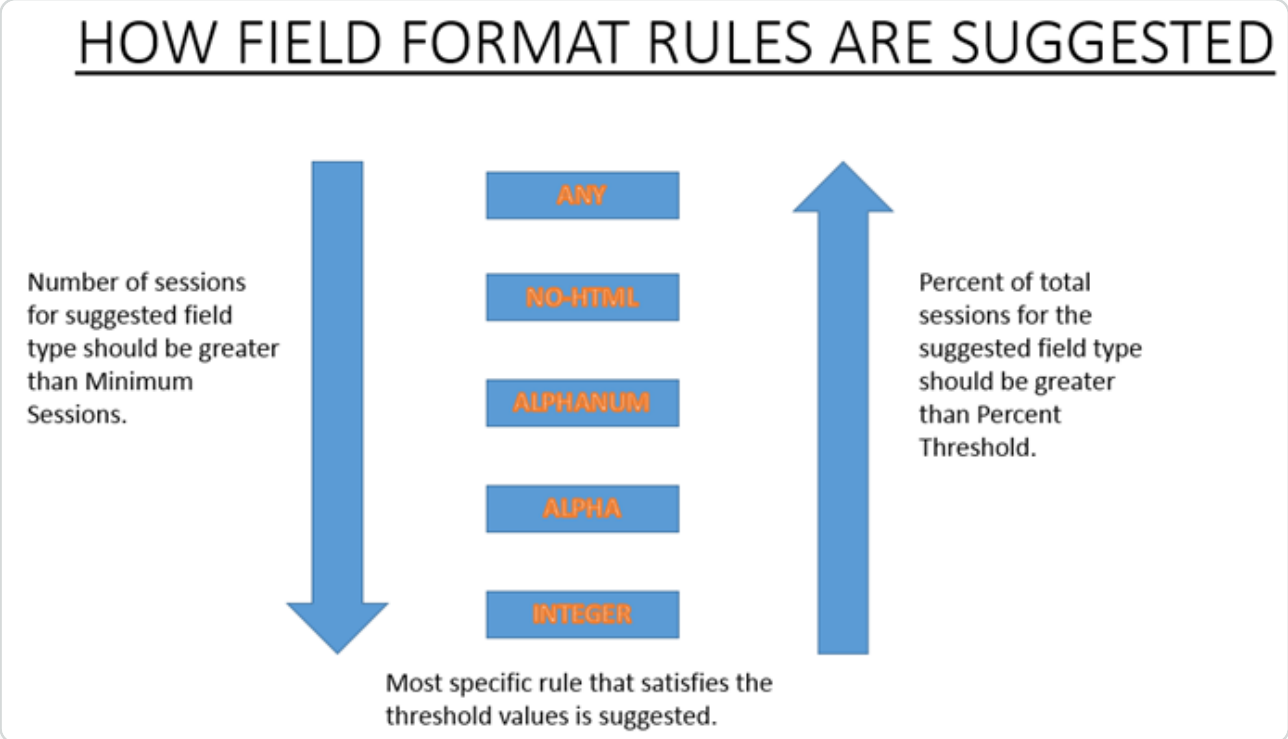
Using the learn feature with the Field Formats Check

When the learn action is enabled, the Web App Firewall learning engine monitors the traffic and learns the triggered violations. You can periodically inspect these learned rules. After due consideration, you can deploy the learned rule as a Field Format relaxation rule.

Field formats learning enhancement—An Web App Firewall learning enhancement was introduced in release 11.0. In the previous releases, once the learned field format recommendation is deployed, the Web App Firewall learning engine stops monitoring the valid requests for the purpose of recommending new rules on the basis of the new data points. This limits the configured security protection, because the learning database does not include any representations of the new data seen in the valid requests processed by the security check.

Violations are no longer coupled with learning. The learning engine learns and makes recommendations for the field formats regardless of the violations. In addition to checking the blocked requests to determine whether the current field format is too restrictive and needs to be relaxed, the learning engine also monitors the allowed requests to determine whether the current field format is too permissive, and allows elevating the security by deploying a more restrictive rule.

Following is a summary of the Field Formats learning behavior:



© 1997–2026 Citrix Systems, Inc. All rights reserved.

No Field format is bound—The behavior remains unchanged in this scenario. All learn data is sent to the aslearn engine. The learning engine suggests a field format rule based on the data set.

Field format is bound: In the previous releases, observed data is sent to the aslearn engine only in the case of a violation. The learning engine suggests a field format rule based on the data set. In the 11.0 release, all data is sent to aslearn engine even if no violation is triggered. The learning engine suggests a field format rule based on the entire data set of all received inputs.

Use Case for learning enhancement:

If the initial field format learned rules are based on a small sample of data, a few non typical values might result in a recommendation that is too lenient for the target field. The ongoing learning allows the Web App Firewall to observe data points from every request to collect a representative sample for the learned recommendations. This is helpful in further tightening the security to deploy the optimal input format with an adequate range value.

The field format learning makes use of the priority of the Field Types as well as the configured settings of the following learning thresholds:

- **FieldFormatMinThreshold**—Minimum number of times a specific form field must be observed before a learned relaxation is generated. Default: 1.
- **FieldFormatPercentThreshold**—Percentage of times a form field matched a particular Field Type, before a learned relaxation is generated. Default: 0.

The field format rule recommendations are based on the following criteria:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Field Type recommendations**—The Field Type recommendations are determined by the assigned priorities of the existing Field Types and the specified Field Format thresholds. The priorities determine the order in which the Field Types are matched against the inputs. A lower number specifies a higher priority. For example, Field Type integer has the higher priority (30) and is therefore evaluated before Field Type alphanum (50). The thresholds determine the number of inputs evaluated to collect a representative sample for the data point. Assigning the right priority to the configured Field Types, and configuring an appropriate **learningsetting** value for the **fieldFormatPercentThreshold** and **fieldFormatMinThreshold** parameters, is essential for getting the correct Field Format recommendation. The Field Type with the highest priority, based on the configured thresholds, is matched first against the inputs. If there is a match, this Field Type is suggested without considering the other Field Types. For example, three default Field Types, integer, alphanum, and any will match if all the inputs contain only numbers. However, integer will be recommended since it has the highest priority.
- **Minimum and Maximum length recommendations**—Calculations for the minimum and maximum lengths for the Field Format are done independently of the determination for the Field Type. The field format length calculations are based on the average length of all the observed inputs. Half of this calculated average is suggested as the min value, and twice the value of this average is suggested as the max value. The range for the Minimum Length is 0-65535 and the range for the Maximum Length is 1-65535. The configured value for the minimum length cannot exceed the maximum length.
- **Handling of space character**—The Field Format check counts every space character when checking for the Field Formats length. Leading or trailing spaces are not stripped, and multiple consecutive spaces in the middle of the input string are no longer consolidated to a single space during input processing.

Example to illustrate the Field Format recommendations:

```
Total requests: 100

Number of Req with Field Type:

Int : 22            (22 int values) – 22%

Alpha : 44                  (44 alpha values) – 44%

Alphanum: 14            (14 + 44 + 22 = 80 alphanum values) = 80%

noHTML: 10              (80 + 10 = 90 noHTML values) = 90%
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
any : 10                    (90 + 10 = 100 any values) = 100%

% threshold                              Suggested Field Type

0-22                int

23-44               alpha

45-80               alphanum

81-90               noHTML

91-100              any
```

To view or use learned data by using the command line interface

```
show appfw learningdata <profilename> FieldFormat

rm appfw learningdata <profilename> -fieldFormat <string>  <formActionURL>

export appfw learningdata <profilename> FieldFormat
```

To view or use learned data by using the GUI

1. Navigate to **Application Firewall** > **Profiles**, highlight the target profile, and click **Edit**.
2. In the **Advanced Settings** pane, click **Learned Rules**. You can select the Field Formats entry in the Learned Rules table and double-click it to access the learned rules. You can deploy the learned rules or edit a rule before deploying it as a relaxation rule. To discard a rule, you can select it and click the **Skip** button. You can edit only one rule at a time, but you can select multiple rules to deploy or skip.

   You also have the option to show a summarized view of the learned relaxations by selecting the Field Formats entry in the Learned Rules table and clicking Visualizer to get a consolidated view of all the learned violations. The visualizer makes it very easy to manage the learned rules. It presents a comprehensive view of the data on one screen and facilitates taking action on a group of rules with one click. The biggest advantage of the visualizer is that it recommends regular expressions to consolidate multiple rules. You can select a subset of these rules, based on the delimiter and Action URL. You can display 25, 50, or 75 rules in the

© 1997–2026 Citrix Systems, Inc. All rights reserved.

visualizer, by selecting the number from a drop-down list. The visualizer for learned rules offers the option to edit the rules and deploy them as relaxations. Or you can skip the rules to ignore them.

Using the log feature with the field formats check

When the log action is enabled, the Field Formats security check violations are logged in the audit log as APPFW_FIELDFORMAT violations. The Web App Firewall supports both Native and CEF log formats. You can also send the logs to a remote syslog server.

To access the log messages by using the command line

Switch to the shell and tail the ns.logs in the /var/log/ folder to access the log messages pertaining to the Field Formats violations:

- `Shell`
- `tail -f /var/log/ns.log | grep APPFW_FIELDFORMAT`

To access the log messages by using the GUI

The GUI includes a very useful tool (Syslog Viewer) for analyzing the log messages. You have multiple options for accessing the Syslog Viewer:

- Navigate to the **Application Firewall** > **Profiles**, select the target profile, and click **Security Checks**. Highlight the Field Formats row and click **Logs**. When you access the logs directly from the **Field Formats security** check of the profile, it filters out the log messages and displays only the logs pertaining to these security check violations.
- You can also access the Syslog Viewer by navigating to **NetScaler** > **System** > **Auditing**. In the **Audit Messages** section, click the **Syslog messages** link to display the **Syslog Viewer**, which displays all log messages, including other security check violation logs. This is useful for debugging when multiple security check violations might be triggered during request processing.
- Navigate to **Application Firewall** > **policies** > **Auditing**. In the **Audit Messages** section, click the Syslog messages link to display the Syslog Viewer, which displays all log messages, including other security check violation logs.

  The HTML based Syslog Viewer provides various filter options for selecting only the log messages that are of interest to you. To access Field Formats security check violation log messages, filter by selecting APPFW in the dropdown options for Module. The Event Type displays a rich set of options to further refine your selection. For example, if you select the

© 1997–2026 Citrix Systems, Inc. All rights reserved.

APPFW_FIELDFORMAT check box and click the **Apply** button, only log messages pertaining to the Field Formats security check violations appear in the Syslog Viewer.

If you place the cursor in the row for a specific log message, multiple options, such as Module and EventType, appear below the log message. You can select any of these options to highlight the corresponding information in the logs.

Example of a Native format log message when the request is not blocked

```

```

Statistics for the field formats violations

When the stats action is enabled, the corresponding counter for the Field Formats check is incremented when the Web App Firewall takes any action for this security check. The statistics are collected for Rate and Total count for Traffic, Violations, and Logs. The increment of the log counter can vary depending on the configured settings. For example, if the block action is enabled, the request for a page that contains 3 Field Format violations increments the stats counter by one, because the page is blocked as soon as the first Field Formats violation is detected. However, if

© 1997–2026 Citrix Systems, Inc. All rights reserved.

block is disabled, processing the same request increments the statistics counter for violations and the logs by 3, because each Field Formats violation generates a separate log message.

To display Field Formats statistics by using command line

At the command prompt, type:

```
sh appfw stats
```

To display stats for a specific profile, use the following command:

```
stat appfw profile <profile name>
```

To display Field Formats statistics by using GUI

1. Navigate to **System** > **Security** > **Application Firewall**.
2. In the right pane, access the Statistics Link.
3. Use the scroll bar to view the statistics about Field Formats violations and logs. The statistics table provides real-time data and is updated every 7 seconds.

Deployment Tip

- Enable Field format actions log, learn and stats.
- After running a representative sample of the traffic to your application, review the learned recommendations.
- If a Field Type is recommended by most of the learned rules, configure that Field Type as the Default Field Type. For minimum and maximum lengths, use the widest range suggested by these rules.
- Deploy rules for other fields for which different Field Types or different minimum/maximum lengths are better suited.
- Enable blocking and disable learning.
- Monitor stats and logs. If a significant number of violations are still being triggered, you might want to review the log messages to confirm that the violations represent malicious requests that must have been blocked. If valid requests are being flagged as violations, you can either edit the configured Field Format rule to further relax it or enable learning again to get recommendations based on the new data points.

NOTE:

You can fine tune your configuration by getting new learning recommendations.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Highlights

Note the following points about the Field Format security check:

- **Protection**—By configuring optimal field format rules, you can protect against many attacks. For example, if you specify that a field can only have integers, hackers will not be able to launch SQL Injection or cross-site scripting attacks by using this field, because the inputs required to launch such attacks will not meet the configured field format requirement.
- **Performance**—You can limit the minimum and the maximum allowed length for the inputs in the field format rules. This can prevent a malicious user from entering excessively large input strings in an attempt to add processing overhead to the server, or worse, cause the server to dump core because of stack overflow. By limiting the input size, you can shorten the time required for processing legitimate requests.
- **Configuring Field Formats**—You must enable one of the actions (block, log, stats, learn) to engage the field Format protection. You can also specify the Field format rules to identify the allowed inputs in your form fields.
- **Selecting Character Maps vs. Field Types**—Both Character Maps and Field Types use regular expressions. However, a Character Map provides a more specific expression by narrowing down the list of allowed characters. For example, for an input such as janedoe@citrix.com, the learning engine might recommend the Field Type nohtml but the Character Map might be more specific, because it narrows down the allowed set of non-alpha characters. The Character Map option allows, in addition to alpha characters, only two non-alpha characters: period (.) and at (@).
- **Ongoing Learning**—The Web App Firewall monitors and takes into account all the incoming data (violations as well as allowed inputs) to build a learning table for recommending rules. The rules are revised and updated as new incoming data arrives. New field format rules are suggested for a field even if it already has a bound field format rule. If the configured Field Formats are too restrictive and are blocking the valid requests, you can deploy a more relaxed Field Format. Similarly, if the current Field Formats are too generic, you can further refine and tighten the security by deploying a more restrictive Field Format.
- **Overwriting Rules**—If a rule has already been deployed for a field/URL combination, the GUI allows the user to update the field format. A dialog box asks for confirmation to replace the existing rule. If you are using the command line interface, you have to explicitly unbind the previous binding and then bind the new rule.
- **Multiple match**—If multiple field formats match a given field name and its action URL, the Web App Firewall arbitrarily selects one of them to apply.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Buffer boundary**—If a field value extends across multiple streaming buffers, and the format for these two parts of the field value is different, a field format corresponding to “any” is sent to the learn database.
- **Field Format vs. Field Consistency Check**—Both the Field Format check and the Field Consistency check are form-based protection checks. The Field Formats check provides a different type of protection than does the Form Field Consistency check. The Form Field Consistency check verifies that the structure of the web forms returned by users is intact, that data format restrictions configured in the HTML are respected, and that data in hidden fields has not been modified. It can do this without any specific knowledge about your web forms other than what it derives from the web form itself. The Field Formats check verifies that the data in each form field matches the specific formatting restrictions that you configured manually, or that the learning feature generated and you approved. In other words, the Form Field Consistency check enforces general web form security, while the Field Formats check enforces the specific rules for the allowed inputs for your web forms.

Form field consistency check

The Form Field Consistency check examines the web forms returned by users of your website, and verifies that web forms were not modified inappropriately by the client. This check applies only to HTML requests that contain a web form, with or without data. It does not apply to XML requests.

The Form Field Consistency check prevents clients from making unauthorized changes to the structure of the web forms on your website when they fill out and submit a form. It also ensures that the data a user submits meets the HTML restrictions for length and type, and that data in hidden fields is not modified. This prevents an attacker from tampering with a web form and using the modified form to gain unauthorized access to website, redirect the output of a contact form that uses an insecure script and thereby send unsolicited bulk email, or exploit a vulnerability in your web server software to gain control of the web server or the underlying operating system. Web forms are a weak link on many websites and attract a wide range of attacks.

The Form Field Consistency check verifies all of the following:

- If a field is sent to the user, the check ensures that it is returned by the user.
- The check enforces HTML field lengths and types.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE:

- The Form Field Consistency check enforces HTML restrictions on data type and length but does not otherwise validate the data in web forms. You can use the Field Formats check to set up rules that validate data returned in specific form fields on your web forms.
- The Form Field Consistency protection inserts a hidden field "as_fid" in the response forms which are sent to the client. The same hidden field will be stripped by ADC when the client submits the form. If there is any client-side javascript doing checksum computation on the form fields and verifying the same checksum at the backend may cause application breakage. In this scenario, It is recommended to relax the application firewall form field consistency hidden field "as_fid" from client-side javascript checksum computation.

- If your web server does not send a field to the user, the check does not allow the user to add that field and return data in it.
- If a field is a read-only or hidden field, the check verifies that the data has not changed.
- If a field is a list box or radio button field, the check verifies that the data in the response corresponds to one of the values in that field.

If a web form returned by a user violates one or more of the Form Field consistency checks, and you have not configured the Web App Firewall to allow that web form to violate the Form Field Consistency checks, the request is blocked.

If you use the wizard or the GUI, in the Modify Form Field Consistency Check dialog box, on the General tab you can enable or disable the Block, Log, Learn, and Statistics actions.

You also configure Sessionless Field Consistency in the General tab. If Sessionless Field Consistency is enabled, the Web App Firewall checks only the web form structure, dispensing with those parts of the Form Field Consistency check that depend upon maintaining session information. This can speed the Form Field Consistency check with little security penalty for websites that use many forms. To use Sessionless Field Consistency on all web forms, select On. To use it only for forms submitted with the HTTP POST method, select postOnly

If you use the command-line interface, you can enter the following command to configure the Form Field Consistency Check:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- `set appfw profile <name> -fieldConsistencyAction [**block**] [**learn**] [**log**] [**stats**] [**none**]`

To specify relaxations for the Form Field Consistency check, you must use the GUI. On the Checks tab of the Modify Form Field Consistency Check dialog box, click Add to open the Add Form Field Consistency Check Relaxation dialog box, or select an existing relaxation and click Open to open the Modify Form Field Consistency Check Relaxation dialog box. Either dialog box provides the same options for configuring a relaxation, as described in Manual Configuration By Using the GUI.

Following are examples of Form Field Consistency check relaxations:

Form Field Names:

- Choose form fields with the name UserType:

```
^UserType$
```

- Choose form fields with names that begin with UserType_ and are followed by a string that begins with a letter or number and consists of from one to twenty-one letters, numbers, or the apostrophe or hyphen symbol:

```
^UserType_[0-9A-Za-z][0-9A-Za-z'-]{0,20}$
```

- Choose form fields with names that begin with Turkish-UserType_ and are otherwise the same as the previous expression, except that they can contain Turkish special characters throughout:

```
^T\xC3\xBCrk\xC3\xA7e-UserType_([0-9A-Za-z]|\\x[0-9A-Fa-f][0-9A-Fa-f])+
$
```

NOTE:

See PCRE Character Encoding Format for a complete description of supported special characters and how to encode them properly.

- Choose form field names that begin with a letter or number, consist of a combination of letters and/or numbers only, and that contain the string Num anywhere in the string:

```
^[0-9A-Za-z]*Num[0-9A-Za-z]*$
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Form Field Action URLs:

- Choose URLs beginning with `http://www.example.com/search.pl?` and containing any string after the query except for a new query:

```
^http://www[.]example[.]com/search[.]pl?[^?]*$
```

- Choose URLs that begin with `http://www.example-español.com` and have paths and filenames that consist of upper-case and lower-case letters, numbers, non-ASCII special characters, and selected symbols in the path. The ñ character and any other special characters are represented as encoded UTF-8 strings containing the hexadecimal code assigned to each special character in the UTF-8 charset:

```
^http://www[.]example-espa\xC3\xB1ol[.]com/(([0-9A-Za-z]|\\x[0-9A-Fa-f]
[0-9A-Fa-f])

([0-9A-Za-z_-]|\\x[0-9A-Fa-f][0-9A-Fa-f])*/)*([0-9A-Za-z]|\\x[0-9A-Fa-
f][0-9A-Fa-f])

([0-9A-Za-z_-]|\\x[0-9A-Fa-f][0-9A-Fa-f])*.$
```

- Choose all URLs that contain the string /search.cgi?:

```
^[^?<>]*/search[.]cgi\?[^?<>]*$
```

CAUTION:

Regular expressions are powerful. Especially if you are not thoroughly familiar with PCRE-format regular expressions, double-check any regular expressions you write. Make sure that they define exactly the URL you want to add as an exception, and nothing else. Careless use of wildcards, and especially of the dot-asterisk (.*) metacharacter/wildcard combination, can have results you do not want or expect, such as blocking access to web content that you did not intend to block or allowing an attack that the Cookie Consistency check would otherwise have blocked.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

CSRF form tagging check

The Cross Site Request Forgery (CSRF) Form Tagging check tags each web form sent by a protected website to users with a unique and unpredictable FormID, and then examines the web forms returned by users to ensure that the supplied FormID is correct. This check protects against cross-site request forgery attacks. This check applies only to HTML requests that contain a web form, with or without data. It does not apply to XML requests.

The CSRF Form Tagging check prevents attackers from using their own web forms to send high volume form responses with data to your protected websites. This check requires relatively little CPU processing capacity compared to certain other security checks that analyze web forms in depth. It is therefore able to handle high volume attacks without seriously degrading the performance of the protected website or the Web App Firewall itself.

Before you enable the CSRF Form Tagging check, you must be aware of the following:

- You need to enable form tagging. The CSRF check depends on form tagging and does not work without it.
- You must disable the NetScaler Integrated Caching feature for all web pages containing forms that are protected by that profile. The Integrated Caching feature and CSRF form tagging are not compatible.
- You must consider enabling Referer checking. Referer checking is part of the Start URL check, but it prevents cross-site request forgeries, not Start URL violations. Referer checking also puts less load on the CPU than does the CSRF Form Tagging check. If a request violates Referer checking, it is immediately blocked, so the CSRF Form Tagging check is not invoked.
- The CSRF Form Tagging check does not work with web forms that use different domains in the form-origin URL and form-action URL. For example, CSRF Form Tagging cannot protect a web form with a form-origin URL of `http://www.example.com` and a form action URL of `http://www.example.org/form`.pl, because example.com and example.org are different domains.

If you use the wizard or the GUI, in the Modify CSRF Form Tagging Check dialog box, on the General tab you can enable or disable the Block, Log, Learn and Statistics actions.

If you use the command-line interface, you can enter the following command to configure the CSRF Form Tagging Check:

- `set appfw profile <name> -CSRFtagAction [**block**] [**log**] [**learn**] [**stats**] [**none**]`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To specify relaxations for the CSRF Form Tagging check, you must use the GUI. On the Checks tab of the Modify CSRF Form Tagging Check dialog box, click Add to open the Add CSRF Form Tagging Check Relaxation dialog box, or select an existing relaxation and click Open to open the Modify CSRF Form Tagging Check Relaxation dialog box. Either dialog box provides the same options for configuring a relaxation.

An alert is generated when you set the NetScaler Web App Firewall session limit to a value of 0 or lower, because such a setting affects advanced protection check functionality that requires a properly functioning Web App Firewall session.

Following are examples of CSRF Form Tagging check relaxations:

Note: The following expressions are URL expressions that can be used in both the Form Origin URL and Form Action URL roles.

- Choose URLs beginning with `http://www.example.com/search.pl?` and containing any string after the query, except for a new query:

```
^http://www[.]example[.]com/search[.]pl?[^?]*$
```

- Choose URLs that begin with `http://www.example-español.com` and have paths and filenames that consist of upper-case and lower-case letters, numbers, non-ASCII special characters, and selected symbols in the path. The ñ character and any other special characters are represented as encoded UTF-8 strings containing the hexadecimal code assigned to each special character in the UTF-8 charset:

```
    ^http://www[.]example-espa\xC3\xB1ol[.]com/(([0-9A-Za-z]|\\x[0-9A-Fa-
f][0-9A-Fa-f])

([0-9A-Za-z_-]|\\x[0-9A-Fa-f][0-9A-Fa-f])*/)*([0-9A-Za-z]|\\x[0-9A-Fa-f]
[0-9A-Fa-f])([0-9A-Za-z_-]|\\x[0-9A-Fa-f][0-9A-Fa-f])*.$
```

- Choose all URLs that contain the string /search.cgi?:

```
^[^?<>]*/search[.]cgi\?[^?<>]*$
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

IMPORTANT

Regular expressions are powerful. If you are not thoroughly familiar with PCRE-format regular expressions, double-check any regular expressions you write. Make sure that they define exactly the URL that you want to add as an exception, and nothing else. Careless use of wildcards, and especially of the dot-asterisk (.*) metacharacter/wildcard combination, can have results you do not want, such as blocking access to web content that you did not intend to block or allowing an attack that the check would otherwise have blocked.

