Change the directory to /var/opt/nfast/bin, and at the shell prompt, run the following commands:

```
1 root@ns# ./chkserv root@ns# ./nfkminfo root@ns# ./sigtest
```

See Appendix for an example.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Create an HSM RSA Key

Only RSA keys are supported as HSM keys.

Note: Skip this step if keys are already present in the /opt/nfast/kmdata/local folder on the RFS.

Create an RSA key, a self-signed certificate, and a Certificate Signing Request (CSR). Send the CSR to a certificate authority to get a server certificate.

The following files are created in the following example:

- Embed RSA key: key_embed_2ed5428aaeae1e159bdbd63f25292c7113ec2c78
- Self-Signed Certificate: example_selfcert
- Certificate Signing Request: example_req

Note: The generatekey command is supported in strict FIPS 140-2 Level 3 Security World. An administrator card set (ACS) or an operator card set (OCS) is needed to control many operations, including the creation of keys and OCSs. When you run the generatekey command, you are prompted to insert an ACS or OCS card. For more information about strict FIPS 140-2 Level 3 Security World, see the nShield Connect User Guide.

The following example uses Level-2 Security World. In the example, the commands are in boldface type.

Example:

```
[root@localhost bin]# ./generatekey embed
size: Key size? (bits, minimum 1024) [1024] > 2048
OPTIONAL: pubexp: Public exponent for RSA key (hex)? []
>
embedsavefile: Filename to write key to? []
> example
plainname: Key name? [] > example
x509country: Country code? [] > US
x509province: State or province? [] > CA
x509locality: City or locality? [] > Santa Clara
x509org: Organisation? [] > Citrix
x509orgunit: Organisation unit? [] > NS
x509dnscommon: Domain name? [] > www.citrix.com
x509email: Email address? [] > example@citrix.com
nvram: Blob in NVRAM (needs ACS)? (yes/no) [no] >
digest: Digest to sign cert req with? (md5, sha1, sha256, sha384,
    sha512)
  [default sha1] > sha512
key generation parameters:
 operation      Operation to perform              generate
 application    Application                       embed
 verify         Verify security of key            yes
 type           Key type                          RSA
 size           Key size                          2048
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
 pubexp          Public exponent for RSA key (hex)
 embedsavefile   Filename to write key to           example
 plainname       Key name                           example
 x509country     Country code                       US
 x509province    State or province                  CA
 x509locality    City or locality                   Santa Clara

 x509email       Email address                      example@citrix.com
 nvram           Blob in NVRAM (needs ACS)          no
 digest          Digest to sign cert req with       sha512
Key successfully generated.
Path to key: /opt/nfast/kmdata/local/
   key_embed_2ed5428aaeae1e159bdbd63f25292c7113ec2c78
You have new mail in /var/spool/mail/root
```

Result:

You have created a CSR (example_req), a self-signed certificate (example_selfcert), and an application key token file in embed format (/opt/nfast/kmdata/local/key_embed_2ed5428aaeae1e159bdbd63f25292c7113ec2

Because the ADC supports keys in simple format only, you must convert the embed key to a simple key.

To convert the embed key to a simple key, run the following command on the RFS:

```
[root@localhost bin]# ./generatekey -r simple
from-application: Source application? (embed, simple) [embed] > embed
from-ident: Source key identifier? (
   c6410ca00af7e394157518cb53b2db46ff18ce29,
                                    2
                                        ed5428aaeae1e159bdbd63f25292c7113ec2c78
                                        )
  [default c6410ca00af7e394157518cb53b2db46ff18ce29]
> 2ed5428aaeae1e159bdbd63f25292c7113ec2c78
ident: Key identifier? [] > examplersa2048key
plainname: Key name? [] > examplersa2048key
key generation parameters:
 operation         Operation to perform    retarget
 application       Application             simple
 verify            Verify security of key  yes
 from-application  Source application      embed
 from-ident        Source key identifier   2
    ed5428aaeae1e159bdbd63f25292c7113ec2c78
 ident             Key identifier          examplersa2048key
 plainname         Key name                examplersa2048key
Key successfully retargetted.
Path to key: /opt/nfast/kmdata/local/key_simple_examplersa2048key
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

> **Important:**
>
> When prompted for the source key identifier, enter **2ed5428aaeae1e159bdbd63f25292c7113ec2c78** as the embed key.

Result:

A key with the prefix key_simple (for example key_simple_examplersa2048key) is created.

Note: examplersa2048key is the key identifier (ident) and is referred to as the HSM key name on the ADC. A key identifier is unique. All the simple files have the prefix key_simple.

Configure the entities on the ADC

Before the ADC can process traffic, you must do the following:

1. Enable features.
2. Add a subnet IP (SNIP) address.
3. Add the HSM key to the ADC.
4. Add a certificate-key pair by using the HSM key.
5. Add a virtual server.
6. Add a server object.
7. Add a service.
8. Bind the service to the virtual server.
9. Bind the certificate-key pair to the virtual server.
10. Verify the configuration.

Enable features on the ADC

Licenses must be present on the ADC before you can enable a feature.

Enable a feature by using the CLI At the command prompt, run the following commands:

```
enable feature lb
enable feature ssl
```

Enable a feature by using the GUI Navigate to **System** > **Settings** and, in the **Modes and Features** group, select **Configure basic features**, and then select **SSL Offloading**.

Add a subnet IP address

For more information about subnet IP addresses, see Configuring Subnet IP Addresses.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Add a SNIP address and verify the configuration by using the CLI At the command prompt, run the following commands:

```
add ns ip <IPAddress> <netmask> -type SNIP
show ns ip
```

Example:

```
add ns ip 192.168.17.253 255.255.248.0 -type SNIP
Done
show ns ip
        Ipaddress        Traffic Domain  Type             Mode     Arp
                 Icmp     Vserver  State
        ---------        --------------  ----             ----     ---
                 ----     -------  ------
1)      192.168.17.251   0               NetScaler IP     Active
   Enabled  Enabled  NA       Enabled
2)      192.168.17.252   0               VIP              Active
   Enabled  Enabled  Enabled  Enabled
3)      192.168.17.253   0               SNIP              Active
   Enabled  Enabled  NA       Enabled
 Done
```

Add a SNIP address and verify the configuration by using the GUI Navigate to **System > Network > IPs**, add an IP address, and select the **IP Type as Subnet IP**.

Copy the HSM key and certificate to the ADC

Use a secure file transfer utility to securely copy the key (key_simple_examplersa2048key) to the `/var/opt/nfast/kmdata/local` folder, and the certificate (example_selfcert) to the `/nsconfig/ssl` folder on the ADC.

Add the key on the ADC

All the keys have a key-simple prefix. When adding the key to the ADC, use the ident as the HSM key name. For example, if the key that you added is key_simple_XXXX, the HSM key name is XXXX.

Important:

- The HSM key name must be the same as the ident that you specified when you converted an embed key to a simple key format.
- The keys must be present in the `/var/opt/nfast/kmdata/local/` directory on the ADC.

Add an HSM key by using the CLI At the shell prompt, run the following command:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
add ssl hsmKey <hsmKeyName> -key <string>
```

Example:

```
add ssl hsmKey examplersa2048key  – key key_simple_examplersa2048key
Done
```

Add an HSM key by using the GUI Navigate to **Traffic Management > SSL > HSM**, and add an HSM key.

Add a certificate-key pair on the ADC

For information about certificate-key pairs, see Add or update a certificate-key pair.

Add a certificate-key pair by using the CLI At the command prompt, run the following command:

```
add ssl certKey <certkeyName> -cert <string> -hsmKey <string>
```

Example:

```
add ssl certKey key22 -cert example_selfcert -hsmKey examplersa2048key
Done
```

Add a certificate-key pair by using the GUI Navigate to **Traffic Management > SSL > Certificates**, and add a certificate-key pair.

Add a virtual server

For information about a virtual server, see SSL virtual server configuration.

Configure an SSL-based virtual server by using the CLI At the command prompt, run the following command:

```
add lb vserver <name> <serviceType> <IPAddress> <port>
```

Example:

```
add lb vserver v1 SSL 192.168.17.252 443
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Configure an SSL-based virtual server by using the GUI Navigate to **Traffic Management > Load Balancing > Virtual Servers**, create a virtual server, and specify the protocol as SSL.

Add a server object

Before you can add a server object on the ADC, make sure that you have created a back-end server. The following example uses the built-in python HTTP Server module on a Linux system.

Example:

```
%python  – m SimpleHTTPServer 80
```

Add a server object by using the CLI At the command prompt, run the following command:

```
add server <name> <IPAddress>
```

Example:

```
add server s1 192.168.17.246
```

Add a server object by using the GUI Navigate to **Traffic Management > Load Balancing > Servers**, and add a server.

Add a service

For more information, see Configuring services.

Configure a service by using the CLI At the command prompt, run the following command:

```
add service <name> <serverName> <serviceType> <port>
```

Example:

```
add service sr1 s1 HTTP 80
```

Configure a service by using the GUI Navigate to **Traffic Management > Load Balancing > Services**, and create a service.

Bind the service to the virtual server

For more information, see Bind services to the SSL virtual server.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Bind a service to a virtual server by using the CLI At the command prompt, run the following command:

```
bind lb vserver <name> <serviceName>
```

Example:

```
bind lb vserver v1 sr1
```

Bind a service to a virtual server by using the GUI

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**.
2. Open a virtual server, and click in the Services pane to bind a service to the virtual server.

Bind the certificate-key pair to the virtual server on the ADC

For more information, see Bind the certificate-key pair to the SSL virtual server.

Bind a certificate-key pair to a virtual server by using the CLI At the command prompt, run the following command:

```
bind ssl vserver <vServerName> -certkeyName <string>
```

Example:

```
bind ssl vserver v1 -certkeyName key22
Warning: Current certificate replaces the previous binding
```

Bind a certificate-key pair to a virtual server by using the GUI

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**.
2. Open an SSL virtual server and, in **Advanced Settings**, click **SSL Certificate**.
3. Bind a server certificate to the virtual server.

Verify the configuration

To view the configuration by using the CLI:

At the command prompt, run the following commands:

```
show lb vserver <name>
show ssl vserver <vServerName>
```

Example:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
show lb vserver v1
        v1 (192.168.17.252:443) - SSL   Type: ADDRESS
        State: UP
        Last state change was at Wed Oct 29 03:11:11 2014

```
18
19 1)      CertKey Name: key22       Server Certificate
20
21 1)      Cipher Name: DEFAULT
22         Description: Predefined Cipher Alias
23  Done
```

To view the configuration by using the GUI:

Navigate to **Traffic Management > Load Balancing > Virtual Servers**, and double-click an SSL virtual server to open it and view the configuration.

Limitations

September 14, 2021

- SSL version 3 (SSLv3) is not supported on an MPX appliance but is supported on a VPX virtual appliance. A VPX instance provisioned on an SDX appliance supports SSLv3 only if an SSL chip is not assigned to the instance.
- Export ciphers are not supported.
- SSL server key exchange using HSM keys is not supported.
- If you have added or removed keys after you last saved the configuration, you must save the configuration before you perform a warm restart. If you do not save the configuration, there is a key mismatch between the ADC and the HSM.
- You cannot bind an HSM key to a DTLS virtual server.
- You cannot bind a certificate-key pair that is created by using an HSM key to an SSL service.
- You cannot use the GUI to enroll the ADC as a client of the HSM or check the status of the HSM from the configuration utility.
- From release 11 build 62.x, SSL renegotiation is supported.
- You cannot sign OCSP requests by using a certificate-key pair that is created by using an HSM key.
- A certificate bundle with HSM keys is not supported.
- An error does not appear if the HSM key and certificate do not match. Therefore, while adding a certificate-key pair, you must make sure that the HSM key and certificate match.
- Clustering and admin partitions are not supported.

Troubleshooting

September 14, 2021

If the SSL feature does not work as expected after configuration, you can use some common tools to access Citrix ADC resources and diagnose the problem.

Resources for troubleshooting

For best results, use the following resources to troubleshoot an SSL issue on a Citrix ADC appliance:

- The relevant ns.log file
- The latest ns.conf file
- The messages file
- The relevant `newnslog` file
- Trace files
- A copy of the certificate files, if possible
- A copy of the key file, if possible
- The error message, if any

In addition to these resources, you can use the Wireshark application customized for the Citrix ADC trace files to expedite troubleshooting.

Troubleshooting SSL issues

To troubleshoot an SSL issue, proceed as follows:

- Verify that the Citrix ADC appliance is licensed for SSL Offloading and load balancing.
- Verify that SSL Offloading and load balancing features are enabled on the appliance.
- Verify that the status of the SSL virtual server is not displayed as DOWN.
- Verify that the status of the service bound to the virtual server is not displayed as DOWN.
- Verify that a valid certificate is bound to the virtual server.
- Verify that the service is using an appropriate port, preferably port 443.

Decrypting TLS1.3 traffic from packet trace

To troubleshoot protocols that run over TLS1.3, you must first decrypt the TLS1.3 traffic. To decrypt TLS 1.3 in Wireshark, the secrets must be exported in the `NSS` key log format. For more information about the key log format, see NSS Key Log Format.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

For information about how to capture a packet trace, see Capturing SSL Session Keys During a Trace.

Note: Citrix ADC automatically logs each connection's secrets in the appropriate format for the TLS/SSL protocol version in use.

CRL refresh does not happen on the secondary node in an HA setup

The refresh does not happen because the CRL server is accessible only to the primary node through a private network.

Workaround: Add a service on the primary node with the IP address of the CRL server. This service acts as a proxy for the CRL server. When the configuration is synchronized between the nodes, CRL refresh works for both primary and secondary nodes through the service configured on the primary node.

SSL FAQs

September 14, 2021

Basic questions

HTTPS access to the GUI fails on a VPX instance. How do I gain access?

A certificate-key pair is required for HTTPS access to the GUI. On a Citrix ADC appliance, a certificate-key pair is automatically bound to the internal services. On an MPX or SDX appliance, the default key size is 1024 bytes, and on a VPX instance, the default key size is 512 bytes. However, most browsers today do not accept a key that is less than 1024 bytes. As a result, HTTPS access to the VPX configuration utility is blocked.

Citrix recommends that you install a certificate-key pair of at least 1024 bytes and bind it to the internal service for HTTPS access to the configuration utility. Alternately, update the `ns-server-certificate` to 1024 bytes. You can use HTTP access to the configuration utility or the CLI to install the certificate.

If I add a license to an MPX appliance, the certificate-key pair binding is lost. How do I resolve this problem?

If a license is not present on an MPX appliance when it starts, and you add a license later and restart the appliance, you might lose the certificate binding. Reinstall the certificate and bind it to the internal service

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Citrix recommends that you install an appropriate license before starting the appliance.

What are the various steps involved in setting up a secure channel for an SSL transaction?

Setting up a secure channel for an SSL transaction involves the following steps:

1. The client sends an HTTPS request for a secure channel to the server.
2. After selecting the protocol and cipher, the server sends its certificate to the client.
3. The client checks the authenticity of the server certificate.
4. If any of the checks fail, the client displays the corresponding feedback.
5. If the checks pass or the client decides to continue even if a check fails, the client creates a temporary, disposable key. This key is called the *pre-master secret* and the client encrypts this key by using the public key of the server certificate.
6. The server, upon receiving the pre-master secret, decrypts it by using the server's private key and generates the session keys. The client also generates the session keys from the pre-master secret. Thus both client and server now have a common session key, which is used for encryption and decryption of application data.

I understand that SSL is a CPU-intensive process. What is the CPU cost associated with the SSL process?

The following two stages are associated with the SSL process:

- The initial handshake and secure channel setup by using the public and private key technology.
- Bulk data encryption by using the symmetric key technology.

Both of the preceding stages can affect server performance, and they require intensive CPU processing for of the following reasons:

1. The initial handshake involves public-private key cryptography, which is very CPU intensive because of large key sizes (1024 bit, 2048 bit, 4096 bit).
2. Encryption/decryption of data is also computationally expensive, depending on the amount of data that must be encrypted or decrypted.

What are the various entities of an SSL configuration?

An SSL configuration has the following entities:

- Server certificate

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- Certificate Authority (CA) certificate
- Cipher suite that specifies the protocols for the following tasks:
  - Initial key exchange
  - Server and client authentication
  - Bulk encryption algorithm
  - Message authentication
- Client authentication
- CRL
- SSL Certificate Key Generation Tool that enables you to create the following files:
  - Certificate request
  - Self-signed certificate
  - RSA keys
  - DH parameters

I want to use the SSL offloading feature of the Citrix ADC appliance. What are the various options for receiving an SSL certificate?

You must receive an SSL certificate before you can configure the SSL setup on the Citrix ADC appliance. You can use any of the following methods to receive an SSL certificate:

- Request a certificate from an authorized certificate authority (CA).
- Use the existing server certificate.
- Create a certificate-key pair on the Citrix ADC appliance.

Note: This certificate is a test certificate signed by the test Root-CA generated by the Citrix ADC appliance. Test certificates signed by the test Root-CA are not accepted by browsers. The browser throws a warning message stating that the server's certificate cannot be authenticated.

- For anything other than test purposes, you must provide a valid CA certificate and CA key to sign the server certificate.

What are the minimum requirements for an SSL setup?

The minimum requirements for configuring an SSL setup are as follows:

- Obtain the certificates and keys.
- Create a load balancing SSL virtual server.
- Bind HTTP or SSL services to the SSL virtual server.
- Bind a certificate-key pair to the SSL virtual server.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

What are the limits for the various components of SSL?

SSL components have the following limits:

- Bit size of SSL certificates: 4096.
- Number of SSL certificates: Depends on the available memory on the appliance.
- Maximum linked intermediate CA SSL certificates: 9 per chain.
- CRL revocations: Depends on the available memory on the appliance.

What are the various steps involved in the end-to-end data encryption on a Citrix ADC appliance?

The steps involved in the server-side encryption process on a Citrix ADC appliance are as follows:

1. The client connects to the SSL VIP configured on the Citrix ADC appliance at the secure site.
2. After receiving the secure request, the appliance decrypts the request and applies layer 4–7 content switching techniques and load balancing policies. Then, it selects the best available back-end web server for the request.
3. The Citrix ADC appliance creates an SSL session with the selected server.
4. After establishing the SSL session, the appliance encrypts the client request and sends it to the Web server by using the secure SSL session.
5. When the appliance receives the encrypted response from the server, it decrypts and re-encrypts the data. Then, it sends the data to the client by using the client side SSL session.

The multiplexing technique of the Citrix ADC appliance enables the appliance to reuse SSL sessions that have been established with the Web servers. Therefore, the appliance avoids the CPU intensive key exchange, known as *full handshake*. This process reduces the overall number of SSL sessions on the server and maintains end-to-end security.

Certificates and Keys

Can I place the certificate and key files at any location? Is there any recommended location to store these files?

You can store the certificate and key files on the Citrix ADC appliance or a local computer. However, Citrix recommends that you store the certificate and key files in the `/nsconfig/ssl` directory of the Citrix ADC appliance. The `/etc` directory exists in the flash memory of the Citrix ADC appliance. This action provides portability and facilitates backup and restoration of the certificate files on the appliance.

Note: Make sure that the certificate and the key files are stored in the same directory.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

What is the maximum size of the certificate key supported on the Citrix ADC appliance?

A Citrix ADC appliance running a software release earlier than release 9.0 supports a maximum certificate key size of 2048 bits. Release 9.0 and later support a maximum certificate key size of 4096 bits. This limit is applicable to RSA certificates.

An MPX appliance supports certificates from 512 bits up to the following sizes:

- 4096-bit server certificate on the virtual server
- 4096-bit client certificate on the service
- 4096-bit CA certificate (includes intermediate and root certificates)
- 4096-bit certificate on the back end server
- 4096-bit client certificate (if client authentication is enabled on the virtual server)

A virtual appliance supports certificates from 512 bits up to the following sizes:

- 4096-bit server certificate on the virtual server
- 4096-bit client certificate on the service
- 4096-bit CA certificate (includes intermediate and root certificates)
- 4096-bit certificate on the back end server from release 12.0-56.x. Older releases support 2048-bit certificates.
- 2048-bit client certificate (if client authentication is enabled on the virtual server) from release 12.0-56.x.

What is the maximum size of the DH parameter supported on the Citrix ADC appliance?

The Citrix ADC appliance supports a DH parameter of maximum 2048 bits.

What is the maximum certificate-chain length, that is, the maximum number of certificates in a chain, supported on a Citrix ADC appliance?

A Citrix ADC appliance can send a maximum of 10 certificates in a chain when sending a server certificate message. A chain of the maximum length includes the server certificate and nine intermediate CA certificates.

What are the various certificate and key formats supported on the Citrix ADC appliance?

The Citrix ADC appliance supports the following certificate and key formats:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- Privacy Enhanced Mail (PEM)
- Distinguished Encoding Rule (DER)

Is there a limit for the number of certificates and keys that I can install on the Citrix ADC appliance?

No. The number of certificates and keys that can be installed is limited only by the available memory on the Citrix ADC appliance.

I have saved the certificate and key files on the local computer. I want to transfer these files to the Citrix ADC appliance by using the FTP protocol. Is there any preferred mode for transferring these files to the Citrix ADC appliance?

Yes. If using the FTP protocol, you must use binary mode to transfer the certificate and key files to the Citrix ADC appliance.

Note: By default, FTP is disabled. Citrix recommends using the SCP protocol for transferring certificate and key files. The configuration utility implicitly uses SCP to connect to the appliance.

What is the default directory path for the certificate and key?

The default directory path for the certificate and key is '/nsconfig/ssl'.

When adding a certificate and key pair, what happens if I do not specify an absolute path to the certificate and key files?

When adding a certificate-key pair, specify an absolute path to the certificate and key files. If you do not specify, the ADC appliance searches the default directory for these files and attempts to load them to the kernel. The default directory is /nsconfig/ssl. For example, if the cert1024.pem and rsa1024.pem files are available in the /nsconfig/ssl directory of the appliance, both of the following commands are successful:

```
1 add ssl certKey cert1 -cert cert1204.pem -key rsa1024.pem
```

```
1 add ssl certKey cert1 -cert /nsconfig/ssl/cert1204.pem -key /nsconfig/
     ssl/rsa1024.pem
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

I have configured a high availability setup. I want to implement the SSL feature on the setup. How must I handle the certificate and key files in a high availability setup?

In a high availability setup, you must store the certificate and key files on both the primary and the secondary Citrix ADC appliance. The directory path for the certificate and key files must be the same on both appliances before you add an SSL certificate-key pair on the primary appliance.

nCipher nShield® HSM

When integrating with nCipher nShield® HSM, do we have to keep in mind any specific configuration when adding the Citrix ADC appliance to HA?

Configure the same nCipher devices on both the nodes in HA. nCipher configuration commands don't synchronize in HA. For information about the prerequisites for nCipher nShield® HSM, see Prerequisites.

Do we have to individually integrate both the appliances with nCipher nShield® HSM and RFS? Do we need to complete this action before or after the HA setup?

You can complete the integration before or after the HA setup. If the integration is done after the HA setup, the keys imported on the primary node before configuring the secondary node are not synced to the secondary node. Therefore, Citrix recommends nCipher integration before the HA setup.

Do we need to import the key into both the primary and secondary Citrix ADC appliances, or are the keys synchronized from the primary node to the secondary node?

If nCipher is integrated on both devices before forming the HA, the keys are automatically synchronized from RFS in the process of integration.

Given that the HSM is not on the Citrix ADC appliance, but on nCipher, what happens to the keys and certificates when a node fails and is replaced?

If a node fails, you can synchronize the keys and certificates to the new node, by integrating nCipher on the new node. Then, run the following commands:

```
sync ha files ssl
force ha sync
```

The certificates are synchronized and added if the keys are synchronized in the process of integrating nCipher.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Ciphers

What is a NULL-Cipher?

Ciphers with no encryption are known as NULL-Ciphers. For example, NULL-MD5 is a NULL-Cipher.

Are the NULL-Ciphers enabled by default for an SSL VIP or an SSL service?

No. NULL-Ciphers are not enabled by default for an SSL VIP or an SSL service.

What is the procedure to remove NULL-Ciphers?

To remove the NULL-Ciphers from an SSL VIP, run the following command:

```
bind ssl cipher <SSL_VIP> REM NULL
```

To remove the NULL-Ciphers from an SSL Service, run the following command:

```
bind ssl cipher <SSL_Service> REM NULL -service
```

What are the various cipher aliases supported on the Citrix ADC appliance?

To list the cipher aliases supported on the appliance, at the command prompt, type:

```
sh cipher
```

What is the command to display all the predefined ciphers of the Citrix ADC appliance?

To display all the predefined ciphers of the Citrix ADC appliance, at the CLI, type:

```
show ssl cipher
```

What is the command to display the details of an individual cipher of the Citrix ADC appliance?

To display the details of an individual cipher of the Citrix ADC appliance, at the CLI, type:

```
show ssl cipher <Cipher_Name/Cipher_Alias_Name/Cipher_Group_Name>
```

Example:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
show cipher SSL3-RC4-SHA
     1) Cipher Name: SSL3-RC4-SHA
     Description: SSLv3 Kx=RSA Au=RSA Enc=RC4(128)
    Mac=SHA1
     Done
```

What is the significance of adding the predefined ciphers of the Citrix ADC appliance?

Adding the predefined ciphers of the Citrix ADC appliance causes the NULL-Ciphers to get added to an SSL VIP or an SSL service.

Is it possible to change the cipher's order without unbinding them from a cipher group on a Citrix ADC appliance?

Yes. It is possible to change the cipher's order without unbinding the ciphers from a custom cipher group. However, you cannot change the priority in inbuilt cipher groups. To change the priority of a cipher bound to an SSL entity, first unbind the cipher from the virtual server, service, or service group.

Note: If the cipher group bound to an SSL entity is empty, the SSL handshake fails because there is no negotiated cipher. The cipher group must contain at least one cipher.

Is ECDSA supported on the Citrix ADC appliance?

ECDSA is supported on the following Citrix ADC platforms. For details of supported builds, see Table 1 and Table 2 in Ciphers available on the Citrix ADC appliances.

- Citrix ADC MPX and SDX appliances with N3 chips
- Citrix ADC MPX 5900/8900/15000/26000
- Citrix ADC SDX 8900/15000
- Citrix ADC VPX appliances

Does the Citrix ADC VPX appliance support AES-GCM/SHA2 ciphers on the front-end?

Yes, AES-GCM/SHA2 ciphers are supported on the Citrix ADC VPX appliance. For details about the supported builds, see Ciphers available on the Citrix ADC appliances.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Certificates

Is the distinguished name in a client certificate available for the length of the user session?

Yes. You can access the distinguished name of the client certificate in subsequent requests during the length of the user session. That is, even after the SSL handshake is complete and the certificate is not sent again by the browser. Use a variable and an assignment as detailed in the following sample configuration:

Example:

```
add ns variable v2 -type "text(100)"

add ns assignment a1 -variable "$v2" -set       "CLIENT.SSL.CLIENT_CERT
    .SUBJECT.TYPECAST_NVLIST_T('=','/').VALUE("CN")"

add rewrite action act1 insert_http_header subject "$v2"  // example:
    to insert the distinguished name in the header

add rewrite policy pol1 true a1

add rewrite policy pol2 true act1

bind rewrite global pol1 1 next -type RES_DEFAULT

bind rewrite global pol2 2 next -type RES_DEFAULT

set rewrite param -undefAction RESET
```

Why do I need to bind the server certificate?

Binding the server certificates is the basic requirement for enabling the SSL configuration to process SSL transactions.

To bind the server certificate to an SSL VIP, at the CLI, type:

```
bind ssl vserver <vServerName> -certkeyName <cert_name>
```

To bind the server certificate to an SSL service, at the CLI, type:

```
bind ssl service <serviceName> -certkeyName <cert_name>
```

How many certificates can I bind to an SSL VIP or an SSL service?

On a Citrix ADC VPX, MPX/SDX (N3), and MPX/SDX 14000 FIPS appliance, you can bind two certificates to an SSL virtual server or an SSL service if SNI is disabled. The certificates must be one each of type RSA and ECDSA. If SNI is enabled, you can bind multiple server certificates of type RSA or ECDSA. On

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

a Citrix ADC MPX (N2) or MPX 9700 FIPS appliance, if SNI is disabled, you can bind only one certificate of type RSA. If SNI is enabled, you can bind multiple server certificates of type RSA only.

What happens if I unbind or overwrite a server certificate?

When you unbind or overwrite a server certificate, all the connections and SSL sessions created by using the existing certificate are terminated. When you overwrite an existing certificate, the following message appears:

```
ERROR:

Warning: Current certificate replaces the previous binding.
```

How do I install an intermediate certificate on a Citrix ADC appliance and link to a server certificate?

See the article at http://support.citrix.com/article/ctx114146 for information about installing an intermediate certificate.

Why am I getting a "resource already exists"error when I try to install a certificate on the Citrix ADC?

See the article at http://support.citrix.com/article/CTX117284 for instructions for resolving the "resource already exists"error.

I want to create a server certificate on a Citrix ADC appliance to test and evaluate the product. What is the procedure to create a server certificate?

Perform the following procedure to create a test certificate.

Note: A certificate created with this procedure cannot be used to authenticate all the users and browsers. After using the certificate for testing, you must obtain a server certificate signed by an authorized Root certificate authority.

To create a self-signed server certificate:

1. To create a Root CA certificate, at the CLI, type:

```
create ssl rsakey /nsconfig/ssl/test-ca.key 1024

create ssl certreq /nsconfig/ssl/test-ca.csr -keyfile /nsconfig/
   ssl/test-ca.key

```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
Enter the required information when prompted, and then type the
    following command:

create ssl cert /nsconfig/ssl/test-ca.cer /nsconfig/ssl/test-ca.
    csr ROOT_CERT -keyfile /nsconfig/ssl/test-ca.key
```

2. Perform the following procedure to create a server certificate and sign it with the root CA certificate that you just created

   a) To create the request and the key, at the CLI, type:

   ```
   create ssl rsakey /nsconfig/ssl/test-server.key 1024

       create ssl certreq /nsconfig/ssl/test-server.csr -keyfile
           /nsconfig/ssl/test-server.key
   ```

   b) Enter the required information when prompted.

   c) To create a serial-number file, at the CLI, type:

   ```
   shell
    # echo '01' >
   /nsconfig/ssl/serial.txt
    # exit
   ```

   d) To create a server certificate signed by the root CA certificate created in step 1, at the CLI, type:

   ```
   create ssl cert /nsconfig/ssl/test-server.cer /nsconfig/ssl/
       test-server.csr SRVR_CERT -CAcert /nsconfig/ssl/test-ca.cer
        -CAkey /nsconfig/ssl/test-ca.key -CAserial /nsconfig/ssl/
       serial.txt
   ```

   e) To create a Citrix ADC cert-key pair, which is the in-memory object that holds the server certificate information for SSL handshakes and bulk encryption, at the CLI, type:

   ```
   add ssl certkey test-certkey -cert /nsconfig/ssl/test-server.
       cer -key /nsconfig/ssl/test-server.key
   ```

   f) To bind the cert-key pair to the SSL virtual server, at the CLI, type:

   ```
   bind ssl vserver <vServerName> -certkeyName <cert_name>
   ```

I have received a Citrix ADC appliance on which NetScaler software release 9.0 is installed. I have noticed an extra license file on the appliance. Is there any change in the licensing policy starting with NetScaler software release 9.0?

Yes. Starting with Citrix NetScaler software release 9.0, the appliance might not have a single license file. The number of license files depends on the Citrix ADC software release edition. For example, if

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

you have installed the Advanced edition, you might need extra license files for the full functionality of the various features. However, if you have installed the Premium edition, the appliance has only one license file.

How do I export the certificate from the Internet Information Service (IIS)?

There are many ways, but by using the following method the appropriate certificate and private key for the website are exported. This procedure must be performed on the actual IIS server.

1. Open the Internet Information Services (IIS) Manager administration tool.
2. Expand the websites node and locate the SSL-enabled website that you want to serve through the Citrix ADC appliance.
3. Right-click this website and click Properties.
4. Click the Directory Security tab and, in the Secure Communications section of the window, select the View Certificate box.
5. Click the Details tab, and then click Copy to File.
6. On the Welcome to the Certificate Export Wizard page, click Next.
7. Select Yes, export the private key, and click Next.

   Note: The private key MUST be exported for SSL Offload to work on the Citrix ADC.
8. Make sure that the Personal Information Exchange -PKCS #12 radio button is selected, and select *only* the Include all certificates in the certification path if possible check box. Click Next.
9. Enter a password and click Next.
10. Enter a file name and location, and then click Next. Give the file an extension of .PFX.
11. Click Finish.

How do I convert the PKCS#12 certificate and install it on the Citrix ADC?

1. Move the exported .PFX certificate file to a location from where it can be copied to the Citrix ADC appliance. That is, to a machine that permits SSH access to the management interface of a Citrix ADC appliance. Copy the certificate to the appliance by using a secure copy utility such as SCP.
2. Access the BSD shell and convert the certificate (for example, cert.PFX) to .PEM format:

   ```
   1 root@ns# openssl pkcs12 -in cert.PFX -out cert.PEM
   ```
3. To make sure that the converted certificate is in the correct x509 format, verify that the following command produces no error:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
root@ns# openssl x509 -in cert.PEM -text
```

4. Verify that the certificate file contains a private key. Begin by issuing the following command:

```
root@ns# cat cert.PEM

Verify that the output file includes an RSA PRIVATE KEY section.

-----BEGIN RSA PRIVATE KEY-----
Mkm^s9KMs9023pz/s...
-----END RSA PRIVATE KEY-----
```

The following is another example of an RSA PRIVATE KEY section:

```
    Bag Attributes
    1.3.6.1.4.1.311.17.2: <No Values>
    localKeyID: 01 00 00 00
    Microsoft CSP Name: Microsoft RSA SChannel Cryptographic
    Provider
    friendlyName:
    4b9cef4cc8c9b849ff5c662fd3e0ef7e_76267e3e-6183-4d45-886e-6
       e067297b38f

    Key Attributes
    X509v3 Key Usage: 10
    -----BEGIN RSA PRIVATE KEY-----
    Proc-Type: 4,ENCRYPTED
    DEK-Info: DES-EDE3-CBC,43E7ACA5F4423968
    pZJ2SfsSVqMbRRf6ug37Clua5gY0Wld4frPIxFXyJquUHr31dilW5ta3hbIaQ+
       Rg

    ... (more random characters)
    v8dMugeRplkaH2Uwt/mWBk4t71Yv7GeHmcmjafK8H8iW80ooPO3D/ENV8X4U/
       tlh

    5eU6ky3WYZ1BTy6thxxLlwAullynVXZEflNLxq1oX+ZYl6djgjE3qg==
    -----END RSA PRIVATE KEY-----
```

The following is a SERVER CERTIFICATE section:

```
    Bag Attributes
    localKeyID: 01 00 00 00
    friendlyName: AG Certificate
    subject=/C=AU/ST=NSW/L=Wanniassa/O=Dave Mother
    Asiapacific/OU=Support/CN=davemother.food.lan
    issuer=/DC=lan/DC=food/CN=hotdog
    -----BEGIN CERTIFICATE-----
    MIIFiTCCBHGgAwIBAgIKCGryDgAAAAAHzANBgkqhkiG9w0BAQUFADA8MRMwEQYK

    ... (more random characters) 5
       pLDWYVHhLkA1pSxvFjNJHRSIydWHc5ltGyKqIUcBezVaXyel94pNSUYx07NpPV
       /
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
11
12      MY2ovQyQZM8gGe3+lGFum0VHbv/y/gB9HhFesog=
13      -----END CERTIFICATE-----
```

The following is an INTERMEDIATE CA CERTIFICATE section:

```
1       Bag Attributes: <Empty Attributes>
2       subject=/DC=lan/DC=food/CN=hotdog
3       issuer=/DC=lan/DC=food/CN=hotdog
4       -----BEGIN CERTIFICATE-----
5       MIIESDCCAzCgAwIBAgIQah20fCRYTY9LRXYMIRaKGjANBgkqhkiG9w0BAQUFADA8
6
7       ... (more random characters)
           Nt0nksawDnbKo86rQcNnY5xUs7c7pj2zxj/IOsgNHUp5W6dDI9pQoqFFaDk
           =
8
9       -----END CERTIFICATE-----
```

Further Intermediate CA certificates might follow, depending on the certification path of the exported certificate.

5. Open the .PEM file in a text editor
6. Locate the first line of the .PEM file and the first instance of the following line, and copy those two lines and all the lines between them:

```
1  -----END CERTIFICATE-----
2
3  Note: Make sure that last copied line is the first
4  -----END CERTIFICATE----- line in the .PEM file.
```

7. Paste the copied lines into a new file. Call the new file something intuitive, such as cert-key.pem. This certificate-key pair is for the server hosting the HTTPS service. This file must contain both the section labeled RSA PRIVATE KEY and the section labeled SERVER CERTIFICATE in the preceding example.

   Note: The certificate-key pair file contains the private key and must be kept secure.

8. Locate any subsequent sections beginning with ––BEGIN CERTIFICATE––and ending with ––END CERTIFICATE––, and copy each such section to a separate new file.

   These sections correspond to certificates of trusted CAs that have been included in the certification path. These sections must be copied and pasted into new individual files for these certificates. For example, the INTERMEDIATE CA CERTIFICATE section of the preceding example must be copied and pasted into a new file).

   For multiple intermediate CA certificates in the original file, create files for each intermediate CA certificate in the order in which they appear in the file. Keep track (using appropriate file names)

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

of the order in which the certificates appear, as they must be linked together in the correct order in a later step.

9. Copy the certificate-key file (cert-key.pem) and any additional CA certificate files into the /nsconfig/ssl directory on the Citrix ADC appliance.
10. Exit the BSD shell and access the Citrix ADC prompt.
11. Follow the steps in "Install the certificate-key files on the appliance"to install the key/certificate once uploaded on the device.

How do I convert the PKCS#7 certificate and install it on the Citrix ADC appliance?

You can use OpenSSL to convert a PKCS #7 Certificate to a format recognizable by the Citrix ADC appliance. The procedure is identical to the procedure for PKCS #12 certificates, except that you invoke OpenSSL with different parameters. The steps for converting PKCS #7 certificates are as follows:

1. Copy the certificate to the appliance by using a secure copy utility, such as SCP.
2. Convert the certificate (for example, cert.P7B) to PEM format:

```
openssl pkcs7 -inform DER -in cert.p7b -print_certs -text -out
    cert.pem
```

3. Follow steps 3 through 7 as described in the answer for PKCS #12 certificates.
   Note: Before loading the converted PKCS #7 certificate to the appliance, verify that it contains a private key, exactly as described in step 3 for the PKCS #12 procedure. PKCS #7 certificates, particularly the certificates exported from IIS, do not typically contain a private key.

When I bind a cipher to a virtual server or service by using the bind cipher command, I see the error message "Command deprecated."?

The command for binding a cipher to a virtual server or service has changed.

Use the `bind ssl vserver <vsername> -ciphername <ciphername>` command to bind an SSL cipher to an SSL virtual server.

Use the `bind ssl service <serviceName> -ciphername <ciphername>` command to bind an SSL cipher to an SSL service.

Note: New ciphers and cipher groups are added to the existing list and not replaced.

Why can't I create a cipher group and bind ciphers to it by using the add cipher command?

The add cipher command functionality has changed in release 10. The command only creates a cipher group. To add ciphers to the group, use the bind cipher command.

OpenSSL

How do I use OpenSSL to convert certificates between PEM and DER?

To use OpenSSL, you must have a working installation of the OpenSSL software and be able to run OpenSSL from the command line.

x509 certificates and RSA keys can be stored in several different formats.

Two common formats are:

- DER (a binary format used primarily by Java and Macintosh platforms)
- PEM (a base64 representation of DER with header and footer information, which is used primarily by UNIX and Linux platforms).

A key and the corresponding certificate, in addition to the root and any intermediate certificates, can also be stored in a single PKCS#12 (.P12, .PFX) file.

Procedure

Use the **OpenSSL** command to convert between formats as follows:

1. To convert a certificate from PEM to DER:

```
x509 -in input.crt -inform PEM -out output.crt -outform DER
```

2. To convert a certificate from DER to PEM:

```
x509 -in input.crt -inform DER -out output.crt -outform PEM
```

3. To convert a key from PEM to DER:

```
rsa -in input.key -inform PEM -out output.key -outform DER
```

4. To convert a key from DER to PEM:

```
rsa -in input.key -inform DER -out output.key -outform PEM
```

   Note: If the key you are importing is encrypted with a supported symmetric cipher, you are prompted to enter the pass-phrase.

   Note: To convert a key to or from the obsolete NET (Netscape server) format, substitute NET for PEM or DER as appropriate. The stored key is encrypted in a weak unsalted RC4 symmetric cipher, so a pass-phrase is requested. A blank pass-phrase is acceptable.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

System Limits

What are the important numbers to remember?

1. Create Certificate Request:

    - Request File Name: Maximum 63 characters
    - Key File Name: Maximum 63 characters
    - PEM Passphrase (For Encrypted Key): Maximum 31 characters
    - Common Name: Maximum 63 characters
    - City: Maximum 127 characters
    - Organization Name: Maximum 63 characters
    - State/Province Name: Maximum 63 characters
    - Email Address: Maximum 39 Characters
    - Organization Unit: Maximum 63 characters
    - Challenge Password: Maximum 20 characters
    - Company Name: Maximum 127 characters

2. Create Certificate:

    - Certificate File Name: Maximum 63 characters
    - Certificate Request File Name: Maximum 63 characters
    - Key File Name: Maximum 63 characters
    - PEM Passphrase: Maximum 31 characters
    - Validity Period: Maximum 3650 days
    - CA Certificate File Name: Maximum 63 characters
    - CA Key File Name: Maximum 63 characters
    - PEM Passphrase: Maximum 31 characters
    - CA Serial Number File: Maximum 63 characters

3. Create and Install a Server Test Certificate:

    - Certificate File Name: Maximum 31 characters
    - Fully Qualified Domain Name: Maximum 63 characters

4. Create Diffie-Hellman (DH) key:

    - DH File Name (with path): Maximum 63 characters
    - DH Parameter Size: Maximum 2048 bits

5. Import PKCS12 key:

    - Output File Name: Maximum 63 characters
    - PKCS12 File Name: Maximum 63 characters

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- Import Password: Maximum 31 characters
- PEM Passphrase: Maximum 31 characters
- Verify PEM Passphrase: Maximum 31 characters

6. Export PKCS12

   - PKCS12 File Name: Maximum 63 characters
   - Certificate File Name: Maximum 63 characters
   - Key File Name: Maximum 63 characters
   - Export Password: Maximum 31 characters
   - PEM Passphrase: Maximum 31 characters

7. CRL Management:

   - CA Certificate File Name: Maximum 63 characters
   - CA Key File Name: Maximum 63 characters
   - CA Key File Password: Maximum 31 characters
   - Index File Name: Maximum 63 characters
   - Certificate File Name: Maximum 63 characters

8. Create RSA Key:

   - Key File Name: Maximum 63 characters
   - Key Size: Maximum 4096 bits
   - PEM Passphrase: Maximum 31 characters
   - Verify Passphrase: Maximum 31 characters

9. Change advanced SSL settings:

   - Maximum CRL memory size: Maximum 1024 Mbytes
   - Encryption trigger timeout (10 mS ticks): Maximum 200
   - Encryption trigger packet count: Maximum 50
   - OCSP cache size: Maximum 512 Mbytes

10. Install Certificate:

    - Certificate-Key pair Name: Maximum 31 characters
    - Certificate File Name: Maximum 63 characters
    - Private Key File Name: Maximum 63 characters
    - Password: Maximum 31 characters
    - Notification Period: Maximum 100

11. Create Cipher Group:

    - Cipher Group Name: Maximum 39 characters

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

12. Create CRL:

    - CRL Name: Maximum 31 characters
    - CRL File: Maximum 63 characters
    - URL: Maximum 127 characters
    - Base DN: Maximum 127 characters
    - Bind DN: Maximum 127 characters
    - Password: Maximum 31 characters
    - Days: Maximum 31

13. Create SSL Policy:

    - Name: Maximum 127 characters

14. Create SSL Action:

    - Name: Maximum 127 characters

15. Create OCSP Responder:

    - Name: Maximum 32 characters
    - URL: Maximum 128 characters
    - Batching Depth: Maximum 8
    - Batching Delay: Maximum 10000
    - Produced At Time Skew: Maximum 86400
    - Request Time-out: Maximum120000

16. Create Virtual Server:

    - Name: Maximum 127 characters
    - Redirect URL: Maximum 127 characters
    - Client Time-out: Maximum 31536000 secs

17. Create Service:

    - Name: Maximum 127 characters
    - Idle Time-out (secs):
      Client: Maximum 31536000
      Server: Maximum 31536000

18. Create Service Group:

    - Service Group Name: Maximum 127 characters
    - Server ID: Maximum 4294967295

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- Idle Time-out (secs):
  Client: Maximum value 31536000
  Server: Maximum 31536000

19. Create Monitor:

    - Name: Maximum 31 characters

20. Create Server:

    - Server Name: Maximum 127 characters
    - Domain Name: Maximum 255 characters
    - Resolve Retry: Maximum 20939 secs

Content inspection

September 14, 2021

In recent times, there is an expansion of device types to display various multimedia content. The device types can be of mobile handsets to tablets, and to desktops. Intermediate infrastructure providers need to transform the original content from a web server to a format suitable for the device that asks for the content. The external devices inspect the content that transcodes and send it back to the client. Commonly used protocol to achieve this is ICAP. ICAP enables the Citrix ADC appliance to be put in various deployments. ICAP uses the content inspection technique that inspects data for malware and security issues.

> **Note**
>
> HTTP/2 is not compatible with content inspection. The applications using the HTTP/2 might not function properly if the traffic is sent through the content inspection.

ICAP for remote content inspection

September 14, 2021

The Internet Content Adaptation Protocol (ICAP) is a simple lightweight protocol for running the value-added transformation service on HTTP messages. In a typical scenario, an ICAP client forwards HTTP requests and responses to one or more ICAP servers for processing. The ICAP servers perform content transformation on the requests and send back responses with appropriate action to take on the request or response.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

ICAP on a Citrix ADC appliance

In a Citrix ADC setup, the appliance acts as an ICAP client interoperating with third-party ICAP servers (such as antimalware and Data Loss Protection (DLP)). When the appliance receives an incoming web traffic, the appliance intercepts the traffic and uses a Content Inspection policy to evaluate if the HTTP request needs an ICAP processing. If yes, the appliance decrypts and sends the message as a plain text to the ICAP servers. The ICAP servers run the content transformation service on the request message and send back a response to the appliance. The adapted messages can either be an HTTP request or an HTTP response. If the appliance interoperates with multiple ICAP servers, the appliance performs load balancing of ICAP servers. This scenario happens when one ICAP server is not sufficient to handle all the traffic load. Once the ICAP servers return a modified message, the appliance forwards the modified message to the back-end origin server.

The Citrix ADC appliance also provides a secured ICAP service if the incoming traffic is an HTTPS type. The appliance uses an SSL based TCP service to establish a secured connection between the appliance and ICAP servers.

How ICAP request modification (REQMOD) works

In the request modification (REQMOD) mode, the Citrix ADC appliance forwards the HTTP request received from the client to the ICAP server. The ICAP server then performs one of the following:

1. Sends back a modified version of the request and the appliance in turn sends the modified request to the back-end origin server or it pipelines the modified request to another ICAP server.
2. Responds with a message indicating no adaptation is required.
3. Returns an error and the appliance in turn sends the error message back to the user.

How ICAP response modification (RESPMOD) works

In the response modification (RESPMOD) mode, the Citrix ADC appliance sends an HTTP response to the ICAP server (the response sent by the appliance is typically the response sent by the origin server). The ICAP server then performs one of the following:

1. Sends a modified version of the response and the appliance in turn sends the response to the user or pipelines the response to another ICAP server.
2. Responds with a message indicating no adaptation is required.
3. Returns an error and the appliance in turn sends the error message to the user.

ICAP license

The ICAP feature works on a Citrix ADC standalone or high availability setup with Citrix ADC Premium or Advanced license edition.

Configure ICAP for content transformation service

To use ICAP for content transformation service, you must begin by enabling the Content inspection and load balancing features. Once you enable the features, you can complete the following tasks

To enable content inspection

If you want the Citrix ADC appliance to act as an ICAP client, you must first enable the Content Inspection and load balancing features.

At the command prompt, type:

```
enable ns feature contentInspection LoadBalancing
```

Add ICAP profile

ICAP configurations for a Citrix ADC appliance are specified in an entity called the ICAP profile. The profile has a collection of the ICAP settings. The settings include parameters to dynamically generate an ICAP request, receive the ICAP response, and log content inspection data.

To dynamically generate an ICAP request to the ICAP server, a new parameter, "insertHTTPRequest" is added to the ICAP profile. If this parameter is configured, the appliance takes the configured value as a policy expression and evaluates the expression and includes the result as an encapsulated HTTP request or response and then sent it to the ICAP server. Also, a new parameter "insertICAPHeaders"is configurable to dynamically evaluate and include the ICAP headers.

When the appliance sends an ICAP request and does not receive a response the ICAP server, the connection becomes unresponsive. It occurs until the ICAP server sends a response or a session gets freed. The behavior can be handled by configuring the ICAP response time-out option. You can set a request time-out parameter for action if there is delayed ICAP response. If the Citrix ADC appliance does not receive a response within the configured request time-out, the request timeout action is performed.

ReqTimeoutAction: Possible values are BYPASS, RESET, DROP.
BYPASS: This Ignores the remote ICAP server's response and sends the request/response to Client/Server.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

RESET (default): Reset the client connection by closing it.
DROP: Drop the request without sending a response to the user

To evaluate an ICAP response, a new policy expression `ICAP.RES` is used in the content inspection callout return expression. This expression evaluates the ICAP response similar to the `HTTP.RES` expression in a `HTTP_CALLOUT`.

For example, when a Citrix ADC appliance receives an HTTP request for a service hosted behind the Citrix ADC virtual IP address, the appliance might have to check the client's authentication with an external server and take an action.

At the command prompt, type:

```
add ns icapProfile <name> [-preview ( ENABLED | DISABLED )][-previewLength
 <positive_integer>] -uri <string> [-hostHeader <string>] [-userAgent
 <string>] -Mode ( REQMOD | RESPMOD )[-queryParams <string>] [-
connectionKeepAlive ( ENABLED | DISABLED )][-allow204 ( ENABLED
 | DISABLED )] [-insertICAPHeaders <string>][-insertHTTPRequest
 <string>] [-reqTimeout <positive_integer>][-reqTimeoutAction <
reqTimeoutAction>] [-logAction <string>]
```

Example:

```
add icapprofile reqmod-profile -mode RESPMOD -uri “/req_scan” -hostHeader
 “Webroot.reqsca” -useragent “NS_SWG-Proxy”
```

```
add ns icapProfile icap_prof1 -uri "/example"-Mode REQMOD -reqtimeout
 4 -reqtimeoutaction BYPASS
```

```
> add icapProfile reqmode-profile -uri '/example'-mode REQMOD -
insertHTTPRequest q{ HTTP.REQ.METHOD + ""+ HTTP.REQ.URL + "HTTP/1.1\r
\n"+ "Host: "+ HTTP.REQ.HOSTNAME + "\r\n\r\n"}
```

Log ICAP content inspection action To dynamically generate content inspection log stream records or SYSLOG logs, you can use the ICAP.RES based policy expression on the ICAP response. This parameter is configurable in the ICAP profile to configure the policy expression to generate the dynamic log records.

At the command prompt, type:

```
add audit messageaction icap_log_expr INFORMATIONAL icap.res.full_header
```

```
set icapProfile reqmode-profile -logAction messageaction
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Add ICAP service as a TCP or SSL_TCP service

After you enable the Content Inspection feature, you must add an ICAP service for the ICAP servers that will be part of the load balancing setup. The service that you add provides the ICAP connection between the Citrix ADC appliance and load balancing virtual servers.

Note: As an administrator, you can add an ICAP service and directly configure the ICAP server IP address in the Content Inspection action.

At the command prompt, type the following:

```
add service <name> <IP> <serviceType> <port>
```

Example:

```
add service icapsv1 10.10.10.10 SSL_TCP 1345
add service icapsv2 10.10.10.11 SSL_TCP 1345
```

Add a TCP or SSL_TCP based load balancing virtual server

After creating an ICAP service, you must create a virtual server to accept ICAP traffic and load balance the ICAP servers.

> **Note:**
>
> You can also use an SSL based TCP service over a secured channel. You use a SSL_TCP service and bind to the Content Inspection action.

At the command prompt, type the following:

```
add lb vserver <name> <serviceType> <port>
```

Example:

```
add lb vserver vicap TCP 0.0.0.0 – persistenceType NONE -cltTimeout
    9000

add lb vserver vicap SSL_TCP 0.0.0.0 0 – persistenceType NONE -
    cltTimeout 9000
```

Bind ICAP service to the load balancing virtual server

After you create an ICAP service and virtual server, you must bind the ICAP service to the virtual server.

At the command prompt, type the following:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
bind lb vserver <name> <serviceName>
```

Example:

```
bind lb vserver vicap icapsv1
```

Add content inspection action

After you enable the Content Inspection feature, you must add an ICAP action for handling the ICAP request information. The ICAP profile and services, or load balancing virtual server that are created are bound to the ICAP action. If the ICAP server is down, you can configure the `ifserverdown` parameter for the appliance to perform any one of the following actions.

CONTINUE: If the User wants to bypass the content inspection when the remote server is down, you can choose the "CONTINUE"action, as default.
RESET (default): This action responds to the client by closing the connection with RST.
DROP: This action silently drops the packets without sending a response to the user.

At the command prompt, type the following:

```
add contentInspection action <name> -type ICAP -serverName <string> -
    icapProfileName <string>

add ContentInspection action <name> -type ICAP -serverip <ip> -
    serverport <port> -icapProfileName <string>
```

> **Note:**
>
> If you can configure the ICAP service instead of a load balancing virtual server, you can mention the service name in the \<-serverip> option. When adding the Content Inspection action, the TCP service is automatically created for the given IP address with port 1344 and it is used for ICAP communication.

Example:

```
add ContentInspection action ci_act_lb -type ICAP -serverName vicap -
    icapProfileName icap_reqmod

add ContentInspection action ci_act_svc -type ICAP -serverName icapsv1
    -icapProfileName icap_reqmod

add ContentInspection action ci_act_svc -type ICAP -serverip 1.1.1.1 -
    serverport 1344 -icapProfileName icap_reqmod
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Add content inspection policies

After you create a Content Inspection action, you must create content inspection policies to evaluate requests for ICAP processing and audit logging. The policy is based on a rule which consists of one or more expressions. The rule is associated to the content inspection action that is associated if a request matches the rule.

At the command prompt, type the following:

```
add contentInspection policy <name> -rule <expression> -action <string>
```

Example:

```
add ContentInspection policy ci_pol_basic – rule true – action
    ci_act_svc

add ContentInspection policy ci_pol_HTTP – rule HTTP.REQ.URL.CONTAINS(
    “ html ” ) – action ci_act_svc
```

Bind content inspection policies to the content switching or load balancing virtual server

To put an ICAP policy into effect, you must bind it globally or bind it to a Content Switching or load balancing virtual server, which front end the application. When you bind the policy, you must assign a priority to it. The priority determines the order in which the policies you define are evaluated.

> **Note:**
>
> The application virtual server must be of type - HTTP/SSL/CS-PROXY.

For information about configuring a load balancing setup for forwarding the traffic to the back-end origin server after content transformation, see Load Balancing.

Configure secured ICAP service

To establish a secured connection between the Citrix ADC appliance and the ICAP web servers, the appliance uses an SSL-based TCP service or load balancing virtual server bound to an ICAP action.

To establish a secured ICAP connection, complete the following tasks:

1. Add SSL-based TCP service.
2. Bind SSL-based TCP service to load balancing virtual server of type TCP or SSL_TCP.
3. Bind SSL-based TCP service or load balancing virtual server to Content Inspection action.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Add SSL-based TCP service to load balancing virtual server

To establish a secured connection between the Citrix ADC appliance and the ICAP web servers, the appliance uses an SSL-based TCP service or load balancing virtual server bound to an ICAP action.

To establish a secured ICAP connection, complete the following tasks:

1. Add SSL-based TCP service.
2. Bind SSL-based TCP service to load balancing virtual server of type TCP or SSL_TCP.

Bind SSL-based TCP service or load balancing virtual server to Content Inspection action

Add SSL-based TCP service to load balancing virtual server

After you enable the Content Inspection feature, you must add a secured ICAP service that will be part of the load balancing setup. The service that you add provides a secured ICAP connection between the Citrix ADC appliance and load balancing virtual servers.

At the command prompt, type the following:

```
add service <name> <IP> <serviceType> <port>
```

Example:

```
add service icapsv2 10.102.29.200 SSL_TCP 1344 -gslb NONE -maxclient
    0 -maxReq 0 -cip DISABLED -usip NO -useproxport YES -sp ON -
    cltTimeout 9000 -svrTimeout 9000 -CKA NO -TCPB NO -CMP NO
```

Bind SSL-based TCP service to SSL_TCP or TCP load balancing virtual server

After you create a secured ICAP service, you must bind the service to the load balancing virtual server. It is required if you are using a load balancing virtual server to load balance the ICAP servers.

At the command prompt, type the following:

```
bind lb vserver <name> <serviceName>
```

Example:

```
bind lb vserver vicap icapsv2
```

Bind SSL-based TCP service or load balancing virtual server to the Content Inspection action

You add an ICAP action for handling the ICAP request information and also bind the SSL-based TCP service to the action.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

At the command prompt, type the following:

```
add contentInspection action <name> -type ICAP -serverName <string> -
    icapProfileName <string>
```

Example:

```
add ContentInspection action ci_act_svc -type ICAP -serverName icapsv2
    -icapProfileName icap_reqmod

add ContentInspection action ci_act_svc -type ICAP -serverName vicap -
    icapProfileName icap_reqmod
```

Configure ICAP protocol by using the GUI

1. Navigate to **Load Balancing** > **Services** and click **Add**.
2. In the **Services** page, enter the service details.
3. Navigate to **Load Balancing** > **Virtual Servers**. Add a load balancing virtual server of type HTTP/SSL. Or, you can select a virtual server and click **Edit**.
4. After entering the server basic details, click **Continue**.
5. In the **Advanced Settings** section, click **Policies**.
6. Go the **Policies** section and click the **Pencil** icon to configure the Content Inspection policy.
7. On the **Choose Policy** page, select **Content Inspection**. Click **Continue**.
8. In the **Policy Binding** section, click **+** to add a Content Inspection policy.
9. In the **Create ICAP Policy** page, enter a name for the policy.
10. In the **Action** field, click the "+"sign to add an ICAP action.
11. In the **Create ICAP Action** page, enter a name for the action.
12. Enter a name for the action.
13. In the **Server Name** field, enter the name of the TCP service already created.
14. In **ICAP Profile** field, click the "+"sign to add an ICAP profile.
15. In the **Create ICAP Profile** page, enter a profile name, URI, and MODE.
16. Click **Create**.
17. In the **Create ICAP Action** page, click **Create**.
18. In the **Create ICAP Policy** page, enter "true"in the **Expression Editor** and then click **Create**.
19. Click **Bind**.
20. When prompted to enable the Content Inspection feature, click **Yes**.
21. Click **Done**.

For information about the Citrix ADC GUI configuration for load balancing and forwarding the traffic to the back-end origin server after content transformation, see Load Balancing.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Configure secured ICAP protocol by using the GUI

1. Navigate to **Load Balancing** > **Services** and click **Add**.
2. In the **Services** page, enter the service details.
3. Navigate to **Load Balancing** > **Virtual Servers**. Add a virtual server of type HTTP/SSL. Or, you can select a virtual server and click **Edit**.
4. After entering the server basic details, click **Continue**.
5. In the **Advanced Settings** section, click **Policies**.
6. Go the **Policies** section and click the **Pencil** icon to configure the Content Inspection policy.
7. On the **Choose Policy** page, select **Content Inspection**. Click **Continue**.
8. In the **Policy Binding** section, click **+** to add a Content Inspection policy.
9. In the **Create ICAP Policy** page, enter a name for the policy.
10. In the **Action** field, click the "+"sign to add an ICAP action.
11. In the **Create ICAP Action** page, enter a name for the action.
12. Enter a name for the action.
13. In the **Server Name** field, enter the name of the TCP_SSL service already created.
14. In **ICAP Profile** field, click the "+"sign to add an ICAP profile.
15. In the **Create ICAP Profile** page, enter a profile name, URI, and MODE.
16. Click **Create**.
17. In the **Create ICAP Action** page, click **Create**.
18. In the **Create ICAP Policy** page, enter "true"in the **Expression Editor** and then click **Create**.
19. Click **Bind**.
20. When prompted to enable the Content Inspection feature, click **Yes**.
21. Click **Done**.

Audit log support for remote content inspection

If an incoming request or outgoing response is content inspected, the Citrix ADC appliance logs the ICAP details. The appliance stores the details as a log message in the ns.log file.

Each log message typically contains the following details:

```
<Source IP> <Destination IP> <Domain> <ICAP server IP><ICAP Mode> <
    Service URI> <ICAP response> <Policy action>
```

Example for content inspected request log message:

```
Apr 18 14:45:41 <local0.info> 10.106.97.104 04/18/2018:14:45:41 GMT 0-
    PPE-0 : default CI ICAP_LOG 788 0 : Source 10.102.1.98:39048 -
    Destination 10.106.97.89:8011 - Domain 10.106.97.89 - Content-Type
    application/x-www-form-urlencoded - ICAP Server 10.106.97.99:1344 -
    Mode REQMOD - Service /example - Response 204 - Action FORWARD
```

Example for content inspected response log message:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
Apr 18 12:34:08 <local0.info> 10.106.97.104 04/18/2018:12:34:08 GMT 0-

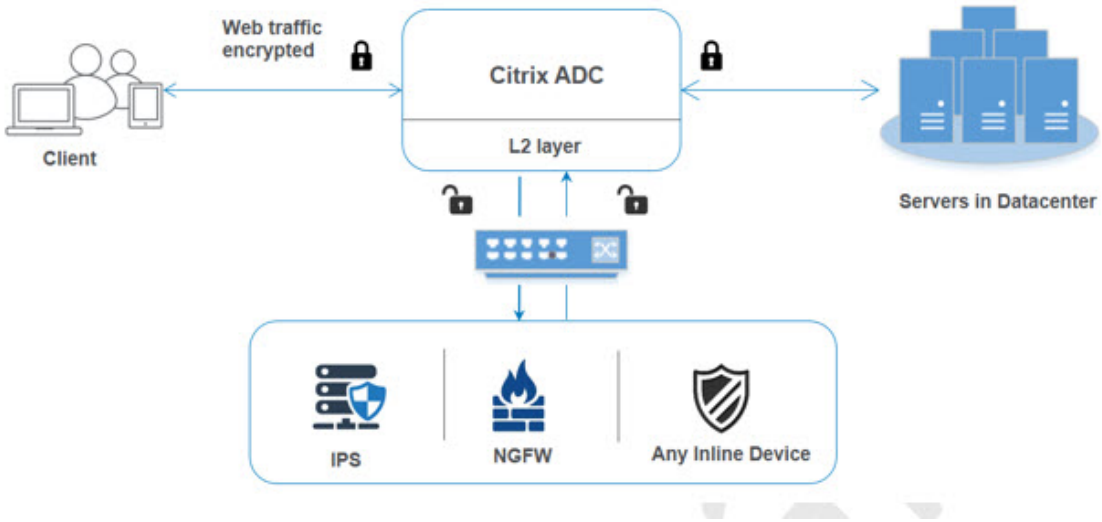
Inline device integration with Citrix ADC

October 16, 2023

Security devices such as Intrusion Prevention System (IPS) and Next Generation Firewall (NGFW) protect servers from network attacks. These devices are deployed in layer 2 inline mode and their primary function is to protect servers from network attacks and report security threats on the network.

To prevent vulnerable threats and provide advanced security protection, a Citrix ADC appliance is integrated with one or more inline devices. The inline devices can be any security device such as IPS, NGFW.



Following are some of the use cases that benefit in using the inline device integration with the Citrix ADC appliance:

- **Inspecting encrypted traffic**. Most IPS and NGFW appliances bypass encrypted traffic, thereby leaving servers vulnerable to attacks. A Citrix ADC appliance can decrypt traffic and send it to inline devices for inspection. It enhances the customer's network security.
- **Offloading inline devices from TLS/SSL processing**. TLS/SSL processing is expensive and the issue can result in high system CPU in IPS or NGFW appliances if they decrypt the traffic. As encrypted traffic is growing at a fast pace, these systems fail to decrypt and inspect encrypted traffic. Citrix ADC helps in offloading inline devices from TLS/SSL processing. It results in the inline device supporting a high volume of traffic inspection.
- **Loading balancing inline devices**. The Citrix ADC appliance load balances multiple inline devices when there is a high volume of traffic.
- **Smart selection of traffic**. Every packet flowing into the appliance might be content inspected, for example download of text files. User can configure the Citrix ADC appliance to select specific traffic (for example .exe files) for inspection and send the traffic to inline devices for processing the data

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

How the Citrix ADC is integrated with inline devices

The following diagram shows how a Citrix ADC is integrated with inline security devices.

When you integrate inline devices with the Citrix ADC appliance, the component interacts as per the following:

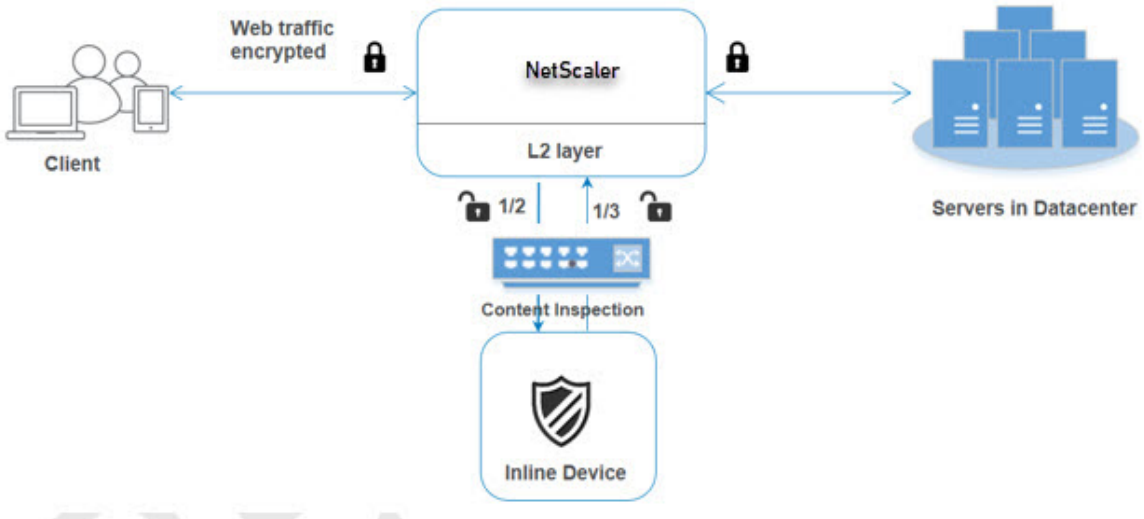
1. A client sends a request to Citrix ADC appliance.
2. The appliance receives the request and sends it to an inline device based on policy evaluation.
   Note: If there are two or more inline devices, the appliance load balances the devices and sends the traffic.
   If the incoming traffic is an encrypted one, the appliance decrypts the data and sends it as a plain text to the inline device for content inspection.
3. The inline device inspects the data for threats and decides whether to drop, reset, or send the data back to the appliance.
4. If there are security threats, the device modifies the data and sends it to the appliance.
5. The Citrix ADC in turn re-encrypts the data and forwards the request to the back-end server.
6. The back-end server sends the response to the Citrix ADC appliance.
7. The appliance again decrypts the data and sends it to the inline device for inspection.
8. Appliance re-encrypts the data and sends the response to the client

Software licensing

To deploy the inline device integration, your Citrix ADC appliance must be provisioned with one of the following licenses:

1. ADC Premium
2. ADC Advanced

© 1999–2025 Cloud Software Group, Inc. All rights reserved.



3. Telco Advanced
4. Telco Premium
5. SWG license

Configuring inline device integration

You can configure a Citrix ADC appliance with an inline device in three different ways. The configuration scenarios are as follows.

Scenario 1 for using a single inline device

If you want to integrate a security device (IPS or NGFW) in inline mode, you must begin by first enabling the Content Inspection feature and enabling the Citrix ADC in MBF (MAC-based forwarding) in global mode. Once you have enabled the features, you must add the Content Inspection profile, add the Content Inspection action for inline devices to reset, block, or drop the traffic based on inspection. Then, add the Content Inspection policy for the appliance to decide what subset of traffic to send to the inline devices. Then, configure the load balancing virtual server with layer 2 connection enabled on the server. Finally, bind the content inspection policy to the load balancing virtual server.

Enable MBF (MAC-based forwarding) mode If you want the Citrix ADC appliance to be integrated to inline devices such as IPS, or firewalls, you must enable this mode. For more information about MBF, see Configure MAC-based Forwarding topic.

At the command prompt, type:

```
enable ns mode mbf
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Enable Content Inspection If you want the Citrix ADC appliance to decrypt and then send the content for inspection to the inline devices, you must enable the Content Inspection and load balancing features.

```
enable ns feature contentInspection LoadBalancing
```

Add Layer 2 connection method To handle response generated by inline devices, the appliance uses the VLAN channel as a layer 2 method (L2ConnMethod) of communication with inline devices.

At the command prompt, type:

```
set l4param -l2ConnMethod <l2ConnMethod>
```

Example

```
set l4param –l2ConnMethod VlanChannel
```

Add Content Inspection profile for service Inline device configuration for a Citrix ADC appliance can be specified in an entity called the Content Inspection profile. The profile has a collection of settings that explains how to integrate with an inline device.

At the command prompt, type:

```
add contentInspection profile <name> -type InlineInspection -egressInterface
 <interface_name> -ingressInterface <interface_name>[-egressVlan <
positive_integer>] [-ingressVlan <positive_integer>]
```

Example:

```
add contentInspection profile Inline_profile1 -type InlineInspection
-ingressinterface “1/2” -egressInterface “1/3”
```

Add IPS-TCP monitor If you want to configure monitors, you add a user defined monitor.
Note: If you want to configure monitors, you must use a custom monitor. When adding a monitor, you must enable the transparent parameter.

At the command prompt, type:

```
add lb monitor <monitorName> <type> [-destIP <ip_addr|ipv6_addr>] [-
destPort <port>] [-transparent ( YES | NO )]
```

Example:

```
add lb monitor ips_tcp TCP -destIP 192.168.10.2 -destPort 80 -transparent
 YES
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Add a service Add a service. Specify a dummy IP address that is not owned by any of the devices, including the inline devices. Set `use source IP address` (USIP) to YES. Set `useproxyport` to NO. By default, health monitoring is ON, bind the service to a health monitor, and also set the TRANSPARENT option in the monitor ON. At the command prompt, type:

```
add service <Service_name> <IP> TCP * - contentinspectionProfileName
<Name> -healthMonitor YES -usip ON –useproxyport OFF
```

Example:

```
add service ips_service 192.168.10.2 TCP * -healthMonitor YES -usip
YES -useproxyport NO -contentInspectionProfileName ipsprof
```

Add a health monitor By default the health monitor is turned on and you also have the option to disable it, if necessary. At the command prompt, type:

```
add lb monitor <name> TCP -destIP <ip address> -destPort 80 -transparent
 <YES, NO>
```

Example:

```
add lb monitor ips_tcp TCP -destIP 192.168.10.2 -destPort 80 -transparent
 YES
```

Bind the service to the health monitor After configuring the health monitor, you must bind the service to the health monitor. At the command prompt, type:

```
bind service <name> -monitorName <name>
```

Example:

```
bind service ips_svc -monitorName ips_tcp
```

Add content inspection action for service After you enable the Content Inspection feature and then after you add the inline profile and service, you must add the Content Inspection action for handling the request. Based on the content inspection action, the inline device can drop, reset, or block action after it has inspected the data.