Tip

When enableValidate referrer header is enabled under the Start URL Action, ensure that the Referrer Header URL is added to StartURL as well.

Note

When NetScaler reaches the appfw_session_limit and CSRF checks are enabled, the web application freezes.

To prevent web application freeze, decrease the session timeout and increase the session limit by using the following commands:

From CLI: > set appfw settings –sessiontimeout 300 From shell: root@ns# nsapimgr_wr.sh -s appfw_session_limit=200000

Logging and generating SNMP alarms when appfw_session_limit is reached assists you in troubleshooting and debugging issues.

Managing CSRF form tagging check relaxations

You configure an exception (or relaxation) to the CSRF Form Tagging security check in the Add Cross-Site Request Forgery Tagging Check Relaxation dialog box or the Modify Cross-Site Request Forgery Tagging Check Relaxation dialog box.

To configure a CSRF form tagging check relaxation by using the GUI

1. Navigate to **Security > NetScaler Web App Firewall > Profiles**.
2. In the **Profiles** pane, select the profile you want to configure, and then click **Open**.
3. In the **Configure Web App Firewall Profile** dialog box, click the **Security Checks** tab. The **Security Checks** tab contains the list of Web App Firewall security checks.
4. To add or modify a CSRF relaxation, do one of the following:
   - To add a new relaxation, click Add.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- To modify an existing relaxation, select the relaxation that you want to modify, and then click **Open**.

The **Add Cross-Site Request Forgery Tagging Check Relaxation** or **Modify Cross-Site Request Forgery Tagging Check Relaxation** dialog box is displayed. Except for the title, these dialog boxes are identical.

5. Fill in the dialog box as described below.

   - **Enabled check box**—Select to place this relaxation or rule in active use; clear to deactivate it.
   - **Form Origin URL**—In the text area, enter a PCRE-format regular expression that defines the URL that hosts the form.
   - **Form Action URL**—In the text area, enter a PCRE-format regular expression that defines the URL to which data entered into the form is delivered.
   - **Comments**—In the text area, type a comment. Optional.

   NOTE:

   For any element that requires a regular expression, you can type the regular expression, use the **Regex Tokens** menu to insert regular expression elements and symbols directly into the text box, or click **Regex Editor** to open the **Add Regular Expression** dialog box, and use it to construct the expression.

6. Click **OK**. The **Add Cross-Site Request Forgery Tagging Check Relaxation** or **Modify Cross-Site Request Forgery Tagging Check Relaxation** dialog box closes and you return to the **Modify Cross-Site Request Forgery Tagging Check** dialog box.
7. To remove a relaxation or rule, select it, and then click **Remove**.
8. To enable a relaxation or rule, select it, and then click **Enable**.
9. To disable a relaxation or rule, select it, and then click **Disable**.
10. To configure the settings and relationships of all existing relaxations in an integrated interactive graphic display, click **Visualizer**, and use the display tools.
11. To review and configure learned rules for the CSRF check, click **Learning** and perform the steps in To configure and use the Learning feature.
12. Click **OK**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

URL protection checks

The URL Protection checks examine request URLs to prevent attackers from aggressively attempting to access multiple URLs (forceful browsing) or using a URL to trigger a known security vulnerability in web server software or website scripts.

Start URL check

The Start URL check examines the URLs in incoming requests and blocks the connection attempt if the URL does not meet the specified criteria. To meet the criteria, the URL must match an entry in the Start URL list, unless the Enforce URL Closure parameter is enabled. If you enable this parameter, a user who clicks a link on your website is connected to the target of that link.

The primary purpose of the Start URL check is to prevent repeated attempts to access random URLs on a website, (forceful browsing) through bookmarks, external links, or jumping to pages by manually typing in the URLs to skip the pages required to reach that part of the website. Forceful browsing can be used to trigger a buffer overflow, find content that users were not intended to access directly, or find a back door into secure areas of your Web server. The Web App Firewall enforces a website's given traversal or logic path by allowing access to only the URL's that are configured as start URLs.

If you use the wizard or the GUI, in the Modify Start URL Check dialog box, on the General tab you can enable or disable Block, Log, Statistics, Learn actions, and the following parameters:

- **Enforce URL Closure.** Allow users to access any web page on your website by clicking a hyperlink on any other page on your website. Users can navigate to any page on your website that can be reached from the home page or any designated start page by clicking hyperlinks. Note: The URL closure feature allows any query string to be appended to and sent with the action URL of a web form submitted by using the HTTP GET method. If your protected websites use forms to access an SQL database, make sure that you have the SQL injection check enabled and properly configured.
- **Sessionless URL Closure.** From the client's point of view, this type of URL closure functions in exactly the same way as standard, session-aware URL Closure, but uses a token embedded in the URL instead of a cookie to track the user's activity, which consumes considerably fewer resources. When sessionless URL closure is enabled, the Web App Firewall appends a "as_url_id" tag to all the URL's that are in URL closure. **Note**: When enabling sessionless (Sessionless URL Closure), you must also enable regular URL closure (Enforce URL Closure) or sessionless URL closure does not work.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Validate Referer Header.** Verify that the Referer header in a request that contains web form data from your protected website instead of another website. This action verifies that your website, not an outside attacker, is the source of the web form. Doing so protects against cross-site request forgeries (CSRF) without requiring form tagging, which is more CPU-intensive than header checks. The Web App Firewall can handle the HTTP Referer header in one of the following four ways, depending on which option you select in the drop-down list:
  - **Off**—Do not validate the Referer header.
  - **If-Present**—Validate the Referer header if a Referer header exists. If an invalid Referer header is found, the request generates a referer-header violation. If no Referer header exists, the request does not generate a referer-header violation. This option enables the Web App Firewall to perform Referer header validation on requests that contain a Referer header, but not block requests from users whose browsers do not set the Referer header or who use web proxies or filters that remove that header.
  - **Always Except Start URLs**—Always validate the Referer header. If there is no Referer header and the requested URL is not exempted by the startURL relaxation rule, the request generates a referer-header violation. If the Referer header is present but it is invalid, the request generates a referer-header violation.
  - **Always Except First Request**—Always validate the referer header. If there is no referer header, only the URL that is accessed first is allowed. All other URL's are blocked without a valid referer header. If the Referer header is present but it is invalid, the request generates a referer-header violation.

One Start URL setting, **Exempt Closure URLs from Security Checks**, is not configured in the Modify Start URL Check dialog box, but is configured in the Settings tab of the Profile. If enabled, this setting directs the Web App Firewall not to run further form based checks (such as Cross-Site Scripting and SQL Injection inspection) on URLs that meet the URL Closure criteria.

NOTE

Although the referer header check and Start URL security check share the same action settings, it is possible to violate the referer header check without violating the Start URL check. The difference is visible in the logs, which log referer header check violations separately from Start URL check violations.

The Referer header settings (OFF, if-Present, AlwaysExceptStartURLs, and AlwaysExceptFirstRequest) are arranged in order of least restrictive to most restrictive and work as follows:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

OFF:

- Referer Header Not checked.

If-Present:

- Request has no referer header -> Request is allowed.
- Request has referer header and the referer URL is in URL closure -> Request is allowed.
- Request has referer header and the referer URL is **not** in URL closure -> Request is blocked.

AlwaysExceptStartURLs:

- Request has no referer header and the request URL is a start URL -> Request is allowed.
- Request has no referer header and the request URL is not a start URL ->Request is blocked.
- Request has referer header and the referer URL is in URL closure -> Request is allowed.
- Request has referer header and the referer URL is **not** in URL closure -> Request is blocked.

AlwaysExceptFirstRequest:

- Request has no referer header and is the first request URL of the session -> Request is allowed.
- Request has no referer header and is **not** the first request URL of the session -> Request is blocked.
- Request has referer header and is either the first request URL of the session or is in URL closure -> Request is allowed.
- Request has referer header and is neither the first request URL of the session nor is in URL closure -> Request is blocked.

If you use the command-line interface, you can enter the following commands to configure the Start URL Check:

- `set appfw profile <name> -startURLAction [block] [learn] [log] [stats] [none]`
- `set appfw profile <name> -startURLClosure ([ON] | [OFF])`
- `set appfw profile <name> -sessionlessURLClosure ([ON] | [OFF])`
- `set appfw profile <name> -exemptClosureURLsFromSecurityChecks ([ON] | [OFF)`
- `set appfw profile <name> -RefererHeaderCheck ([OFF] | [if-present] | [AlwaysExceptStartURLs] | [AlwaysExceptFirstRequest])`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To specify relaxations for the Start URL check, you must use the GUI. On the Checks tab of the Modify Start URL Check dialog box, click Add to open the Add Start URL Check Relaxation dialog box, or select an existing relaxation and click Open to open the Modify Start URL Check Relaxation dialog box. Either dialog box provides the same options for configuring a relaxation.

Following are examples of Start URL check relaxations:

- Allow users to access the home page at www.example.com:

```
^http://www[.]example[.]com$
```

- Allow users to access all static HTML (.htm and .html), server-parsed HTML (.htp and .shtml), PHP (.php), and Microsoft ASP (.asp) format web pages at www.example.com:

```
^http://www[.]example[.]com/([0-9A-Za-z][0-9A-Za-z_-]*/)*

[0-9A-Za-z][0-9A-Za-z_.-]*.$
```

- Allow users to access web pages with pathnames or file names that contain non-ASCII characters at www.example-español.com:

```
^http://www[.]example-espaxC3xB1ol[.]com/(([0-9A-Za-z]|x[0-9A-Fa-f]
[0-9A-Fa-f])([0-9A-Za-z_-]|x[0-9A-Fa-f][0-9A-Fa-f])*/)*

([0-9A-Za-z]|x[0-9A-Fa-f][0-9A-Fa-f])([0-9A-Za-z_-]|x[0-9A-Fa-f][0-9A-
Fa-f])*.$
```

  Note: In the above expression, each character class has been grouped with the string x0-9A-Fa-f, which matches all properly-constructed character encoding strings but does not allow stray backslash characters that are not associated with a UTF-8 character encoding string. The double backslash () is an escaped backslash, which tells the Web App Firewall to interpret it as a literal backslash. If you included only one backslash, the Web App Firewall would instead interpret the following left square bracket ([) as a literal character instead of the opening of a character class, which would break the expression.

- Allow users to access all GIF (.gif), JPEG (.jpg and .jpeg), and PNG (.png) format graphics at www.example.com:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
^http://www[.]example[.]com/([0-9A-Za-z][0-9A-Za-z_-]*/)*

[0-9A-Za-z][0-9A-Za-z_.-]*.$
```

- Allow users to access CGI (.cgi) and PERL (.pl) scripts, but only in the CGI-BIN directory:

```
^http://www[.]example[.]com/CGI-BIN/[0-9A-Za-z][0-9A-Za-z_.-]*.$
```

- Allow users to access Microsoft Office and other document files in the docsarchive directory:

```
^http://www[.]example[.]com/docsarchive/[0-9A-Za-z][0-9A-Za-z_-.]*.$
```

NOTE

By default, all Web App Firewall URLs are considered to be regular expressions.

Caution: Regular expressions are powerful. Especially if you are not thoroughly familiar with PCRE-format regular expressions, double-check any regular expressions that you write. Make sure that they define exactly the URL you want to add as an exception, and nothing else. Careless use of wildcards, and especially of the dot-asterisk (.*) metacharacter/wildcard combination, can have results you do not want, such as blocking access to web content that you did not intend to block or allowing an attack that the Start URL check would otherwise have blocked.

TIP

You can add the *-and-* to the allowed list of SQL keywords for URL naming scheme. For example, example https://FQDN/bread-and-butter.

Deny URL check

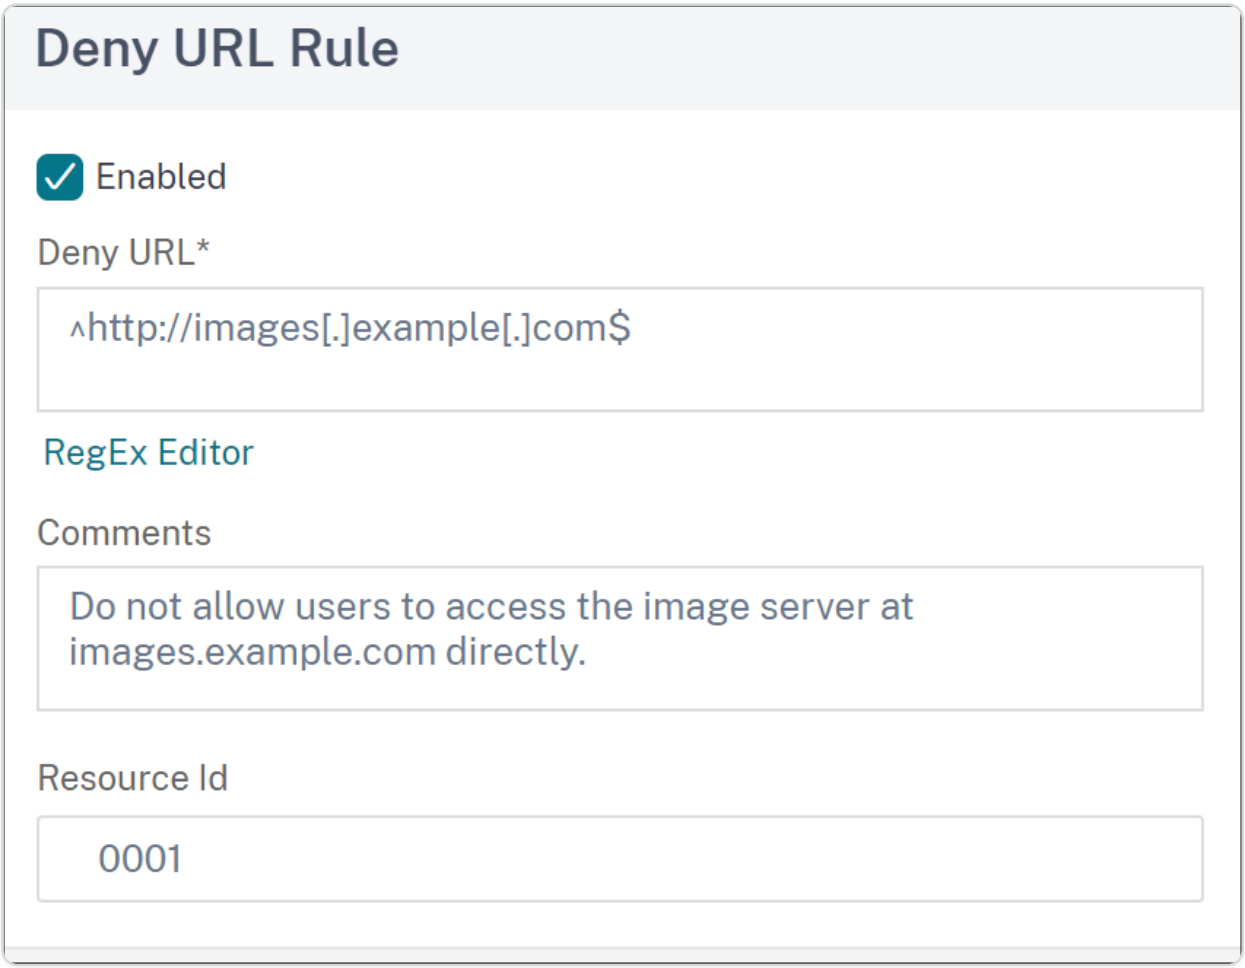
The Deny URL check examines and blocks connections to URLs that are commonly accessed by hackers and malicious code. This check contains a list of URLs that are common targets of hackers or malicious code and that rarely if ever appear in legitimate requests. You can also add URLs or URL patterns to the list. The Deny URL check prevents attacks against various security weaknesses known to exist in web server software or on many websites.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The Deny URL check takes priority over the Start URL check, and thus denies malicious connection attempts even when a Start URL relaxation would normally allow a request to proceed.

In the Modify Deny URL Check dialog box, on the General tab you can enable or disable the Block, Log, and Statistics actions.

If you use the command-line interface, you can enter the following command to configure the Deny URL Check:



```
set appfw profile <name> -denyURLAction [**block**] [**log**] [**stats**]
[**none**]
```

You can create and configure your own deny URLs only in the NetScaler GUI.

1. Navigate to **Security > NetScaler Web App Firewall > Profiles**.
2. Select a profile for which you want to add a deny URL and click **Edit**.
3. In the **NetScaler Web App Firewall Profile** page, select **Relaxation Rules** from the **Advanced Settings** section.
4. Select **Deny URL** and click **Edit**.
5. In the **Deny URL Rules** page, click **Add**.
6. Specify the following details and click **Create**.

    - **Deny URL** - A regular expression to define a deny URL.
    - **Comments** - Description for the expression.
    - **Resource ID** - Unique ID to identify the deny URL rule.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

7. Click **Close**.
8. In the **NetScaler Web App Firewall Profile** page, click **Done**.

Following are examples of Deny URL expressions:

- Do not allow users to access the image server at images.example.com directly:

```
^http://images[.]example[.]com$
```

- Do not allow users to access CGI (.cgi) or PERL (.pl) scripts directly:

```
^http://www[.]example[.]com/([0-9A-Za-z][0-9A-Za-z_-]*/)*

[0-9A-Za-z][0-9A-Za-z_.-]*.$
```

- Here is the same deny URL, modified to support non-ASCII characters:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
^http://www[.]example[.]com/(([0-9A-Za-z]|x[0-9A-Fa-f][0-9A-Fa-f])

([0-9A-Za-z_-]|x[0-9A-Fa-f][0-9A-Fa-f])*/)*([0-9A-Za-z]|x[0-9A-Fa-f]
[0-9A-Fa-f])

([0-9A-Za-z_-]|x[0-9A-Fa-f][0-9A-Fa-f])*.$
```

CAUTION:

Regular expressions are powerful. Especially if you are not thoroughly familiar with PCRE-format regular expressions, double-check any regular expressions you write. Make sure that they define exactly the URL or pattern that you want to block, and nothing else. Careless use of wildcards, and especially of the dot-asterisk (.*) metacharacter/wildcard combination, can have results that you do not want, such as blocking access to web content that you did not intend to block.

XML protection checks

The XML Protection checks examine requests for XML-based attacks of all types.

CAUTION:

The XML security checks apply only to content that is sent with an HTTP content-type header of text/xml. If the content-type header is missing, or is set to a different value, all XML security checks are bypassed. If you plan to protect XML or Web 2.0 web applications, the webmasters of each web server that hosts those applications must ensure that the proper HTTP content-type header is sent.

XML format check

The XML Format check examines the XML format of incoming requests and blocks those requests that are not well formed or that do not meet the criteria in the XML specification for properly-formed XML documents. Some of those criteria are:

- An XML document must contain only properly-encoded Unicode characters that match the Unicode specification.
- No special XML syntax characters—such as < , > and &—can be included in the document except when used in XML markup.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- All begin, end, and empty-element tags must be correctly nested, with none missing or overlapping.
- XML element tags are case-sensitive. All beginning and end tags must match exactly.
- A single root element must contain all the other elements in the XML document.

A document that does not meet the criteria for well-formed XML does not meet the definition of an XML document. Strictly speaking, it is not XML. However, not all XML applications and web services enforce the XML well-formed standard, and not all handle poorly-formed or invalid XML correctly. Inappropriate handling of a poorly-formed XML document can cause security breaches. The purpose of the XML Format check is to prevent a malicious user from using a poorly-formed XML request to breach security on your XML application or web service.

If you use the wizard or the GUI, in the Modify XML Format Check dialog box, on the General tab you can enable or disable the Block, Log, and Statistics actions.

If you use the command-line interface, you can enter the following command to configure the XML Format Check:

- `set appfw profile <name> -xmlFormatAction [**block**] [**log**] [**stats**] [**none**]`

You cannot configure exceptions to the XML Format check. You can only enable or disable it.

XML Denial-of-Service check

The XML Denial of Service (XML DoS or XDoS) check examines incoming XML requests to determine whether they match the characteristics of a denial-of-service (DoS) attack. If there is a match, blocks those requests. The purpose of the XML DoS check is to prevent an attacker from using XML requests to launch a denial-of-service attack on your web server or website.

If you use the wizard or the GUI, in the Modify XML Denial-of-Service Check dialog box, on the **General** tab you can enable or disable the Block, Log, Statistics, and Learn actions:

If you use the command-line interface, you can enter the following command to configure the XML Denial-of-Service check:

- `set appfw profile <name> -xmlDoSAction [**block**] [**log**] [**learn**] [**stats**] [**none**]`

To configure individual XML Denial-of-Service rules, you must use the GUI. On the **Checks** tab of the **Modify XML Denial-of-Service Check** dialog box, select a rule and click **Open** to open the

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Modify XML Denial-of-Service dialog box for that rule. The individual dialog boxes differ for the different rules but are simple. Some only allow you to enable or disable the rule; others allow you to modify a number by typing a new value in a text box.

NOTE:

The expected behavior of Learning engine for denial-of-service attack is based on the configured action. If the action is set as "Block", the engine learns the configured bind value +1 and the XML parsing stops when there is a violation. If the configured action is not set as "Block", the engine learns the actual incoming violation length value.

The individual XML Denial-of-Service rules are:

- Maximum Element Depth. Restrict the maximum number of nested levels in each individual element to 256. If this rule is enabled, and the Web App Firewall detects an XML request with an element that has more than the maximum number of allowed levels, it blocks the request. You can modify the maximum number of levels to any value from one (1) to 65,535.
- Maximum Element Name Length. Restrict the maximum length of each element name to 128 characters. This includes the name within the expanded namespace, which includes the XML path and element name in the following format:

  ```
  {http://prefix.example.com/path/}target_page.xml
  ```

The user can modify the maximum name length to any value between one (1) character and 65,535.

- Maximum # Elements. Restrict the maximum number of any one type of element per XML document to 65,535. You can modify the maximum number of elements to any value between one (1) and 65,535.
- Maximum # Element Children. Restrict the maximum number of children (including other elements, character information, and comments) each individual element is allowed to have to 65,535. You can modify the maximum number of element children to any value between one (1) and 65,535.
- Maximum # Attributes. Restrict the maximum number of attributes each individual element is allowed to have to 256. You can modify the maximum number of attributes to any value between one (1) and 256.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Maximum Attribute Name Length. Restrict the maximum length of each attribute name to 128 characters. You can modify the maximum attribute name length to any value between one (1) and 2,048.
- Maximum Attribute Value Length. restrict the maximum length of each attribute value to 2048 characters. You can modify the maximum attribute name length to any value between one (1) and 2,048.
- Maximum Character Data Length. Restrict the maximum character data length for each element to 65,535. You can modify the length to any value between one (1) and 65,535.
- Maximum File Size. Restrict the size of each file to 20 MB. You can modify the maximum file size to any value.
- Minimum File Size. Require that each file is least 9 bytes in length. You can modify the minimum file size to any positive integer representing various bytes.
- Maximum # Entity Expansions. Limit the number of entity expansions allowed to the specified number. Default: 1024.
- Maximum Entity Expansion Depth. Restrict the maximum number of nested entity expansions to no more than the specified number. Default: 32.
- Maximum # Namespaces. Limit the number of namespace declarations in an XML document to no more than the specified number. Default: 16.
- Maximum Namespace URI Length. Limit the URL length of each namespace declaration to no more than the specified number of characters. Default: 256.
- Block Processing Instructions. Block any special processing instructions included in the request. This rule has no user-modifiable values.
- Block DTD. Block any document type definitions (DTD) included with the request. This rule has no user-modifiable values.
- Block External Entities. Block all references to external entities in the request. This rule has no user-modifiable values.
- SOAP Array Check. Enable or disable the following SOAP array checks:
    - **Maximum SOAP Array Size.** The maximum total size of all SOAP arrays in an XML request before the connection is blocked. You can modify this value. Default: 20000000.
    - **Maximum SOAP Array Rank.** The maximum rank or dimensions of any single SOAP array in an XML request before the connection is blocked. You can modify this value. Default: 16.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

XML cross-site scripting check

The XML Cross-Site Scripting check examines the user requests for possible cross-site scripting attacks in the XML payload. If it finds a possible cross-site scripting attack, it blocks the request.

To prevent misuse of the scripts on your protected web services to breach security on your web services, the XML Cross-Site Scripting check blocks scripts that violate the same origin rule, which states that scripts must not access or modify content on any server but the server on which they are located. Any script that violates the same origin rule is called a cross-site script, and the practice of using scripts to access or modify content on another server is called cross-site scripting. The reason cross-site scripting is a security issue is that a web server that allows cross-site scripting can be attacked with a script that is not on that web server, but on a different web server, such as one owned and controlled by the attacker.

The Web App Firewall offers various action options for implementing XML Cross-Site Scripting protection. You have the option to configure **Block**, **Log**, and **Stats** actions.

The Web App Firewall XML cross-site scripting check is performed on the payload of the incoming requests and attack strings are identified even if they are spread over multiple lines. The check looks for cross-site scripting attack strings in the **element** and the **attribute** values. You can apply relaxations to bypass security check inspection under specified conditions. The logs and statistics can help you identify needed relaxations.

The CDATA section of the XML payload might be an attractive area of focus for the hackers because the scripts are not executable outside the CDATA section. A CDATA section is used for content that is to be treated entirely as character data. HTML mark up tag delimiters **<**, **>**, and **/>** will not cause the parser to interpret the code as HTML elements. The following example shows a CDATA Section with cross-site scripting attack string:

```
<![CDATA[rn

<script language="Javascript" type="text/javascript">alert ("Got you")</
script>rn

]]>
```

Action Options

An action is applied when the XML Cross-Site Scripting check detects an cross-site scripting attack in the request. The following options are available for optimizing XML Cross-Site Scripting protection for your application:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Block**—Block action is triggered if the cross-site scripting tags are detected in the request.
- **Log**—Generate log messages indicating the actions taken by the XML Cross-Site Scripting check. If block is disabled, a separate log message is generated for each location (ELEMENT, ATTRIBUTE) in which the cross-site scripting violation is detected. However, only one message is generated when the request is blocked. You can monitor the logs to determine whether responses to legitimate requests are getting blocked. A large increase in the number of log messages can indicate attempts to launch an attack.
- **Stats**—Gather statistics about violations and logs. An unexpected surge in the stats counter might indicate that your application is under attack. If legitimate requests are getting blocked, you might have to revisit the configuration to see if you need to configure new relaxation rules or modify the existing ones.

Relaxation Rules

If your application requires you to bypass the Cross-Site Scripting check for a specific ELEMENT or ATTRIBUTE in the XML payload, you can configure a relaxation rule. The XML Cross-Site Scripting check relaxation rules have the following parameters:

- **Name**—You can use literal strings or regular expressions to configure the name of the ELEMENT or the Attribute. The following expression exempts all ELEMENTS beginning with the string name_ followed by a string of uppercase or lowercase letters, or numbers, that is at least two and no more than fifteen characters long:

  `\^name_[0-9A-Za-z]{2,15}$`

NOTE

The names are case sensitive. Duplicate entries are not allowed, but you can use capitalization of the names and differences in location to create similar entries. For example, each of the following relaxation rules is unique:

1. `XMLcross-site scripting: ABC IsRegex: NOTREGEX Location: ATTRIBUTE State: ENABLED`
2. `XMLcross-site scripting: ABC IsRegex: NOTREGEX Location: ELEMENT State: ENABLED`
3. `XMLcross-site scripting: abc IsRegex: NOTREGEX Location: ELEMENT State: ENABLED`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. `XMLcross-site scripting: abc IsRegex: NOTREGEX` `Location: ATTRIBUTE State: ENABLED`

- **Location**—You can specify the Location of the Cross-site Scripting Check exception in your XML payload. The option ELEMENT is selected by default. You can change it to ATTRIBUTE.
- **Comment**—This is an optional field. You can use up to a 255 character string to describe the purpose of this relaxation Rule.

WARNING

Regular expressions are powerful. Especially if you are not thoroughly familiar with PCRE-format regular expressions, double-check any regular expressions you write. Make sure that they define exactly the name that you want to add as an exception, and nothing else. Careless use of Regular Expressions can have results that you do not want, such as blocking access to web content that you did not intend to block or allowing an attack that the XML Cross-Site Scripting check would otherwise have blocked.

Using the Command Line to Configure the XML Cross-Site Scripting check

To configure XML Cross-Site Scripting check actions and other parameters by using the command line

If you use the command-line interface, you can enter the following commands to configure the XML Cross-Site Scripting Check:

```
> set appfw profile <name> -XMLcross-site scriptingAction (([block] [log] [stats]) | [none])
```

To configure a XML Cross-Site Scripting check relaxation rule by using the command line

You can add relaxation rules to bypass inspection of cross-site scripting script attack inspection in a specific location. Use the bind or unbind command to add or delete the relaxation rule binding, as follows:

```
> bind appfw profile <name> -XMLcross-site scripting <string> [isRegex (REGEX | NOTREGEX)] [-location ( ELEMENT | ATTRIBUTE )] –comment <string> [-state ( ENABLED | DISABLED )]
```

```
> unbind appfw profile <name> -XMLcross-site scripting <String>
```

Example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
> bind appfw profile test_pr -XMLcross-site scripting ABC
```

After executing the above command, the following relaxation rule is configured. The rule is enabled, the name is treated as a literal (NOTREGEX), and ELEMENT is selected as the default location:

```
1)      XMLcross-site scripting:  ABC             IsRegex:  NOTREGEX

        Location:  ELEMENT       State:  ENABLED

`> unbind appfw profile test_pr -XMLcross-site scripting abc`

ERROR: No such XMLcross-site scripting check

`> unbind appfw profile test_pr -XMLcross-site scripting ABC`

 Done
```

Using the GUI to configure the XML Cross-Site scripting check

In the GUI, you can configure the XML Cross-Site scripting check in the pane for the profile associated with your application.

To configure or modify the XML Cross-Site Scripting check by using the GUI

1. Navigate to **Web App Firewall** > **Profiles**, highlight the target profile, and click **Edit**.
2. In the Advanced Settings pane, click **Security Checks**.

The security check table displays the currently configured action settings for all the security checks. You have 2 options for configuration:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

a) If you just want to enable or disable **Block**, **Log**, and **Stats** actions for the **XML Cross-Site Scripting check**, you can select or clear check boxes in the table, click **OK**, and then click Save and Close to close the Security Check pane.

b) You can double click **XML Cross-Site Scripting**, or select the row and click **Action Settings**, to display the action options. After changing any of the action settings, click **OK** to save the changes and return to the Security Checks table.

You can proceed to configure other security checks if needed. Click **OK** to save all the changes you have made in the Security Checks section, and then click **Save and Close** to close the Security Check pane.

To configure a XML Cross-Site Scripting relaxation rule by using the GUI

1. Navigate to **Web App Firewall** > **Profiles**, highlight the target profile, and click **Edit**.
2. In the **Advanced Settings** pane, click **Relaxation Rules**.
3. In the Relaxation Rules table, double-click the **XML Cross-Site Scripting** entry, or select it and click **Edit**.
4. In the **XML Cross-Site Scripting Relaxation Rules** dialogue box, perform **Add**, **Edit**, **Delete**, **Enable**, or **Disable** operations for relaxation rules.

To manage XML Cross-Site Scripting relaxation rules by using the visualizer

For a consolidated view of all the relaxation rules, you can highlight the **XML Cross-Site Scripting** row in the Relaxation Rules table, and click **Visualizer**. The visualizer for deployed relaxations offers you the option to **Add** a new rule or **Edit** an existing one. You can also **Enable** or **Disable** a group of rules by selecting a node and clicking the corresponding buttons in the relaxation visualizer.

To view or customize the Cross-Site Scripting patterns by using the GUI

You can use the GUI to view or customize the default list of cross-site scripting allowed attributes or allowed tags. You can also view or customize the default list of cross-site scripting denied Patterns.

The default lists are specified in **Web App Firewall** > **Signatures** > **Default Signatures**. If you do not bind any signature object to your profile, the default cross-site scripting Allowed and Denied list specified in the Default Signatures object will be used by the profile for the Cross-Site Scripting security check processing. The Tags, Attributes, and Patterns, specified in the default signatures object, are read-only. You cannot edit or modify them. If you want to modify or change these, make

© 1997–2026 Citrix Systems, Inc. All rights reserved.

a copy of the Default Signatures object to create a User-Defined signature object. Make changes in the Allowed or Denied lists in the new user-defined signature object and use this signature object in the profile that is processing the traffic for which you want to use these customized allowed and denied lists.

For more information about signatures, see `<http://support.citrix.com/proddocs/topic/ns-security-10-map/appfw-signatures-con.html>`.

To view default cross-site scripting patterns:

1. Navigate to **Web App Firewall** > **Signatures**, select ***Default Signatures**, and click **Edit**. Then click **Manage SQL/cross-site scripting Patterns**.

The **Manage SQL/cross-site scripting Paths** table shows following three rows pertaining to cross-site scripting :

```
xss/allowed/attribute

xss/allowed/tag

xss/denied/pattern
```

Select a row and click **Manage Elements** to display the corresponding cross-site scripting Elements (Tag, Attribute, Pattern) used by the Web App Firewall **Cross-Site Scripting** check.

To customize cross-site scripting Elements: You can edit the user-defined signature object to customize the allowed Tag, allowed Attributes and denied Patterns. You can add new entries or remove the existing ones.

1. **Navigate to Web App Firewall** > **Signatures**, highlight the target user-defined signature, and click **Edit**. Click **Manage SQL/cross-site scripting Patterns** to display the **Manage SQL/cross-site scripting paths** table.
2. Select the target cross-site scripting row.

a) Click **Manage Elements**, to **Add**, **Edit** or **Remove** the corresponding cross-site scripting element.

b) Click **Remove** to remove the selected row.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

WARNING

Be very careful when you remove or modify any default cross-site scripting element, or delete the cross-site scripting path to remove the entire row. The signatures, HTML Cross-Site Scripting security check, and XML Cross-Site Scripting security check rely on these Elements for detecting attacks to protect your applications. Customizing the cross-site scripting Elements can make your application vulnerable to Cross-Site Scripting attacks if the required pattern is removed during editing.

Using the log feature with the XML cross-site scripting check

When the log action is enabled, the XML Cross-Site Scripting security check violations are logged in the audit log as **APPFW_XML_cross-site scripting** violations. The Web App Firewall supports both Native and CEF log formats. You can also send the logs to a remote syslog server.

To access the log messages by using the command line

Switch to the shell and tail the ns.logs in the /var/log/ folder to access the log messages pertaining to the XML Cross-Site Scripting violations:

```
> **Shell**

> **tail -f /var/log/ns.log | grep APPFW_XML_cross-site scripting**
```

Example of a XML Cross-Site Scripting security check violation log message in Native log format showing `<blocked>` action

```
Oct  7 01:44:34 <local0.warn> 10.217.31.98 10/07/2015:01:44:34 GMT ns 0-
PPE-1 : default APPFW APPFW_XML_cross-site scripting 1154 0 :
 10.217.253.69 3466-PPE1 - owa_profile http://10.217.31.101/FFC/login.html
Cross-site script check failed for field script="Bad tag: script"
<**blocked**>
```

Example of a XML Cross-Site Scripting security check violation log message in CEF log format showing `<not blocked>` action

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Oct  7 01:46:52 <local0.warn> 10.217.31.98 CEF:0|Citrix|NetScaler|NS11.0|
APPFW|APPFW_XML_cross-site scripting|4|src=10.217.30.17
geolocation=Unknown spt=33141 method=GET request=http://10.217.31.101/FFC/
login.html msg=Cross-site script check failed for field script="Bad tag:
script" cn1=1607 cn2=3538 cs1=owa_profile cs2=PPE0 cs4=ERROR cs5=2015
act=**not blocked**
```

To access the log messages by using the GUI

The GUI includes a useful tool (**Syslog Viewer**) for analyzing the log messages. You have multiple options for accessing the Syslog Viewer:

- Navigate to the **Web App Firewall** > **Profiles**, select the target profile, and click **Security Checks**. Highlight the **XML Cross-Site Scripting** row and click **Logs**. When you access the logs directly from the XML Cross-Site Scripting check of the profile, the GUI filters out the log messages and displays only the logs pertaining to these security check violations.
- You can also access the Syslog Viewer by navigating to **NetScaler** > **System** > **Auditing**. In the Audit Messages section, click the Syslog messages link to display the Syslog Viewer, which displays all log messages, including other security check violation logs. This is useful for debugging when multiple security check violations might be triggered during request processing.
- Navigate to **Web App Firewall** > **policies** > **Auditing**. In the **Audit Messages** section, click the **Syslog messages** link to display the Syslog Viewer, which displays all log messages, including other security check violation logs.

The XML based Syslog Viewer provides various filter options for selecting only the log messages that are of interest to you. To select log messages for the **XML Cross-Site Scripting** check, filter by selecting **APPFW** in the dropdown options for **Module**. The **Event Type** list offers a rich set of options to further refine your selection. For example, if you select the **APPFW_XML_cross-site scripting** check box and click the **Apply** button, only log messages pertaining to the XML Cross-Site Scripting security check violations appear in the Syslog Viewer.

If you place the cursor in the row for a specific log message, multiple options, such as **Module**, **Event Type**, **Event ID**, **Client IP** and so forth. appear below the log message. You can select any of these options to highlight the corresponding information in the log message.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Statistics for the XML cross-site scripting violations

When the stats action is enabled, the counter for the XML Cross-Site Scripting check is incremented when the Web App Firewall takes any action for this security check. The statistics are collected for Rate and Total count for Traffic, Violations, and Logs. The size of an increment of the log counter can vary depending on the configured settings. For example, if the block action is enabled, a request for a page that contains three XML Cross-Site Scripting violations increments the stats counter by one, because the page is blocked as soon as the first violation is detected. However, if block is disabled, processing the same request increments the statistics counter for violations and the logs by three, because each violation generates a separate log message.

To display XML Cross-Site Scripting check statistics by using the command line

At the command prompt, type:

```
> **sh appfw stats**
```

To display stats for a specific profile, use the following command:

```
> **stat appfw profile** <profile name>
```

To display XML Cross-Site Scripting statistics by using the GUI

1. Navigate to **System** > **Security** > **Web App Firewall**.
2. In the right pane, access the **Statistics** Link.
3. Use the scroll bar to view the statistics about XML Cross-Site Scripting violations and logs. The statistics table provides real-time data and is updated every 7 seconds.

XML SQL injection check

The XML SQL injection check examines the user requests for possible XML SQL Injection attacks. If it finds injected SQL in XML payloads, it blocks the requests.

A XML SQL attack can inject source code into a web application such that it can be interpreted and run as a valid SQL query to perform a database operation with malicious intent. For example, XML SQL attacks can be launched to gain unauthorized access to the contents of a database or to manipulate the stored data. XML SQL Injection attacks are not only common, but can also be very harmful and costly.

Compartmentalizing the privileges of the database users can assist in protecting the database to some extent. All database users must be given only the required privileges to complete their intended tasks, so that they cannot run SQL queries to perform other tasks. For example, a read-

© 1997–2026 Citrix Systems, Inc. All rights reserved.

only user must not be allowed to write or manipulate data tables. The Web App Firewall XML SQL Injection check inspects all XML requests to provide special defenses against injection of unauthorized SQL code that might break security. If the Web App Firewall detects unauthorized SQL code in any XML request of any user, it can block the request.

The NetScaler Web App Firewall inspects the presence of SQL keywords and special characters to identify the XML SQL Injection attack. A default set of keywords and special characters provides known keywords and special characters that are commonly used to launch XML SQL attacks. The Web App Firewall considers three characters, single straight quote ('), backslash (\), and semicolon (;) as special characters for SQL security check processing. You can add new patterns, and you can edit the default set to customize the XML SQL check inspection.

The Web App Firewall offers various action options for implementing XML SQL Injection protection. You can **Block** the request, **Log** a message in the ns.log file with details regarding the observed violations, and collect **Stats** to keep track of the number of observed attacks.

In addition to actions, there are several parameters that can be configured for XML SQL injection processing. You can check for **SQL wildcard characters**. You can change the XML SQL Injection type and select one of the 4 options (**SQLKeyword**, **SQLSplChar**, **SQLSplCharANDKeyword**, **SQLSplCharORKeyword**) to indicate how to evaluate the SQL keywords and SQL special characters when processing the XML payload. The XML **SQL Comments Handling** parameter gives you an option to specify the type of comments that need to be inspected or exempted during XML SQL Injection detection.

You can deploy relaxations to avoid false positives. The Web App Firewall XML SQL check is performed on the payload of the incoming requests, and attack strings are identified even if they are spread over multiple lines. The check looks for SQL Injection strings in the **element** and the **attribute** values. You can apply relaxations to bypass security check inspection under specified conditions. The logs and statistics can help you identify needed relaxations.

Action options

An action is applied when the XML SQL Injection check detects an SQL Injection attack string in the request. The following actions are available for configuring an optimized XML SQL Injection protection for your application:

Block—If you enable block, the block action is triggered only if the input matches the XML SQL injection type specification. For example, if **SQLSplCharANDKeyword** is configured as the XML SQL injection type, a request is not blocked if it does not contain any key words, even if SQL

© 1997–2026 Citrix Systems, Inc. All rights reserved.

special characters are detected in the payload. Such a request is blocked if the XML SQL injection type is set to either **SQLSplChar**, or **SQLSplCharORKeyword**.

Log—If you enable the log feature, the XML SQL Injection check generates log messages indicating the actions that it takes. If block is disabled, a separate log message is generated for each location (**ELEMENT**, **ATTRIBUTE**) in which the XML SQL violation was detected. However, only one message is generated when the request is blocked. You can monitor the logs to determine whether responses to legitimate requests are getting blocked. A large increase in the number of log messages can indicate attempts to launch an attack.

Stats—If enabled, the stats feature gathers statistics about violations and logs. An unexpected surge in the stats counter might indicate that your application is under attack. If legitimate requests are getting blocked, you might have to revisit the configuration to see if you need to configure new relaxation rules or modify the existing ones.

XML SQL parameters

In addition to the block, log and stats actions, you can configure the following parameters for XML SQL Injection check:

Check for XML SQL wildcard Characters—Wild card characters can be used to broaden the selections of a structured query language (SQL-SELECT) statement. These wild card operators can be used in conjunction with **LIKE** and **NOT LIKE** operators to compare a value to similar values. The percent (%), and underscore (_) characters are frequently used as wild cards. The percent sign is analogous to the asterisk (*) wildcard character used with MS-DOS and to match zero, one, or multiple characters in a field. The underscore is similar to the MS-DOS question mark (?) wildcard character. It matches a single number or character in an expression.