If the Inline server or service is down, you can configure the `ifserverdown` parameter in the appliance to perform any one of the following actions.

CONTINUE: If the User wants to bypass the content inspection when the remote server is down, you can choose the “CONTINUE”action, as default.
RESET (default): This action responds to the client by closing the connection with RST.
DROP: This action silently drops the packets without sending a response to the user.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

At the command prompt, type:

```
add contentInspection action <name> -type <type> (-serverName <string
> [-ifserverdown <ifserverdown>] [-reqTimeout <positive_integer>] [-
reqTimeoutAction <reqTimeoutAction>]

add ContentInspection action <action_name> -type InlineINSPECTION -
serverName Service_name/Vserver_name>
```

Example:

```
add ContentInspection action <Inline_action> -type InlineSPECTION –
serverName Inline_service1
```

Add content inspection policy for inspection After you create a Content Inspection action, you must add Content Inspection policies to evaluate requests for inspection. The policy is based on a rule which consists of one or more expressions. The policy evaluates and selects the traffic for inspection based on the rule.

At the command prompt, type the following:

```
add contentInspection policy <policy_name> –rule <Rule> -action <
action_name>
```

Example

```
add contentInspection policy Inline_pol1 –rule true –action Inline_action
```

Add content switching or load balancing virtual server of type HTTP/SSL To receive the web traffic, you must add a load balancing virtual server. Also you must enable the layer2 connection on the virtual server.

At the command prompt, type:

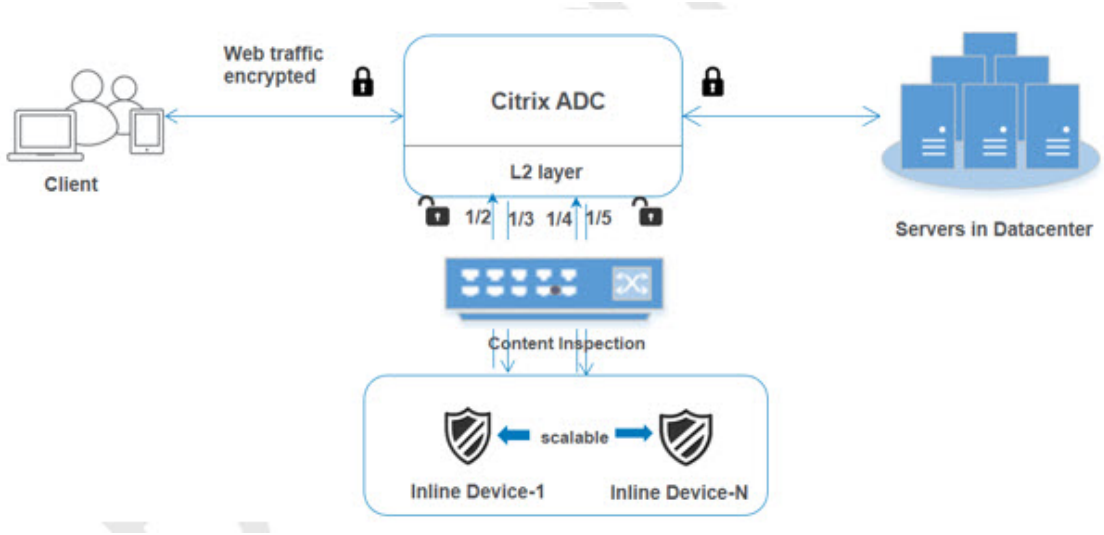
```
add lb vserver <name> <vserver name> -l2Conn ON
```

Example:

```
add lb vserver HTTP_vserver HTTP 10.102.29.200 8080 –l2Conn ON
```

Bind Content Inspection policy to content switching virtual server or load balancing virtual server of type HTTP/SSL You bind the load balancing virtual server or content switching virtual server of type HTTP/SSL to the Content Inspection policy.
At the command prompt, type the following:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.



```
bind lb vserver <vserver name> -policyName < policy_name > -priority
< priority > -type <REQUEST>
```

Example:

```
bind lb vserver HTTP_vserver -policyName Inline_pol1 -priority 100 -
type REQUEST
```

Scenario 2: Load balancing multiple inline devices using dedicated interfaces

If you are using two or more inline devices, you must load balance the devices using different content inspection services in a dedicated VLAN setup. In this case, the Citrix ADC appliance load balances the devices on top of sending a subset of traffic to each device through a dedicated interface.
For basic configuration steps, refer to scenario 1.

Add content inspection profile1 for service1 Inline configurations for a Citrix ADC appliance can be specified in an entity called the Content Inspection profile. The profile has a collection of device settings. The Content Inspection profile1 is created for inline service 1 and the communication is through 1/2 and 1/3 dedicated interfaces.

At the command prompt, type:

```
add contentInspection profile <name> -type InlineInspection -egressInterface
 <interface_name> -ingressInterface <interface_name>[-egressVlan <
positive_integer>] [-ingressVlan <positive_integer>]
```

Example:

```
add contentInspection profile Inline_profile1 -type InlineInspection
-ingressinterface “1/2” -egressInterface “1/3”
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Add content inspection profile2 for service2 The Content Inspection profile2 is added for service2 and the inline device communicates with the appliance through 1/4 and 1/5 dedicated interfaces. At the command prompt, type:

```
add contentInspection profile <name> -type InlineInspection -egressInterface
 <interface_name> -ingressInterface <interface_name>[-egressVlan <
positive_integer>] [-ingressVlan <positive_integer>]
```

Example:

```
add contentInspection profile Inline_profile2 -type InlineInspection
-ingressinterface “1/4” -egressInterface “1/5”
```

Add service 1 for inline device 1 After you enable the Content Inspection feature and add the inline profile, you must add an inline service 1 for inline device 1 to be part of the load balancing setup. The service that you add, provides all the inline configuration details.

At the command prompt, type:

```
add service <Service_name_1> <Pvt_IP1> TCP * -contentInspectionProfileName
 <Inline_Profile_1> -healthmonitor OFF –usip ON –useproxyport OFF
```

Example:

```
add service Inline_service1 10.102.29.200 TCP 80 -contentInspectionProfileName
 Inline_profile1 -healthmonitor OFF -usip ON -useproxyport OFF
```

Add service 2 for inline device 2 After you enable the Content Inspection feature and add the inline profile, you must add an inline service 2 for inline device 2. The service that you add, provides all the inline configuration details.

At the command prompt, type:

```
add service <Service_name_1> <Pvt_IP1> TCP * -contentInspectionProfileName
 <Inline_Profile_2> -healthmonitor OFF –usip ON –useproxyport OFF
```

Example:

```
add service Inline_service1 10.29.20.205 TCP 80 -contentInspectionProfileName
 Inline_profile2 -healthmonitor OFF -usip ON -useproxyport OFF
```

Add load balancing virtual server After you have added the inline profile and the services, you must add a load balancing virtual server for load balancing the services.

At the command prompt, type:

```
add lb vserver <vserver_name> TCP <Pvt_IP3> <port>
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Example:

```
add lb vserver lb-Inline_vserver TCP *
```

Bind service 1 to the load balancing virtual server After you add the load balancing virtual server, now bind the load balancing virtual server to the first service.

At the command prompt, type:

```
bind lb vserver <Vserver_name> <Service_name_1>
```

Example:

```
bind lb vserver lb-Inline_vserver Inline_service1
```

Bind service 2 to the load balancing virtual server After you add the load balancing virtual server, now bind the server to the second service.

At the command prompt, type:

```
bind lb vserver <Vserver_name> <Service_name_1>
```

Example:

```
bind lb vserver lb-Inline_vserver Inline_service2
```

Add content inspection action for the service After you enable the Content Inspection feature, you must add the Content Inspection action for handling the inline request information. Based on the action selected, the inline device drops, resets, or blocks after it has examined the given subset of traffic.

At the command prompt, type:

```
add contentInspection action <name> -type <type> (-serverName <string
> [-ifserverdown <ifserverdown>] [-reqTimeout <positive_integer>] [-
reqTimeoutAction <reqTimeoutAction>]
```

```
add ContentInspection action < action_name > -type InlineINSPECTION -
serverName Service_name/Vserver_name>
```

Example:

```
add ContentInspection action Inline_action -type InlineINSPECTION –
serverName lb-Inline_vserver
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Add content inspection policy for inspection After you create a Content Inspection action, you must add the Content Inspection policy to evaluate requests for service. The policy is based on a rule which consists of one or more expressions. The rule is associated to the Content Inspection action that is associated if a request matches the rule.

At the command prompt, type the following:

```
add contentInspection policy <policy_name> –rule <Rule> -action <
action_name>
```

Example:

```
add contentInspection policy Inline_pol1 –rule true –action Inline_action
```

Add content switching or load balancing virtual server of type HTTP/SSL Add a content switching or load balancing virtual server to accept web traffic. Also you must enable the layer2 connection on the virtual server.
For more information about load balancing, see How load balancing works topic.

At the command prompt, type:

```
add lb vserver <name> <vserver name> -l2Conn ON
```

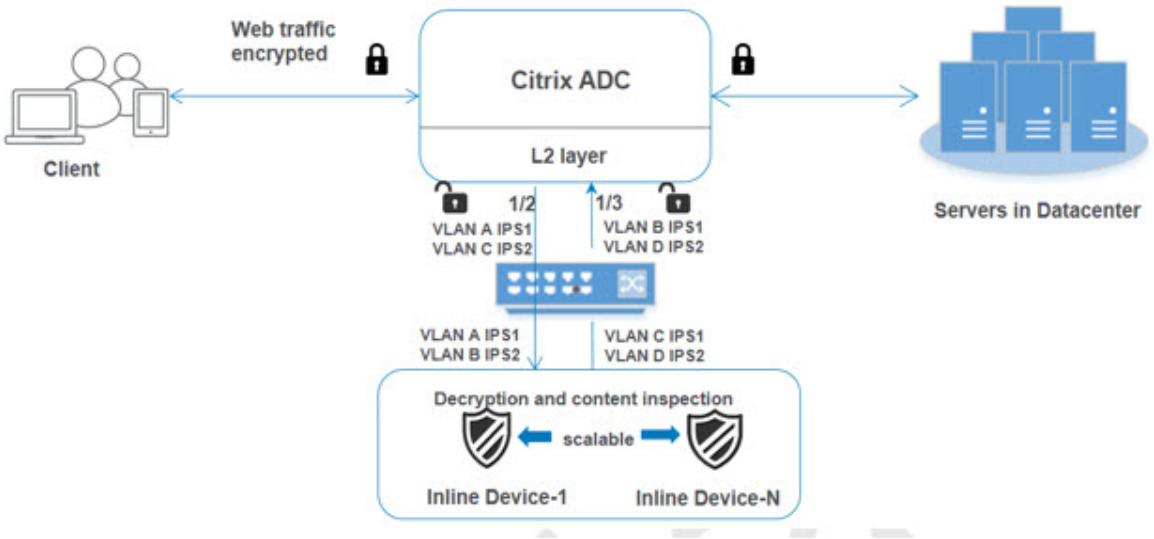
Example:

```
add lb vserver http_vserver HTTP 10.102.29.200 8080 –l2Conn ON
```

Bind Content Inspection policy to load balancing virtual server of type HTTP/SSL You must bind the content switching or load balancing virtual server of type HTTP/SSL to the Content Inspection policy.

At the command prompt, type the following:

```
bind lb vserver <vserver name> -policyName < policy_name > -priority
<> -type <L7InlineREQUEST | L4Inline-REQUEST>
```



Example:

```
bind lb vserver http_vserver -policyName Inline_pol1 -priority 100 -
type REQUEST
```

Scenario 3: Load balancing multiple inline devices using shared interfaces

You can refer to this configuration, if you are using multiple inline devices and if you want to load balance the devices using different services in a shared VLAN interface. This configuration using shared VLAN interfaces is similar to use case 2. For basic configuration, refer to scenario 2.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Bind VLAN A with sharing option enabled At the command prompt, type the following:

```
bind vlan <id> -ifnum <interface> -tagged
```

Example:

```
bind vlan 100 –ifnum 1/2 tagged
```

Bind VLAN B with sharing option enabled At the command prompt, type the following:

```
bind vlan <id> -ifnum <interface> -tagged
```

Example:

```
bind vlan 200 –ifnum 1/3 tagged
```

Bind VLAN C with sharing option enabled At the command prompt, type the following:

```
bind vlan <id> -ifnum <interface> -tagged
```

Example:

```
bind vlan 300 –ifnum 1/2 tagged
```

Bind VLAN D with sharing option enabled At the command prompt, type the following:

```
bind vlan <id> -ifnum <interface> -tagged
```

Example:

```
bind vlan 400 –ifnum 1/3 tagged
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Add content inspection profile1 for service1 Inline configurations for a Citrix ADC appliance can be specified in an entity called the Content Inspection profile. The profile has a collection of device settings. The Content Inspection profile is created for inline service 1 and the communication is through 1/2 and 1/3 dedicated interfaces.

At the command prompt, type:

```
add contentInspection profile <name> -type InlineInspection -egressInterface
 <interface_name> -ingressInterface <interface_name>[-egressVlan <
positive_integer>] [-ingressVlan <positive_integer>]
```

Example:

```
add contentInspection profile Inline_profile1 -type InlineInspection
 -ingressinterface "1/2" -egressInterface "1/3" –egressVlan 100 -
ingressVlan 300
```

Add content inspection profile2 for service2 The Content Inspection profile2 is added for service2 and the inline device communicates with the appliance through 1/2 and 1/3 dedicated interfaces.

At the command prompt, type:

```
add contentInspection profile <name> -type InlineInspection -egressInterface
 <interface_name> -ingressInterface <interface_name>[-egressVlan <
positive_integer>] [-ingressVlan <positive_integer>]
```

Example:

```
add contentInspection profile Inline_profile2 -type InlineInspection
 -ingressinterface "1/2" -egressInterface "1/3" –egressVlan 200 -
ingressVlan 400
```

Configure inline service integration using the Citrix ADC GUI

1. Log on to the Citrix ADC appliance and navigate to **Configuration** tab page.
2. Navigate to **System** > **Settings** > **Configure Modes**.
3. In the **Configure Modes** page, select **Mac Based Forwarding**.
4. Click **OK** and **Close**.
5. Navigate to **System** > **Settings** > **Configure Advanced Features**.
6. In the **Configure Advanced Feature** page, select **Content Inspection**.
7. Click **OK** and **Close**.
8. Navigate to **Security** > **Content Inspection** > **ContentInspection Profiles**.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

9. In the **ContentInspection Profiles** page, click **Add**.
10. In the **Create ContentInspection Profiles** page, set the following parameters.
    a) Profile Name. Name of the content inspection profile.
    b) Type. Select the profile type as inlineInspection.
    c) Egress Interface. Interface through which the appliance sends traffic from the Citrix ADC to the Inline device.
    d) Ingress Interface. Interface through which the appliance receives traffic from the Inline device to the Citrix ADC.
    e) Egress VLAN. Interface VLAN ID through which the traffic is sent to the Inline device.
    f) Ingress VLAN. Interface VLAN ID through which the appliance receives traffic from Inline to Citrix ADC (if it is configured).
11. Click **Create** and **Close**.
12. Navigate to **Traffic Management** > **Load Balancing** > **Services** and click **Add**.
13. In the **Services** page, set the following parameters:
    a) Service name. Name of the load balancing service.
    b) IP address. Use a dummy IP address. Note: No device must own the IP address.
    c) Protocol. Select protocol type as TCP.
    d) Port. Enter *
    e) Health Monitoring. Clear this option and enable it only if you want to bind the service to the TCP type monitor. If you want to bind a monitor to service then the TRANSPARENT option in the monitor must be ON. See step 14 on how to add monitor and how to bind it to service.
    f) Click **OK**.
14. In the **Settings** section, edit the following and click **OK**.
    a) Use Proxy Port: Turn it OFF
    b) Use Source IP Address: Turn it ON
15. In the **Advanced Settings** section, click **Profiles**.
16. Go to **Profiles** section, and add the inline content inspection profile and click **OK**.
17. Go to **Monitors** section, **Add Bindings** > **Select Monitor** > **Add**.
    a) Name: Name of monitor
    b) Type: Select TCP type
    c) Destination IP, PORT: Destination IP address and Port.
    d) Transparent: Turn ON

Note: Monitor packets must flow through the inline device to monitor inline device status.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

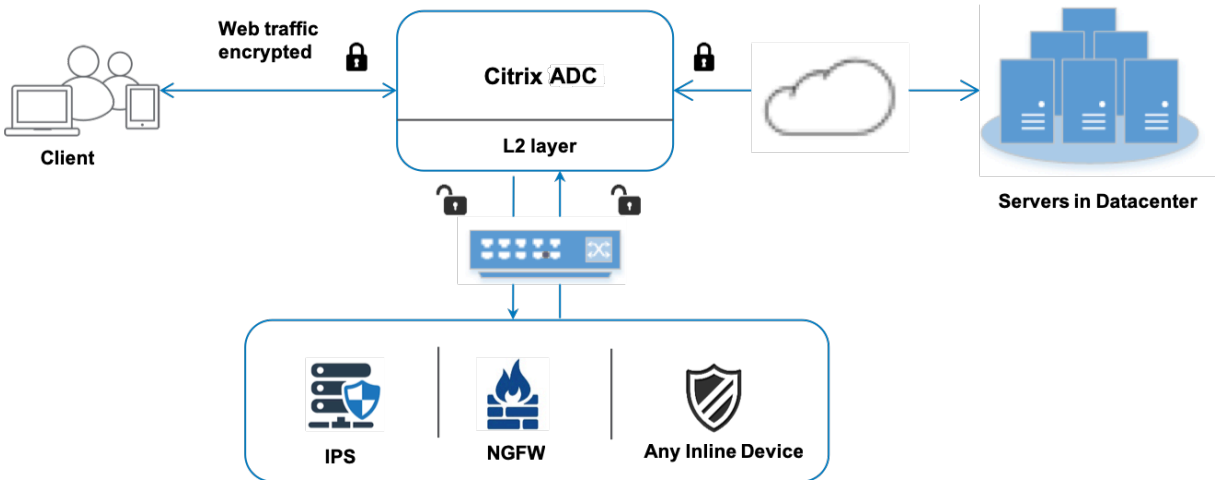
18. Click **Create**.
19. Click **Done**.
20. Navigate to **Traffic Management** > **Load Balancing** > **Virtual Servers**. Add a virtual server of type HTTP or SSL.
21. After entering the server details, click **OK** and again **OK**.
22. In the **Traffic Settings** section of Load Balancing Virtual Server, turn Layer 2 Parameters ON.
23. In the **Advanced Settings** section, click **Policies**.
24. Go the **Policies** section and click the "+"icon to configure the content inspection policy.
25. On the **Choose Policy** page, select **Content Inspection**. Click **Continue**.
26. In the **Policy Binding** section, click **Add** to add a Content Inspection policy.
27. In the **Create ContentInspection Policy** page, enter a name for the Inline content inspection policy.
28. In the **Action** field, click **Add** to create an Inline content inspection action.
29. In the **Create CI Action** page, set the following parameters:
    a) Name. Name of the content inspection Inline policy.
    b) Type. Select the type as inlineInspection.
    c) Server. Select the server/service as Inline devices.
    d) If Server Down. Select an operation if the server goes down.
    e) Request Time-out. Select a time-out value. You can use default values.
    f) Request Time-out Action. Select a time-out action. You can use default values.
30. Click **Create**.
31. In the **Create CI Policy** page, enter other details:
32. Click **OK** and **Close**.

Integration with IPS or NGFW as inline devices using SSL forward proxy

August 27, 2024

Security devices such as Intrusion Prevention System (IPS) and Next Generation Firewall (NGFW) protect servers from network attacks. These devices can inspect live traffic and are typically deployed in layer 2 inline mode. The SSL forward proxy appliance provides security of users and the enterprise network when accessing resources on the internet.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.



An SSL forward proxy appliance can be integrated with one or more inline devices to prevent threats and provide advanced security protection. The inline devices can be any security device, such as IPS and NGFW.

Some use cases where you can benefit by using the SSL forward proxy appliance and inline device integration are:

- **Inspecting encrypted traffic:** Most IPS and NGFW appliances bypass encrypted traffic, which can leave servers vulnerable to attacks. An SSL forward proxy appliance can decrypt traffic and send it to the inline devices for inspection. This integration enhances the customer's network security.
- **Offloading inline devices from TLS/SSL processing:** TLS/SSL processing is expensive, which can result in high CPU utilization in IPS or NGFW appliances if they also decrypt the traffic. An SSL forward proxy appliance helps in offloading TLS/SSL processing from inline devices. As a result, inline devices can inspect a higher volume of traffic.
- **Loading balancing inline devices:** If you have configured multiple inline devices to manage heavy traffic, an SSL forward proxy appliance can load balance and distribute traffic evenly to these devices.
- **Smart selection of traffic:** Instead of sending all the traffic to the inline device for inspection, the appliance does a smart selection of traffic. For example, it skips sending text files for inspection to the inline devices.

SSL forward proxy integration with inline devices

The following diagram shows how an SSL forward proxy is integrated with inline security devices.

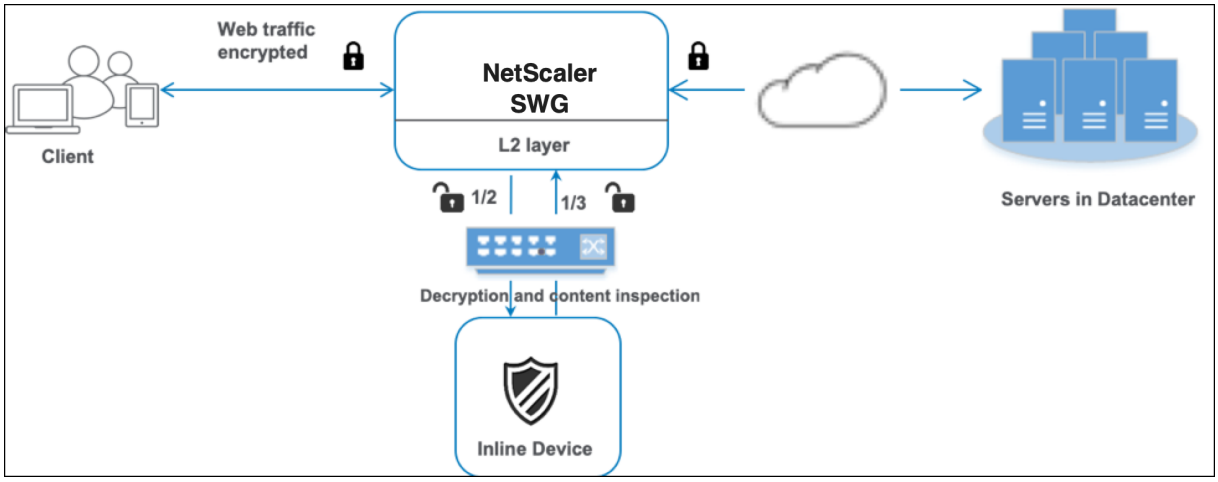
When you integrate inline devices with the SSL forward proxy appliance, the components interact as follows:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

1. A client sends a request to an SSL forward proxy appliance.
2. The appliance sends the data to the inline device for content inspection based on the policy evaluation. For HTTPS traffic, the appliance decrypts the data and sends it in plain text to the inline device for content inspection.

   > **Note**
   >
   > If there are two or more inline devices, the appliance load balances the devices and sends the traffic.

3. Add a content switching or an HTTP/HTTPS load balancing virtual server.
4. The inline device inspects the data for threats and decides whether to drop, reset, or send the data back to the appliance.
5. If there are security threats, the device modifies the data and sends it to the appliance.
6. For HTTPS traffic, the appliance re-encrypts the data and forwards the request to the back-end server.
7. The back-end server sends the response to the appliance.
8. The appliance again decrypts the data and sends it to the inline device for inspection.
9. The inline device inspects the data. If there are security threats, the device modifies the data and sends it to the appliance.
10. The appliance re-encrypts the data and sends the response to the client.



Configuring inline device integration

You can configure an SSL forward proxy appliance with an inline device in three different ways as follows:

Scenario 1: Using a single inline device

To integrate a security device (IPS or NGFW) in inline mode, you must enable content inspection and MAC-based forwarding (MBF) in global mode on the SSL forward proxy appliance. Then, add a content inspection profile, a TCP service, a content inspection action for inline devices to reset, block, or drop the traffic based on inspection. Also add a content inspection policy that the appliance uses to decide the subset of traffic to send to the inline devices. Finally, configure the proxy virtual server with layer 2 connection enabled on the server and bind the content inspection policy to this proxy virtual server.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Perform the following steps:

1. Enable MAC-based forwarding (MPF) mode.
2. Enable the content inspection feature.
3. Add a content inspection profile for the service. The content inspection profile contains the inline device settings that integrate the SSL forward proxy appliance with an inline device.
4. (Optional) Add a TCP monitor.

   > **Note:**
   >
   > Transparent devices do not have an IP address. Therefore, to perform health checks, you must explicitly bind a monitor.

5. Add a service. A service represents an inline device.
6. (Optional) Bind the service to the TCP monitor.
7. Add a content inspection action for the service.
8. Add a content inspection policy and specify the action.
9. Add an HTTP or HTTPS proxy (content switching) virtual server.
10. Bind the content inspection policy to the virtual server.

Configure using the CLI Type the following commands at the command prompt. Examples are given after most commands.

1. Enable MBF.

```
enable ns mode mbf
```

1. Enable the feature.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
enable ns feature contentInspection
```

1. Add a content inspection profile.

```
add contentInspection profile <name> -type InlineInspection -egressInterface
 <interface_name> -ingressInterface <interface_name>[-egressVlan <
positive_integer>] [-ingressVlan <positive_integer>]
```

Example:

```
add contentInspection profile ipsprof -type InlineInspection -ingressinterface
 “1/2” -egressInterface “1/3”
```

1. Add a service. Specify a dummy IP address that is not owned by any of the devices, including the inline devices. Set `use source IP address` (USIP) to YES. Set `useproxyport` to NO. By default, health monitoring is ON, bind the service to a health monitor, and also set the TRANSPARENT option in the monitor ON.

```
add service <service_name> <IP> TCP * - contentinspectionProfileName
<Name> -healthMonitor YES -usip YES –useproxyport NO
```

Example:

```
add service ips_service 198.51.100.2 TCP * -healthMonitor YES -usip
YES -useproxyport NO -contentInspectionProfileName ipsprof
```

1. Add a health monitor. By default the health monitor is turned on and you also have the option to disable it, if necessary. At the command prompt, type:

   ```
   add lb monitor <name> TCP -destIP <ip address> -destPort 80 -
   transparent <YES, NO>
   ```

Example:

```
add lb monitor ips_tcp TCP -destIP 192.168.10.2 -destPort 80 -transparent
 YES
```

1. Bind the service to the health monitor

After configuring the health monitor, you must bind the service to the health monitor. At the command prompt, type:

```
bind service <name> -monitorName <name>
```

Example:

```
bind service ips_svc -monitorName ips_tcp
```

1. Add a content inspection action.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
add contentInspection action <name> -type INLINEINSPECTION -serverName
 <string>
```

Example:

```
add contentInspection action ips_action -type INLINEINSPECTION -
serverName ips_service
```

1. Add a content inspection policy.

```
add contentInspection policy <name> -rule <expression> -action <
string>
```

Example:

```
add contentInspection policy ips_pol -rule "HTTP.REQ.METHOD.NE(\"
CONNECT\")"-action ips_action
```

1. Add a proxy virtual server.

```
add cs vserver <name> PROXY <IPAddress> <port> -cltTimeout <secs> -
l2Conn ON
```

> **Note:**
>
> Load balancing virtual servers of type HTTP/SSL are also supported.

Example:

```
add cs vserver transparentcs PROXY * * -cltTimeout 180 -l2Conn ON
```

1. Bind the policy to the virtual server.

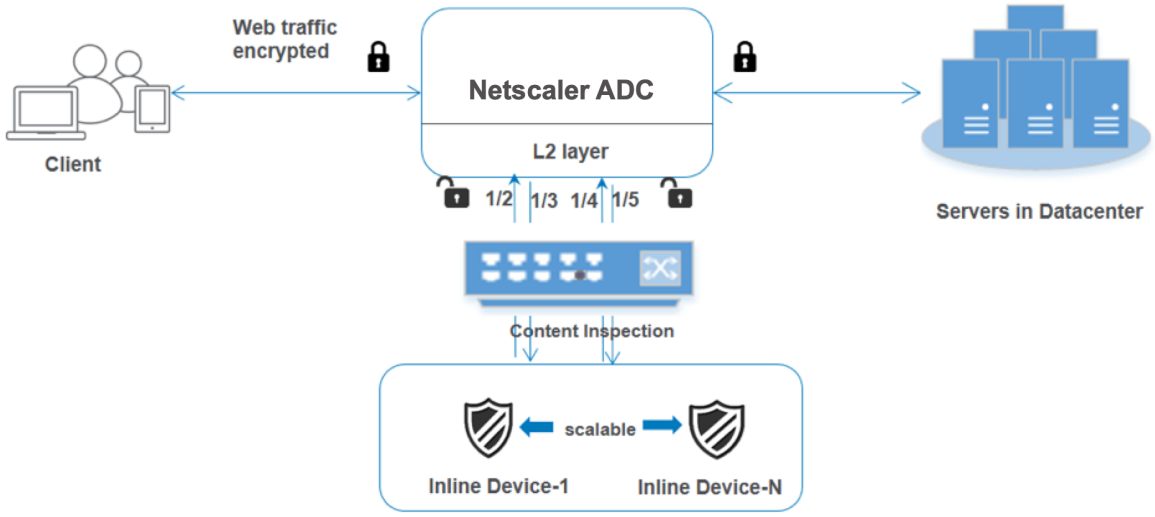
```
bind cs vserver <name> -policyName <string> -priority <positive_integer
> -gotoPriorityExpression <expression> -type REQUEST
```

Example:

```
bind cs vserver explicitcs -policyName ips_pol -priority 1 -gotoPriorityExpres
 END -type REQUEST
```

Configure using the GUI

1. Navigate to **System > Settings**. In **Modes and Features**, click **Configure Modes**.
2. In the **Configure Modes** page, select the **MAC based forwarding** option.
3. Navigate to **System > Settings**. In **Modes and Features**, click **Configure Advanced Features**.
4. In the **Configure Advanced Features** page, select the **Content Inspection** option.



© 1999–2025 Cloud Software Group, Inc. All rights reserved.

5. Navigate to **Secure Web Gateway > Content Inspection > Content Inspection Profiles**. Click **Add**.
   Navigate to **Load Balancing > Services > Add** and add a service.
   a) In **Advanced Settings**, click **Profiles**. In the **CI Profile Name** list, select the content inspection profile created earlier.
   b) In **Service Settings**, set **Use Source IP Address** to YES and **Use Proxy Port** to No. In **Basic Settings**, set **Health Monitoring** to NO.
   c) Turn on health monitoring only if you bind this service to a TCP monitor. If you bind a monitor to a service, then set the TRANSPARENT option in the monitor to ON.
6. Navigate to **Secure Web Gateway > Proxy Virtual Servers> Add**. Specify a name, IP address, and port. In **Advanced Settings**, select **Policies**. Click the "+"sign.
7. In **Choose Policy** select **Content Inspection**. Click **Continue**.
8. Click **Add**. Specify a name. In **Action**, click **Add**.
9. Specify a name. In **Type**, select **INLINEINSPECTION**. In **Server Name**, select the TCP service created earlier.
10. Click **Create**. Specify the rule and click **Create**.
11. Click **Bind**.
12. Click **Done**.

Scenario 2: Load balance multiple inline devices with dedicated interfaces

If you are using two or more inline devices, you can load balance the devices using different content inspection services with dedicated interfaces. In this case, the SSL forward proxy appliance load balances the subset of traffic sent to each device through a dedicated interface. The subset is decided based on the policies configured. For example, TXT or image files might not be sent for inspection to the inline devices.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

The basic configuration remains the same as in scenario 1. However, you must create a content inspection profile for each inline device and specify the ingress and egress interface in each profile. Add a service for each inline device. Add a load balancing virtual server and specify it in the content inspection action. Perform the following extra steps:

1. Add content inspection profiles for each service.
2. Add a service for each device.
3. Add a load balancing virtual server.
4. Specify the load balancing virtual server in the content inspection action.

Configure using the CLI Type the following commands at the command prompt. Examples are given after each command.

1. Enable MBF.

```
enable ns mode mbf
```

1. Enable the feature.

```
enable ns feature contentInspection
```

1. Add profile 1 for service 1.

```
add contentInspection profile <name> -type InlineInspection -egressInterface
 <interface_name> -ingressInterface <interface_name>[-egressVlan <
positive_integer>] [-ingressVlan <positive_integer>]
```

Example:

```
add contentInspection profile ipsprof1 -type InlineInspection -
ingressInterface "1/2"-egressInterface "1/3"
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

1. Add profile 2 for service 2.

```
add contentInspection profile <name> -type InlineInspection -egressInterface
 <interface_name> -ingressInterface <interface_name>[-egressVlan <
positive_integer>] [-ingressVlan <positive_integer>]
```

Example:

```
add contentInspection profile ipsprof2 -type InlineInspection -
ingressInterface "1/4"-egressInterface "1/5"
```

1. Add service 1. Specify a dummy IP address that is not owned by any of the devices, including the inline devices. Set `use source IP address` (USIP) to YES. Set `useproxyport` to NO. Turn on health monitoring with TCP monitor with TRANSPARENT option set ON.

```
add service <service_name> <IP> TCP * - contentinspectionProfileName
<Name> -healthMonitor NO -usip YES –useproxyport NO
```

Example:

```
add service ips_service1 192.168.10.2 TCP * -healthMonitor NO -usip
YES -useproxyport NO -contentInspectionProfileName ipsprof1
```

1. Add service 2. Specify a dummy IP address that is not owned by any of the devices, including the inline devices. Set `use source IP address` (USIP) to YES. Set `useproxyport` to NO. Turn on health monitoring with TRANSPARENT option set ON.

```
add service <service_name> <IP> TCP * - contentinspectionProfileName
<Name> -healthMonitor NO -usip YES –useproxyport NO
```

Example:

```
add service ips_service2 192.168.10.3 TCP * -healthMonitor NO -usip
YES -useproxyport NO -contentInspectionProfileName ipsprof2
```

1. Add a load balancing virtual server.

```
add lb vserver <LB_VSERVER_NAME> TCP <IP> <port>
```

Example:

```
add lb vserver lb_inline_vserver TCP 192.0.2.100 *
```

1. Bind the services to the load balancing virtual server.

```
bind lb vserver <LB_VSERVER_NAME> <service_name>
bind lb vserver <LB_VSERVER_NAME> <service_name>
```

Example:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
bind lb vserver lb_inline_vserver ips_service1
bind lb vserver lb_inline_vserver ips_service2
```

1. Specify the load balancing virtual server in the content inspection action.

```
add contentInspection action <name> -type INLINEINSPECTION -serverName
 <string>
```

Example:

```
add contentInspection action ips_action -type INLINEINSPECTION -
serverName lb_inline_vserver
```

1. Add a content inspection policy. Specify the content inspection action in the policy.

```
add contentInspection policy <name> -rule <expression> -action <
string>
```

Example:

```
add contentInspection policy ips_pol -rule "HTTP.REQ.METHOD.NE(\"
CONNECT\")"-action ips_action
```

1. Add a proxy virtual server.

```
add cs vserver <name> PROXY <IPAddress> <port> -l2Conn ON
```

Example:

```
add cs vserver transparentcs PROXY * * -l2Conn ON
```

1. Bind the content inspection policy to the virtual server.

```
bind cs vserver <name> -policyName <string> -priority <positive_integer
> -gotoPriorityExpression <expression> -type REQUEST
```

Example:

```
bind cs vserver explicitcs -policyName ips_pol -priority 1 -gotoPriorityExpres
 END -type REQUEST
```

Configuration using the GUI

1. Navigate to **System > Settings**. In **Modes and Features**, click **Configure Modes**.
2. In the **Configure Modes** page, select the **MAC based forwarding** option.
3. Navigate to **System > Settings**. In **Modes and Features**, click **Configure Advanced Features**.
4. Navigate to **Secure Web Gateway > Content Inspection > Content Inspection Profiles**. Click **Add**.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

5. Specify the ingress and egress interfaces.
6. Create two profiles. Specify a different ingress and egress interface in the second profile.
7. Navigate to **Load Balancing > Services > Add** and add a service.

    a) In **Advanced Settings**, click **Profiles**. In the **CI Profile Name** list, select the content inspection profile created earlier.

    b) In **Service Settings**, set **Use Source IP Address** to YES and **Use Proxy Port** to No. In **Basic Settings**, set **Health Monitoring** to NO.

    c) Turn on health monitoring only if you bind this service to a TCP monitor. If you bind a monitor to a service, then set the TRANSPARENT option in the monitor to ON.

    Create two services. Specify dummy IP addresses that are not owned by any of the devices, including the inline devices.
8. Navigate to **Load Balancing > Virtual Servers > Add**. Create a TCP load balancing virtual server and Click **OK**.
9. Click the **Load Balancing Virtual Server Service Binding** section. In **Service Binding**, click the arrow in **Select Service**. Select the two services created earlier, and click **Select**. Click **Bind**.
10. Navigate to **Secure Web Gateway > Proxy Virtual Servers> Add**. Specify a name, IP address, and port. In **Advanced Settings**, select **Policies**. Click the "+"sign.
11. In **Choose Policy** select **Content Inspection**. Click **Continue**.
12. Click **Add**. Specify a name. In **Action**, click **Add**.
13. Specify a name. In **Type**, select **INLINEINSPECTION**. In **Server Name**, select the load balancing virtual server created earlier.
14. Click **Create**. Specify the rule and click **Create**.
15. Click **Bind**.
16. Click **Done**.

Scenario 3: Load balance multiple inline devices with shared interfaces

If you are using two or more inline devices, you can load balance the devices using different content inspection services with shared interfaces. In this case, the SSL forward proxy appliance load balances the subset of traffic sent to each device through a shared interface. The subset is decided based on the policies configured. For example, TXT or image files might not be sent for inspection to the inline devices.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

The basic configuration remains the same as in scenario 2. For this scenario, bind the interfaces to different VLANs to segregate the traffic for each inline device. Specify the VLANs in the content inspection profiles. Perform the following extra steps:

1. Bind the shared interfaces to different VLANs.
2. Specify the ingress and egress VLANs in the content inspection profiles.

Configuration using the CLI Type the following commands at the command prompt. Examples are given after each command.

1. Enable MBF.

```
enable ns mode mbf
```

1. Enable the feature.

```
enable ns feature contentInspection
```

1. Bind the shared interfaces to different VLANs.

```
bind vlan <id> -ifnum <interface> -tagged
```

Example:

```
bind vlan 100 -ifnum 1/2 tagged
bind vlan 200 -ifnum 1/3 tagged
bind vlan 300 -ifnum 1/2 tagged
bind vlan 400 -ifnum 1/3 tagged
```

1. Add profile 1 for service 1. Specify the ingress and egress VLANs in the profile.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
add contentInspection profile <name> -type InlineInspection -egressInterface
 <interface_name> -ingressInterface <interface_name>[-egressVlan <
positive_integer>] [-ingressVlan <positive_integer>]
```

Example:

```
add contentInspection profile ipsprof1 -type InlineInspection -
egressInterface “1/3” -ingressinterface “1/2” –egressVlan 100 -ingressVlan
 300
```

1. Add profile 2 for service 2. Specify the ingress and egress VLANs in the profile.

```
add contentInspection profile <name> -type InlineInspection -egressInterface
 <interface_name> -ingressInterface <interface_name>[-egressVlan <
positive_integer>] [-ingressVlan <positive_integer>]
```

Example:

```
add contentInspection profile ipsprof2 -type InlineInspection -
egressInterface “1/3” -ingressinterface “1/2” –egressVlan 200 -ingressVlan
 400
```

1. Add service 1.

```
add service <service_name> <IP> TCP * - contentinspectionProfileName
<Name> -healthMonitor NO -usip YES –useproxyport NO
```

Example:

```
add service ips_service1 192.168.10.2 TCP * -healthMonitor NO -usip
YES -useproxyport NO -contentInspectionProfileName ipsprof1
```

1. Add service 2.

```
add service <service_name> <IP> TCP * - contentinspectionProfileName
<Name> -healthMonitor NO -usip YES –useproxyport NO
```

Example:

```
add service ips_service2 192.168.10.3 TCP * -healthMonitor NO -usip
YES -useproxyport NO -contentInspectionProfileName ipsprof2
```

1. Add a load balancing virtual server.

```
add lb vserver <LB_VSERVER_NAME> TCP <IP> <port>
```

Example:

```
add lb vserver lb_inline_vserver TCP 192.0.2.100 *
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

1. Bind the services to the load balancing virtual server.

```
bind lb vserver <LB_VSERVER_NAME> <service_name>
bind lb vserver <LB_VSERVER_NAME> <service_name>
```

Example:

```
bind lb vserver lb_inline_vserver ips_service1
bind lb vserver lb_inline_vserver ips_service2
```

1. Specify the load balancing virtual server in the content inspection action.

```
add contentInspection action <name> -type INLINEINSPECTION -serverName
 <string>
```

Example:

```
add contentInspection action ips_action -type INLINEINSPECTION -
serverName lb_inline_vserver
```

1. Add a content inspection policy. Specify the content inspection action in the policy.

```
add contentInspection policy <name> -rule <expression> -action <
string>
```

Example:

```
add contentInspection policy ips_pol -rule "HTTP.REQ.METHOD.NE(\"
CONNECT\")"-action ips_action
```

1. Add a proxy virtual server.

```
add cs vserver <name> PROXY <IPAddress> <port> -l2Conn ON
```

Example:

```
add cs vserver transparentcs PROXY * * -l2Conn ON
```

1. Bind the content inspection policy to the virtual server.

```
bind cs vserver <name> -policyName <string> -priority <positive_integer
> -gotoPriorityExpression <expression> -type REQUEST
```

Example:

```
bind cs vserver explicitcs -policyName ips_pol -priority 1 -gotoPriorityExpres
 END -type REQUEST
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Configuration using the GUI

1. Navigate to **System > Settings**. In **Modes and Features**, click **Configure Modes**.
2. In the **Configure Modes** page, select the **MAC based forwarding** option.
3. Navigate to **System > Settings**. In **Modes and Features**, click **Configure Advanced Features**.
4. In the **Configure Advanced Features** page, select the **Content Inspection** option.
5. Navigate to **System > Network > VLANs > Add**. Add four VLANs and tag them to the interfaces.
6. Navigate to **Secure Web Gateway > Content Inspection > Content Inspection Profiles**. Click **Add**.
7. Specify the ingress and egress VLANs.
8. Create another profiles. Specify a different ingress and egress VLAN in the second profile.
9. Navigate to **Load Balancing > Services > Add** and add a service.

    a) In **Advanced Settings**, click **Profiles**. In the **CI Profile Name** list, select the content inspection profile created earlier.

    b) In **Service Settings**, set **Use Source IP Address** to YES and **Use Proxy Port** to No. In **Basic Settings**, set **Health Monitoring** to NO.

    c) Turn on health monitoring only if you bind this service to a TCP monitor. If you bind a monitor to a service, then set the TRANSPARENT option in the monitor to ON.

    Create two services. Specify dummy IP addresses that are not owned by any of the devices, including the inline devices. Specify profile 1 in service 1, and profile 2 in service 2.
10. Navigate to **Load Balancing > Virtual Servers > Add**. Create a TCP load balancing virtual server and Click **OK**.
11. Click inside the **Load Balancing Virtual Server Service Binding** section. In **Service Binding**, click the arrow in **Select Service**. Select the two services created earlier, and click **Select**. Click **Bind**.
12. Navigate to **Secure Web Gateway > Proxy Virtual Servers> Add**. Specify a name, IP address, and port. In **Advanced Settings**, select **Policies**. Click the "+"sign.
13. In **Choose Policy** select **Content Inspection**. Click **Continue**.
14. Click **Add**. Specify a name. In **Action**, click **Add**.
15. Specify a name. In **Type**, select **INLINEINSPECTION**. In **Server Name**, select the load balancing virtual server created earlier.
16. Click **Create**. Specify the rule and click **Create**.
17. Click **Bind**.

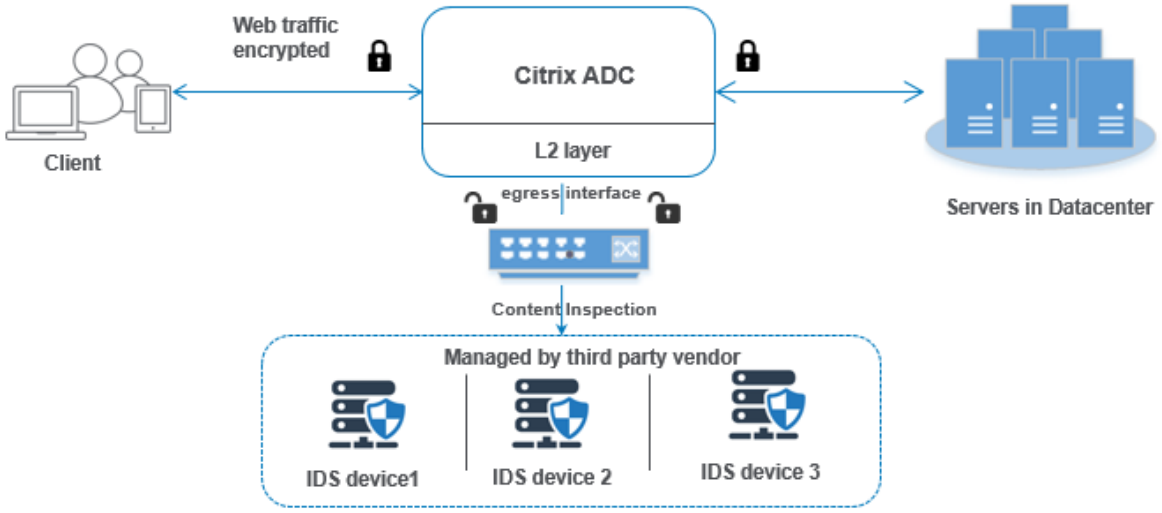
© 1999–2025 Cloud Software Group, Inc. All rights reserved.

18. Click **Done**.

Integrating Citrix ADC with passive security devices (Intrusion Detection System)

October 25, 2023

A Citrix ADC appliance is now integrated with passive security devices such as the Intrusion Detection System (IDS). These passive devices store logs and trigger alerts when it detects a bad or non-compliant traffic. It also generates reports for the compliance purpose. If the Citrix ADC appliance is integrated with two or more IDS devices and when there is a high volume of traffic, the appliance can load balance the devices by cloning traffic at the virtual server level.



For advanced security protection, a Citrix ADC appliance is integrated with passive security devices such as IDS deployed in detection-only mode. These devices store log and trigger alerts when it sees a bad or non-compliant traffic. It also generates reports for the compliance purpose. Following are some of the benefits of integrating the Citrix ADC with an IDS device.

- **Inspecting encrypted traffic**. Most security devices bypass encrypted traffic, thereby leaving servers vulnerable to attacks. A Citrix ADC appliance can decrypt traffic and send it to IDS devices for enhancing the customer's network security.
- **Offloading inline devices from TLS/SSL processing**. TLS/SSL processing is expensive and it results in high system CPU in intrusion detection devices if they decrypt the traffic. As encrypted traffic is growing at a fast pace, these systems fail to decrypt and inspect encrypted traffic. Citrix ADC helps in offloading traffic to IDS devices from TLS/SSL processing. This way of offloading data results in an IDS device supporting a high volume of traffic inspection.
- **Loading balancing IDS devices**. The Citrix ADC appliance load balances multiple IDS devices when there is a high volume of traffic by cloning traffic at the virtual server level.
- **Replicating traffic to passive devices**. The traffic flowing into the appliance can be replicated to other passive devices for generating compliance reports. For example, few government agencies mandate every transaction to be logged in some passive devices.
- **Fanning traffic to multiple passive devices**. Some customers prefer to fan out or replicate incoming traffic into multiple passive devices.
- **Smart selection of traffic**. Every packet flowing into the appliance might not be must be content inspected, for example download of text files. User can configure the Citrix ADC appliance to select specific traffic (for example .exe files) for inspection and send the traffic to IDS devices for processing data.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

How Citrix ADC is integrated with IDS device with L2 connectivity

The following diagram shows how IDS is integrated with a Citrix ADC appliance.

The component interaction is given as follows:

1. A client sends an HTTP/HTTPS request to the Citrix ADC appliance.
2. The appliance intercepts the traffic and replicates it to an IDS device based on content inspection policy evaluation.
3. If the traffic is an encrypted one, the appliance decrypts the data and sends it as a plain text.
4. Based on policy evaluation, the appliance applies a “MIRROR”type content inspection action.
5. The action has the IDS service or load balancing service (for multiple IDS device integrations) configured in it.
6. The IDS device is configured as content inspection service type “Any”on the appliance. The content inspection service is then associated to the content inspection profile of type “MIRROR” which specifies the egress interface through which the data has to be forwarded to the IDS device. Optionally, you can also configure a VLAN tag in the content inspection profile.

   > **Note:**
   >
   > - The IP-address used for the IDS service or server is a dummy address.
   > - Citrix ADC appliance does not support LA-Channel for the egress interface.

7. The appliance then, replicates the data through the egress interface to one or more IDS devices.
8. Similarly, when the back-end server sends a response to the Citrix ADC, the appliance replicates the data and forwards it to the IDS device.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

9. If your appliance is integrated to one or more IDS devices and if you prefer to load balance the devices, then you can use the load balancing virtual server.

Software licensing

To deploy the inline device integration, your Citrix ADC appliance must be provisioned with one of the following licenses:

1. ADC Premium
2. ADC Advanced
3. Telco Advanced
4. Telco Premium

Configuring intrusion detection system integration

You can integrate the IDS device with the Citrix ADC in two different ways.

Scenario 1: Integration with a single IDS device

Following are the steps you must configure using the command line interface.

1. Enable content inspection
2. Add content inspection profile of type MIRROR for service representing IDS device.
3. Add IDS service of type "ANY"
4. Add content inspection action of type "MIRROR"
5. Add content inspection policy for IDS inspection
6. Bind content inspection policy to content switching or load balancing virtual service of type HTTP/SSL

Enable Content Inspection If you want the Citrix ADC appliance to send the content for inspection to the IDS devices, you must enable the Content Inspection and load balancing features irrespective of performing decryption.

At the command prompt, type:

```
enable ns feature contentInspection LoadBalancing
```

Add Content Inspection profile of type "MIRROR The Content Inspection profile of type "MIRROR" explains how you can connect to the IDS device.
At the command prompt, type.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
add contentInspection profile <name> -type MIRROR -egressInterface <
interface_name> [-egressVlan <positive_integer>]
```

Example:

```
add contentInspection profile IDS_profile1 -type MIRROR -egressInterface
 1/1 -egressVLAN 10
```

Add IDS service You must configure a service of type "ANY"for each IDS device that is integrated with the appliance. The service has the IDS device configuration details. The service represents the IDS device.

At the command prompt, type:

```
add service <Service_name> <IP> ANY <Port> - contentinspectionProfileName
 <Name> -healthMonitor OFF -usip ON –useproxyport OFF
```

Example:

```
add service IDS_service 1.1.1.1 ANY 8080 -contentInspectionProfileName
 IDS_profile1 -healthMonitor OFF
```

Add content inspection action of type MIRROR for IDS service After you enable the Content Inspection feature and then add the IDS profile and service, you must add the Content Inspection action for handling the request. Based on the content inspection action, the appliance can drop, reset, block, or send data to the IDS device.

At the command prompt, type:

```
add ContentInspection action < action_name > -type MIRROR -serverName
 Service_name/Vserver_name>
```

Example:

```
add ContentInspection action IDS_action -type MIRROR –serverName
IDS_service
```

Add content inspection policy for IDS inspection After you create a Content Inspection action, you must add Content Inspection policies to evaluate requests for inspection. The policy is based on a rule which consists of one or more expressions. The policy evaluates and selects the traffic for inspection based on the rule.

At the command prompt, type the following:

```
add contentInspection policy < policy_name > –rule <Rule> -action <
action_name>
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Example:

```
add contentInspection policy IDS_pol1 –rule true –action IDS_action
```

Bind content inspection policy to content switching or load balancing virtual service of type HTTP/SSL To receive the web traffic, you must add a load balancing virtual server.
At the command prompt, type:

```
add lb vserver <name> <vserver name>
```

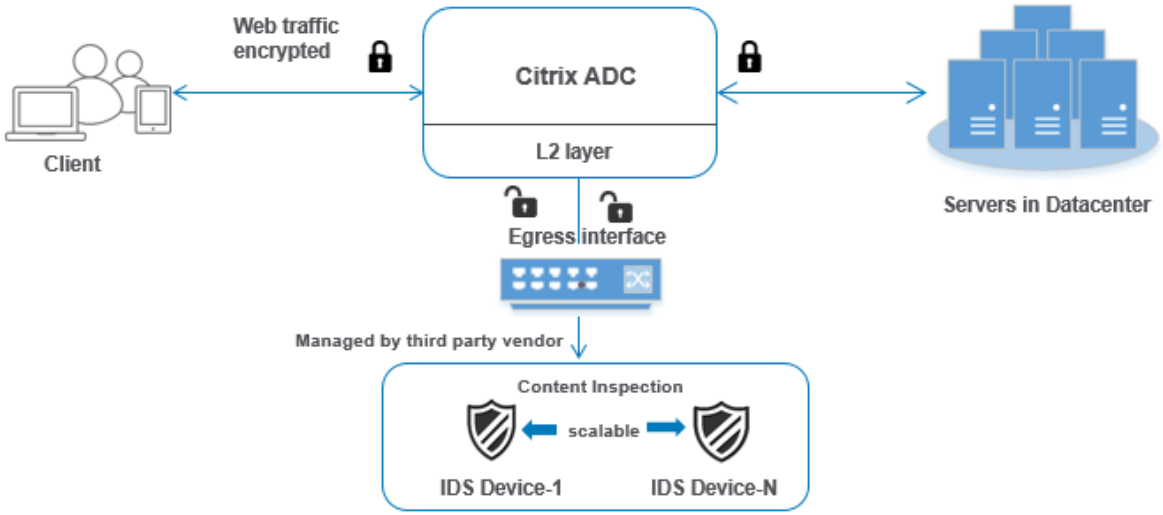
Example:

```
add lb vserver HTTP_vserver HTTP 1.1.1.3 8080
```

Bind Content Inspection policy to content switching virtual server or load balancing virtual server of type HTTP/SSL You must bind the load balancing virtual server or content switching virtual server of type HTTP/SSL to the Content Inspection policy.

At the command prompt, type the following:

```
bind lb vserver <vserver name> -policyName < policy_name > -priority
< priority > -type <REQUEST>
```



Example:

```
bind lb vserver HTTP_vserver -policyName IDS_pol1 -priority 100 -type
 REQUEST
```

Scenario 2: Load balancing multiple IDS devices

If you are using two or more IDS devices, you must load balance the devices using different content inspection services. In this case, the Citrix ADC appliance load balances the devices on top of sending a subset of traffic to each device.
For basic configuration steps, refer to scenario 1.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Following are the steps you must configure using the command line interface.

1. Add content inspection profile 1 of type MIRROR for IDS service 1
2. Add content inspection profile 2 of type MIRROR for IDS service 2
3. Add IDS service 1 of type ANY for IDS device 1
4. Add IDS service 2 of type ANY for IDS device 2
5. Add load balancing virtual server of type ANY
6. Bind IDS service 1 to load balancing virtual server
7. Bind IDS service 2 to load balancing virtual server
8. Add content inspection action for the load balancing of IDS devices.
9. Add content inspection policy for inspection
10. Add content switching or load balancing virtual server of type HTTP/SSL
11. Bind content inspection policy to load balancing virtual server of type HTTP/SSL

Add content inspection profile1 of type MIRROR for IDS service 1 IDS configuration can be specified in an entity called the Content Inspection profile. The profile has a collection of device settings. The Content Inspection profile1 is created for IDS service 1.

At the command prompt, type:

```
add contentInspection profile <name> -type ANY -egressInterface <
interface_name> [-egressVlan <positive_integer>]
```

Example:

```
add contentInspection profile IDS_profile1 -type MIRROR -egressInterface
 1/1 -egressVLAN 1
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Add content inspection profile 2 for type MIRROR for IDS service 2 The Content Inspection profile 2 is added for service 2 and the inline device communicates with the appliance through the egress 1/1 interface.

At the command prompt, type:

```
add contentInspection profile <name> -type MIRROR -egressInterface -
egressVlan <positive_integer>]
```

Example:

```
add contentInspection profile IDS_profile1 -type MIRROR -egressInterface
 1/1 -egressVLAN 1
```

Add IDS service 1 of type ANY for IDS device 1 After you enable the Content Inspection feature and add the inline profile, you must add an inline service 1 for inline device 1 to be part of the load balancing setup. The service that you add, provides all the inline configuration details.

At the command prompt, type:

```
add service <Service_name_1> <Pvt_IP1> ANY <Port> -contentInspectionProfileNam
 <IDS_Profile_1> –usip ON –useproxyport OFF
```

Example:

```
add service IDS_service1 1.1.1.1 ANY 80 -contentInspectionProfileName
 IDS_profile1 -usip ON -useproxyport OFF
```

> **Note**
>
> The IP address mentioned in the example is a dummy one.

Add IDS service 2 of type ANY for IDS device 2 After you enable the Content Inspection feature and add the inline profile, you must add an inline service 2 for inline device 2. The service that you add, provides all the inline configuration details.

At the command prompt, type:

```
add service <Service_name_1> <Pvt_IP1> ANY -contentInspectionProfileName
 <Inline_Profile_2> -healthmonitor OFF –usip ON –useproxyport OFF
```

Example:

```
add service IDS_service 1 1.1.2 ANY 80 -contentInspectionProfileName
IDS_profile2
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

> **Note**
>
> The IP address mentioned in the example is a dummy one.

Add load balancing virtual server After you have added the inline profile and the services, you must add a load balancing virtual server for load balancing the services.

At the command prompt, type:

```
add lb vserver <vserver_name> ANY <Pvt_IP3> <port>
```

Example:

```
add lb vserver lb-IDS_vserver ANY 1.1.1.2
```

Bind IDS service 1 to load balancing virtual server After you add the load balancing virtual server, now bind the load balancing virtual server to the first service.

At the command prompt, type:

```
bind lb vserver <Vserver_name> <Service_name_1>
```

Example:

```
bind lb vserver lb-IDS_vserver IDS_service1
```

Bind IDS service 2 to load balancing virtual server After you add the load balancing virtual server, now bind the server to the second service.

At the command prompt, type:

```
bind lb vserver <Vserver_name> <Service_name_1>
```

Example:

```
bind lb vserver lb-IDS_vserver IDS_service2
```

Add content inspection action for the IDS service After you enable the Content Inspection feature, you must add the Content Inspection action for handling the inline request information. Based on the action selected, the appliance drops, resets, blocks, or sends traffic to the IDS device.

At the command prompt, type:

```
add contentInspection action <name> -type <type> (-serverName <string
> [-ifserverdown <ifserverdown>]
```

Example:

```
add ContentInspection action IDS_action -type MIRROR –serverName lb-
IDS_vserver
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Add content inspection policy for inspection After you create a Content Inspection action, you must add a Content Inspection policy to evaluate requests for service.

At the command prompt, type the following:

```
add contentInspection policy <policy_name> –rule <Rule> -action <
action_name>
```

Example:

```
add contentInspection policy IDS_pol1 –rule true –action IDS_action
```

Add content switching or load balancing virtual server of type HTTP/SSL Add a content switching or load balancing virtual server to accept web traffic. Also you must enable the layer2 connection on the virtual server.

For more information about load balancing, refer to How load balancing works topic.

At the command prompt, type:

```
add lb vserver <name> <vserver name>
```

Example:

```
add lb vserver http_vserver HTTP 1.1.1.1 8080
```

Bind Content Inspection policy to load balancing virtual server of type HTTP/SSL You must bind the content switching or load balancing virtual server of type HTTP/SSL to the Content Inspection policy.

At the command prompt, type the following:

```
bind lb vserver <vserver name> -policyName < policy_name > -priority
<> -type <REQUEST>
```

Example:

```
bind lb vserver http_vserver -policyName IDS_pol1 -priority 100 -type
 REQUEST
```

Configure inline service integration using the Citrix ADC GUI

1. Navigate to **Security** > **Content Inspection** > **Content Inspection Profiles**.
2. In the **Content Inspection Profile** page, click **Add**.
3. In the **Create Content Inspection Profile** page, set the following parameters.
    a) Profile Name. Name of the content inspection profile for IDS.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

b) Type. Select the profile types as MIRROR.
c) Egress Interface. The interface through which the traffic is sent from the Citrix ADC to the IDS device.
d) Egress VLAN (optional). The interface VLAN ID through which the traffic is sent to the IDS device.

4. Click **Create**.
5. Navigate to **Traffic Management** > **Load Balancing** > **Services** and click **Add**.
6. In the **Load Balancing Service** page, enter the content inspection service details.
7. In the **Advanced Settings** section, click **Profiles**.
8. Go to the **Profiles** section and click the **Pencil** icon to add the content inspection profile.
9. Click **OK**.
10. Navigate to **Load Balancing** > **Servers**. Add a virtual server of type HTTP or SSL.
11. After entering the server details, click **OK** and again **OK**.
12. In the **Advanced Settings** section, click **Policies**.
13. Go the **Policies** section and click the **Pencil** icon to configure the content inspection policy.
14. On the **Choose Policy** page, select **Content Inspection**. Click **Continue**.
15. In the **Policy Binding** section, click "+"to add a Content Inspection policy.
16. In the **Create CI Policy** page, enter a name for the Inline content inspection policy.
17. In the **Action** field, click the "+"sign to create an IDS content inspection action of type MIRROR.
18. In the **Create CI Action** page, set the following parameters.

    a. Name. Name of the content inspection Inline policy.

    b. Type. Select the type as MIRROR.
    c. Server Name. Select the server/service name as Inline devices.

    d. If Server Down. Select an operation if the server goes down.
    e. Request Time-out. Select a time-out value. Default values can be used.

    f. Request Time-out Action. Select a time-out action. Default values can be used.

19. Click **Create**.
20. In the **Create CI Policy** page, enter other details.
21. Click **OK** and **Close**.

For information about the Citrix ADC GUI configuration for load balancing and replicating the traffic to IDS devices, see Load Balancing.

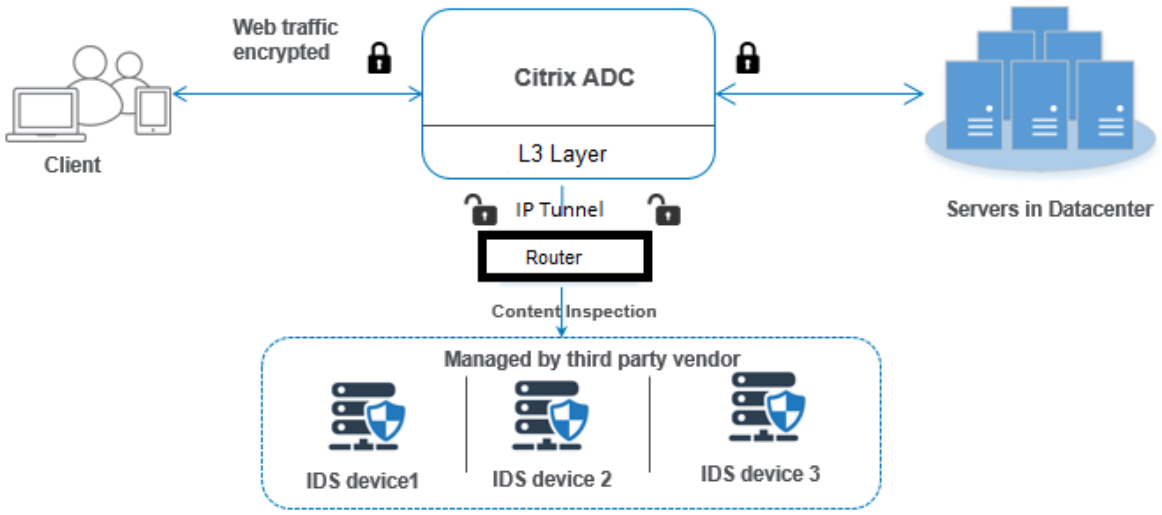
For information about the Citrix ADC GUI configuration for load balancing and forwarding the traffic to the back-end origin server after content transformation, see Load Balancing topic.

Integrating Citrix ADC layer 3 with passive security devices (Intrusion Detection System)

October 25, 2023

A Citrix ADC appliance is now integrated with passive security devices such as the Intrusion Detection System (IDS). In this setup, the appliance sends a copy of the original traffic securely to remote IDS devices. These passive devices store logs and trigger alerts when it detects a bad or non-compliant traffic. It also generates reports for the compliance purpose. If a Citrix ADC appliance is integrated with two or more IDS devices and when there is a high volume of traffic, the appliance can load balance the devices by cloning traffic at the virtual server level.



For advanced security protection, a Citrix ADC appliance is integrated with passive security devices such as IDS deployed in detection-only mode. These devices store log and trigger alerts when it sees a bad or non-compliant traffic. It also generates reports for the compliance purpose. Following are some of the benefits of integrating the Citrix ADC with an IDS device.

- **Inspecting encrypted traffic**. Most security devices bypass encrypted traffic, thereby leaving servers vulnerable to attacks. A Citrix ADC appliance can decrypt traffic and send it to IDS devices for enhancing the customer's network security.
- **Offloading inline devices from TLS/SSL processing**. TLS/SSL processing is expensive and it results in high system CPU in intrusion detection devices if they decrypt the traffic. As encrypted traffic is growing at a fast pace, these systems fail to decrypt and inspect encrypted traffic. Citrix ADC helps in offloading traffic to IDS devices from TLS/SSL processing. This way of offloading data results in an IDS device supporting a high volume of traffic inspection.
- **Loading balancing IDS devices**. The Citrix ADC appliance load balances multiple IDS devices when there is a high volume of traffic by cloning traffic at the virtual server level.
- **Replicating traffic to passive devices**. The traffic flowing into the appliance can be replicated to other passive devices for generating compliance reports. For example, few government agencies mandate every transaction to be logged in some passive devices.
- **Fanning traffic to multiple passive devices**. Some customers prefer to fan out or replicate incoming traffic into multiple passive devices.
- **Smart selection of traffic**. Every packet flowing into the appliance might not be must be content inspected, for example download of text files. User can configure the Citrix ADC appliance to select specific traffic (for example .exe files) for inspection and send the traffic to IDS devices for processing data.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

How Citrix ADC is integrated with IDS device with L3 connectivity

The following diagram shows how the IDS is integrated with a Citrix ADC appliance.

The component interaction is given as follows:

1. A client sends an HTTP/HTTPS request to the Citrix ADC appliance.
2. The appliance intercepts the traffic and sends the data to remote IDS devices across different data centers or even in a cloud. This integration is done through IP tunneled layer 3. For more information about IP tunneling in a Citrix ADC appliance, see IP tunnels topic.
3. If the traffic is an encrypted one, the appliance decrypts the data and sends it as a plain text.
4. Based on policy evaluation, the appliance applies a "MIRROR"type content inspection action.
5. The action has an IDS service or load balancing service (for multiple IDS device integrations) configured in it.
6. The IDS device is configured as content inspection service type "Any"on the appliance. The content inspection service is then associated to the content inspection profile of type "MIRROR" and the tunnel parameter which specifies the IP tunneled layer 3 interface through which the data is forwarded to the IDS device.

> **Note:**
>
> Optionally, you can also configure a VLAN tag in the content inspection profile.

1. Similarly, when the back-end server sends a response to the Citrix ADC, the appliance replicates the data and forwards it to the IDS device.
2. If your appliance is integrated to one or more IDS devices and if you prefer to load balance the devices, then you can use the load balancing virtual server.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Software licensing

To deploy the IDS integration, your Citrix ADC appliance must be provisioned with one of the following licenses:

1. ADC Premium
2. ADC Advanced

Configuring intrusion detection system integration

You can integrate IDS device with a Citrix ADC in two different ways.

Scenario 1: Integration with a single IDS device

Following are the steps you must configure using the command line interface.

1. Enable content inspection
2. Add content inspection profile of type MIRROR for service representing IDS device.
3. Add IDS service of type "ANY"
4. Add content inspection action of type "MIRROR"
5. Add content inspection policy for IDS inspection
6. Bind content inspection policy to content switching or load balancing virtual service of type HTTP/SSL

Enable Content Inspection If you want the Citrix ADC appliance to send the content for inspection to the IDS devices, you must enable the Content Inspection and load balancing features irrespective of performing decryption.

At the command prompt, type:

```
enable ns feature contentInspection LoadBalancing
```

Add Content Inspection profile of type "MIRROR" The Content Inspection profile of type "MIRROR"explains how you can connect to the IDS device.
At the command prompt, type.