For example, you can use the following query to do a string search to find all customers whose names contain the D character.

```
SELECT * from customer WHERE name like "%D%"
```

The following example combines the operators to find any salary values that have 0 as the second and third character.

```
SELECT * from customer WHERE salary like '_00%
```

Different DBMS vendors have extended the wildcard characters by adding extra operators. The NetScaler Web App Firewall can protect against attacks that are launched by injecting these

© 1997–2026 Citrix Systems, Inc. All rights reserved.

wildcard characters. The 5 default Wildcard characters are percent (%), underscore (_), caret (\^), opening square bracket (). This protection applies to both HTML and XML profiles.

The default wildcard chars are a list of literals specified in the ***Default Signatures**:

```
-  <wildchar type=”LITERAL”>%</wildchar>

-  <wildchar type=”LITERAL”>_</wildchar>

-  <wildchar type=”LITERAL”>^</wildchar>

-  <wildchar type=”LITERAL”>[</wildchar>

-  <wildchar type=”LITERAL”>]</wildchar>
```

Wildcard characters in an attack can be PCRE, like . The Web App Firewall also supports PCRE wildcards, but the literal wildcard chars above are sufficient to block most attacks.

NOTE

The XML SQL **wildcard character** check is different from the XML SQL **special character** check. This option must be used with caution to avoid false positives.

Check Request Containing SQL Injection Type—The Web App Firewall provides 4 options to implement the desired level of strictness for SQL Injection inspection, based on the individual need of the application. The request is checked against the injection type specification for detecting SQL violations. The 4 SQL injection type options are:

- **SQL Special Character and Keyword**—Both an SQL keyword and an SQL special character must be present in the inspected location to trigger SQL violation. This least restrictive setting is also the default setting.
- **SQL Special Character**—At least one of the special characters must be present in the processed payload string to trigger SQL violation.
- **SQL keyword**—At least one of the specified SQL keywords must be present in the processed payload string to trigger an SQL violation. Do not select this option without due consideration. To avoid false positives, make sure that none of the keywords are expected in the inputs.
- **SQL Special Character or Keyword**—Either the keyword or the special character string must be present in the payload to trigger the security check violation.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

TIP

If you select the SQL Special Character option, the Web App Firewall skips strings that do not contain any special characters. Since most SQL servers do not process SQL commands that are not preceded by a special character, enabling this option can significantly reduce the load on the Web App Firewall and speed up processing without placing your protected websites at risk.

SQL comments handling—By default, the Web App Firewall parses and checks all comments in XML data for injected SQL commands. Many SQL servers ignore anything in a comment, even if preceded by an SQL special character. For faster processing, if your XML SQL server ignores comments, you can configure the Web App Firewall to skip comments when examining requests for injected SQL. The XML SQL comments handling options are:

- **ANSI**—Skip ANSI-format SQL comments, which are normally used by UNIX-based SQL databases.
- **Nested**—Skip nested SQL comments, which are normally used by Microsoft SQL Server.
- **ANSI/Nested**—Skip comments that adhere to both the ANSI and nested SQL comment standards. Comments that match only the ANSI standard, or only the nested standard, are still checked for injected SQL.
- **Check all Comments**—Check the entire request for injected SQL, without skipping anything. This is the default setting.

TIP

In most cases, you must not choose the Nested or the ANSI/Nested option unless your back-end database runs on Microsoft SQL Server. Most other types of SQL server software do not recognize nested comments. If nested comments appear in a request directed to another type of SQL server, they might indicate an attempt to breach security on that server.

Relaxation rules

If your application requires you to bypass the XML SQL Injection inspection for a specific ELEMENT or ATTRIBUTE in the XML payload, you can configure a relaxation rule. The XML SQL Injection inspection relaxation rules have the following parameters:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Name:** You can use literal strings or regular expressions to configure the name of the **ELEMENT** or the **ATTRIBUTE**. The following expression exempts all **ELEMENTS** beginning with the string **PurchaseOrder**_ followed by a string of numbers that is at least two and no more than ten characters long:

  Comment: "Exempt XML SQL Check for Purchase Order Elements"

```
    XMLSQLInjection:  "PurchaseOrder_[0-9A-Za-z]{2,10}"

    IsRegex:  REGEX          Location:  ELEMENT

    State:  ENABLED
```

Note: The names are case sensitive. Duplicate entries are not allowed, but you can use capitalization of the names and differences in location to create similar entries. For example, each of the following relaxation rules is unique:

```
1)      XMLSQLInjection:  XYZ    IsRegex:  NOTREGEX

        Location:  ELEMENT       State:  ENABLED

2)      XMLSQLInjection:  xyz    IsRegex:  NOTREGEX

        Location:  ELEMENT       State:  ENABLED

3)      XMLSQLInjection:  xyz    IsRegex:  NOTREGEX
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
        Location:  ATTRIBUTE     State:  ENABLED

4)      XMLSQLInjection:  XYZ    IsRegex:  NOTREGEX

        Location:  ATTRIBUTE     State:  ENABLED
```

- **Location**: You can specify the Location of the XML SQL Inspection exception in your XML payload. The option **ELEMENT** is selected by default. You can change it to **ATTRIBUTE**.
- **Comment**: This is an optional field. You can use up to a 255 character string to describe the purpose of this relaxation Rule.

WARNING

Regular expressions are powerful. Especially if you are not thoroughly familiar with PCRE-format regular expressions, double-check any regular expressions you write. Make sure that they define exactly the name that you want to add as an exception, and nothing else. Careless use of Regular Expressions can have results that you do not want, such as blocking access to web content that you did not intend to block or allowing an attack that the XML SQL Injection inspection would otherwise have blocked.

Using the command line to configure the XML SQL Injection Check

To configure XML SQL Injection actions and other parameters by using the command line:

In the command line interface, you can use either the **set appfw profile** command or the **add appfw profile** command to configure the XML SQL Injection protections. You can enable the block, log, and stats action(s). Select the type of SQL attack pattern (key words, wildcard characters, special strings) you want to detect in the payloads. Use the **unset appfw profile** command to revert the configured settings back to their defaults. Each of the following commands sets only one parameter, but you can include multiple parameters in a single command:

- `set appfw profile <name> **-XMLSQLInjectionAction** (([block] [log] [stats]) | [none])`
- `set appfw profile <name> -XMLSQLInjectionCheckSQLWildChars (ON |OFF)`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- `set appfw profile <name> -XMLSQLInjectionType ([SQLKeyword] | [SQLSplChar] | [SQLSplCharANDKeyword] | [SQLSplCharORKeyword])`
- `set appfw profile <name> -XMLSQLInjectionParseComments ([checkall] | [ansi| nested] | [ansinested])`

To configure a SQL Injection relaxation rule by using the command line

Use the bind or unbind command to add or delete relaxation rules, as follows:

```
-  bind appfw profile <name> -XMLSQLInjection <string> [isRegex (REGEX | NOTREGEX)] [-location ( ELEMENT | ATTRIBUTE )] –comment <string> [-state ( ENABLED | DISABLED )]

-  unbind appfw profile <name> -XMLSQLInjection <String>
```

Example:

```
> bind appfw profile test_profile -XMLSQLInjection "PurchaseOrder_[0-9A-Za-z]{2,15}" -isregex REGEX -location ATTRIBUTE

> unbind appfw profile test_profile –XMLSQLInjection "PurchaseOrder_[0-9A-Za-z]{2,15}" -location ATTRIBUTE
```

Using the GUI to configure the XMLSQL injection security check

In the GUI, you can configure the XML SQL Injection security check in the pane for the profile associated with your application.

To configure or modify the XML SQL Injection check by using the GUI

1. Navigate to **Web App Firewall** > **Profiles**, highlight the target profile, and click **Edit**.
2. In the Advanced Settings pane, click **Security Checks**.

The security check table displays the currently configured action settings for all the security checks. You have 2 options for configuration:

a. If you just want to enable or disable Block, Log, and Stats actions for XML SQL Injection, you can select or clear check boxes in the table, click OK, and then click Save and Close to close the Security Check pane.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

b. If you want to configure additional options for this security check, double click XML SQL Injection, or select the row and click **Action Settings**, to display the following options:

Check for SQL Wildcard Characters—Consider SQL Wildcard characters in the payload to be attack patterns.

Check Request Containing—Type of SQL injection (SQLKeyword, SQLSplChar, SQLSplCharANDKeyword, or SQLSplCharORKeyword) to check.

SQL Comments Handling—Type of comments (Check All Comments, ANSI, Nested, or ANSI/Nested) to check.

After changing any of the above settings, click **OK** to save the changes and return to the Security Checks table. You can proceed to configure other security checks if needed. Click **OK** to save all the changes you have made in the Security Checks section, and then click **Save** and **Close** to close the Security Check pane.

To configure a XML SQL Injection relaxation rule by using the GUI

1. Navigate to **Web App Firewall** > **Profiles**, highlight the target profile, and click **Edit**.
2. In the **Advanced Settings** pane, click **Relaxation Rules**.
3. In the Relaxation Rules table, double-click the **XML SQL Injection** entry, or select it and click **Edit**.
4. In the **XML SQL Injection Relaxation Rules** dialogue box, perform **Add**, **Edit**, **Delete**, **Enable**, or **Disable** operations for relaxation rules.

To manage XML SQL Injection relaxation rules by using the visualizer

For a consolidated view of all the relaxation rules, you can highlight the **XML SQL Injection** row in the Relaxation Rules table, and click **Visualizer**. The visualizer for deployed relaxations offers you the option to **Add** a new rule or **Edit** an existing one. You can also **Enable** or **Disable** a group of rules by selecting a node and clicking the corresponding buttons in the relaxation visualizer.

To view or customize the SQL Injection patterns by using the GUI:

You can use the GUI to view or customize the SQL patterns.

The default SQL patterns are specified in **Web App Firewall** > **Signatures** > ***Default Signatures**. If you do not bind any signature object to your profile, the default SQL patterns specified in the Default Signatures object will be used by the profile for XML SQL Injection security check processing. The rules and patterns in the Default Signatures object are read-only. You cannot edit

© 1997–2026 Citrix Systems, Inc. All rights reserved.

or modify them. If you want to modify or change these patterns, create a user-defined signature object by making a copy of the Default Signatures object and changing the SQL patterns. Use the user-defined signature object in the profile that processes the traffic for which you want to use these customized SQL patterns.

For more information, see Signatures.

To view default SQL patterns:

a. Navigate to **Web App Firewall** > **Signatures**, select ***Default Signatures**, and click **Edit**. Then click **Manage SQL/cross-site scripting Patterns**.

The Manage SQL/cross-site scripting Paths table shows following four rows pertaining to SQL Injection:

```
Injection (not_alphanum, SQL)/ Keyword

Injection (not_alphanum, SQL)/ specialstring

Injection (not_alphanum, SQL)/ transformrules/transform

Injection (not_alphanum, SQL)/ wildchar
```

b. Select a row and click **Manage Elements** to display the corresponding SQL patterns (keywords, special strings, transformation rules or the wildcard characters) used by the Web App Firewall SQL injection check.

To customize SQL Patterns: You can edit a user-defined signature object to customize the SQL key words, special strings, and wildcard characters. You can add new entries or remove the existing ones. You can modify the transformation rules for the SQL special strings.

a. Navigate to **Web App Firewall** > **Signatures**, highlight the target user-defined signature, and click **Edit**. Click **Manage SQL/cross-site scripting Patterns** to display the **Manage SQL/cross-site scripting paths** table.

b. Select the target SQL row.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

i. Click **Manage Elements**, to **Add**, **Edit** or **Remove** the corresponding SQL element.

ii. Click **Remove** to remove the selected row.

WARNING

You must be very careful when removing or modifying any default SQL element, or deleting the SQL path to remove the entire row. The signature rules as well as the XML SQL Injection security check rely on these elements for detecting SQL Injection attacks to protect your applications. Customizing the SQL patterns can make your application vulnerable to XML SQL attacks if the required pattern is removed during editing.

Using the log feature with the XML SQL injection check

When the log action is enabled, the **XML SQL Injection** security check violations are logged in the audit log as **APPFW_XML_SQL** violations. The Web App Firewall supports both Native and CEF log formats. You can also send the logs to a remote syslog server.

To access the log messages by using the command line:

Switch to the shell and tail the ns.logs in the /var/log/ folder to access the log messages pertaining to the XML Cross-Site Scripting violations:

```
> Shell

> tail -f /var/log/ns.log | grep APPFW_XML_SQL
```

To access the log messages by using the GUI

The GUI includes a useful tool (Syslog Viewer) for analyzing the log messages. You have multiple options for accessing the Syslog Viewer:

- Navigate to **Web App Firewall** > **Profiles**, select the target profile, and click **Security Checks**. Highlight the **XML SQL Injection** row and click **Logs**. When you access the logs directly from the XML SQL Injection check of the profile, the GUI filters out the log messages and displays only the logs pertaining to these security check violations.
- You can also access the Syslog Viewer by navigating to **System** > **Auditing**. In the Audit Messages section, click the **Syslog messages** link to display the Syslog Viewer, which

© 1997–2026 Citrix Systems, Inc. All rights reserved.

displays all log messages, including other security check violation logs. This is useful for debugging when multiple security check violations might be triggered during request processing.

- Navigate to **Web App Firewall** > **Policies** > **Auditing**. In the Audit Messages section, click the **Syslog messages** link to display the **Syslog Viewer**, which displays all log messages, including other security check violation logs.

The XML based Syslog Viewer provides various filter options for selecting only the log messages that are of interest to you. To select log messages for the **XML SQL Injection** check, filter by selecting **APPFW** in the dropdown options for **Module**. The **Event Type** list offers a rich set of options to further refine your selection. For example, if you select the **APPFW_XML_SQL** check box and click the **Apply** button, only log messages pertaining to the **XML SQL Injection** security check violations appear in the Syslog Viewer.

If you place the cursor in the row for a specific log message, multiple options, such as **Module**, **Event Type**, **Event ID**, and **Client IP** appear below the log message. You can select any of these options to highlight the corresponding information in the log message.

Statistics for the XML SQL injection violations

When the stats action is enabled, the counter for the **XML SQL Injection** check is incremented when the Web App Firewall takes any action for this security check. The statistics are collected for Rate and Total count for Traffic, Violations, and Logs. The size of an increment of the log counter can vary depending on the configured settings. For example, if the block action is enabled, a request for a page that contains three **XML SQL Injection** violations increments the stats counter by one, because the page is blocked as soon as the first violation is detected. However, if block is disabled, processing the same request increments the statistics counter for violations and the logs by three, because each violation generates a separate log message.

To display XML SQL Injection check statistics by using the command line

At the command prompt, type:

```
> sh appfw stats
```

To display stats for a specific profile, use the following command:

```
> stat appfw profile <profile name>
```

To display XML SQL Injection statistics by using the GUI

1. Navigate to **System** > **Security** > **Web App Firewall**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. In the right pane, access the **Statistics** Link.
3. Use the scroll bar to view the statistics about **XML SQL Injection** violations and logs. The statistics table provides real-time data and is updated every 7 seconds.

XML attachment check

The XML Attachment check examines incoming requests for malicious attachments, and it blocks those requests that contain attachments that might breach applications security. The purpose of the XML Attachment check is to prevent an attacker from using an XML attachment to breach security on your server.

If you use the wizard or the GUI, in the Modify XML Attachment Check dialog box, on the General tab you can enable or disable the Block, Learn, Log, Statistics, and Learn actions:

If you use the command-line interface, you can enter the following command to configure the XML Attachment Check:

- `set appfw profile <name> -xmlAttachmentAction [block] [learn] [log] [stats] [none]`

You must configure the other XML Attachment check settings in the GUI. In the `Modify XML Attachment` Check dialog box, on the Checks tab, you can configure the following settings:

- **Maximum Attachment Size.** Allow attachments that are no larger than the maximum attachment size you specify. To enable this option, first select the Enabled check box, and then type the maximum attachment size in bytes in the `Size` text box.
- **Attachment Content Type.** Allow attachments of the specified content type. To enable this option, first select the Enabled check box, and then enter a regular expression that matches the Content-Type attribute of the attachments that you want to allow.
    - You can type the URL expression directly in the text window. If you do so, you can use the `Regex Tokens` menu to enter a number of useful regular expressions at the cursor instead of typing them manually.
    - You can click Regex Editor to open the `Add Regular Expression` dialog box and use it to construct the URL expression.

Web services interoperability check

The Web Services Interoperability (WS-I) check examines both requests and responses for adherence to the WS-I standard, and blocks those requests and responses that do not adhere to this standard. The purpose of the WS-I check is to block requests that might not interact with other

© 1997–2026 Citrix Systems, Inc. All rights reserved.

XML appropriately. An attacker can use inconsistencies in interoperability to launch an attack on your XML application.

If you use the wizard or the GUI, in the Modify Web Services Interoperability Check dialog box, on the General tab you can enable or disable the Block, Log, Statistics, and Learn actions.

If you use the command-line interface, you can enter the following command to configure the Web Services Interoperability check:

- `set appfw profile <name> -xmlWSIAction [block] ][log] [learn] [stats] [none]`

To configure individual Web Services Interoperability rules, you must use the GUI. On the Checks tab of the Modify Web Services Interoperability Check dialog box, select a rule and click Enable or Disable to enable or disable the rule. You can also click Open to open the Web Services Interoperability Detail message box for that rule. The message box displays read-only information about the rule. You cannot modify or make other configuration changes to any of these rules.

The WS-I check uses the rules listed in WS-I Basic Profile 1.0. WS-I delivers best practices for developing interoperable Web Services solutions. WS-I checks are performed only on SOAP Messages.

Description of each WSI standard rule is provided below:

RULE	DESCRIPTION
BP1201	Message body should be a soap:envelope with namespace.
R1000	When an ENVELOPE is a Fault, the soap:Fault element MUST NOT have element children other than faultcode, faultstring, faultactor and detail.
R1001	When an ENVELOPE is a Fault, the element children of the soap:Fault element MUST be unqualified.
R1003	A RECEIVER MUST accept fault messages that have any number of qualified or unqualified attributes, including zero, appearing on the detail element. The namespace of qualified attributes can be

© 1997–2026 Citrix Systems, Inc. All rights reserved.

RULE	DESCRIPTION
	anything other than the namespace of the qualified document element Envelope.
R1004	When an ENVELOPE contains a faultcode element, the content of that element must be either one of the fault codes defined in SOAP 1.1 (supplying additional information if necessary in the detail element), or a Qname whose namespace is controlled by the fault's specifying authority (in that order of preference).
R1005	An ENVELOPE MUST NOT contain soap:encodingStyle attribute on any of the elements whose namespace is the same as the namespace of the qualified document element Envelope.
R1006	An ENVELOPE MUST NOT contain soap:encodingStyle attributes on any element that is a child of soap:Body.
R1007	An ENVELOPE described in an rpc-literal binding MUST NOT contain soap:encodingStyle attribute on any element that is a grandchild of soap:Body.
R1011	An ENVELOPE MUST NOT have any element children of soap:Envelope following the soap:Body element.
R1012	A MESSAGE MUST be serialized as either UTF-8 or UTF-16.
R1013	An ENVELOPE containing a soap:mustUnderstand attribute MUST only use the lexical forms 0 and 1.
R1014	The children of the soap:Body element in an ENVELOPE MUST be namespace qualified.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

RULE	DESCRIPTION
R1015	A RECEIVER MUST generate a fault if they encounter an envelope whose document element is not soap:Envelope.
R1031	When an ENVELOPE contains a faultcode element the content of that element must NOT use of the SOAP 1.1 dot notation to refine the meaning of the fault.
R1032	The soap:Envelope, soap:Header, and soap:Body elements in an ENVELOPE MUST NOT have attributes in the same namespace as that of the qualified document element Envelope
R1033	An ENVELOPE SHOULD NOT contain the namespace declaration: `xmlns:xml=http://www.w3.org/XML/1998/namespace.`
R1109	The value of the SOAPAction HTTP header field in a HTTP request MESSAGE MUST be a quoted string.
R1111	An INSTANCE SHOULD use a 200 OK HTTP status code on a response message that contains an envelope that is not a fault.
R1126	An INSTANCE MUST return a 500 Internal Server Error HTTP status code if the response envelope is a Fault.
R1132	A HTTP request MESSAGE MUST use the HTTP POST method.
R1140	A MESSAGE SHOULD be sent using HTTP/1.1.
R1141	A MESSAGE MUST be sent using either HTTP/1.1 or HTTP/1.0.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

RULE	DESCRIPTION
R2113	An ENVELOPE MUST NOT include the soapenc:arrayType attribute.
R2211	An ENVELOPE described with an rpc-literal binding MUST NOT have the xsi:nil attribute with a value of 1 or true on the part accessors.
R2714	For one-way operations, an INSTANCE MUST NOT return a HTTP response that contains an envelope. Specifically, the HTTP response entity-body must be empty.
R2729	An ENVELOPE described with an rpc-literal binding that is a response MUST have a wrapper element whose name is the corresponding wsdl:operation name suffixed with the stringResponse.
R2735	An ENVELOPE described with an rpc-literal binding MUST place the part accessor elements for parameters and return value in no namespace.
R2738	An ENVELOPE MUST include all soapbind:headers specified on a wsdl:input or wsdl:output of a wsdl:operation of a wsdl:binding that describes it.
R2740	A wsdl:binding in a DESCRIPTION SHOULD contain a soapbind:fault describing each known fault.
R2744	A HTTP request MESSAGE MUST contain a SOAPAction HTTP header field with a quoted value equal to the value of the soapAction attribute of soapbind:operation, if present in the corresponding WSDL description.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

XML message validation check

The XML Message Validation check examines requests that contain XML messages to ensure that they are valid. If a request contains an invalid XML message, the Web App Firewall blocks the request. The purpose of the XML Validation check is to prevent an attacker from using specially constructed invalid XML messages to breach the security of your application.

If you use the wizard or the GUI, in the Modify XML Message Validation Check dialog box, on the General tab you can enable or disable the Block, Log, and Statistics actions.

If you use the command-line interface, you can enter the following command to configure the XML Message Validation Check:

- `set appfw profile <name> -xmlValidationAction [**block**] [**log**] [**stats**] [**none**]`

You must use the GUI to configure the other XML Validation check settings. In the Modify XML Message Validation Check dialog box, on the Checks tab, you can configure the following settings:

- **XML Message Validation.** Use one of the following options to validate the XML message:
  - **SOAP Envelope.** Validate only the SOAP envelope of XML messages.
  - **WSDL.** Validate XML messages by using an XML SOAP WSDL. If you choose WSDL validation, in the WSDL Object drop-down list you must choose a WSDL. If you want to validate against a WSDL that has not already been imported to the Web App Firewall, you can click the Import button to open the Manage WSDL Imports dialog box and import your WSDL. See WSDL for more information.
    - If you want to validate the entire URL, leave the Absolute radio button in the End Point Check button array selected. If you want to validate only the portion of the URL after the host, select the Relative radio button.
    - If you want the Web App Firewall to enforce the WSDL strictly, and not allow any additional XML headers not defined in the WSDL, you must clear the Allow additional headers not defined in the WSDL check box. Caution: If you uncheck the Allow Additional Headers not defined in the WSDL check box, and your WSDL does not define all XML headers that your protected XML application or Web 2.0 application expects or that a client sends, you may block legitimate access to your protected service.
  - **XML Schema.** Validate XML messages by using an XML schema. If you choose XML schema validation, in the XML Schema Object drop-down list you must choose an XML

© 1997–2026 Citrix Systems, Inc. All rights reserved.

schema. If you want to validate against an XML schema that has not already been imported to the Web App Firewall, you can click the Import button to open the Manage XML Schema Imports dialog box and import your WSDL. See WSDL for more information.

- **Response Validation.** By default, the Web App Firewall does not attempt to validate responses. If you want to validate responses from your protected application or Web 2.0 site, select the Validate Response check box. When you do, the Reuse the XML Schema specified in request validation check box and the XML Schema Object drop-down list are activated.
  - Check the Reuse XML Schema check box to use the schema you specified for request validation to do response validation as well. Note: If you check this check box, the XML Schema Object drop-down list is grayed out.
  - If you want to use a different XML schema for response validation, use the XML Schema Object drop-down list to select or upload that XML schema.

XML SOAP fault filtering check

The XML SOAP fault filtering check examines responses from your protected web services and filters out XML SOAP faults. This prevents leaking of sensitive information to attackers.

If you use the wizard or the GUI, in the Modify XML SOAP Fault Filtering Check dialog box, on the **General** tab you can enable or disable the Block, Log, and Statistics actions, and the Remove action, which removes SOAP faults before forwarding the response to the user.

If you use the command-line interface, you can enter the following command to configure the XML SOAP Fault Filtering Check:

```
set appfw profile <name> -XMLSOAPFaultAction [block] [log] [stats] [none]
```

You cannot configure exceptions to the XML SOAP Fault Filtering check. You can only enable or disable it.

JSON Protection Checks

NetScaler Web App Firewall protects your JSON applications from content-level DoS, SQL, or cross-site scripting attacks. When an JSON request has a DoS, SQL, or cross-site scripting attack, you must protection your application by configuring limits on JSON structures such as arrays and strings.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE:

The JSON security checks apply only to content that is sent with a JSON content-type header. If the content-type header is missing, or is set to a different value, all JSON security checks are bypassed. If you want to protect your JSON applications, the webmasters of each web server that hosts those applications must ensure a proper JSON content-type header is sent.

The learning feature is not support for JSON SQL, cross-site scripting, DOS content types.

JSON Denial-of-Service protection check

The JSON denial-of-service (DoS) check examines an incoming JSON request and validates if there is any data that matches the characteristics of a DoS attack. If the request had JSON violations, the appliance blocks the request, logs the data, sends an SNMP alert, and also displays a JSON error page. The purpose of the JSON DoS check is to prevent an attacker from sending JSON request to launch DoS attacks on your JSON applications or website.

When a client sends a request to a NetScaler appliance, the JSON parser parses the request payload and if a violation is observed, the appliance enforces constraints on the JSON structure. The constraint enforces a size limit on the JSON request. As a result, if any JSON violation was observed, the appliance applies an action and responds with the JSON error page.

JSON DoS rules

When the appliance receives a JSON request, The JSON DOS protection enforces size limit on the following DoS parameters in the request payload.

1. maximum depth: Maximum nesting (depth) of JSON document. This check protects against documents that have excessive depth of hierarchy.
2. maximum document length: Maximum document length of JSON document.
3. maximum array length: Maximum array length in the any of JSON object. This check protects against arrays having large lengths.
4. maximum string length: Maximum string length in the JSON. This check protects against strings that have large length.
5. maximum object key count: Maximum key count in the any of JSON object. This check protects against objects that have large number of keys.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

6. maximum object key length: Maximum key length in the any of JSON object. This check protects against objects that have large keys.

Following is a list of JSON DoS rules validated during JSON parsing.

1. JSONMaxContainerDepth. This check can be enabled by configuring the JSONMaxContainerDepth check and by default the option is OFF.
2. JSONMaxContainerDepth. This check can be enabled/disabled by configurable option JSONMaxContainerDepthCheck and default value can be changed by option JSONMaxContainerDepth. However, you can vary the maximum levels to a value ranging from 1 to 127. Default value: 5, Minimum value: 1, Maximum value: 127
3. JSONMaxDocumentLength. This check can be enabled by configuring the JSONMaxDocumentLength check and the default option is OFF.
4. JSONMaxDocumentLength. This check can be enabled by configuring the JSONMaxDocumentLength check and the default length is set to 20000000 bytes. Minimum value: 1, Maximum value: 2147483647
5. JSONMaxObjectKeyCount. The rule validates if the JSON maximum object key count check is turned on or off. Possible values: ON, OFF, Default value: OFF
6. JSONMaxObjectKeyCount. This check can be enabled by configuring the JSONMaxObjectKeyCount check. The check protects against objects that have large number of keys and the default value is set to 1000 bytes. Minimum value: 0, Maximum value: 2147483647
7. JSONMaxObjectKeyLength. This check can be enabled by configuring the JSONMaxObjectKeyLength check. The rule validates if the JSON maximum object key length check is turned on or off. By default it is turned OFF.
8. JSONMaxObjectKeyLength. The check protects against objects that have large key length. Default value: 128. Minimum value: 1, Maximum value: 2147483647
9. JSONMaxArrayLength. The rule validates if the JSON maximum array length check is ON or OFF. By default it is turned off.
10. JSONMaxArrayLength. The check protects against arrays that has large lengths. By default, the value is set to 10000. Minimum value: 1, Maximum value: 2147483647
11. JSONMaxStringLength. This check can be enabled by configuring the JSONMaxStringLength check. The check validates if the JSON maximum string length is ON or OFF. By default it is turned off.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

12. JSONMaxStringLength. The check protects against strings that has large length. By default, it is set to 1000000. Minimum value: 1, Maximum value: 2147483647

Configure JSON DoS protection check

For configure JSON DoS protection, you must complete the following steps:

1. Add application firewall profile for JSON.
2. Set application firewall profile for JSON DoS settings.
3. Configure JSON DoS variables by binding the application firewall profile.

Add application firewall profile for JSON DoS protection

You must first create a profile that specifies how the application firewall must protect your JSON web content from JSON DoS attack. At the command prompt, type:

```
add appfw profile <name> -type (HTML | XML | JSON)
```

Note:

> When you set the profile type as JSON, other checks such as HTML or XML will not applicable.

EXAMPLE

```
add appfw profile profile1 –type JSON
```

Set application firewall profile for JSON DoS protection

You must configure the profile for one or more JSON DoS actions and JSON DoS error object to be set on the application firewall profile. At the command prompt, type:

```
set appfw profile <name> -JSONDoSAction [block] | [log] | [stats] | [none]
```

Block - Block connections that violate this security check. Log - Log violations of this security check. Stats - Generate statistics for this security check. None - Disable all actions for this security check.

Note:

> To enable one or more actions, type "set appfw profile -JSONDoSAction" followed by the actions to be enabled.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

EXAMPLE

```
set appfw profile profile1 -JSONDoSAction block log stat
```

Configure DoS variables by binding application firewall profile

To provide JSON DoS protection, you must bind the application firewall profile with JSON DoS settings. At the command prompt, type:

```
bind appfw profile <name> -JSONDoSURL <expression> [-JSONMaxContainerDepthCheck ( ON | OFF ) [-JSONMaxContainerDepth <positive_integer>]] [-JSONMaxDocumentLengthCheck ( ON | OFF ) [-JSONMaxDocumentLength <positive_integer>]] [-JSONMaxObjectKeyCountCheck ( ON | OFF ) [-SONMaxObjectKeyCount <positive_integer>]] [-JSONMaxObjectKeyLengthCheck ( ON | OFF ) [-JSONMaxObjectKeyLength <positive_integer>]] [-JSONMaxArrayLengthCheck ( ON | OFF ) [-JSONMaxArrayLength <positive_integer>]] [-JSONMaxStringLengthCheck ( ON | OFF ) [-JSONMaxStringLength <positive_integer>]]
```

EXAMPLE

```
bind appfw profile profile1 -JSONDoSURL ".*" -JSONMaxContainerDepthCheck ON
```

Note:

> The JSON DoS checks will be applicable only if the profile type is selected as JSON. Also, the SQL, cross-site scripting, Field format and Form field signatures are applied on Query parameters in cases of JSON profile.

Import JSON errorpage

If an incoming request had a DoS attack and when you block the request, the appliance displays an error message. For doing this, you must import the JSON error page. At the command prompt, type:

```
import appfw jsonerrorpage <src> <name> [-comment <string>] [-overwrite]
```

Where,

src. URL (protocol, host, path, and name) for the location at which to store the imported JSON error object.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Note:

> The import fails if the object to be imported is on an HTTPS server that requires client certificate authentication for access. This is a mandatory argument. Maximum Length: 2047.

Name. Name to assign to the JSON error object on the NetScaler. This is a mandatory argument. Maximum Length: 31 Comment. Any comments to preserve information about the JSON error object. Maximum Length: 255 Overwrite. Overwrite any existing JSON error object of the same name.

SAMPLE CONFIGURATION

```
Add appfw prof profjson –type JSON

Bind appfw prof profjson –JSONDoSURL “.*” -JSONMaxDocumentLengthCheck ON
 -JSONMaxDocumentLength 30 -JSONMaxContainerDepthCheck ON  -
JSONMaxContainerDepth  3 JSONMaxObjectKeyCountCheck ON  -
JSONMaxObjectKeyCount  4 -JSONMaxObjectKeyLengthCheck  ON
-JSONMaxObjectKeyLength  10 -JSONMaxArrayLengthCheck ON  -
JSONMaxArrayLength  5 -JSONMaxStringLengthCheck ON -JSONMaxStringLength 30
```

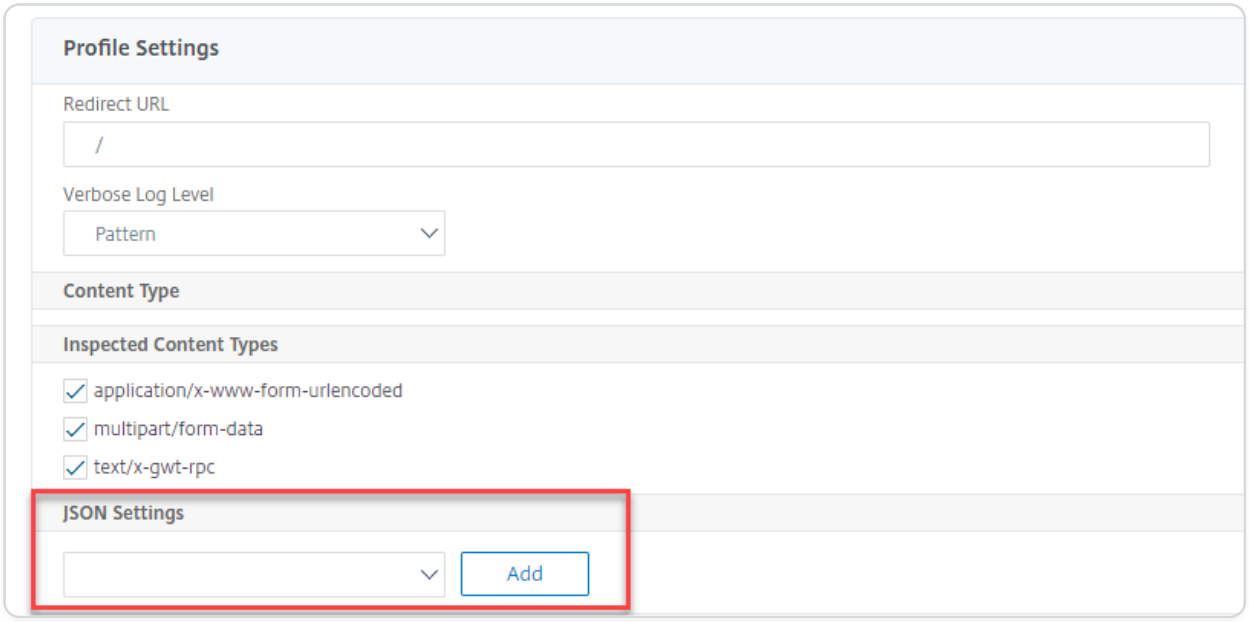
Configure JSON DoS protection by using GUI



Follow the procedure below to set the JSON DoS protection settings.

1. On the navigation pane, navigate to **Security** > **Profiles**.
2. In the **Profiles** page, click **Add**.
3. In the **NetScaler Web App Firewall Profile** page, click **Security Checks under Advanced Settings**.
4. In the **Security Checks** section, go to **JSON Denial of Service** settings.
5. Click the executable icon near the checkbox.
6. Click **Action Settings** to access the **JSON Denial of Service Settings** page.
7. Select the JSON DoS action.
8. Click **OK**.
9. In the **NetScaler Web App Firewall Profile** page, click **Relaxation Rules** under **Advanced Settings**.
10. In **Relaxation Rules** section, select **JSON Denial of Service** settings and click **Edit**.
11. In the **Application Firewall JSON Denial of Service Check** set the JSON DoS validation values.
12. Click **OK**.

13. In the **NetScaler Web App Firewall Profile** page, click **Profile Settings** under **Advanced Settings**.
14. In the **Profile Settings** section, go to **JSON Error Settings** sub section to set **JSON DoS error** page.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

15. In the **JSON Error Page Import Object** page, set the following parameters:

    a. Import from. Import the error page as text, file or URL.

    b. URL. URL to redirect the user to the error page. 1 File. Select a file to be imported as JSON DoS error file.

    c. Text. Enter the JSON file contents.

    d. Click Continue.

    e. File. Enter the file name.

    f. File Content. Add the error file content.

    g. Click **OK**.

16. Click **OK**.

17. Click **Done**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

JSON SQL Injection protection check

An incoming JSON request can have SQL injection in the form of partial SQL query strings or unauthorized commands in the code. This leads to stealing of data from the JSON database of your web servers. On receiving such request, the appliance blocks such request to protection your data.

Consider a scenario, where a client sends a JSON SQL request to a NetScaler appliance, the JSON parser parses the request payload and if an SQL Injection is observed, the appliance enforces constraints on the JSON SQL content. The constraint enforces a size limit on the JSON SQL request. As a result, if any JSON SQL Injection is observed, the appliance applies an action and responds with the JSON SQL error page.

Configure JSON SQL Injection protection

For configure JSON SQL protection, you must complete the following steps:

1. Add application firewall profile as JSON.
2. Set application firewall profile for JSON SQL Injection settings
3. Configure JSON SQL action by binding the application firewall profile.

Add application firewall profile of type JSON

You must first create a profile that specifies how the application firewall must protect your JSON web content from JSON SQL Injection attack. At the command prompt, type:

```
add appfw profile <name> -type (HTML | XML | JSON)
```

Note:

> When you set the profile type as JSON, other checks such as HTML or XML will not applicable.

Example

```
add appfw profile profile1 –type JSON
```

Configure JSON SQL Injection action

You must configure one or more JSON SQL Injection actions to protection your application from JSON SQL injection attacks. At the command prompt, type:

```
set appfw profile <name> - JSONSQLInjectionAction [block] [log] [stats] [none]
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SQL Injection actions are: Block - Block connections that violate this security check. Log - Log violations of this security check. Stats - Generate statistics for this security check. None - Disable all actions for this security check.

Configure JSON SQL Injection type

To configure the JSON SQL Injection type on an application firewall profile, at the command prompt, type:

```
set appfw profile <name> - JSONSQLInjectionType <JSONSQLInjectionType>
```

Example

```
set appfw profile profile1 -JSONSQLInjectionType SQLKeyword
```

Where the available SQL Injection types are: Available SQL injection types. SQLSplChar. Checks for SQL Special Characters, SQLKeyword. Checks for SQL Keywords. SQLSplCharANDKeyword. Checks for both and blocks if found. SQLSplCharORKeyword. . Blocks if SQL special character or spl keyword is found. Possible values: SQLSplChar, SQLKeyword, SQLSplCharORKeyword, SQLSplCharANDKeyword.

Note: To enable one or more actions, type "set appfw profile - JSONSQLInjectionAction" followed by the actions to be enabled.

Example

```
set appfw profile profile1 -JSONSQLInjectionAction block log stat
```

The following example shows a sample payload, its corresponding log message and statistics counters:

```
Payload:

=======

{

  "test": "data",

  "username": "waf",

  "password": "select * from t1;",

  "details": {
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
    "surname": "test",

    "age": "23"

  }

}

Configure JSON SQL Injection protection by using GUI

Follow the procedure below to set the JSON SQL Injection protection settings.

1. On the navigation pane, navigate to **Security** > **Profiles**.
2. In the **Profiles** page, click **Add**.
3. In the **NetScaler Web App Firewall Profile** page, click **Security Checks** under **Advanced Settings**.
4. In the **Security Checks** section, go to **JSON SQL Injection** settings.
5. Click the executable icon near the check box.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

6. Click **Action Settings** to access the **JSON SQL Injection Settings** page.
7. Select the **JSON SQL Injection** actions.
8. Click **OK**.
9. In the **NetScaler Web App Firewall Profile** page, click **Relaxation Rules** under **Advanced Settings**.
10. In **Relaxation Rules** section, select **JSON SQL Injection** settings and click **Edit**.
11. In the JSON SQL Injection Relaxation Rule page, enter the URL to which the request has to be sent. All requests sent to this URL will not be blocked.
12. Click **Create**.

Configure fine grain relaxation for JSON SQL injection protection

The Web App Firewall gives you an option to relax a specific JSON key or value from the JSON based SQL Injection inspection check. You can configure multiple options to relax JSON payloads using fine grain relaxation rules.

Previously, the only way to configure relaxations for JSON protection checks is to specify the entire URL and that would bypass the verification of the entire URL.

The JSON based SQL security protection provides relaxation for the following:

- Key names
- Key values

© 1997–2026 Citrix Systems, Inc. All rights reserved.

JSON based SQL protection check enables you to configure relaxations that allow specific patterns and block the rest. For example, the Web App Firewall currently has a default set of more than 100 SQL keywords. Because hackers can use these keywords in SQL Injection attacks, the Web App Firewall flags all as potential threats. If you want to relax one or more keywords that are considered safe for the specific location, you can configure a relaxation rule that can bypass the security check and block the rest. The commands used in relaxations have optional parameters for Value Type and Value Expression. You can specify whether the value expression is a regular expression or a literal string. The value type can be left blank, or you have an option to select Keyword or Special String.

NOTE:

Regular expressions are powerful. Especially if you are not thoroughly familiar with PCRE-format regular expressions, double-check any regular expressions you write. Make sure that they define exactly the URL that you want to add as an exception, and nothing else. Careless use of wildcards, and especially of the dot-asterisk (.*) metacharacter or wildcard combination, can have results that you do not want, such as blocking access to web content that you did not intend to block or allowing an attack that the JSON SQL Injection check would otherwise have blocked.

Points to Consider

- Value expression is an optional argument. A field name might not have any value expression.
- A key name can be bound to multiple value expressions.
- Value expressions must be assigned a value type. The value type can be: 1) Keyword, 2) SpecialString.
- You can have multiple relaxation rules per key name or URL combination.

Configure JSON fine grain relaxation for command injection attacks using command interface

To configure JSON file grain relaxation rule, you must bind the fine grain relaxation entities to the Web App Firewall profile.