> **Note:**
>
> The IP tunnel parameter must be used only for layer 3 IDS topology. Otherwise, you must use the egress interface with the egress VLAN option. GRE/IPIP tunnel types are supported with the layer 3 IDS topology.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
add contentInspection profile <name> -type MIRROR -ipTunnel <iptunnel_name
>
```

Example:

```
add contentInspection profile IDS_profile1 -type MIRROR –ipTunnel
ipsect-tunnel1
```

Add IDS service You must configure a service of type "ANY"for each IDS device that is integrated with the appliance. The service has the IDS device configuration details. The service represents the IDS device.

At the command prompt, type:

```
add service <Service_name> <IP> ANY <Port> - contentinspectionProfileName
 <Name> -healthMonitor OFF -usip ON –useproxyport OFF
```

Example:

```
add service IDS_service 1.1.1.1 ANY 8080 -contentInspectionProfileName
 IDS_profile1 -healthMonitor OFF
```

Add content inspection action of type MIRROR for IDS service After you enable the Content Inspection feature and then add the IDS profile and service, you must add the Content Inspection action for handling the request. Based on the content inspection action, the appliance can drop, reset, block, or send data to the IDS device.

At the command prompt, type:

```
add ContentInspection action < action_name > -type MIRROR -serverName
 Service_name/Vserver_name>
```

Example:

```
add ContentInspection action IDS_action -type MIRROR –serverName
IDS_service
```

Add content inspection policy for IDS inspection After you create a Content Inspection action, you must add Content Inspection policies to evaluate requests for inspection. The policy is based on a rule which consists of one or more expressions. The policy evaluates and selects the traffic for inspection based on the rule.

At the command prompt, type the following:

```
add contentInspection policy < policy_name > –rule <Rule> -action <
action_name>
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Example:

```
add contentInspection policy IDS_pol1 –rule true –action IDS_action
```

Bind content inspection policy to content switching or load balancing virtual service of type HTTP/SSL To receive the web traffic, you must add a load balancing virtual server.
At the command prompt, type:

```
add lb vserver <name> <vserver name>
```

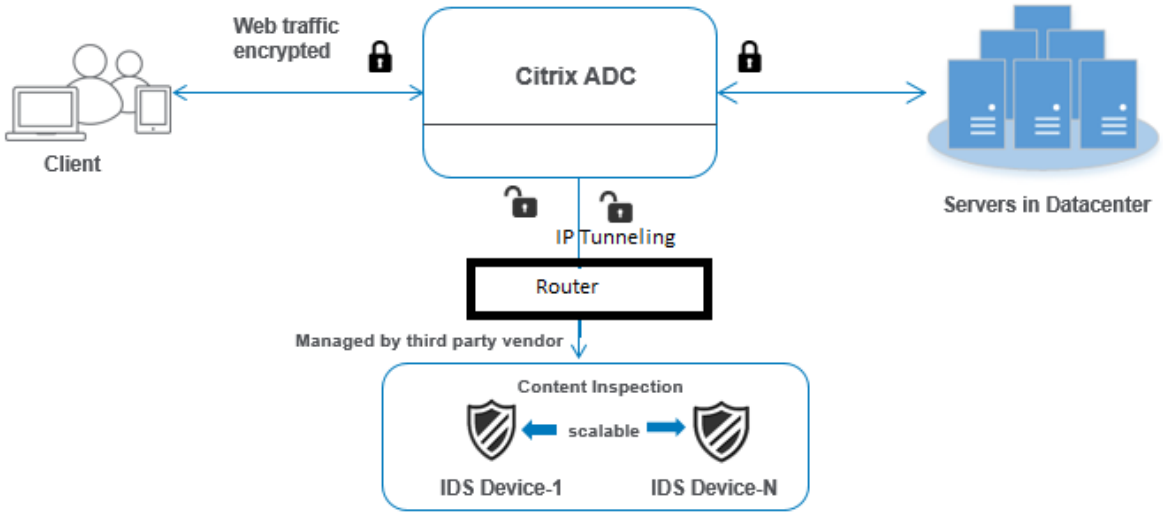
Example:

```
add lb vserver HTTP_vserver HTTP 1.1.1.3 8080
```

Bind Content Inspection policy to content switching virtual server or load balancing virtual server of type HTTP/SSL You must bind the load balancing virtual server or content switching virtual server of type HTTP/SSL to the Content Inspection policy.

At the command prompt, type the following:

```
bind lb vserver <vserver name> -policyName < policy_name > -priority
< priority > -type <REQUEST>
```



Example:

```
bind lb vserver HTTP_vserver -policyName IDS_pol1 -priority 100 -type
 REQUEST
```

Scenario 2: Load balancing multiple IDS devices

If you are using two or more IDS devices, you must load balance the IDS devices using different content inspection services. In this case, the Citrix ADC appliance load balances the devices on top of sending a subset of traffic to each device.
For basic configuration steps, refer to scenario 1.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Following are the steps you must configure using the command line interface.

1. Add content inspection profile 1 of type MIRROR for IDS service 1
2. Add content inspection profile 2 of type MIRROR for IDS service 2
3. Add IDS service 1 of type ANY for IDS device 1
4. Add IDS service 2 of type ANY for IDS device 2
5. Add load balancing virtual server of type ANY
6. Bind IDS service 1 to load balancing virtual server
7. Bind IDS service 2 to load balancing virtual server
8. Add content inspection action for the load balancing of IDS devices.
9. Add content inspection policy for inspection
10. Add content switching or load balancing virtual server of type HTTP/SSL
11. Bind content inspection policy to load balancing virtual server of type HTTP/SSL

Add content inspection profile1 of type MIRROR for IDS service 1 IDS configuration can be specified in an entity called the Content Inspection profile. The profile has a collection of device settings. The Content Inspection profile1 is created for IDS service 1.

> **Note**:
> IP tunnel parameter must be used only for layer 3 IDS topology. Otherwise, you must use the egress interface with the egress VLAN option.

At the command prompt, type:

```
add contentInspection profile <name> -type ANY – ipTunnel <iptunnel_name
>
```

Example:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
add contentInspection profile IDS_profile1 -type MIRROR - ipTunnel
ipsect_tunnel1
```

Add content inspection profile 2 for type MIRROR for IDS service 2 The Content Inspection profile 2 is added for service 2 and the inline device communicates with the appliance through the egress 1/1 interface.

At the command prompt, type:

```
add contentInspection profile <name> -type ANY – ipTunnel <iptunnel_name
>
```

Example:

```
add contentInspection profile IDS_profile2 -type ANY – ipTunnel
ipsect_tunnel2
```

Add IDS service 1 of type ANY for IDS device 1 After you enable the Content Inspection feature and add the inline profile, you must add an inline service 1 for inline device 1 to be part of the load balancing setup. The service that you add, provides all the inline configuration details.

At the command prompt, type:

```
add service <Service_name_1> <Pvt_IP1> ANY <Port> -contentInspectionProfileNam
 <IDS_Profile_1> –usip ON –useproxyport OFF
```

Example:

```
add service IDS_service1 1.1.1.1 ANY 80 -contentInspectionProfileName
 IDS_profile1 -usip ON -useproxyport OFF
```

> **Note**:
>
> The IP address mentioned in the example is a dummy one.

Add IDS service 2 of type ANY for IDS device 2 After you enable the Content Inspection feature and add the inline profile, you must add an inline service 2 for inline device 2. The service that you add, provides all the inline configuration details.

At the command prompt, type:

```
add service <Service_name_1> <Pvt_IP1> ANY -contentInspectionProfileName
 <Inline_Profile_2> -healthmonitor OFF –usip ON –useproxyport OFF
```

Example:

```
add service IDS_service 1 1.1.2 ANY 80 -contentInspectionProfileName
IDS_profile2
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

> **Note**:
>
> The IP address mentioned in the example is a dummy one.

Add load balancing virtual server After you have added the inline profile and the services, you must add a load balancing virtual server for load balancing the services.

At the command prompt, type:

```
add lb vserver <vserver_name> ANY <Pvt_IP3> <port>
```

Example:

```
add lb vserver lb-IDS_vserver ANY 1.1.1.2
```

Bind IDS service 1 to load balancing virtual server After you add the load balancing virtual server, now bind the load balancing virtual server to the first service.

At the command prompt, type:

```
bind lb vserver <Vserver_name> <Service_name_1>
```

Example:

```
bind lb vserver lb-IDS_vserver IDS_service1
```

Bind IDS service 2 to load balancing virtual server After you add the load balancing virtual server, now bind the server to the second service.

At the command prompt, type:

```
bind lb vserver <Vserver_name> <Service_name_1>
```

Example:

```
bind lb vserver lb-IDS_vserver IDS_service2
```

Add content inspection action for the IDS service After you enable the Content Inspection feature, you must add the Content Inspection action for handling the inline request information. Based on the action selected, the appliance drops, resets, blocks, or sends traffic to the IDS device.

At the command prompt, type:

```
add contentInspection action <name> -type <type> (-serverName <string
> [-ifserverdown <ifserverdown>]
```

Example:

```
add ContentInspection action IDS_action -type MIRROR –serverName lb-
IDS_vserver
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Add content inspection policy for inspection After you create a Content Inspection action, you must add the Content Inspection policy to evaluate requests for service.

At the command prompt, type the following:

```
add contentInspection policy <policy_name> –rule <Rule> -action <
action_name>
```

Example:

```
add contentInspection policy IDS_pol1 –rule true –action IDS_action
```

Add content switching or load balancing virtual server of type HTTP/SSL Add a content switching or load balancing virtual server to accept web traffic. Also you must enable the layer2 connection on the virtual server.

For more information about load balancing, refer to How load balancing works topic.

At the command prompt, type:

```
add lb vserver <name> <vserver name>
```

Example:

```
add lb vserver http_vserver HTTP 1.1.1.1 8080
```

Bind Content Inspection policy to load balancing virtual server of type HTTP/SSL You must bind the content switching or load balancing virtual server of type HTTP/SSL to the Content Inspection policy.

At the command prompt, type the following:

```
bind lb vserver <vserver name> -policyName < policy_name > -priority
<> -type <REQUEST>
```

Example:

```
bind lb vserver http_vserver -policyName IDS_pol1 -priority 100 -type
 REQUEST
```

Configure inline service integration using the Citrix ADC GUI

1. Navigate to **Security** > **Content Inspection** > **ContentInspection Profiles**.
2. In the **ContentInspection Profile** page, click **Add**.
3. In the **Create ContentInspectionProfile** page, set the following parameters.

    a) Profile Name. Name of the content inspection profile for IDS.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

   b) Type. Select the profile types as MIRROR.
   c) Connectivity. Layer 2 or Layer 3 interface.
   d) IP Tunnel. Select the network communication channel between the two networks.

4. Click **Create**.
5. Navigate to **Traffic Management** > **Load Balancing** > **Services** and click **Add**.
6. In the **Load Balancing Service** page, enter the content inspection service details.
7. In the **Advanced Settings** section, click **Profiles**.
8. Go to the **Profiles** section and click the **Pencil** icon to add the content inspection profile.
9. Click **OK**.
10. Navigate to **Load Balancing** > **Servers**. Add a virtual server of type HTTP or SSL.
11. After entering the server details, click **OK** and again **OK**.
12. In the **Advanced Settings** section, click **Policies**.
13. Go the **Policies** section and click the **Pencil** icon to configure the content inspection policy.
14. On the **Choose Policy** page, select **Content Inspection**. Click **Continue**.
15. In the **Policy Binding** section, click "+"to add a Content Inspection policy.
16. In the **Create CI Policy** page, enter a name for the Inline content inspection policy.
17. In the **Action** field, click the "+"sign to create an IDS content inspection action of type MIRROR.
18. In the **Create CI Action** page, set the following parameters.

    a) Name. Name of the content inspection Inline policy.
    b) Type. Select the type as MIRROR.
    c) Server Name. Select the server/service name as Inline devices.
    d) If Server Down. Select an operation if the server goes down.
    e) Request Time-out. Select a time-out value. Default values can be used.
    f) Request Time-out Action. Select a time-out action. Default values can be used.

19. Click **Create**.
20. In the **Create CI Policy** page, enter other details.
21. Click **OK** and **Close**.

For information about the Citrix ADC GUI configuration for load balancing and replicating the traffic to IDS devices, see Load Balancing.

For information about the Citrix ADC GUI configuration for load balancing and forwarding the traffic to the back-end origin server after content transformation, see Load Balancing.

Content inspection statistics for ICAP, IPS, and IDS

September 14, 2021

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

The content inspection statistics for ICAP, inline device integration (IDS), and Intrusion Prevention System (IPS) devices is a detailed output (summary) of request, response, and server action details.

The content inspection statistics is a collection of statistical data that includes the HTTP/HTTPS request sent for content inspection. HTTP/HTTPS response received from IPS, IDS, and ICAP devices and back-end server action.

To display Content inspection statistics by using the CLI:

At the command prompt, type:

```
> stat contentInspection
```

```
ContentInspection Stats

Inline Statistics
                                    Total

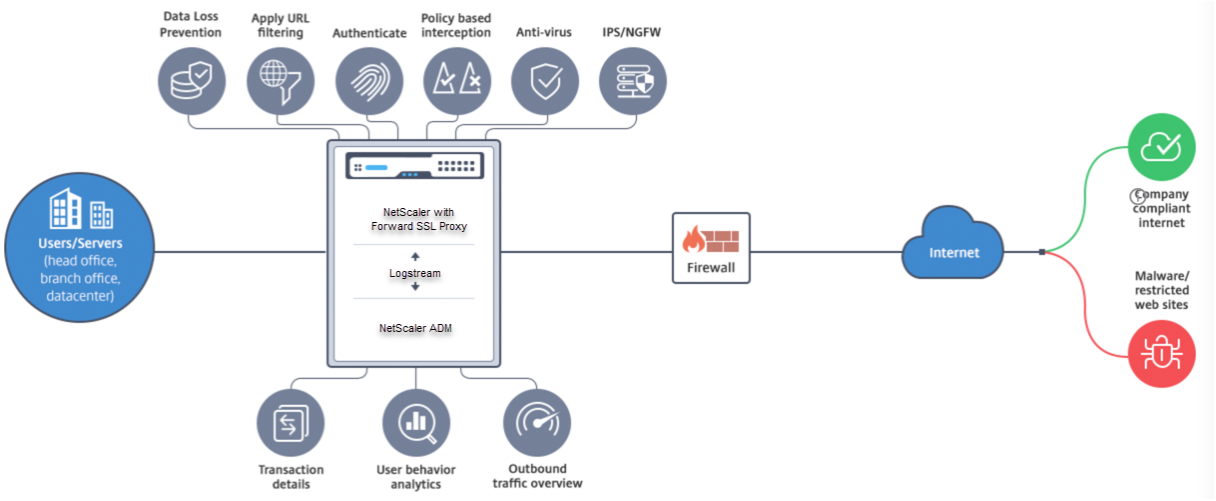
SSL forward proxy

September 14, 2021



Note: SSL forward proxy feature is available with the ADC Premium license.

Web traffic has increased exponentially in recent years, and corporations are increasingly relying on the internet for their day to day operations. That, combined with the emergence of more diverse endpoints, mobility, and BYOD, along with a growing attacker base, is making users easy targets of modern malware. They are increasingly vulnerable to identity theft and having their data compromised. Traditionally, enterprises have inspected HTTP traffic for malware and viruses. They bypassed HTTPS/TLS traffic, because it was not as prominent. It was used sparingly for content that was sensitive and trusted. But that has changed rapidly as most public internet websites now prefer to use HTTPS to protect user privacy. As a result, the inability to inspect encrypted packets allows malware or intrusions into the enterprise network. The SSL forward proxy solution offers tools that enterprises can use to protect against internet threats.

A proxy is a server that controls all the traffic between users and the Internet or SaaS applications. Since all the traffic passes through this proxy, it performs security-related functions, such as user authentication and URL categorization.

The following figure is an overview of the SSL forward proxy implementation. Traffic flows through the enterprise network from the head office, branch offices, data center, and remote employees. A Citrix ADC appliance at the edge of the network acts a proxy. The appliance can operate in transparent proxy mode or explicit proxy mode and offers controls to intercept internet traffic, including HTTPS. Policies configured on the appliance determine whether it intercepts, bypasses, or blocks a particular request. Access to restricted sites can be blocked by using URL filtering. A user is authenticated before logging on to the enterprise network. All requests and responses are tagged to identify the user, and internet-site access is categorized. User activity is logged and used to generate reports. If a breach occurs, administrators can isolate the infected system, determine whether the devices of any other users who visited that website are compromised, and take appropriate action. When you integrate Citrix Application Delivery Management (ADM) with SSL forward proxy, the logged user activity and the subsequent records in the appliance are exported to Citrix ADM by using `logstream`. Citrix ADM collates and presents information about the activities of users, from websites visited to the time spent online. It also provides information about bandwidth use and detected threats, such as malware and phishing sites. You can use these key metrics to monitor your network, and use the SSL forward proxy feature to take corrective actions.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

SSL forward proxy enables IT directors to do the following:

- Gain visibility into the otherwise bypassed secure traffic.
- Block access to malicious or unknown sites and avoid infecting users within the enterprise.
- Control access to some websites, such as personal mail, social networking, and job search websites, from the enterprise network.
- Apply intelligent content control policies to ensure maximum user productivity.

Getting started with the SSL forward proxy feature

September 14, 2021

Important:

- OCSP check requires an internet connection to check the validity of certificates. If your appliance is not accessible from the internet by using the NSIP address, add access control lists (ACLs) to perform NAT from the NSIP address to the subnet IP (SNIP) address. The SNIP must be able to access the internet. For example,

```
add ns acl a1 ALLOW -srcIP = <NSIP> -destIP " != "
    10.0.0.0-10.255.255.255

add rnat RNAT-1 a1

bind rnat RNAT-1 -<SNIP>

apply acls
```

- Specify a DNS name server to resolve domain names.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- Make sure that the date on the appliance is synchronized with the NTP servers. If the date is not synchronized, the appliance cannot effectively verify whether an origin server certificate is an expired one.

To use the SSL forward proxy feature, you must perform the following tasks:

- Add a proxy server in explicit or transparent mode.
- Enable SSL interception.
  - Configure an SSL profile.
  - Add and bind SSL policies to the proxy server.
  - Add and bind a CA certificate-key pair for SSL interception.

Note:

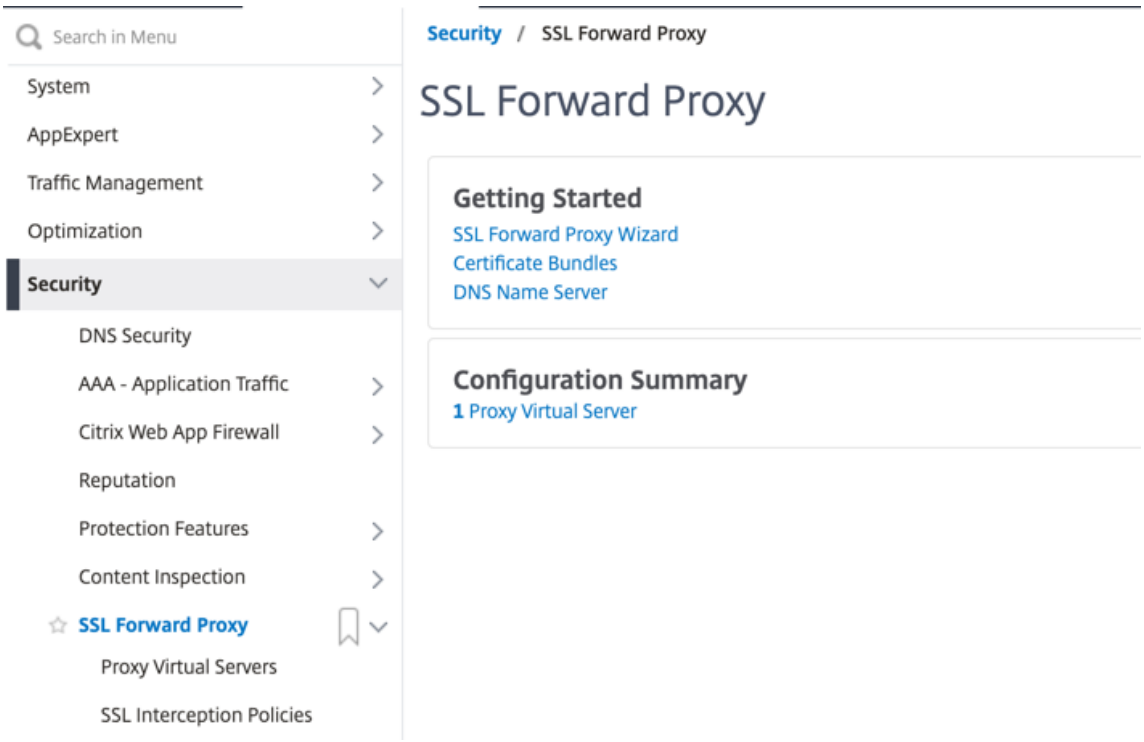
An ADC appliance configured in transparent proxy mode can intercept only HTTP and HTTPS protocols. To bypass any other protocol, such as telnet, you must add the following listen policy on the proxy virtual server.

The virtual server now accepts only HTTP and HTTPS incoming traffic.

```
1 set cs vserver transparent-pxy1 PROXY * * -cltTimeout 180 -Listenpolicy
      "CLIENT.TCP.DSTPORT.EQ(80) || CLIENT.TCP.DSTPORT.EQ(443)"`
```

You might need to configure the following features, depending on your deployment:

- Authentication Service (recommended) –to authenticate users. Without the Authentication Service, user activity is based on client IP address.
- URL Filtering –to filter URLs by categories, reputation score, and URL lists.
- Analytics –to view user activity, user risk indicators, bandwidth consumption, and transactions break down in Citrix Application Delivery Management (ADM).



Note: SSL Forward Proxy implements most typical HTTP and HTTPS standards followed by similar products. This implementation is done with no specific browser in mind and is compatible with most common browsers. SSL Forward Proxy has been tested with common browsers and recent versions of Google Chrome, Internet Explorer, and Mozilla Firefox.

SSL forward proxy wizard

The SSL forward proxy wizard provides administrators with a tool for managing the entire SSL forward proxy deployment by using a web browser. It helps guide the customers to bring up an SSL forward proxy service quickly and helps simplify the configuration by following a sequence of well-defined steps.

1. Navigate to **Security > SSL Forward Proxy**. In **Getting Started**, click **SSL Forward Proxy Wizard**.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

2. Follow the steps in the wizard to configure your deployment.

Add a listen policy to the transparent proxy server

1. Navigate to **Security >SSL Forward Proxy** > **Proxy Virtual Servers**. Select the transparent proxy server and click **Edit**.
2. Edit **Basic Settings**, and click **More**.
3. In **Listen priority**, enter 1.
4. In **Listen Policy Expression**, enter the following expression:

```
(CLIENT.TCP.DSTPORT.EQ(80)||CLIENT.TCP.DSTPORT.EQ(443))
```

This expression assumes standard ports for HTTP and HTTPS traffic. If you have configured different ports, for example 8080 for HTTP or 8443 for HTTPS, modify the expression to reflect those ports.

Limitations

SSL forward proxy is not supported in a cluster setup, in admin partitions, and on a Citrix ADC FIPS appliance.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Proxy modes

December 16, 2024

The Citrix ADC appliance acts as a client's proxy to connect to the internet and SaaS applications. As a proxy, it accepts all the traffic and determines the traffic's protocol. Unless the traffic is HTTP or SSL, it is forwarded to the destination as is. When the appliance receives a request from a client, it intercepts the request and performs some actions, such as user authentication, site categorization, and redirection. It uses policies to determine which traffic to allow and which traffic to block.

The appliance maintains two different sessions, one between the client and the proxy and the other between the proxy and the origin server. The proxy relies on customer defined policies to allow or block HTTP and HTTPS traffic. Therefore, it is important that you define policies to bypass sensitive data, such as financial information. The appliance offers a rich set of Layer 4 to Layer 7 traffic attributes and user-identity attributes to create traffic management policies.

For SSL traffic, the proxy verifies the origin server's certificate and establishes a legitimate connection with the server. It then emulates the server certificate, signs it using a CA certificate installed on Citrix ADC, and presents the created server certificate to the client. You must add the CA certificate as a trusted certificate to the client's browser for the SSL session to be successfully established.

The appliance supports transparent and explicit proxy modes. In explicit proxy mode, the client must specify an IP address in their browser, unless the organization pushes the setting onto the client's device. This address is the IP address of a proxy server that is configured on the ADC appliance. All client requests are sent to this IP address. For explicit proxy, you must configure a content switching virtual server of type PROXY and specify an IP address and a valid port number. Also, when the `markconnReqInval` parameter is set to ON globally on the default HTTP profile, then you must bind another HTTP profile with `markconnReqInval` set to OFF to the content switching virtual server.

Example to bind a custom HTTP profile to the proxy content switching virtual server:

```
add ns httpprofile custom_http_profile1 -markconnReqInval DISABLED
set cs vserver swgVS -httpprofileName custom_http_profile1
```

Transparent proxy, as the name implies, is transparent to the client. That is, the clients might not be aware that a proxy server is mediating their requests. The ADC appliance is configured in an inline deployment, and transparently accepts all HTTP and HTTPS traffic. For transparent proxy, you must configure a content switching virtual server of type PROXY, with asterisks (* *) as the IP address and port. When using the **SSL Forward Proxy Wizard** in the GUI, you do not have to specify an IP address and port.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

> **Note**
>
> To intercept protocols other than HTTP and HTTPS in transparent proxy mode, you must add a listen policy and bind it to the proxy server.

Configure SSL forward proxy by using the CLI

At the command prompt, type:

```
add cs vserver <name> PROXY <ipaddress> <port>
```

Arguments:

Name:

Name for the proxy server. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the CS virtual server is created.

The following requirement applies only to the CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, “my server”or ‘my server’).

This argument is mandatory. Maximum Length: 127

IPAddress:

IP address of the proxy server.

Port:

Port number for the proxy server. Minimum value: 1

Example for explicit proxy:

```
add cs vserver swgVS PROXY 192.0.2.100 80
```

Example for transparent proxy:

```
add cs vserver swgVS PROXY * *
```

Add a listen policy to the transparent proxy server by using the GUI

1. Navigate to **Security** > **SSL Forward Proxy** > **Proxy Virtual Servers**. Select the transparent proxy server and click **Edit**.
2. Edit **Basic Settings**, and click **More**.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

3. In **Listen priority**, enter 1.
4. In **Listen Policy Expression**, enter the following expression:

```
(CLIENT.TCP.DSTPORT.EQ(80)||CLIENT.TCP.DSTPORT.EQ(443))
```

> **Note**
>
> This expression assumes standard ports for HTTP and HTTPS traffic. If you have configured different ports, for example 8080 for HTTP or 8443 for HTTPS, modify the preceding expression to specify those ports.

SSL interception

September 14, 2021

A Citrix ADC appliance configured for SSL interception acts as a proxy. It can intercept and decrypt SSL/TLS traffic, inspect the unencrypted request, and enable an admin to enforce compliance rules and security checks. SSL interception uses a policy that specifies which traffic to intercept, block, or allow. For example, traffic to and from financial websites, such as banks, must not be intercepted, but other traffic can be intercepted, and blacklisted sites can be identified and blocked. Citrix recommends that you configure one generic policy to intercept traffic and more specific policies to bypass some traffic.

The client and the proxy establish an HTTPS/TLS handshake. The proxy establishes another HTTPS/TLS handshake with the server and receives the server certificate. The proxy verifies the server certificate on behalf of the client, and also checks the validity of the server certificate by using the Online Certificate Status Protocol (OCSP). It regenerates the server certificate, signs it by using the key of the CA certificate installed on the appliance, and presents it to the client. Therefore, one certificate is used between the client and the Citrix ADC appliance, and another certificate between the appliance and the back-end server.

> **Important**
>
> The CA certificate that is used to sign the server certificate must be preinstalled on all the client devices, so that the regenerated server certificate is trusted by the client.

For intercepted HTTPS traffic, the proxy server decrypts the outbound traffic, accesses the clear text HTTP request, and can use any Layer 7 application to process the traffic, such as by looking into the plain text URL and allowing or blocking access based on the corporate policy and URL reputation. If the policy decision is to allow access to the origin server, the proxy server forwards the re-encrypted request to the destination service (on the origin server). The proxy decrypts the response from the

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

origin server, accesses the clear text HTTP response, and optionally applies any policies to the response. The proxy then reencrypts the response and forwards it to the client. If the policy decision is to block the request to the origin server, the proxy can send an error response, such as HTTP 403, to the client.

To perform SSL interception, in addition to the proxy server configured earlier, you must configure the following on the ADC appliance:

- SSL profile
- SSL policy
- CA certificate store
- SSL-error autolearning and caching

> **Note:**
>
> HTTP/2 traffic is not intercepted by the SSL Interception feature.

SSL interception certificate store

An SSL certificate, which is a part of any SSL transaction, is a digital data form (X509) that identifies a company (domain) or an individual. An SSL certificate is issued by a certificate authority (CA). A CA can be private or public. Certificates issued by public CAs, such as Verisign, are trusted by applications that conduct SSL transactions. These applications maintain a list of CAs that they trust.

As a forward proxy, the ADC appliance performs encryption and decryption of traffic between a client and a server. It acts as a server to the client (user) and as a client to the server. Before an appliance can process HTTPS traffic, it must validate the identity of a server to prevent any fraudulent transactions. Therefore, as a client to the origin server, the appliance must verify the origin server certificate before accepting it. To verify a server certificate, all the certificates (for example, root and intermediate certificates) that are used to sign and issue the server certificate must be present on the appliance. A default set of CA certificates is preinstalled on an appliance. The appliance can use these certificates to verify almost all the common origin-server certificates. This default set cannot be modified. However, if your deployment requires more CA certificates, you can create a bundle of such certificates and import the bundle to the appliance. A bundle can also contain a single certificate.

When you import a certificate bundle to the appliance, the appliance downloads the bundle from the remote location and, after verifying that the bundle contains only certificates, installs it on the appliance. You must apply a certificate bundle before you can use it to validate a server certificate. You can also export a certificate bundle for editing or to store it in an offline location as a backup.

Import and apply a CA certificate bundle on the appliance by using the CLI

At the command prompt, type:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
import ssl certBundle <name> <src>
apply ssl certBundle <name>
```

```
show ssl certBundle
```

ARGUMENTS:

Name:

Name to assign to the imported certificate bundle. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. The following requirement applies only to the CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my file"or 'my file').

Maximum Length: 31

src:

URL specifying the protocol, host, and path, including file name, to the certificate bundle to be imported or exported. For example, `http://www.example.com/cert_bundle_file`.

NOTE: The import fails if the object to be imported is on an HTTPS server that requires client certificate authentication for access.

Maximum Length: 2047

Example:

```
import ssl certbundle swg-certbundle http://www.example.com/cert_bundle
apply ssl certBundle swg-certbundle
```

```
show ssl certbundle

            Name : swg-certbundle(Inuse)

            URL : http://www.example.com/cert_bundle

    Done
```

Import and apply a CA certificate bundle on the appliance by using the GUI

1. Navigate to **Security > SSL Forward Proxy > Getting Started > Certificate Bundles**.
2. Do one of the following:
   - Select a certificate bundle from the list.
   - To add a certificate bundle, click "+"and specify a name and source URL. Click **OK**.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

3. Click **OK**.

Remove a CA certificate bundle from the appliance by using the CLI

At the command prompt, type:

```
remove certBundle <cert bundle name>
```

Example:

```
remove certBundle mytest-cacert
```

Export a CA certificate bundle from the appliance by using the CLI

At the command prompt, type:

```
export certBundle <cert bundle name> <Path to export>
```

ARGUMENTS:

Name:

Name to assign to the imported certificate bundle. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. The following requirement applies only to the CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, “my file”or ‘my file’).

Maximum Length: 31

src:

URL specifying the protocol, host, and path, including file name, to the certificate bundle to be imported or exported. For example, `http://www.example.com/cert_bundle_file`.

NOTE: The import fails if the object to be imported is on an HTTPS server that requires client certificate authentication for access.

Maximum Length: 2047

Example:

```
export certBundle mytest-cacert http://192.0.2.20/
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Import, apply, and verify a CA certificate bundle from the Mozilla CA certificate store

At the command prompt, type:

```
> import certbundle mozilla_public_ca https://curl.haxx.se/ca/cacert.pem
Done
```

To apply the bundle, type:

```
> apply certbundle mozilla_public_ca
Done
```

To verify the certificate bundle in use, type:

```
> sh certbundle | grep mozilla
                Name : mozilla_public_ca (Inuse)
```

Limitations

- Certificate bundles are not supported in a cluster setup, or on a partitioned appliance.
- TLSv1.3 protocol is not supported with SSL Forward Proxy.

SSL policy infrastructure for SSL interception

A policy acts like a filter on incoming traffic. Policies on the ADC appliance help define how to manage proxied connections and requests. The processing is based on the actions that are configured for that policy. That is, data in connection requests is compared to a rule specified in the policy, and the action is applied to connections that match the rule (expression). After defining an action to assign to the policy and create the policy, you must bind it to a proxy server, so that it applies to traffic flowing through that proxy server.

An SSL policy for SSL interception evaluates incoming traffic and applies a predefined action to requests that match a rule (expression). A decision to intercept, bypass, or reset a connection is made based on the defined SSL policy. You can configure one of three actions for a policy—INTERCEPT, BYPASS, or RESET. You must specify an action when you create a policy. To put a policy into effect, you must bind it to a proxy server on the appliance. To specify that a policy is intended for SSL interception, you must specify the type (bind point) as INTERCEPT_REQ when you bind the policy to a proxy server. When unbinding a policy, you must specify the type as INTERCEPT_REQ.

> **Note**:
>
> The proxy server cannot make a decision to intercept unless you specify a policy.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Traffic interception can be based on any SSL handshake attribute. The most commonly used is the SSL domain. The SSL domain is usually indicated by the attributes of the SSL handshake. It can be the Server Name Indicator value extracted from the SSL Client Hello message, if present, or the Server Alternate Name (SAN) value extracted from the origin server certificate. The SSL interception policy presents a special attribute, DETECTED_DOMAIN. This attribute makes it easier for the customers to author interception policies based on the SSL domain from the origin server certificate. The customer can match the domain name against a string, URL list (URL set or `patset`), or a URL category derived from the domain.

Create an SSL policy by using the CLI

At the command prompt, type:

```
add ssl policy <name> -rule <expression> -action <string>
```

Examples:

The following examples are for policies with expressions that use the `detected_domain` attribute to check for a domain name.

Do not intercept traffic to a financial institution, such as XYZBANK

```
add ssl policy pol1 -rule client.ssl.detected_domain.contains("XYZBANK"
    ) -action BYPASS
```

Do not allow a user to connect to YouTube from the corporate network

```
add ssl policy pol2 -rule client.ssl.client.ssl.detected_domain.
    url_categorize(0,0).category.eq ("YouTube") -action RESET
```

Intercept all user traffic

```
add ssl policy pol3 – rule true – action INTERCEPT
```

If the customer doesn't want to use the detected_domain, they can use any of the SSL handshake attributes to extract and infer the domain.

For example, a domain name is not found in the SNI extension of the client hello message. The domain name must be taken from the origin server certificate. The following examples are for policies with expressions that check for a domain name in the subject name of the origin server certificate.

Intercept all user traffic to any Yahoo domain

```
add ssl policy pol4 -rule client.ssl.origin_server_cert.subject.
    contains("yahoo") – action INTERCEPT
```

Intercept all user traffic for the category "Shopping/Retail"

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
add ssl policy pol_url_category -rule client.ssl.origin_server_cert.
    subject.URL_CATEGORIZE(0,0).CATEGORY.eq("Shopping/Retail") -action
    INTERCEPT
```

Intercept all user traffic to an uncategorized URL

```
add ssl policy pol_url_category -rule client.ssl.origin_server_cert.
    subject.url_categorize(0,0).category.eq("Uncategorized") -action
    INTERCEPT
```

The following examples are for policies that match the domain against an entry in a URL set.

Intercept all user traffic if the domain name in SNI matches an entry in the URL set "top100"

```
add ssl policy pol_url_set  -rule client.ssl.client_hello.SNI.
    URLSET_MATCHES_ANY("top100") -action INTERCEPT
```

Intercept all user traffic of the domain name if the origin server certificate matches an entry in the URL set "top100"

```
add ssl policy pol_url_set  -rule client.ssl.origin_server_cert.subject
    .URLSET_MATCHES_ANY("top100") -action INTERCEPT
```

Create an SSL policy to a proxy server by using the GUI

1. Navigate to **Traffic Management > SSL > Policies**.
2. On the **SSL Policies** tab, click **Add** and specify the following parameters:
   - Policy name
   - Policy action –Select from intercept, bypass, or reset.
   - Expression
3. Click **Create**.

Bind an SSL policy to a proxy server by using the CLI

At the command prompt, type:

```
bind ssl vserver <vServerName> -policyName <string> -priority <
    positive_integer> -type  INTERCEPT_REQ
```

Example:

```
bind ssl vserver <name> -policyName pol1 -priority 10 -type
    INTERCEPT_REQ
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Bind an SSL policy to a proxy server by using the GUI

1. Navigate to **Security > SSL Forward Proxy > Proxy Virtual Servers**.
2. Select a virtual server and click **Edit**.
3. In **Advanced Settings**, click **SSL Policies**.
4. Click inside the **SSL Policy** box.
5. In **Select Policy**, select a policy to bind.
6. In **Type**, select **INTERCEPT_REQ**.
7. Click **Bind** and then click **OK**.

Unbind an SSL policy to a proxy server by using the CLI

At the command prompt, type:

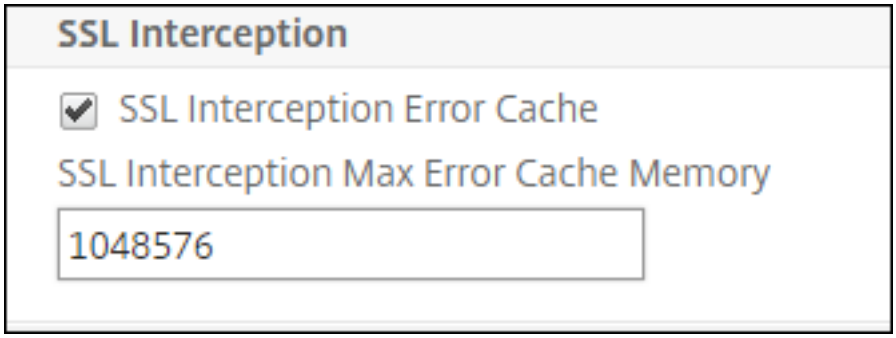
```
unbind ssl vserver <vServerName> -policyName <string> -type
    INTERCEPT_REQ
```

SSL expressions used in SSL policies

Expression	Description
`CLIENT.SSL.CLIENT_HELLO.SNI.*`	Returns the SNI extension in a string format. Evaluate the string to see if it contains the specified text. Example: client.ssl.client_hello.sni.contains(" `xyz.com` ")
`CLIENT.SSL.ORIGIN_SERVER_CERT.*`	Returns a certificate, received from a back-end server, in a string format. Evaluate the string to see if it contains the specified text. Example: client.ssl.origin_server_cert.subject.contains(" `xyz.com` ")
`CLIENT.SSL.DETECTED_DOMAIN.*`	Returns a domain, either from the SNI extension or from the origin server certificate, in a string format. Evaluate the string to see if it contains the specified text. Example: client.ssl.detected_domain.contains(" `xyz.com` ")

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

SSL error autolearning



The appliance adds a domain to the SSL bypass list if learning mode is on. The learning mode is based on the SSL alert message received from either a client or an origin server. That is, learning depends the client or server sending an alert message. There is no learning if an alert message is not sent. The appliance learns if any of the following conditions are met:

1. A request for a client certificate is received from the server.
2. Any one of the following alerts is received as part of the handshake:
    - BAD_CERTIFICATE
    - UNSUPPORTED_CERTIFICATE
    - CERTIFICATE_REVOKED
    - CERTIFICATE_EXPIRED
    - CERTIFICATE_UNKNOWN
    - UNKNOWN_CA (If a client uses pinning, it sends this alert message if it receives a server certificate.)
    - HANDSHAKE_FAILURE

To enable learning, you must enable the error cache and specify the memory reserved for learning.

Enable learning by using the GUI

1. Navigate to **Traffic Management > SSL**.
2. In **Settings**, click **Change advanced SSL settings**.
3. In **SSL Interception**, select **SSL Interception Error Cache**.
4. In **SSL Interception Max Error Cache Memory**, specify the memory (in bytes) to reserve.

5. Click **OK**.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Enable learning by using the CLI

At the command prompt type:

```
set ssl parameter -ssliErrorCache ( ENABLED | DISABLED ) -
    ssliMaxErrorCacheMem <positive_integer>
```

Arguments:

ssliErrorCache:

Enable or disable dynamic learning, and cache the learned information to make subsequent decisions to intercept or bypass requests. When enabled, the appliance performs a cache lookup to decide whether to bypass the request.

Possible values: ENABLED, DISABLED

Default value: DISABLED

ssliMaxErrorCacheMem:

Specify the maximum memory, in bytes, that can be used to cache the learned data. This memory is used as an LRU cache so that the old entries are replaced with new entries after the set memory limit is exhausted. A value of 0 decides the limit automatically.

Default value: 0

Minimum value: 0

Maximum value: 4294967294

SSL profile

An SSL profile is a collection of SSL settings, such as ciphers and protocols. A profile is helpful if you have common settings for different servers. Instead of specifying the same settings for each server, you can create a profile, specify the settings in the profile, and then bind the profile to different servers. If a custom front-end SSL profile is not created, the default front-end profile is bound to client-side entities. This profile enables you to configure settings for managing the client-side connections.

For SSL interception, you must create an SSL profile and enable SSL interception in the profile. A default cipher group is bound to this profile, but you can configure more ciphers to suit your deployment. Bind an SSL interception CA certificate to this profile and then bind the profile to a proxy server. For SSL interception, the essential parameters in a profile are the ones used for the following actions:

- Check the OCSP status of the origin server certificate.
- Trigger client renegotiation if the origin server requests renegotiation.
- Verify the origin server certificate before reusing the front-end SSL session.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Use the default back-end profile when communicating with the origin servers. Set any server-side parameters, such as cipher suites, in the default back-end profile. A custom back-end profile is not supported.

For examples of the most commonly used SSL settings, see “Sample Profile”at the end of this section.

Cipher/protocol support differs on the internal and external network. In the following tables, the connection between the users and an ADC appliance is the internal network. The external network is between the appliance and the internet.

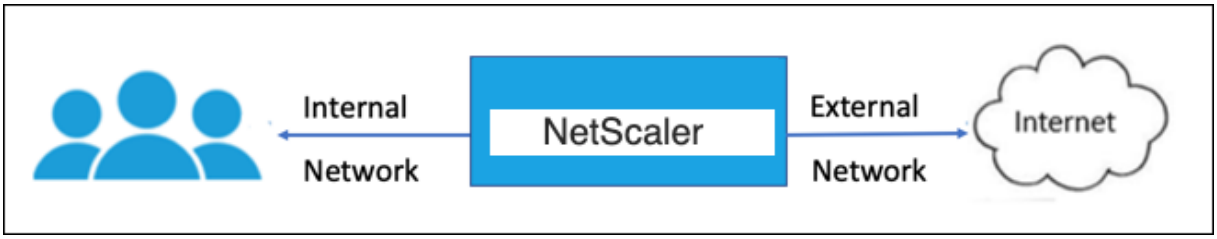


Table 1: Cipher/protocol support matrix for the internal network

See Table 1-Support on virtual server/frontend service/internal service in Ciphers available on the Citrix ADC appliances.

Table 2: Cipher/protocol support matrix for the external network

See Table 2-Support on back-end services in Ciphers available on the Citrix ADC appliances.

Add an SSL profile and enable SSL interception by using the CLI

At the command prompt, type:

```
add ssl profile <name> -sslinterception ENABLED -ssliReneg ( ENABLED
| DISABLED )-ssliOCSPCheck ( ENABLED | DISABLED )-ssliMaxSessPerServer
 <positive_integer>
```

Arguments:

sslInterception:

Enable or disable interception of SSL sessions.

Possible values: ENABLED, DISABLED

Default value: DISABLED

ssliReneg:

Enable or disable triggering client renegotiation when a renegotiation request is received from the origin server.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Possible values: ENABLED, DISABLED

Default value: ENABLED

ssliOCSPCheck:

Enable or disable OCSP check for an origin-server certificate.

Possible values: ENABLED, DISABLED

Default value: ENABLED

ssliMaxSessPerServer:

Maximum number of SSL sessions to be cached per dynamic origin server. A unique SSL session is created for each SNI extension received from the client in a client hello message. The matching session is used for server-session reuse.

Default value: 10

Minimum value: 1

Maximum value: 1000

Example:

```
add ssl profile swg_ssl_profile  -sslinterception ENABLED

Done

sh ssl profile swg_ssl_profile

1)    Name: swg_ssl_profile (Front-End)

                SSLv3: DISABLED               TLSv1.0: ENABLED  TLSv1
                   .1: ENABLED  TLSv1.2: ENABLED

                Client Auth: DISABLED

                Use only bound CA certificates: DISABLED

                Strict CA checks:                                NO

                Session Reuse: ENABLED
                   Timeout: 120 seconds

                DH: DISABLED

                DH Private-Key Exponent Size Limit: DISABLED
                   Ephemeral RSA: ENABLED
                   Refresh Count: 0

                Deny SSL Renegotiation
                   ALL

```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
25                  Non FIPS Ciphers: DISABLED
26
27                  Cipher Redirect: DISABLED
28
29                  SSL Redirect: DISABLED
30
31                  Send Close-Notify: YES
32
33                  Strict Sig-Digest Check: DISABLED
34
35                  Push Encryption Trigger: Always
36
37                  PUSH encryption trigger timeout:              1 ms
38

Bind an SSL interception CA certificate to an SSL profile by using the GUI

1. Navigate to **System** > **Profiles** > **SSL Profile**.
2. Click **Add**.
3. Specify a name for the profile.
4. Enable **SSL Sessions Interception**.
5. Click **OK**.
6. In **Advanced Settings**, click **Certificate Key**.
7. Specify an SSL interception CA certificate key to bind to the profile.
8. Click **Select** and then click **Bind**.
9. Optionally, configure ciphers to suit your deployment.
    - Click the edit icon, and then click **Add**.
    - Select one or more cipher groups, and click the right arrow.
    - Click **OK**.
10. Click **Done**.

Bind an SSL profile to a proxy server by using the GUI

1. Navigate to **Security** >**SSL Forward Proxy** > **Proxy Virtual Servers**, and add a server or select a server to modify.
2. In **SSL Profile**, click the edit icon.
3. In the **SSL Profile** list, select the SSL profile that you created earlier.
4. Click **OK**.
5. Click **Done**.

Sample Profile:

```
Name: swg_ssl_profile (Front-End)

                SSLv3: DISABLED              TLSv1.0: ENABLED  TLSv1
                    .1: ENABLED  TLSv1.2: ENABLED

                Client Auth: DISABLED

                Use only bound CA certificates: DISABLED

                Strict CA checks:                                NO

                Session Reuse: ENABLED
                   Timeout: 120 seconds
```

```

User identity management

September 14, 2021

An increasing number of security breaches and the growing popularity of mobile devices has emphasized the need to ensure that use of the external internet is compliant with the corporate policies. Only authorized users must be allowed access to external resources provisioned by the corporate personnel. Identity Management makes it possible by verifying the identity of a person or a device. It does not determine what tasks the individual can take or what files the individual can see.

An SSL forward proxy deployment identifies the user before allowing access to the internet. All requests and responses from the user are inspected. User activity is logged, and records are exported to the Citrix Application Delivery Management (ADM) for reporting. In Citrix ADM, you can view the statistics about the user activities, transactions, and bandwidth consumption.

By default, only the user's IP address is saved, but you can configure the feature to record more details about the user. You can use this identity information to create richer internet usage policies for specific users.

The Citrix ADC appliance supports the following authentication modes for an explicit-proxy configuration.

- **Lightweight Directory Access Protocol (LDAP)**. Authenticates the user through an external LDAP authentication server. For more information, see LDAP Authentication Policies.
- **RADIUS**. Authenticates the user through an external RADIUS server. For more information, see RADIUS Authentication Policies.
- **TACACS+**. Authenticates the user through an external Terminal Access Controller Access-Control System (TACACS) authentication server. For more information, see Authentication Policies.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- **Negotiate**. Authenticates the user through a Kerberos authentication server. If there is an error in Kerberos authentication, the appliance uses NTLM authentication. For more information, see Negotiate Authentication Policies.

For transparent proxy, only IP-based LDAP authentication is supported. When a client request is received, the proxy authenticates the user by checking an entry for the client IP address in the active directory. It then creates a session based on the user IP address. However, if you configure the ssoNameAttribute in an LDAP action, a session is created by using the user name instead of the IP address. Classic policies are not supported for authentication in a transparent proxy setup.

> **Note**
>
> For explicit proxy, you must set the LDAP login name to **sAMAccountName**. For transparent proxy, you must set the LDAP login name to **networkAddress** and attribute1 to **sAMAccountName**.

Example for explicit proxy:

```
add authentication ldapAction swg-auth-action-explicit -serverIP
    10.105.157.116 -ldapBase "CN=Users,DC=CTXNSSFB,DC=COM" -ldapBindDn "
    CN=Administrator,CN=Users,DC=CTXNSSFB,DC=COM" -ldapBindDnPassword
    freebsd123$ -ldapLoginName sAMAccountName
```

Example for transparent proxy:

```
add authentication ldapAction swg-auth-action-explicit -serverIP
    10.105.157.116 -ldapBase "CN=Users,DC=CTXNSSFB,DC=COM" -ldapBindDn "
    CN=Administrator,CN=Users,DC=CTXNSSFB,DC=COM" -ldapBindDnPassword
    freebsd123$ -ldapLoginName networkAddress -authentication disable -
    Attribute1 sAMAccountName
```

Set up user authentication by using the CLI

At the command prompt type:

```
add authentication vserver <vserver name> SSL

bind ssl vserver <vserver name> -certkeyName <certkey name>

add authentication ldapAction <action name> -serverIP <ip_addr> -
    ldapBase <string> -ldapBindDn <string> -ldapBindDnPassword -
    ldapLoginName <string>

add authentication Policy <policy name> -rule <expression> -action <
    string>

bind authentication vserver <vserver name> -policy <string> -priority <
    positive_integer>
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
10
11 set cs vserver <name> -authn401 ON -authnVsName <string>
```

Arguments:

Vserver name:

Name of the authentication virtual server to which to bind the policy.

Maximum Length: 127

serviceType:

Protocol type of the authentication virtual server. Always SSL.

Possible values: SSL

Default value: SSL

Action name:

Name for the new LDAP action. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after the LDAP action is added. The following requirement applies only to the CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my authentication action"or 'my authentication action').

Maximum Length: 127

serverIP:

IP address assigned to the LDAP server.

ldapBase:

Base (node) from which to start LDAP searches. If the LDAP server is running locally, the default value of base is dc=netscaler, dc=com. Maximum Length: 127

ldapBindDn:

Full distinguished name (DN) that is used to bind to the LDAP server.

Default: cn=Manager,dc=netscaler,dc=com

Maximum Length: 127

ldapBindDnPassword:

Password used to bind to the LDAP server.

Maximum Length: 127

ldapLoginName:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

LDAP login name attribute. The Citrix ADC appliance uses the LDAP login name to query external LDAP servers or Active Directories. Maximum Length: 127

Policy name:

Name for the advance AUTHENTICATION policy. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after an AUTHENTICATION policy is created. The following requirement applies only to the CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, “my authentication policy”or ‘my authentication policy’).

Maximum Length: 127

rule:

Name of the rule, or a default syntax expression, that the policy uses to determine whether to attempt to authenticate the user with the AUTHENTICATION server.

Maximum Length: 1499

action:

Name of the authentication action to be performed if the policy matches.

Maximum Length: 127

priority:

Positive integer specifying the priority of the policy. A lower number specifies a higher priority. Policies are evaluated in the order of their priorities, and the first policy that matches the request is applied. Must be unique within the list of policies bound to the authentication virtual server.

Minimum value: 0

Maximum Value: 4294967295

Example:

```
add authentication vserver swg-auth-vs SSL

Done

bind ssl vserver explicit-auth-vs -certkeyName ns-swg-ca-certkey

Done

add authentication ldapAction swg-auth-action-explicit -serverIP
    192.0.2.116 -ldapBase "CN=Users,DC=CTXNSSFB,DC=COM" -ldapBindDn "CN=
    Administrator,CN=Users,DC=CTXNSSFB,DC=COM" -ldapBindDnPassword zzzzz
     -ldapLoginName sAMAccountName

```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
Done

add authenticationpolicy swg-auth-policy -rule true -action swg-auth-
   action-explicit
Done

bind authentication vserver swg-auth-vs -policy swg-auth-policy -
   priority 1

Done

set cs vserver testswg -authn401 ON -authnVsName swg-auth-vs

Done
```

Enable user name logging by using the CLI

At the command prompt, type:

```
set appflow param -AAAUserName ENABLED
```

Arguments:

AAAUserName

Enable AppFlow authentication, authorization, and auditing user name logging.

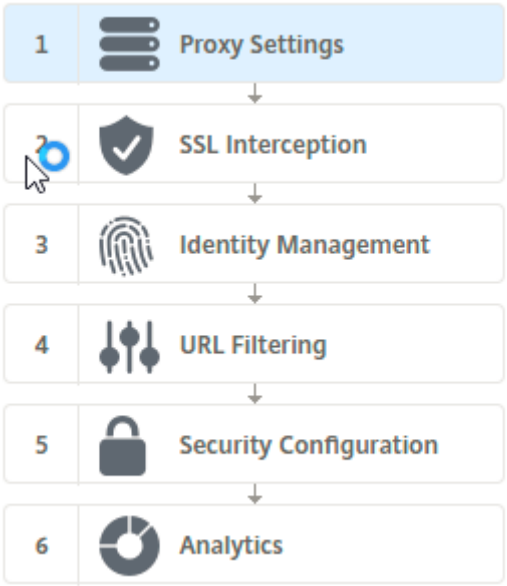
Possible values: ENABLED, DISABLED

Default value: DISABLED

Example:

```
set appflow param -AAAUserName ENABLED
```

URL filtering



September 14, 2021

URL Filtering provides policy based control of websites by using the information contained in URLs. This feature helps network administrators monitor and control user access to malicious websites on the network.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Get started

If you are a new user and want to configure URL filtering, you must complete the initial SSL forward proxy setup. To get started with URL Filtering, you must first log on to the SSL forward proxy wizard. The wizard takes you through a series of configuration steps before you apply the URL Filtering policies.

> **Note**
>
> Before you begin, be sure you have a valid URL Threat Intelligence feature license installed on your appliance. If you are using a trial version, be sure to purchase a valid license to continue using this feature on the ADC appliance.

Log on to SSL forward proxy wizard

The SSL forward proxy wizard guides you through a series of simplified configuration tasks and the right pane displays the corresponding flow sequence. You can use this wizard to apply URL Filtering policies to a URL list or a predefined list of categories.

Step 1: Configure proxy settings

First configure a proxy server through which the client accesses the gateway. This server is of type SSL, and it operates in explicit or transparent mode. For more information about proxy server configuration, see Proxy Modes.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Step 2: Configure SSL interception

After configuring the proxy server, you must configure the SSL interception proxy to intercept encrypted traffic at the Citrix ADC appliance. In the case of URL filtering, the SSL proxy intercepts the traffic and does not allow blocked URLs while all other traffic can be bypassed. For more information about configuring SSL interception, see SSL Interception.

Step 3: Configure identity management

A user is authenticated before being allowed to log on to the enterprise network. Authentication provides the flexibility to define specific policies for a user or a group of users, based on their roles. For more information about user authentication, see User Identify Management.

Step 4: Configure URL filtering

The administrator can apply a URL filtering policy either by using the URL Categorization feature or by using the URL List feature.

URL Categorization. Controls access to websites and webpages by filtering traffic based on a predefined list of categories.

URL List. Controls access to blacklisted websites and webpages by denying access to URLs that are in a URL set imported into the appliance.

Step 5: Configure security configuration

This step enables you to configure a reputation score and allow users to control access to the websites by denying access if the score is too low. Your reputation score can range from one to four, and you can configure the threshold at which the score becomes unacceptable. For scores that exceed the threshold, you can select a policy action to allow, block, or redirect traffic. For more information, see URL Reputation Score.

Step 6: Configure SSL forward proxy analytics

This step enables you to activate SSL forward proxy analytics for categorizing web traffic, logging URL category in the user transaction logs and viewing traffic analytics. For more information about SSL forward proxy analytics, see Analytics.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Step 7: Click "Done"to complete the initial configuration and continue managing the URL filtering configuration

URL list

November 2, 2023

The URL List feature enables enterprise customers to control access to specific websites and website categories. The feature filters websites by applying a responder policy bound to a URL matching algorithm. The algorithm matches the incoming URL against a URL set consisting of up to one million (1,000,000) entries. If the incoming URL request matches an entry in the set, the appliance uses the responder policy to evaluate the request (HTTP/HTTPS) and control access to it.

URL set types

Each entry in a URL set can include a URL and, optionally, its metadata (URL category, category groups, or any other related data). For URLs with metadata, the appliance uses a policy expression that evaluates the metadata. For more information, see URL Set.

SSL forward proxy supports custom URL sets. You can also use pattern sets to filter URLs.

Custom URL set. You can create a customized URL set with up to 1,000,000 URL entries and import it as a text file into your appliance.

Pattern set. An ADC appliance can use pattern sets to filter URLs before granting access to websites. A pattern set is a string-matching algorithm that looks for an exact string match between an incoming URL and up to 5000 entries. For more information, see Pattern Set.

Each URL in an imported URL set can have a custom category in the form of URL metadata. Your organization can host the set and configure the ADC appliance to periodically update the set without requiring manual intervention.

After the set is updated, the Citrix ADC appliance automatically detects the metadata. The category is now available as a policy expression for evaluating the URL and applying an action such as allow, block, redirect, or notify the user.

Advanced policy expressions used with URL sets

The following table describes the basic expressions you can use to evaluate incoming traffic.

1. .URLSET_MATCHES_ANY - Evaluates to TRUE if the URL exactly matches any entry in the URL set.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

2. .GET_URLSET_METADATA() - The GET_URLSET_METADATA() expression returns the associated metadata if the URL exactly matches any pattern within the URL set. An empty string is returned if there is no match.
3. .GET_ URLSET_METADATA().EQ(<METADATA)- .GET_ URLSET_METADATA().EQ (<METADATA)
4. .GET_URLSET_METADATA ().TYPECAST_LIST_T(',').GET(0).EQ() - Evaluates to TRUE if the matched metadata is at the beginning of the category. This pattern can be used to encode separate fields within metadata but match only the first field.
5. HTTP.REQ.HOSTNAME.APPEND(HTTP.REQ.URL) - Joins the host and URL parameters, which can then be used for matching.

Responder action types

> **Note:** In the table, HTTP.REQ.URL is generalized as <URL expression>.

The following table describes the actions that can be applied to incoming internet traffic.

Responder Action	Description
Allow	Allow the request to access the target URL.
Redirect	Redirect the request to the URL specified as the target.
Block	Deny the request.

Prerequisites

Configure a DNS server if you import a URL Set from a host name URL. This configuration is not required if you use an IP address.

At the command prompt, type:

```
add dns nameServer ((<IP> [-local])| <dnsVserverName>)[-state (
ENABLED | DISABLED )] [-type <type>] [-dnsProfileName <string>]
```

Example:

```
add dns nameServer 10.140.50.5
```

Configure a URL list

To configure a URL list, you can use the Citrix SSL forward proxy wizard or the Citrix ADC command-line interface (CLI). On the Citrix ADC appliance, you must first configure the responder policy and then

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

bind the policy to a URL set.

Citrix recommends that you use the Citrix SSL forward proxy wizard as the preferred option to configure a URL list. Use the wizard to bind a responder policy to a URL set. Alternatively, you can bind the policy to a pattern set.

Configure a URL list by using the SSL forward proxy wizard

To configure URL List for HTTPS traffic by using the GUI:

1. Navigate to **Security** > **SSL Forward Proxy** page.
2. In the details pane, do one of the following:
    a) Click **SSL Forward Proxy Wizard**.
    b) Select an existing configuration and click **Edit**.
3. In the **URL Filtering** section, click **Edit**.
4. Select the **URL List** check box to enable the feature.
5. Select a **URL List** policy and Click **Bind**.
6. Click **Continue** and then **Done**.

For more information, see How to Create a URL List Policy.

Configure a URL list by using the CLI

To configure a URL list, do the following.

1. Configure a proxy virtual server for HTTP and HTTPS traffic.
2. Configure SSL interception for intercepting HTTPS traffic.
3. Configure a URL list containing a URL set for HTTP traffic.
4. Configure URL list containing URL set for HTTPS traffic.
5. Configure a private URL set.

> **Note**
>
> If you have already configured an ADC appliance, you can skip steps 1 and 2, and configure with step 3.

Configuring a proxy virtual server for Internet traffic The Citrix ADC appliance supports transparent and explicit proxy virtual servers. To configure a proxy virtual server for internet traffic in explicit mode, do the following:

1. Add a proxy SSL virtual server.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

2. Bind a responder policy to the proxy virtual server.

To add a proxy virtual server by using the CLI:

At the command prompt, type:

```
add cs vserver <name> <serviceType> <IPAddress> <port>
```

Example:

```
add cs vserver starcs PROXY 10.102.107.121 80 -cltTimeout 180
```

To bind a responder policy to a proxy virtual server by using the CLI:

```
bind ssl vserver <vServerName> -policyName <string> [-priority <
    positive_integer>]
```

> **Note**
>
> If you have already configured the SSL interceptor as part of the Citrix ADC configuration, you can skip the following procedure.

Configure SSL interception for HTTPS traffic To configure SSL interception for HTTPS traffic, do the following:

1. Bind a CA certificate-key pair to the proxy virtual server.
2. Enable the default SSL profile.
3. Create a front-end SSL profile, and bind it to the proxy virtual server and enable SSL interception in the front-end SSL profile.

To bind a CA certificate-key pair to the proxy virtual server by using the CLI:

At the command prompt, type:

```
bind ssl vserver <vServerName> -certkeyName <certificate-KeyPairName>
```

To configure a front-end SSL profile by using the CLI:

At the command prompt, type:

```
set ssl parameter -defaultProfile ENABLED

add ssl profile <name> -sslInterception ENABLED -ssliMaxSessPerServer <
    positive_integer>
```

To bind a front-end SSL profile to a proxy virtual server by using the CLI

At the command prompt, type:

```
set ssl vserver <vServer name>  -sslProfile <name>
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Configure a URL list by importing a URL set for HTTP traffic For information about how to configure a URL Set for HTTP traffic, see URL Set.

Perform explicit subdomain match You can now perform an explicit subdomain match for an imported URL set. A new parameter, "subdomainExactMatch"is added to the `import policy URLset` command.

When you enable the parameter, the URL Filtering algorithm performs an explicit subdomain match. For example, if the incoming URL is `news.example.com` and if the entry in the URL set is `example.com`, the algorithm does not match the URLs.

At the command prompt, type:

```
import policy urlset <name> [-overwrite] [-delimiter <character>][-rowSeparator <character>] -url [-interval <secs>] [-privateSet][-subdomainExactMatch] [-canaryUrl <URL>]
```

Example

```
import policy urlset test -url http://10.78.79.80/top-1k.csv -privateSet -subdomainExactMatch -interval 900
```

Configure a URL set for HTTPS traffic To configure a URL Set for HTTPS traffic by using the CLI

At the command prompt type:

```
add ssl policy <name> -rule <expression> -action <string> [-undefAction <string>] [-comment <string>]
```

Example:

```
add ssl policy pol1 -rule client.ssl.client_hello.SNI.URLSET_MATCHES_ANY("top1m") -action INTERCEPT
```

To configure a URL set for HTTPS traffic by using the SSL forward proxy wizard Citrix recommends that you use the SSL forward proxy wizard as the preferred option to configure a URL list. Use the wizard to import a custom URL set and bind to a responder policy.

1. Navigate to **Security > SSL Forward proxy > URL Filtering > URL Lists**.
2. In the details pane, click **Add**.
3. On the **URL List Policy** page, specify the policy name.
4. Select an option to import a URL set.
5. On the **URL List Policy** tab page, select the **Import URL Set** check box and specify the following URL Set parameters.

    a) URL Set Name—Name of the custom URL set.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

b) URL—Web address of the location at which to access the URL Set.
c) Overwrite—Overwrite a previously imported URL set.
d) Delimiter—Character sequence that delimits a CSV file record.
e) Row Separator—Row separator used in the CSV file.
f) Interval—Interval in seconds, rounded off to the nearest number of seconds equal to 15 minutes, at which the URL set is updated.
g) Private Set—Option to prevent exporting the URL set.
h) Canary URL—Internal URL for testing whether the content of the URL set is to be kept confidential. The maximum length of the URL is 2047 characters.

6. Select a responder action from the drop-down list.
7. Click **Create** and **Close**.

Configure a private URL set If you configure a private URL set and keep its contents confidential, the network administrator might not know the blacklisted URLs in the set. For such cases, you can configure a Canary URL and add it to the URL set. Using the Canary URL, the administrator can request the private URL Set to be used for every lookup request. You can refer to the wizard section for descriptions of each parameter.

To import a URL set by using the CLI:

At the command prompt, type:

```
import policy urlset <name> [-overwrite] [-delimiter <character>] [-
    rowSeparator <character>] -url <URL> [-interval <secs>] [-privateSet
    ] [-canaryUrl <URL>]
```

Example:

```
import policy urlset test1 -url http://10.78.79.80/alytra/top-1k.csv -
    private -canaryUrl http://www.in.gr
```

Display imported URL set

You can now display imported URL sets in addition to added URL sets. A new parameter "imported"is added to the `show urlset` command. If you enable this option, the appliance displays all imported URL sets and distinguishes the imported URL sets from the added URL sets.

At the command prompt, type:

```
show policy urlset [<name>] [-imported]
```

Example

```
show policy urlset -imported
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Configure audit log messaging

Audit logging enables you to review a condition or a situation in any phase of a URL List process. When a Citrix ADC appliance receives an incoming URL, if the responder policy has a URL Set advanced policy expression, the audit log feature collects URL Set information in the URL. It stores the details as a log message for any target allowed by audit logging.

The log message contains the following information:

1. Timestamp.
2. Log message type.
3. The predefined log levels (Critical, Error, Notice, Warning, Informational, Debug, Alert, and Emergency).
4. Log message information, such as URL set name, policy action, URL.

To configure audit logging for the URL List feature, you must complete the following tasks:

1. Enable Audit Log.
2. Create Audit Log message action.
3. Set URL List responder policy with Audit Log message action.

For more information, see Audit Logging topic.

URL pattern semantics

September 14, 2021

The following table shows the URL patterns used for specifying the list of pages you to want to filter. For example, the pattern, www.example.com/bar matches only one page at www.example.com/bar. To match all the pages whose URL starts with 'www.example.com/bar', you add an asterisk (*) at the end of the URL.

Semantics for URL pattern to match metadata mapping

The pattern matching semantics is available in a table format. For more information, see Pattern Semantics PDF page.

Mapping URL categories

September 14, 2021

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

A list of third party categories and category groups. For more information, see URL Category Mapping page.

Use case: URL filtering by using custom URL set

April 8, 2022

If you are an enterprise customer looking to control access to specific websites and website categories, use a custom URL set bound to a responder policy. Your organization's network infrastructure can use a URL filter to block access to malicious or dangerous websites. For example, websites featuring adult, violence, gaming, drugs, politics, or job portals. In addition to filtering the URLs, you can create a customized list of URLs and import it to the ADC appliance. For example, your organization's policies might call for blocking access to certain websites such as social networking, shopping portals, and job portals.

Each URL in the list can have a custom category in the form of metadata. The organization can host the list of URLs as a URL set on the Citrix ADC appliance. Configure the appliance to periodically update the set without requiring manual intervention.

After the set is updated, the Citrix ADC appliance automatically detects the metadata. The responder policy uses the URL metadata (category details) to evaluate the incoming URL and apply an action such as allow, block, redirect, or notify the user.

To do so, configure in your network, you can perform the following tasks:

1. Import a custom URL set
2. Add a custom URL set
3. Configure a custom URL list in the SSL Forward Proxy wizard.

Import a custom URL set by using the CLI

At the command prompt, type:

```
import policy urlset <name> [-overwrite] [-delimiter <character>] [-
   rowSeparator <character>] -url <URL> [-interval <secs>] [-privateSet
   ] [-canaryUrl <URL>]

import policy urlset test1 –url http://10.78.79.80/alytra/top-1k.csv
```

Add a custom URL set by using the CLI

At the command prompt, type:

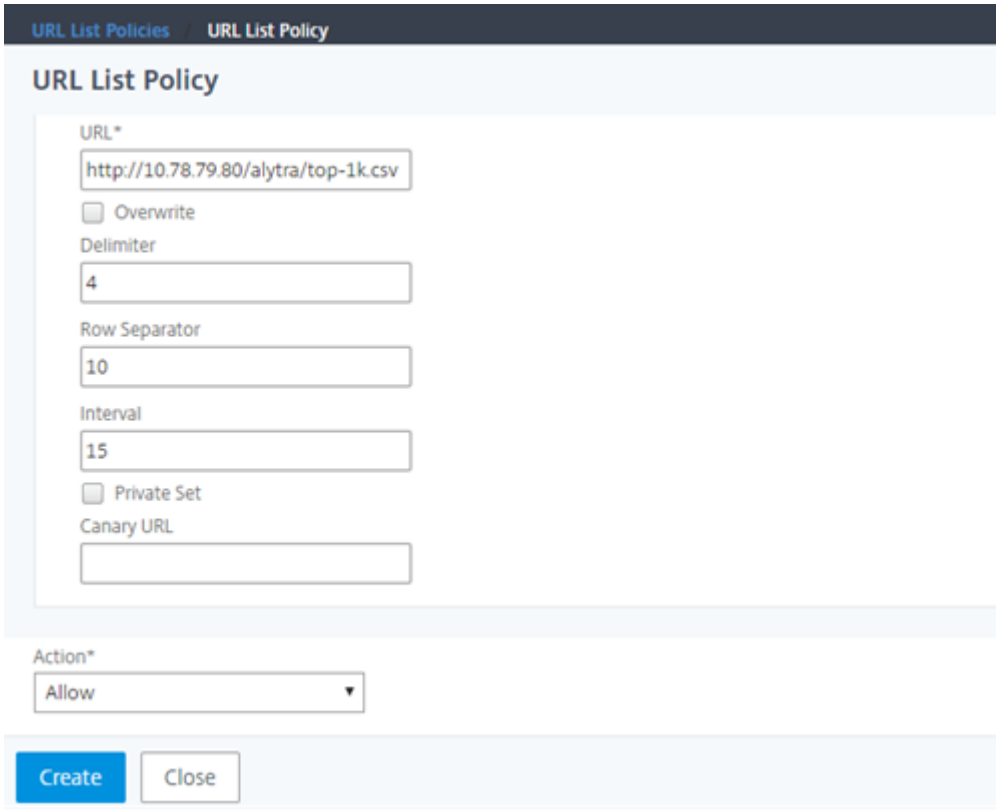
© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
add urlset <urlset_name>
```

Example:

```
add urlset test1
```

Configure a URL list by using the SSL Forward Proxy wizard



Citrix recommends that you use the SSL Forward Proxy wizard as the preferred option to configure a URL list. Use the wizard to import a custom URL set and bind it to a responder policy.

1. Navigate to **Security > SSL Forward Proxy > URL Filtering > URL Lists**.
2. In the details pane, click **Add**.
3. On the **URL List Policy** page, specify the policy name.
4. Select an option to either import a URL set.
5. In the **URL List Policy** tab page, select the **Import URL Set** check box and specify the following URL Set parameters.

    a) URL Set Name—Name of the custom URL set.
    b) URL—Web address of the location at which to access the URL Set.
    c) Overwrite—Overwrite a previously imported URL set.
    d) Delimiter—Character sequence that delimits a CSV file record.
    e) Row Separator—Row separator used in the CSV file.
    f) Interval—Interval in seconds, rounded off to the nearest 15 minutes, at which the URL set is updated.
    g) Private Set—Option to prevent exporting the URL set.
    h) Canary URL—Internal URL for testing if the content of the URL set is to be kept confidential. The maximum length of the URL is 2047 characters.

6. Select a responder action from the drop-down list.
7. Click **Create** and **Close**.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Metadata semantics for custom URL sets

To import a custom URL set, add the URLs to a text file and bind it to a responder policy to block Social networking URLs.

Following are examples of URLs that you might add to the text file:

cnn.com, News

bbc.com, News

google.com, Search Engine

yahoo.com, Search Engine

facebook.com, Social Media

twitter.com, Social Media

Configure a responder policy to block social media URLs by using the CLI

```
1 add responder action act_url_unauthorized respondwith '"HTTP/1.1 451
     Unavailable For Legal Reasons\r\n\r\nURL is NOT authorized\n"'
2
```

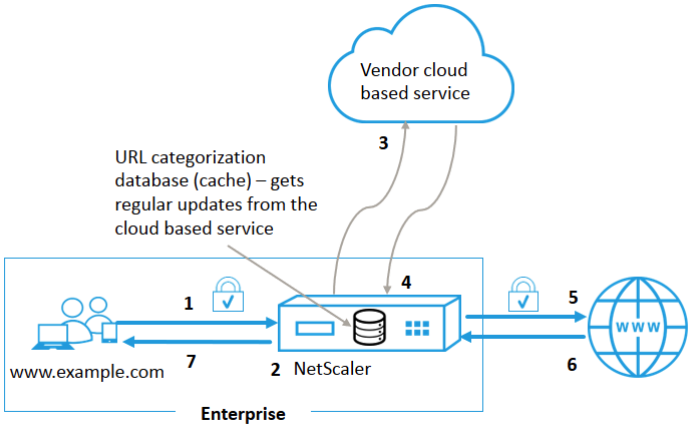
© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
3 add responder policy pol_url_meta_match 'HTTP.REQ.HOSTNAME.APPEND(HTTP.
    REQ.URL).GET_URLSET_METADATA("u1").EQ("Social Media")'
    act_url_unauthorized
```

URL categorization

May 4, 2022

URL Categorization restricts user access to specific websites and website categories. As a subscribed service in collaboration with NetSTAR, the feature enables enterprise customers to filter web traffic using a commercial categorization database. The NetSTAR database has a vast number (billions) of URLs classified into different categories, such as social networking, gambling, adult content, new media, and shopping. In addition to categorization, each URL has a reputation score kept up to date based on the site's historical risk profile. We can use NetSTAR data to filter the traffic by configuring advanced policies based on categories, category groups (such as Terrorism, Illegal drugs), or site-reputation scores.



For example, you might block access to dangerous sites, such as sites known to be infected with malware. You might also selectively restrict access to content such as adult content or entertainment streaming media for enterprise users. You can also capture the user's transactional details and outbound traffic details for monitoring web traffic analytics on the Citrix ADM server.

Citrix ADC uploads or downloads data from the pre-configured NetSTAR device nsv10.netstar-inc.com and incompasshybridpc.netstar-inc.com is used as a cloud host by default for cloud-categorization requests. These URLs must be accessible through the firewall for URL filtering to work properly. The appliance uses its NSIP address as a source IP address and 443 as the destination port for communication.

How URL categorization works

The following figure shows how a Citrix ADC URL categorization service is integrated with a commercial URL Categorization database and cloud services for frequent updates.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

The components interact as follows:

1. A client sends an internet bound URL request.
2. The SSL forward proxy applies a policy enforcement to the request based on the category details, such as, category, category group, and site-reputation score. The category details are retrieved from the URL categorization database. If the database returns the category details, the process jumps to step 5.
3. If the database misses the categorization details, the request is sent to a cloud-based lookup service maintained by a URL categorization vendor. However, the appliance does not wait for a response, instead, the URL is marked as uncategorized and a policy enforcement is performed (jump to step 5). The appliance continues to monitor the cloud query feedback and updates the cache so that future requests can benefit from the cloud lookup.
4. The ADC appliance receives the URL category details (category, category group, and reputation score) from the cloud-based service and stores it in the categorization database.
5. The policy allows the URL and the request is sent to the origin server. Otherwise, the appliance drops, redirects, or responds with a custom HTML page.
6. The origin server responds with the requested data to the ADC appliance.
7. The appliance sends the response to the client.

Use Case: Internet usage under corporate compliance for enterprises

You can use the URL Filtering feature to detect and implement compliance policies to block sites that violate corporate compliance. For example, sites such as adult, streaming media, social networking which can be deemed nonproductive or consume excess internet bandwidth in an enterprise network. Blocking access to these websites can improve employee productivity, reduce operating costs for bandwidth usage, and reduce the overhead of network consumption.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Prerequisites

The URL Categorization feature works on a Citrix ADC platform only if it has an optional subscription service with URL filtering capabilities and threat intelligence for SSL forward proxy. The subscription allows customers to download the latest threat categorizations for websites and then enforce those categories to the SSL forward proxy. Before enabling and configuring the feature, you must install the following licenses:

- CNS_WEBF_SSERVER_Retail.lic
- CNS_XXXX_SERVER_PLT_Retail.lic

Where, XXXXX is the platform type, for example: V25000

Responder policy expressions

The following table lists the different policy expressions that you can use to verify if an incoming URL must be allowed, redirected, or blocked.

1. `<text>. URL_CATEGORIZE (<min_reputation>, <max_reputation>)` - Returns a URL_CATEGORY object. If `<min_reputation>` is greater than 0, the returned object does not contain a category with a reputation lower than `<min_reputation>`. If `<max_reputation>` is greater than 0, the returned object does not contain a category with a reputation higher than `<max_reputation>`. If the category fails to resolve in a timely manner, the undef value is returned.
2. `<url_category>. CATEGORY()` - Returns the category string for this object. If the URL does not have a category, or if the URL is malformed, the returned value is "Unknown."
3. `<url_category>. CATEGORY_GROUP()` - Returns a string identifying the object's category group. This grouping is a higher level grouping of categories, which is useful in operations that require less detailed information about the URL category. If the URL does not have a category, or if the URL is malformed, the returned value is "Unknown."
4. `<url_category>. REPUTATION()` - Returns the reputation score as a number from 0 to 5, where 5 indicates the riskiest reputation. If there is the category "Unknown", the reputation value is 1.

Policy types:

1. Policy to select requests for URLs that are in the Search Engine category - `add responder policy p1 'HTTP.REQ.HOSTNAME.APPEND(HTTP.REQ.URL).URL_CATEGORIZE (0,0). CATEGORY().EQ("Search Engine")`
2. Policy to select requests for URLs that are in the Adult category group - `add responder policy p1 'HTTP.REQ.HOSTNAME.APPEND(HTTP.REQ.URL).URL_CATEGORIZE (0,0). CATEGORY_GROUP().EQ("Adult")'`

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

3. Policy to select requests for Search Engine URLs with a reputation score lower than 4 - `add responder policy p2 'HTTP.REQ.HOSTNAME.APPEND (HTTP.REQ.URL).URL_CATEGORIZE(4,0).HAS_CATEGORY("Search Engine")`
4. Policy to select requests for Search Engine and Shopping URLs - `add responder policy p3 'HTTP.REQ.HOSTNAME.APPEND(HTTP.REQ.URL).URL_CATEGORIZE(0,0).CATEGORY().EQ ("good_categories")`
5. Policy to select requests for Search Engine URLs with a reputation score equal to or greater than 4 - `add responder policy p5 'CLIENT.SSL.DETECTED_DOMAIN.URL_CATEGORIZE(4,0). CATEGORY().EQ("Search Engines")`
6. Policy to select requests for URLs that are in the Search Engine category and compare them with a URL Set - `' HTTP.REQ.HOSTNAME.APPEND(HTTP.REQ.URL).URL_CATEGORIZE(0,0). CATEGORY().EQ("Search Engine")&& HTTP.REQ.HOSTNAME.APPEND(HTTP.REQ.URL).URLSET_MATCHES_ANY("u1")'`

Responder policy types

There are two types of policies used in a URL Categorization feature and each of these policy types is explained the following table:

Policy Type	Description
URL Category	Categorize web traffic and based on evaluation result blocks, allows, or redirects traffic.
URL Reputation Score	Determines the reputation score of the website and allows you to control access based on the reputation score threshold level set by the administrator.

Configure URL categorization

To configure URL categorization on a Citrix ADC appliance, do the following:

1. Enable URL filtering.
2. Configure a proxy server for Web traffic.
3. Configure SSL interception for Web traffic in explicit mode.
4. Configure shared memory to limit cache memory.
5. Configure URL categorization parameters.
6. Configure URL categorization by using the Citrix SSL forward proxy wizard.
7. Configure URL categorization parameters by using the SSL forward proxy wizard.
8. Configure seed database path and cloud server name

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Step 1: Enabling URL Filtering

To enable URL categorization, enable the URL filtering feature and enable modes for URL categorization.

To enable URL Categorization by using the CLI

At the command prompt, type:

```
enable ns feature URLFiltering

disable ns feature URLFiltering
```

Step 2: Configure a proxy server for web traffic in explicit mode

The Citrix ADC appliance supports transparent and explicit proxy virtual servers. To configure a proxy virtual server for SSL traffic in explicit mode, do the following:

1. Add a proxy server.
2. Bind an SSL policy to the proxy server.

To add a proxy server by using the CLI

At the command prompt, type:

```
add cs vserver <name> [-td <positive_integer>] <serviceType> [-
cltTimeout <secs>]
```

Example:

```
add cs vserver starcs PROXY 10.102.107.121 80 -cltTimeout 180
```

Bind an SSL policy to a proxy virtual server by using the CLI

```
bind ssl vserver <vServerName> -policyName <string> [-priority <
positive_integer>]
```

Step 3: Configure SSL interception for HTTPS traffic

To configure SSL interception for HTTPS traffic, do the following:

1. Bind a CA certificate-key pair to the proxy virtual server.
2. Configure the default SSL profile with SSL parameters.
3. Bind a front-end SSL profile to the proxy virtual server and enable SSL interception in the front-end SSL profile.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

To bind a CA certificate-key pair to the proxy virtual server by using the CLI

At the command prompt, type:

```
bind ssl vserver <vServerName> -certkeyName <certificate-KeyPairName>
 -CA –skipCAName
```

To configure the default SSL profile by using the CLI

At the command prompt, type:

```
set ssl profile <name> -denySSLReneg <denySSLReneg> -sslInterception
(ENABLED | DISABLED)-ssliMaxSessPerServer positive_integer>
```

Bind a front-end SSL profile to a proxy virtual server by using the CLI

At the command prompt, type:

```
set ssl vserver <vServer name> -sslProfile ssl_profile_interception
```

Step 4: Configure shared memory to limit cache memory

To configure shared memory to limit cache memory by using the CLI

At the command prompt, type:

```
set cache parameter [-memLimit <megaBytes>]
```

Where, the memory limit configured for caching is set as 10 MB.

Step 5: Configure URL categorization parameters

To configure the URL categorization parameters by using the CLI

At the command prompt, type:

```
set urlfiltering parameter [-HoursBetweenDBUpdates <positive_integer
>] [-TimeOfDayToUpdateDB <HH:MM>]
```

Example:

```
set urlfiltering parameter –urlfilt_hours_betweenDB_updates 20
```

Step 6: Configure URL Categorization by using the Citrix SSL forward proxy wizard

1. Log on to the Citrix ADC appliance and navigate to **Security** > **SSL Forward Proxy** page.
2. In the details pane, do one of the following:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

a) Click **SSL Forward Proxy Wizard** to create a new configuration.
b) Select an existing configuration and click **Edit**.

3. In the **URL Filtering** section, click **Edit**.
4. Select the **URL Categorization** check box to enable the feature.
5. Select a **URL Categorization** policy and Click **Bind**.
6. Click **Continue** and then **Done**.

For more information about URL Categorization policy, see How to Create a URL Categorization Policy.

Step 7: Configuring URL Categorization parameters by using an SSL forward proxy Wizard

1. Log on to **Citrix ADC** appliance and navigate to **Security > URL Filtering**.
2. In the **URL Filtering** page, click **Change URL filtering settings** link.
3. In the **Configuring URL Filtering Params** page, specify the following parameters.

a) Hours Between DB Updates. URL Filtering hours between database updates. Minimum value: 0 and Maximum value: 720.
b) Time of Day to Update DB. URL Filtering time of day to update database.
c) Cloud Host. The URL path of the cloud server.
d) Seed DB Path. The URL path of the seed database lookup server.

4. Click **OK** and **Close**.

Sample Configuration:

```
enable ns feature LB CS SSL IC RESPONDER AppFlow URLFiltering

enable ns mode FR L3 Edge USNIP PMTUD

set ssl profile ns_default_ssl_profile_frontend -denySSLReneg NONSECURE
    -sslInterception ENABLED -ssliMaxSessPerServer 100

add ssl certKey swg_ca_cert -cert ns_swg_ca.crt -key ns_swg_ca.key

set cache parameter -memLimit 100

add cs vserver starcs PROXY 10.102.107.121 80 -cltTimeout 180

add responder action act1 respondwith "\"HTTP/1.1 200 OK\r\n\r\n\" +
   http.req.url.url_categorize(0,0).reputation + \"\n\""

add responder policy p1 "HTTP.REQ.URL.URL_CATEGORIZE(0,0).CATEGORY.eq
   (\"Shopping/Retail\") || HTTP.REQ.URL.URL_CATEGORIZE(0,0).CATEGORY.
   eq(\"Search Engines & Portals

\")" act1
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
18
19 bind cs vserver starcs_PROXY -policyName p1 -priority 10 -
      gotoPriorityExpression END -type REQUEST
20
21 add dns nameServer 10.140.50.5
22
23 set ssl parameter -denySSLReneg NONSECURE -defaultProfile ENABLED -
      sigDigestType RSA-MD5 RSA-SHA1 RSA-SHA224 RSA-SHA256 RSA-SHA384 RSA-
      SHA512 -ssliErrorCache ENABLED
24
25 -ssliMaxErrorCacheMem 100000000
26
27 add ssl policy pol1 -rule "client.ssl.origin_server_cert.subject.
      URL_CATEGORIZE(0,0).CATEGORY.eq(\"Search Engines & Portals\")"" -
      action INTERCEPT
28
29 add ssl policy pol3 -rule "client.ssl.origin_server_cert.subject.ne(\"
      citrix\")" -action INTERCEPT
30
31 add ssl policy swg_pol -rule "client.ssl.client_hello.SNI.
      URL_CATEGORIZE(0,0).CATEGORY.ne(\"Uncategorized\")" -action
      INTERCEPT
32
33 set urlfiltering parameter -HoursBetweenDBUpdates 3 -
      TimeOfDayToUpdateDB 03:00
```

Configure seed database path and cloud server name

You can now configure the seed database path and cloud lookup server name for manual setting of the cloud lookup server name and the seed database path. To do this, two new parameters, "CloudHost" and "SeedDBPath", are added to the URL filtering parameter.

At the command prompt, type:

```
set urlfiltering parameter [-HoursBetweenDBUpdates <positive_integer
>] [-TimeOfDayToUpdateDB <HH:MM>] [-LocalDatabaseThreads <positive_integer
>] [-CloudHost <string>] [-SeedDBPath <string>]
```

Example:

```
set urlfiltering parameter -HoursBetweenDBUpdates 3 -TimeOfDayToUpdateDB
 03:00 –CloudHost localhost –SeedDBPath /mypath
```

The Communication between a Citrix ADC appliance and NetSTAR might require a domain name server. You can test using a simple console or telnet connection from the appliance.

Example:

```
1 root@ns# telnet nsv10.netstar-inc.com 443
2 Trying 1.1.1.1...
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
Connected to nsv10.netstar-inc.com.
Escape character is '^]'.

root@ns# telnet incompasshybridpc.netstar-inc.com 443
Trying 10.10.10.10...
Connected to incompasshybridpc.netstar-inc.com.
Escape character is '^]'.
```

Configure audit log messaging

Audit logging enables you to review a condition or a situation in any phase of the URL Categorization process. When a Citrix ADC appliance receives an incoming URL, if the responder policy has a URL Filtering expression, the audit log feature collects URL Set information in the URL. It stores the information as log messages for any target allowed by audit logging.

- Source IP address (the IP address of the client that made the request).
- Destination IP address (the IP address of the requested server).
- Requested URL containing the schema, the host, and the domain name (http://www.example.com).
- URL category that the URL filtering framework returns.
- URL category group that the URL filtering framework returned.
- URL reputation number that the URL filtering framework returned.
- Audit log action taken by the policy.

To configure audit logging for a URL List feature, you must complete the following tasks:

1. Enable Audit Log.
2. Create Audit Log message action.
3. Set URL List responder policy with Audit Log message action.

For more information, see Audit Logging topic.

Storing failure errors using SYSLOG messaging

At any stage of the URL Filtering process, if there is a system-level failure, the ADC appliance uses the audit log mechanism to store logs in the ns.log file. The errors are stored as text messages in SYSLOG format so that, an administrator can view it later in a chronological order of event occurrence. These logs are also sent to an external SYSLOG server for archival. For more information, see article CTX229399.

For example, if a failure occurs when you initialize the URL Filtering SDK, the error message is stored in the following messaging format.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
Oct 3 15:43:40 <local0.err> ns URLFiltering[1349]: Error initializing
 NetStar SDK (SDK error=-1). (status=1).
```

The Citrix ADC appliance stores the error messages under four different failure categories:

- **Download failure**. If an error occurs when you try to download the categorization database.
- **Integration failure**. If an error occurs when you integrate an update into the existing categorization database.
- **Initialization failure**. If an error occurs when you initialize the URL Categorization feature, set categorization parameters, or end a categorization service.
- **Retrieval failure**. If an error occurs when the appliance retrieves the categorization details of the request.

Configure SNMP traps for NetSTAR events

The URL Filtering feature generates SNMP traps, if the following conditions occur:

- NetSTAR database update fails or succeeds.
- NetSTAR SDK initialization fails or succeeds.

The appliance has a set of conditional entities called SNMP alarms. When a condition in the SNMP alarm is met, the appliance generates traps and sends it to a specified trap destination. For example, if the NetSTAR SDK initialization fails, an SNMP OID 1.3.6.1.4.1.5951.1.1.0.183 is generated and sent to the trap destination.

For the appliance to generate traps, you must first enable and configure SNMP alarms. Then, you specify the trap destination to which the appliance sends the generated trap messages

Enable an SNMP alarm

The Citrix ADC appliance generates traps only for SNMP alarms that are enabled. Some alarms are enabled by default, but you can disable them.

When you enable an SNMP alarm, the URL filtering feature generates trap messages when a success or failure event occurs. Some alarms are enabled by default.

To enable an SNMP alarm by using the command line interface:

At the command prompt, type the following commands to set the parameters and verify the configuration:

```
enable snmp alarm <trapName>
show snmp alarm <trapName>
```

To enable an SNMP alarm by using the Citrix ADC GUI

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

1. Navigate to **System** > **SNMP** > **Alarms**, and select the alarm.
2. Click **Actions** and select **Enable**.

Configure SNMP alarm by using the CLI

At the command prompt, type the following commands to set the parameters and verify the configuration:

```
set snmp alarm <trapName> [-thresholdValue <positive_integer> [-
normalValue <positive_integer>]] [-time <secs>] [-state ( ENABLED
| DISABLED )] [-severity <severity>] [-logging ( ENABLED | DISABLED )
]
```

Example:

```
set snmp alarm URL-FIL-DB-UPDATE-STATUS –state ENABLED
set snmp alarm URL-FIL-INIT-SDK –state ENABLED
```

Configure SNMP alarms by using the GUI

Navigate to **System** > **SNMP** > **Alarms**, select an alarm, and configure the alarm parameters.

For more information about SNMP traps, see SNMP topic

URL reputation score

September 14, 2021

The URL Categorization feature provides policy-based control to restrict blacklisted URLs. You can control access to websites based on URL category, reputation score, or URL category and reputation score. If network administrators monitor a user accessing highly risky websites, they can use a responder policy bound to the URL reputation score to block such risky websites.

Upon receiving an incoming URL request, the appliance retrieves the category and reputation score from the URL categorization database. Based on the reputation score returned by the database, the appliance assigns a reputation rating for websites. The value can range from 1 to 4, where 4 is the riskiest type of websites, as shown in the following table.

URL Reputation Rating	Reputation Comment
1	Clean site
2	Unknown site

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

URL Reputation Rating	Reputation Comment
3	Potentially dangerous or affiliated to a dangerous site
4	Malicious site

Use Case: Filtering by URL reputation score

Consider an enterprise organization with a network administrator monitoring user transactions and network bandwidth consumption. If malware can enter the network, the administrator must enhance the data security and control access to malicious and dangerous websites accessing the network. To protect the network against such threats, the administrator can configure the URL filtering feature to allow or deny access by URL reputation score.

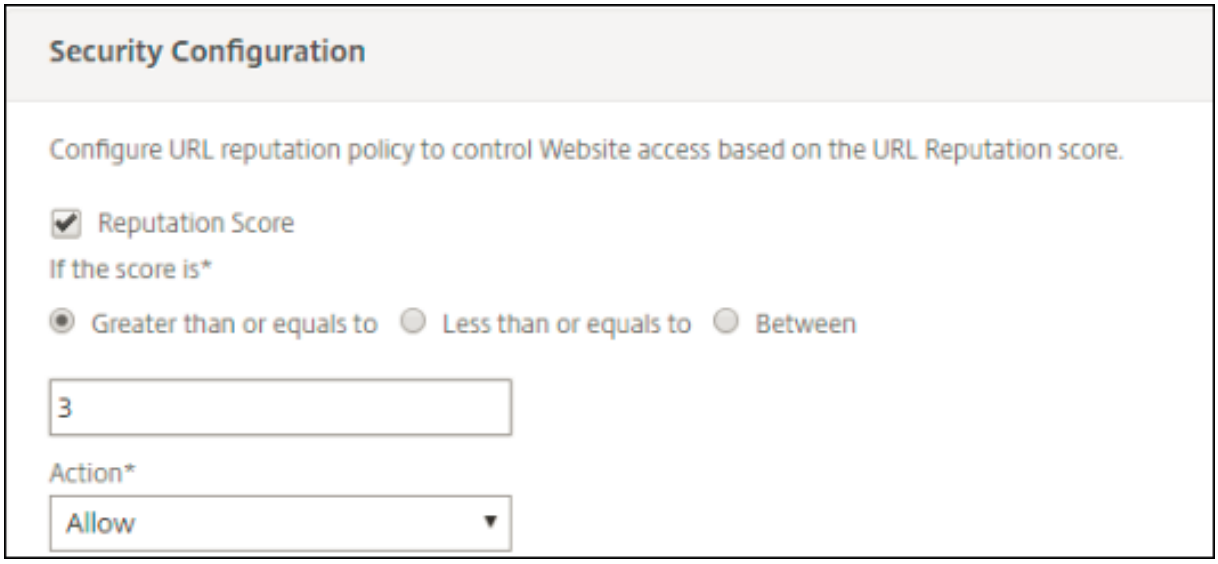
For more information about monitoring outbound traffic and user activities on the network, see Analytics.

If an employee of the organization tries to access a social networking website, the ADC appliance receives a URL request. It queries the URL Categorization database to retrieve the URL category as social networking and a reputation score 3, which indicates a potentially dangerous website. The appliance then checks the security policy configured by the administrator, such as block access to sites with a reputation rating of 3 or more. It then applies the policy action to control access to the website.

To implement this feature, you must configure the URL reputation score and security threshold levels by using the SSL Forward Proxy wizard.

Configure reputation score by using the GUI

Citrix recommends that you use the SSL forward proxy wizard to configure the reputation score and security levels. Based on the configured threshold, you can select a policy action to allow, block, or redirect traffic.



1. Navigate to **Security** > **SSL Forward Proxy**.
2. In the details pane, click **SSL Forward Proxy Wizard**.
3. In the details page, specify the proxy server settings.
4. Click **Continue** to specify other settings such as SSL interception and identify management.
5. Click **Continue** to access the **Security Configuration** section.
6. In the **Security Configuration** section, select the **Reputation Score** check box to control access based on URL reputation score.
7. Select the security level and specify the reputation score threshold value:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

a) Greater than or equals to—Allow or block a website if the threshold value is greater than or equal to N, where N ranges from one to four.
b) Less than or equals to—Allow or block a website if the threshold value is less than or equal to N, where N ranges from one to four.
c) In between—Allow or block a website if the threshold value is between N1 and N2 and the range is from one to four.

8. Select a responder action from the drop-down list.
9. Click **Continue** and **Close**.

The following image shows the **Security Configuration** section on the SSL Forward Proxy wizard. Enable the URL Reputation Score option to configure the policy settings.

Analytics

September 14, 2021

In the Citrix ADC appliance, all the user records and subsequent records are logged. When you integrate Citrix Application Delivery Management (ADM) with the Citrix ADC appliance, the logged user activity and the subsequent records in the appliance are exported to Citrix ADM using the `logstream` feature.

Citrix ADM collates and presents information on the activities of users, such as, websites visited and the bandwidth spent. It also reports bandwidth use and detected threats, such as malware and phishing sites. You can use these key metrics to monitor your network and take corrective actions with the Citrix SWG appliance. For more information, see Citrix SSL Forward Proxy Analytics.

To integrate Citrix ADC appliance with Citrix ADM:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

1. In the Citrix ADC appliance, while configuring the SSL forward proxy feature, enable Analytics and provide the details of the Citrix ADM instance that you want to use for analytics.
2. In Citrix ADM, add the Citrix ADC appliance as an instance to Citrix ADM. For more information see Add Instances to Citrix ADM.

Use case: Making an enterprise network secure by using ICAP for remote malware inspection

September 14, 2021

The Citrix ADC appliance acts as a proxy and intercepts all the client traffic. The appliance uses policies to evaluate the traffic and forwards client requests to the origin server on which the resource resides. The appliance decrypts the response from the origin server and forwards the plain text content to the ICAP server for an antimalware check. The ICAP server responds with a message indicating "No adaptation required,"or error, or modified request. Depending on the response from the ICAP server, the content requested is either forwarded to the client, or an appropriate message is sent.

For this use case, you must perform some general configuration, proxy and SSL interception related configuration, and ICAP configuration on the Citrix ADC appliance.

General configuration

Configure the following entities:

- NSIP address
- Subnet IP (SNIP) address
- DNS name server
- CA certificate-key pair to sign the server certificate for SSL interception

Proxy server and SSL interception configuration

Configure the following entities:

- Proxy server in explicit mode to intercept all outbound HTTP and HTTPS traffic.
- SSL profile to define SSL settings, such as ciphers and parameters, for connections.
- SSL policy to define rules for intercepting traffic. Set to true to intercept all client requests.

For more details, see the following topics:

- Proxy modes

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- SSL interception

In the following sample configuration, the antimalware detection service resides at www.example.com.

Sample general configuration:

```
add dns nameServer 203.0.113.2

add ssl certKey ns-swg-ca-certkey -cert ns_swg_ca.crt -key ns_swg_ca.key
```

Sample proxy server and SSL interception configuration:

```
add cs vserver explicitswg PROXY 192.0.2.100 80 –Authn401 ENABLED –authnVsName explicit-auth-vs

set ssl parameter -defaultProfile ENABLED

add ssl profile swg_profile -sslInterception ENABLED

bind ssl profile swg_profile -ssliCACertkey ns-swg-ca-certkey

set ssl vserver explicitswg -sslProfile swg_profile

add ssl policy ssli-pol_ssli -rule true -action INTERCEPT

bind ssl vserver explicitswg -policyName ssli-pol_ssli -priority 100 -type INTERCEPT_REQ
```

Sample ICAP Configuration:

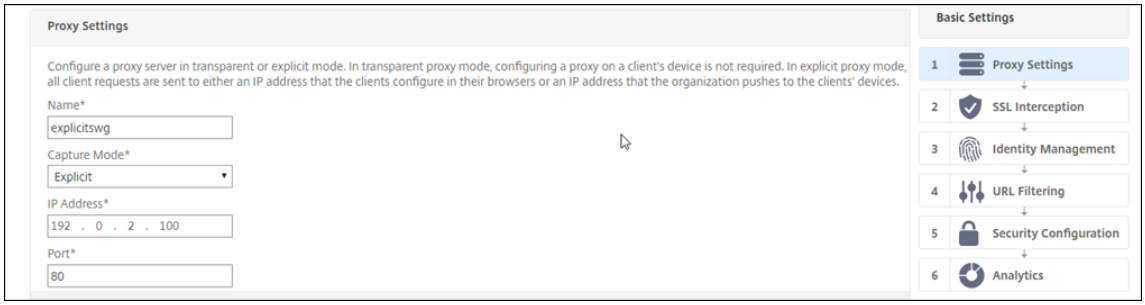
```
add service icap_svc 203.0.113.225 TCP 1344

enable ns feature contentinspection

add icapprofile icapprofile1 -uri /example.com -Mode RESMOD

add contentInspection action CiRemoteAction -type ICAP -serverName icap_svc -icapProfileName icapprofile1

add contentInspection policy CiPolicy -rule "HTTP.REQ.METHOD.NE("CONNECT")" -action CiRemoteAction

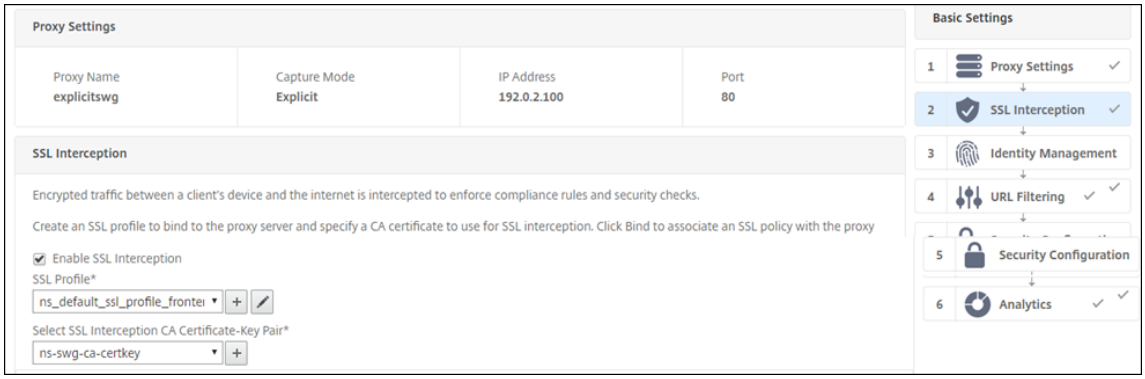


bind cs vserver explicitswg -policyName  CiPolicy -priority 200 -type response
```

Configure the proxy settings

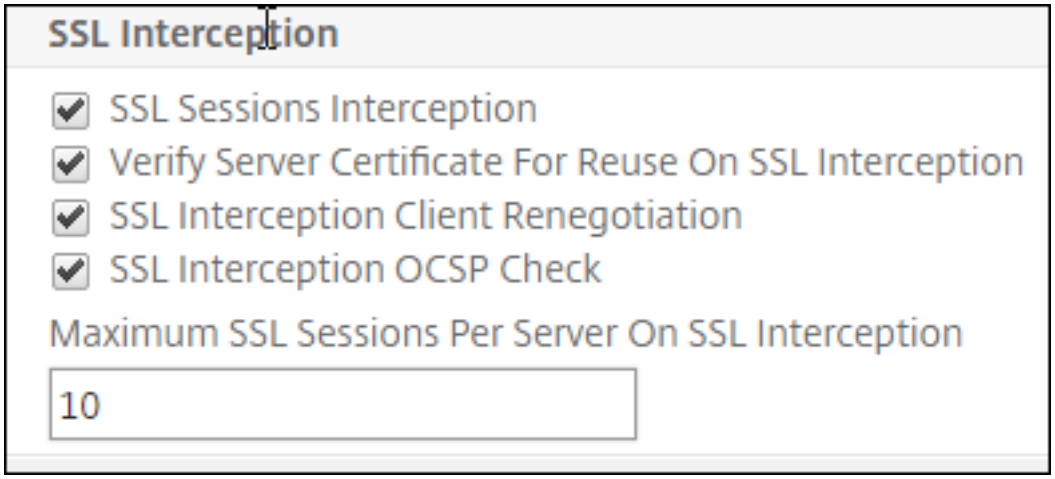
1. Navigate to **Security** > **SSL Forward Proxy** > **SSL Forward Proxy Wizard**.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.



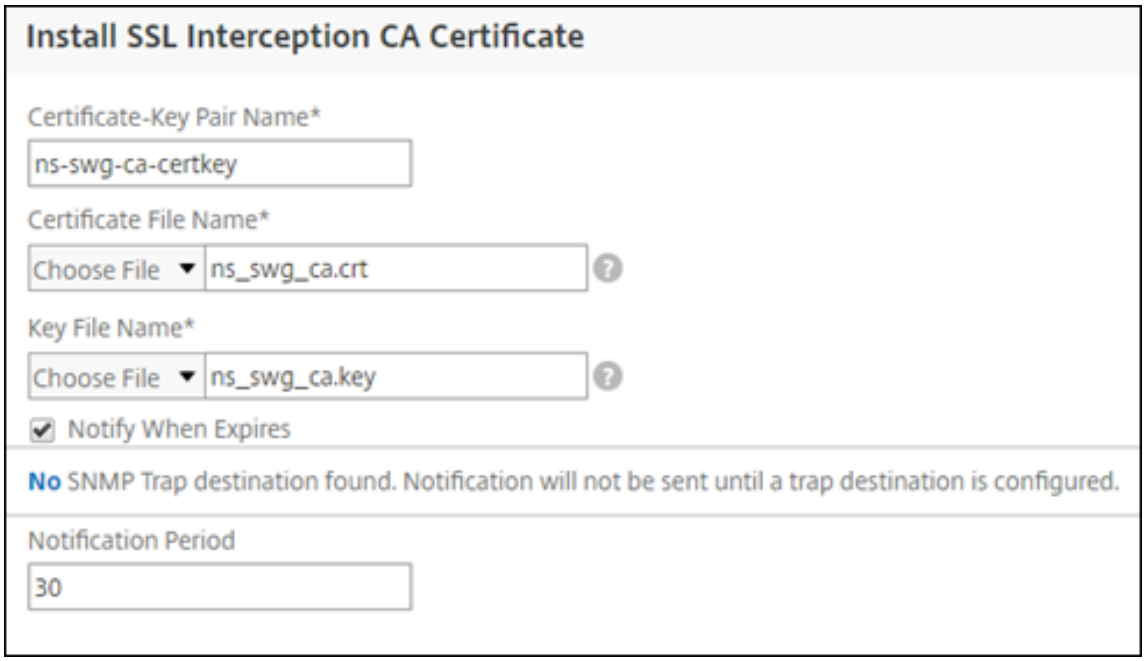
2. Click **Get Started** and then click **Continue**.
3. In the **Proxy Settings** dialog box, enter a name for the explicit proxy server.
4. For **Capture Mode,** select **Explicit**.
5. Enter an IP address and port number.

6. Click **Continue**.

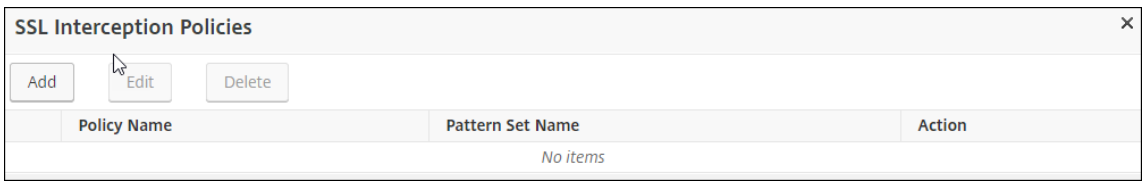


Configure the SSL interception settings

1. Select **Enable SSL Interception**.

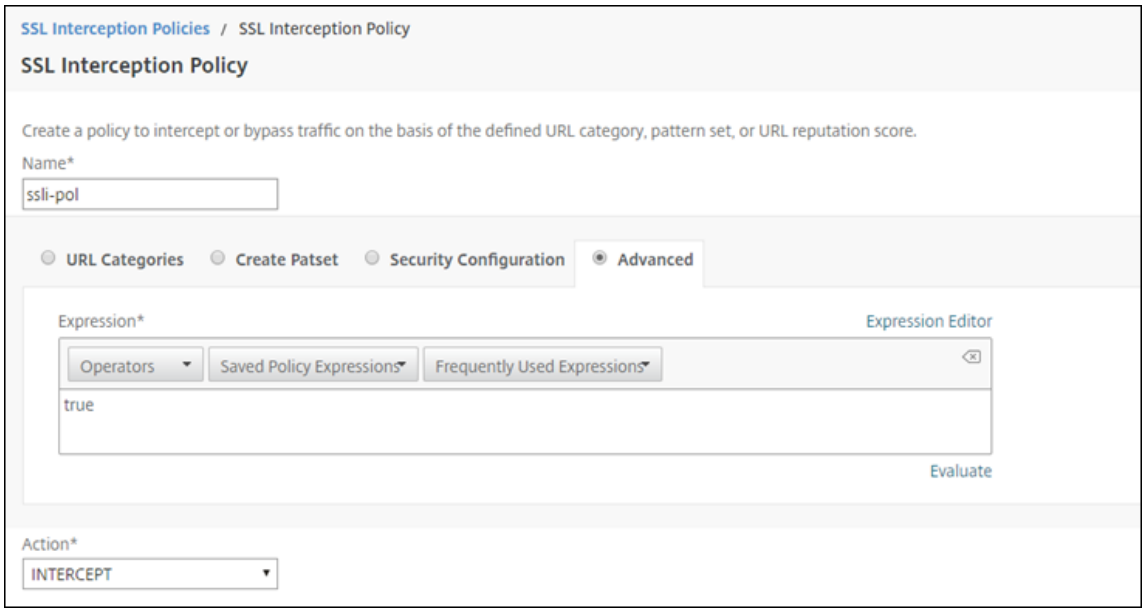


2. In **SSL Profile**, select an existing profile or click "+"to add a new front-end SSL profile. Enable **SSL Sessions Interception** in this profile. If you select an existing profile, skip the next step.



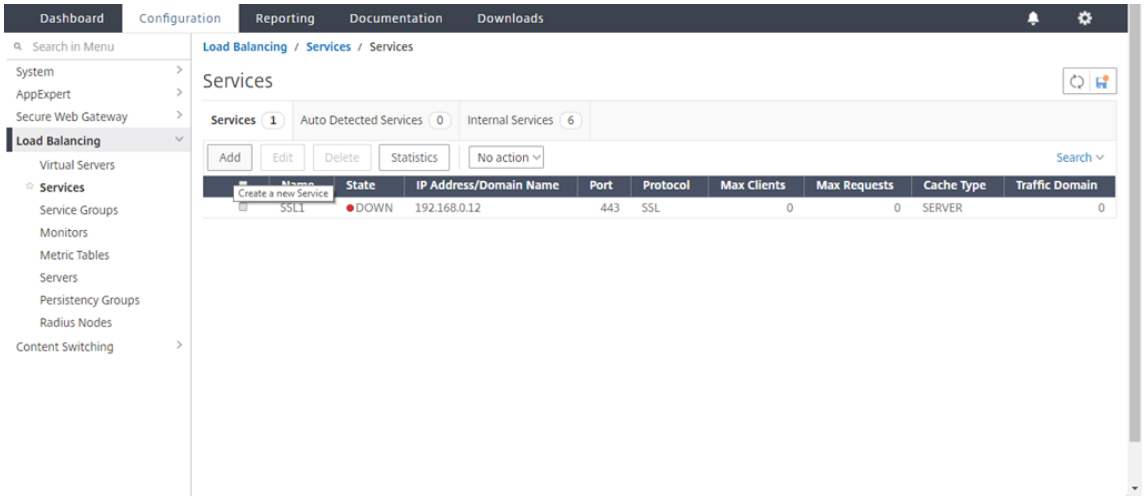
© 1999–2025 Cloud Software Group, Inc. All rights reserved.

3. Click **OK** and then click **Done**.
4. In **Select SSL interception CA Certificate-Key Pair**, select an existing certificate or click "+"to install a CA certificate-key pair for SSL interception. If you select an existing certificate, skip the next step.



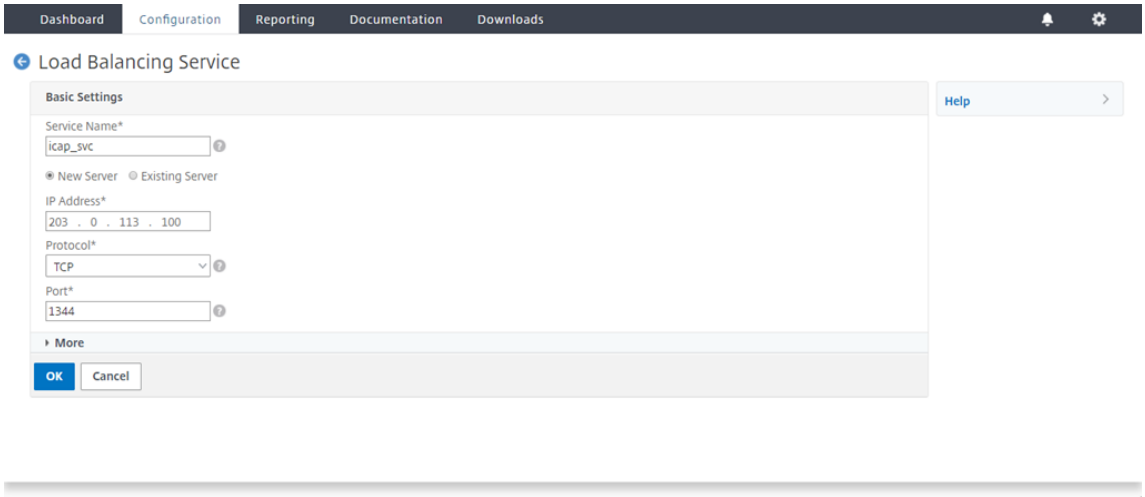
5. Click **Install** and then click **Close**.
6. Add a policy to intercept all the traffic. Click **Bind**. Click **Add** to add a new policy or select an existing policy. If you select an existing policy, click **Insert**, and skip the next three steps.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.



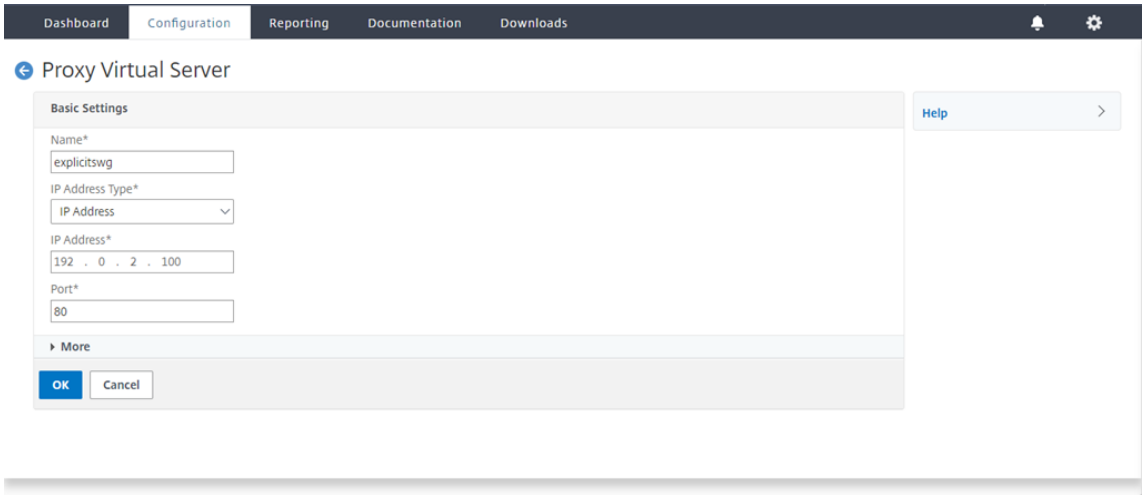
7. Enter a name for the policy and select **Advanced**. In the Expression editor, enter true.
8. For **Action**, select **INTERCEPT**.

9. Click **Create**.
10. Click **Continue** four times, and then click **Done**.

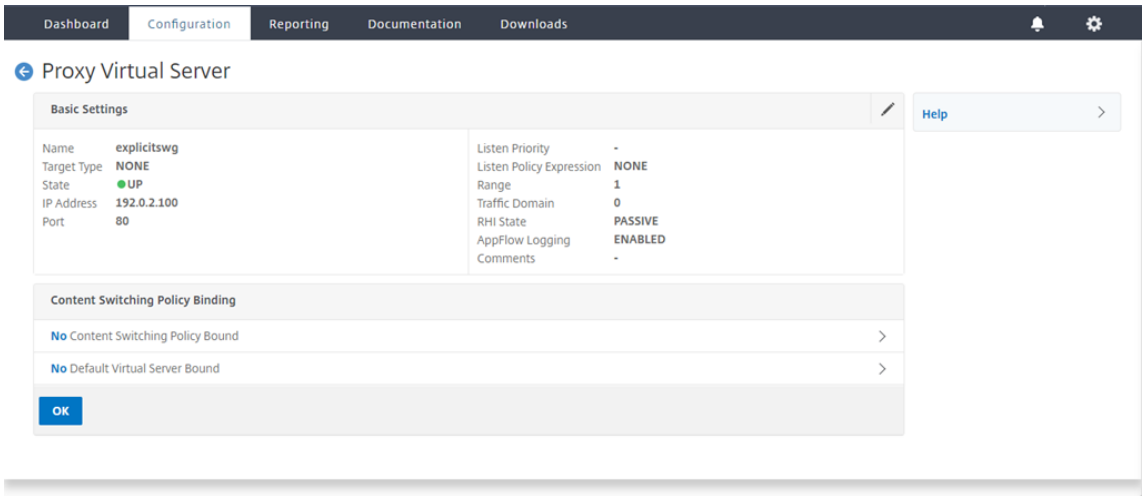


Configure the ICAP settings

1. Navigate to **Load Balancing** > **Services** and click **Add**.

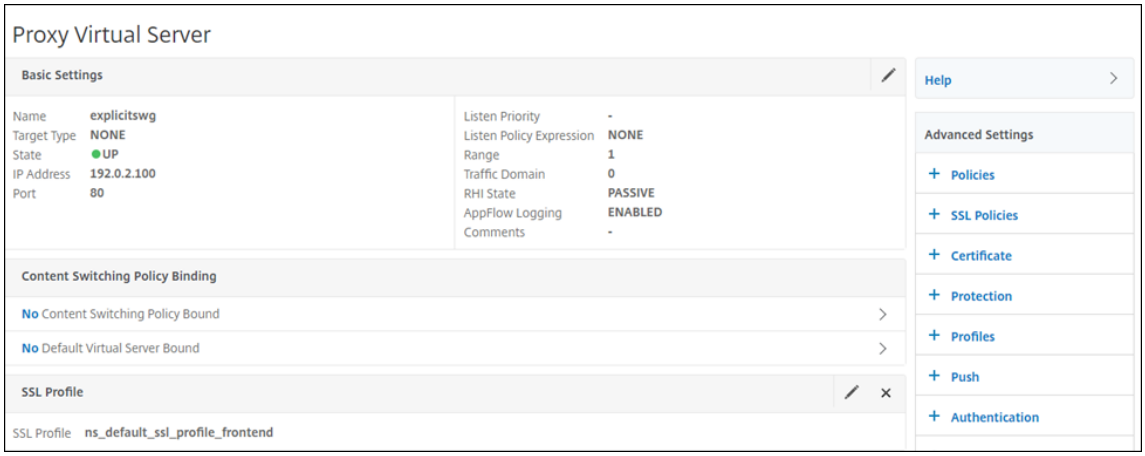


2. Type a name and IP address. In **Protocol**, select **TCP**. In **Port**, type **1344**. Click **OK**.

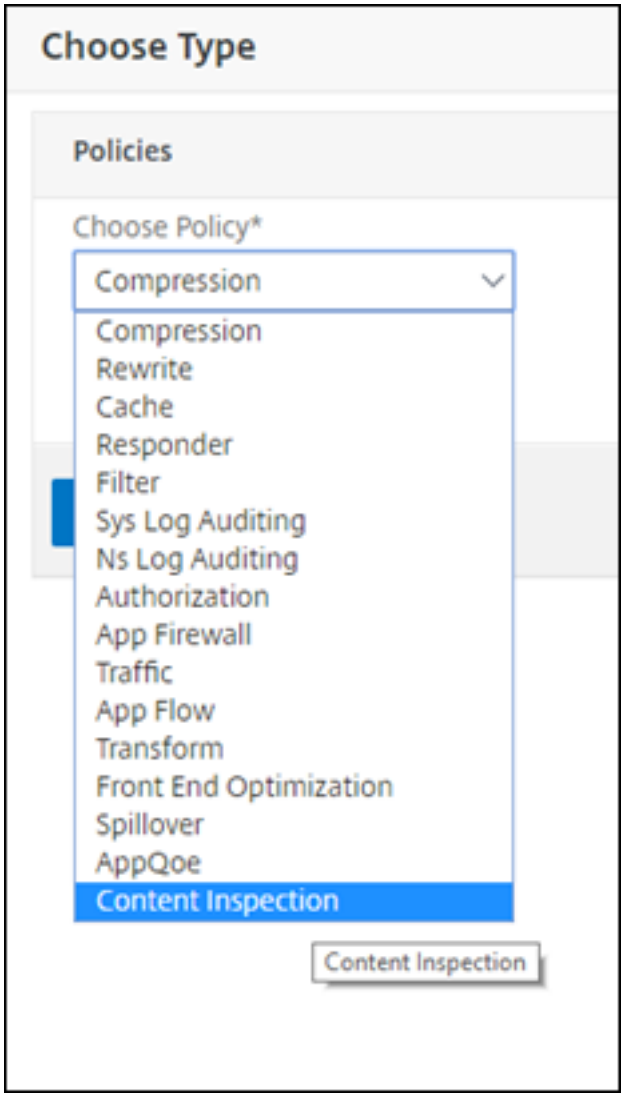


© 1999–2025 Cloud Software Group, Inc. All rights reserved.

3. Navigate to **SSL Forward Proxy** > **Proxy Virtual Servers**. Add a proxy virtual server or select a virtual server and click **Edit**. After entering details, click **OK**.

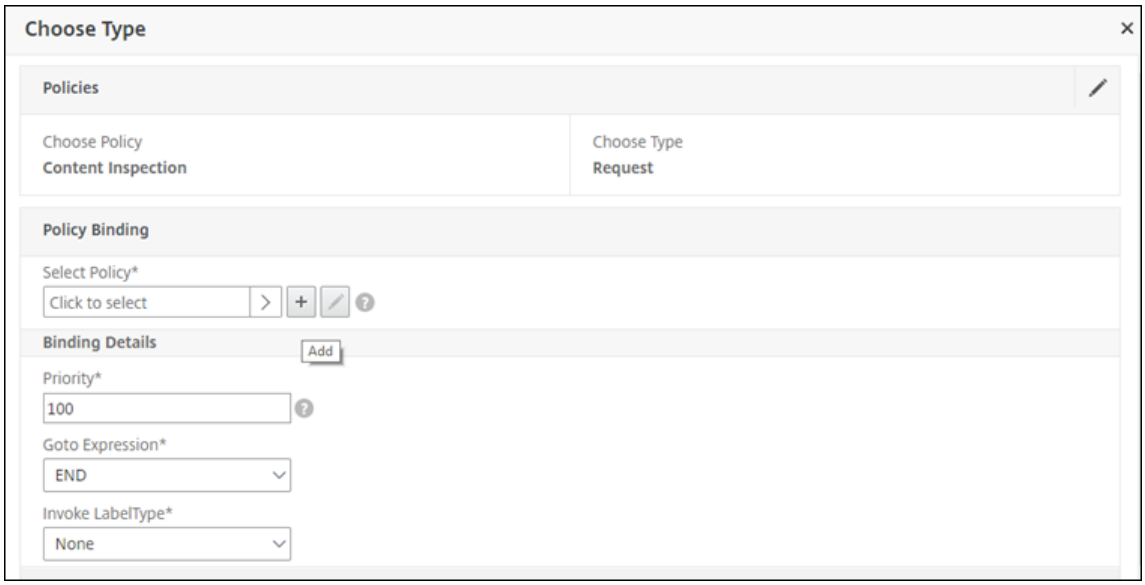


Click **OK** again.

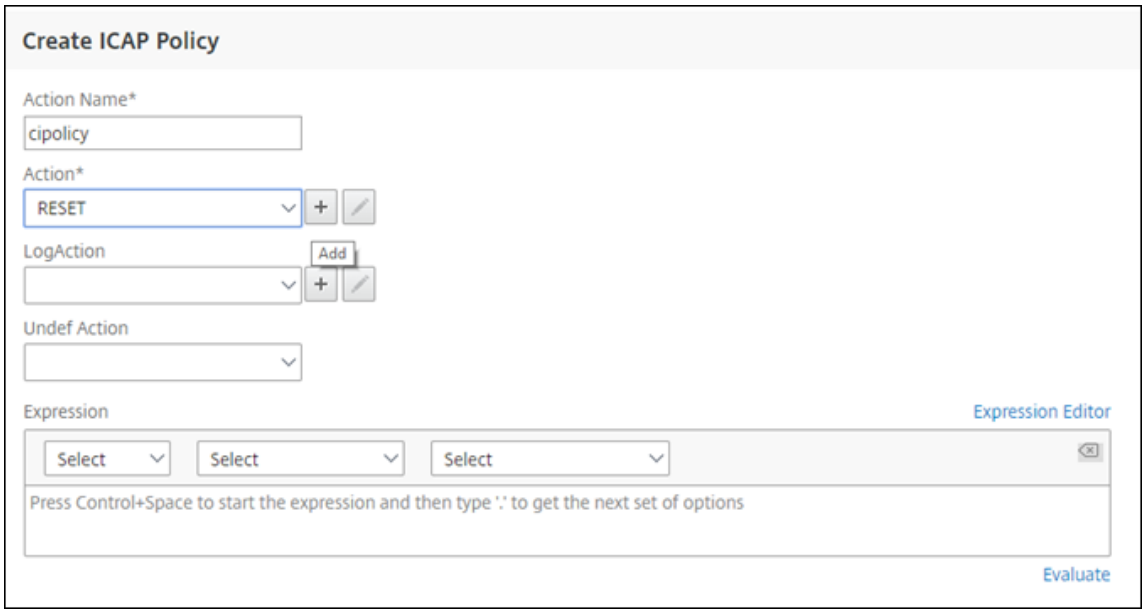


© 1999–2025 Cloud Software Group, Inc. All rights reserved.

4. In **Advanced Settings**, click **Policies**.



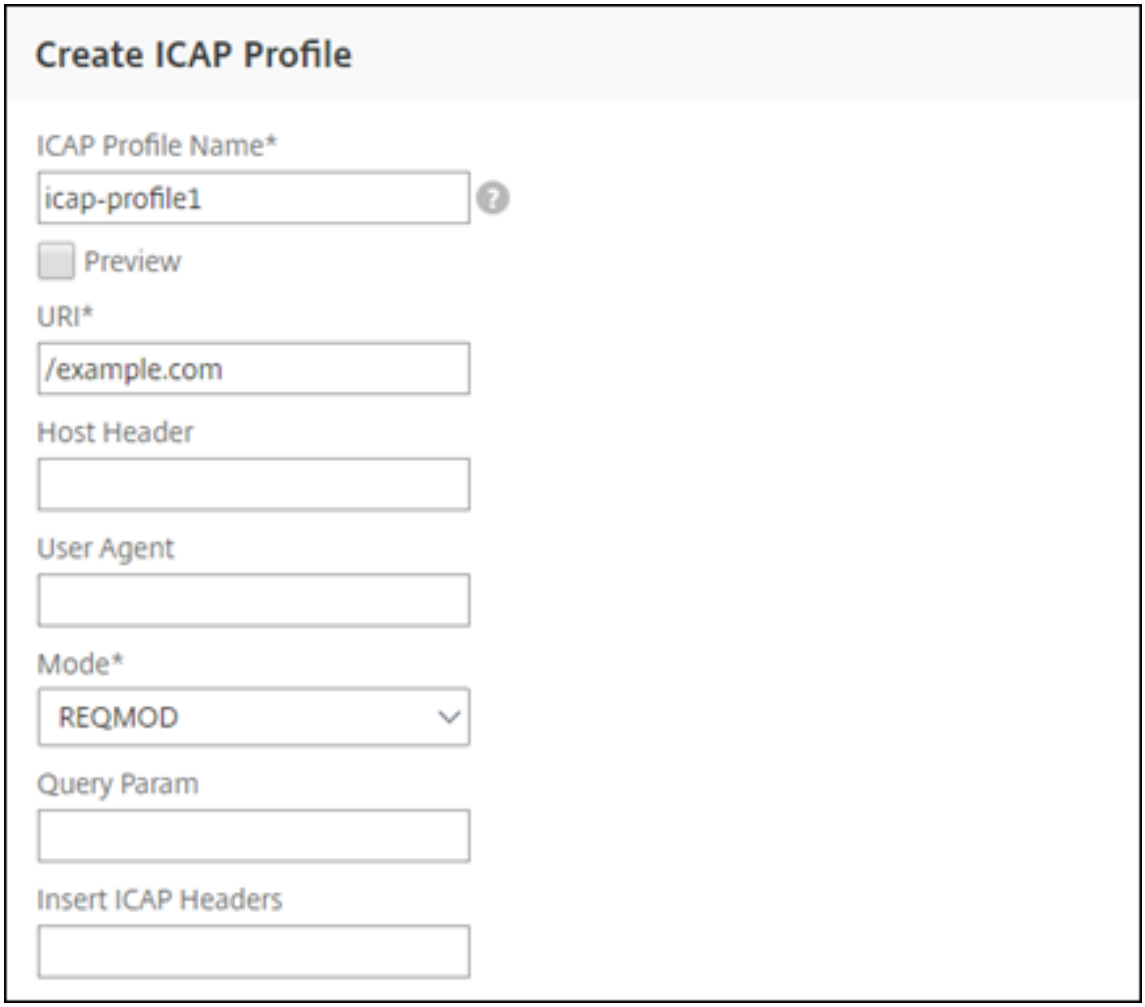
5. In **Choose Policy**, select **Content Inspection**. Click **Continue**.



© 1999–2025 Cloud Software Group, Inc. All rights reserved.

6. In **Select Policy**, click the “+”sign to add a policy.

7. Enter a name for the policy. In **Action**, click the “+”sign to add an action.



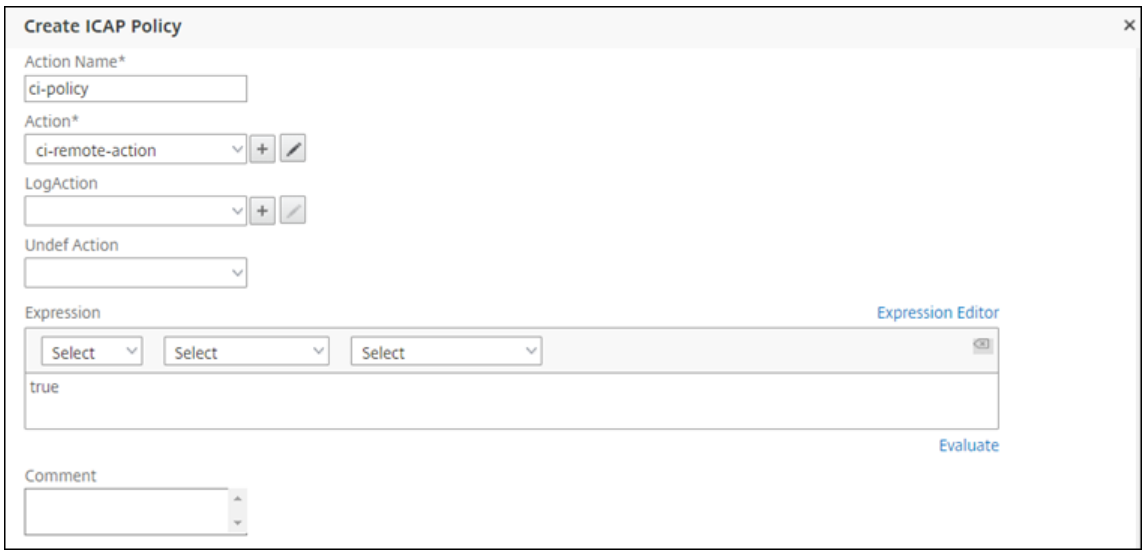
8. Type a name for the action. In **Server Name**, type the name of the TCP service created earlier. In **ICAP Profile**, click the “+”sign to add an ICAP profile.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

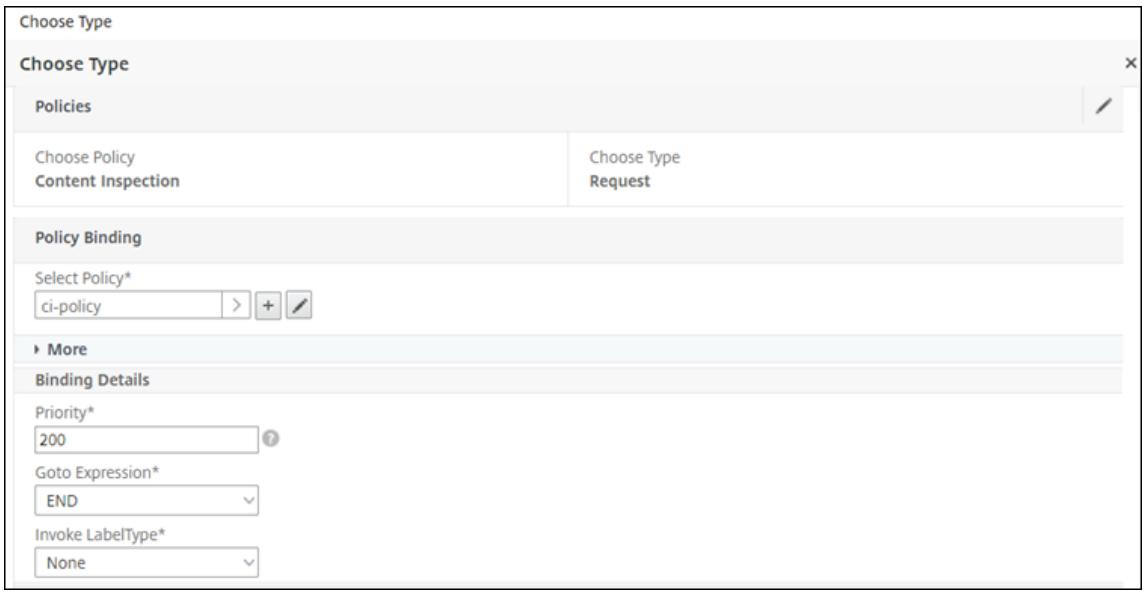
9. Type a profile name, URI. In **Mode**, select **REQMOD**.

10. Click **Create**.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

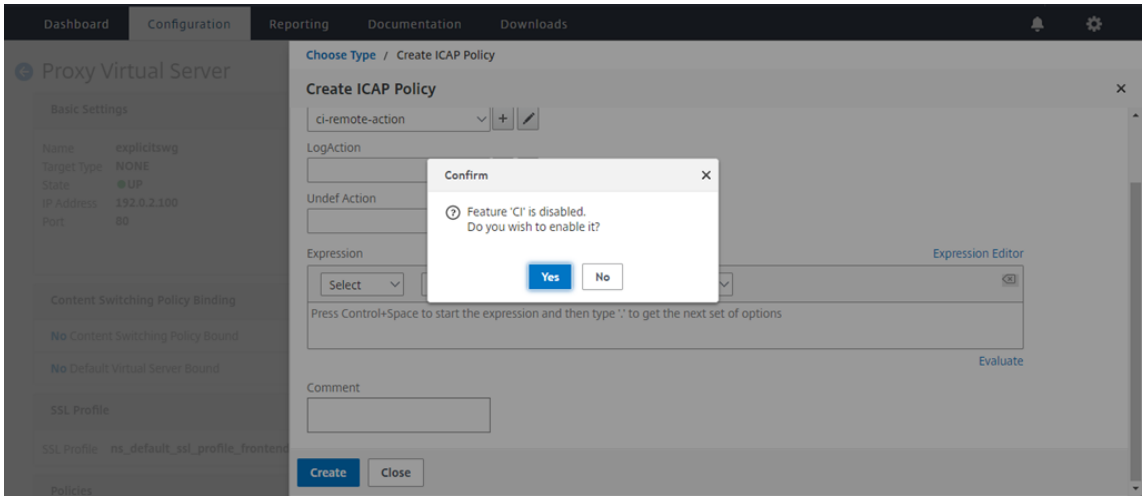


11. In the **Create ICAP Action** page, click **Create**.

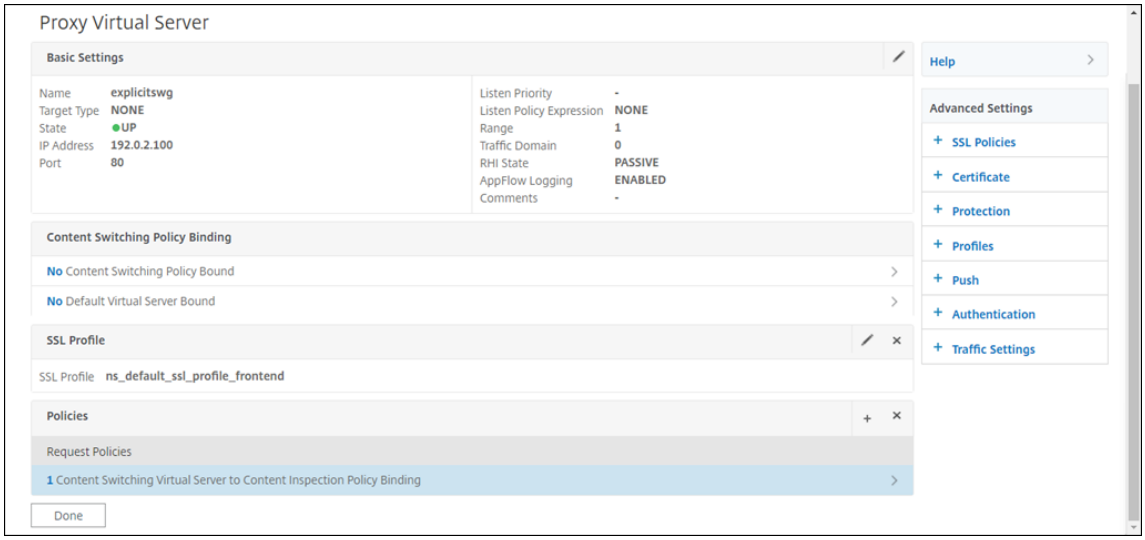


12. In the **Create ICAP Policy** page, enter true in the **Expression Editor**. Then, click **Create**.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.



13. Click **Bind**.



14. When prompted to enable the content inspection feature, select **Yes**.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

15. Click **Done**.

Sample ICAP transactions between the Citrix ADC appliance and the ICAP server in RESPMOD

Request from the Citrix ADC appliance to the ICAP server:

```
RESPMOD icap://10.106.137.15:1344/resp ICAP/1.0

Host: 10.106.137.15

Connection: Keep-Alive

Encapsulated: res-hdr=0, res-body=282

HTTP/1.1 200 OK

Date: Fri, 01 Dec 2017 11:55:18 GMT
```

How-to articles

May 31, 2024

Following are some configuration instructions or functional use cases available as “How to”articles to help you manage your SSL forward proxy deployment.

URL filtering

How to create a URL categorization policy

How to create a URL list policy

How to allow an exceptional URL

How to block adult category websites

How to configure a pattern set

Security

September 14, 2021

The following topics cover configuration and installation information for Citrix ADC security features. Most of these features are policy based.

Content Filtering	Blocks inappropriate HTML requests, preventing the requests from reaching the Web servers.
Surge Protection	Detects any rapid rise in connection attempts and adjusts the rate at which connections are allowed to proceed to the server, preventing server overload.
DNS Security Options	Simplified UI wizard to create policies to protect against DNS attacks.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Content filtering

September 16, 2021

> **Warning:**
>
> Filter actions are deprecated from NetScaler 12.0 build 56.20 onwards and as an alternative, Citrix recommends you to use the Responder, Rewrite, or Content Switching features. However, Filter actions are removed and no longer available on the Citrix ADC appliance release 13.1 onwards. For more information, see Responder, Rewrite, or Content Switching topics.

Content filtering can do some of the same tasks as the Citrix Web App Firewall, and is a less CPU-intensive tool. It is limited, however, to examining the header portion of the HTTP request or response and to performing a few simple actions on connections that match. If you have a complex website that makes extensive use of scripts and accesses back-end databases, the Application Firewall might be the better tool for protecting that website. For more information about the Citrix Web App Firewall, see Application Firewall.

Content filtering is based on regular expressions that you can apply to either HTTP requests or HTTP responses. To block requests from a particular site, for example, you can use an expression that compares each request's URL to the URL specified in the expression. The expression is part of a policy, which also specifies an action to be performed on requests or responses that match the expression. For example, an action might drop a request or reset the connection.

Following are some examples of things you can do with content filtering policies:

- Prevent users from accessing certain parts of your websites unless they are connecting from authorized locations.
- Prevent inappropriate HTTP headers from being sent to your Web server, possibly breaching security.
- Redirect specified requests to a different server or service.

To configure content filtering, once you have made sure that the feature is enabled, you configure filtering actions for your servers to perform on selected connections (unless the predefined actions are adequate for your purposes). Then you can configure policies to apply the actions to selected connections. Your policies can use predefined expressions, or you can create your own. To activate the policies you configured, you bind them either globally or to specific virtual servers.

Enabling content filtering

September 14, 2021

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

By default, content filtering is enabled on Citrix ADC appliances running the Citrix ADC operating system 8.0 or above. If you are upgrading an existing appliance from an operating system version earlier than 8.0, you must update the licenses before you can use content filtering, and you might need to enable the content filtering feature itself manually.

Enable content filtering by using the CLI

At the command prompt, type the following commands to enable content filtering and verify the configuration:

```
-  enable ns feature ContentFiltering
-  show ns feature
```

Example:

```
> enable ns feature ContentFiltering
 Done
> show ns feature

        Feature                         Acronym              Status
        -------                         -------              ------
 1)     Web Logging                     WL                   ON
 2)     Surge Protection                SP                   OFF
 .
 .
 .
 .
 11)    Http DoS Protection             HDOSP                OFF
 12)    Content Filtering               CF                   ON
 .
 .
 23)    HTML Injection                  HTMLInjection        ON
 24)    Citrix ADC Push                  push                 OFF
 Done
```

Enable content by filtering by using the GUI

1. In the navigation pane, expand System, and then select Settings.
2. In the details pane, click Configure basic features.
3. In the Configure Basic Features pane, select the Content Filter check box, and then click OK.

Configure a content filtering action

September 14, 2021

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

After you enable the content filtering feature, you create one or more actions to tell your Citrix ADC appliance how to handle the connections it receives.

Content filtering supports the following actions for HTTP requests:

- **Add:** Adds the specified HTTP header before sending the request to the web server.
- **Reset:** Terminates the connection, sending the appropriate termination notice to the user's browser.
- **Forward:** Redirects the request to the designated service.
- **Drop:** Silently deletes the request, without sending a response to the user's browser.
- **Corrupt:** Modifies the designated HTTP header in a manner that prevents it from performing the function it was intended to perform, then sends the request to the server.

Content filtering supports the following actions for HTTP responses:

- **Add:** Adds the specified HTTP header before sending the response to the user's browser.
- **ErrorCode:** Returns the designated HTTP error code to the user's browser.
- **Corrupt:** Modifies the designated HTTP header in a manner that prevents it from performing the function it was intended to perform, then sends the response to the user's browser.

Configure a content filtering action by using the CLI

At the command prompt, type the following commands to configure a Content Filtering action and verify the configuration:

```
1 - add filter action <name> <qualifier> [<serviceName>] [<value>] [<
    respCode>] [<page>]
2 - show filter action <name>
```

Example:

```
1 > add filter action act_drop Drop
2  Done
3 > show filter action act_drop
4 1)      Name: act_drop   Filter Type: drop
5  Done
```

Configure a content filtering action by using the GUI

1. Navigate to **Security > Protection Features > Filter**.
2. In the details pane, do one of the following:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- To create a new action, click **Add**.
- To modify an existing action, select the action, and then click **Open**.

3. In the **Add Filter Action** or **Configure Filter Action** dialog box, specify values for the parameters:
   - Action Name*—name
   - Qualifier*—qualifier (Determines which of the following parameters you can configure)
   - Service Name—service name
   - HeaderName:Value—value
   - Response Code—`respcode`
   - Response Page—page
4. Fill in any other required information. For example, if you are configuring an action to send an HTTP error code, you must choose the appropriate error code from a drop-down list. If necessary, you can then modify the text of the error message, which is displayed beneath the drop-down list.
5. Click Create or OK, and then click Close. The Actions list displays the action you configured, and a message in the status bar indicates that your action has been created.

Configure a content filtering policy

September 14, 2021

To implement content filtering, you must configure at least one policy to tell your Citrix ADC appliance how to distinguish the connections you want to filter. You must first have configured at least one filtering action, because when you configure a policy, you associate it with an action.

Content filtering policies examine a combination of one or more of the following elements to select requests or responses for filtering:

- **URL:** The URL in the HTTP request.
- **URL query:** Only the query portion of the URL, which is the portion after the query (?) symbol.
- **URL token:** Only the tokens in the URL, if any, which are the parts that begin with an ampersand (&) and consist of the token name, followed by an equals sign (=), followed by the token value.
- **HTTP method:** The HTTP method used in the request, which is usually GET or POST, but can be any of the eight defined HTTP methods.
- **HTTP version:** The HTTP version in the request, which is usually HTTP 1.1.
- **Standard HTTP header:** Any of the standard HTTP headers defined in the HTTP 1.1 specification.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- **Standard HTTP header value:** The value portion of the HTTP header, which is the portion after the colon and space (:).
- **Custom HTTP header:** A non-standard HTTP header issued by your website or that appears in a user request.
- **Custom header value:** The value portion of the custom HTTP header, which (as with the standard HTTP header) is the portion after the colon and space (:).
- **Client Source IP:** The IP from which the client request was sent.

Content filtering policies use the simpler of two Citrix ADC expressions languages, called classic expressions. For a complete description of classic expressions, how they work, and how to configure them manually, see "Policies and Expressions."

Note: Users who are not experienced in configuring policies at the Citrix ADC command line will usually find using the configuration utility considerably easier.

Configure a content filtering policy by using the CLI

At the command prompt, type the following commands to configure a content filtering policy and verify the configuration:

```
1 -  add filter policy <name> -rule <expression> (-reqAction <action> | -
     resAction <string>
2 -  show filter policy <name>
```

Example:

```
1 > add filter policy cf-pol -rule "REQ.HTTP.URL CONTAINS http://abc.com"
      -reqaction DROP
2  Done
3 > show filter policy cf-pol
4 1)      Name: cf-pol    Rule: REQ.HTTP.URL CONTAINS http://abc.com
5         Request action: DROP
6         Response action:
7         Hits: 0
8  Done
```

Configure a content filtering policy by using the GUI

1. Navigate to Security > Protection Features > Filter.
2. Navigate to Protection Features > Filter.
3. In the details pane, to create a new policy, click Add.
4. If you are creating a new policy, in the Create Filter Policy dialog box, in the Filter Name text box, type a name for your new policy.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

5. Select either Request Action or Response Action to activate the drop-down list to the right of that item.
6. Click the down arrow to the right of the drop-down list and select the action to be performed on the request or response. The default choices are RESET and DROP. Any other actions you have created will also appear in this list.
   Note: You can also click New to create a new Content Filtering action, or Modify to modify an existing Content Filtering action. You can only modify actions you created; the default actions are read-only.
7. If you want to use a predefined expression (or named expression) to define your policy, choose one from the Named Expressions list.

   a) Click the down arrow to the right of the first Named Expressions drop-down list, and choose the category of named expressions that contains the named expression you want to use.
   b) Click the down arrow to the right of the second Named Expressions drop-down list, and choose the named expression you want. As you choose a named expression, the regular expression definition of that named expression appears in the Preview Expression pane beneath the Named Expression list boxes.
   c) Click Add Expression to add that named expression to the Expression list.
   Note: You must perform either this step or step 7, but not both.

8. If you want to create a new expression to define your policy, use the Expression Editor.

   a) Click the Add button. The Add Expression dialog box appears.
   b) In the Add Expression dialog box, choose the type of connection you want to filter. The Flow Type is set to REQ by default, which tells the Citrix ADC appliance to look at incoming connections, or requests. If you want to filter outgoing connections (responses), you click the right arrow beside the drop-down list and choose RES.
   c) If the Protocol is not already set to HTTP, click the down arrow to the right of the Protocol drop-down list and choose HTTP.
   Note: In the Citrix ADC classic expressions language, “HTTP”includes HTTPS requests, as well.
   d) Click the down arrow to the right of the Qualifier drop-down list, and then choose a qualifier for your expression. Your choices are:
      - **METHOD:** The HTTP method used in the request.
      - **URL:** The contents of the URL header.
      - **URLTOKENS:** The URL tokens in the HTTP header.
      - **VERSION:** The HTTP version of the connection.
      - **HEADER:** The header portion of the HTTP request.
      - **URLLEN:** The length of the contents of the URL header.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- **URLQUERY:** The query portion of the contents of the URL header.
- **URLQUERYLEN:** The length of the query portion of the URL header.
  The contents of the remaining list boxes change to the choices appropriate to the Qualifier you pick. For example, if you choose HEADER, a text field labeled Header Name* appears below the Flow Type list box.

e) Click the down arrow to the right of the Operator drop-down list, and choose an operator for your expression. Your choices will vary depending on the Protocol you chose in the preceding step. The following list includes all of the operators:

- **==:** Matches the following text string exactly.
- **!=:** Does not exactly match the following text string.
- **>:** Is greater than the following integer.
- **CONTAINS:** Contains the following text string.
- **CONTENTS:** The contents of the designated header, URL, or URL query.
- **EXISTS:** The specified header or query exists.
- **NOTCONTAINS:** Does not contain the following text string.
- **NOTEXISTS:** The specified header or query does not exist.

f) If the Value text box is visible, type the appropriate string or number. If you are testing a string in any way, type the string into the Value text box. If you are testing an integer in any way, type the integer into the Value text box.

g) If you chose HEADER as the Protocol, type the header you want in the Header Name* text box.

h) Click OK to add your expression to the Expressions list.

i) Repeat steps B through H to create any additional expressions you want for your profile.

j) Click Close to close the Expressions Editor.

9. If you created a new expression, in the Expression frame select an option from the Match Any Expression drop-down list. Your choices are:

- Match Any Expression. If a request matches any expression in the Expressions list, the request matches this policy.
- Match All Expressions If a request matches all expressions in the Expressions list, the request matches this policy. If it does not match all of them, it does not match this policy.
- Tabular Expression Switches the Expressions list to a tabular format with three columns. In the first column you can place a BEGIN [(] operator. The second column contains the expressions you have selected or created. In the third column, you can place any of the other operators in the following list, to create complex policy groups in which each group can be configured for match any expression or match all expressions.
- The AND [&&] operator tells the appliance to require that a request match both the current expression and the following expression.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- The OR [||] operator tells the appliance to require that a request match either the current expression or the following expression, or both. Only if the request does not match either expression does it not match the policy.
- The END [)] operator tells the appliance that this is the last expression in this expression group or policy.
  Note: The Tabular format allows you to create a complex policy that contains both "Match Any Expression"and "Match All Expressions"on a per-expression basis. You are not limited to just one or the other.
- Advanced Free-Form Switches off the Expressions Editor entirely and modifies the Expressions list into a text area. In the text area, you can type the PCRE-format regular expression of your choice to define this policy. This is both the most powerful and the most difficult method of creating a policy, and is recommended only for those thoroughly familiar with the Citrix ADC appliance and PCRE-format regular expressions.
  Caution: If you switch to Advanced Free Form expression editing mode, you cannot switch back to any of the other modes. Do not choose this expression editing mode unless you are sure that is what you want.

10. Repeat steps 6 through 8 to add any additional expressions you want to the Expressions list. You can mix named expressions and expressions created in the Expressions Editor. To the Citrix ADC appliance, they are all the same.
11. Click Create to create your new policy. Your new policy appears in the Policies pane list.
12. Click **Close**. To create additional Content Filtering policies, repeat the previous procedure. To remove a Content Filtering policy, select the policy in the **Policies** tab and click **Remove**.

Binding a content filtering policy

September 14, 2021

You must bind each content filtering policy to put it into effect. You can bind policies globally or to a particular virtual server. Globally bound policies are evaluated each time traffic directed to any virtual server matches the policy. Policies bound to a specific virtual server are evaluated only when that virtual server receives traffic that matches the policy.

Bind a policy to a virtual server by using the CLI

At the command prompt, type the following commands to bind a policy to a virtual server and verify the configuration:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
- bind lb vserver <name>@ -policyName <string> -priority <
   positive_integer>
- show lb vserver <name>
```

Example:

```
> bind lb vserver vs-loadbal -policyName policyTwo -priority 100
 Done
> show lb vserver vs-loadbal
1)      vs-loadbal (10.102.29.20:80) - HTTP     Type: ADDRESS
        State: OUT OF SERVICE
        Last state change was at Wed Aug 19 09:05:47 2009 (+211 ms)
        Time since last state change: 2 days, 00:58:03.260
        Effective State: DOWN
        Client Idle Timeout: 180 sec
        Down state flush: ENABLED
        Disable Primary Vserver On Down : DISABLED
        Port Rewrite : DISABLED
        No. of Bound Services :  0 (Total)       0 (Active)
        Configured Method: LEASTCONNECTION
        Mode: IP
        Persistence: NONE
        Vserver IP and Port insertion: OFF
        Push: DISABLED  Push VServer:
        Push Multi Clients: NO
        Push Label Rule: none

 Done
```

Globally bind a policy by using the CLI

At the command prompt, type the following commands to globally bind a policy and verify the configuration:

```
- bind filter global (<policyName> [-priority <positive_integer>]) [-
   state ( ENABLED | DISABLED )]
- show filter global
```

Example:

```
 bind filter global cf-pol -priority 1
 Done show filter global
1)      Policy Name: cf-pol     Priority: 1
 Done
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Bind a policy to a virtual server by using the GUI

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**.
2. In the details pane, select the virtual server to which you want to bind the content filtering policy from the list, and click **Open**.
3. In the **Configure Virtual Server** (Load Balancing) dialog box, select the **Policies** tab, and then select the check box in the Active column of the filter policy that you want to bind to the virtual server.
4. Click **OK**. The policies you have bound display a check mark and the word Yes in the Policies Bound column of the Policies tab.

Globally bind a policy by using the GUI

1. Navigate to **Security > Protection Features > Filter**.
2. In the details pane, in the **Policies** tab, select the policy that you want to bind, and then click **Global Bindings**.
3. In the Bind/Unbind Filter Policies dialog box, in the **Policy Name** drop-down list, select a policy, and then click **Add**. The policy is added to the Configured list.

   > **Note**
   >
   > To select multiple policies from the list, drag the Ctrl key, then click each policy you want.

4. Click **OK**, and then click **Close**. The policies you have bound display a check mark and the word Yes in the Globally Bound column of the Policies tab.

Configuring content filtering for a commonly used deployment scenario

September 14, 2021

This example provides instructions for using the configuration utility to implement a content filtering policy in which, if a requested URL contains root.exe or cmd.exe, the content filtering policy `filter-CF-nimda` is evaluated and the connection is reset.

To configure this content filtering policy, you must do the following:

- Enable content filtering
- Configure content filtering policy
- Bind content filtering policy globally or to a virtual server
- Verify the configuration

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Note: Since this example uses a default content filtering action, you do not need to create a separate content filtering action.

Enable content filtering

1. In the navigation pane, expand System, and click Settings.
2. In the details pane, under Modes & Features, click Change Basic Features.
3. In the Configure Basic Features dialog box, select the Content Filtering check box, and then click OK.
4. In the Enable/Disable feature(s) dialog box, click Yes. A message appears in the status bar, stating that the selected feature is enabled.

Configure the content filtering policy `filter-CF-nimda`

1. Navigate to Security > Protection Features > Filter.
2. In the details pane, click Add. The Create Filter Policy dialog box appears.
3. In the Create Filter Policy dialog box, in the Filter Name text box, type the name `filter-CF-nimda`.
4. Select the Request Action option, and in the drop-down list, select RESET.
5. In the Expression frame, select Match Any Expression from the drop-down list, and then click Add.
6. In the Add Expression dialog box, Expression Type drop-down list, select General.
7. In the Flow Type drop-down list, select REQ.
8. In the Protocol drop-down list, select HTTP.
9. In the Qualifier drop-down list, select URL.
10. In the Operator drop-down list, select CONTAINS.
11. In the Value text box, type cmd.exe, and then click OK. The expression is added in the Expression text box.
12. To create another expression, repeat Steps 7 through 11, but in the Value text box, type root.exe. Then click OK, and finally click Close.
13. Click Create on the Create Filter Policy dialog box. The filter policy `filter-CF-nimda` appears in the Filter list.
14. Click Close.

Globally bind the content filtering policy

1. Navigate to Security > Protection Features > Filter. The Filter page appears in the right pane.
2. In the details pane, Policies tab, select the policy that you want to bind and click Global Bindings. The Bind/Unbind Filter Policies dialog box appears.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

3. In the Bind/Unbind Filter Policies dialog box, in the Policy Name drop-down list, select the policy `filter-CF-nimda`, and click Add. The policy is added to the Configured list.
4. Click OK, and then click Close. The policy you have bound displays a check mark and Yes in the Globally Bound column of the Policies tab.

Bind the content filtering policy to a virtual server

1. Navigate to Traffic Management > Load Balancing > Virtual Servers.
2. In the details pane virtual servers list, select vserver-CF-1 to which you want to bind the content filtering policy and click Open.
3. In the Configure Virtual Server (Load Balancing) dialog box, select the Policies tab.
4. In the Active column, select the check box for the policy `filter-CF-nimda`, and then click OK. Your content filtering policy is now active, and must be filtering requests. If it is functioning correctly, the select counter is incremented every time there is a request for a URL containing either root.exe or cmd.exe. This allows you to confirm that your content filtering policy is working. The content filtering policy is bound to the virtual server.

Verify the content filtering configuration by using the command line interface

At the command prompt, type the following command to verify the content filtering configuration:

```
show filter policy filter-CF-nimda
```

Example:

```
1 sh filter policy filter-CF-nimda
2         Name: filter-CF-nimda   Rule: REQ.HTTP.URL CONTAINS cmd.exe ||
             REQ.HTTP.URL CONTAINS root.exe
3         Request action: RESET
4         Response action:
5         Hits: 0
6 Done
```

> **Note**
>
> The select counter displays an integer that denotes the number of times the `filter-CF-nimda` policy is evaluated. In the preceding steps, the select counter is set to zero because no requests for a URL containing either cmd.exe or root.exe has been made yet. If you want to see the counter increment in real time, you can simply request a URL that contains either of these strings.

Verify the content filtering configuration by using the GUI

1. Navigate to **Security > Protection Features > Filter**.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

2. In the details pane, select the filter policy `filter-CF-nimda`. The bottom of the pane must display the following:

```
    **Request Action:**

    RESET

    **Rule:**

    REQ.HTTP.URL CONTAINS cmd.exe || REQ.HTTP.URL CONTAINS root.exe

    **Hits:**

    0
```

Troubleshooting

September 14, 2021

If the content filtering feature does not work as expected after you have configured it, you can use some common tools to access Citrix ADC resources and diagnose the problem.

Resources for troubleshooting

You can use the following tools and resources to troubleshoot most Content Filtering issues on a Citrix ADC appliance:

- The Wireshark application customized for the Citrix ADC trace files
- Trace files recorded when accessing the resource
- The configuration files
- The ns.log file
- The `iehttpheaders`, or a Fiddler trace or a similar utility

Troubleshooting content filtering issues

To troubleshoot a content filtering issue, proceed as follows:

- Verify that the feature is enabled.
- Verify that the content filtering policy is configured correctly. Pay special attention to the expression that evaluates the incoming requests.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

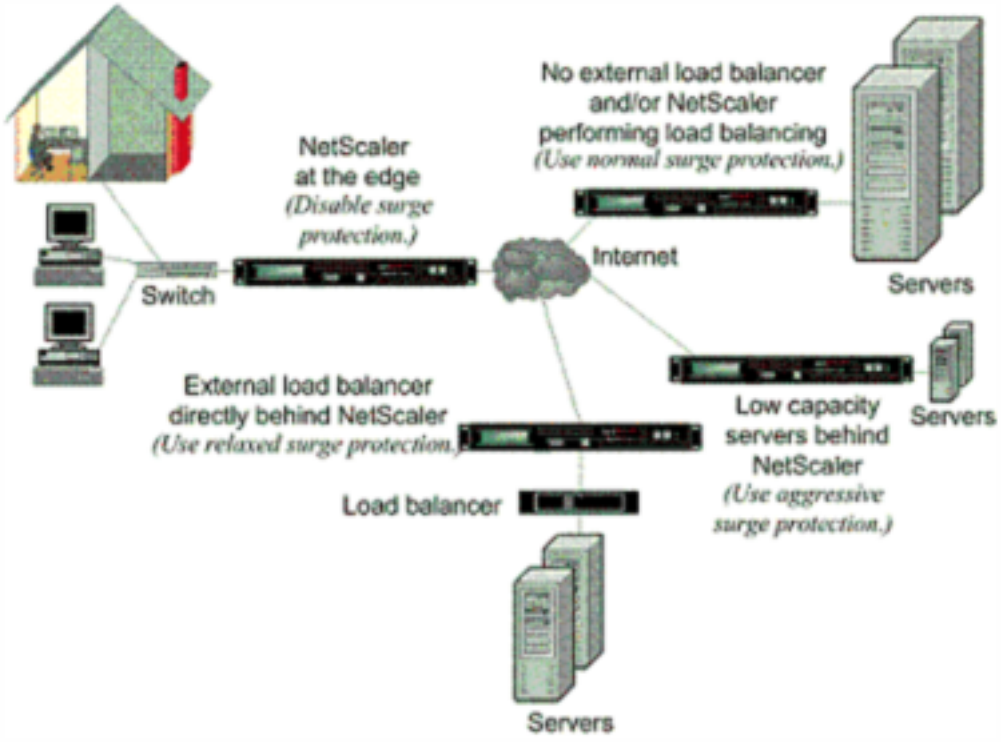
> **Note**
>
> Most content filtering issues are caused by incorrect configuration, and the error is most often in the policy configuration.

- Check the policy's select counter to verify that it is incrementing. If it is not, the policy is not getting evaluated.
- If the policy is getting evaluated and the required filtering is still not performed, you need to look into the policy expressions and action.
- If the policy's expression seems valid, test it by assigning a simple NSTRUE value to see if the evaluation of the expression is creating any issue.
- Reevaluate whether the filtering must be based on the request or the response.
- Verify that the action is configured correctly. For example, if a custom action is used to corrupt a header in the request, verify that the header name in the action is correct. If you are not sure about the header name, start a browser with `iehttpheaders` or a similar utility, and then verify the headers in the request. When this feature is used, you can use ns trace to find out if appropriate action is performed when the packets leave Citrix ADC appliance.
- An `iehttpheaders` or Fiddler trace can help you find header options and names, client-side request headers, and response headers recorded on the client.
- To check the modifications made to the request header, record an ns trace on the Citrix ADC appliance or a Wireshark trace on the server.
- If none of the above measures resolves the issue, verify that the connection has not become untrackable, which can happen in certain circumstances. If a connection becomes untrackable, the appliance does not perform any application-level processing of the requests. In that event, contact Citrix Technical Support.

Surge protection

April 14, 2023

When a surge in client requests overloads a server, server response becomes slow, and the server is unable to respond to new requests. The Surge Protection feature ensures that connections to the server occur at a rate that the server can handle. The response rate depends on how surge protection is configured. The Citrix ADC appliance also tracks the number of connections to the server, and uses that information to adjust the rate at which it opens new server connections.



© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Surge protection is enabled by default. If you do not want to use surge protection, as is the case with some special configurations, you must disable it.

The default surge protection settings are sufficient for most uses, but you can configure surge protection to tune it for your needs. First, you can set the throttle value to tell it how aggressively to manage connection attempts. Second you can set the base threshold value to control the maximum number of concurrent connections that the Citrix ADC appliance allows before triggering surge protection. (The default base threshold value is set by the throttle value, but after setting the throttle value you can change it to any number you want.)

The following figure illustrates how surge protection is configured to handle traffic to a website.

Figure 1. A Functional Illustration of Citrix ADC Surge Protection

> **Note**
>
> If the Citrix ADC appliance is installed at the edge of the network, where it interacts with network devices on the client side of the Internet, the surge protection feature must be disabled. Surge protection must also be disabled if you enable USIP (Using Source IP) mode on your appliance.

When surge protection is disabled and a surge in requests occurs, the server accepts as many requests as it can process concurrently, and then begins to drop requests. As the server becomes more overloaded, it goes down and the response rate is reduced to zero. When the server recovers from the crash, several minutes later, it sends resets for all pending requests, which are abnormal behavior, and also responds to new requests with resets. The process repeats for each surge in requests. Therefore,

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

a server that is under DDoS attack and receives multiple surges of requests can become unavailable to legitimate users.

When surge protection is enabled and a surge in requests occurs, surge protection manages the rate of requests to the server, sending requests to the server only as fast as the server can handle those requests. This enables the server to respond to each request correctly in the order it was received. When the surge is over, the backlogged requests are cleared as fast as the server can handle them, until the request rate matches the response rate.

Disable and reenable surge protection

September 14, 2021

The surge protection feature is enabled by default. When surge protection is enabled, it is active for any service that you add.

Disable or reenable surge protection by using the CLI

At the command prompt, type one of the following sets of commands to disable or reenable surge protection and verify the configuration:

```
- disable ns feature SurgeProtection
- show ns feature
- enable ns feature SurgeProtection
- show ns feature
```

Example:

```
disable ns feature SurgeProtection
 Done show ns feature

        Feature                       Acronym              Status
        -------                       -------              ------
 1)     Web Logging                   WL                   ON
 2)     Surge Protection              SP                   OFF
 .
 .
 .
 23)    HTML Injection                HTMLInjection        ON
 24)    Citrix ADC Push                push                 OFF
 Done
```

```
 enable ns feature SurgeProtection
 Done
> show ns feature
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
4
5          Feature                          Acronym              Status
6          -------                          -------              ------
7   1)     Web Logging                      WL                   ON
8   2)     Surge Protection                 SP                   ON
9   .
10  .
11  .
12
13  23)    HTML Injection                   HTMLInjection        ON
14  24)    Citrix ADC Push                   push                 OFF
15  Done
16  >
```

Disable or reenable surge protection by using the GUI

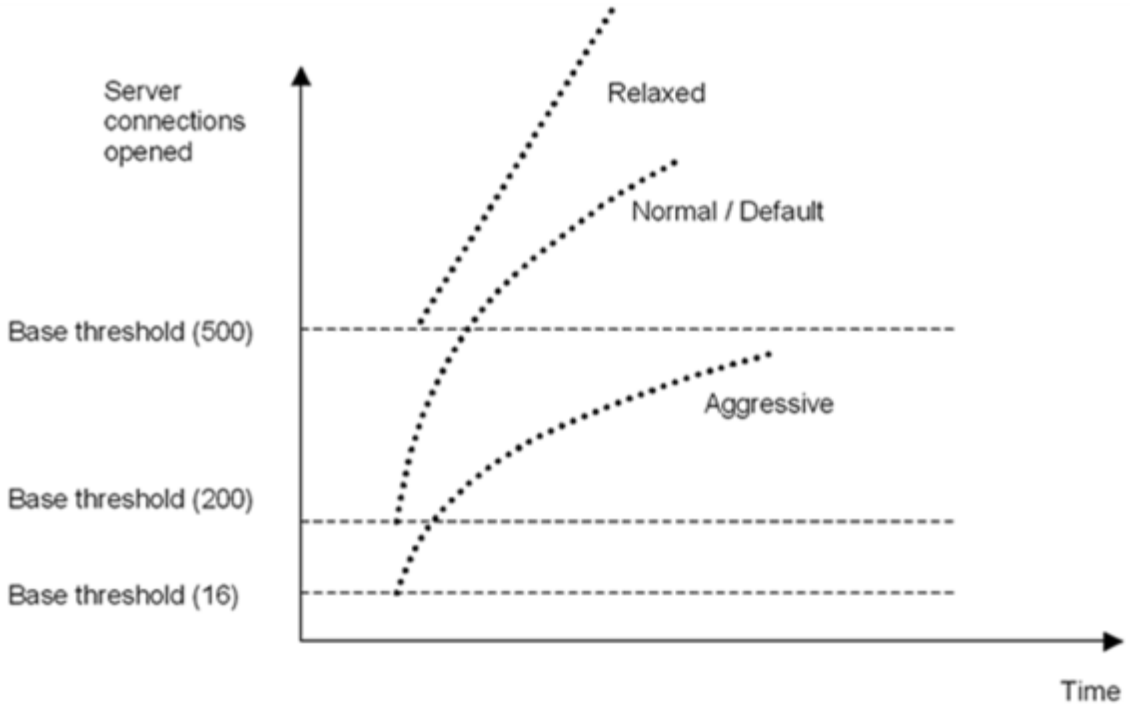
1. In the navigation pane, expand **System**, and then select **Settings**.
2. In the details pane, click **Change Advanced Features**.
3. In the **Configure Advanced Features** dialog box, clear the selection from the **Surge Protection** check box to disable the surge protection feature, or select the check box to enable the feature.
4. Click **OK**.
5. In the Enable/Disable Features dialog box, click Yes. A message appears in the status bar, stating that the feature has been enabled or disabled.

Disable or reenable surge protection for a particular service by using the GUI

1. Navigate to Traffic Management > Load Balancing > Services. The list of configured services is displayed in the details pane.
2. In the details pane, select the service for which you want to disable or reenable the surge protection feature, and then click Open.
3. In the Configure Service dialog box, click the Advanced tab and scroll down.
4. In the Others frame, clear the selection from the Surge Protection check box to disable the surge protection feature, or select the check box to enable the feature.
5. Click OK. A message appears in the status bar, stating that the feature has been enabled or disabled.

   Note: Surge protection works only when both the feature and the service setting are enabled.

Set thresholds for surge protection



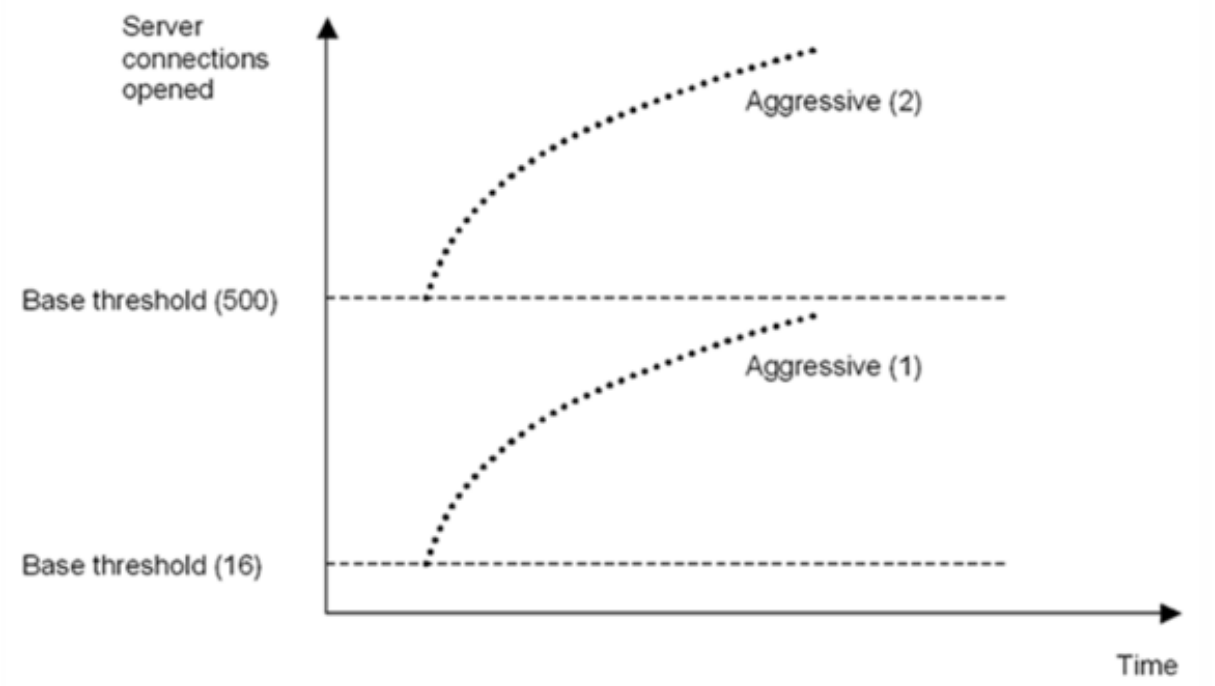
September 14, 2021

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

To set the rate at which the Citrix ADC appliance opens connections to the server, you must configure the threshold and throttle values for surge protection.

The following figure shows the surge protection curves that result from setting the throttle rate to relaxed, normal, or aggressive. Depending on the configuration of the server capacity, you can set base threshold values to generate appropriate surge protection curves.

Figure 1. Surge Protection Curves



Your configuration settings affect the behavior of surge protection in the following manner:

- If you do not specify a throttle rate, it is set to normal (the default value), and the base threshold is set to 200, as shown in the preceding figure.
- If you specify a throttle rate (aggressive, normal, or relaxed) without specifying a base threshold, the curve reflects the default values of the base threshold for that throttle rate. For example, if you set the throttle rate to relaxed, the resulting curve will have the base threshold value of 500.
- If you specify only the base threshold, the entire surge protection curve shifts up or down, depending on the value you specify, as shown in the figure that follows.
- If you specify both a base threshold and a throttle rate, the resulting surge protection curve is based on the set throttle rate and adjusted according to the value set for the base threshold.

In the following figure, the lower curve (Aggressive 1) results when the throttle rate is set to aggressive but the base threshold is not set. The upper curve (Aggressive 2) results when the base threshold is set to 500, but the throttle rate is not set. The second upper curve (Aggressive 2) also results when the base threshold is set to 500, and the throttle rate is set to aggressive.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Figure 2. Aggressive Rate with the Default or a Set Base Threshold

Set the threshold for surge protection by using the GUI

1. In the navigation pane, expand System, and then select Settings.
2. In the details pane, click Global System Settings.
3. If you want to set a base threshold different from the default for the throttle rate, in the Configure Global Settings dialog box, Base Threshold text box, enter the maximum number of concurrent server connections allowed before surge protection is triggered. The base threshold is the maximum number of server connections that can be open before surge protection is activated. The maximum value for this setting is 32,767 server connections. The default setting for this value is controlled by the throttle rate you choose in the next step.

   Note: If you do not set an explicit value here, the default value will be used.
4. In the Throttle drop-down list, select a throttle rate. The throttle is the rate at which the Citrix ADC appliance allows connections to the server to be opened. The throttle can be set to the following values:

   - **Aggressive:** Choose this option when the connection-handling and surge-handling capacity of the server is low and the connection needs to be managed carefully. When you set the throttle to aggressive, the base threshold is set to a default value of 16, which means

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

that surge protection is triggered whenever there are 17 or more concurrent connections to the server.

- **Normal:** Choose this option when there is no external load balancer behind the Citrix ADC appliance or downstream. The base threshold is set to a value of 200, which means that surge protection is triggered whenever there are 201 or more concurrent connections to the server. Normal is the default throttle option.
- **Relaxed:** Choose this option when the Citrix ADC appliance is performing load balancing between a large number of Web servers, and can therefore handle a high number of concurrent connections. The base threshold is set to a value of 500, which means that surge protection is triggered only when there are 501 or more concurrent connections to the server.

5. Click OK. A message appears in the status bar, stating that the global settings are configured.

Flush the surge queue

September 14, 2021

When a physical server receives a surge of requests, it becomes slow to respond to the clients that are currently connected to it, which leaves users dissatisfied and disgruntled. Often, the overload also causes clients to receive error pages. To avoid such overloads, the Citrix ADC appliance provides features such as surge protection, which controls the rate at which new connections to a service can be established.

The appliance does connection multiplexing between clients and physical servers. When it receives a client request to access a service on a server, the appliance looks for an already established connection to the server that is free. If it finds a free connection, it uses that connection to establish a virtual link between the client and the server. If it does not find an existing free connection, the appliance establishes a new connection with the server, and establishes a virtual link between a client and the server. However, if the appliance cannot establish a new connection with the server, it sends the client request to a surge queue. If all the physical servers bound to the load balancing or content switching virtual server reach the upper limit on client connections (max client value, surge protection threshold or maximum capacity of the service), the appliance cannot establish a connection with any server. The surge protection feature uses the surge queue to regulate the speed at which connections are opened with the physical servers. The appliance maintains a different surge queue for each service bound to the virtual server.

The length of a surge queue increases whenever a request comes for which the appliance cannot establish a connection, and the length decreases whenever a request in the queue gets sent to the server or a request gets timed out and is removed from the queue.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

If the surge queue for a service or service group becomes too long, you may want to flush it. You can flush the surge queue of a specific service or service group, or of all the services and service groups bound to a load balancing virtual server. Flushing a surge queue does not affect the existing connections. Only the requests present in the surge queue get deleted. For those requests, the client has to make a fresh request.

You can also flush the surge queue of a content switching virtual server. If a content switching virtual server forwards some requests to a particular load balancing virtual server, and the load balancing virtual server also receives some other requests, when you flush the surge queue of the content switching virtual server, only the requests received from this content switching virtual server are flushed. The other requests in the surge queue of the load balancing virtual server are not flushed.

Note:

> - You cannot flush the surge queues of cache redirection, authentication, VPN, or GSLB virtual servers or GSLB services.
> - Do not use the Surge Protection feature if Use Source IP (USIP) is enabled.

Flush a surge queue by using the CLI

The flush ns surgeQ command works in the following manner:

- You can specify the name of a service, service group, or virtual server whose surge queue has to be flushed.
- If you specify a name while running the command, the surge queue of the specified entity is flushed. If more than one entity has the same name, the appliance flushes surge queues of all those entities.
- If you specify the name of a service group, and a server name and port while running the command, the appliance flushes the surge queue of only the specified service group member.
- You cannot directly specify a service group member <serverName> and <port> without specifying the name of the service group <name> and you cannot specify <port> without a <serverName>. Specify the <serverName> and <port> if you want to flush the surge queue for a specific service group member.
- If you run the command without specifying any names, the appliance flushes the surge queues of all the entities present on the appliance.
- If a service group member is identified with a server name, you must specify the server name in this command; you cannot specify its IP address.

At the command prompt, type:

```
flush ns surgeQ [-name <name>] [-serverName <serverName> <port>]
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Examples

1. `flush ns surgeQ –name SVC1ANZGB –serverName 10.10.10.1 80`

   The preceding command flushes the surge queue of the service or virtual server that is named SVC1ANZGB and has IP address as 10.10.10

2. `flush ns surgeQ`

   The preceding command flushes all the surge queues on the appliance.

Flush a surge queue by using the GUI

Navigate to Traffic Management > Content Switching > Virtual Servers, select a virtual server and, in the Action list, select Flush Surge Queue.

DNS security options

September 14, 2021

You can now configure the DNS security options from the Add DNS Security Profile page in the Citrix ADC GUI. To configure the DNS security options from the Citrix ADC CLI or the NITRO API, use the AppExpert components. For instructions, see the NITRO API documentation and the Citrix ADC Command Reference Guide.

One option, cache poisoning protection, is enabled by default and cannot be disabled. You can apply the other options to all DNS endpoints or to specific DNS virtual servers in your deployment, as shown in the following table:

Security option	Can be applied to all DNS endpoints?	Can be applied to specific DNS virtual servers?
DNS DDoS protection	Yes	Yes
Manage exceptions – whitelist/blacklist servers	Yes	Yes
Prevent random subdomain attacks	Yes	Yes
Bypass the cache	Yes	No
Enforce DNS transactions over TCP	Yes	Yes

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Security option	Can be applied to all DNS endpoints?	Can be applied to specific DNS virtual servers?
Provide root details in the DNS response	Yes	No

Cache poisoning protection

A cache poisoning attack redirects users from legitimate sites to malicious websites.

For example, the attacker replaces a genuine IP address in the DNS cache with a fake IP address that they control. When the server responds to requests from these IP addresses, the cache is poisoned. Subsequent requests for the addresses of the domain are redirected to the attacker's site.

The Cache Poisoning Protection option prevents insertion of corrupt data into the database that caches DNS server requests and responses. This feature is inbuilt in the Citrix ADC appliances and is always enabled.

DNS DDoS protection

You can configure the DNS DDoS Protection option for each type of request that you suspect might be used in a DDoS attack. For each type, the appliance drops any requests received after a threshold value for the number of requests received in a specified time period (time slice) is exceeded. You can also configure this option to log a warning to the SYSLOG server. For example:

- **DROP:** - Select this option to DROP requests without logging. Assume that you have enabled A record protection with threshold value 15, time slice as 1 second, and chosen DROP. When the incoming requests exceed 15 queries in 1 second, then the packets start getting dropped.
- **WARN:** - Select this option to LOG and DROP requests. Assume that you have enabled A record protection with threshold value 15, time slice as 1 second, and chosen WARN. When the incoming requests exceed 15 queries in 1 second, a warning message is logged indicating a threat and then the packets are dropped. Citrix recommends you to set threshold values for WARN smaller than the threshold value of DROP for a record type. Such a setting helps administrators identify an attack by logging a warning message before the actual attack happens and Citrix ADC starts dropping incoming requests.

Set a threshold for incoming traffic by using the GUI

1. Navigate to **Configuration** > **Security** > **DNS Security**.
2. On the **DNS Security Profile** page, click **Add**.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

3. On the **Add DNS Security Profile** page, do the following:
4. Expand **DNS DDoS Protection**.

    a) Select the record type and enter the threshold limit and the time slice value.
    b) Select **DROP** or **WARN**.
    c) Repeat steps a and b for each of the other record types that you want to protect against.

5. Click **Submit**.

Manage exceptions –allowlist/blocklist servers

Manage exceptions enables you to add exceptions either to block list or allow list domain name and IP addresses. For example:

- When a particular IP address is identified posting an attack, such IP address can be added to the block list.
- When administrators find that there is an unexpectedly high number of requests for a particular domain name, then that domain name can be added to the block list.
- `NXDomains` and some of the existent domains which can consume the server resources can be blacklisted.
- When administrators allow list domain names or IP addresses, queries or requests only from these domains or IP addresses are answered and all others are dropped.

Create an allow list or a block list by using the GUI

1. Navigate to **Configuration > Security > DNS Security**.
2. On the **DNS Security Profiles** page, click **Add**.
3. On the **Add DNS Security Profile** page, do the following:

    a) Expand **Manage exceptions –Whitelist/Blacklist Servers**.
    b) Select **Block** to block queries from blacklisted domains/addresses, or select **Allow** only to allow queries from whitelisted domains/addresses.
    c) In the **Domain name / IP Address** box, enter the domain names, IP addresses, or IP address ranges. Use commas to separate the entries.
    Note: If you select **Advanced Option**, you can use the "start with,""contains,"and "ends with"options to set the criteria.
    For example, you can set criteria to block a DNS query that starts with "image"or ends with ".co.ru"or contains "mobile sites."

4. Click **Submit**.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Prevent random subdomain attacks

In random subdomain attacks, queries are sent to random, nonexistent subdomains of legitimate domains. This action increases the load on the DNS resolvers and servers. As a result, they can become overloaded and slow down.

The Prevent Random Subdomain Attacks option directs the DNS responder to drop DNS queries that exceed a specified length.

Assume that example.com is a domain name owned by you and hence the resolution request comes to your DNS server. The attacker can append a random subdomain to example.com and send a request. Based on the specified query length and the FQDN, the random queries are dropped.

For example, if the query is www.image987trending.example.com, it is dropped if the query length is set to 20.

Specify a DNS query length by using the GUI

1. Navigate to **Configuration > Security > DNS Security**.
2. On the **DNS Security Profiles** page, click **Add**.
3. On the **Add DNS Security Profile** page, do the following:
    a) Expand **Prevent Random Subdomain Attacks**.
    b) Enter the numerical value for the query length.
4. Click **Submit**.

Bypassing the cache

During an attack, the data that is already cached must be protected. To protect the cache, new requests for certain domains or record types or response codes can be sent to the origin servers instead of cached.

The Bypassing the cache option directs the Citrix ADC appliance to bypass the cache for specified domains, record types, or response codes when an attack is detected.

Bypass the cache for specified domains or record types or response types by using the GUI

1. Navigate to **Configuration > Security > DNS Security**.
2. On the **DNS Security Profiles** page, click **Add**.
3. On the **Add DNS Security Profile** page, expand **Bypassing the cache** and enter the domain names. Optionally, choose the record types or the response types for which the cache has to be bypassed.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- Click **Domains** and enter the domain names. Use commas to separate the entries.
- Click **Record Types** and choose the record types.
- Click **Response Types** and choose the response type.

4. Click **Submit**.

Enforce DNS transactions over TCP

Some DNS attacks can be prevented if the transactions are forced to use TCP instead of UDP. For example, during a bot attack, the client sends a flood of queries but cannot handle responses. If the use of TCP is enforced for these transactions, then the bots cannot understand the responses and therefore cannot send requests over TCP.

Force domains or record types to operate at the TCP level by using the GUI

1. Navigate to **Configuration > Security > DNS Security**.
2. On the **DNS Security Profiles** page, click **Add**.
3. On the **Add DNS Security Profile** page, expand **Enforce DNS Transactions over TCP** and enter the domain names and / or choose the record types for which the DNS transactions must be enforced over TCP.
   - Click **Domains** and enter the domain names. Use commas to separate the entries.
   - Click **Record Types** and choose the record types.
4. Click **Submit**.

Provide root details in the DNS response

In some attacks, the attacker sends a flood of queries for unrelated domains that are not configured or cached on the Citrix ADC appliance. If the `dnsRootReferral` parameter is ENABLED, it exposes all the root servers.

The Provide Root Details in the DNS Response option directs the Citrix ADC appliance to restrict access to root referrals for a query that is not configured or cached. The appliance sends a blank response.

The Provide Root Details in the DNS Response option can also mitigate or block amplification attacks. When the dnsRootReferral parameter is DISABLED, there are no root referrals in the Citrix ADC responses and hence they do not get amplified.

Enable or disable access to the root server by using the GUI

1. Navigate to **Configuration > Security > DNS Security**.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

2. On the **DNS Security Profiles** page, click **Add**.
3. On the **Add DNS Security Profile** page, do the following:
    a) Expand **Provide Root Details in the DNS Response**.
    b) Click **ON** or **OFF** to allow or restrict access to the root server.
4. Click **Submit**.

System

September 14, 2021

This section provides system-level information of the Citrix ADC. This includes a detailed explanation of system-level features, the scenarios in which the features can be used, the configuration steps, and examples to help you better understand the features.

- Basic Operations
- Authentication and Authorization
- TCP Configurations
- HTTP Configurations
- SNMP
- Audit Logging
- Web Server Logging
- Call Home
- Reporting Tool
- CloudBridge Connector
- High Availability
- TCP Optimization

System base operations

November 14, 2023

The following configurations enable you to perform system base operations on a Citrix ADC appliance.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

How to view, save, and clear Citrix ADC configuration

Citrix ADC configurations are stored in the `/nsconfig/ns.conf directory`. For configurations to be available across sessions, you must save the configuration after every configuration change.

View running configuration by using the command interface

At the command prompt, type:

```
show ns runningConfig
```

View running configuration by using the GUI

1. Navigate to **System** > **Diagnostics** and, in the **View Configuration group**, click **Running Configuration.**

View the difference between the two configuration files by using the command interface

At the command prompt, type:

```
diff ns config <configfile> <configfile2>
```

View the difference between the two configuration files by using the GUI

1. Navigate to **System** > **Diagnostics** and, in the **View Configuration group**, click **Configuration difference**.

Save Citrix ADC configurations by using the command interface

At the command prompt, type:

```
save ns config
```

Save Citrix ADC configurations by using the GUI

1. On the **Configuration** tab, in the top-right corner, click the **Save** icon.

View saved configurations by using the command interface

At the command prompt, type:

```
show ns ns.conf
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

View saved configurations by using the GUI

Navigate to **System** > **Diagnostics** and, in the **View Configuration** group, click **Saved Configuration**.

Clear Citrix ADC configuration by using the command interface

You have the following three options for clearing the Citrix ADC configuration.

Basic level. Clearing your configuration at the basic level clears all settings except the following:

- `Nsroot` password
- Time Zone
- NTP server
- ADM server connect
- License fie information
- NSIP, MIP(s), and SNIP(s)
- Network settings (Default Gateway, VLAN, RHI, NTP, and DNS settings)
- HA node definitions
- Feature and mode settings
- Default administrator password (`nsroot`)

Extended level. Clearing your configuration at the extended level clears all settings except the following:

- `NSIP, MIP(s), and SNIP(s)`
- `Network settings (Default Gateway, VLAN, RHI, NTP, and DNS settings)`
- `HA node definitions`

Feature and mode settings revert to their default values.

Full level. Clearing your configuration at the full level returns all settings to their factory default values. However, the NSIP and default gateway are not changed, because changing them can cause the appliance to lose network connectivity.

At the command prompt, type:

```
clear ns config -force
```

Example: To forcefully clear the basic configurations on an appliance.

```
clear ns config -force basic
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Clear Citrix ADC configuration by using the GUI

Navigate to **System** > **Diagnostics** and, in the Maintenance group, click **Clear Configuration** and select the configuration level to be cleared from the appliance.

How to restart or shut down appliance for unsaved Citrix ADC configurations

The Citrix ADC appliance can be remotely restarted or shut down from the available user interfaces. When you restart or shut down a standalone Citrix ADC appliance, the unsaved configurations (configurations performed since the last
save ns config command was issued) are lost.

In a high availability setup, when the primary appliance is rebooted or shut down, the secondary appliance takes over and becomes the primary. The unsaved configurations from the old primary are available on the new primary appliance.

You can also restart the appliance by only rebooting the Citrix ADC software and not rebooting the underlying operating system. This is called a warm reboot. For example, when you add a new license or change the IP address, you can warm reboot the Citrix ADC appliance for these changes to take place.

> **Note:**
>
> You can perform warm reboot only on a standalone Citrix ADC appliance.

Restart the appliance by using the command interface

At the command prompt, type:

```
reboot [-warm]
```

Restart a Citrix ADC appliance by using the GUI

1. In the configuration page, click **Reboot**.
2. When prompted to reboot, select **Save configuration** to make sure that you do not lose any configurations.

> **Note:**
>
> You can perform a warm reboot by selecting Warm reboot.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Shut down an appliance by using the command interface

At the shell prompt, type:

- `shutdown -p now`: Shuts down the software and switches off the Citrix ADC. To restart Citrix ADC MPX, press the AC power switch. To Restart Citrix ADC VPX, restart the VPX instance.
- `shutdown -h now`: Shuts down the software and leaves the Citrix ADC switched on. Press any key to restart the Citrix ADC. This command does not switch off the Citrix ADC. Therefore, do not switch off the AC power or remove the AC power cables.

> **Note:**
>
> You cannot shut down an appliance through the Citrix ADC GUI.

How to synchronize system clock with servers on the network

You can configure your Citrix ADC appliance to synchronize its local clock with a Network Time Protocol (NTP) server. This ensures that its clock has the same date and time settings as the other servers on your network.

You can configure clock synchronization on your appliance by adding NTP server entries to the ntp.conf file from either the GUI or the command line interface, or by manually modifying the ntp.conf file and then starting the NTP daemon (NTPD). The clock synchronization configuration does not change if the appliance is restarted, upgraded, or downgraded. However, the configuration does not get propagated to the secondary Citrix ADC in a high availability setup.

Citrix ADC GUI allows you to configure the time zone and the NTP server IP address required for clock synchronization on the first-time-user (FTU) screen.

> **Note:**
>
> If you do not have a local NTP server, you can find a list of public, open access, NTP servers at the official NTP site, <`http://www.ntp.org`>, under Public Time Servers List. Before configuring your Citrix ADC to use a public NTP server, be sure to read the Rules of Engagement page (link included on all Public Time Servers pages).
>
> In Citrix ADC release 11, the NTP version has been updated from 4.2.6p3 to 4.2.8p2.

Pre-requisite

To configure clock synchronization, you must configure the following entities:

1. NTP servers
2. NTP synchronization.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Add an NTP server by using the command interface

At the command prompt, type the following commands to add an NTP server and verify the configuration:

- `add ntp server (<serverIP> | <serverName>)[-minpoll <positive_integer>] [-maxpoll <positive_integer>]`
- `show ntp server`

Example:

```
add ntp server 10.102.29.30 -minpoll 6 -maxpoll 11
```

Add an NTP server by using the GUI

Navigate to **System** > **NTP Servers**, and create the NTP server.

Enable NTP synchronization by using the command interface

When you enable NTP synchronization, the Citrix ADC starts the NTP daemon and uses the NTP server entries in the ntp.conf file to synchronize its local time setting. If you do not want to synchronize the appliance time with the other servers in the network, you can disable NTP synchronization, which stops the NTP daemon (NTPD).

At the command prompt, type one of the following commands:

```
enable ntp sync
```

Enable NTP synchronization by using the GUI

Navigate to **System** > **NTP Servers**, click **Action** and select **NTP Synchronization**.

Configure clock synchronization to edit a ntp.conf file by using the GUI

1. Log on to the command line interface.
2. Switch to the shell prompt.
3. Copy the `/etc/ntp.conf` file to `/nsconfig/ntp.conf`, unless the `/nsconfig directory` already contains an `ntp.conf` file.
4. For each NTP server you want to add, you must add the following two lines to the `/nsconfig /ntp.conf` file:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
server <IP address for NTP server> iburst

restrict <IP address for NTP server> mask <netmask> nomodify notrap
nopeer noquery
```

```
1  > Note:
2  >
3  > For security reasons, there should be a corresponding restrict entry
      for each server entry.
4
5  Example
6
7  In the following example, an administrator has inserted # characters to
       " comment out " an existing NTP entry, and then added an entry:
8
9  `#server 1.2.3.4 iburst`
10
11 `#restrict 1.2.3.4 mask 55.255.255.255 nomodify notrap nopeer noquery`
12
13 `server 10.102.29.160 iburst`
14
15 `restrict 10.102.29.160 mask 255.255.255.255 nomodify notrap nopeer
     noquery`
```

1. If the /nsconfig directory does not contain a file named rc.netscaler, create the file.
2. Add the following entry to /nsconfig/rc.netscaler: /bin/sh /etc/ntpd_ctl full_start

   This entry starts the ntpd service, checks the ntp.conf file, and logs messages in the /var/log directory.

   This process runs every time the Citrix ADC is restarted.
3. Restart the Citrix ADC appliance to enable clock synchronization. Or, to start the time synchronization process without restarting the appliance, enter the following commands at the shell prompt:

- rm /etc/ntp.conf
- ln -s /nsconfig/ntp.conf /etc/ntp.conf
- /bin/sh /etc/ntpd_ctl full_start

How to configure session timeout for idle client connections

A session timeout interval is provided to restrict the time duration for which a session (GUI, CLI, or API) remains active when not in use. For the Citrix ADC, the system session timeout can be configured at the following levels:

- **User level timeout.** Applicable to the specific user.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Interface type	Time out configuration
GUI	Navigate to **System > User Administration > Users**, select a user, and edit the user's timeout setting.
CLI	At the command prompt, enter the following command: set system user <name> -timeout <secs>

- **User group level timeout.** Applicable to all users in the group.

Interface type	Time out configuration
GUI	Navigate to **System > User Administration > Groups**, select a group, and edit the group's timeout setting.
CLI	At the command prompt, enter the following command: set system group <groupName> -timeout <secs>

- **Global system timeout.** Applicable to all users and users from groups who do not have a time-out configured.

Interface type	Time out configuration
GUI	Navigate to **System > Settings**, click Change global system settings, and update the timeout value as required.
CLI	At the command prompt, enter the following command: set system parameter -timeout <secs>

```
The timeout value specified for a user has the highest priority. If
    timeout is not configured for the user, the timeout configured for a
     member group is considered. If timeout is not specified for a group
     (or the user does not belong to a group), the globally configured
    timeout value is considered. If timeout is not configured at any
    level, the default value of 900 seconds is set as the system session
     timeout.

```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
Additionally, you can specify timeout durations for each of the
   interfaces you are accessing. However, the timeout value specified
   for a specific interface is restricted to the timeout value
   configured for the user that is accessing the interface. For example
   , let us consider an user "publicadmin" who has a timeout value of
   20 minutes. Now, when accessing an interface, the user must specify
   a timeout value that is within 20 minutes.

> **Note:**
>
> You can choose to keep a check on the minimum and maximum timeout
   values by specifying the timeout as restricted (in CLI by specifying
    the *restrictedTimeout* parameter). This parameter is provided to
   account for previous Citrix ADC versions where the timeout value was
    not restricted.
```

- When enabled, the minimum configurable timeout value is 5 minutes (300 secs) and the maximum value is 1 day (86400 secs). If the timeout value is already configured to a value larger than 1 day, when this parameter is enabled, you are prompted to change it. If you do not change the value, the timeout value will automatically be reconfigured to the default timeout duration of 15 minutes (900 secs) on the next reboot. The same will happen is the configured timeout value is less than 5 minutes.
- When disabled, the configured timeout durations are considered.
- **Timeout duration at each interface:**

Interface type	Time out configuration
CLI	Specify the timeout value on the command prompt by using the following command: `set cli mode -timeout <secs>`
API	Specify the timeout value in the login payload.

How to set system date and time to synchronize clock with a time server

To change the system date and time, you must use the shell interface to the underlying FreeBSD OS. However, to view the system date and time, you can use the command line interface or the GUI.

View system date and time by using the command interface

At the command prompt, type:

```
show ns config
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

View system date and time by using the GUI

Navigate to **System** and select the **System Information** tab to view the system date.

How to configure HTTP and HTTPS management ports for internal services

In a single-IP mode deployment of a Citrix ADC appliance, a single IP address is used as NSIP, SNIP, and VIP addresses. This single IP address uses different port numbers to function as NSIP, SNIP, and VIP addresses.

Port numbers 80 and 443 are well-known ports for HTTP and HTTPS services. Earlier, port 80 and 443 of the Citrix ADC IP address (NSIP) were dedicated ports for internal HTTP and HTTPS management services. Because these ports were reserved for internal services, you cannot use these well-known ports for providing HTTP and HTTPS data services from a VIP address, which has the same address as the NSIP address in a single-IP mode deployment.

To address this requirement, you can now configure ports for internal HTTP and HTTPS management services (of the NSIP address) other than port 80 and 443.

The following lists the default port numbers for internal HTTP and HTTPS management services in Citrix ADC MPX, VPX, and CPX appliances:

- Citrix ADC MPX and VPX appliances: 80 (HTTP) and 443 (HTTPS)
- Citrix ADC CPX appliances: 9080 (HTTP) and 9443 (HTTPS)

Configure HTTP and HTTPS management ports by using the command interface

You can configure an HTTP and an HTTPS port to any value on the Citrix ADC appliance to support the HTTP and HTTPS management service. However, by default, the Citrix ADC appliance uses 80 and 443 ports for HTTP and HTTPS connection.

At the command prompt, type:

```
set ns param –mgmtHttpPort<port>
```

Example:

```
set ns param -mgmtHttpPort 2000
```

To configure an HTTPS port by using the command interface

At the command prompt, type:

```
set ns param –mgmtHttpsPort<port>
```

Example:

```
set ns param -mgmtHttpsPort 3000
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Configure HTTP and HTTPS management ports by using the GUI

Follow the steps given below to configure HTTP and HTTPS port values:

1. Navigate to **System** > **settings** > **Change global system settings**.
2. In **Configure Global System Settings Parameters** page, under **Other Setting** section, set the following parameters.

    a) Management HTTP Port. set port value to 2000. Default = 80, Min = 1, Max = 65534.
    b) Management HTTPS Port. set port value to 3000. Default = 443, Min = 1, Max = 65534.

How to allocate extra management CPU for data processing and monitoring

If you need better performance for configuration and monitoring of a Citrix ADC MPX appliance, you can allocate an extra management CPU from the appliance's packet engine pool. This feature is supported on certain Citrix ADC MPX models and all VPX models except the VPX instances that run on Citrix ADC SDX appliances. It affects the output of the stat system CPU and stat system commands.

Supported Citrix ADC MPX models:

- 25xxx
- 22xxx
- 14xxx
- 115xx
- 15xxx
- 26xxx

> **Note:**
>
> For Citrix ADC MPX 26xxx models with more than 20 cores, the mandatory extra management CPU feature is enabled by default. For Citrix ADC VPX models, a license that supports at least 12 vCPUs is required to enable this feature.

Allocate an extra management CPU by using the command interface

At the command prompt, type one of the following commands:

- `enable extramgmtcpu`
- `disable extramgmtcpu`

> **Note:**
>
> After you enable and disable this feature, the Citrix ADC appliance displays a warning to restart

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

> the appliance, for the changes to take effect.

To show the configured and effective state of an extra management CPU.

At the command prompt, type:

```
`show extramgmtcpu`
```

Example:

```
> show extramgmtcpu ConfiguredState: ENABLED EffectiveState: ENABLED
```

> **Note:**
>
> In this example, the show command is entered before restarting the appliance.

Allocate an extra management CPU by using the GUI

To allocate an extra management CPU by using the GUI, navigate to **System** > **Settings** and click **Configure Extra Management CPU**. From the **Configured State** drop-down menu, select **Enabled** and then select **OK**.

To check CPU usage, go to **System** > **Settings** > **Dashboard**.

Configure an extra management CPU by using the NITRO API

Use the following NITRO methods and formats to enable, disable, and show an extra management CPU.

To enable an extra management CPU:

```
HTTP Method: POST
```

```
URL: http://<NSIP>/nitro/v1/config/systemextramgmtcpu?action=enable
```

```
Payload: { "systemextramgmtcpu":{ } }
```

```
curl -v -X POST -H "Content-Type: application/json"-u nsroot:nsroot
http://10.102.201.92/nitro/v1/config/systemextramgmtcpu?action=enable
 -d '{ "systemextramgmtcpu":{ } } '
```

To disable an extra management CPU

```
HTTP Method: POST
```

```
URL: http://<NSIP>/nitro/v1/config/systemextramgmtcpu?action=disable
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
Payload: { "systemextramgmtcpu":{ } }
```

```
curl -v -X POST -H "Content-Type: application/json"-u nsroot:nsroot
 http://10.102.201.92/nitro/v1/config/systemextramgmtcpu?action=
disable -d '{ "systemextramgmtcpu":{ } } '
```

To show an extra management CPU

```
HTTP Method: GET
```

```
URL: http://<NSIP>/nitro/v1/config/systemextramgmtcpu
```

Example:

```
curl -v -X GET -H "Content-Type: application/json"-u nsroot:nsroot
http://10.102.201.92/nitro/v1/config/systemextramgmtcpu
```

Statistics and monitoring before and after adding extra management CPU

The following examples show the differences in the output of the stat system CPU and stat system commands before and after adding an extra management CPU.

```
stat system cpu
```

This command displays statistics of CPUs.

Here is a sample output before adding an extra management CPU on one of the supported models.

Example

```
```
> stat system cpu

CPU statistics

ID   Usage

8   1

7   1

11   2

1   1

6   1

9   1

3   1

5   1
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved. 
```

```
4               1

10              1

2               1
```

Here is the output after adding an extra management CPU on the same MPX appliance.

```
> stat system cpu

CPU statistics

ID          Usage

9               1

7               1

5               1

8               1

11              2

10              1

6               1

4               1

3               1

2               1
```

stat system

This command displays CPU use. In the following example, the output before adding an extra management CPU on one of the supported models is:

Mgmt Additional-CPU usage (%) 0.00

Example

```
> stat system

Citrix ADC Executive View

System Information:

```

```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

How to backup and restore your appliance to recover lost configuration

When your appliance gets corrupted or needs an upgrade, you can back up your system configuration. The backup procedure is done either through the Citrix CLI or GUI interface. The appliance also enables you to import the backup file from an external source. However, you can do this only through the GUI interface and there is no support through the CLI interface.

Points to remember

You must remember the following points when your backup and restore your appliance.

- There must be a support for network configuration on a new platform.
- The new platform build must be same as the backup file or a later version.

Back up a Citrix ADC appliance

Depending on data and backup requirement, you can create a "basic"backup or a "full"backup.

- **Basic backup.** You can perform this type of backup if you want to back up files that constantly change. The files that you can back up are in the following table.

For information about the basic backup details, see the Table topic.

- **Full backup.** In addition to the files that are backed up by a basic backup, a full backup has less frequently updated files. The files that are backed up when you use the "Full"backup option are:

Directory	Sub-Directory or Files
nsconfig	ssl, *license*, fips*
/var/	netscaler/ssl/, *wi/java_home/jre/lib/security/cacerts/*, wi/java_home/lib/security/cacerts/*

The backed-up data is stored as a compressed TAR file in the `/var/ns_sys_backup/` directory. To avoid issues due to non-availability of disk space, you can store up to 50 backup files in this directory. You can use the `rm system backup` command to delete existing backup files and create more backups.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

> **Note:**
>
> When the backup operation is in progress, do not run commands that affect the configuration.
>
> If a file that is required to be backed up is not available, the operation skips that file.

Back up a Citrix ADC appliance using command interface

Follow the procedure given below to back up a Citrix ADC appliance by using the Citrix ADC command interface.

At the command prompt, do the following:

1. Save the Citrix ADC configurations.

```
save ns config
```

1. Create the backup file.

```
create system backup [<fileName>] -level <basic ¦ full> -comment <
string>
```

> **Note:**
>
> If the file name is not specified, the appliance creates a TAR file with the following naming convention:`backup_<level>_<nsip_address>_<date-timestamp>.tgz`.

Example: To back up the full appliance using the default naming convention for the backup file.

```
> create system backup -level full
```

1. Verify that the backup file was created.

```
show system backup
```

You can view the properties of a specific backup file by using the `fileName` parameter.

Restore a Citrix ADC appliance by using the command interface

> **Important:**
>
> You cannot successfully restore your appliance, if you rename or modify your backup file.

When you restore your appliance, the restore operation untars the backup file from the `/var/ns_sys_backup/` directory. Once the files are untarred, the files are copied to the respective directories.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Restore the Citrix ADC from a local backup file by using the command interface

> **Note:**
>
> Citrix recommends you to back up the current configuration before restoring a previous configuration. However, if you do not want the restore command to automatically create a backup of the current configuration, use the `–skipBackup` parameter.

At the command prompt, do the following:

1. Obtain a list of the backup files available on the appliance.

   ```
   show system backup
   ```

2. Restore the appliance by specifying one of the backup files.

   ```
   restore system backup <filename> [-skipBackup]
   ```

   Example: To restore by using a full backup of an appliance

   ```
   > restore system backup backup_full_<nsip_address>_<date-timestamp
   >.tgz
   ```

3. Reboot the appliance.

   ```
   reboot
   ```

Backup and restore a Citrix ADC appliance by using the GUI

1. Navigate to **System** > **Backup and Restore**.
2. Click **Backup/Import** to start the process.
3. In the **Backup/Import** page, select **Create** and set the following parameters.
   a) File Name. Name of the appliance backup file.
   b) Level. Select a backup level as basic or full.
   c) Comment. Provide a brief description for the backup.
4. Click **Backup**.
5. If you want to import a backup, you must select **Import**.
6. Once backup is complete, you can select the file and click **Download**.
7. To restore, select the backup file and click **Restore**.
8. In the **Restore** page, verify backup file details and click **Restore**.
9. After you restore, you must reboot the appliance.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

For more information on how to backup and restore Citrix ADC instances, see Backup and Restore using Citrix ADM topic.

For more information on how to backup and restore an SDX appliance, see Backup and restore SDX appliance

For information about operations performed on system backup, see System Backup topic.

How to generate technical support bundle for resolving appliance issues

For help with analyzing and resolving any issues with a Citrix ADC appliance, you can generate a technical support bundle on the appliance and send the bundle to Citrix Technical Support. The Citrix ADC technical support bundle is a zipped tar archive of system configuration data and statistics. It collects the following data from the Citrix ADC appliance on which you generate the bundle:

- **Configuration files**. All files in the /flash/nsconfig directory.
- **Newnslog files**. The currently running newnslog and some previous files. To minimize the archive file size, `newnslog` collection is restricted to 500 MB, 6 files, or 7 days, whichever occurs first. If older data is needed, it might require manual collection.
- **Log files**. Files in /var/log/messages, */var/log/ns.log*, and other files under /var/log and /var/nslog.
- **Application core files**. Files created in the /var/core directory within the last week, if any.
- **Output of some CLI show commands**.
- **Output of some CLI stat commands**.
- **Output of BSD shell commands**.

You can use a single command to generate the technical support bundle and securely upload it to the Citrix Technical Support server. To upload, you must specify your Citrix credentials. When you generate the bundle, you can specify the case or service request number that was allotted to you by Citrix Technical Support. If you have already generated a technical support bundle, you can upload the existing archive file to the Citrix Technical Support server by specifying the file name with the full path.

The technical support bundle is saved on the Citrix ADC appliance in an archive at the following location:

`/var/tmp/support/support.tgz`

The path is a symlink to the most recent collector for easy access. The full file name varies, depending on the deployment topology, but generally follows a format similar to:

`collector_<P/S>_<NS IP>_<DateTime>.tgz.`

If your Citrix ADC appliance does not have direct internet connectivity, you can use a proxy server to directly upload the technical support bundle to the Citrix technical support server. The basic format

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

of the proxy string is:

```
proxy_IP:<proxy_port>
```

If the proxy server requires authentication, the format is:

```
username:password@proxsy_IP:<proxy_port>
```

> **Note:**
>
> For Citrix ADC appliances in a high availability pair, you must generate the technical support bundle on each of the two nodes.
>
> For Citrix ADC appliances in a cluster setup, you can generate the technical support bundle on each node individually, or you can generate smaller abbreviated archives for all nodes by using the cluster IP address.
>
> For Citrix ADC admin partitions, you must generate the technical support bundle from the default admin partition. To get the technical support bundle for a specific partition, you must specify the name of the partition for which you want to generate the technical support bundle. If you do not specify the name of the partition, data is collected from all admin partitions.

Generate the Citrix ADC technical support bundle by using the command interface

At the command prompt, type:

```
show techsupport [-scope <scope> <partitionName>] [-upload [-proxy
 <string>] [-casenumber <string>] [-file <string>] [-description <
string>] [-userName <string> -password ]]
```

Sr. No	Task	Command
1	Generate and upload the technical support bundle to the Citrix Technical Support server.	show techsupport –upload –userName account1 –password xxxxxxx
2	Generate and upload the technical support bundle to the Citrix Technical Support server through a proxy server	show techsupport –upload –proxy 1.1.1.1:80 –userName account1 –password xxxxxxx
3	Upload an existing technical support bundle to the Citrix Technical Support server.	show techsupport –upload -file,/var/tmp/support/collector_P_10.102.29 –userName account1 –password xxxxxxx

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Sr. No	Task	Command
4	Generate small, abbreviated archives for all nodes in a Cluster setup. Run this command by using the cluster IP address	show techsupport –scope CLUSTER
5	Generate a technical support bundle specific to an admin partition. Run this command on the default admin partition.	show techsupport –scope PARTITION partition1

How to collect the technical support bundle from SDX and VPX appliances for insight analysis

A Citrix ADC appliance has a built-in mechanism to collect log files. The log files are in turn sent to Citrix Insight Services for analysis.

> **Note:**
>
> All procedures are applicable for software release 9.2 or later.

Download technical support bundle from Citrix ADC MPX and VPX appliances

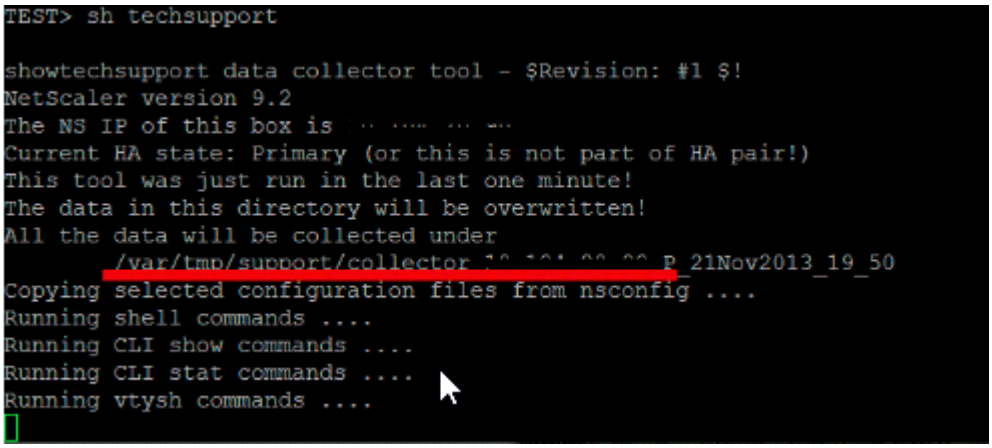
To run a collector file by using the Citrix ADC GUI, you must complete the following procedure:

> **Note:**
>
> The procedure is applicable for software release 9.2 or later.