At the command prompt, type:

```
bind appfw profile <profile name> -jsoncmdURL <URL> -key <key name>
-isregex <REGEX/NOTREGEX> -valueType <keyword/SpecialString> <value
Expression> -isvalueRegex <REGEX/NOTREGEX>
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Example:

```
bind appfw profile appprofile1 -jsonsqlurl www.example.com -key stn_name
 -isRegex NOTREGEX -valueType Keyword “union” -isvalueRegex NOTREGEX
```

To configure fine grain relaxation rule for JSON-based command injection attacks by using the GUI

1. Navigate to **Application Firewall > Profiles**, select a profile, and click **Edit**.
2. In the **Advanced Settings** pane, click **Relaxation Rules**.
3. In the **Relaxation Rules** section, select a **JSON SQL Injection** record and click **Edit**.
4. In the **JSON SQL Injection Relaxation Rule** slider, click **Add**.
5. In the **JSON SQL Injection Relaxation Rule** page, set the following parameters.
    a. Enabled
    b. Is Name Regex
    c. Key Name
    d. URL
    e. Value Type
    f. Comments
    g. Resource ID
6. Click **Create**.

JSON Cross-Site Scripting protection check

If an incoming JSON payload has a malicious cross-site scripting data, WAF blocks the request. The following procedures explain how you can configure this through CLI and GUI interfaces.

Configure JSON Cross-Site Scripting protection

For configure JSON cross-site scripting protection, you must complete the following steps:

1. Add application firewall profile as JSON.
2. Configure JSON cross-site scripting action to block cross-site scripting malicious payload

Add application firewall profile of type JSON

You must first create a profile that specifies how the application firewall must protect your JSON web content from JSON cross-site scripting attack.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

At the command prompt, type:

```
add appfw profile <name> -type (HTML | XML | JSON)
```

NOTE

When you set the profile type as JSON, other checks such as HTML or XML will not applicable.

Example

```
add appfw profile profile1 –type JSON
```

Sample output for JSON cross-site scripting violation

```
JSONcross-site scriptingAction: block log stats

Payload: {"username":"<a href=\"jAvAsCrIpT:alert(1)\">X</
a>","password":"xyz"}

Log message: Aug 19 06:57:33 <local0.info> 10.106.102.21

```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure JSON Cross-Site Scripting action

You must configure one or more JSON cross-site scripting actions to protection your application from JSON Cross-Site Scripting attacks. At the command prompt, type:

```
set appfw profile <name> - JSONcross-site scriptingAction [block] [log] [stats] [none]
```

Example

```
set appfw profile profile1 –JSONcross-site scriptingAction block
```

The available Cross-Site Scripting actions are: Block - Block connections that violate this security check. Log - Log violations of this security check. Stats - Generate statistics for this security check. None - Disable all actions for this security check.

NOTE

. To enable one or more actions, type "set appfw profile - JSONcross-site scriptingAction " followed by the actions to be enabled.

Example

```
set appfw profile profile1 -JSONSQLInjectionAction block log stat
```

Configure JSON Cross Site Scripting (cross-site scripting) protection by using GUI

Follow the procedure below to set the Cross Site Scripting (cross-site scripting) protection settings.

1. On the navigation pane, navigate to **Security** > **Profiles**.
2. In the **Profiles** page, click **Add**.
3. In the **NetScaler Web App Firewall Profile** page, click **Security Checks** under **Advanced Settings**.
4. In the **Security Checks** section, go to **JSON Cross-Site Scripting (cross-site scripting)** settings.
5. Click the executable icon near the checkbox.
6. Click **Action Settings** to access the **JSON Cross-Site Scripting Settings** page.
7. Select the JSON cross-site scripting actions.
8. Click **OK**.
9. In the **NetScaler Web App Firewall Profile** page, click **Relaxation Rules** under **Advanced Settings**.
10. In **Relaxation Rules** section, select JSON Cross-Site Scripting settings and click **Edit**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

11. In the **JSON Cross-Site Scripting Relaxation Rule** page, click **Add** to add a JSON Cross-Site Scripting relaxation rule.
12. Enter the URL to which the request has to be sent. All requests sent to this URL will not be blocked.
13. Click **Create**.

Configure fine grained relaxation for JSON-based cross-site scripting

The Web App Firewall gives you an option to relax a specific JSON key or value from the JSON based cross-site scripting (XSS) inspection check. You can configure multiple options to relax JSON payloads using fine grain relaxation rules. Previously, the only way to configure relaxations for JSON protection checks is to specify the entire URL and that would bypass the verification of the entire URL. The JSON based SQL security protection provides relaxation for the following:

- Key names
- Key values

JSON based cross-site scripting (XSS) protection enables you to configure relaxations that allow specific patterns and block the rest. For example, the Web App Firewall currently has a default set of more than 100 SQL keywords. Because hackers can use these keywords in SQL Injection attacks, the Web App Firewall flags all as potential threats. If you want to relax one or more keywords that are considered safe for the specific location, you can configure a relaxation rule that can bypass the security check and block the rest. The commands used in relaxations have optional parameters for Value Type and Value Expression. You can specify whether the value expression is a regular expression or a literal string. The value type can be left blank, or you have an option to select Keyword or Special String.

NOTE:

Regular expressions are powerful. Especially if you are not thoroughly familiar with PCRE-format regular expressions, double-check any regular expressions you write. Make sure that they define exactly the URL that you want to add as an exception, and nothing else. Careless use of wildcards, and especially of the dot-asterisk (.*) metacharacter or wildcard combination, can have results that you do not want, such as blocking access to web content that you did not intend to block or allowing an attack that the JSON SQL Injection check would otherwise have blocked.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Points to Consider

- Value expression is an optional argument. A field name might not have any value expression.
- A key name can be bound to multiple value expressions.
- Value expressions must be assigned a value type. The value types are tag, attribute, and pattern.
- You can have multiple relaxation rules per key name/URL combination.

Configure JSON fine grain relaxation for cross-site scripting (XSS) injection attacks using command interface

To configure JSON file grain relaxation rule, you must bind the fine grain relaxation entities to the Web App Firewall profile.

At the command prompt, type:

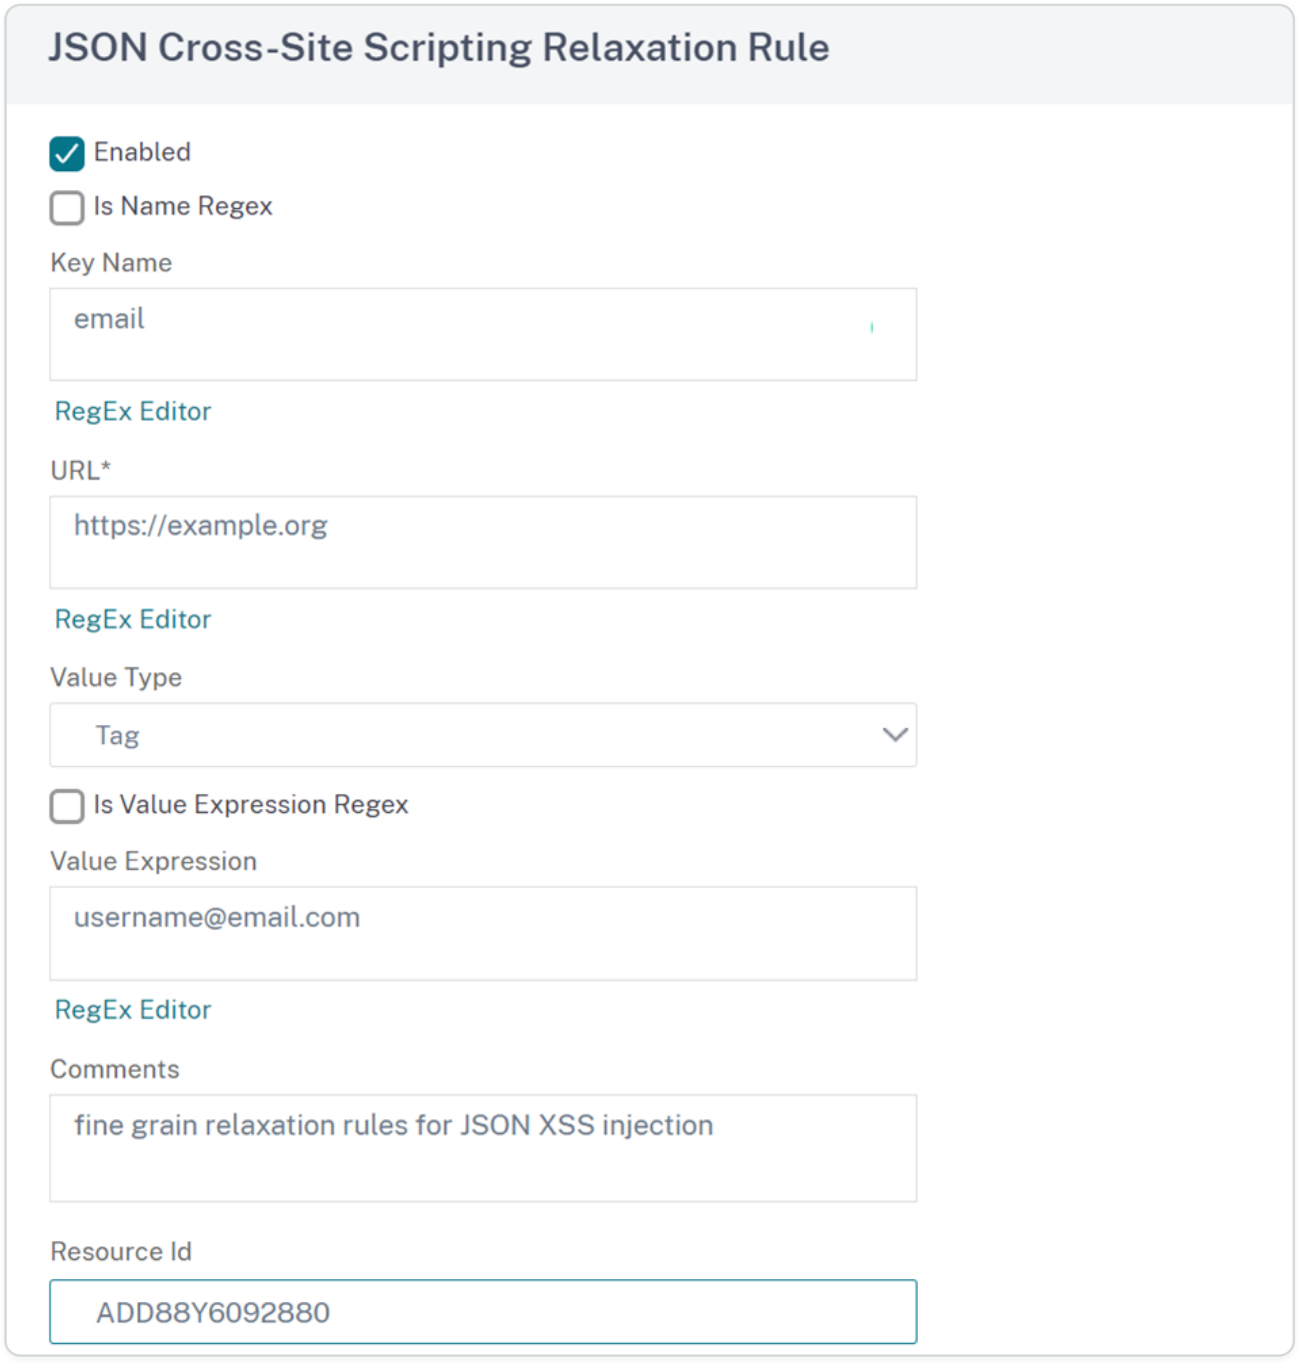
```
bind appfw profile <profile name> -jsonxssURL <URL> -key <key name>
-isregex <REGEX/NOTREGEX> -valueType <keyword/SpecialString> <value
Expression> -isvalueRegex <REGEX/NOTREGEX>
```

Example:

```
bind appfw profile appprofile1 -jsonxssurl www.example.com -key name  -
isRegex NOTREGEX -valueType Tag “sname” -isvalueRegex NOTREGEX
```

To configure an JSON based cross-site scripting (XSS) Injection fine grain relaxation rule by using the GUI

1. Navigate to **Application Firewall > Profiles**, select a profile, and click **Edit**.
2. In the **Advanced Settings** pane, click **Relaxation Rules**.
3. In the **Relaxation Rules** section, select a JSON SQL Injection record and click **Edit**.
4. In the **JSON Cross-Site Scripting Relaxation Rules** slider, click **Add**.
5. In the **JSON Cross-Site Scripting Relaxation Rule** page, set the following parameters.
    a. Enabled
    b. Is Name Regex
    c. Key Name
    d. URL



© 1997–2026 Citrix Systems, Inc. All rights reserved.

e. Value Type

f. Comments

g. Resource ID

6. Click **Create**.

JSON command injection protection check

The JSON command injection check examines the incoming JSON traffic for unauthorized commands that break the system security or modify the system. When examining the traffic, if any

© 1997–2026 Citrix Systems, Inc. All rights reserved.

malicious commands are detected, the appliance blocks the request or performs the configured action.

In a command injection attack, the attacker aims to run unauthorized commands on the NetScaler operating system or the back-end server. To achieve this, the attacker injects operating system commands using a vulnerable application. The back-end application is vulnerable to injection attacks if the appliance simply forwards a request without any security check. Therefore, it is highly important to configure a security check, so the NetScaler appliance can protect your web application by blocking unsafe data.

How command injection protection works

1. For an incoming JSON request, WAF examines the traffic for keywords or special characters. If the JSON request has no patterns that match any of the denied keywords or special characters, the request is allowed. Otherwise, the request is blocked, dropped, or redirected based on the configured action.
2. If you prefer to exempt a keyword or a special character from the list, you can create a relaxation rule to bypass the security check under specific conditions.
3. You can enable logging to generate log messages. You can monitor the logs to determine whether responses to legitimate requests are getting blocked. A large increase in the number of log messages can indicate attempts to launch an attack.
4. You can also enable the statistics feature to gather statistical data about violations and logs. An unexpected surge in the stats counter might indicate that your application is under attack. If legitimate requests are getting blocked, you might have to revisit the configuration to see if you must configure the new relaxation rule or modify the existing one.

Keywords and special characters denied for command injection check

To detect and block JSON command injection attacks, the appliance has a set of patterns (keywords and special characters) defined in the default signature file. Following is a list of keywords blocked during command injection detection.

```
<commandinjection>

      <keyword type="LITERAL" builtin="ON">7z</keyword>

      <keyword type="LITERAL" builtin="ON">7za</keyword>

      <keyword type="LITERAL" builtin="ON">7zr</keyword>
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
…

</commandinjection>
```

Special characters defined in the signature file are: `| ; & $ > < ' \ ! >> #`

NOTE:

You can find the list of keywords and patterns in the /netscaler/default_signatures.xml file.

Configuring JSON command injection check by using the CLI

You can use either the set `appfw profile` command or add an `appfw profile` command to configure the JSON command injection settings. You can enable the block, log, and stats actions. You must also set the command injection type such as key words and string characters that you want to detect in the payloads.

At the command prompt, type:

```
set appfw profile <profile-name> –cmdInjectionAction <action-name>
-CMDInjectionType <CMDInjectionType>]
```

NOTE:

By default, the command injection action is set as **Block**, **Log**, and **Stats**. Also, the default command injection type is set as `CmdSplCharANDKeyWord`. After an upgrade, the existing Web app Firewall profiles have the action set as **None**.

Example:

```
set appfw profile profile1 -JSONCMDInjectionAction block -JSONCMDInjectionType
CmdSplChar
```

Where, the available JSON command injection actions are:

None - Disable command injection protection. Log - Log command injection violations for the security check. Block - blocks traffic that violates the command injection security check. Stats - Generates statistics for command injection security violations.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Where, the available JSON command injection types are:

`Cmd SplChar` - Checks special characters `CmdKeyWord` - Checks command injection Keywords `CmdSplCharANDKeyWord` - This is the default action. The action checks special characters and command injection. Keywords and blocks only if both are present. `CmdSplCharORKeyWord` - Checks special characters and command injection Keywords and blocks if either of them is found.

Configuring relaxation rules for JSON command injection protection check

If your application requires you to bypass the JSON command injection inspection for a specific ELEMENT or ATTRIBUTE in the payload, you can configure a relaxation rule.

The JSON command Injection inspection relaxation rules have the following syntax.

```
bind appfw profile <profile name> –JSONCMDURL <expression> -comment <string>
-isAutoDeployed ( AUTODEPLOYED | NOTAUTODEPLOYED ) -state ( ENABLED | DISABLED )
```

Example for relaxation rule for Regex in header

```
bind appfw profile abc_json -jsoncmDURL http://1.1.1.1/hello.html
```

Whereas, the following relaxes requests from all URLs hosted on 1.1.1.1:

```
bind appfw profile abc_json -jsoncmDURL http://1.1.1.1/*”
```

To remove the relaxation, use ‘unbind’.

```
unbind appfw profile abc_json -jsoncmDURL “ http://1.1.1.1/*”
```

Configure JSON command injection check by using the GUI

Complete the following steps to configure the JSON command injection check.

1. Navigate to **Security > NetScaler Web App Firewall and Profiles**.
2. On the **Profiles** page, select a profile and click **Edit**.
3. On the **NetScaler Web App Firewall Profile** page, go to **Advanced Settings** section and click **Security Checks**.
4. In **Security Checks** section, select **JSON Command Injection** and click **Action** settings.
5. In the **JSON Command Injection Settings** page, set the following parameters

    a. Actions. Select one or more actions to perform for JSON command injection security check.

    b. Check Request Containing. Select a command injection pattern to check if the incoming request has the pattern.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

6. Click **OK**.

Viewing command injection traffic and violation statistics

The **NetScaler Web App Firewall Statistics** page shows security traffic and security violation details in a tabular or graphical format.

To view security statistics by using the command interface.

At the command prompt, type:

```
stat appfw profile profile1
```

Configure fine grain relaxation for JSON command injection

The Web App Firewall gives you an option to relax a specific JSON key or value from the JSON based command injection check. You can completely bypass the inspection for one or more fields by configuring the fine grain relaxation rules.

Previously, the only way to configure relaxations for JSON protection checks is to specify the entire URL and that would bypass the verification of the entire URL.

The JSON based command injection security protection provides relaxation for the following:

- Key names
- Key values

JSON based command injection protection enables you to configure relaxations that allow specific patterns and block the rest. For example, the Web App Firewall currently has a default set of more than 100 SQL keywords. Because hackers can use these keywords in command injection attacks, the Web App Firewall flags all as potential threats. If you want to relax one or more keywords that are considered safe for the specific location, you can configure a relaxation rule that can bypass the security check and block the rest. The commands used in relaxations have optional parameters for Value Type and Value Expression. You can specify whether the value expression is a regular expression or a literal string. The value type can be left blank, or you have an option to select Keyword or Special String.

NOTE:

Regular expressions are powerful. Especially if you are not thoroughly familiar with PCRE-format regular expressions, double-check any regular expressions you write. Make sure that they define exactly the URL that you want to add as an exception, and nothing else. Careless use of wildcards, and especially of the dot-asterisk (.*) metacharacter or wildcard combination, can have results that you do not want, such as blocking access to web content that you did not intend to block or allowing an attack that the JSON SQL Injection check would otherwise have blocked.

Points to Consider

- Value expression is an optional argument. A field name might not have any value expression.
- A key name can be bound to multiple value expressions.
- Value expressions must be assigned a value type. The value type can be: 1) Keyword, 2) SpecialString.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

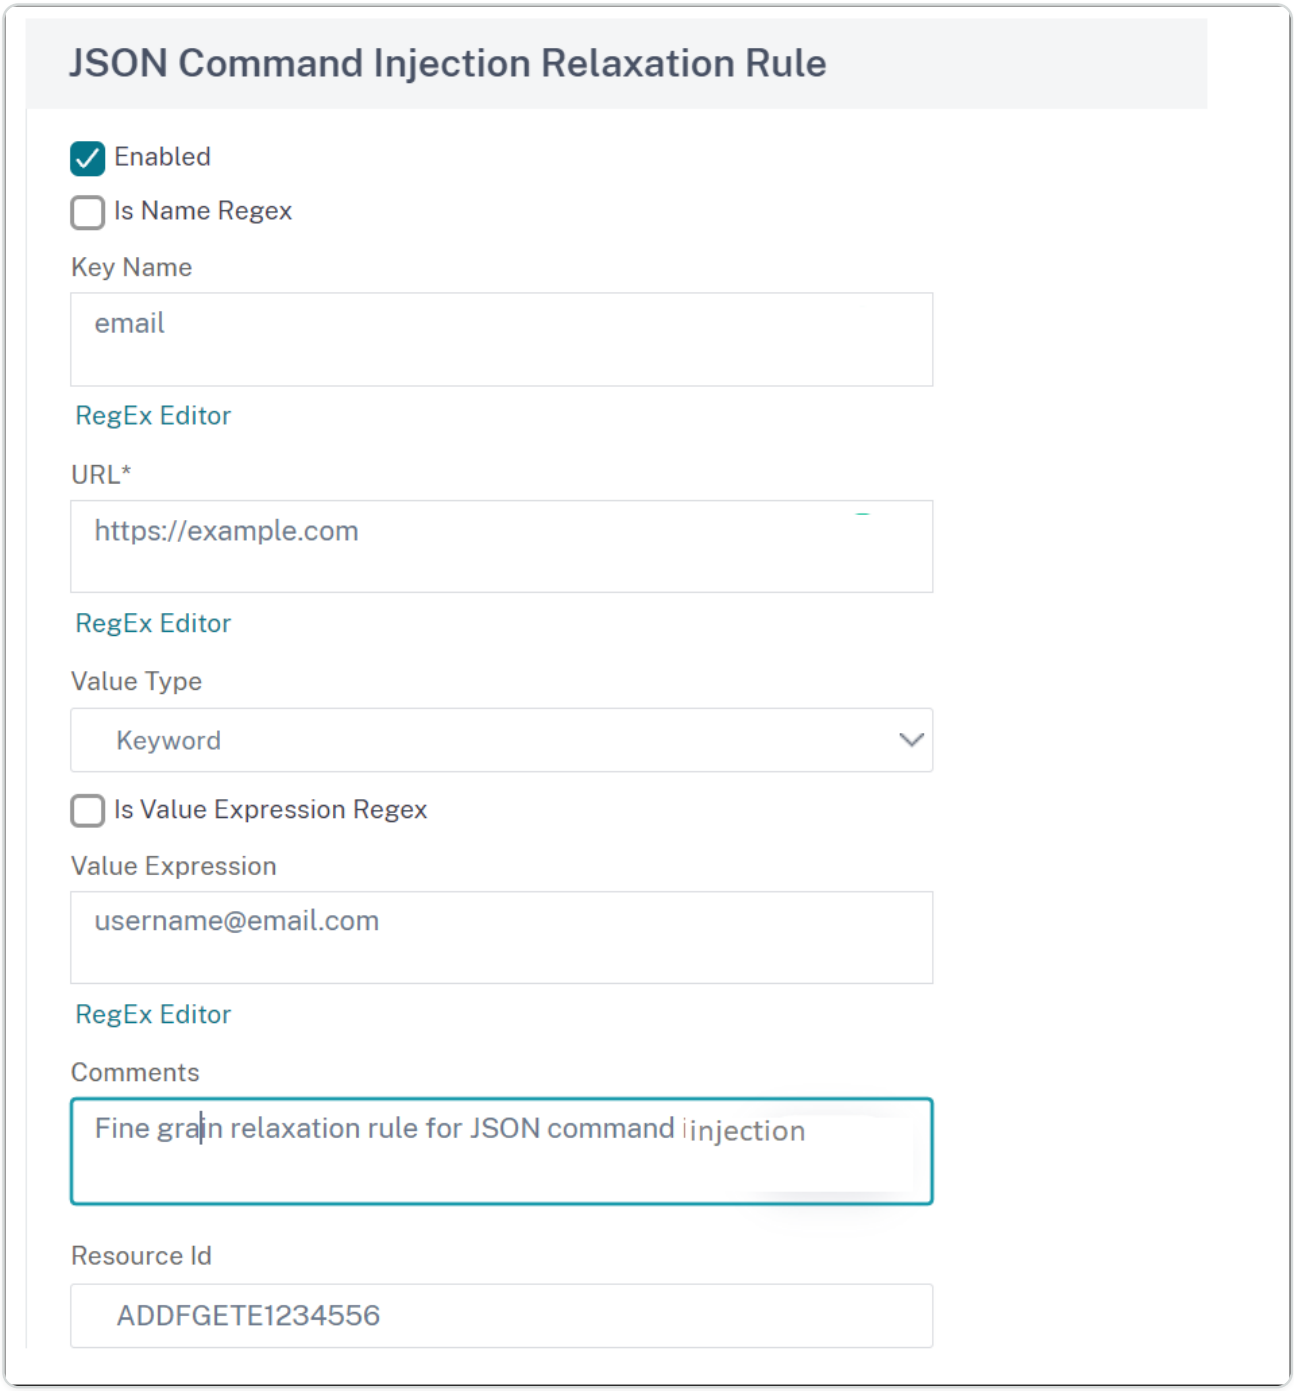
- You can have multiple relaxation rules per key name/URL combination.

Configure JSON fine grain relaxation for command injection attacks using command interface

To configure JSON file grain relaxation rule, you must bind the fine grain relaxation entities to the Web App Firewall profile.

At the command prompt, type:

```
bind appfw profile <profile name> -jsoncmdURL <URL> -key <key name>
-valueType <keyword/SpecialString> <value Expression>
```



Example:

```
bind appfw profile appprofile1 -jsoncmdurl www.example.com -key blg_cnt -isRegex
NOTREGEX -valueType Keyword “cat” -isvalueRegex NOTREGEX
```

To configure fine grain relaxation rule for JSON-based command injection attacks by using the GUI

1. Navigate to **Application Firewall > Profiles**, select a profile, and click **Edit**.
2. In the **Advanced Settings** pane, click **Relaxation Rules**.
3. In the **Relaxation Rules** section, select a **JSON Command Injection** record and click **Edit**.
4. In the **JSON Command Injection Relaxation Rule** slider, click **Add**.
5. In the **JSON Command Injection Relaxation Rule** page, set the following parameters.
    a. Enabled
    b. Is Name Regex
    c. Key Name
    d. URL
    e. Value Type
    f. Comments
    g. Resource ID
6. Click **Create**.

Custom keyword support for JSON payload

Starting from NetScaler release 13.1 build 33.x, you can add keywords of your choice and check if these configured keywords are present in the JSON payload.

SQL injection and command injection have a predefined set of keywords or patterns that they look for in the incoming requests. These predefined sets of keywords might not cover all the keywords as per your requirement and might lead to an increase in the number of false positives. With this feature, you can add keywords that are not covered in the SQL injection and command injection checks and therefore, reduce the false positives.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

After adding the keywords, configure the NetScaler appliance to check if the added keywords are detected in the incoming requests. Then configure the appliance to perform one of the following actions:

Add custom keywords using the CLI

Complete the following steps to add a custom keyword using the CLI:

1. Configure a web application firewall profile and define an action when the custom keyword is detected in the incoming request.

   ```
   set appfw profile <profile-name> –blockKeywordAction (block | log |
   stats | none)
   ```

   By default, `blockKeywordAction` is set to `none`.

   Example:

   ```
   set appfw profile test_profile -blockKeywordAction block
   ```

2. Bind the web application firewall profile with your custom keywords.

   ```
   bind appfw profile <profile_name> -jsonblockkeyword <keyword_name> -key
   <expression> -JSONBlockkeywordURL <expression> -isRegex ( REGEX |
   NOTREGEX ) -JSONBlockKeywordType ( literal | PCRE ) [-comment <string>]
   [-resourceId <string>] [-RuleType ( ALLOW | DENY )] [-state ( ENABLED |
   DISABLED )] [-isAutoDeployed ( AUTODEPLOYED |NOTAUTODEPLOYED )]
   ```

   Example:

   To add **blockkeyword** as the custom keyword and bind it to **test-profile**, run the following command:

   ```
   bind appfw profile test_profile -jsonblockKeyword "blockkeyword" -key
   id -jsonblockkeywordurL "/signup.php" JSONBlockKeywordType literal
   -state enable
   ```

View the statistics of the custom keyword in CLI

Run the following command to view the statistics of the custom keyword:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

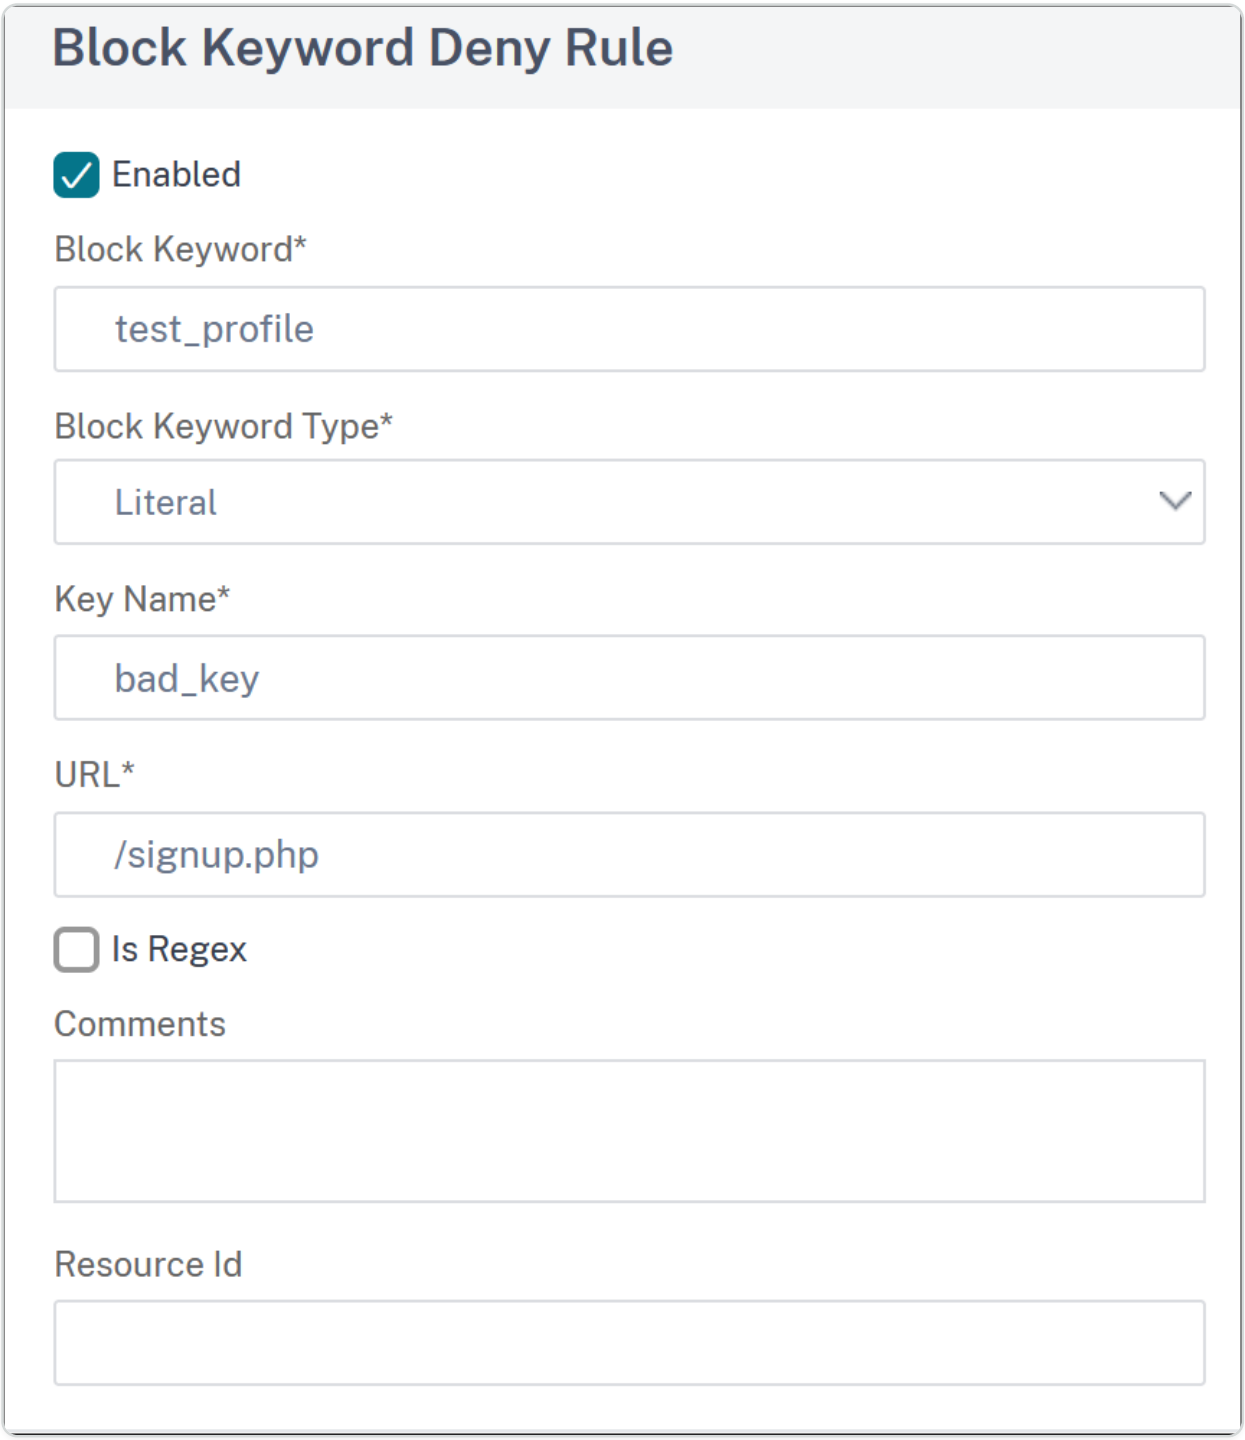
```
stat appfw profile <profile name>
```

Example:

```
stat appfw profile test_profile
```

Add custom keywords using the GUI

Complete the following steps to add keywords using the GUI:



1. Navigate to **Security > NetScaler Web App Firewall Profile > Profiles**.
2. Select a custom profile and click **Edit**.

   NOTE

   Make sure that the selected profile type is JSON.

3. Go to the **Advanced Settings** section and click **Deny Rules**.
4. Select the **Block Keyword** option for the **JSON** check type and click **Edit**.
5. Click **Add** and set the required parameters.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

6. Click **Create**.

   The custom keyword that you added is listed in the **Block Keyword Deny Rules** page.

7. Go to the **Advanced Settings** section and click **Security Checks**.
8. Select **Block Keyword** and click **Action Settings**.
9. Select the required actions and click **OK**.

View the statistics of the custom keyword in GUI

Complete the following steps to view the statistics of the custom keyword in the GUI:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. Navigate to **Security > NetScaler Web App Firewall > Profiles**.
2. In the details pane, select a **Web App Firewall profile** and click **Statistics**.

   The **NetScaler Web App Firewall Statistics** page displays the custom keyword traffic and violation details.
3. You can select **Tabular View** or switch to **Graphical View** to display the data in a tabular or graphical format.

Managing content types

Web servers add a Content-Type header with a MIME/type definition for each content type. Web servers serve many different types of content. For example, standard HTML is assigned the "text/html" MIME type. JPG images are assigned the "image/jpeg" or "image/jpg" content type. A normal web server can serve different types of content, all defined in the Content Type header by the assigned MIME/type.

Many Web App Firewall filtering rules are designed to filter a specific content type. The filtering rules apply to one type of content such as HTML and are often inappropriate when filtering a different type of content (such as images). As a result, the Web App Firewall attempts to determine the content type of requests and responses before it filters them. If a web server or browser does not add a Content-Type header to a request or response, the Web App Firewall applies a default content type and filters content accordingly.

The default content type is usually "application/octet-stream" with the most generic MIME/type definition. The MIME/type is appropriate for any content type a web server is likely to serve. But does not provide much information to the Web App Firewall to allow it to choose appropriate filtering. If a protected web server is configured to add accurate content type headers, you can then create a profile for the web server and assign a default content type to it. This is done to improve both the speed and the accuracy of filtering.

You can also configure a list of allowed request content types for a specific profile. When this feature is configured, if the Web App Firewall filters a request that does not match one of the allowed content types, it blocks the request.

Requests must always be of either the "application/x-www-form-urlencoded", "multipart/form-data," or "text/x-gwt-rpc" types. The Web App Firewall blocks any request that has any other content type designated.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE

You cannot include the "application/x-www-form-urlencoded" or "multipart/form-data" content types on the allowed response content types list.

To set the default request content type by using the command line interface

At the command prompt, type the following commands:

- `set appfw profile <name> -requestContentType <type>`
- `save ns config`

Example

The following example sets the "text/html" content type as the default for the specified profile:

```
set appfw profile profile1 -requestContentType "text/html"

save ns config
```

To remove the user-defined default request content type by using the command line interface

At the command prompt, type the following commands:

- `unset appfw profile <name> -requestContentType <type>`
- `save ns config`

Example

The following example unsets the default content type of "text/html" for the specified profile, allowing the type to revert to "application/octet-stream":

```
unset appfw profile profile1 -requestContentType "text/html"

save ns config
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE

Always use last content-type header for processing and remove remaining content-type headers if any that ensures that the back-end server receives a request with only one content-type.

To block requests that can be bypassed, add a Web App Firewall policy with rule as HTTP.REQ.HEADER ("content-type").COUNT.GT(1)' and profile as *appfw_block*.
If a request is received without a Content-Type header or if the request has Content-Type header without any value, Web App Firewall applies the configured **RequestContentType** value and processes the request accordingly.

To set the default response content type by using the command line interface

At the command prompt, type the following commands:

- `set appfw profile <name> -responseContentType <type>`
- `save ns config`

Example

The following example sets the "text/html" content type as the default for the specified profile:

```
set appfw profile profile1 -responseContentType "text/html"

save ns config
```

To remove the user-defined default response content type by using the command line interface

At the command prompt, type the following commands:

- `unset appfw profile <name> -responseContentType <type>`
- `save ns config`

Example

The following example unsets the default content type of "text/html" for the specified profile, allowing the type to revert to "application/octet-stream":

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
unset appfw profile profile1 -responseContentType "text/html"

save ns config
```

To add a content type to the allowed content types list by using the command line interface

At the command prompt, type the following commands:

- `bind appfw profile <name> -ContentType <contentTypeName>`
- `save ns config`

Example

The following example adds the "text/shtml" content type to the allowed content types list for the specified profile:

```
bind appfw profile profile1 -contentType "text/shtml"

save ns config
```

To remove a content type from the allowed content types list by using the command line interface

At the command prompt, type the following commands:

- `unbind appfw profile <name> -ContentType <contentTypeName>`
- `save ns config`

Example

The following example removes the "text/shtml" content type from the allowed content types list for the specified profile:

```
unbind appfw profile profile1 -contentType "text/shtml"

save ns config
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Manage urlencoded and multipart-form content types

The NetScaler Web App Firewall now enables you to configure Urlencoded and Multipart-Form content types for forms. The content type configuration is similar to XML and JSON list. Based on the configuration, Web App Firewall classifies the requests and inspects for urlencoded or multipart-form content type.

To configure Web App Firewall profile with Urlencoded and Multipart-Form content types At the command prompt, type:

```
bind appfw profile p2 -contentType <string>
```

Example:

```
bind appfw profile p2 -contentType UrlencodedFormContentType
```

```
bind appfw profile p2 -ContentType appfwmultipartform
```

To manage the default and allowed content types by using the GUI

1. Navigate to **Security** > **Web App Firewall** > **Profiles**.
2. In the details pane, select the profile that you want to configure, and then click **Edit**. The **Configure Web App Firewall Profile** dialog box is displayed.
3. The **Configure Web App Firewall Profile** dialog box, click the **Settings** tab.
4. On the **Settings** tab, scroll down about halfway to the Content Type area.
5. In the Content Type area, configure the default request or response content type:
    - To configure the default request content type, type the MIME/type definition of the content type you want to use in the Default Request text box.
    - To configure the default response content type, type the MIME/type definition of the content type you want to use in the Default Response text box.
    - To create a new allowed content type, click **Add**. The **Add Allowed Content Type** dialog box is displayed.
    - To edit an existing allowed content type, select that content type, and then click **Open**. The **Modify Allowed Content Type** dialog box is displayed.
6. To manage the allowed content types, click Manage Allowed Content Types.
7. To add a new content type or modify an existing content type, click Add or Open, and in the **Add Allowed Content Type** or **Modify Allowed Content Type** dialog box, do the following steps.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

a. Select/clear the Enabled check box to include the content type in, or exclude it from, the list of allowed content types.

b. In the Content Type text box, type a regular expression that describes the content type that you want to add, or change the existing content type regular expression.

   Content types are formatted exactly as MIME type descriptions are.

   NOTE:

   You can include any valid MIME type on the allowed contents type list. Since many types of document can contain active content and therefore can potentially contain malicious content, you must exercise caution when adding MIME types to this list.

c. Provide a short description that explains the reason for adding this particular MIME type to the allowed contents type list.

d. Click **Create** or **OK** to save your changes.

8. Click **Close** to close the Manage Allowed Content Types dialog box and return to the **Settings** tab.
9. Click **OK** to save your changes.

To manage Urlencoded and Multipart-form content types by using the NetScaler GUI

1. Navigate to **Security** > **Web App Firewall** > **Profiles**.
2. In the details pane, select the profile that you want to configure, and then click **Edit**.
3. In the **Configure Web App Firewall Profile** page, select the **Profile Settings** in the **Advanced Settings** section.
4. Under **Inspected Content Type** section, set the following parameters:

   a. application/x-www-form-urlencoded. Select the checkbox to inspect Urlencoded content type.

   b. multipart/form-data. Select the check to inspect Multipart-form content type.

5. Click **OK**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Profiles

A profile is a collection of security settings that are used to protect specific types of web content or specific parts of your website. In a profile, you determine how the Web App Firewall applies each of its filters (or checks) to requests to your websites, and responses from them. The Web App Firewall supports two types of profile: four built-in (default) profiles that do not require further configuration, and user-defined profiles that do require further configuration.

Built-in profiles

The four Web App Firewall built-in profiles provide simple protection for applications and websites that either do not require protection, or that must not be directly accessed by users at all. These profile types are:

- **APPFW_BYPASS.** Skips all Web App Firewall filtering and sends the unmodified traffic to the protected application or website, or to the client.
- **APPFW_RESET.** Resets the connection, requiring that the client re-establish his or her session by visiting a designated start page.
- **APPFW_DROP.** Drops all traffic to or from the protected application or website, and sends no response of any kind to the client.
- **APPFW_BLOCK.** Blocks traffic to or from the protected application or website.
- **ns-aaa-default-appfw-profile:** Protects the authentication virtual servers and ensures that network traffic is secure and compliant with the API specifications.
- **ns-aaatm-default-appfw-profile:** Protects the traffic management virtual servers and ensures that network traffic is secure and compliant with the API specifications.
- **ns-vpn-default-appfw-profile:** Protects the VPN virtual servers and ensures that network traffic is secure and compliant with the API specifications.

You use the built-in profiles exactly as you do user-defined profiles, by configuring a policy that selects the traffic to which you want to apply the profile and then associating the profile with your policy. Since you do not have to configure a built-in policy, it provides a quick way to allow or block specified types of traffic or traffic that is sent to specific applications or websites.

User-defined profiles

User-defined profiles are profiles that are build and configured by users. Unlike the default profiles, you must configure a user-defined profile before it will be of use filtering traffic to and from your protected applications.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

There are three types of user-defined profile:

- **HTML.** Protects HTML-based web pages.
- **XML.** Protects XML-based web services and websites.
- **Web 2.0.** Protects Web 2.0 content that combines HTML and XML content, such as ATOM feeds, blogs, and RSS feeds.

The Web App Firewall has a number of security checks, all of which can be enabled or disabled, and configured in a number of ways in each profile. Each profile also has a number of settings that control how it handles different types of content. Finally, rather than manually configuring all of the security checks, you can enable and configure the learning feature. This feature observes normal traffic to your protected websites for a period of time, and uses those observations to provide you with a tailored list of recommended exceptions (*relaxations*) to some security checks, and additional rules for other security checks.

During initial configuration, whether by using the Web App Firewall Wizard or manually, you normally create one general purpose profile to protect all content on your websites that is not covered by a more specific profile. After that, you can create as many specific profiles as you want to protect more specialized content.

The Profiles pane consists of a table that contains the following elements:

Name. Displays all the Web App Firewall profiles configured in the appliance.

Bound signature. Displays the signatures object that is bound to the profile in the previous column, if any.

Policies. Displays the Web App Firewall policy that invokes the profile in the leftmost column of that row, if any.

Comments. Displays the comment associated with the profile in the leftmost column of that row, if any.

Profile Type. Displays the type of profile. Types are Built-In, HTML, XML, and Web 2.0.

Above the table is a row of buttons and a drop-down list that allow you to create, configure, delete, and view information about your profiles:

- **Add.** Add a new profile to the list.
- **Edit.** Edit the selected profile.
- **Delete.** Delete the selected profile from the list.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Statistics.** View the statistics for the selected profile.
- **Action.** Drop-down list that contains additional commands. Currently allows you to import a profile that was exported from another Web App Firewall configuration.

Creating Web App Firewall profiles

You can create a Web App Firewall profile in one of two ways: by using the command line, and by using the GUI. Creating a profile by using the command line requires that you specify options on the command line. The process is similar to that of configuring a profile, and with a few exceptions the two commands take the same parameters.

NOTE

Core profile: This profile is available in the build 33.x and later. It contains limited but fundamental security checks enabled by default whereas the basic and advanced profiles have many other security checks enabled by default. The core profile contains the following security checks:

- Grammar-based SQL injection
- Grammar-based CMD injection
- Cross-site scripting
- Buffer overflow
- Block keywords

CVE profile: This profile is available in the build 42.x and later. Use this profile to only add and bind a signature. It disables all checks from the NetScaler Web App Firewall except the CVE check.
When creating a profile, specify one of these options: basic, advanced, core, or CVE. The default configuration for the various security checks and settings that are part of that profile are applied. You can also, optionally, add a comment. After you create the profile, you must then configure it by selecting it in the data pane, and then clicking **Edit**.

If you plan to use the learning feature or to enable and configure many advanced protections, you must choose advanced defaults. In particular, if you plan to configure either of the SQL injection checks, either of the cross-site scripting checks, any check that provides protection against Web form attacks, or the cookie consistency check, you must plan to use the learning feature. Unless you include the proper exceptions for your protected websites when configuring these checks, they can block legitimate traffic. Anticipating all exceptions without creating any that is too broad is

© 1997–2026 Citrix Systems, Inc. All rights reserved.

difficult. The learning feature makes this task much easier. Otherwise, basic defaults are quick and must provide the protection that your web applications need.

There are three profile types:

- **HTML.** Protects standard HTML-based websites.
- **XML.** Protects XML-based web services and websites.
- **Web 2.0 (HTML XML).** Protects websites that contain both HTML and XML elements, such as ATOM feeds, blogs, and RSS feeds.