1. Navigate to **System** > **Diagnostic**.
2. In the **Technical Support Tools** section, click **Generate Support File** link.
3. In the **Tech Support** page, set the following parameters:
    a) Scope. To collect data from one or more nodes.
    b) Partition. Name of the partition.
    c) Citrix Technical Support load Options. Set all options such as proxy server, service case number, collector archive file name and a brief description of the archive file for uploading the technical support bundle.
    d) Citrix Account. Enter your Citrix credentials.
4. Click **Run**.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

5. The Technical Support bundle is generated.
6. Click **Yes** to download the Technical support bundle to your local desktop.



Obtain technical support bundle by using the command interface

1. Download the file from the appliance using a Secure FTP (SFTP) or Secure Copy (SCP) utility, such as `WinSCP`, and upload it to Citrix Insight Services for analysis.

> **Note:**
>
> In the Citrix ADC software release earlier than 9.0, the collector script must be downloaded separately and ran.

```
> show techsupport -scope CLUSTER
```

1. This collects show technical support information from all nodes in the cluster and compress the files into a single archive.
2. After the appliance generates the collector archive the location of the file is displayed as shown in the following screenshot.

The file is stored in `/var/tmp/support` and you can verify it by logging into a Citrix ADC appliance and running the following command from a shell prompt.

```
root@NS# cd /var/tmp/support/
root@NS# ls -l
```

Obtain diagnostic bundle from Citrix ADC SDX using the GUI

1. Open the Citrix SDX GUI.
2. Expand the **Diagnostics** node.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

3. Select the **Technical Support** node.
4. Click Generate Technical Support File.
5. Select **Appliance** (Including Instances) from the drop-down menu.
6. Click **Add**.
7. Select one or more instances to add in.
8. Click **OK**. Wait for the process to complete.
9. Select the bundle name that was generated and then click **Download**
10. Upload the bundle file to Citrix Insight Services.

Command Reference Doc

System user authentication and authorization

September 14, 2021

To configure Citrix ADC user authentication and authorization, you must first define the users who have access to the Citrix ADC appliance, and then you can organize these users into groups. After configuring users and groups, you need to configure command policies to define types of access, and assign the policies to users and/or groups.

You must log on as an administrator to configure users, groups, and command policies. The default Citrix ADC administrator user name is *nsroot*. After logging on as the default administrator, you should change the password for the nsroot account. Once you have changed the password, no user can access the Citrix ADC appliance until you create an account for that user. If you forget the administrator password after changing it from the default, you can reset it to nsroot.

> **Note:**
>
> - Local users can authenticate to the Citrix ADC even if external authentication servers are configured. You can restrict this by disabling the localAuth parameter of the set system parameter command.
> - For enhanced security, Citrix recommends that you change the nsroot password. Frequently changing the password is advisable. For information about how to change the nsroot password, see Resetting the default administrator (nsroot) password topic.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

User, user groups, and command policies

December 19, 2024

You must first define a user with an account and then organize all users into groups. You can create command policies, or use built-in command policies to regulate user access to commands.

> **Note:**
>
> If you prefer to know more about configuring user and user groups as part of Citrix ADC authentication and authorization setup for traffic management, see Configure users and groups topic.

You can also customize the command-line prompt for a user. Prompts can be defined in a user's configuration, in a user-group configuration, and in the global system configuration settings. The prompt displayed for a user is in the following order of precedence:

1. Display the prompt as defined in the user's configuration.
2. Display the prompt as defined in the group configuration for the user's group.
3. Display the prompt as defined in the system global configuration settings.

You can now specify a timeout value for inactive CLI sessions for a system user. If a user's CLI session is idle for a time that exceeds the timeout value, the Citrix ADC appliance terminates the connection. The timeout can be defined in a user configuration, in a user-group configuration, or in the global system configuration settings. The timeout for inactive CLI sessions for a user is determined in the following order of precedence:

1. User configuration.
2. Group configuration for the user's group.
3. Global system configuration settings.

A Citrix ADC root administrator can configure the maximum concurrent session limit for system users. By restricting the limit, you can reduce the number of open connections and improve server performance. As long as the CLI count is within the configured limit, concurrent users can log on the GUI any number of times. However, if the number of CLI sessions reaches the configured limit, users can no longer log on to the GUI. For example, if the number of concurrent sessions is configured to 20, concurrent users can log on to 19 CLI sessions. But if the user is logged on to the `20<sup>th</sup` > CLI session, any attempt to log on to the GUI, CLI, or NITRO results in an error message ((ERROR: Connection limit to CFE exceeded).

> **Note:**
>
> The default the number of concurrent sessions is configured to 20 and the maximum number of concurrent sessions is configured to 40.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Configure user accounts

To configure user accounts, you simply specify user names and passwords. You can change passwords and remove user accounts at any time.

> **Note:**
>
> All characters in a password are not accepted. However, it works if you type the characters within quotes.
>
> Also, the string must not exceed a maximum length of 127 characters.

To create a user account by using the command line interface

At the command prompt, type the following commands to create a user account and verify the configuration:

- `add system user <username> [-externalAuth ( ENABLED | DISABLED )] [-promptString <string>] [-timeout <secs>] [-logging ( ENABLED | DISABLED )] [-maxsession <positive_integer>]`
- `show system user <userName>`

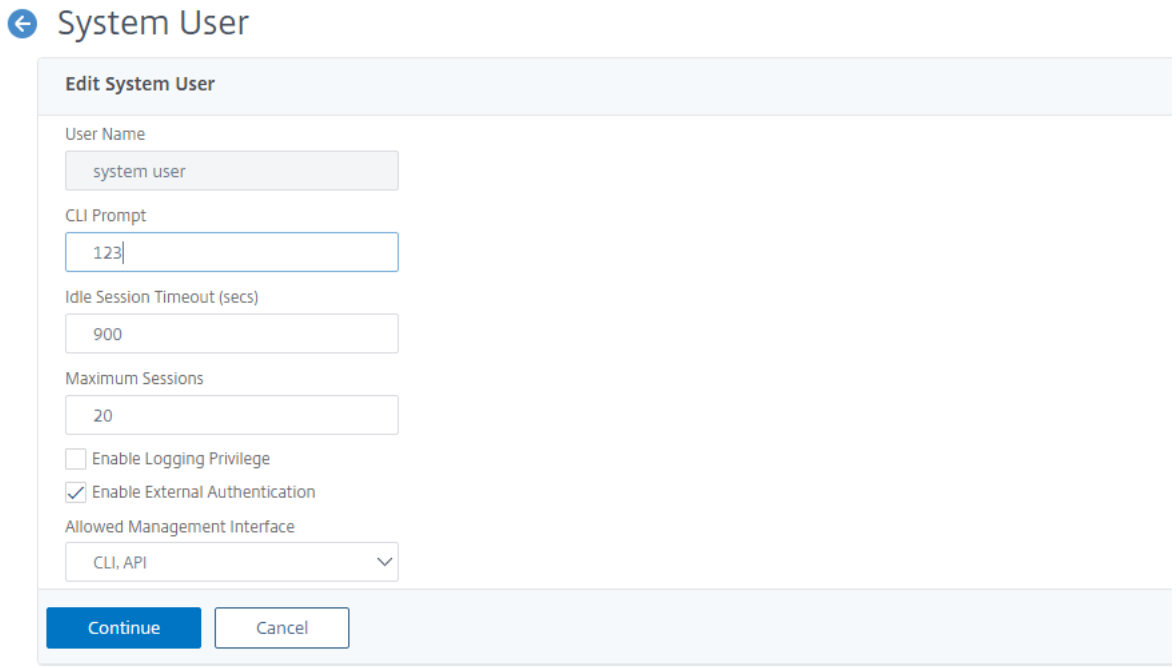
External users can configure the “logging”parameter to collect external logs using a web logging or audit logging mechanism. If the parameter is enabled, the auditing client authenticates itself with the Citrix ADC appliance to collect logs.

Example:

```
> add system user johnd -promptString user-%u-at-%T
```

```
1 Enter password:
2 Confirm password:
3 > show system user johnd
4 user name: john
5      Timeout:900 Timeout Inherited From: Global
6      External Authentication: ENABLED
7      Logging: DISABLED
8      Maximum Client Sessions: 20
```

For parameter description, see Authentication and authorization user command reference topic.



Configure a user account by using the Citrix ADC GUI

1. Navigate to **System** > **User Administration** > **Users**, and create the user.
2. In the details pane, click **Add** to create a system user.
3. In the **Create System Group** page, set the following parameters:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

a) User Name. Name of the user group.
b) CLI Prompt. The prompt that you prefer to set for the CLI interface access.
c) Idle Session Timeout (secs). Set the time that a user can be inactive before the session times out and closes.
d) Maximum sessions. Set the maximum number of sessions that a user can try.
e) Enable Logging Privilege. Enable logging privilege for the user. The **Enable Logging Privilege** parameter collects external logs information using web logging or audit logging mechanism. If the parameter is enabled, the auditing client authenticates itself with NetScaler to collect logs.
f) Enable external Authentication. Select the option if you want to use an external authentication server for authenticating the user.
g) Allowed Management Interface. Select the Citrix ADC interfaces for which the user group is granted permission to access.
h) Command Policies. Bind command policies to the user group.
i) Partitions. Bind partitions to the user group.

4. Click **Create** and **Close**.

Configure user groups

After configuring a user group, you can easily grant the same access rights to everyone in the group. To configure a group, you create the group and bind users to the group. You can bind each user account to more than one group. Binding user accounts to multiple groups might allow more flexibility when applying command policies.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

To create a user group by using the command line interface

At the command prompt, type the following commands to create a user group and verify the configuration:

- `add system group <groupName> [-promptString <string>] [-timeout <secs>]`
- `show system group <groupName>`

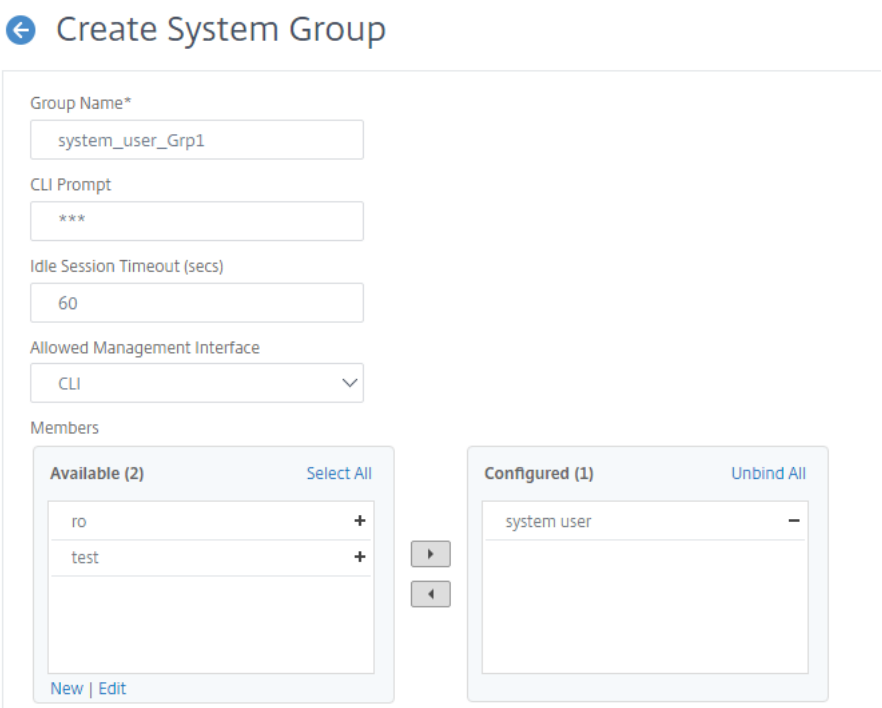
Example:

```
> add system group Managers -promptString Group-Managers-at-%h
```

Bind a user account to a group by using the CLI

At the command prompt, type the following commands to bind a user account to a group and verify the configuration:

- `bind system group <groupName> -userName <userName>`
- `show system group <groupName>`



Example:

```
> bind system group Managers -userName user1
```

Configure a user group by using the Citrix ADC GUI

1. Navigate to **System** > **User Administration** > **Groups**, and create the user group.
2. In the details pane, click **Add** to create a system user group.
3. In the **Create System Group** page, set the following parameters:
   a) Group Name. Name of the user group.
   b) CLI Prompt. The prompt that you prefer to set for the CLI interface access.
   c) Idle Session Timeout (secs). Set the time that a user can be inactive before the session times out and closes.
   d) Allowed Management Interface. Select the Citrix ADC interfaces for which the user group is granted permission to access.
   e) Members. Add user accounts to the group.
   f) Command Policies. Bind command policies to the user group.
   g) Partitions. Bind partitions to the user group.
4. Click **Create** and **Close**.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

> **Note:**
>
> To add members to the group, in the Members section, click **Add**. Select users from the Available list and add them to the Configured list.

Configure command policies

Command policies regulate which commands, command groups, virtual servers, and other entities that users and user groups are permitted to use.

The appliance provides a set of built-in command policies, and you can configure custom policies. To apply the policies, you bind them either to users or to groups.

Here are the key points to keep in mind when defining and applying command policies.

- You cannot create global command policies. Command policies must be bound directly to the users and groups on the appliance.
- Users or groups with no associated command policies are subject to the default (DENY-ALL) command policy, and are therefore unable to run any configuration commands until the proper command policies are bound to their accounts.
- All users inherit the policies of the groups to which they belong.
- You must assign a priority to a command policy when you bind it to a user account or group account. This enables the appliance to determine which policy has priority when two or more conflicting policies apply to the same user or group.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- If two different command policies of the same priority are bound to a user account or group account, the first policy that is bound takes the highest priority.
- The following commands are available by default to any user and are unaffected by any command you specify:
- help, show CLI attribute, set CLI prompt, clear CLI prompt, show CLI prompt, alias, unalias, history, quit, exit, whoami, config, set CLI mode, unset CLI mode, and show CLI mode.

The following table describes the built-in policies.

Policy name	Allows
read-only	Read-only access to all show commands except show ns runningConfig, show ns ns.conf, and the show commands for the Citrix ADC command group.
operator	Read-only access and access to commands to enable and disable services and servers.
network	Full access, except to the set and unset SSL commands, show ns ns.conf, show ns runningConfig, and show gslb runningConfig commands.
sysadmin	[Included in Citrix ADC 12.0 and later] A sysadmin is lower than a superuser in terms of access allowed on the appliance. A sysadmin user can perform all Citrix ADC operations with the following exceptions: no access to the Citrix ADC shell, cannot perform user configurations, cannot perform partition configurations, and some other configurations as stated in the sysadmin command policy.
superuser	Full access. Same privileges as the nsroot user.

Create custom command policies

Regular expression support is offered for users with the resources to maintain more customized expressions, and for those deployments that require the flexibility that regular expressions offer. For most users, the built-in command policies are sufficient. Users who need more levels of control but are unfamiliar with regular expressions might want to use only simple expressions, such as those in the examples provided in this section, to maintain policy readability.

When you use a regular expression to create a command policy, keep the following in mind.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- When you use regular expressions to define commands that are affected by a command policy, you must enclose the commands in double quotation marks. For example, to create a command policy that includes all commands that begin with show, type the following:
- “^show .*$”
- To create a command policy that includes all commands that begin with rm, type the following:
- “^rm .*$”
- Regular expressions used in command policies are not case sensitive.

The following table lists examples of regular expressions for Command Policies:

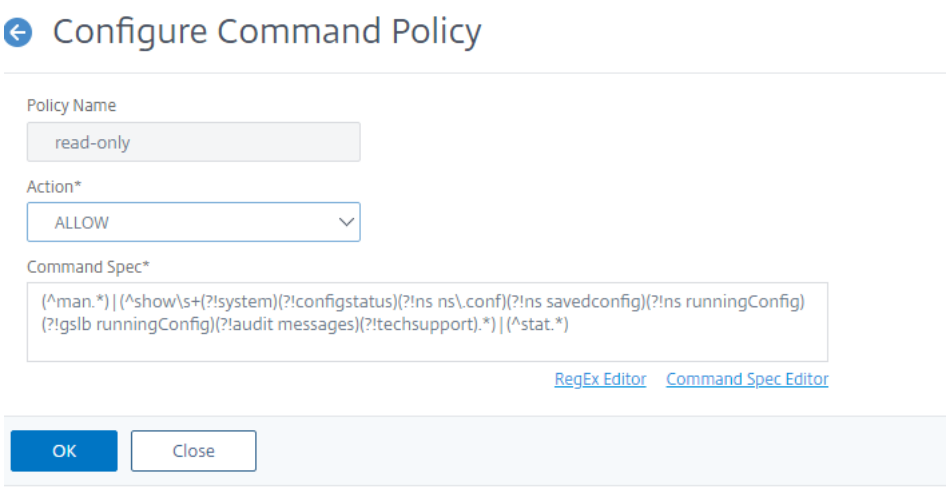
Command specification	Matches these commands
“^rm\s+.*$”	All remove actions, because all remove actions begin with the rm string, followed by a space and more parameters such as command groups, command object types, and arguments.
“^show\s+.*$”	All show commands, because all show actions begin with the show string, followed by a space and more parameters such as command groups, command object types, and arguments.
“^shell$”	The shell command alone, but not combined with any additional parameters such as command groups, command object types, and arguments.
“^add\s+vserver\s+.*$”	All create virtual server actions, which consist of add virtual server command followed by a space and more parameters such as command groups, command object types, and arguments.
“^add\s+(lb\s+vserver)\s+.*”	All create lb virtual server actions, which consist of the add lb virtual server command followed by a space and more parameters such as command groups, command object types, and arguments.

For information about built-in command policies, see table Built-in command policy table.

To create a command policy by using the command line interface

At the command prompt, type the following commands to create a command policy and verify the configuration:

- `add system cmdPolicy <policyname> <action> <cmdspec>`
- `show system cmdPolicy <policyName>`



© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Example:

```
add system cmdPolicy USER-POLICY ALLOW (\ server\ )|(\ service(Group)
*\ )|(\ vserver\ )|(\ policy\ )|(\ policylabel\ )|(\ limitIdentifier\
 )|(^show\ (?!(system|ns\ (ns.conf|runningConfig)))|(save)|(stat\ .*
serv)
```

Configure a command policy by using the Citrix ADC GUI

1. Navigate to **System** > **User Administration** > **Command Policies**.
2. In the details pane, click **Add** to create a command policy.
3. In the **Configure Command Policy** page, set the following parameters:
   a) Policy name
   b) Action
   c) Command Spec.
4. Click **OK**.

Bind command policies to user accounts and user groups

Once you have defined your command policies, you must bind them to the appropriate user accounts and groups. When you bind a policy, you must assign it a priority so that the appliance can determine which command policy to follow when two or more applicable command policies are in conflict.

Command policies are evaluated in the following order:

- Command policies bound directly to users and the corresponding groups are evaluated according to a priority number. A command policy with a lower priority number is evaluated before

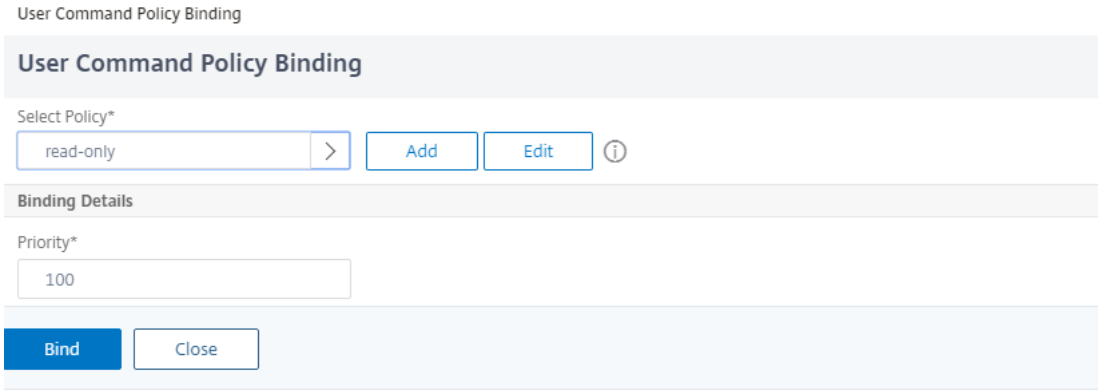
© 1999–2025 Cloud Software Group, Inc. All rights reserved.

one with a higher priority number. Therefore, any privileges the lower-numbered command policy explicitly grants or denies are not overridden by a higher-numbered command policy.

- When two command policies, one bound to a user account and other to a group, have the same priority number, the command policy bound directly to the user account is evaluated first.

To bind command policies to a user by using the command line interface

At the command prompt, type the following commands to bind a command policy to a user and verify the configuration:



- `bind system user <userName> -policyName <policyName> <priority>`
- `show system user <userName>`

Example:

```
> bind system user user1 -policyName read_all 1
```

Bind command policies to a user account by using the Citrix ADC GUI

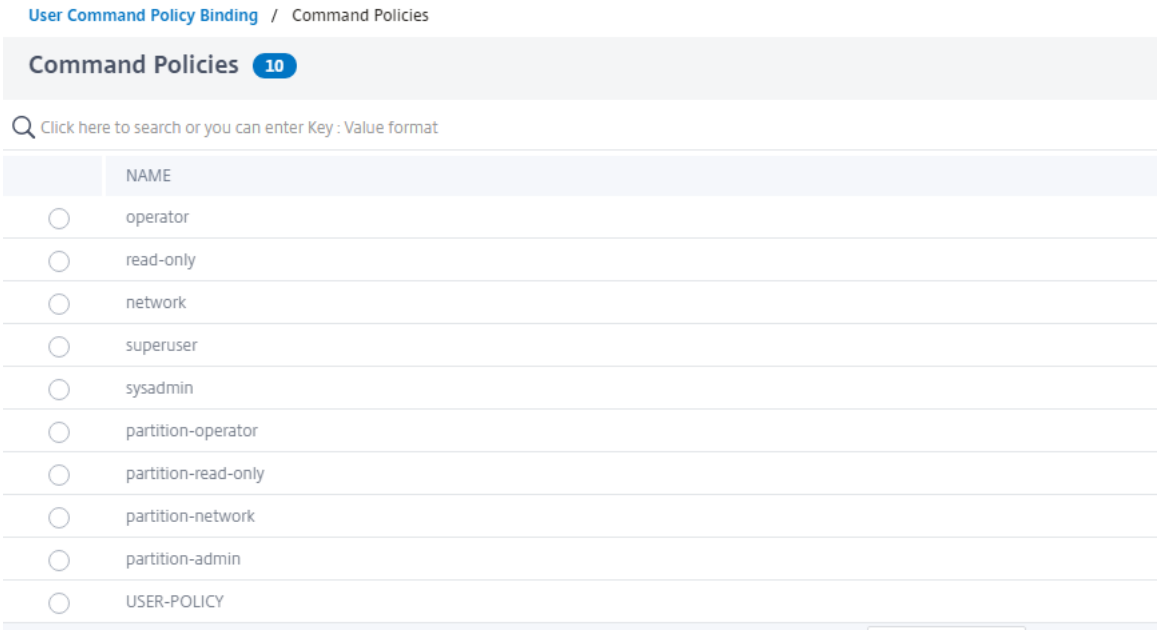
Navigate to **System** > **User Administration** > **Users**, select the user and bind command policies.

Optionally, you can modify the default priority to ensure that the policy is evaluated in the proper order.

To bind command policies to a group by using the command line interface

At the command prompt, type the following commands to bind a command policy to a user group and verify the configuration:

- `bind system group <groupName> -policyName <policyName> <priority>`
- `show system group <groupName>`



Example:

```
> bind system group Managers -policyName read_all 1
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Bind command policies to a user group by using the Citrix ADC GUI

Navigate to **System** > **User Administration** > **Groups**, select the group and bind command policies.

Optionally, you can modify the default priority to ensure that the policy is evaluated in the proper order.

Example use case: Manage user accounts, user groups, and command policies in a manufacturing organization

The following example shows how to create a complete set of user accounts, groups, and command policies and bind each policy to the appropriate groups and users. The company, Example Manufacturing, Inc., has three users who can access the Citrix ADC appliance:

- **John Doe.** The IT manager. John must be able to see all parts of the Citrix ADC configuration but does not need to modify anything.
- **Maria Ramiez.** The lead IT administrator. Maria must be able to see and modify all parts of the Citrix ADC configuration except for Citrix ADC commands (which local policy dictates must be performed while logged on as nsroot).
- **Michael Baldrock.** The IT administrator in charge of load balancing. Michael must be able to see all parts of the Citrix ADC configuration, but must modify only the load balancing functions.

The following table shows the breakdown of network information, user account names, group names, and command policies for the sample company.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Field	Value	Note
Citrix ADC host name	ns01.example.net	N/A
User accounts	johnd, mariar, and michaelb	John Doe, IT manager, Maria Ramirez, IT administrator and Michael Baldrock, IT administrator.
Groups	Managers and SysOps	All managers and all IT administrators.
Command Policies	read_all, modify_lb, and modify_all	Allow complete read-only access, Allow modify access to load balancing, and Allow complete modify access.

The following description walks you through the process of creating a complete set of user accounts, groups, and command policies on the Citrix ADC appliance named ns01.example.net.

The description includes procedures for binding the appropriate user accounts and groups to one another, and binding appropriate command policies to the user accounts and groups.

This example illustrates how you can use prioritization to grant precise access and privileges to each user in the IT department.

The example assumes that initial installation and configuration have already been performed on the Citrix ADC.

Configure user accounts, groups, and command policies for a sample organization

1. Use the procedure described in the **Configuring User Accounts** section to create user accounts **johnd**, **mariar**, and **michaelb**.
2. Use the procedure described in Configuring User Groups to create user groups **Managers** and **SysOps**, and then bind the users **mariar** and **michaelb** to the **SysOps** group and the user **johnd** to the **Managers** group.
3. Use the procedure described in Creating Custom Command Policies to create the following command policies:
   - **read_all** with action **Allow** and command spec `"(^show\s+(?!system)(?!ns ns.conf)(?!ns runningConfig).*)|(^stat.*)"`
   - **modify_lb** with action as **Allow** and the command spec `"^set\s+lb\s+.*$"`
   - modify_all with action as Allow and the command spec `"^\S+\s+(?!system).*"`

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

4. Use the procedure described in "Binding Command Policies to Users and Groups"to bind the **read_all** command policy to the **SysOps** group, with priority value **1**.
5. Use the procedure described in "Binding Command Policies to Users and Groups"to bind the **modify_lb** command policy to user **michaelb**, with priority value **5**.

The configuration you just created results in the following:

- John Doe, the IT manager, has read-only access to the entire Citrix ADC configuration, but he cannot make modifications.
- Maria Ramirez, the IT lead, has near-complete access to all areas of the Citrix ADC configuration, having to log on only to perform Citrix ADC-level commands.
- Michael Baldrock, the IT administrator responsible for load balancing, has read-only access to the Citrix ADC configuration, and can modify the configuration options for load balancing.

The set of command policies that applies to a specific user is a combination of command policies applied directly to the user's account and command policies applied to one or more groups of which the user is a member.

Each time a user enters a command, the operating system searches the command policies for that user until it finds a policy with an ALLOW or DENY action that matches the command. When it finds a match, the operating system stops its command policy search and allows or denies access to the command.

If the operating system finds no matching command policy, it denies the user access to the command, in accordance with the Citrix ADC appliance's default deny policy.

> **Note:**
>
> When placing a user into multiple groups, take care not to cause unintended user command restrictions or privileges. To avoid these conflicts, when organizing your users in groups, bear in mind the Citrix ADC command policy search procedure and policy ordering rules.

User account and password management

January 10, 2024

Citrix ADC enables you to manage user accounts and password configuration. Following are some of the activities that you can perform using a system user account or `nsroot` administrative user account.

- System user account lockout
- Lock system user account for management access

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- Unlock a locked system user account for management access
- Disable management access for system user account
- Force password change for `nsroot` administrative users
- Remove sensitive files in a system user account
- Strong password configuration for system users

System user account lockout

To prevent brute force security attacks, you can configure the user lockout configuration. The configuration enables a network administrator to prevent a system user to log on to Citrix ADC. Also, unlock the user account before the lock period expires.

To get the details of the unsuccessful user login attempts across reboots, the `persistentLoginAttempts` parameter can be enabled.

At the command prompt, type:

```
set aaa parameter -maxloginAttempts <value> -failedLoginTimeout <
value> -persistentLoginAttempts (ENABLED | DISABLED)
```

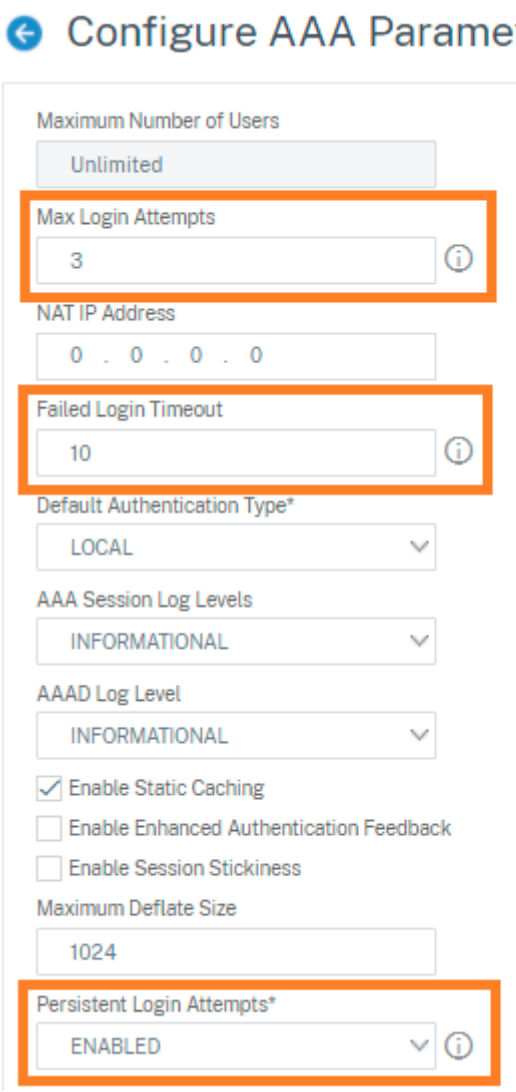
Example:

```
set aaa parameter -maxloginAttempts 3 -failedLoginTimeout 10 -persistentLoginA
 ENABLED
```

> **Note:**
>
> For the `aaa.user.login_attempts` expression to take effect, you must disable the "persistent login attempts"parameter.
>
> Run the `unset aaa parameter -persistentLoginAttempts` command to disable (if enabled) the persistent login attempts.
>
> For details about the login attempt functionality, see Support to retrieve current login attempts for a user.

The following show command output displays the configuration status of the authentication, authrorization, and auditing parameters:

```
1 show aaaparameter
2
3 Configured AAA parameters
4
5 EnableStaticPageCaching: YES
6
7 EnableEnhancedAuthFeedback: NO
8
9 DefaultAuthType: LOCAL MaxAAAUsers: Unlimited
```



© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
10
11 AAAD nat ip: None
12
13 EnableSessionStickiness : NO
14
15 aaaSessionLoglevel: INFORMATIONAL
16
17 AAAD Log Level: INFORMATIONAL
18
19 ...
20
21 Persistent Login Attempts: DISABLED
```

Configure system user account lockout by using the GUI

1. Navigate to **Configuration > Security > AAA-Application Traffic > Authentication Settings > Change authentication AAA Settings**.
2. In the **Configure AAA Parameter** page, set the following parameters:
   a) Max Login Attempts. The maximum number of logon attempts allowed for the user to try.
   b) Failed Login Timeout. The maximum number of invalid logon attempts by the user.
   c) Persistent Login Attempts. Persistent storage of unsuccessful user login attempts across reboots.
3. Click **OK**.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

When you set the parameters, the user account gets locked for 10 minutes for three or more invalid login attempts. Also, the user cannot log on even with valid credentials for 10 minutes.

> **Note**
>
> If a locked user tries to log on to Citrix ADC, an error message, `RBA Authentication Failure: maxlogin attempt reached for test.` displays.

Lock system user account for management access

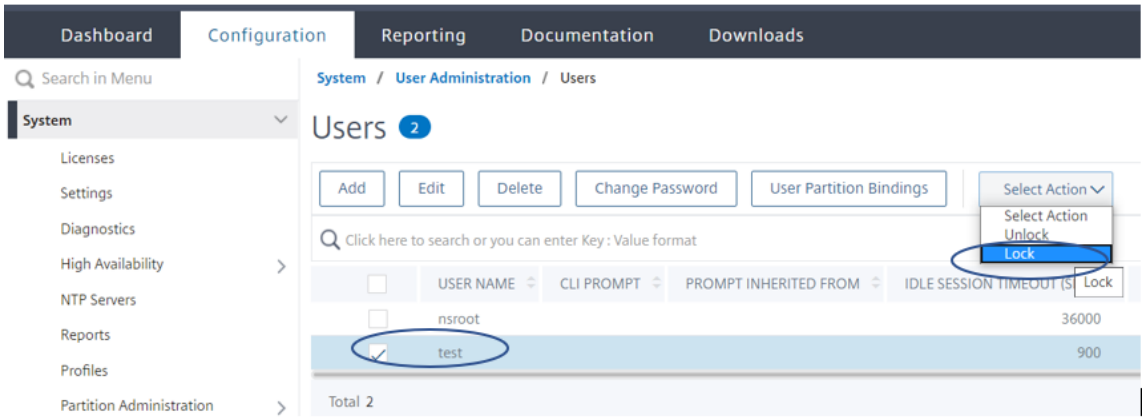
Citrix ADC enables you to lock a system user for 24 hours and deny access to the user.

Citrix ADC supports the configuration for both system user and external users.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

> **Note**
>
> The feature is supported only if you disable the `persistentLoginAttempts` option in the `aaa` parameter.

At the command prompt type:



```
set aaa parameter –persistentLoginAttempts DISABLED
```

Now, to lock a user account, at the command prompt, type:

```
lock aaa user test
```

Lock a system user account by using the GUI

1. Navigate to **Configuration > Security > AAA-Application Traffic > Authentication Settings > Change authentication AAA Settings**.
2. In **Configure AAA Parameter**, in the **Persistent Login Attempts** list, select **DISABLED**.
3. Navigate to **System > User Administration > Users**.
4. Select a user.
5. In the Select Action list, select **Lock**.

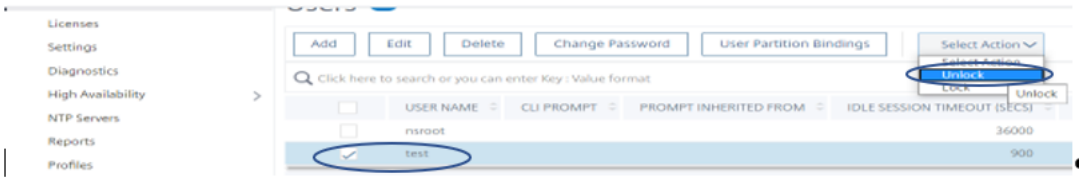
> **Note**
>
> The Citrix ADC GUI does not have an option to lock external users. To lock an external user, the ADC administrator must use the CLI.
> When a locked system user (locked with lock authentication, authorization, and auditing user command) attempts to log in to Citrix ADC, an error message, "RBA Authentication Failure: User test is locked down for 24 hours."appears.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

> When a user is locked to log on to management access, console access is exempted. Locked user is able to log on to console.

Unlock a locked system user account for management access

System users and external users can be locked for 24 hours using the lock authentication, authorization, and auditing user command.



> **Note**
>
> Citrix ADC allows admins to unlock the locked user and the feature does not require any settings in “persistentloginAttempts”command.

At the command prompt, type:

```
unlock aaa user test
```

Configure system user unlock by using the GUI

1. Navigate to **System > User Administration > Users**.
2. Select a user.
3. Click **Unlock**.

The Citrix ADC GUI only lists system users created in the ADC, so there is no option in the GUI to unlock external users. To unlock an external user, the `nsroot` administrator must use the CLI.

Disable management access for system user account

When external authentication is configured on the Citrix ADC and as an admin you prefer to deny access to system users to log on to management access, you must disable the localAuth option in the system parameter.

At the command prompt, type the following:

```
set system parameter localAuth <ENABLED|DISABLED>
```

Example:

```
set system parameter localAuth DISABLED
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Disable management access to system user by using the GUI

1. Navigate to **Configuration > System > Settings > Change Global System Settings**.
2. In **Command Line Interface (CLI)** section, unselect the **Local Authentication** check box.

By disabling the option, local system users cannot log on to ADC management access.

> **Note**
>
> External authentication server must be configured and reachable to disallow local system user authentication in the system parameter. If external server configured in ADC for management access is unreachable, local system users can log on to the appliance. The behavior is set up for recovery purpose.

Force password change for administrative users

For `nsroot` secured authentication, Citrix ADC prompts the user to change the default password to a new one if the `forcePasswordChange` option is enabled in the system parameter. You can change your `nsroot` password either from CLI or GUI, on your first login with the default credentials.

At the command prompt, type:

```
set system parameter -forcePasswordChange ( ENABLED | DISABLED )
```

SSH session example for NSIP:

```
ssh nsroot@1.1.1.1
Connecting to 1.1.1.1:22...
Connection established.
To escape to local shell, press Ctrl+Alt+].
###############################################################################

WARNING: Access to this system is for authorized users only #
Disconnect IMMEDIATELY if you are not an authorized user! #

###############################################################################

Please change the default NSROOT password.
Enter new password:
Please re-enter your password:
Done
```

Remove sensitive files in a system user account

To manage sensitive data such as authorized keys and public keys for a system user account, you must enable the `removeSensitiveFiles` option. The commands that remove sensitive files when the system parameter is enabled are:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- rm cluster instance
- rm cluster node
- rm high availability node
- clear config full
- join cluster
- add cluster instance

At the command prompt, type:

```
set system parameter removeSensitiveFiles ( ENABLED | DISABLED )
```

Example:

```
set system parameter -removeSensitiveFiles ENABLED
```

Strong password configuration for system users

For secured authentication, Citrix ADC prompts system users and administrators to set strong passwords when logging on to the console. The password must be long and must be a combination of:

- One lower case character
- One upper case character
- One numeric character
- One special character

At the command prompt, type:

```
set system parameter -strongpassword <value> -minpasswordlen <value>
```

Where,

`Strongpassword`. After enabling strong password (`enable all` / `enablelocal`) all the passwords or sensitive information must have the following:

- At least 1 lower case character
- At least 1 upper case character
- At least 1 numeric character
- At least 1 special character

Exclude the list in `enablelocal` is - `NS_FIPS`, `NS_CRL`, `NS_RSAKEY`, `NS_PKCS12`, NS_PKCS8, NS_LDAP, `NS_TACACS`, `NS_TACACSACTION`, `NS_RADIUS`, `NS_RADIUSACTION`, `NS_ENCRYPTION_PARAMS` . So no Strong Password checks are performed on these ObjectType commands for the system user.

Possible values: `enableall`, `enablelocal`, disabled
Default value: disabled

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

`minpasswordlen`. Minimum length of the system user password. When the strong password is enabled by default, the minimum length is 4. User entered value can be greater than or equal to 4. Default minimum value is 1 when the strong password is disabled. Maximum value is 127 in both cases.

Minimum value: 1
Maximum value: 127

Example:

```
set system parameter -strongpassword enablelocal -minpasswordlen 6
```

Default user account

The `nsrecover` user account can be used by the administrator to recover the Citrix ADC appliance. You can log on to Citrix ADC using `nsrecover` if the default system users (`nsroot`) are unable to log in due to any unforeseen issues. The `nsrecover` login is independent of user configurations and lets you access the shell prompt directly. You are always allowed to log in through the `nsrecover` irrespective of the maximum configuration limit is reached.

How to reset root administrator (nsroot) password

June 3, 2024

The Citrix ADC root administrator (`nsroot`) account provides complete access to all ADC features. So, to preserve security, the administrative account must be used only if necessary.

As an admin, the recommendation is to change your password. If you forget your password, you must first reset to the default one and then change it to a new password.

As a `nsroot` administrator, to reset your password, you must log on to your appliance and change the password. However, if you do not remember the password, you can reboot the appliance in single user mode. Mount the file system in read/write mode, and then remove the **Citrix ADC** entry from the ns.conf file. As a final step, reboot and log on to your appliance with the default one and then set a new password.

Complete the following steps to reset your root administrator password:

1. Connect a computer to the console port of the Citrix ADC and log on.

   > **Note:**
   >
   > You cannot log on by using SSH to do this procedure; you must connect directly to the

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

> appliance.

2. Reboot the Citrix ADC.
3. Press CTRL+C when the following message appears:

```
Press [Ctrl-C] for command prompt, or any other key to boot
immediately.
Booting [kernel] in # seconds.
```

4. Run the following command to start the Citrix ADC in a single user mode:

```
boot -s
```

After the appliance boots, it displays the following message:

Enter full path name of shell or `RETURN for /bin/sh:`

5. Press ENTER to display the # prompt, and type the following commands to mount the file systems:

a) Run the following command to check the disk consistency:

```
fsck_ufs /dev/ada0s1a
```

> **Note**
>
> Your flash drive has a specific device name depending on your Citrix ADC. So, you have to replace ad0s1a in the preceding command with the appropriate device name.

For more information, see CTX124609 article.

b) Access the dev directory and enter 'ls'to check the drive details.

c) Run the following command to display the mounted partitions:

```
df
```

> **Note**
>
> If the flash partition is not listed, you must mount it manually.

d) Run the following command to mount the flash drive:

```
mount dev/ada0s1a/flash
```

6. Run the following command to change to the `nsconfig` directory:

```
cd /flash/nsconfig
```

7. Run the following commands to rewrite the ns.conf file and remove the set of system commands defaulting to the admin:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

a) Run the following command to create a configuration file that does not have commands defaulting to the administrator:

```
grep –v “set system user nsroot” ns.conf > new.conf
```

b) Run the following command to make a backup of the existing configuration file:

```
mv ns.conf old.ns.conf
```

c) Run the following command to rename the new.conf file to ns.conf:

```
mv new.conf ns.conf
```

8. Run the following command to reboot Citrix ADC:

```
reboot
```

9. Log on using the default administrator credentials. Citrix ADC prompts you to replace the default `nsroot` password with a new password.

> **Note**
>
> To use the “?”character in a password string, precede this character with the \ character.

For example, `yourexamplepasswd?` is set for the administrator account after you perform the following operation:

```
> set system user nsroot yourexamplepasswd\?
```

10. Once the new password is set, save the configuration using the `save ns config` command.

> **Note**
>
> For resetting a forgotten (`nsroot`) password in a high availability setup, it is recommended to shut down the peer node. If the peer node is active, the password is overwritten, as the config sync is triggered when the node comes up after reboot.

Also, read article, CTX224027 to know how secure SSH access to Citrix ADC appliance works.

External user authentication

March 7, 2025

Authentication service in a Citrix ADC appliance can be local or external. In external user authentication, the appliance uses an external server such as LDAP, RADIUS, or TACACS+ to authenticate the user. To authenticate an external user and grant the user access into the appliance, you must apply an authentication policy. The Citrix ADC system authentication uses Advanced authentication policies

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

with advanced policy expressions. The Advanced authentication policies are also used for the system user management in a partitioned Citrix ADC appliance.

> **Note**
>
> If your appliance is still using Classic policies and its expressions, you must stop using it and migrate your Classic policy usage to the Advanced policy infrastructure.

Once you create an authentication policy, you must bind it to the system global entity. You can configure an external authentication server (for example, TACACS) by binding a single authentication policy to the system global entity. Or, you can configure a cascade of authentication servers by binding multiple policies to the system global entity.

> **Note**
>
> When an external user logs into the appliance, the system generates an error message, "User does not exist"in the `ns.log` file. The occurrence is because the system runs the systemuser_systemcmdpolicy_binding command to initialize the GUI for the user.

LDAP authentication (using external LDAP servers)

You can configure the Citrix ADC appliance to authenticate user access with one or more LDAP servers. LDAP authorization requires identical group names in the Active directory, on the LDAP server, and on the appliance. The characters and case must also be the same.

For more information about LDAP authentication policies, see LDAP authentication policies topic.

By default, LDAP authentication is secured by using the SSL/TLS protocol. There are two types of secure LDAP connections. In the first type, the LDAP server accepts the SSL/TLS connection on a port separate from the port used to accept clear LDAP connections. After users establish the SSL/TLS connection, LDAP traffic can be sent over the connection. The second type allows both unsecure and secure LDAP connections and the single port handles it on the server. In this scenario, to create a secure connection, the client first establishes a clear LDAP connection. Then the **LDAP** command StartTLS is sent to the server over the connection. If the LDAP server supports StartTLS, the connection is converted to a secure LDAP connection by using TLS.

The port numbers for LDAP connections are:

- 389 for unsecured LDAP connections
- 636 for secure LDAP connections
- 3268 for Microsoft unsecure LDAP connections
- 3269 for Microsoft secure LDAP connections

LDAP connections that use the StartTLS command use port number 389. If port numbers 389 or 3268 are configured on the appliance, it tries to use StartTLS to make the connection. If any other port num-

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

ber is used, connection attempts use SSL/TLS. If StartTLS or SSL/TLS cannot be used, the connection fails.

When configuring the LDAP server, the case of the alphabetic characters must match that on the server and on the appliance. If the root directory of the LDAP server is specified, all subdirectories are also searched to find the user attribute. In large directories, it can affect performance. For this reason, Citrix recommends that you use a specific organizational unit (OU).

The following table lists examples of the base distinguished name (DN).

LDAP server	Base DN
Microsoft Active Directory	DC=Citrix, DC=local
Novell eDirectory	dc=Citrix, dc=net
IBM Directory Server	cn=users
Lotus Domino	OU=City, O=Citrix, C=US
Sun ONE directory (formerly iPlanet)	ou=People, dc=Citrix, dc=com

The following table lists examples of the bind distinguished name (DN).

LDAP server	Bind DN
Microsoft Active Directory	CN=Administrator, CN=Users, DC=Citrix, DC=local
Novell eDirectory	cn=admin, dc=Citrix, dc=net
IBM Directory Server	LDAP_dn
Lotus Domino	CN=Notes Administrator, O=Citrix, C=US
Sun ONE directory (formerly iPlanet)	uid=admin, ou=Administrators, ou=TopologyManagement, o=NetscapeRoot

Configure LDAP user authentication by using the CLI

Complete the following steps to configure LDAP authentication for external users

Configure LDAP policy

At the command prompt, do the following:

Step 1: Create an LDAP action.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
add authentication ldapAction <name> { -serverIP <ip_addr|ipv6_addr
|*> | { -serverName <string> } } >] [-authTimeout <positive_integer>]
 [-ldapBase <string>] [-ldapBindDn <string>] { -ldapBindDnPassword }
[-ldapLoginName <string>] [-groupAttrName <string>] [-subAttributeName
 <string>]
```

Example:

```
add authentication ldapAction ldap_act -serverIP <IP> -authTimeout 30
 -ldapBase "CN=xxxxx,DC=xxxx,DC=xxx"-ldapBindDn "CN=xxxxx,CN=xxxxx,DC
=xxxx,DC=xxx"-ldapBindDnPassword abcd -ldapLoginName sAMAccountName -
groupattrName memberOf -subAttributeName CN
```

For parameter description, see Authentication and authorization command reference topic.

Step 2: Create a classic LDAP policy.

```
add authentication ldapPolicy <name> <rule> [<reqAction>]
```

Example:

```
add authentication ldappolicy ldap_pol_classic ns_true ldap_act
```

> **Note**
>
> You can configure using a classic or an advanced LDAP policy but Citrix recommends you to use advanced authentication policy because classic policies are deprecated from the Citrix ADC 13.0 release onwards.

Step 3: Create an advanced LDAP policy

```
add authentication Policy <name> <rule> [<reqAction>]
```

Example:

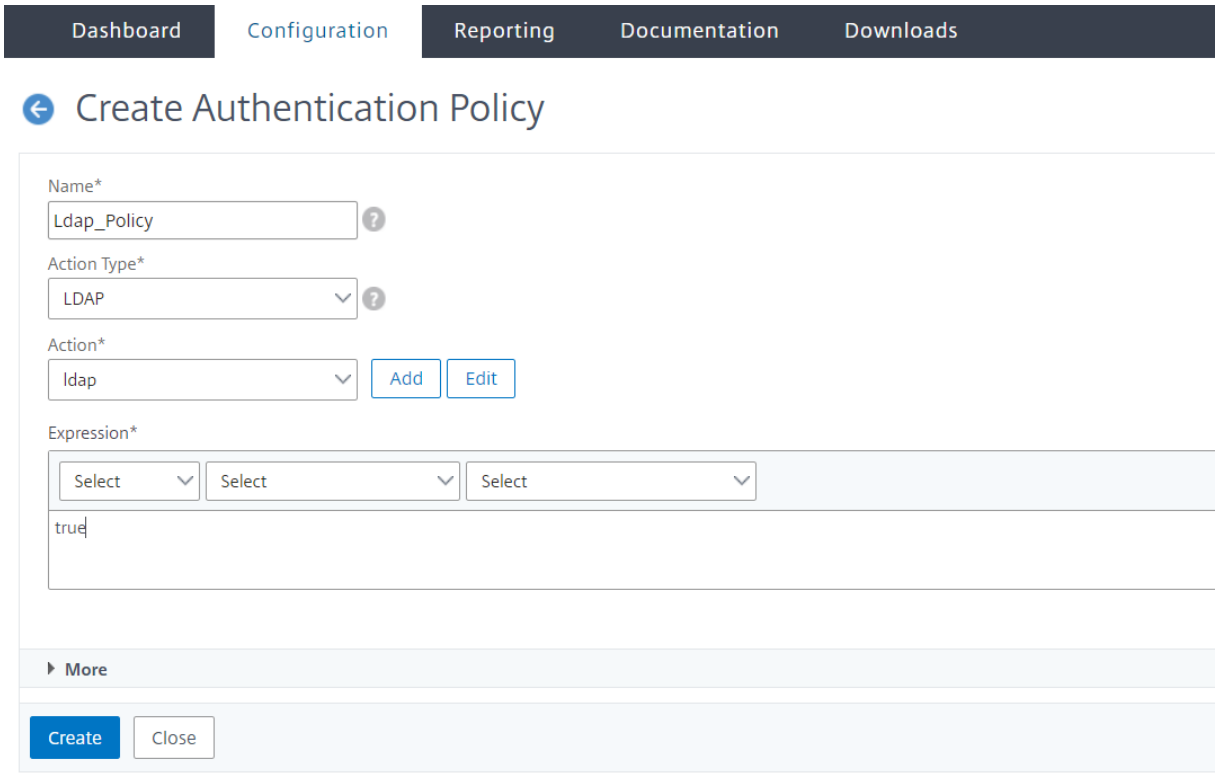
```
add authentication policy ldap_pol_advance -rule true -action ldap_act
```

Step 4: Bind the LDAP policy to system global

At the command line prompt, do the following:

```
bind system global <policyName> [-priority <positive_integer]
```

Example:

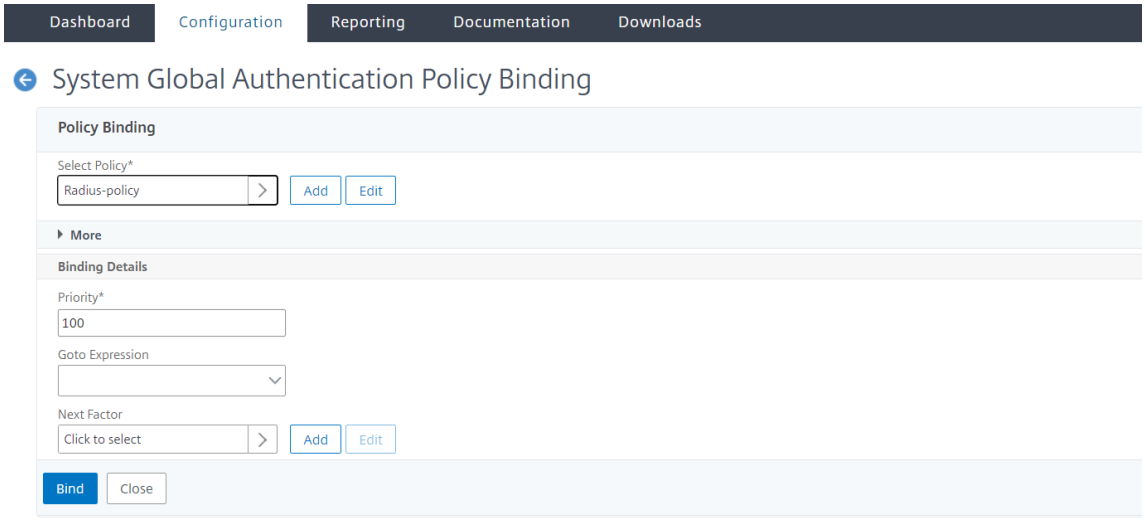


```
bind system global ldap_pol_advanced -priority 10
```

Configure LDAP user authentication by using the Citrix ADC GUI

1. Navigate to **System** > **Authentication** > **Advanced Policies** > **Policy**.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.



2. Click **Add** to create an authentication policy of type LDAP.
3. Click **Create** and **Close**.

Bind an authentication policy to the system global for LDAP authentication using the Citrix ADC GUI

1. Navigate to **System** > **Authentication** > **Advanced Policies** > **Authentication PoliciesPolicy**.
2. In the details pane, click **Global Bindings** to create system global authentication policy binding.
3. Click **Global Bindings**.
4. Select an authentication profile.
5. Select the LDAP policy.
6. In the **System Global Authentication Policy Binding** page, set the following parameters:
    a) Select Policy.
    b) Binding Details

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

7. Click **Bind** and **Done**.
8. Click **Global Bindings** to confirm the policy bounded to the system global.

Determining attributes in the LDAP directory

If you need help with determining your LDAP directory attributes, you can easily look them up with the free LDAP browser from Softerra.

You can download the LDAP browser from the Softerra LDAP Administrator website at <http://www.ldapbrowser.com>. After the browser is installed, set the following attributes:

- The host name or IP address of your LDAP server.
- The port of your LDAP server. The default is 389.
- The base DN field can be left blank.
- The information provided by the LDAP browser can help you determine the base DN needed for the Authentication tab.
- The Anonymous Bind check determines whether the LDAP server requires user credentials for the browser to connect to it. If the LDAP server requires credentials, leave the check box cleared.

After completing the settings, the LDAP browser displays the profile name in the left pane and connects to the LDAP server.

For more information, see LDAP topic.

Key-based authentication support for LDAP users

With key-based authentication, you can now fetch the list of public keys that are stored on the user object in the LDAP server through SSH. The Citrix ADC appliance during the role-based authentication

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

(RBA) process must extract public SSH keys from the LDAP server. The retrieved public key, which is compatible with SSH, must allow you to log in through the RBA method.

A new attribute "sshPublicKey"is introduced in the "add authentication ldapAction"and "set authentication ldapAction"commands. By using this attribute, you can obtain the following benefits:

- Can store the retrieved public key, and the LDAP action uses this attribute to retrieve SSH key information from LDAP server.
- Can extract attribute names of up to 24 KB.

> **Note**
>
> The external authentication server, such as LDAP is used only to retrieve SSH key information. It is not used for authentication purpose.

Following is an example of the flow of events through SSH:

- SSH daemon sends an AAA_AUTHENTICATE request with password field empty to authentication, authorization, and auditing daemon port.
- If LDAP is configured to store the SSH public key, authentication, authorization, and auditing responds with "sshPublicKey"attribute along with other attributes.
- SSH daemon verifies these keys with the client keys.
- SSH daemon passes user name in the request payload, and authentication, authorization, and auditing returns the keys specific to this user along with generic keys.

To configure the sshPublicKey attribute, at the command prompt type the following commands:

- With add operation, you can add "sshPublicKey"attribute while configuring ldapAction command.

```
add authentication ldapAction <name> { -serverIP <ip_addr|ipv6_addr
|*> | { -serverName <string> } } [-serverPort <port>] … [-Attribute1
 <string>] … [-Attribute16 <string>][-sshPublicKey <string>][-
authentication off]
```

- With set operation, you can configure "sshPublicKey"attribute to an already added ldapAction command.

```
set authentication ldapAction <name> [-sshPublicKey <string>][-
authentication off]
```

RADIUS authentication (using external RADIUS servers)

You can configure the Citrix ADC appliance to authenticate user access with one or more RADIUS servers. If you are using RSA SecurID, SafeWord, or Gemalto Protiva products, use a RADIUS server.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

For more information about RADIUS authentication policies, see RADIUS authentication policies topic.

Your configuration might require using a network access server IP address (NAS IP) or a network access server identifier (NAS ID). When configuring the appliance to use a RADIUS authentication server, use the following guidelines:

- If you enable use of the NAS IP, the appliance sends its configured IP address to the RADIUS server, rather than the source IP address used in establishing the RADIUS connection.
- If you configure the NAS ID, the appliance sends the identifier to the RADIUS server. If you do not configure the NAS ID, the appliance sends its host name to the RADIUS server.
- When the NAS IP address is enabled, the appliance ignores any NAS ID that it used for communicating with the RADIUS server.

Configure RADIUS user authentication by using the CLI

At the command prompt, do the following:

Step 1: Create an RADIUS action

```
add authentication radiusaction <name> -serverip <ip> -radkey <key> -
radVendorID <id> -radattributetype <value>
```

Where,
`radVendorID` RADIUS vendor ID attribute, used for RADIUS group extraction.
`radAttributeType` RADIUS attribute type, used for RADIUS group extraction.

Example:

```
add authentication radiusaction RADserver531 rad_action -serverip
1.1.1.1 -radkey key123 -radVendorID 66 -radattributetype 6
```

Step 2: Create a classic RADIUS policy.

```
add authentication radiusPolicy <name> <rule> [<reqAction>]
```

Example:

```
add authentication radiuspolicy radius_pol_classic ns_true radius_act
```

> **Note**
>
> You can configure using a classic or an advanced RADIUS policy. Citrix recommends you to use the advanced authentication policy because classic policies are deprecated from the Citrix ADC 13.0 release onwards.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

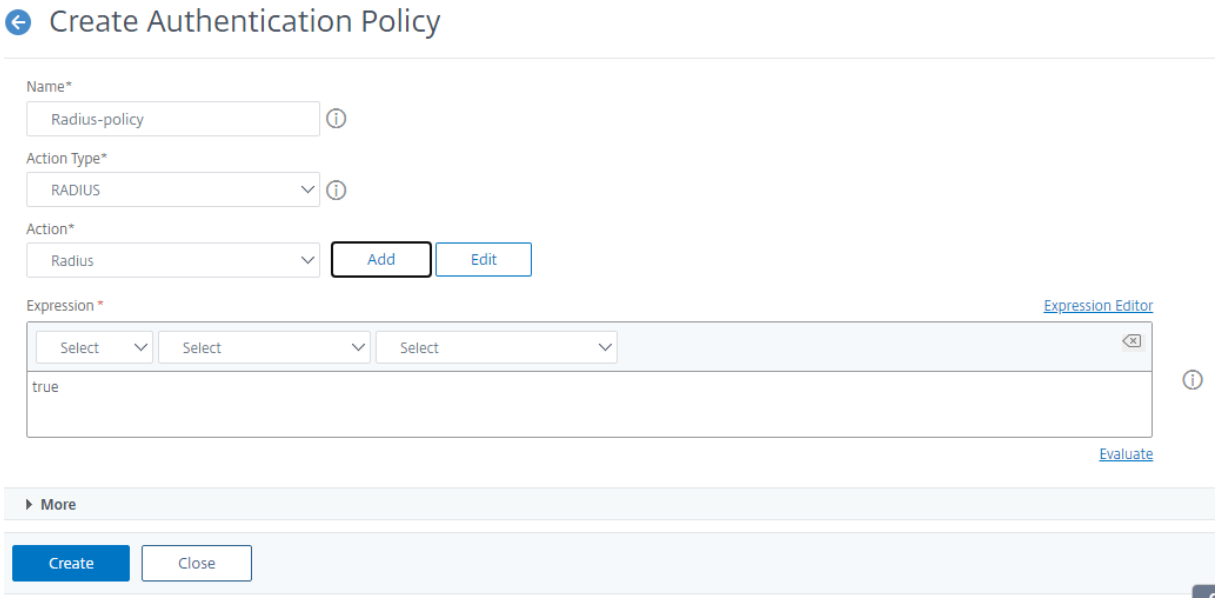
Step 3: Create an advanced RADIUS policy

```
add authentication policy <policyname> -rule true -action <radius
action name>
```

Example:

```
add authentication policy rad_pol_advanced -rule true -action radserver531rad_
```

Step 4: Bind the RADIUS policy to the system global.



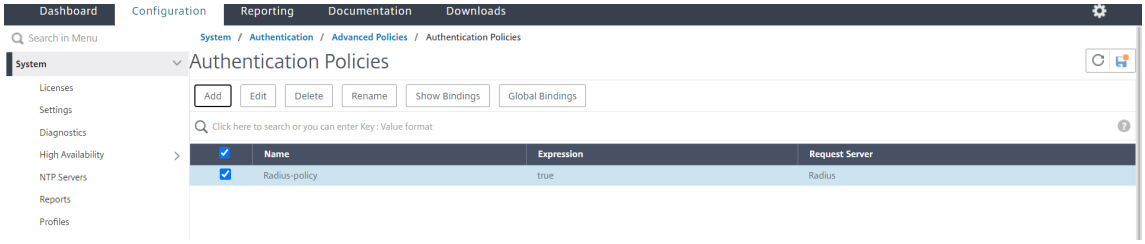
```
bind system global <policyName> -priority <positive_integer
```

Example:

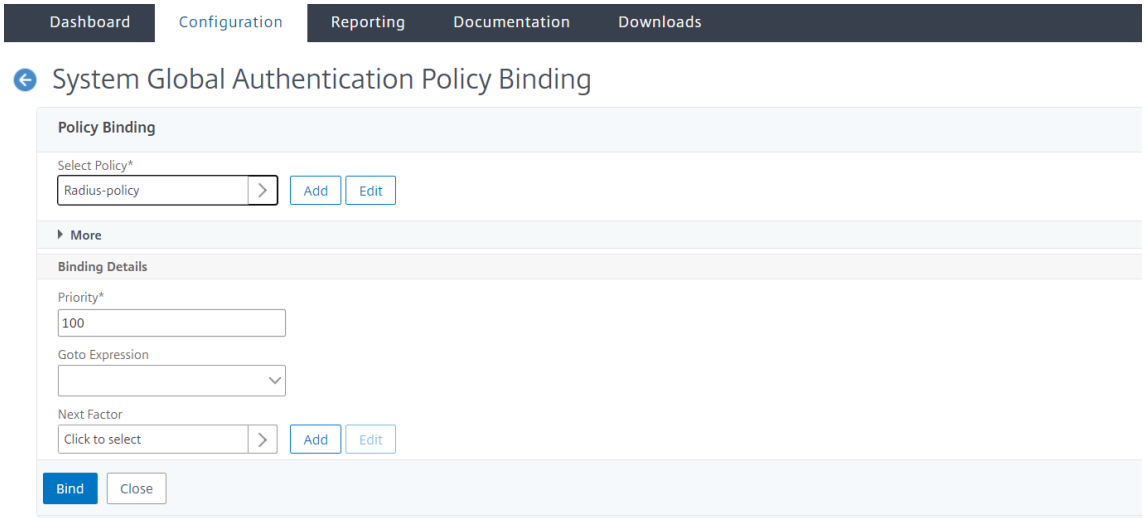
```
bind system global radius_pol_advanced -priority 10
```

Configure RADIUS user authentication by using the GUI

1. Navigate to **System** > **Authentication** > **Advanced Policies** > **Policy**.
2. Click **Add** to create an authentication policy of type RADIUS.
3. Click **Create** and **Close**.

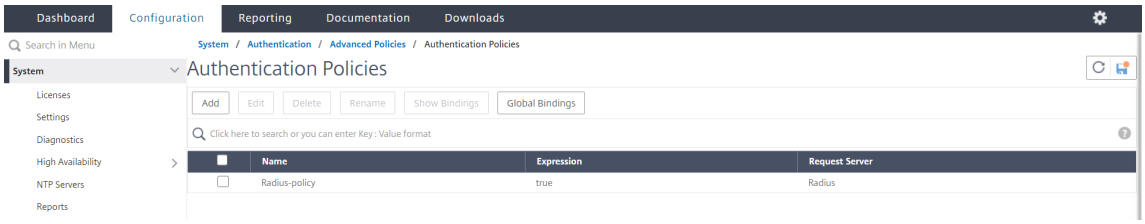


Bind the authentication policy to the system global for RADIUS authentication by using the GUI



1. Navigate to **System** > **Authentication** > **Advanced Policies** > **Policy**.
2. In the details pane, click **Global Bindings** to create system global authentication policy binding.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.



3. Click **Global Bindings**.

4. Select RADIUS.
5. In the **System Global Authentication Policy Binding** page, set the following parameters:
   a) Select Policy.
   b) Binding Details.

6. Click **Bind** and **Close**.
7. Click **Global Bindings** to confirm the policy bounded to the system global.

Choose RADIUS user authentication protocols

The Citrix ADC appliance supports implementations of RADIUS that are configured to use any of several protocols for user authentication, including:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- Password Authentication Protocol
- Challenge-Handshake Authentication Protocol (CHAP)
- Microsoft Challenge-Handshake Authentication Protocol (MS-CHAP Version 1 and Version 2)

If your deployment is configured to use RADIUS authentication and your RADIUS server is configured with a Password Authentication Protocol. You can strengthen user authentication by assigning a strong shared secret to the RADIUS server. Strong RADIUS shared secrets consist of random sequences of uppercase and lowercase letters, numbers, and punctuation, and are minimum 22 characters in length. If possible, use a random character generation program to determine RADIUS shared secrets.

To further protect RADIUS traffic, assign a different shared secret to each appliance or virtual server. When you define clients on the RADIUS server, you can also assign a separate shared secret to each client. Also, you must configure separately each policy that uses RADIUS authentication.

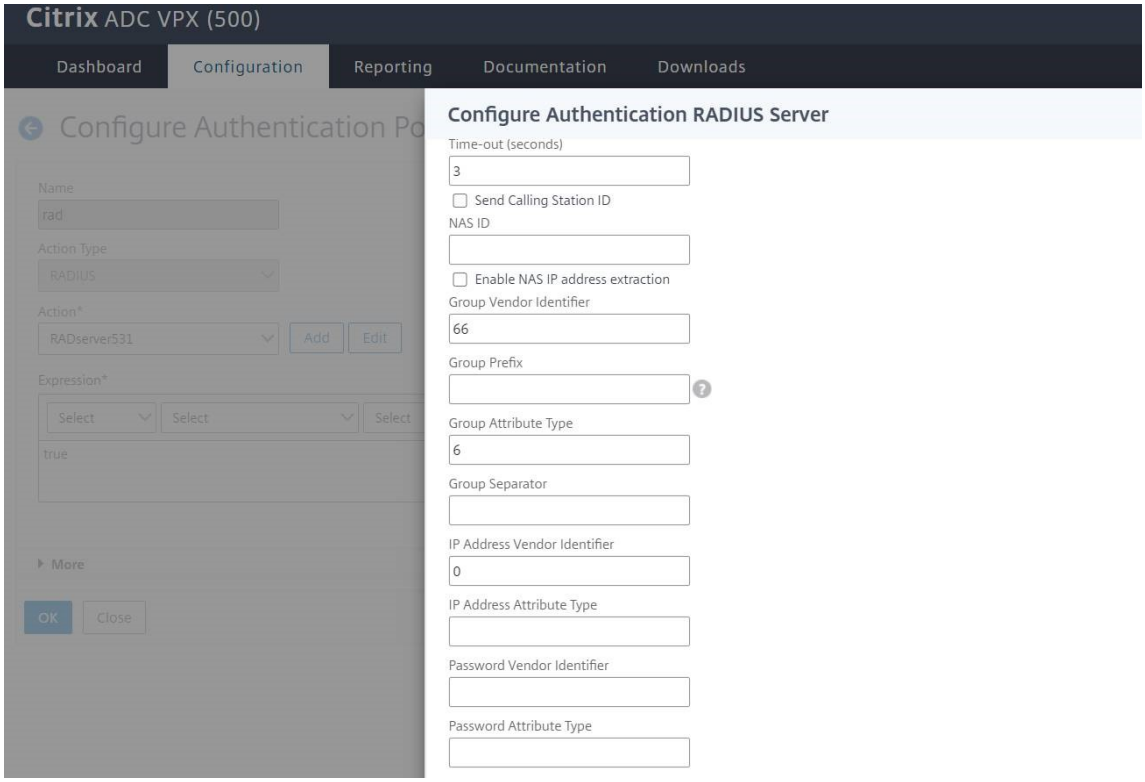
Configure IP address extraction

You can configure the appliance to extract the IP address from a RADIUS server. When a user authenticates with the RADIUS server, the server returns a framed IP address that is assigned to the user. The following are attributes for IP address extraction:

- Allows a remote RADIUS server to supply an IP address from the internal network for a user logged on to the appliance.
- Allows configuration for any RADIUS attribute using the type ip-address, including that are vendor encoded.

When configuring the RADIUS server for IP address extraction, you configure the vendor identifier and the attribute type.

The vendor identifier enables the RADIUS server to assign an IP address to the client from a pool of IP addresses that are configured on the RADIUS server. The vendor ID and attributes are used to make the association between the RADIUS client and the RADIUS server. The vendor ID is the attribute in the RADIUS response that provides the IP address of the internal network. A value of zero indicates that the attribute is not vendor encoded. The attribute type is the remote IP address attribute in a RADIUS response. The minimum value is one and the maximum value is 255.



A common configuration is to extract the **RADIUS** attribute *framed IP address*. The vendor ID is set to zero or is not specified. The attribute type is set to eight.

Group extraction for RADIUS by using the GUI

1. Navigate to **System** > **Authentication** > **Advanced Policies** > **Radius**, and select a policy.

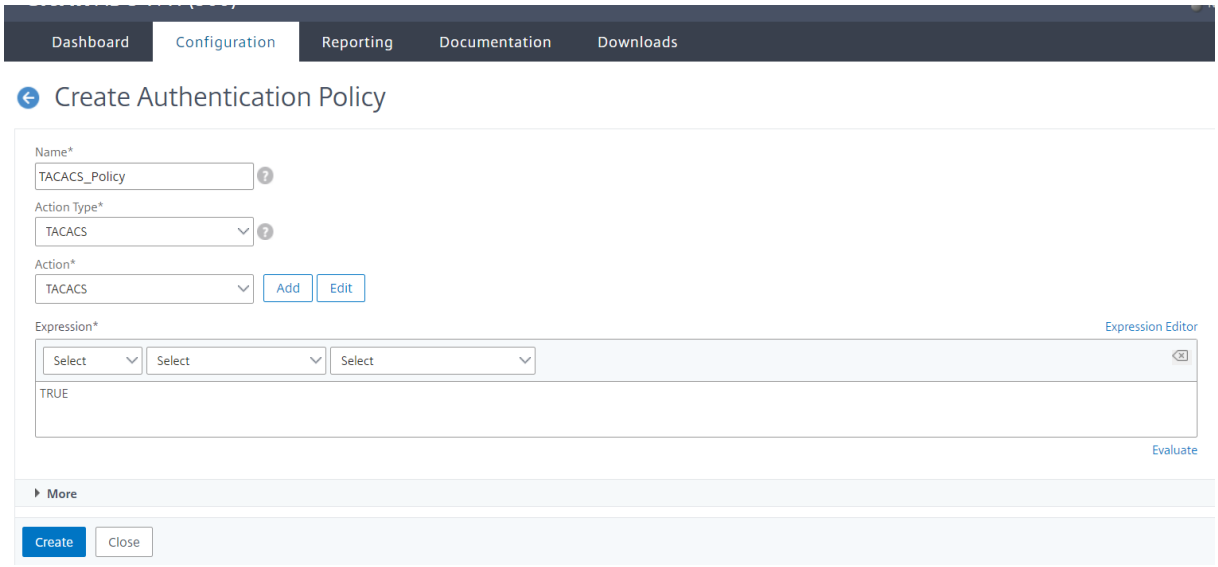
© 1999–2025 Cloud Software Group, Inc. All rights reserved.

2. Select or create RADIUS policy.
3. In the **Configure Authentication RADIUS Server** page, set the following parameters.
    a) **Group Vendor Identifier**
    b) **Group Attribute Type**
4. Click **OK** and **Close**.

TACACS+ authentication (using external TACACS+ servers)

> **Important**
>
> - Citrix recommends you do not modify any TACACS related configurations when you run a "clear ns config"command.
> - TACACS related configuration related to advanced policies is cleared and reapplied when the `RBAconfig` parameter is set to NO in "clear ns config"command for advanced policy.
> - When the `RBAconfig` parameter is set to NO as part of the "clear config"operation, Citrix ADC retains the management access sessions, in addition to retaining the RBA configurations and TACACS policies.

You can configure a TACACS+ server for authentication. Similar to RADIUS authentication, TACACS+ uses a secret key, an IP address, and the port number. The default port number is 49. To configure the



© 1999–2025 Cloud Software Group, Inc. All rights reserved.

appliance to use a TACACS+ server, provide the server IP address and the TACACS+ secret. You must specify port only when the server port number in use is something other than the default port number of 49.

For more information, see TACACS authentication.

Configure TACACS+ authentication by using the GUI

1. Navigate to **System** > **Authentication** > **Advanced Policies** > **Policy**.
2. Click **Add** to create an authentication policy of type TACACS.
3. Click **Create** and **Close**.

After the TACACS+ server settings are configured on the appliance, bind the policy to the system global entity.

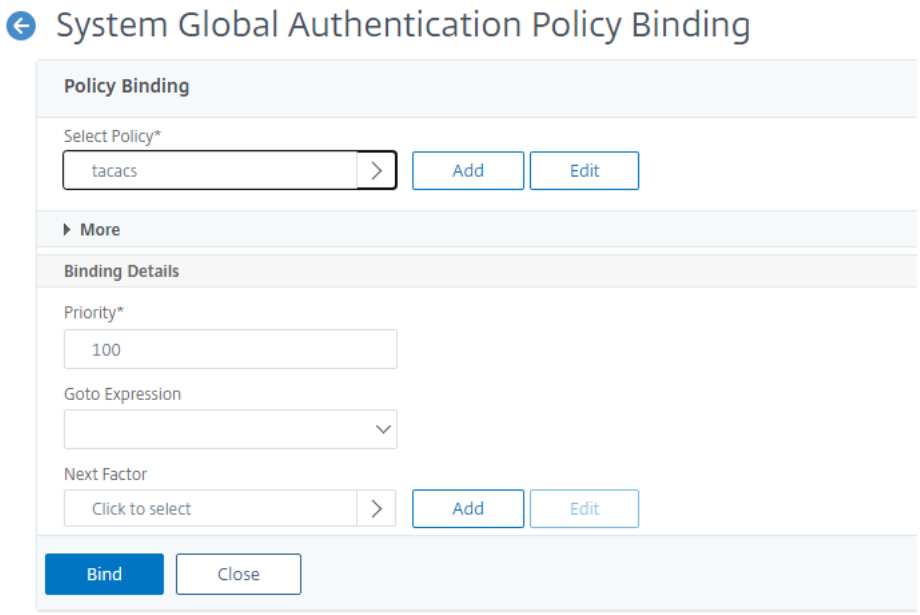
Bind authentication policies to the system global entity by using the CLI

When the authentication policies are configured, bind the policies to the system global entity.

At the command line prompt, do the following:

```
bind system global <policyName> [-priority <positive_integer>]
```

Example:

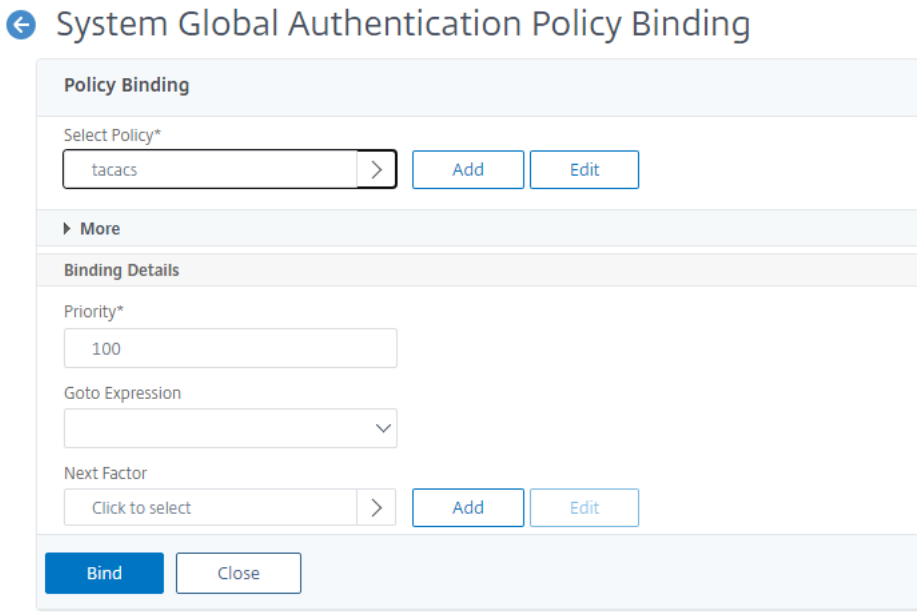


```
bind system global pol_classic -priority 10
```

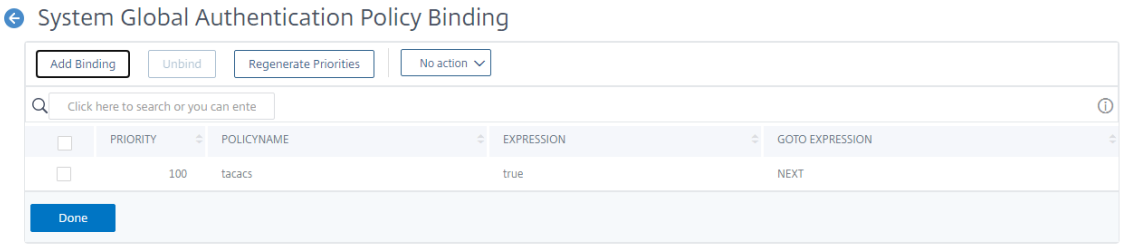
Also, read the Citrix article, CTX113820 to know about external authentication using TACACS.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Bind authentication policies to the system global entity by using the GUI



1. Navigate to **System** > **Authentication** > **Advanced Policies** > **Authentication Policies > Policy**.
2. In the details pane, click **Global Bindings** to create system global authentication policy binding.
3. Click **Global Bindings**.



4. Select the TACACS policy.
5. In the System Global Authentication Policy Binding page, set the following parameters:

   a) Select Policy.
   b) Binding Details

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

6. Click **Bind** and **Close**.
7. Click **Global Bindings** to confirm the policy bounded to the system global.

For more information about TACACS group extraction, read Citrix article CTX220024.

Display number of unsuccessful logon attempts for external users

The Citrix ADC appliance displays the number of invalid login attempts to the external user when you attempt at least one unsuccessful login before successfully logging on to the Citrix ADC management console.

> **Note**
>
> Currently, Citrix supports only keyboard interactive authentication for external users with the "persistentLoginAttempts"parameter enabled in the system parameter.

At the command prompt, type:

```
set aaa parameter -maxloginAttempts <value> -failedLoginTimeout <
value> -persistentLoginAttempts (ENABLED | DISABLED )]
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Example:

```
set aaa parameter –maxloginAttempts 5 -failedLoginTimeout 4 –persistentLoginAtt
 ENABLED
```

```
Following msg will be seen to external user when he tries 1 invalid
   login attempt before successfully login to the ADC management access
   .

Connection established.
To escape to local shell, press 'Ctrl+Alt+]'.

SSH key-based authentication for local system users

September 14, 2021

To have a secured user access for the Citrix ADC appliance you can have the public key authentication of the SSH server. The SSH key-based authentication is preferred over traditional user name or password based authentication for the following reasons:

- Provides better cryptographic strength than user passwords.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- Eliminates the need of remembering complicated passwords and prevents shoulder-surfing attacks which are possible if passwords are used.
- Provides a password-less login for making automation scenarios more secured.

Citrix ADC supports SSH key-based authentication by applying the public and private key concept. The SSH key-based authentication in Citrix ADC can be enabled either for a specific user or for all local users.

> **Note**
>
> The feature is supported only for Citrix ADC local users and not supported for external users.

SSH key-based authentication for local system users

In a Citrix ADC appliance, an administrator can set up SSH key-based authentication for a secured system access. When a user logs into the Citrix ADC using a private key, the system authenticates the user using the public key configured on the appliance.

Configure SSH key-based authentication for the Citrix ADC local system users by using CLI

Following configuration helps you to configure key-based authentication for Citrix ADC local system users.

1. Log on to a Citrix ADC appliance using administrator credentials.
2. By default your `sshd_config` file accesses this path: **AuthorizedKeysFile /nsconfig/ssh/authorized_keys**.
3. Append the public key to the authorized_keys file: **/nsconfig/ssh/authorized_keys**. The file path for `sshd_config` is `/etc/sshd_config`.
4. Copy the `sshd_config` file into `/nsconfig` to ensure that the changes persist even after restarting the appliance.
5. You can use the following command to restart your `sshd` process.

```
kill -HUP `cat /var/run/sshd.pid`
```

> **Note**
>
> If the authorized_keys file is not available, you must first create one and then append the public key. **Make sure the file has the following permission for the authorized_keys**.
>
> ```
> root@Citrix ADC# chmod 0644 authorized_keys
> ```

```
> shell
Copyright (c) 1992-2013 The FreeBSD Project.
```

root@ns# cd /nsconfig/ssh
root@ns# vi authorized_keys
### Add public keys in authorized_keys file
```

User-specific SSH key-based authentication for local system users

In a Citrix ADC appliance, an administrator can now set up a user specific SSH key-based authentication for a secured system access. The administrator must first configure the `Authorizedkeysfile` option in the `sshd_config` file and then add the public key in the `authorized_keys` file for a system user.

> **Note**
>
> If the authorized_keys file is not available for a user, the administrator must first create one and then add the public key to it.

Configure user-specific SSH key-based authentication by using the CLI

Following procedure helps you to configure user-specific SSH key-based authentication for Citrix ADC local system users.

1. Log on to a Citrix ADC appliance using administrator credentials.
2. At the shell prompt, access the `sshd_config` file and add the following configuration line:

   `AuthorizedKeysFile ~/.ssh/authorized_keys`

   > **Note**
   >
   > The ~ is the home directory and differs for different users. It expands to the different home directory.

3. Change the directory to the system user folder and add the public keys in the `authorized_keys` file.

   `/var/pubkey/<username>/.ssh/authorized_keys`

Once you have completed the earlier steps, restart the `sshd` process on your appliance by the following command:

```
    kill -HUP `cat /var/run/sshd.pid`
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

> **Note**
>
> If the authorized_keys file is not available, you must first create one and then add the public key.

```
> shell

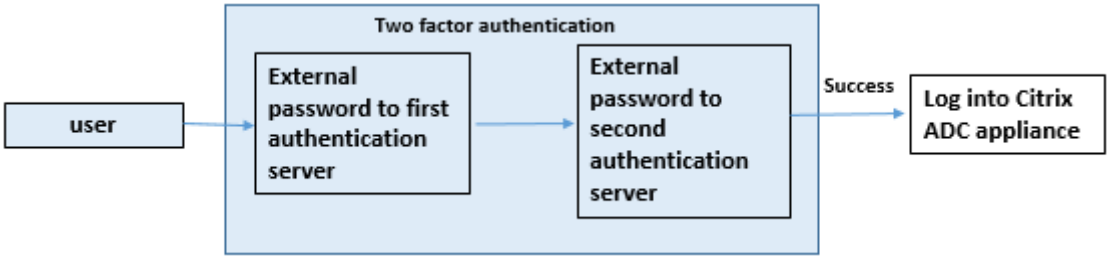
The Regents of the University of California. All rights reserved.
root@ns# cd /var/pubkey/<username>/
root@ns# ls
.ssh
root@ns# cd .ssh
root@ns# vi authorized_keys
### Add public keys in authorized_keys file
```

Also, read Citrix article, CTX109011 to know how secure SSH access to Citrix ADC appliance works.

Two factor authentication for system users and external users

January 8, 2024



Two factor authentication is a security mechanism where a Citrix ADC appliance authenticates a system user at two authenticator levels. The appliance grants access to the user only after successful validation of passwords by both levels of authentication. If a user is authenticated locally, the user profile must be created in the Citrix ADC database. If the user is authenticated externally then, the user name and password must match the user identity registered in the external authentication server.

> **Note**
>
> Two factor authentication feature works only from Citrix ADC 12.1 build 51.16 onwards.

How two factor authentication works

Consider a user trying to log on to a Citrix ADC appliance. The requested application server sends the user name and password to the first external authentication server (RADIUS, TACACS, LDAP, or AD). Once the user name and password are validated, the user is prompted for a second level of authentication. The user can now provide the second password. Only if both passwords are correct, the user is allowed to access the Citrix ADC appliance. The following diagram is an illustration of how two-factor authentication works for a Citrix ADC appliance.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Following are the different use cases for configuring two factor authentication for external and system users.

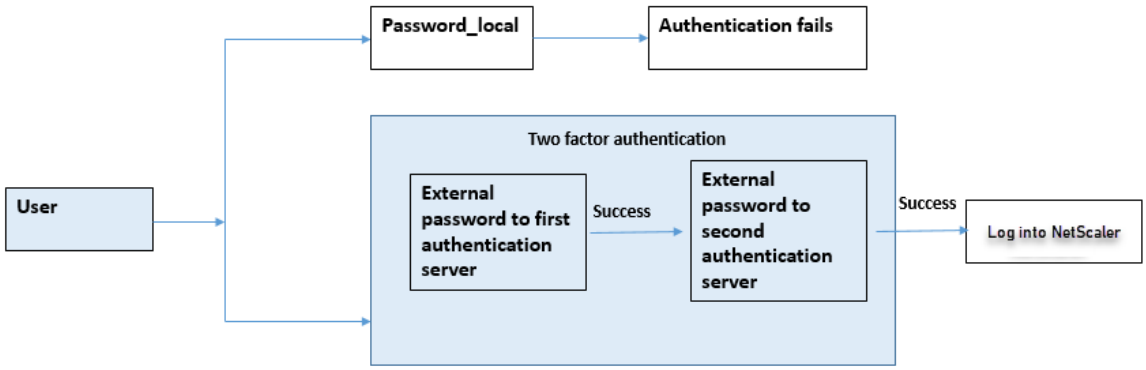
You can configure two-factor authentication on a Citrix ADC appliance in different ways. The following are the different configuration scenarios for two factor authentication on a Citrix ADC appliance.

1. Two factor authentication (2FA) across Citrix ADC, GUI, CLI, API and SSH.
2. External authentication enabled and local authentication disabled for system users.
3. External authentication enabled with policy based local authentication for system users.
4. External authentication disabled for system users with local authentication enabled.
5. External authentication enabled and local authentication enabled for system users.
6. External authentication enabled for selected LDAP users

Use case 1: Two factor authentication (2FA) across Citrix ADC, GUI, CLI, API and SSH interfaces

Two-factor authentication is enabled and available across all Citrix ADC management access for GUI, API, and SSH.

Use case 2: Two factor authentication supported on external authentication servers such as LDAP, RADIUS, Active Directory and TACACS



You can configure two-factor authentication on the following external authentication servers for first-level and second-level user authentication.

- RADIUS
- LDAP
- Active Directory
- TACACS

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Use case 3: External authentication enabled and local authentication disabled for system users

You begin the authentication process by enabling the external authentication option and disabling local authentication for system users.

Complete the following steps by using the command line interface:

1. Add authentication action for LDAP policy
2. Add authentication policy for LDAP policy
3. Add authentication action for RADIUS policy
4. Add authentication policy for RADIUS policy
5. Add authentication login schema
6. Add and bind authentication policy label to RADIUS server
7. Bind system global authentication for LDAP policy
8. Disable local authentication in system parameter

Add authentication action for LDAP server (first level authentication)

At the command prompt, type:

```
add authentication ldapaction <ldap action name> -serverip <IP> -
ldapbase <> -ldapbinddn <binddn name> -ldapbinddnpassword <password
>-ldaploginname <loginname> -groupattrname <grp attribute name> -
subAttributename <string>-ssoNameAttribute <string>
```

Example:

```
add authentication ldapaction ldapact1 -serverip 1.1.1.1 -ldapbase
 base -ldapbindDn name -ldapbindDNpassword password -ldapLoginName
 name -groupAttrName name -subAttributeName name -ssoNameAttribute
name
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Add authentication policy for LDAP server (first level authentication)

At the command prompt, type:

```
add authentication policy <ldap policy name> -rule true -action <ldap
 action name>
```

Example:

```
add authentication policy pol1 -rule true -action ldapact1
```

Add authentication action for RADIUS server (second level authentication)

At the command prompt, type:

```
add authentication radiusaction <rad action name> -serverip <rad
server ip> -radkey <key> -radVendorID <ID >-radattributetype <rad
attribute type>
```

Example:

```
add authentication radiusaction radact1 -serverip 1.1.1.1 -radkey 123
 -radVendorID 1234 -radAttributeType 2
```

Add authentication policy for RADIUS server (second level authentication)

At the command prompt, type:

```
add authentication policy <radius policy name> -rule true -action <
rad action name>
```

Example:

```
add authentication policy radpol11 -rule true -action radact1
```

Add authentication login schema

You can use the "SingleAuth.xml"login schema for system users to provide the second password for the Citrix ADC appliance. At the command prompt, type:

```
add authentication loginSchema <login schema name> -authenticationSchema
 LoginSchema/SingleAuth.xml
```

Example:

```
add authentication loginSchema radschema -authenticationSchema
LoginSchema/SingleAuth.xml
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Add and bind authentication policy label to RADIUS server

At the command prompt, type:

```
add authentication policylabel <labelName> [-type ( AAATM_REQ |
RBA_REQ )] [-comment <string>][-loginSchema <string>]

bind authentication policylabel <labelName> -policyName <string> -
priority <positive_integer> [-gotoPriorityExpression <expression>][-
nextFactor <string>]
```

Example:

```
add authentication policylabel label1 -type RBA_REQ -loginSchema
radschema

bind authentication policylabel label1 -policyName radpol11 -priority
 1
```

Bind authentication system global for LDAP policy

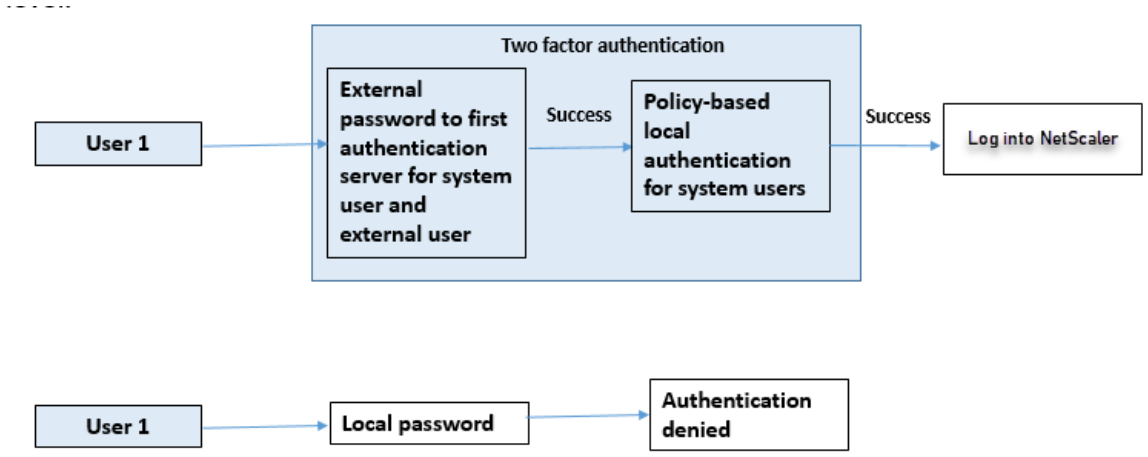
At the command prompt, type:

```
bind system global ldappolicy -priority <priority> -nextFactor <
policy label name>
```

Example:

```
bind system global pol11 -priority 1 -nextFactor label1
```

Disable local authentication in system parameter



At the command prompt, type:

```
set system parameter -localauth disabled
```

Use case 4: External authentication enabled for system user with local authentication policy attached

In this scenario, the user is allowed to log on to the appliance using two-factor authentication with local authentication policy evaluation at the second level of user identification.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Complete the following steps by using the command line interface.

1. Add authentication action for LDAP server
2. Add authentication policy for LDAP policy
3. Add local authentication policy
4. Add authentication policy label
5. Bind LDAP policy as system global
6. Disable local authentication in system parameter

Add authentication action for LDAP server (first level authentication)

At the command prompt, type:

```
add authentication ldapaction <ldap action name> -serverip <IP> -
ldapbase <> -ldapbinddn <binddn name> -ldapbinddnpassword <password
>-ldaploginname <loginname> -groupattrname <grp attribute name> -
subAttributename <string>-ssoNameAttribute <string>
```

Example:

```
add authentication ldapaction ldapact1 -serverip 1.1.1.1 -ldapbase
 base -ldapbindDn name -ldapbindDNpassword password -ldapLoginName
 name -groupAttrName name -subAttributeName name -ssoNameAttribute
name –ssoNameAttribute name
```

Add authentication policy for LDAP server (first level authentication)

At the command prompt, type:

```
add authentication policy <ldap policy name> -rule true -action <ldap
 action name>
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Example:

```
add authentication ldapaction ldapact1 -serverip 1.1.1.1 -ldapbase
 base -ldapbindDn name -ldapbindDNpassword password -ldapLoginName
 name -groupAttrName name -subAttributeName name -ssoNameAttribute
name
```

Add local authentication policy for system users (second level authentication)

At the command prompt, type:

```
add authentication policy <policy> -rule <rule> -action <action name>
```

Example:

```
add authentication policy local_policy -rule true -action LOCAL
```

Add and bind authentication policy label

At the command prompt, type:

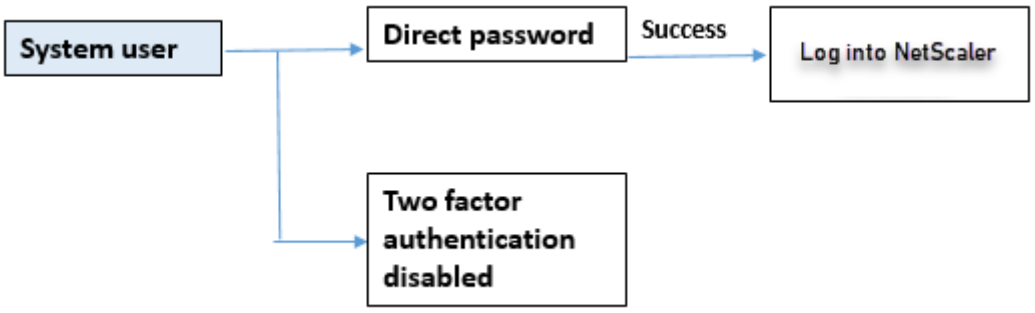
```
add authentication policylabel <labelName> [-type ( AAATM_REQ |
RBA_REQ )] [-comment <string>][-loginSchema <string>]
bind authentication policylabel <labelName> -policyName <string> -
priority <positive_integer> [-gotoPriorityExpression <expression>][-
nextFactor <string>]
```

> **Note**
>
> For management access, the policy type must be RBA_REQ.

Example:

```
add authentication policylabel label1 -type RBA_REQ -loginSchema
radschema
bind authentication policylabel label1 -policyName radpol11 -priority
 1 -gotoPriorityExpression NEXT
```

Disable local authentication in system parameter



At the command prompt, type:

```
set system parameter -localauth disabled
```

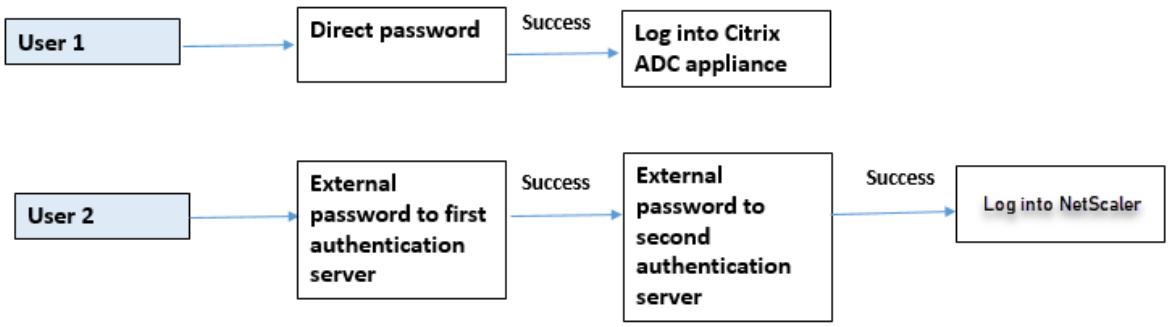
© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Use case 5: External authentication disabled and local authentication enabled for system user

If the user has “externalAuth”disabled, it indicates that the user does not exist on the authentication server. User is not authenticated with the external authentication server even if a user with the same user name exists on the external authenticated server. User is authenticated locally.

To enable system user password and disable external authentication

At the command prompt, type the following:



```
add system user <name> <password> -externalAuth DISABLED
```

Example:

```
add system user user1 password1 –externalAuth DISABLED
```

Use case 6: External authentication enabled and local authentication enabled for system users

To configure the appliance to authenticate system users by using a local password. If this authentication fails, the user is then authenticated by using an external authentication password on the external authentication servers at two levels.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Configure the following steps by using the CLI.

1. Add authentication action for LDAP server
2. Add authentication policy for LDAP policy
3. Add authentication action for RADIUS policy
4. Add authentication policy for RADIUS policy
5. Add authentication login schema
6. Add authentication policy label
7. Bind authentication policy label for login schema
8. Bind authentication system global for RADIUS policy
9. Bind authentication system global for LDAP policy

Add authentication action for LDAP server

At the command prompt, type:

```
add authentication ldapaction <ldap action name> -serverip <IP> -
ldapbase <> -ldapbinddn <binddn name> -ldapbinddnpassword <password
>-ldaploginname <loginname> -groupattrname <grp attribute name> -
subAttributename <>-ssoNameAttribute <>
```

Example:

```
add authentication ldapaction ldapact1 -serverip 1.1.1.1 -ldapbase
 base -ldapbindDn name -ldapbindDNpassword password -ldapLoginName
 name -groupAttrName name -subAttributeName name -ssoNameAttribute
name
```

Add authentication policy for LDAP policy

At the command prompt, type:

```
add authentication policy <policy name> --rule true -action <ldap
action name>
```

Example:

```
add authentication policy pol1 -rule true -action ldapact1
```

Add authentication action for RADIUS server

At the command prompt, type:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
add authentication radiusaction <rad action name> -serverip <rad
server ip> -radkey <key> -radVendorID <ID >-radattributetype <rad
attribute type>
```

Example:

```
add authentication radiusaction radact1 -serverip 1.1.1.1 -radkey 123
 -radVendorID 1234 -radAttributeType 2
```

Add advanced authentication policy for RADIUS server

At the command prompt, type:

```
add authentication policy <policy name> -rule true -action <rad
action name>
```

Example:

```
add authentication policy radpol11 -rule true -action radact1
```

Add authentication login schema

You can use the SingleAuth.xml login schema to display the login page and authenticate the system user at the second level authentication.

At the command prompt, type:

```
add authentication loginSchema <name> -authenticationSchema <string>
```

Example:

```
add authentication loginSchema radschema -authenticationSchema
LoginSchema/SingleAuth.xml
```

Add and bind authentication policy label to RADIUS authentication policy for user login

At the command prompt, type:

```
add authentication policylabel <labelName> [-type ( AAATM_REQ |
RBA_REQ )] [-comment <string>][-loginSchema <string>]
```

Example:

```
add authentication policylabel label1 -type RBA_REQ -loginSchema
radschema
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
bind authentication policylabel <labelName> -policyName <string> -
priority <positive_integer> [-gotoPriorityExpression <expression>][-
nextFactor <string>]
```

Example:

```
bind authentication policylabel label1 -policyName rad pol11 -priority
 1
```

Bind authentication policy global

At the command prompt, type:

```
bind system global [<policyName> [-priority <positive_integer>] [-
nextFactor <string>] [-gotoPriorityExpression <expression>]]
```

Example:

```
bind system global radpol11 -priority 1 -nextFactor label11
```

Use case 7: External authentication enabled for selected external users only

To configure selective external users with two-factor authentication as per the search filter configured in the LDAP action while other system users are authenticated using single factor authentication.

Configure the following steps by using the CLI.

1. Add authentication action for LDAP server
2. Add authentication policy for LDAP policy
3. Add authentication action for RADIUS policy
4. Add authentication policy for RADIUS policy
5. Add authentication login schema
6. Add authentication policy label
7. Bind authentication policy label for login schema
8. Bind authentication system global for RADIUS policy

Add authentication action for LDAP server

At the command prompt, type:

```
add authentication ldapaction <ldap action name> -serverip <IP> -
ldapbase <> -ldapbinddn <binddn name> -ldapbinddnpassword <password
>-ldaploginname <loginname> -groupattrname <grp attribute name> -
subAttributename <>-ssoNameAttribute <>
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Example:

```
add authentication ldapaction ldapact1 -serverip 1.1.1.1 -ldapbase
 base -ldapbindDn name -ldapbindDNpassword password -ldapLoginName
 name -groupAttrName name -subAttributeName name -ssoNameAttribute
name
```

Add authentication policy for LDAP policy

At the command prompt, type:

```
add authentication policy <policy name> --rule true -action <ldap
action name>
```

Example:

```
add authentication policy pol1 -rule true -action ldapact1
```

Add authentication action for RADIUS server

At the command prompt, type:

```
add authentication radiusaction <rad action name> -serverip <rad
server ip> -radkey <key> -radVendorID <ID >-radattributetype <rad
attribute type>
```

Example:

```
add authentication radiusaction radact1 -serverip 1.1.1.1 -radkey 123
 -radVendorID 1234 -radAttributeType 2
```

Add advanced authentication policy for RADIUS server

At the command prompt, type:

```
add authentication policy <policy name> -rule true -action <rad
action name>
```

Example:

```
add authentication policy radpol11 -rule true -action radact1
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Add authentication login schema

You can use the SingleAuth.xml login schema to provide the login page for the appliance to authenticate a system user at a second level of authentication.

At the command prompt, type:

```
add authentication loginSchema <name> -authenticationSchema <string>
```

Example:

```
add authentication loginSchema radschema -authenticationSchema
LoginSchema/SingleAuth.xml
```

Add and bind authentication policy label to RADIUS authentication policy for user login

At the command prompt, type:

```
add authentication policylabel <labelName> [-type ( AAATM_REQ |
RBA_REQ )] [-comment <string>][-loginSchema <string>]
```

Example:

```
add authentication policylabel label1 -type RBA_REQ -loginSchema
radschema
bind authentication policylabel <labelName> -policyName <string> -
priority <positive_integer> [-gotoPriorityExpression <expression>][-
nextFactor <string>]
```

Example:

```
bind authentication policylabel label1 -policyName radpol11 -priority
```

Bind authentication policy global

At the command prompt, type:

```
bind system global [<policyName> [-priority <positive_integer>] [-
nextFactor <string>] [-gotoPriorityExpression <expression>]]
```

Example:

```
bind system global radpol11 -priority 1 -nextFactor label11
```

To configure without two-factor authentication for group users using the search filter:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

1. Add authentication action for LDAP server
2. Add authentication policy for LDAP server
3. Bind authentication system global for LDAP server

Add authentication action for LDAP server

At the command prompt, type:

```
add authentication ldapaction <ldap action name> -serverip <IP> -
ldapbase <> -ldapbinddn <binddn name> -ldapbinddnpassword <password
>-ldaploginname <loginname> -groupattrname <grp attribute name> -
subAttributename <>-searchFilter<>
```

Example:

```
add authentication ldapaction ldapact1 -serverip 1.1.1.1 -ldapbase
 base -ldapbindDn name -ldapbindDNpassword password -ldapLoginName
 name -groupAttrName name -subAttributeName name - searchFilter "
memberOf=CN=grp4,CN=Users,DC=aaatm-test,DC=com"
```

Add authentication policy for LDAP server

At the command prompt, type:

```
add authentication policy <policy name> --rule true -action <ldap
action name>
```

Example:

```
add authentication policy pol1 -rule true -action ldapact1
```

Bind authentication system global for LDAP policy

At the command prompt, type:

```
bind system global ldappolicy -priority <priority> -nextFactor <
policy label name>
```

Example:

```
bind system global pol11 -priority 1 -nextFactor label11
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Display customized prompt message for two factor authentication

When you configure two factor password field with SingleAuth.xml file at /flash/nsconfig/loginschema/LoginSchema

Following is the snippet of a SingleAuth.xml file where 'SecondPassword:'is the second password field name which is prompted to the user to enter a second password.

```
<?xml version="1.0" encoding="UTF-8"?>
<AuthenticateResponse xmlns="http://citrix.com/authentication/response/1">
<Status>success</Status>
<Result>more-info</Result>

</AuthenticationRequirements>
</AuthenticateResponse>
```

Configuring two-factor authentication by using the Citrix ADC GUI

1. Log on to Citrix ADC appliance.
2. Go to **System** > **Authentication** > **Advanced Policies** > **Policy**.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

3. Click Add to create the first level authentication policy.
4. In **Create Authentication Policy** page, set the following parameters.

    a) Name. Name of the policy
    b) Action Type. Select action type as LDAP, Active Directory, RADIUS, TACACS, and so on
    c) Action. The authentication action (profile) to associate with the policy. You can choose an existing authentication action, or click the plus and create an action of the proper type.
    d) Expression. Provide an advanced policy expression.

5. Click **Create** and then **Close**.

    a) Expression. Provide an advanced policy expression.

6. Click **Create**.
7. Click **Add** to create the second level authentication policy.
8. In the **Create Authentication Policy** page, set the following parameters:

    a) Name. Name of the policy
    b) Action Type. Select action type as LDAP, Active Directory, RADIUS, TACACS, and so on
    c) Action. The authentication action (profile) to associate with the policy. You can choose an existing authentication action, or click the + icon to create an action of the proper type.
    d) Expression. Provide an advanced policy expression

9. Click **Create** and then **Close**.

    a) Expression. Provide an advanced policy expression.

10. Click **Create**.
11. In the **Authentication Policies** page, click **Global Binding**.
12. In the **Create Global Authentication Policy Binding** page, select the first level authentication policy, and click **Add Binding**.
13. In the **Policy Binding** page, select the authentication policy and set the following policy binding parameter.

    a) Next Factor. Select the second level authentication policy label.

14. Click **Bind** and **Close**.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

15. Click **Done**.
16. Log on to the Citrix ADC appliance for the second level authentication. The user can now provide the second password. Only if both passwords are correct, the user is allowed to access the Citrix ADC appliance.

> **Note**
>
> The TACACS configured for a second factor authentication does not support authorization and accounting even if you enable it on the "tacacsAction"command. The second factor is used for the authentication purpose only.

Also, see Two factor authentication in Citrix ADC nFactor authentication topic.

Restricted system user authentication to Citrix ADC management interfaces

September 14, 2021

You can restrict system user access to specific Citrix ADC management interfaces such as CLI or API. The `allowedManagementInterface` parameter defines the list of permitted management interfaces. For example, if the management interface for a user or a group is set to API, all users in the group can access Citrix ADC through API and not through CLI. However, the Citrix ADC GUI is part of the API interface and users with API permission can also access the GUI interface.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

> **Note:**
>
> By default, users and groups have access to all interfaces (CLI, API, and the GUI).

You can configure the parameter either at the user level or at the user group level. When you configure at the group level, the configuration is applied across all user accounts in the group. If a user is bound to multiple groups, the appliance allows access to an aggregated set of management interfaces. You can specify settings for a user in a group by configuring the parameter at user level. In this case –user level setting is configured for a group.
In certain scenarios, when the customer is using an external authentication server for managing user accounts, the server details are configured on the appliance. In this case, the administrator can create a user group in the Citrix ADC appliance and add all users (grouped in the external server) to the group. For example, all users managed in the external server are added to the API_users group and the admin can configure the group locally on the appliance.

> **Note:**
>
> The Citrix ADC appliance allows only `nsroot` administrator (superuser) to configure the parameter and does not allow any system user to change the parameter setting.

Configure user access to Citrix ADC management interfaces by using the CLI

To allow user access to a specific management interface, you must set the allowed management interface parameter. At the command prompt, type:

```
set system group <groupName> [-allowedManagementInterface ( CLI | API )]
```

Example:

```
set system group network_usergroup –allowedManagementInterface CLI
```

For parameter description, see Authentication and authorization command reference topic.

To know about Citrix GUI and CLI interfaces, see Access Citrix ADC topic.

TCP Configurations

September 30, 2024

TCP configurations for a Citrix ADC appliance can be specified in an entity called a TCP profile, which is a collection of TCP settings. The TCP profile can then be associated with services or virtual servers that want to use these TCP configurations.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

A default TCP profile can be configured to set the TCP configurations that will be applied by default, globally to all services and virtual servers.

> **Note:**
>
> When a TCP parameter has different values for service, virtual server, and globally, the value of the most-specific entity (the service) is given the highest precedence. The Citrix ADC appliance also provides other approaches for configuring TCP. Read on for more information.

Supported TCP configuration

The Citrix ADC appliance supports the following TCP capabilities:

Defending TCP against spoofing attacks

The **Citrix ADC implementation of** window attenuation is RFC 4953 compliant.

Explicit Congestion Notification (ECN)

The appliance sends notification of the network congestion status to the sender of the data and takes corrective measures for data congestion or data corruption. The Citrix ADC implementation of ECN is RFC 3168 compliant.

Round trip time measurement (RTTM) using the timestamp option

For the TimeStamp option to work, at least one side of the connection (client or server) must support it. The Citrix ADC implementation of the `TimeStamp` option is RFC 1323 compliant.

Detection of spurious retransmissions

This can be done using TCP duplicate selective acknowledgment (D-SACK) and forward RTO-Recovery (F-RTO). If there are spurious retransmissions, the congestion control configurations are reverted to their original state. The Citrix ADC implementation of D-SACK is RFC 2883 compliant, and F-RTO is RFC 5682 compliant.

Congestion control

This functionality use New-Reno, BIC, CUBIC, Nile, and TCP Westwood algorithms.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Window scaling

This increases the **TCP receive** window size beyond its maximum value of 65,535 bytes.

Points to consider before you configure window scaling

- You do not set a high value for the scale factor, because this might have adverse effects on the appliance and the network.
- You do not configure window scaling unless you clearly know why you want to change the window size.
- Both hosts in the TCP connection send a window scale option during connection establishment. If only one side of a connection sets this option, window scaling is not used for the connection.
- Each connection for the same session is an independent window scaling session. For example, when a client's request and the server's response flow through the appliance, it is possible to have window scaling between the client and the appliance without window scaling between the appliance and the server.

TCP maximum congestion window

The window size is a user configurable one. The default value is 8190 bytes.

Selective acknowledgment (SACK)

This uses the data receiver (either a Citrix ADC appliance or a client) notifies the sender about all the segments that have been received successfully.

Forward acknowledgment (FACK)

This functionality avoids TCP congestion by explicitly measuring the total number of data bytes outstanding in the network, and helping the sender (either a Citrix ADC or a client) control the amount of data injected into the network during retransmission timeouts.

TCP connection multiplexing

This functionality enables reuse of existing TCP connections. The Citrix ADC appliance stores established TCP connections to the reuse pool. Whenever a client request is received, the appliance checks for an available connection in the reuse pool and serves the new client if the connection is available. If it is unavailable, the appliance creates a connection for the client request and stores the connection to the reuse pool. The Citrix ADC supports connection multiplexing for HTTP, SSL, and DataStream connection types.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Dynamic receive buffering

This allows the receive buffer to be adjusted dynamically based on memory and network conditions.

Multipath TCP Connection

Multipath TCP (MPTCP) connections between the client and the Citrix ADC appliance. MPTCP connections are not supported between the Citrix ADC appliace and the back-end server. The Citrix ADC implementation of MPTCP is RFC 6824 and RFC 8684 compliant supporting both MPTCP version 0 and 1.

You can view MPTCP statistics such as active MPTCP connections and active subflow connections by using the command line interface.

At the command prompt, type one of the following commands to display a summary or detailed summary of MPTCP statistics, or to clear the statistics display:

1. `Stat MPTCP`
2. `Stat mptcp –detail`
3. `Clearstats basic`

> **Note:**
>
> To establish an MPTCP connection, both the client and the Citrix ADC appliance must support the same MPTCP version. If you use the Citrix ADC appliance as an MPTCP gateway for your servers, the servers do not have to support MPTCP. When the client starts a new MPTCP connection, the appliance identifies the client's MPTPC version from the MP_CAPABALE option in the SYN packet. If the client's version is higher than the one supported on the appliance, the appliance indicates its highest version in the MP_CAPABALE option of the SYN-ACK packet. The client then falls back to a lower version and sends the version number in the MP_CAPABALE option of the ACK packet. If that version is supportable, the appliance continues the MPTCP connection. Otherwise, the appliance falls back to a regular TCP. The Citrix ADC appliance does not initiate subflows (MP_JOIN's). The appliance expects the client to initiate subflows.

Support for additional address advertisement (ADD_ADDR) in MPTCP

In an MPTCP deployment, if you have a virtual server bound with an IP set that has additional virtual server IP addresses, then the additional address advertisement (ADD_ADDR) functionality advertises the IP address of the virtual servers bound to the IP set. Clients can initiate more `MP-JOIN` sub flows to the advertised IP addresses.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Points to remember about MPTCP ADD_ADDR functionality

- You can send a maximum of 10 IP addresses as part of the ADD_ADDR option. If there are more than 10 IP addresses with the mptcpAdvertise parameter enabled, after advertising the 10 IP address, the appliance ignore the rest of the IP addresses.
- If the MP-CAPABLE subflow is made to one of the IP addresses in the IP set instead of the primary virtual server IP address, then the virtual server IP address is advertised if the mptcpAdvertise parameter is enabled for the virtual server IP address

Configure more address advertisement (ADD_ADDR) feature to advertise more VIP address by using the CLI

You can configure the MPTCP ADD_ADDR functionality for both IPv4 and IPv6 address types. In general, multiple IPv4 and IPv6 IPs can be attached to a single IP set and the parameter can be enabled on any subset of IP addresses. In the ADD_ADDR feature, only the IP addresses that have the "mptcpAdvertise"option enabled is advertised and the remaining IP addresses from the IP set is ignored. Complete the following steps to configure the ADD_ADDR feature:

1. Add an IP set.
2. Add an IP address of type virtual server IP (VIP) with MPTCP advertise enabled.
3. Bind the IP address with the IP set.
4. Configure IP set with the load balancing virtual server.

Add an IP set At the command prompt, type:

```
add ipset <name> [-td <positive_integer>]
```

Example:

```
add ipset ipset_1
```

Add an IP address of type virtual server IP (VIP) with MPTCP advertise enabled At the command type:

```
add ns ip <IPAddress>@ <netmask> [-mptcpAdvertise ( YES | NO )] -type <
    type>
```

Example:

```
add ns ip 10.10.10.10 255.255.255.255 -mptcpAdvertise YES -type VIP
```

Bind IP addresses to the IP set At the command prompt, type:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
bind ipset <name> <IPAddress>
```

Example:

```
bind ipset ipset_1 10.10.10.10
```

Configure IP set to load balancing virtual server At the command prompt, type:

```
set lb vserver <name> [-ipset  <string>]
```

Example:

```
set lb vserver lb1 -ipset ipset_1
```

Sample Configuration:

```
Add ipset ipset_1
add ns ip 10.10.10.10 255.255.255.255 -mptcpAdvertise YES -type VIP
bind ipset ipset_1 10.10.10.10
set lb vserver lb1 -ipset ipset_1
```

Configure advertising external IP address using ADD_ADDR functionality

If the advertised IP address is owned by the external entity and the Citrix ADC appliance needs to advertise the IP address, the "MPTCPAdvertise"parameter must be enabled with state and ARP parameters disabled.

Complete the following steps to configure ADD_ADDR for advertising the external IP address.

1. Add an IP address of type virtual server IP (VIP) with MPTCP advertise enabled.
2. Bind the IP address with the IP set.
3. Bind IP set with the load balancing virtual server

Add external IP address of type virtual server IP (VIP) with MPTCP advertise enabled At the command prompt, type:

```
add ns ip <IPAddress>@ <External-IP-mask -type VIP> [-mptcpAdvertise (
    YES | NO )] -type <type> -state DISABLED -arp DISABLED
```

Example:

```
add ns ip 10.10.10.10 255.255.255.255 -mptcpAdvertise YES -type VIP -
state DISABLED -arp DISABLED
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Bind IP addresses to the IP set At the command prompt, type:

```
bind ipset <name> <IPAddress>
```

Example:

```
bind ipset ipset_1 10.10.10.10
```

Configure IP set to load balancing virtual server At the command prompt, type:

```
set lb vserver <name> [-ipset  <string>]
```

Example:

```
set lb vserver lb1 -ipset ipset_1
```

Sample Configuration:

```
add ns ip 10.10.10.10 255.255.255.255 -mptcpAdvertise YES -type VIP
   state DISABLED -arp DISABLED
bind ipset ipset_1 10.10.10.10
set lb vserver lb1 -ipset ipset_1
```

Advertise IP address to MPTCP enabled clients by using the Citrix ADC GUI

Complete the following step to advertise the IP address to the MPTCP enabled clients:

1. Navigate to **System > Network > IPs**.
2. In the details pane, click **Add**.
3. In the **Create IP Address** page, select the **MPTCP Advertise** check box to set the parameter. By default, it is disabled.

Extracting the TCP/IP path overlay option and inserting the client-IP HTTP header

Extracting TCP/IP path overlay and inserting client-IP HTTP header. Data transport through overlay networks often uses connection termination or Network Address Translation (NAT), in which the IP address of the source client is lost. To avoid this, the Citrix ADC appliance extracts the TCP/IP path overlay option and inserts the source client's IP address into the HTTP header. With the IP address in the header, the web server can identify the source client that made the connection. The extracted data is valid for a lifetime of the TCP connection and therefore, this prevents the next hop host from having to interpret the option again. This option is applicable only for web services that have the client-IP insertion option enabled.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

TCP segmentation offload

Offloads TCP segmentation to the NIC. If you set the option as “AUTOMATIC”, TCP segmentation is offloaded to the NIC, if NIC is supported.

Synchronizing cookie for TCP handshake with clients

This is used for resisting SYN flood attacks. You can enable or disable the `SYNCOOKIE` mechanism for TCP handshake with clients. Disabling `SYNCOOKIE` prevents `SYN` attack protection on the Citrix ADC appliance.

Learning MSS to enable MSS learning for all the virtual servers configured on the appliance

Supportable TCP Parameters

The following table provides a list of TCP parameters and its default value configured on a Citrix ADC appliance.

Parameter	Default Value	Description
Window Management		
TCP Delayed-ACK Timer	100 millisec	Timeout for TCP delayed ACK, in milliseconds.
TCP minimum Retransmission Timeout(RTO) in milli sec	1000 milli sec	Minimum retransmission timeout, in milliseconds, specified in 10-millisecond increments (value must yield a whole number if divided by 10)
Connection idle time before starting keep-alive probes	900 seconds	Silently drop TCP established connections on idle timeouts established connections on idle timeout
TCP Timestamp Option	DISABLED	The timestamp option allows for accurate RTT measurement. Enable or Disable TCP Timestamp option.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Parameter	Default Value	Description
Multipath TCP session timeout	0 seconds	MPTCP session timeout in seconds. If this value is not set, idle. MPTCP sessions are flushed after the virtual server's client idle timeout.
Silently Drop HalfClosed connections on idle timeout	0 seconds	Silently drop TCP half closed connections on idle timeout.
Silently Drop Established connections on idle timeout	DISABLED	Silently drop TCP established connections on idle timeout
Memory Management		
TCP Buffer Size	131072 bytes	TCP buffer size is the receive buffer size on the Citrix ADC. This buffer size is advertised to clients and servers from Citrix ADC and it controls their ability to send data to Citrix ADC. The default buffer size is 8K and usually it is safe to increment this when talking to internal server farms. The buffer size is also impact by the actual application layer in Citrix ADC like for SSL endpoint cases it is set to 40 K and for Compression it is set to 96 K. **Note:** The buffer size argument must be set for dynamic adjustments to take place.
TCP Send Buffer Size	131072 bytes	TCP Send Buffer Size

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Parameter	Default Value	Description
TCP Dynamic Receive Buffering	DISABLED	Enable or disable dynamic receive buffering. When enabled, it allows the receive buffer to be adjusted dynamically based on memory and network conditions. **Note:** The buffer size argument must be set for dynamic adjustments to take place
TCP Max congestion window(CWND)	524288 bytes	TCP Maximum Congestion Window
Window Scaling status	ENABLED	Enable or disable window scaling.
Window Scaling factor	8	Factor used to calculate the new window size. This argument is needed only when window scaling is enabled.
Connection Setup		
Keep-alive probes	DISABLED	Send periodic TCP keep-alive (KA) probes to check if peer is still up.
Connection idle time before starting keep-alive probes	900 seconds	Duration, in seconds, for the connection to be idle, before sending a keep-alive (KA) probe.
Keep-alive probe interval	75 seconds	Time interval, in seconds, before the next keep-alive (KA) probe, if the peer does not respond.
Maximum keep-alive probes to be missed before dropping connection.	3	Number of keep-alive (KA) probes to be sent when not acknowledged, before assuming the peer to be down.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Parameter	Default Value	Description
RST window attenuation (spoof protection).	DISABLED	Enable or disable RST window attenuation to protect against spoofing. When enabled, the reply is with corrective ACK when a sequence number is invalid.
Accept RST with last acknowledged sequence number.	ENABLED	
Data transfer		
Immediate ACK on PUSH packet	ENABLED	Send immediate positive acknowledgment (ACK) on receipt of TCP packets with PUSH flag.
Maximum packets per MSS	0	Maximum number of octets to allow in a TCP data segment
Nagle's Algorithm	DISABLED	Nagle's Algorithm fights with the problem of small packets in TCP transmission. Applications like Telnet and other real time engines which require every key stroke to be passed to the other side often create small packets. With Nagle's algorithm Citrix ADC can buffer such small packets and sends them together to increase on the connection efficiency. This algorithm needs to work along with other TCP optimization techniques in the Citrix ADC.
Maximum TCP segments allowed in a burst	10 MSS	Maximum number of TCP segments allowed in a burst
Maximum out-of-order packets to queue	300	Maximum size of out-of-order packets queue. A value of 0 means no limit
Congestion Control		

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Parameter	Default Value	Description
TCP Flavor	CUBIC	
Initial congestion window(cwnd) setting	4 MSS	Initial maximum upper limit on the number of TCP packets that can be outstanding on the TCP link to the server
TCP Explicit Congestion Notification(ECN)	DISABLED	Explicit Congestion Notification (ECN) provides end to end notification of network congestion without dropping packets.
TCP Max congestion window(CWND)	524288 bytes	TCP maintains a congestion window (CWND), limiting the total number of unacknowledged packets that may be in transit end-to-end. In TCP, the congestion window is one of the factors that determines the number of bytes that can be outstanding at any time. The congestion window is a means of stopping a link between the sender and the receiver from becoming overloaded with too much traffic. It is calculated by estimating how much congestion there is on the link.
TCP Hybrid Start (HyStart)	8 bytes	
TCP minimum Retransmission Timeout(RTO) in milli sec	1000	Minimum retransmission timeout, in milliseconds, specified in 10-millisecond increments (value must yield a whole number if divided by 10).
TCP dupack threshold	DISABLED	

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Parameter	Default Value	Description
Burst Rate Control	3	TCP Burst Rate Control DISABLED/FIXED/DYNAMIC. FIXED requires a TCP rate to be set
TCP Rate	DISABLED	TCP connection payload send rate in Kb/s
TCP Rate Maximum Queue	0	Maximum connection queue size in bytes, when BurstRateControl is used.
MPTCP		
Multipath TCP	DISABLED	Multipath TCP (MPTCP) is a set of extensions to regular TCP to provide a Multipath TCP service, which enables a transport connection to operate across multiple paths simultaneously.
Multipath TCP drop data on pre-established subflow	DISABLED	Enable or disable silently dropping the data on Pre-Established subflow. When enabled, DSS data packets are dropped silently instead of dropping the connection when data is received on pre established subflow.
Multipath TCP fastopen	DISABLED	Enable or disable Multipath TCP fastopen. When enabled, DSS data packets are accepted before receiving the third ack of SYN handshake.
Multipath TCP session timeout	0 seconds	MPTCP session timeout in seconds. If this value is not set, idle MPTCP sessions are flushed after the virtual server's client idle timeout.
Security		

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Parameter	Default Value	Description
SYN spoof protection	DISABLED	Enable or disable drop of invalid SYN packets to protect against spoofing. When disabled, established connections are reset when a SYN packet is received.
TCP Syncookie	DISABLED	This is used for resisting SYN flood attacks. Enable or disable the SYNCOOKIE mechanism for TCP handshake with clients. Disabling SYNCOOKIE prevents SYN attack protection on the Citrix ADC appliance.
Loss Detection and Recovery		
Duplicate Selective Acknowledgment (DSACK)	ENABLED	A Citrix ADC appliance uses Duplicate Selective Acknowledgment (DSACK) to determine if a retransmission was sent in error.
Forward RTO recovery (FRTO)	ENABLED	Detects spurious TCP retransmission timeouts. After retransmitting the first unacknowledged segment triggered by a timeout, the algorithm of the TCP sender monitors the incoming acknowledgments to determine whether the timeout was spurious. It then decides whether to send new segments or retransmit unacknowledged segments. The algorithm effectively helps to avoid another unnecessary retransmissions and thereby improves TCP performance in the case of a spurious timeout.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Parameter	Default Value	Description
TCP Forward Acknowledgment (FACK)	ENABLED	Enable or disable FACK (Forward ACK).
Selective Acknowledgement(SACK) status	ENABLED	TCP SACK addresses the problem of multiple packet losses which reduces the overall throughput capacity. With selective acknowledgment the receiver can inform the sender about all the segments which are received successfully, enabling the sender to only retransmit the segments which were lost. This technique helps Citrix ADC improve overall throughput and reduce the connection latency.
Maximum packets per retransmission	1	Allows Citrix ADC to control how many packets to be retransmitted in one attempt. When Citrix ADC receives a partial ACK and it has to do retransmission then this setting is considered. This does not impact the RTO based retransmissions.
TCP Delayed-ACK Timer	100 millisec	Timeout for TCP delayed ACK, in milliseconds
TCO Optimization		
TCP Optimization mode	TRANSPARENT	TCP Optimization modes TRANSPARENT/ENDPOINT
Apply adaptive TCP optimizations	DISABLED	Apply Adaptive TCP optimizations

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Parameter	Default Value	Description
TCP Segmentation Offload	AUTOMATIC	Offload TCP segmentation to the NIC. If set to AUTOMATIC, TCP segmentation is offloaded to the NIC, if the NIC supports it.
ACK Aggregation	DISABLED	Enable or disable ACK Aggregation
TCP Time-wait(or Time_wait)	40 secs	Time to elapse before releasing a closed TCP connection
Delink client and server on RST	DISABLED	Delink client and server connection, when there is outstanding data to be sent to the other side.

Setting Global TCP Parameters

The Citrix ADC appliance allows you to specify values for TCP parameters that are applicable to all Citrix ADC services and virtual servers. This can be done using:

- Default TCP profile
- Global TCP command
- TCP buffering feature

> **Notes:**
>
> - The `recvBuffSize` parameter of the set ns tcpParam command is deprecated from release 9.2 onwards. In later releases, set the buffer size by using the `bufferSize` parameter of the set ns tcpProfile command. If you upgrade to a release where the `recvBuffSize` parameter is deprecated, the `bufferSize` parameter is set to its default value.
> - While configuring TCP profile, ensure that the TCP `buffersize` parameter is lesser or equal to the `httppipelinebuffersize` parameter.
> If the `buffersize` parameter in TCP profile is greater than the `httppipelinebuffersize` parameter in HTTP profile, the TCP payload might get accumulated and exceed the HTTP pipeline buffer size. This results in Citrix ADC appliance resetting the TCP connection.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Default TCP profile

A TCP profile, named as `nstcp_default_profile`, is used to specify TCP configurations that is used if no TCP configurations are provided at the service or virtual server level.

> **Notes:**
>
> - Not all TCP parameters can be configured through the default TCP profile. Some settings have to be performed by using the global TCP command (see section below).
> - The default profile does not have to be explicitly bound to a service or virtual server.

To configure the default TCP profile

- Using the command line interface, at the command prompt enter:

```
set ns tcpProfile nstcp_default_profile...
```

- On the GUI, navigate to **System** > **Profiles**, click **TCP Profiles** and update nstcp_default_profile.

Global TCP command

Another approach you can use to configure global TCP parameters is the global TCP command. In addition to some unique parameters, this command duplicates some parameters that can be set by using a TCP profile. Any update made to these duplicate parameters is reflected in the corresponding parameter in the default TCP profile.

For example, if the SACK parameter is updated using this approach, the value is reflected in the SACK parameter of the default TCP profile (nstcp_default_profile).

> **Note:**
>
> Citrix recommends that you use this approach only for TCP parameters that are not available in the default TCP profile.

To configure the global TCP command

- Using the command line interface, at the command prompt enter:

```
set ns tcpParam ...
```

- On the GUI, navigate to **System > Settings**. Click **Change TCP parameters** and, update the required TCP parameters.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

TCP buffering feature

Citrix ADC provides a feature called TCP buffering that you can use to specify the TCP buffer size. The feature can be enabled globally or at service level.

> **Note:**
>
> The buffer size can also be configured in the default TCP profile. If the buffer size has different values in the TCP buffering feature and the default TCP profile, the greater value is applied.

To configure the TCP buffering feature globally

- At the command prompt enter:

  enable ns mode TCPB

  ```
  set ns tcpbufParam -size <positiveInteger> -memLimit <positiveInteger
  >
  ```

- On the GUI, navigate to **System** > **Settings**, click **Configure Modes** and, select **TCP Buffering**.

  And, navigate to **System** > **Settings**, click **Change TCP parameters**, specify values for **Buffer size** and **Memory usage limit**.

Setting Service or Virtual Server Specific TCP Parameters

Using TCP profiles, you can specify TCP parameters for services and virtual servers. You must define a TCP profile (or use a built-in TCP profile) and associate the profile with the appropriate service and virtual server.

> **Note:**
>
> You can also modify the TCP parameters of default profiles as per your requirements.

You can specify the TCP buffer size at service level using the parameters specified by the TCP buffering feature.

To specify service or virtual server level TCP configurations by using the command line interface

At the command prompt, perform the following:

1. Configure the TCP profile.

   ```
   1 set ns tcpProfile <profile-name>...
   ```

2. Bind the TCP profile to the service or virtual server.

```
1    set service <name> ....
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Example:

```
> set service service1 -tcpProfileName profile1
```

To bind the TCP profile to the virtual server:

```
set lb vserver <name> ....
```

Example:

```
> set lb vserver lbvserver1 -tcpProfileName profile1
```

To specify service or virtual server level TCP configurations by using the GUI

At the GUI, perform the following:

1. Configure the TCP profile.

   Navigate to **System** > **Profiles** > **TCP Profiles**, and create the TCP profile.

2. Bind the TCP profile to the service or virtual server.

   Navigate to **Traffic Management** > **Load Balancing** > **Services/Virtual Servers**, and create the TCP profile, which should be bound to the service or virtual server.

Built-in TCP Profiles

For convenience of configuration, the Citrix ADC provides some built-in TCP profiles. Review the built-in profiles listed for the following and select a profile and use it as it is or modify it to meet your requirements. You can bind these profiles to your required services or virtual servers.

Built-in profile	Description
nstcp_default_profile	Represents the default global TCP settings on the appliance.
nstcp_default_tcp_lan	Useful for back-end server connections, where these servers reside on the same LAN as the appliance.
nstcp_default_WAN	useful for WAN deployments.
nstcp_default_tcp_lan_thin_stream	Similar to the nstcp_default_tcp_lan profile. However, the settings are tuned for small size packet flows.
nstcp_default_tcp_interactive_stream	Similar to the nstcp_default_tcp_lan profile. However, it has a reduced delayed ACK timer and ACK on **PUSH packet** settings.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Built-in profile	Description
nstcp_default_tcp_lfp	Useful for long fat pipe networks (WAN) on the client side. Long fat pipe networks have long delay, high bandwidth lines with minimal packet drops.
nstcp_default_tcp_lfp_thin_stream	Similar to the nstcp_default_tcp_lfp profile. However, the settings are tuned for small size packet flows.
nstcp_default_tcp_lnp	Useful for long narrow pipe networks (WAN) on the client side. Long narrow pipe networks have considerable packet loss occasionally.
nstcp_default_tcp_lnp_thin_stream	Similar to the nstcp_default_tcp_lnp profile. However, the settings are tuned for small size packet flows.
nstcp_internal_apps	Useful for internal applications on the appliance (for example, GSLB site syncing). This contains tuned window scaling and SACK options for the desired applications. This profile should not be bound to applications other than internal applications.
nstcp_default_Mobile_profile	Useful for mobile devices.
nstcp_default_XA_XD_profile	Useful for the Citrix Virtual Apps and Desktops deployment.

Sample TCP Configurations

Sample command line interface examples for configuring the following:

Defending TCP against spoofing attacks

Enable the Citrix ADC to defend TCP against spoof attacks. By default the "rstWindowAttenuation" parameter is disabled. This parameter is enabled to protect the appliance against spoofing. If you enable, it replies with corrective acknowledgment (ACK) for an invalid sequence number. Possible values are Enabled, Disabled.

Where, the RST window attenuate parameter protects the appliance against spoofing. When enabled, reply with corrective ACK when a sequence number is invalid.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
1      > set ns tcpProfile profile1 -rstWindowAttenuate ENABLED -
           spoofSynDrop ENABLED
2      Done
3      > set lb vserver lbvserver1 -tcpProfileName profile1
4      Done
```

Explicit Congestion Notification (ECN)

Enable ECN on the required TCP profile

```
1      > set ns tcpProfile profile1 -ECN ENABLED
2      Done
3      > set lb vserver lbvserver1 -tcpProfileName profile1
4      Done
```

Selective Acknowledgment (SACK)

Enable SACK on the required TCP profile.

```
1      > set ns tcpProfile profile1 -SACK ENABLED
2      Done
3      > set lb vserver lbvserver1 -tcpProfileName profile1
4      Done
```

Forward Acknowledgment (FACK)

Enable FACK on the required TCP profile.

```
1  > set ns tcpProfile profile1 -FACK ENABLED
2  > set lb vserver lbvserver1 -tcpProfileName profile1
```

Window Scaling (WS)

Enable window scaling and set the window scaling factor on the required TCP profile.

```
1  set ns tcpProfile profile1 –WS ENABLED –WSVal 9
2  Done
3  set lb vserver lbvserver1 -tcpProfileName profile1
4  Done
```

Maximum Segment Size (MSS)

Update the MSS related configurations.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
1 > set ns tcpProfile profile1 –mss 1460 - maxPktPerMss 512
2 Done
3 > set lb vserver lbvserver1 -tcpProfileName profile1
4 Done
```

Citrix ADC to learn the MSS of a virtual server

Enable the Citrix ADC to learn the VSS and update other related configurations.

```
1 > set ns tcpParam –learnVsvrMSS ENABLED –mssLearnInterval 180 -
     mssLearnDelay 3600
2 Done
```

TCP keep-alive

Enable TCP keep-alive and update other related configurations.

```
> set ns tcpProfile profile1 –KA ENABLED –KaprobeUpdateLastactivity
ENABLED -KAconnIdleTime 900 -KAmaxProbes 3 -KaprobeInterval 75
Done
> set lb vserver lbvserver1 -tcpProfileName profile1
Done
```

Buffer size - using TCP profile

Specify the buffer size.

```
> set ns tcpProfile profile1 –bufferSize 8190
Done
> set lb vserver lbvserver1 -tcpProfileName profile1
Done
```

Buffer size - using TCP buffering feature

Enable the TCP buffering feature (globally or for a service) and then specify the buffer size and the memory limit.

```
> enable ns feature TCPB
Done
> set ns tcpbufParam -size 64 -memLimit 64
Done
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

MPTCP

Enable MPTCP and then set the optional MPTCP configurations.

```
> set ns tcpProfile profile1 -mptcp ENABLED
Done
> set ns tcpProfile profile1 -mptcpDropDataOnPreEstSF ENABLED -
mptcpFastOpen ENABLED -mptcpSessionTimeout 7200
Done
> set ns tcpparam -mptcpConCloseOnPassiveSF ENABLED -mptcpChecksum
ENABLED -mptcpSFtimeout 0 -mptcpSFReplaceTimeout 10
-mptcpMaxSF 4 -mptcpMaxPendingSF 4 -mptcpPendingJoinThreshold 0 -
mptcpRTOsToSwitchSF 2 -mptcpUseBackupOnDSS ENABLED
Done
```

Congestion control

Set the required TCP congestion control algorithm.

```
set ns tcpProfile profile1 -flavor Westwood
Done
> set lb vserver lbvserver1 -tcpProfileName profile1
Done
```

Dynamic receive buffering

Enable dynamic receive buffering on the required TCP profile.

```
> set ns tcpProfile profile1 -dynamicReceiveBuffering ENABLED
Done
> set lb vserver lbvserver1 -tcpProfileName profile1
Done
```

Support for TCP Fast Open (TFO) in Multipath TCP (MPTCP)

A Citrix ADC appliance now supports the TCP Fast Open (TFO) mechanism for establishing Multipath TCP (MPTCP) connections and speed up data transfers. The mechanism allows subflow data to be carried during the initial MPTCP connection handshake in SYN and SYN-ACK packets and also enables data to be consumed by the receiving node during the MPTCP connection establishment.

For more information, see TCP Fast Open topic.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Support for Variable TFO Cookie Size for MPTCP

A Citrix ADC appliance now enables you to configure a variable length TCP Fast Open (TFO) cookie of a minimum size of 4 bytes and a maximum size of 16 bytes in a TCP profile. By doing this, the appliance can respond with the configured TFO cookie size in the SYN-ACK packet to the client.

To configure the TCP Fast Open (TFO) cookie in a TCP profile by using the command line interface

At the command prompt, type:

```
set tcpProfile nstcp_default_profile -tcpFastOpenCookieSize <positive_integer
>
```

Example

```
set tcpProfile nstcp_default_profile -tcpFastOpenCookieSize 8
```

To configure the TCP Fast Open (TFO) cookie in a TCP profile by using the GUI

1. Navigate to **Configuration** > **System** > Profiles.
2. In the details pane, go to **TCP Profiles** tab and select a TCP profile.
3. In the **Configure TCP Profile** page, set the **TCP Fast Open** cookie size.
4. Click **OK** and **Done**.

SYN-Cookie timeout interval

The `TCPSyncookie` parameter is enabled by default in TCP profiles to provide robust (RFC 4987) based protection against SYN Attacks. If you need to accommodate custom TCP clients that are not compatible with this protection but still want to ensure a fallback in case of attack, the `synAttackDetection` handles this for you by automatically activating the `SYNCookie` behavior internally for time determined by the `autosyncookietimeout` parameter..

To configure the maximum SYN ACK retransmission threshold by using the command line interface:

At the command prompt, type:

```
1     set ns tcpparam [-maxSynAckRetx <positive_integer>]
2
3     Set ns tcpparam [-maxSynAckRetx 150]
```

To configure auto SYN cookie timeout interval by using the command line interface

At the command prompt, type:

```
set ns tcpparam [-autosyncookietimeout <positive_integer>]
```

```
Set ns tcpparam [-autosyncookietimeout 90]
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Delink client and server connection

When enabled, the parameter delinks client and server connection when there is outstanding data to be sent to the other side. By default, the parameter is disabled.

```
set ns tcpparam -delinkClientServerOnRST ENABLED
Done
```

HTTP configurations

September 28, 2023

> **Important:**
>
> Starting from Citrix ADC release 13.0 build 71.x, a Citrix ADC appliance can handle large header size HTTP requests to accommodate the L7 application requests. The header size can be configurable up to 120 KB.

HTTP configurations for a Citrix ADC appliance can be specified in an entity called an HTTP profile, which is a collection of HTTP settings. The HTTP profile can then be associated with services or virtual servers that want to use these HTTP configurations.

A default HTTP profile can be configured to set the HTTP configurations that is applied by default, globally to all services and virtual servers.

> **Note:**
>
> When an HTTP parameter has different values for service, virtual server, and globally, the value of the most-specific entity (the service) is given the highest precedence.

The Citrix ADC appliance also provides other approaches for configuring HTTP. Read on for more information.

The Citrix ADC supports a WebSocket protocol which allows browsers and other clients to create a bidirectional, full duplex TCP connection to the servers. The Citrix ADC implementation of WebSocket is RFC 6455 compliant.

> **Note:**
>
> A Citrix ADC appliance now supports the User Source IP (USIP) address configuration for both HTTP/1.1 and HTTP/2 protocols.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Setting global HTTP parameters

The Citrix ADC appliance allows you to specify values for HTTP parameters that are applicable to all Citrix ADC services and virtual servers. This can be done using:

- Default HTTP profile
- Global HTTP command

Default HTTP profile

An HTTP profile, named as nshttp_default_profile, is used to specify HTTP configurations that is used if no HTTP configurations are provided at the service or virtual server level.

> **Notes:**
>
> - Not all HTTP parameters can be configured through the default HTTP profile. Some settings are performed by using the global HTTP command (see the following section).
> - The default profile does not have to be explicitly bound to a service or virtual server.

To configure the default HTTP profile

- Using the command line interface, at the command prompt enter:

  ```
  set ns httpProfile nshttp_default_profile ...
  ```

- On the GUI, navigate to **System** > **Profiles**, click **HTTP Profiles** and update nshttp_default_profile.