There are also a few restrictions on the name that you can give to a profile. A profile name cannot be the same as the name assigned to any other profile or action in any feature on the NetScaler appliance. Certain action or profile names are assigned to built-in actions or profiles, and can never be used for user profiles. A complete list of disallowed names can be found in the Web App Firewall Profile Supplemental Information. If you attempt to create a profile with a name that has already been used for an action or a profile, an error message is displayed and the profile is not created.

To create a Web App Firewall profile by using the command line interface

At the command prompt, type the following commands:

- `add appfw profile <name> [-defaults ( basic | advanced | core | cve)]`
- `set appfw profile <name> -type ( HTML | XML | HTML XML )`
- `set appfw profile <name> -comment "<comment>"`
- `save ns config`

Example

The following example adds a profile named `pr-basic`, with basic defaults, and assigns a profile type of HTML. This is the appropriate initial configuration for a profile to protect an HTML website.

```
add appfw profile pr-basic -defaults basic -comment "Simple profile for
websites."

set appfw profile pr-basic -type HTML

save ns config
```

To create a Web App Firewall profile by using the GUI

Complete the following procedure to create a Web App Firewall profile:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. Navigate to **Security > NetScaler Web App Firewall > Profiles**.
2. In the details pane, click **Add**.
3. In the **Create Web App Firewall Profile** page, set the following basic parameters:
    a. Name
    b. Profile Type
    c. Comments
    d. Defaults
    e. Description
4. Click **OK**.
5. Select the profile that you created and click **Edit**.
6. In the **Advanced Settings** section, complete the following configurations:
    a. Security Checks
    b. Profile Settings
    c. Dynamic Profiling
    d. Relaxation Rules
    e. Deny Rules
    f. Learned Rule
    g. Extended Logging
7. In the **Security Checks** section, select a security protection and click **Action Settings**.
8. In the security check page, set the parameters.

    NOTE:

    The **Active Rule** setting is available only for **HTML SQL Injection** check to activate relaxation rule or deny rule for SQL injection check. For more information, see Relaxation and Deny Rules topic.

9. Click **OK** and **Close**.
10. In the **Profile Settings** section, set the profile parameters. For more information, see Configure Web App Firewall Profile settings topic. For configuring **Verbose Log Level**, see Ease of troubleshooting with Web Application Firewall logs.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

11. In the **Dynamic Profiling** section, select a security check to add dynamic profile settings. For more information, see Dynamic Profile topic.
12. In the **Relaxation Rules** section, click **Edit** to add a relaxation rule for a security check. For more information, see Relaxation Rule for details.
13. In the **Deny Rules** section, add a deny rule for the HTML SQL Injection check. For more information, see HTML Deny Rules topic.
14. In the **Learnt Rule** section, set the learning settings. For more information, see Web App Firewall Learning topic.
15. In the **Extended logging** section, click **Add** for masking sensitive data. For more information, see Extended logging topic.
16. Click **Done**, and then click **Close**.

Configure fake account detection rules

Fake account creation is an automated process of creating many user accounts that are not associated to a real person or creating user accounts with the real person's details without their consent. Fake accounts that non-legitimate users create use registration details that do not correspond to a person's true identify. These accounts are created to abuse services offered by a web application for non-legitimate purposes such as phishing attacks, spreading of fake news, scalping and so forth. Most often, these accounts are created by bots run by malicious users.

The NetScaler appliance is enhanced to detect fake accounts by binding fake account detection rules to a Web App Firewall profile. The rule consists of form URLs and form parameters for each URL. If an incoming request matches an expression or form URL (sign up pages) configured for a fake account detection rule, the evaluation is true for a suspicious sign-up attempt and the request data is sent to the ADM server for further inspection.

Complete the following steps to configure fake account detection by using the command interface:

1. Enable fake account detection feature
2. Bind fake account rules

Enable fake account detection feature

At the command prompt, type:

```
add/set appfw profile <name> -FakeAccountDetection ( ON | OFF )
```

Example:

```
add appfw profile profile1 -FakeAccountDetection ON
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Bind fake account rules

At the command prompt, type:

```
bind appfw profile <name> -FakeAccount (string|expression) isFieldNameRegex (ON|OFF) -tag <TagExpression> ([-formUrl <FormURL>]| [-formExpression <FormExpression>)]) –state (ENABLED|DISABLED)
```

Where,

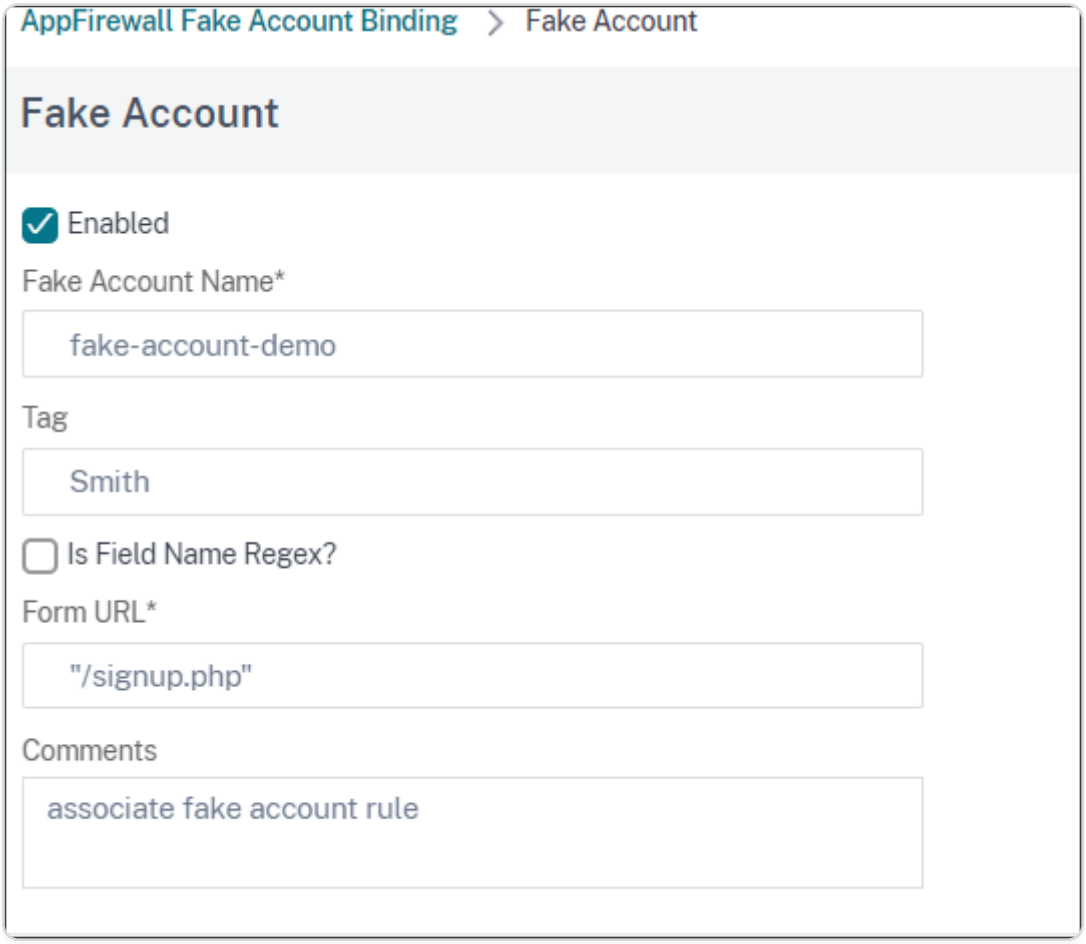
- `formUrl`: HTTP form action URL. formExpression: Form expression to be evaluated.
- `fakeaccount`: Name of the fake account. tag: Tag expression.
- `isFieldNameRegex`: Specifies whether the fieldName is regex. Default value OFF.

Example:

```
bind appfw profile profile1 -FakeAccount john -formURL “/signup.php" -tag "smith"
bind appfw profile profile2 -FakeAccount Will -formExpression "HTTP.REQ.HEADER(\"Authorization\").CONTAINS(\"/test_accounts\").NOT && HTTP.REQ.URL.CONTAINS(\"/login.php\")" -fieldName -tag "smith"
```

Example input for an HTTP post request for `example.com` signup page.

S.NO	INPUT	EXAMPLE
1	Signup HTTP POST request endpoint URL	`https://webapi.example.com/account/api/v1.0/contacts/`
2	Email Field name in HTTP post request	Email address
3	First name Field name in HTTP post request	First name
4	Last name Field name in HTTP post request	Last name



Configure Web App Firewall fake account detection rule by using the GUI

Complete the following steps to configure the fake account detection rule by using the GUI.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. Navigate to **Configuration** > **Security** > **NetScaler Web App Firewall** > **Profile**.
2. Select a profile and click **Edit**.
3. In the **NetScaler Web App Firewall Profile** page, click **Security Checks** from **Advanced Settings**.
4. In the **Checks Integrated with Citrix Cloud™** section, select a fake account rule and click **Edit**.
5. In the **AppFirewall Fake Account Binding** slider, select a rule to edit or click **Add**.
6. In the **Fake Account rule** page, set the following parameters:
    a. **Enabled**. Select to activate the fake account rule.
    b. **Fake Account Name**. Name of the fake account rule.
    c. **Tag**. First name in the fake account registration form.
    d. **Is Field Name Regex?** Select if the form field is a regular expression.
    e. **Form Expression**. Regular expression that defines the fake account.
    f. **Form URL**. Enter the fake account detection URL.
    g. **Comments**. A brief description about the fake account detection rule.
7. Click **Create**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Enforce HTTP RFC compliance

NetScaler Web App Firewall inspects the incoming traffic for HTTP RFC compliance and drops any request that has RFC violations by default. However, there are certain scenarios, where the appliance might have to bypass or block a non-RFC compliance request. In such cases, you can configure the appliance to bypass or block such requests at global or profile level.

Block or bypass non-RFC compliant requests at global level

The HTTP module identifies a request as invalid if it is incomplete and such requests cannot be processed by WAF. For example, an incoming HTTP request having a host header missing. To block or bypass such invalid requests, you must configure the `malformedReqAction` option in the application firewall global settings.

The 'malformedReqAction' parameter validates the incoming request for invalid content length, invalid chunked request, no HTTP version, and incomplete header.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

NOTE:

If you disable the block option in the `malformedReqAction` parameter, the appliance bypasses the entire app firewall processing for all non-RFC compliance requests and forwards the requests to the next module.

To block or bypass invalid non-RFC complaint HTTP requests by using the command line interface

To block or bypass invalid requests, enter the following command:

```
set appfw settings -malformedreqaction <action>
```

Example:

```
set appfw settings –malformedReqAction block
```

To display malformed request action settings

To display malformed request action settings, enter the following command:

```
show appfw settings
```

Output:

```
DefaultProfile:  APPFW_BYPASS UndefAction:  APPFW_BLOCK SessionTimeout:
 900     LearnRateLimit:  400     SessionLifetime:  0 SessionCookieName:
 citrix_ns_id ImportSizeLimit:  134217728 SignatureAutoUpdate:  OFF
SignatureUrl:"https://s3.amazonaws.com/NSAppFwSignatures/
SignaturesMapping.xml" CookiePostEncryptPrefix:  ENC GeoLocationLogging:
 OFF CEFLogging:  OFF       EntityDecoding:  OFF
UseConfigurableSecretKey:  OFF SessionLimit:  100000
 MalformedReqAction:  block log stats

 Done
```

To block or bypass invalid non-RFC complaint HTTP requests by using the NetScaler GUI

1. Navigate to **Security** > **NetScaler Web App Firewall**.
2. In the **NetScaler Web App Firewall** page, click **Change Engine Settings** under **Settings**.
3. In the **Configure NetScaler Web App Firewall Settings** page, select the **Log Malformed Request** option as Block, Log, or Stats.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. Click **OK** and **Close**.

NOTE:

If you unselect the block action or do not select any malformed request action, the appliance bypasses the request without intimating the user.

Block or bypass non-RFC compliant requests at profile level

Other non-RFC compliant requests can be configured to block or bypass at profile level. You must configure the RFC profile either in Block or Bypass mode. By doing this configuration, any invalid traffic that matches the Web App Firewall profile is either bypassed or blocked accordingly. The RFC profile validates the following security checks:

- Invalid GWT-RPC requests
- Invalid content type headers
- Invalid Multipart requests
- Invalid JSON requests
- Duplicate cookie name value pair checks

NOTE:

When you set the `RFC` profile in "Bypass" mode, you must make sure you disable the transformation option in the **HTML Cross-Site Scripting Settings** and in the **HTML SQL Injection Settings** sections. If you enable and set the `RFC` profile in Bypass mode, the appliance displays a warning message, "Transform cross-site scripts" and "Transform SQL special characters" are both currently ON. Recommend turning it off when used with `APPFW_RFC_BYPASS`.

Important:

Also, the appliance displays a warning note, "Appfw Security checks enabled might not be applicable to requests which violates RFC checks when this profile is set. Enabling any transformation setting is not recommended as requests might be partially transformed that contains RFC violations."

To configure an RFC profile in the Web App Firewall profile by using the command line interface

At the command prompt, type the following commands:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
set appfw profile <profile_name> -rfcprofile <rfcprofile_name
```

Example

```
set appfw profile P1 -rfcprofile APPFW_RFC_BLOCK
```

NOTE:

By default, the `RFC` profile is bound to the Web App Firewall profile in Block mode.

To configure an RFC profile in the Web App Firewall profile by using the GUI

1. Navigate to **Security > NetScaler Web App Firewall > Profiles**.
2. In the **Profiles** page, select a profile and click **Edit**.
3. In the **Web App Firewall Profile** page, click **Profile settings** from the **Advanced Settings** section.
4. In the **HTML Settings** section, set the `RFC` profile in `APPFW_RFC_BYPASS` mode. The system displays a warning message, "Appfw Security checks enabled might not be applicable to requests which violates RFC checks when this profile is set. Enabling any transformation setting is not recommended as requests might be partially transformed that contains RFC violations".

Configuring Web App Firewall profiles

To configure a user-defined Web App Firewall profile, first configure the security checks, which are called *deep protections* or *advanced protections* in the Web App Firewall wizard. Certain checks require configuration if you are to use them at all. Others have default configurations that are safe but limited in scope; your websites might need or benefit from a different configuration that takes advantage of more features of certain security checks.

After you have configured the security checks, you can also configure some other settings that control the behavior, not of a single security check, but the Web App Firewall feature. The default configuration is sufficient to protect most websites, but you must review them to make sure that they are right for your protected websites.

NOTE:

The profile name length and all import object name length can be set up to 127 characters.

For more information about the Web App Firewall security checks, see Advanced Protections.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To configure a Web App Firewall profile by using the command line

At the command prompt, type the following commands:

- `set appfw profile <name> <arg1> [<arg2> ...]`

  where:

  - `<arg1>` = a parameter and any associated options.
  - `<arg2>` = a second parameter and any associated options.
  - ... = additional parameters and options.

  For descriptions of the parameters to use when configuring specific security checks, see Advanced Protections.

- `save ns config`

Example

The following example shows how to enable blocking for the HTML SQL Injection and HTML Cross-Site Scripting checks in a profile named `pr-basic`. This command enables blocking for those actions while making no other changes to the profile.

```
set appfw profile pr-basic -crossSiteScriptingAction block
-SQLInjectionAction block
```

Bind relaxation rule to a Web App Firewall profile

When a Web App Firewall detects a violation, the user has the ability to bypass the action applied through relaxation rules. Relaxation rule is an exception applied to the detected security violation. For example, the Start URL relaxation rules protect against forceful browsing. Known web server vulnerabilities that are exploited by hackers can be detected and blocked by enabling a set of default Deny URL rules. Commonly launched attacks, such as Buffer Overflow, SQL, or Cross-site scripting can also be easily detected.

To bind security exemption or relaxation rules by using the CLI

At the command prompt, type:

```
bind appfw profile <name> ((-startURL <expression> [-resourceId
 <string>]) | -denyURL <expression> | (-fieldConsistency <string>
<formActionURL> [-isRegex ( REGEX | NOTREGEX )]) | (-cookieConsistency
<string> [-isRegex ( REGEX | NOTREGEX )]) | (-SQLInjection <string>
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
<formActionURL> [-isRegex ( REGEX | NOTREGEX )] [-location <location>] [-
valueType <valueType> <valueExpression>....
```

To bind security exemption or relaxation rules by using the GUI

1. Navigate to **Security > NetScaler Web App Firewall > Profiles**.
2. In the details pane, select a profile and click **Edit**.
3. In the **NetScaler Web App Firewall Profile** page, click **Relaxation Rules** from the **Advanced Setting** section.
4. In the **Relaxation Rules** section, click **StartURL** and click **Edit**.
5. In the **Start URL Relaxation Rules** page, click **Add**.
6. In the **Start URL Relaxation Rule** page, set the following parameters:
   a. Enabled. Select the check box to enable the relaxation rule
   b. Start URL. Enter the regular expression value
   c. Comments. Provide a short description about the relaxation rule.
7. Click **Create** and **Close**.

To configure a Web App Firewall profile by using the GUI

1. Navigate to **Security > NetScaler Web App Firewall > Profiles**.
2. In the details pane, select the profile that you want to configure, and then click **Edit**.
3. In the **Configure Web App Firewall Profile** dialog box, on the **Security Checks** tab, configure the security checks.
   - To enable or disable an action for a check, in the list, select or clear the check box for the action.
   - To configure the parameters for the security checks in the list, select the check box and click **Active Settings**.
   - To review log entries for the selected security check, select the check box and click **Logs**. You can use this information to determine the security checks that match attacks, so that you can block the traffic for the security checks. You can also use the information to determine the checks that match legitimate traffic, so that you can configure an appropriate exemption to allow those legitimate connections. For more information about the logs, see Logs, Statistics, and Reports.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- To completely disable a check, in the list, clear all of the check boxes to the right of that check.

4. On the **Settings** tab, configure the profile settings.

   - To associate the profile with the set of signatures that you previously created and configured, under Common Settings, choose that set of signatures in the **Signatures** drop-down list.

     NOTE:

     You must use the scroll bar on the right of the dialog box to scroll down to display the Common Settings section.

   - To configure an HTML or XML Error Object, select the object from the appropriate drop-down list.

     NOTE:

     You must first upload the error object that you want to use in the Imports pane. For more information about importing error objects, see Imports.

   - To configure the default XML Content Type, type the content type string directly into the Default Request and Default Response text boxes, or click Manage Allowed Content Types to manage the list of allowed content types. >>More....

5. If you want to use the learning feature, click Learning, and configure the learning settings for the profile, as described in Configuring and Using the Learning Feature.
6. Click **OK** to save your changes and return to the **Profiles** pane.

Confidential fields in WAF profile

NOTE

This feature is available in release 13.1 build 27.x and later.

You can now add confidential fields in a WAF profile. These fields are masked and not captured in the ADC logs when a violation occurs. Earlier you could add these fields using settings only. For more information about adding confidential fields using settings, see Confidential fields.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. Navigate to **Security > NetScaler Web App Firewall > Profiles**.
2. Select a profile and click **Edit**.
3. In **Advanced Settings**, click **Confidential Fields**.
4. Click **Add**.
5. Enter values for the following parameters:
   - Form Field Name*
   - Action URL*
   - Comments A `*` indicates a mandatory field
6. Click **Create**.
7. Click **Done**.

Web Application Firewall profile settings

Following are the profile settings that you must configure on the appliance.

At the command prompt, type:

```
add appfw profile <name> [-invalidPercentHandling <invalidPercentHandling>] [-checkRequestHeaders ( ON | OFF )] [-URLDecodeRequestCookies ( ON | OFF )] [-optimizePartialReqs ( ON | OFF )] [-errorURL <expression>] [-logEveryPolicyHit ( ON | OFF )] [-stripHtmlComments <stripHtmlComments>] [-stripXmlComments ( none | all )] [-postBodyLimitSignature <positive_integer>][-fileUploadMaxNum <positive_integer>][-canonicalizeHTMLResponse ( ON | OFF )][-percentDecodeRecursively ( ON | OFF )] [-multipleHeaderAction <multipleHeaderAction> ...][-inspectContentTypes <inspectContentTypes> ...][-semicolonFieldSeparator ( ON | OFF )]
```

Example:

```
add appfw profile profile1 [-invalidPercentHandling secure_mode] [-checkRequestHeaders ON] [-URLDecodeRequestCookies OFF] [-optimizePartialReqs OFF]
```

Where,

invalidPercentHandling - Configure the method for handling percent-encoded names and values.

Available settings function as follows:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

asp_mode - Strips and Parses Invalid Percent for Parsing.

Example:- `curl –v “http://<vip>/forms/login.html?field=sel%zzect -> Invalid percent encoded char(%zz)` is stripped of and the rest of the content is inspected and action taken for the SQLInjection check.

secure_mode - We detect the invalid percent coded value and ignore it.

Example:- `curl –v “http://<vip>/forms/login.html?field=sel%zzect -> Invalid percent encoded char(%zz)` is detected, counters are incremented and content is passed as is to the server.

apache_mode - This mode works similar to secure mode.

NOTE:

Starting from release 13.1 build 45.x, the `apache_mode` function is deprecated.

Possible values: apache_mode, asp_mode, secure_mode

Default value: secure_mode

optimizePartialReqs - When OFF/ON (without safe object), a NetScaler appliance sends the partial request to the back-end server. This partial response sent back to the client. OptimizePartialReqs makes sense when the Safe object is configured. The appliance sends requests for full response from the server when OFF, requests only partial response when ON.

Available settings are as follows:

ON - Partial requests by the client result in partial requests to the back-end server. OFF - Partial requests by the client are changed to full requests to the back-end server.

Possible values: ON, OFF Default value: ON

URLDecodeRequestCookies. When `checkRequestHeaders` is enabled, cookies are inspected for security checks (SQL, cross-site, cmd injection). If `URLDecodeRequestCookies` is enabled, the cookies are URL decoded and then inspected.

Possible values: ON, OFF Default value: OFF

Signature Post Body Limit (Bytes). Limits the request payload (in bytes) inspected for signatures with the location specified as 'HTTP_POST_BODY'.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Default value: 8096 Minimum value: 0 Maximum Value: 4294967295

Post Body Limit (Bytes). Limits the request payload (in bytes) inspected by Web Application Firewall.

Default value: 20000000 Minimum value: 0 Maximum Value: 10 GB

For more information about the Security setting and its GUI procedure, see Configure Web App Firewall Profile topic.