Global HTTP command

Another approach you can use to configure global HTTP parameters is the global HTTP command. In addition to some unique parameters, this command duplicates some parameters that can be set by using an HTTP profile. Any update made to these duplicate parameters is reflected in the corresponding parameter in the default HTTP profile.

For example, if the maxReusePool parameter is updated using this approach, the value is reflected in the maxReusePool parameter of the default HTTP profile (nshttp_default_profile).

> **Note:**
>
> Citrix recommends that you use this approach only for HTTP parameters that are not available in the default HTTP profile.

To configure the global HTTP command

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- Using the command line interface, at the command prompt enter:

  ```
  set ns httpParam ...
  ```

- On the GUI, navigate to **System > Settings**, click **Change HTTP parameters** and update the required HTTP parameters.

To configure an ignore Coding scheme for connect request

To enable HTTP/2 and set HTTP/2 parameters to ignore the Coding scheme in the connect request, at the command prompt, type:

```
set ns httpParam [-ignoreConnectCodingScheme ( ENABLED | DISABLED )]
```

Example:

```
set ns httpParam -ignoreConnectCodingScheme ENABLED
```

To bind the HTTP profile to a virtual server by using the Citrix ADC command line

Configure HTTP profile to drop TRACE or TRACK invalid requests

You can enable the markTraceReqInval parameter to mark TRACK and TRACK requests as invalid. When you enable this option along with the dropInvalidReqs option on the virtual IP address, you can reset a client sending TRACE or TRACK requests to a Citrix ADC appliance.

To configure the HTTP profile using the CLI

At the command prompt, type:

```
set ns httpProfile <profile name> [-markTraceReqInval ENABLED |
DISABLED ]
```

Example:

```
set ns httpProfile profile1 -markTraceReqInval ENABLED
```

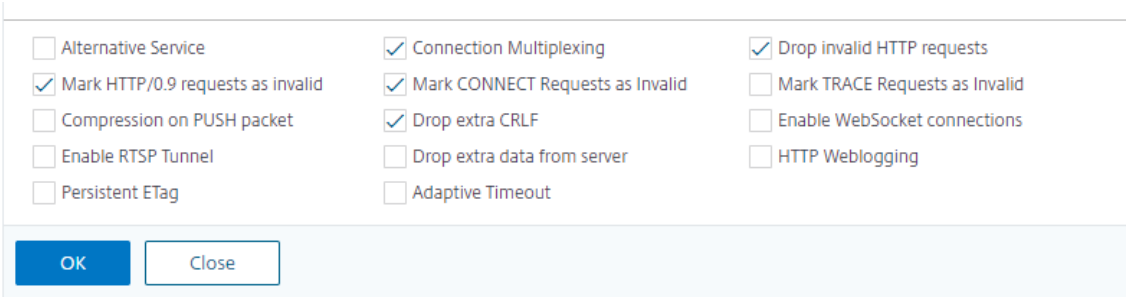
Configure HTTP profile for a service group

At the command prompt, type:

```
1 add serviceGroup <serviceGroupName>@ <serviceType> [-cacheType <
    cacheType>] [-td <positive_integer>] [-maxClient <positive_integer>]
     [-maxReq <positive_integer>] [-cacheable ( YES | NO )] [-cip (
    ENABLED | DISABLED ) [<cipHeader>]] [-usip ( YES | NO )] [-
    pathMonitor ( YES | NO )] [-pathMonitorIndv ( YES | NO )] [-
    useproxyport ( YES | NO )] [-healthMonitor ( YES | NO )] [-sp ( ON |
     OFF )] [-rtspSessionidRemap ( ON | OFF )] [-cltTimeout <secs>] [-
    svrTimeout <secs>] [-CKA ( YES | NO )] [-TCPB ( YES | NO )] [-CMP (
    YES | NO )] [-maxBandwidth
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
2  <positive_integer>] [-monThreshold <positive_integer>] [-state ENABLED
      DISABLED )][-downStateFlush ( ENABLED | DISABLED )] [-tcpProfileName
       <string>] [-httpProfileName <string>] [-comment <string>] [-
      appflowLog ( ENABLED | DISABLED )] [-netProfile <string>] [-
      autoScale <autoScale> -memberPort <port> [-autoDisablegraceful ( YES
       | NO )] [-autoDisabledelay <secs>] ] [-monConnectionClose ( RESET |
       FIN )]
```



Example:

```
add serviceGroup Service-Group-1 HTTP -maxClient 0 -maxReq 0 -cip
ENABLED -usip NO -useproxyport YES -cltTimeout 200 -svrTimeout 300 -
CKA NO -TCPB NO -CMP NO -httpProfileName profile1
```

Configure the HTTP profile using the Citrix ADC GUI

To mark TRACE or TRACK invalid requests, complete the following procedure.

1. Sign into Citrix ADC appliance and navigate to **Configuration** > **System** > **Profiles**.
2. In the **HTTP Profiles** tab page, click **Add**.
3. In the **Create HTTP Profile** page, select **Mark TRACE Requests as Invalid** option.
4. Click **Create**.

Setting service or virtual server specific HTTP parameters

Using HTTP profiles, you can specify HTTP parameters for services and virtual servers. You have to define an HTTP profile (or use a built-in HTTP profile) and associate the profile with the appropriate service and virtual server.

> **Note:**
>
> You can also modify the HTTP parameters of default profiles as per your requirements.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

To specify service or virtual server level HTTP configurations by using the command line interface

At the command prompt, perform the following:

1. Configure the HTTP profile.

   ```
   set ns httpProfile <profile-name>...
   ```

2. Bind the HTTP profile to the service or virtual server.

   To bind the HTTP profile to the service:

```
set service <name> .....
```

Example:

```
1 > set service service1 -httpProfileName profile1
```

To bind the HTTP profile to the virtual server:

```
set lb vserver <name> .....
```

Example:

```
1 > set lb vserver lbvserver1 -httpProfileName profile1
```

To specify service or virtual server level HTTP configurations by using the GUI

At the GUI, perform the following:

1. Configure the HTTP profile.

   Navigate to **System** > **Profiles** > **HTTP Profiles**, and create the HTTP profile.

2. Bind the HTTP profile to the service or virtual server.

   Navigate to **Traffic Management** > **Load Balancing** > **Services/Virtual Servers**, and create the HTTP profile, which must be bound to the service/virtual server.

Built-in HTTP profiles

For convenience of configuration, the Citrix ADC provides some built-in HTTP profiles. Review the profiles listed and use it as it is or modify it to meet your requirements. You can bind these profiles to the required services or virtual servers.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Built-in profile	Description
nshttp_default_profile	Represents the default global HTTP settings on the appliance.
nshttp_default_strict_validation	Settings for deployments that require strict validation of HTTP requests and responses.

Sample HTTP configurations

Sample command line interface examples to configure the following:

- HTTP band statistics
- WebSocket connections

HTTP band statistics

Specify the band size for HTTP requests and responses.

```
> set protocol httpBand reqBandSize 300 respBandSize 2048
Done
> show protocol httpband -type REQUEST
```

WebSocket connections

Enable WebSocket on the required HTTP profile.

```
> set ns httpProfile http_profile1 -webSocket ENABLED
Done
> set lb vserver lbvserver1 -httpProfileName profile1
Done
```

HTTP/2 configuration

November 29, 2024

> **Note:**
>
> - The HTTP/2 functionality is supported on Citrix ADC MPX, VPX, and SDX.
> - The HTTP/2 functionality is not supported on Citrix Gateway.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

The problem with web application performance is directly related to the trend toward increasing the page size and the number of objects on the webpages. HTTP/1.1 was developed to support smaller webpages, slower Internet connections, and more limited server hardware than are common today. It is not suitable for new technologies such as JavaScript and cascading style sheets (CSS) or new media types such as Flash videos and graphics-rich images. This is because it can request only one resource per connection to the server. The limitation significantly increases the number of round trips, causing longer page-rendering and reduced network performance.

The HTTP/2 protocol addresses these limitations by allowing communication to occur with less data transmitted over the network, and providing the ability to send multiple requests and responses across a single connection. At its core, HTTP/2 addresses the key limitations of HTTP/1.1 by using the underlying network connections more efficiently. It changes the way requests and responses travel over the network.

HTTP/2 is a binary protocol. It is more efficient to parse, more compact on the wire, and most importantly, it is less error-prone, compared to textual protocols like HTTP/1.1. The HTTP/2 protocol uses a binary framing layer that defines the frame type and how HTTP messages are encapsulated and transferred between the client and server. The HTTP/2 functionality supports the use of the CONNECT method to establish a tunnel connection through a single HTTP/2 stream to a remote host.

The HTTP/2 protocol includes many performance-enhancing changes that significantly improve performance, particularly for clients connecting over a mobile network.

The following table lists the major improvements in HTTP/2 over HTTP/1.1:

HTTP/2 features	Description
Header Compression	HTTP headers have much repetitive information and therefore consume unnecessary bandwidth during data transmission. HTTP/2 reduces bandwidth requirements by compressing the header and minimizing the requirement to transport HTTP headers with every request and response.
Connection Multiplexing	Latency can have a huge impact on page load times and the end user experience. Connection multiplexing overcomes this problem by sending multiple requests and responses across a single connection.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

HTTP/2 features	Description
Server Push	Server push enables the server to proactively push content to the client browser, avoiding round-trip delay. This feature caches the responses that it thinks the client needs, reduces the number round trips, and improves the page rendering time. Important: The Citrix ADC appliance does not support the server push functionality.
No Head-of-line Blocking	Under HTTP 1.1, browsers can download one resource at a time per connection. When a browser has to download a large resource, it blocks all other resources from downloading until the first download is complete. HTTP/2 overcomes this problem with a multiplexing approach. It allows the client browser to download other web components in parallel over the same connection and display them as they become available.
Request Prioritization	Not all resources have equal priority when the browser renders a webpage. To accelerate the load time, all modern browsers prioritize requests by type of asset, their location on the page, and even by learned priority from previous visits. With HTTP/1.1, the browser has limited ability to use the priority data, because this protocol does not support multiplexing, and there is no way to communicate request prioritization by the server. The result is unnecessary network latency. HTTP/2 overcomes this problem by allowing the browser to dispatch all requests. The browser can communicate its stream prioritization preference via stream dependencies and weights, enabling the servers to optimize response delivery. Important: The Citrix ADC appliance does not support the request prioritization functionality.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

How HTTP/2 works

A Citrix ADC appliance supports HTTP/2 on the client side as well on the server side. On the client side, the Citrix ADC appliance acts as a server that hosts an HTTP/HTTPS virtual server for HTTP/2. On the back-end side, the Citrix ADC acts as a client to the servers that are bound to the virtual server.

Therefore, the Citrix ADC appliance maintains separate connections on the client side as well on the server side. The Citrix ADC appliance has separate HTTP/2 configurations for the client side and the server side.

HTTP/2 for HTTPS (SSL) load balancing configuration

For an HTTPS load balancing configuration, the Citrix ADC appliance uses the TLS ALPN extension (RFC 7301) to determine whether the client/server supports HTTP/2. If it does, the appliance chooses HTTP/2 as the application-layer protocol to transmit data (as described in RFC 7540 - Section 3.3) on the client/server side.
The appliance uses the following order of preference when choosing the application-layer protocol through the TLS ALPN extension:

- HTTP/2 (if enabled in the HTTP profile)
- SPDY (if enabled in the HTTP profile)
- HTTP/1.1

HTTP/2 for HTTP load balancing configuration

For an HTTP load balancing configuration, the Citrix ADC appliance uses one of the following methods to start communicating with the client/server using HTTP/2.

> **Note:**
>
> In the following method descriptions, client and server are general terms for an HTTP/2 connection. For example, for a load balancing setup of a Citrix ADC appliance using HTTP/2, the Citrix ADC appliance acts as a server on the client side and acts as a client to the server side.

- **HTTP/2 Upgrade**. A client sends an HTTP/1.1 request to a server. The request includes an upgrade header, which asks the server to upgrade the connection to HTTP/2. If the server supports HTTP/2, the server accepts the upgrade request and notifies it in its response. The client and the server start communicating using HTTP/2 after the client receives the upgrade confirmation response.
- **Direct HTTP/2**. A client directly starts communicating to a server in HTTP/2 instead of using the HTTP/2 upgrade method. If the server does not support HTTP/2 or is not configured to directly

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

accept HTTP/2 requests, it drops the HTTP/2 packets from the client. This method is helpful if the admin of the client device already knows that the server supports HTTP/2.

- **Direct HTTP/2 using Alternative Service (ALT-SVC).** A server advertises that it supports HTTP/2 to a client by including an Alternative Service (ALT-SVC) field in its HTTP/1.1 response. If the client is configured to understand the ALT-SVC field, the client and the server start directly communicating using HTTP/2 after the client receives the response.

The Citrix ADC appliance provides configurable options in an HTTP profile for the HTTP/2 methods. These HTTP/2 options can be applied to the client side as well to the server side of an HTTPS or HTTP load balancing setup. For more information for HTTP/2 methods and options, refer to the HTTP/2 options PDF.

Before you Begin

Before you begin configuring HTTP/2 on a Citrix ADC appliance, note the following points:

- The Citrix ADC appliance supports HTTP/2 on the client side as well on the server side.
- The Citrix ADC appliance does not support the HTTP/2 server push functionality.
- The Citrix ADC appliance does not support the HTTP/2 request prioritization functionality.
- The Citrix ADC appliance does not support HTTP/2 SSL renegotiation for HTTPS load balancing setups.
- The Citrix ADC appliance does not support HTTP/2 NTLM authentication.
- With HTTP/2 enabled, connection multiplexing disabled (like USIP enabled) and one to one mapping of client and server TCP connections, close events such as FIN, reset (RST) are forwarded from the client or server connection to the linked peer connection.

Configuring HTTP/2

Configuring HTTP/2 for a load balancing setup (HTTPS or HTTP) consists of the following tasks:

- **Enable HTTP/2 and set optional HTTP/2 parameters in an HTTP Profile**. Enable HTTP/2 in an HTTP profile. When you only enable HTTP/2 in an HTTP profile, the Citrix ADC appliance uses only the upgrade method (for HTTP) or TLS ALPN method (for HTTPS) for communicating in HTTP/2.

  For the Citrix ADC appliance to use the direct HTTP/2 method, the **Direct HTTP/2** option must be enabled in the HTTP profile. For the Citrix ADC appliance to use the direct HTTP/2 using the alternative service method, the **Alternative Service (altsvc)** option must be enabled in the HTTP profile.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- **Bind the HTTP profile to a virtual server or a service**. Bind the HTTP profile to a virtual server to configure HTTP/2 for the client side of the load balancing setup. Bind the HTTP profile to a service to configure HTTP2 for the server side of the load balancing setup.

> **Note:**
>
> Citrix recommends binding separate HTTP profiles for the client side and the server side.

- **Enable the global parameter for HTTP/2 server side support**. Enable the **HTTP/2 Service Side** (**HTTP2Serverside**) global HTTP parameter for enabling the HTTP/2 support on the server side of all the load balancing setups that has HTTP/2 configured.

  HTTP/2 does not work on the server side of any load balancing setups if **HTTP/2 Service Side** is disabled even if the **HTTP/2** is enabled on the HTTP profile bound to the related load balancing services.

Citrix ADC Command Line procedures:

To enable HTTP/2 and set HTTP/2 parameters by using the Citrix ADC command line

- To enable HTTP/2 and set HTTP/2 parameters while adding an HTTP profile, at the command prompt, type:

```
add ns httpProfile <name> - http2 ( ENABLED | DISABLED )[-http2Direct
 ( ENABLED | DISABLED )] [-altsvc ( ENABLED | DISABLED )]
show ns httpProfile <name>
```

- To enable HTTP/2 and set HTTP/2 parameters while modifying an HTTP profile, at the command prompt, type:

```
set ns httpProfile <name> -http2 ( ENABLED | DISABLED )[-http2Direct
( ENABLED | DISABLED)] [-altsvc (ENABLED | DISABLED )]
show ns httpProfile <name>
```

To bind the HTTP profile to a virtual server by using the Citrix ADC command line

At the command prompt, type:

```
set lb vserver <name> - httpProfileName <string>
show lb vserver <name>
```

To bind the HTTP profile to a load balancing service by using the Citrix ADC command line

At the command prompt, type:

```
set service <name> -httpProfileName <string>
show service <name>
```

To enable HTTP/2 support globally on the server side by using the Citrix ADC command line

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

At the command prompt, type:

```
set ns httpParam -HTTP2Serverside( ENABLED | DISABLED )
show ns httpParam
```

To enable HTTP/2 and set HTTP/2 parameters by using the Citrix ADC GUI

1. Navigate to **System** > **Profiles**, and click the **HTTP Profiles** tab.
2. Enable **HTTP/2** while adding an HTTP profile or modifying an existing HTTP profile.

To bind the HTTP profile to a virtual server by using the Citrix ADC GUI

1. Navigate to **Traffic Management** > **Load Balancing** > **Virtual Servers**, and open the virtual server.
2. In **Advanced Settings**, click **+ HTTP Profile** to bind the created HTTP profile to the virtual server.

To bind the HTTP profile to a load balancing service by using the Citrix ADC GUI

1. Navigate to **Traffic Management** > **Load Balancing** > **Service**, and open the service.
2. In **Advanced Settings**, click **+ HTTP Profile** to bind the created HTTP profile to the service.

To enable HTTP/2 support globally on the server side by using the GUI

Navigate to **System** > **Settings**, click **Change HTTP parameters**, and enable **HTTP/2 Server Side**.

Sample configurations

In the following sample configuration, HTTP/2 and direct HTTP/2 are enabled on HTTP profile HTTP-PROFILE-HTTP2-CLIENT-SIDE. The profile is bound to virtual server LB-VS-1.

```
1 set ns httpProfile HTTP-PROFILE-HTTP2-CLIENT-SIDE -http2 enabled -
     http2Direct enabled
2 Done
3
4 set lb vserver LB-VS-1 -httpProfileName HTTP-PROFILE-HTTP2-CLIENT-SIDE
5
6 Done
```

In the following sample configuration, HTTP/2 and alternative service (ALT-SVC) is enabled on HTTP profile HTTP-PROFILE-HTTP2-SERVER-SIDE. The profile is bound to service LB-SERVICE-1.

```
1 set ns httpparam -HTTP2Serverside ENABLED
2 Done
3
4 set ns httpProfile HTTP-PROFILE-HTTP2-SERVER-SIDE -http2 ENABLED -
     altsvc ENABLED
5 Done
6
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
set service LB-SERVICE-1 -httpProfileName HTTP-PROFILE-HTTP2-SERVER-
    SIDE
Done
```

Configure HTTP/2 initial connection window size

As per RFC 7540, the flow-control window for HTTP2 stream and connection must be set to 64 K (65535) octets, and any change made to this value must be communicated to the peer. The ADC appliance communicates the change in flow-control window size as follows:

- Using the `SETTINGS` frame for the stream.
- Using the `WINDOW_UPDATE` frame for the connection.

In an HTTP profile, you must configure the `http2InitialWindowSize` parameter to set the initial window size at the stream level. Because of an internal system error, the ADC appliance initializes the flow-control window for the connection also. When there is a change in the configured flow-control window for the stream, the ADC appliance communicates to the peer using the SETTINGS frame. But the ADC appliance fails to communicate the change in flow-control window for the connection using the `WINDOW_UPDATE` frame. This leads to a connection freeze.

To overcome the issue, the `http2InitialConnWindowSize` parameter (in bytes) is now added to control the flow-control window for connection. By using separate configurable parameters, you can now enable the appliance to send updates for changed window size at both stream and connection levels.

Configure the HTTP/2 initial connection window size parameter by using the CLI

At the command prompt, type:

```
set http profile p1 -http2InitialConnWindowSize 8290
Initial window size for stream level flow control, in bytes.
Default value: 65535
Minimum value: 8192
Maximum value: 20971520
```

HTTP/2 DoS mitigation

September 14, 2021

The Http/2 Denial-of-Service (DoS) attacks no longer have any impact on a Citrix ADC appliance. If the appliance receives frames more than the maximum limit, the appliance silently closes the connection.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

To mitigate attacks, HTTP profile enables you to change the default configuration of frames received in a HTTP/2 connection.

The HTTP/2 DoS mitigation table shows the list of HTTP/2 DoS attacks and its mitigation.

Configure the maximum limit for HTTP/2 frames to mitigate DoS attacks by using the command line interface

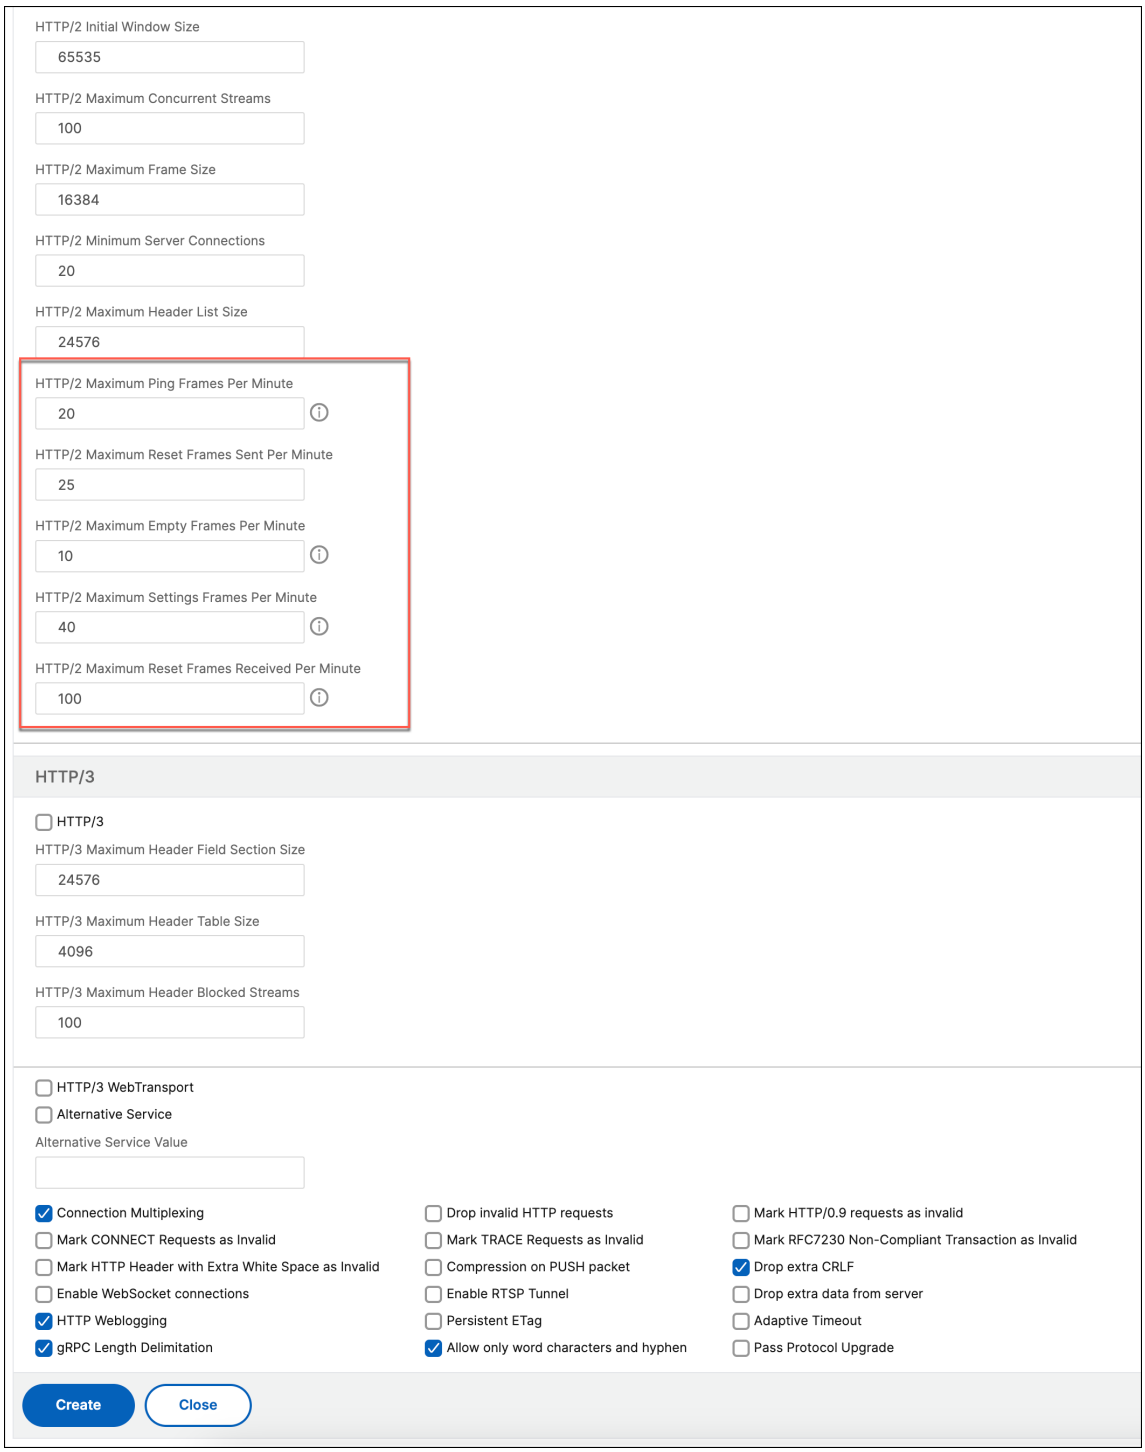
At the command prompt, type the following:

```
set ns httpprofile <profile_name> - http2MaxEmptyFramesPerMin <
positive_integer> -http2MaxPingFramesPerMin <positive_integer> -
http2MaxSettingsFramesPerMin <positive_integer> -http2MaxResetFramesPerMin
 <positive_integer>
```

Example:

```
set ns httpprofile profile1 -http2MaxEmptyFramesPerMin 20 -http2MaxPingFramesP
 20 -http2MaxSettingsFramesPerMin 20 -http2MaxResetFramesPerMin 20
```

Configure the maximum limit for frames received in a HTTP/2 connection by using the Citrix ADC GUI



Follow the steps given below to configure the maximum limit for frames received in a HTTP/2 connection:

1. On the navigation pane, expand **System** and then click **Profiles**.
2. On the **Profile** page, select the **HTTP Profiles** tab.
3. In the **HTTP Profiles** tab page, click **Add**.
4. In the **Configure HTTP Profile** page, set the following parameter.
    a) http2MaxPingFramesPerMin. Set the maximum PING frames received per connection in a minute. If the number of PING frames exceed configuration limit, the appliance silently drops packets on the connection.
    b) http2MaxSettingsFramesPerMin. Set the maximum SETTINGS frames received per connection in a minute. If the number of SETTINGS frames exceed configuration limit, ADC silently drops packets on the connection.
    c) http2MaxResetFramesPerMin. Set the maximum RESET frames sent per connection in a minute. If the number of RESET frames exceed configuration limit, ADC silently drops packets on the connection.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

d) http2MaxEmptyFramesPerMin. Set the maximum empty frames sent per connection in a minute. If the number of empty frames exceed configuration limit, ADC silently drops packets on the connection.

5. Click **OK** and **Close**.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

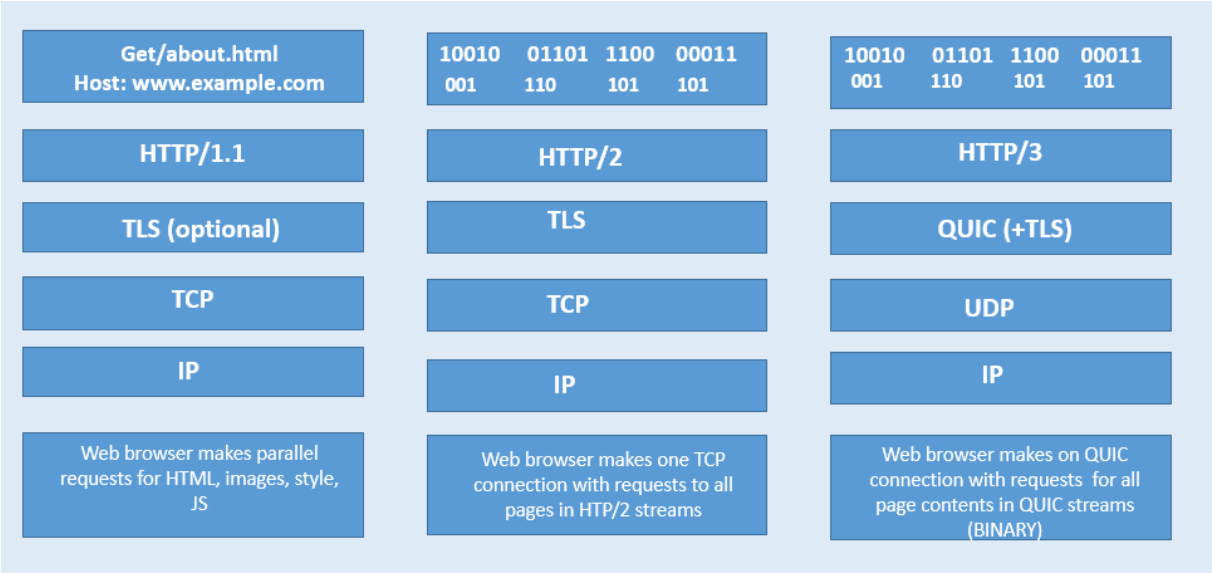
HTTP3 over QUIC protocol

August 16, 2023

HTTP/2 over TCP is the preferred standard for sending multiple streams of HTTP requests over a single connection. But, in TCP transport mechanism there are certain limitations and latency issues in accessing websites and web applications. When you multiplex several requests over the same connection they are subjected to reliability of the same connection. If packet for one request is lost, all other multiplexed requests are delayed until the lost packet is detected and retransmitted. This causes head-of-line-blocking delays and latency issues.

For connection and transport delays, HTTP/3 uses QUIC instead of TCP protocol. The QUIC is an emerging protocol that uses UDP instead of TCP as its base transport. In HTTP-over-QUIC, you can multiplex several independent requests without depending on a single TCP connection. QUIC implements a reliable connection upon which, you can stream multiple HTTP requests. QUIC also incorporates TLS as an integrated component and not as an additional layer as in HTTP/1.1 or HTTP/2.

Advantage of using HTTP/3 protocol



Some of the important benefits of using QUIC protocol for HTTP/3 data transport is given below:

- Stream multiplexing
- Stream and connection-level flow control
- Low-latency connection establishment
- Connection migration and resilience to NAT rebinding
- Authenticated and encrypted header and payload

Transport stack in HTTP protocols

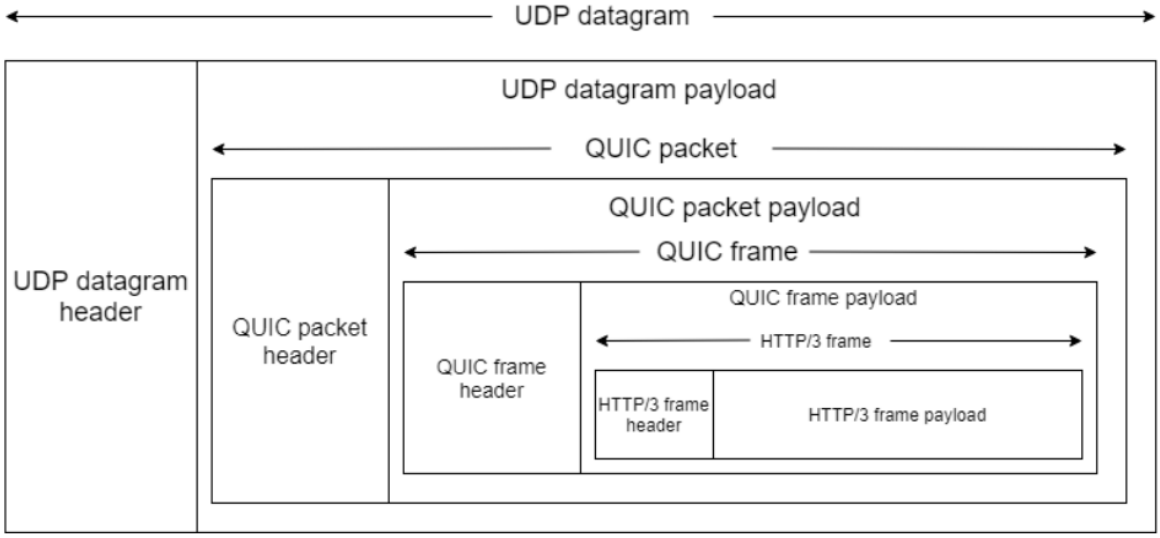
The below illustration shows transport stack in HTTP/1.1, HTTP/2 and HTTP/3 protocols.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

How QUIC and HTTP/3 connection management works in Citrix ADC

The following illustration shows how QUIC and HTTP/3 connection management in a Citrix ADC appliance and how the components interact with each other.

Step 1: Client-side HTTP/3 request over QUIC protocol to Citrix ADC appliance.
Step 2: Request forwarded by Citrix ADC AS HTTP/1.1 or HTTP/2 depending on back-end server support.
Step 3: Response through HTTP/2 or HTTP/1.1 from back-end server to Citrix ADC.
Step 4: ADC forwards the response as HTTP/3 response to client.



How HTTP/3 protocol works

In HTTP/3, when a client knows that an HTTP/3 server exists at a certain endpoint, it opens a QUIC connection. The QUIC protocol provides multiplexing and flow control. Within each stream, the basic

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

unit of HTTP/3 communication is a frame. Each frame type serves a different purpose. For example, HEADERS and DATA frames form the basis of HTTP requests and responses.

Multiplexing of requests is performed using the QUIC stream abstraction. Each request-response pair consumes a single QUIC stream. Streams are independent of each other, so one stream that is blocked or suffers packet loss does not prevent progress on other streams. Server push is an interaction mode introduced in HTTP/2 which permits a server to push a request-response exchange to a client in anticipation of the client making the indicated request. This trades off network usage against a potential latency gain. Several HTTP/3 frames are used to manage server push, such as PUSH_PROMISE, MAX_PUSH_ID, and CANCEL_PUSH. As in HTTP/2, request and response fields are compressed for transmission. Because HPACK relies on in-order transmission of compressed field sections (a guarantee not provided by QUIC), HTTP/3 replaces HPACK with QPACK. QPACK uses separate unidirectional streams to modify and track field table state, while encoded field sections refer to the state of the table without modifying it.

HTTP/3 configuration and Stat summary

January 8, 2024

To configure a HTTP/3 protocol for sending multiple streams of HTTP/3 data using QUIC, you must complete the following steps:

1. Enable SSL and load balancing features.
2. Add load balancing and content switching (optional) virtual servers of type HTTP_QUIC.
3. Associate QUIC protocol parameters with the HTTP_QUIC virtual server.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

4. Enable HTTP/3 on the HTTP_QUIC virtual server.
5. Bind SSL certificate-key pair with HTTP_QUIC virtual server.
6. Associate SSL/TLS protocol parameters with the HTTP_QUIC virtual server.

Enable SSL and load balancing

Before you begin, make sure that the SSL and Load Balancing features are enabled on the appliance. At the command prompt type:

```
enable ns feature ssl lb
```

Add load balancing and content switching (optional) virtual servers of type HTTP_QUIC for HTTP/3 service

You add a load balancing virtual server to accept HTTP/3 traffic over QUIC.
Note: The load balancing virtual server of type HTTP_QUIC has built-in QUIC, SSL, and HTTP3 profiles. If you prefer to create user-define profiles, you can add new profiles and bind it with the load balancing virtual server.

```
add lb vserver <vserver-name> HTTP_QUIC <IP-address> <UDP-listening-
    port>
add cs vserver <vserver-name> HTTP_QUIC <IP-address> <UDP-listening-
    port>
```

Example:

```
add lb vserver lb-http3 HTTP_QUIC 1.1.1.1 443
add cs vserver cs-http3 HTTP_QUIC 10.10.10.10 443
```

Associate QUIC protocol parameters with HTTP_QUIC virtual server

You can create a QUIC profile and specify QUIC parameters for the QUIC service and associate it to the load balancing virtual server. You must either create a user-defined profile or use the in-built QUIC profile and bind the profile to the load balancing virtual server.

Step 1: configure a user-defined QUIC profile
At the command prompt, type:

```
set quic profile <profile_name> -transport_param <value>
```

Example:

```
set quic profile quic_http3 -ackDelayExponent 10 -activeConnectionIDlimit
 4
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

The different QUIC transport parameters are as follows:

-ackDelayExponent. An integer value advertised by the Citrix ADC to the remote QUIC endpoint, indicating an exponent that the remote QUIC endpoint should use, to decode the ACK Delay field in QUIC ACK frames sent by the Citrix ADC.

-activeConnectionIDlimit. An integer value advertised by the Citrix ADC to the remote QUIC endpoint. It specifies the maximum number of QUIC connection IDs from the remote QUIC endpoint, that the Citrix ADC is willing to store.

-activeConnectionMigration. Specify whether the Citrix ADC must allow the remote QUIC endpoint to perform active QUIC connection migration.

-congestionCtrlAlgorithm. Specify the congestion control algorithm to be used for QUIC connections.

-initialMaxData. An integer value advertised by the Citrix ADC to the remote QUIC endpoint, specifying the initial value, in bytes, for the maximum amount of data that can be sent on a QUIC connection.

-initialMaxStreamDataBidiLocal. An integer value advertised by the Citrix ADC to the remote QUIC endpoint, specifying the initial flow control limit, in bytes, for bi-directional QUIC streams initiated by the Citrix ADC.

-initialMaxStreamDataBidiRemote. An integer value advertised by the Citrix ADC to the remote QUIC endpoint, specifying the initial flow control limit, in bytes, for bi-directional QUIC streams initiated by the remote QUIC endpoint.

-initialMaxStreamDataUni. An integer value advertised by the Citrix ADC to the remote QUIC endpoint, specifying the initial flow control limit, in bytes, for uni-directional streams initiated by the remote QUIC endpoint.

-initialMaxStreamsBidi. An integer value advertised by the Citrix ADC to the remote QUIC endpoint, specifying the initial maximum number of bi-directional streams the remote QUIC endpoint must initiate.

-initialMaxStreamsUni. An integer value advertised by the Citrix ADC to the remote QUIC endpoint, specifying the initial maximum number of uni-directional streams the remote QUIC endpoint must initiate.

-maxAckDelay. An integer value advertised by the Citrix ADC to the remote QUIC endpoint, specifying the maximum amount of time, in milliseconds, by which the Citrix ADC delays sending acknowledgments.

-maxIdleTimeout. An integer value advertised by the Citrix ADC to the remote QUIC endpoint, specifying the maximum idle timeout, in seconds, for a QUIC connection. A QUIC connection that remains idle, for longer than the minimum of the idle timeout values advertised by the Citrix ADC and the remote QUIC endpoint, and three times the current Probe Timeout (PTO), will be silently discarded by the Citrix ADC.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

-maxUDPPayloadSize. An integer value advertised by the Citrix ADC to the remote QUIC endpoint, specifying the size of the largest UDP datagram payload, in bytes, that the Citrix ADC is willing to receive on a QUIC connection.

-newTokenValidityPeriod. An integer value, specifying the validity period, in seconds, of address validation tokens issued through QUIC NEW_TOKEN frames sent by the Citrix ADC.

-retryTokenValidityPeriod. An integer value, specifying the validity period, in seconds, of address validation tokens issued through QUIC Retry packets sent by the Citrix ADC.

-statelessAddressValidation. Specify whether the Citrix ADC must perform stateless address validation for QUIC clients, by sending tokens in QUIC Retry packets during QUIC connection establishment, and by sending tokens in QUIC NEW_TOKEN frames after QUIC connection establishment.

Step 2: Associate the user-defined QUIC profile to a load balancing virtual server of type http_quic

At the command prompt, type:

```
set lb vserver <name>@ [-IPAddress <ip_addr|ipv6_addr|*>@]  <
    serviceName>@] [-persistenceType <persistenceType>] [-
    quicProfileName <string>]
```

Example:

```
set lb vserver lb-http3 -quicProfileName quic_http3
```

Enable and bind HTTP/3 on a HTTP_QUIC virtual server

To enable HTTP/3 on an HTTP_QUIC virtual server, a set of configuration parameters is added to the HTTP profile configuration. To facilitate ease of configuration, when you add an HTTP_QUIC virtual server, a new default/built-in HTTP profile is available on the appliance. The profile has the HTTP/3 protocol support parameters set to ENABLED, and also bounded to the HTTP_QUIC virtual servers (applicable if you choose not to associate the HTTP_QUIC virtual server with a user-added HTTP profile). The value of the HTTP/3 parameters in the HTTP profile decides whether to select the HTTP/3 protocol and advertise when processing the TLS ALPN (Application Layer Protocol Negotiation) extension, during the QUIC protocol handshake.

You can create a HTTP/3 profile and specify HTTP parameters for the HTTP/3 service and load balancing virtual server. You must either create a user-defined profile or use the in-built HTTP/3 profile and bind the profile to the load balancing virtual server.

Step 1: configure a user-defined HTTP/3 profile
At the command prompt, type:

```
Add ns httpProfile <profile_name> -http3 ENABLED
```

Example:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
add ns httpProfile http3_quic –http3 ENABLED
```

Step 2: Bind the user-defined HTTP/3 profile to a load balancing virtual server of type http_quic
At the command prompt, type:

```
set lb vserver <name>@ [-IPAddress <ip_addr|ipv6_addr|*>@]  <
    serviceName>@] [-persistenceType <persistenceType>] [-
    httpProfileName <string>]
```

Example:

```
set lb vserver lb-http3 –httpProfileName http3_quic
```

Bind SSL certificate-key pair with HTTP_QUIC virtual server

For processing encrypted traffic, you must add an SSL certificate-key pair and bind it to the HTTP_QUIC virtual server.

At the command prompt, type:

```
bind ssl vserver <vServerName> -certkeyName <certificate-KeyPairName>
```

Example:

```
bind ssl vserver lb-http3 -certkeyName rsa_certkeypair
```

For more information, see Bind SSL certificate topic.

Bind SSL/TLS protocol parameters with a HTTP_QUIC virtual server

Virtual servers of type HTTP_QUIC has in-built TLS 1.3 server functionality because the QUIC protocol uses TLS 1.3 as a mandatory security component. To facilitate the configuration when adding a HTTP_QUIC virtual server, a new default or built-in SSL profile of type - QUIC-FrontEnd is added. The SSL profile has TLS 1.3 version enabled with TLS 1.3 cipher suites (and elliptic curves) configured. The SSL profile must then be bound to the newly added HTTP_QUIC virtual servers.
You can create an SSL profile and specify SSL encryption parameters for the TLP 1.1 service and load balancing virtual server. You must either create a user-defined profile or use the in-built SSL profile and bind the profile to the load balancing virtual server.

Step 1: configure a user-defined SSL profile
At the command prompt, type:

```
add ssl profile <name> -sslprofileType QUIC-FrontEnd
```

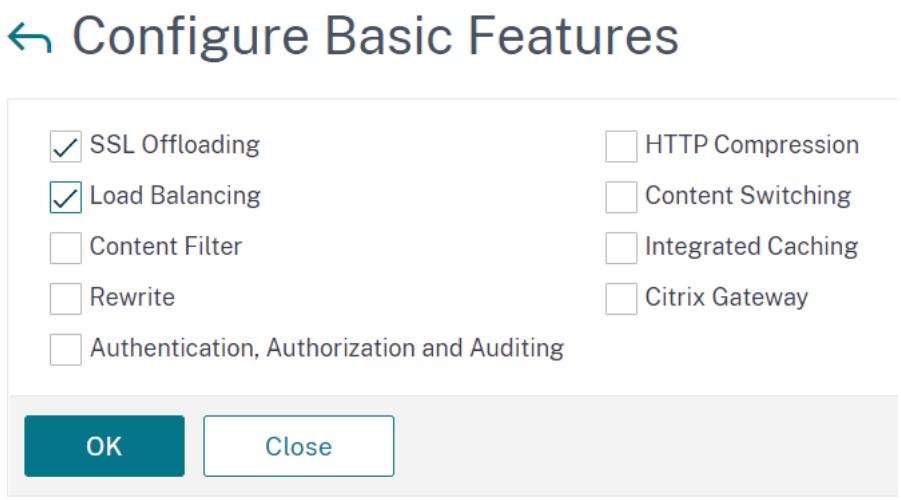
Example:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
add ssl profile ssl_profile1 -sslprofileType QUIC-FrontEnd -tls13
ENABLED -tls12 DISABLED -tls11 DISABLED -tls1 DISABLED
```

Step 2: Bind the user-defined SSL profile to a load balancing virtual server of type HTTP_QUIC
At the command prompt, type:

```
1 set ssl vserver <name>@ [-sslProfile <string>]
```



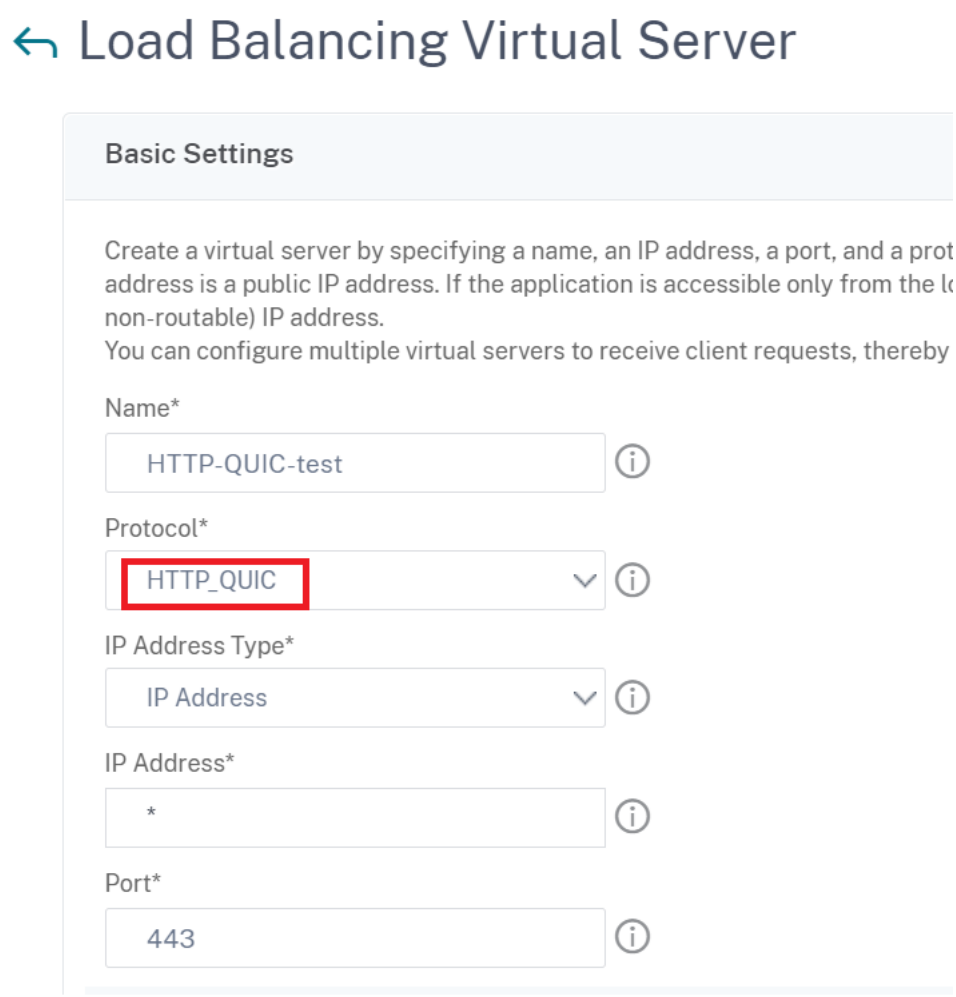
Example:

```
set ssl vserver lb-http3 -sslprofile ssl_profile1
```

Enable SSL and load balancing features by using the GUI

Complete the following steps to enable SSL and load balancing features:

1. On the navigation pane, expand **System** and then click **Settings**.
2. On the **Configure Basic Features** page, select the **SSL** and **Load Balancing**.
3. Click **OK**, and then click **Close**.



Add load balancing and content switching (optional) virtual servers of type HTTP_QUIC by using the GUI

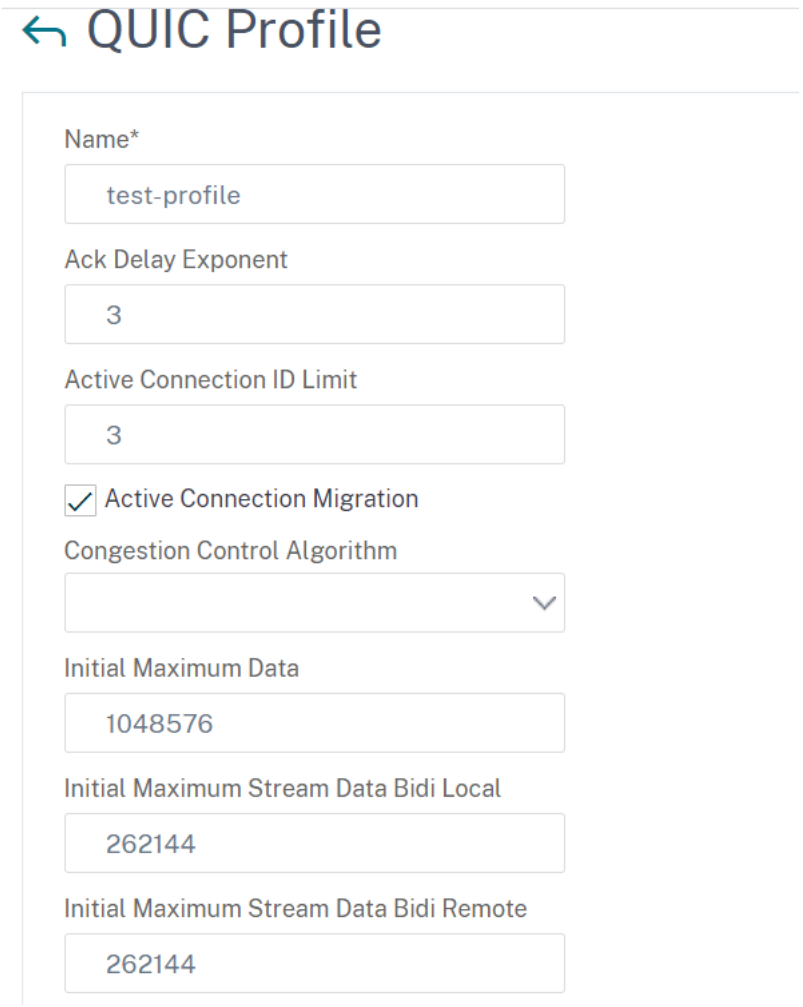
1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**.
2. Click **Add** to create a load balancing virtual server of type HTTP_QUIC.
3. In **Load Balancing Virtual Server** page, click **Profiles**.
4. In the **Profiles** section, select the profile type as QUIC.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

> **Note:**
>
> QUIC, HTTP/3 and SSL profiles are built-in ones.

5. Click **OK** and then **Done**.

Associate QUIC protocol parameters with the HTTP_QUIC virtual server by using the GUI



Step 1: Add QUIC profile

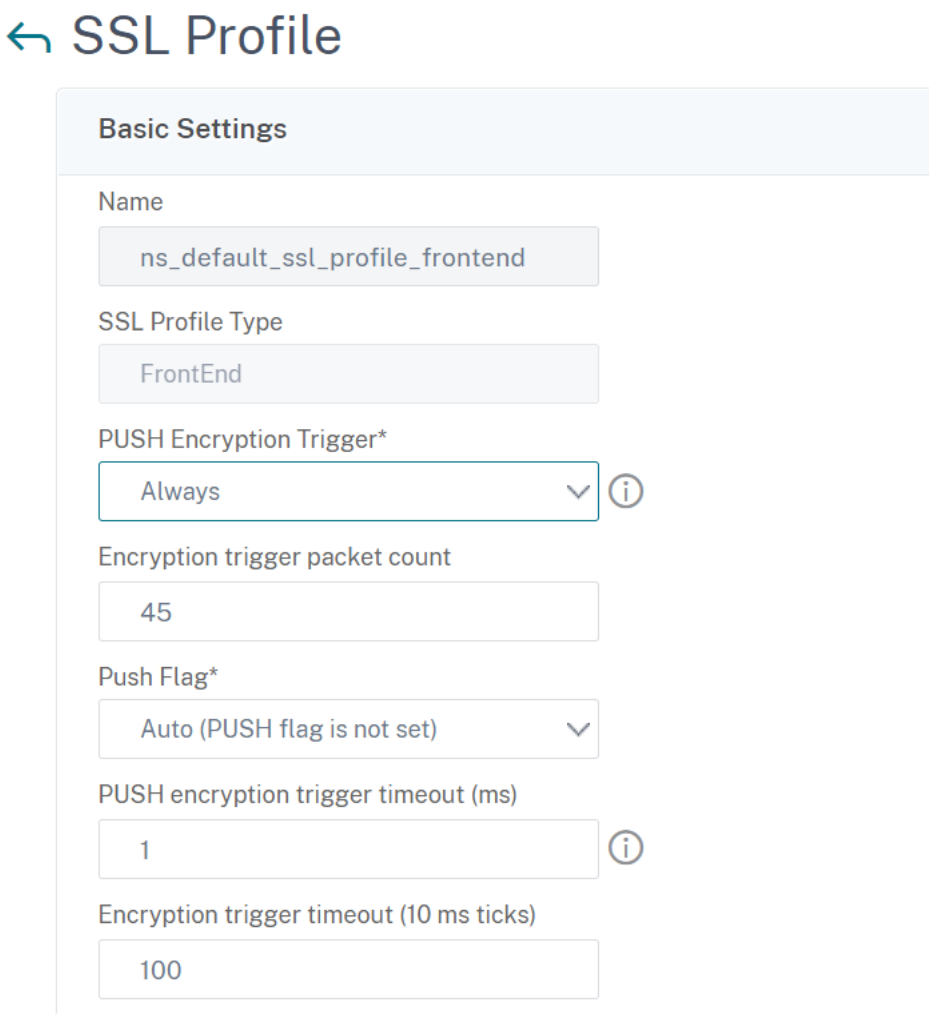
1. Navigate to **System > Profiles > QUIC Profile**.
2. Click **Add**.
3. In the QUIC Profile page, set the following parameters. For detailed description of each parameter, see the Associate QUIC protocol CLI section.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

a) `Ack Delay` Exponent
b) Active Connection ID Limit
c) Active Connection Migration
d) Congestion Control Algorithm
e) Initial Maximum Data
f) Initial Maximum Stream Data Bidi Local
g) Initial Maximum Stream Data Bidi Remote
h) Initial Maximum Stream Data Unit
i) Initial Maximum Stream bidi
j) Initial Maximum Stream Uni
k) Maximum Acknowledgment Delay
l) Maximum Idle Timeout
m) Maximum UDP Data GramsperBurst
n) New Token Validity Period
o) Retry Token Validity Period
p) Stateless Address Validation

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

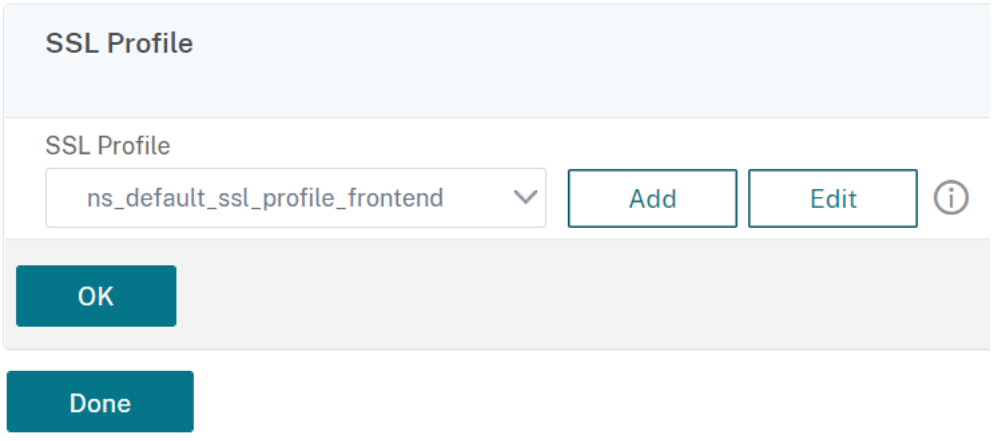
Step 2: Associate QUIC profile with load balancing virtual server of type HTTP_QUIC



1. In the **Profiles** section, select the QUIC profile. Note: QUIC, HTTP/3 and SSL profiles are built-in ones.
2. Click **OK** and then **Done**.

Associate SSL/TLS protocol parameters with the virtual server of type SSL by using the GUI

Step 1: Add SSL profile



1. Navigate to **System > Profiles > SSL Profile**.
2. Click **Add**.
3. In the **QUIC Profile** page, set the SSL parameters. For detailed description see, SSL Profile configuration topic.
4. Click **OK** and **Close**.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Step 2: Associate SSL profile with load balancing virtual server of type SSL.

1. In the **Profiles** section, select the SSL profile.
2. Click **OK** and then **Done**.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

View QUIC, and HTTP/3 statistics

The following commands display a detailed summary of QUIC, and HTTP3 statistics. At the command prompt, type the following:

```
> stat quic
> stat quic  – detail
```

To clear the statistics display, type one of the following:

```
> stat quic -clearstats basic
> stat quic -clearstats full
```

To display a detailed summary of HTTP/3 statistics:

```
> stat http3
> stat http3  – detail
```

To clear the statistics display, type one of the following:

```
> stat http3 -clearstats basic
> stat http3 -clearstats full
```

Policy configuration for HTTP/3 traffic

September 14, 2021

HTTP/3 uses QUIC transport which is based on UDP. If you had policy expression defined for the HTTP or SSL virtual server that includes TCP policy expressions, it can no longer be used with a HTTP_QUIC virtual server. All other policies that do not have TCP or classic expressions can be bound with a HTTP_QUIC virtual server. For the policies to take effect, you must ensure that the feature policies are bound to the newly added global bind points as per the following.

- HTTPQUIC_REQ_DEFAULT
- HTTPQUIC_REQ_OVERRIDE
- HTTPQUIC_RES_DEFAULT
- HTTPQUIC_RES_OVERRIDE

Or, the policies can be bound to specific virtual server bind points:

- REQUEST
- RESPONSE

For more information, see Bind policy using advanced policy infrastructure topic.

Following are the policies supported for HTTP over QUIC configuration:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- Responder
- Rewrite
- HTTP Compression
- Integrated Caching
- Web Application Firewall
- URL transformation
- SSL
- Front end optimization (FEO)
- AppQoE

Responder policy configuration for HTTP/3 traffic

HTTP over QUIC type virtual servers have responder policy support. However, as QUIC uses UDP as its transport mechanism, TCP based expressions are excluded and UDP based expressions are included.

New or existing policy configurations with TCP expressions cannot be bound to HTTP/3 QUIC virtual servers or HTTP over QUIC global bind points. Instead of TCP expressions, UDP expressions can be included in the policy configurations that are bound to HTTP/3 QUIC virtual servers or HTTP over QUIC bind points.

Add responder action for redirecting URLs

To add a responder action, at the command prompt, type:

```
add responder action <name> <type> (<target> | <htmlpage>) [-comment <
    string>] [-responseStatusCode <positive_integer>] [-reasonPhrase <
    expression>] [-headers <name(value)> ...]
```

Example:

```
add responder action redirectURL redirect "\"https://www.citrix.com
/\""
```

Add responder policy

To add a responder policy, at the command prompt, type:

```
add responder policy <name> <rule> <action> [<undefAction>] [-comment <
    string>] [-logAction <string>] [-appflowAction <string>]
```

Example:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
add responder policy res-pol "CLIENT.IP.SRC.IN_SUBNET(10.10.10.10/32)
"redirectURL
```

Add responder policy based UDP expression

To add a responder policy based UDP expression, at the command prompt, type:

```
1 add responder policy <name> <rule> <action> [<undefAction>] [-comment <
    string>] [-logAction <string>] [-appflowAction <string>]
```

Example:

```
add responder policy redirectCitrixUdp "CLIENT.UDP.DSTPORT.EQ(443)"
redirectURL
```

Bind responder policy based UDP expression with HTTP/3 QUIC based load balancing virtual server

To bind a responder policy based UDP expression to a load balancing virtual server, at the command prompt, type:

```
1 bind lb vserver <name>@ ((<serviceName>@   [-weight <positive_integer>]
     ) | <serviceGroupName>@ |         (-policyName <string>@  [-
    priority <positive_integer>]  [-gotoPriorityExpression <expression>]
      [-type <type>]  [-invoke  (<labelType>  <labelName>) ]  ) | -
    analyticsProfile <string>@)
```

Example:

```
bind lb vserver lb-http3 -policyName redirectCitrixUdp -priority 9 -
gotoPriorityExpression END -type REQUEST
```

Bind responder policy with HTTP/3 QUIC based load balancing virtual server

To bind a responder policy to a load balancing virtual server, at the command prompt, type:

```
1 bind lb vserver <name>@ ((<serviceName>@   [-weight <positive_integer>]
     ) | <serviceGroupName>@ |         (-policyName <string>@  [-
    priority <positive_integer>]  [-gotoPriorityExpression <expression>]
      [-type <type>]  [-invoke  (<labelType>  <labelName>) ]  ) | -
    analyticsProfile <string>@)
```

Example:

```
bind lb vserver lb-http3 -policyName redirectCitrixUdp -priority 10 -
gotoPriorityExpression END -type REQUEST
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Bind responder policy to HTTP/3 global bind point

To bind a responder policy with the HTTP/3 global bind point, at the command prompt, type:

```
bind responder global <policyName> <priority>  [<gotoPriorityExpression
    >] [-type <type>] [-invoke (<labelType>  <labelName>) ] bind
    responder global redirectCitrixUdp 3 -type HTTPQUIC_REQ_DEFAULT
```

Example:

```
bind responder global redirectCitrixUdp 3 -type HTTPQUIC_REQ_DEFAULT
```

> **Note:**
>
> For more information, see Responder policy documentation.

Rewrite policy configuration for HTTP/3 traffic

HTTP over QUIC type virtual servers have rewrite policy support. However, as QUIC uses UDP as its transport mechanism, TCP based expressions are excluded and UDP based expressions are included.

New or existing policy configurations with TCP expressions cannot be bound to HTTP/3 virtual servers or to the newly added HTTP/3 global bind points. Instead of TCP expressions, UDP expressions can be included in the policy configurations that are bound to HTTP/3 QUIC virtual servers or HTTP over QUIC bind points.

Following are the configuration steps to configure the rewrite policy for HTTP3 over QUIC.

Add rewrite action for HTTP over QUIC

To add rewrite action, at the command prompt, type:

```
add rewrite action <name> <type> <target> [<stringBuilderExpr>] [-
    pattern <expression> | -search <expression>] [-refineSearch <
    expression>] [-comment <string>]
```

Example:

```
add rewrite action http3-altsvc-action insert_http_header Alt-Svc q/"
h3-29=\":443\"; ma=3600; persist=1"/
```

Add rewrite policy for HTTP over QUIC

To add a write action, at the command prompt, type:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
add rewrite policy <name> <rule> <action> [<undefAction>] [-comment  <
    string>] [-logAction <string>]
```

Example:

```
add rewrite policy http3-altsvc-policy true http3-altsvc-action
```

Bind rewrite policy to load balancing virtual server of type HTTP/3_QUIC

To bind rewrite policy to the load balancing virtual server, at the command prompt, type:

```
bind lb vserver <name>@ ((<serviceName>@ [-weight <positive_integer>] )
     | <serviceGroupName>@ | (-policyName <string>@ [-priority <
    positive_integer>] [-gotoPriorityExpression <expression>] [-type <
    type>] [-invoke (<labelType> <labelName>) ] ) | -analyticsProfile  <
    string>@)
```

Example:

```
bind lb vserver lb-http3 -policyName http3-altsvc-policy -priority 10
 -type RESPONSE
```

Bind rewrite policy to HTTP/3 global bind point

```
To bind a responder policy with HTTP/3 global bind point, at the
    command prompt, type:
bind rewrite global <policyName> <priority> [<gotoPriorityExpression>]
     [-type <type>] [-invoke (<labelType> <labelName>)]
```

Example:

```
bind rewrite global http3-altsvc-policy 3 -type HTTPQUIC_RES_DEFAULT
```

> **Note:**
>
> For more information, see Rewrite policy documentation.

Compression policy configuration for HTTP/3 traffic

When the Citrix ADC receives an HTTP response from a server, it evaluates the built-in compression policies and any custom compression policies to determine whether to compress the response and, if so, the type of compression to apply. Priorities assigned to the policies determine the order in which the policies are matched against the requests.
HTTP over QUIC type virtual servers have compression policy support. However, as QUIC uses UDP

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

as its transport mechanism, TCP based expressions are excluded and UDP based expressions are included.
New or existing policy configurations with TCP expressions cannot be bound to HTTP/3 virtual servers or to the newly added HTTP/3 global bind points. Instead of TCP expressions, UDP expressions can be included in the policy configurations that are bound to HTTP/3 QUIC virtual servers or HTTP over QUIC bind points.

Add compression policy

To add compression policy, at the command prompt, type:

```
add cmp policy <name> -rule <expression> -resAction <string>
```

Example:

```
add cmp policy udp_port_cmp_policy -rule "CLIENT.UDP.DSTPORT.EQ(443)"
-resAction COMPRESS
```

Bind compression policy with load balancing virtual server of type HTTP/3_QUIC

To bind URL transformation policy with load balancing virtual server of type HTTP/3_QUIC, at the command prompt, type:

```
bind lb vserver <name>@ ((<serviceName>@  [-weight <positive_integer>]
    ) | <serviceGroupName>@ |  (-policyName <string>@  [-priority <
    positive_integer>]  [-gotoPriorityExpression <expression>]  [-type (
     REQUEST | RESPONSE )] [-invoke  (<labelType>  <labelName>) ]  ) |
    -analyticsProfile <string>@)
```

Example:

```
bind lb vserver lb-http3 -policyName udp_port_cmp_policy -priority 10
 -type RESPONSE
```

Bind compression global to HTTP/3 global bind point

To bind a compression policy with the HTTP/3 global bind point, at the command prompt, type:

```
bind compression global <policyName> <priority>  [<
    gotoPriorityExpression>] [-type <type>] [-invoke (<labelType>  <
    labelName>) ] bind responder global redirectCitrixUdp 3 -type
    HTTPQUIC_REQ_DEFAULT
```

Example:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
bind cmp global udp_port_cmp_policy -priority 100 -type HTTPQUIC_RES_DEFAULT
```

Global built-in compression policies

After you upgrade your appliance to Citrix ADC release 13.0 build 82.x, the following compression policies will be automatically bound to the HTTP/3 default bind point.

```
> sho cmp global -type HTTPQUIC_RES_DEFAULT
        Policy Name: ns_adv_nocmp_xml_ie
        Priority: 8700
        GotoPriorityExpression: END
        Type: HTTPQUIC_RES_DEFAULT

        Policy Name: ns_adv_nocmp_mozilla_47
        Priority: 8800
        GotoPriorityExpression: END
        Type: HTTPQUIC_RES_DEFAULT

        Policy Name: ns_adv_cmp_mscss
        Priority: 8900
        GotoPriorityExpression: END
        Type: HTTPQUIC_RES_DEFAULT

        Policy Name: ns_adv_cmp_msapp
        Priority: 9000
        GotoPriorityExpression: END
        Type: HTTPQUIC_RES_DEFAULT

        Policy Name: ns_adv_cmp_content_type
        Priority: 10000
        GotoPriorityExpression: END
        Type: HTTPQUIC_RES_DEFAULT
```

If not bound, the following commands can be configured through the command prompt and you can configuration on your appliance.

```
bind cmp global ns_adv_nocmp_xml_ie -priority 8700 -gotoPriorityExpression
 END -type HTTPQUIC_RES_DEFAULT

bind cmp global ns_adv_nocmp_mozilla_47 -priority 8800 -gotoPriorityExpression
 END -type HTTPQUIC_RES_DEFAULT

bind cmp global ns_adv_cmp_mscss -priority 8900 -gotoPriorityExpression
 END -type HTTPQUIC_RES_DEFAULT

bind cmp global ns_adv_cmp_msapp -priority 9000 -gotoPriorityExpression
 END -type HTTPQUIC_RES_DEFAULT

bind cmp global ns_adv_cmp_content_type -priority 10000 -gotoPriorityExpressio
 END -type HTTPQUIC_RES_DEFAULT
```

For more information, see Compression policy configuration.

Caching policy configuration for HTTP/3 traffic

The integrated cache provides in-memory storage on the Citrix ADC appliance and serves Web content to users without requiring a round trip to an origin server. For static content, the integrated cache requires little initial setup. After you enable the integrated cache feature and perform basic setup (for example, determining the amount of Citrix ADC appliance memory the cache is permitted to use), the integrated cache uses built-in policies to store and serve specific types of static content, including simple webpages and image files. You can also configure the integrated cache to store and serve dynamic content that is marked as non-cacheable by Web and application servers (for example, database records and stock quotes).
HTTP over QUIC type virtual servers have cache policy support. However, as QUIC uses UDP as its transport mechanism, TCP based expressions are excluded and UDP based expressions are included.

New or existing policy configurations with TCP expressions cannot be bound to HTTP/3 virtual servers or to the newly added HTTP/3 global bind points. Instead of TCP expressions, UDP expressions can be included in the policy configurations that are bound to HTTP/3 QUIC virtual servers or HTTP over QUIC bind points.

Add cache content group

To add the cache content group, at the command prompt, type:

```
1 add cache contentGroup <name> [-weakPosRelExpiry <secs> | -relExpiry <
    secs> | -relExpiryMilliSec <msecs> | -absExpiry <HH:MM> ... | -
    absExpiryGMT <HH:MM> ...] [-heurExpiryParam <positive_integer>] [-
    weakNegRelExpiry <secs>] [-maxResSize <KBytes>] [-memLimit <MBytes>]
    ...
```

Example::

```
add cache contentGroup DEFAULT -maxResSize 500
```

Add cache policy

To add cache policy, at the command prompt, type:

```
1 add cache policy <policyName> -rule <expression> -action <action>  [-
    storeInGroup <string>] [-invalGroups <string> ...] [-invalObjects <
    string> ...] [-undefAction ( NOCACHE | RESET )] add cache policy <
    name> <rule> <profileName> [-comment <string>]  [-logAction <string
    >]
```

Example:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
add cache policy ctx_doc_pdf -rule "HTTP.REQ.URL.ENDSWITH(\".pdf\")"-
action CACHE -storeInGroup DEFAULT
```

Bind cache policy with load balancing virtual server of type HTTP/3_QUIC

To bind cache policy with load balancing virtual server of type HTTP/3_QUIC, at the command prompt, type:

```
bind lb vserver <name>@ ((<serviceName>@  [-weight <positive_integer>]
    ) | <serviceGroupName>@ |  (-policyName <string>@  [-priority <
    positive_integer>]  [-gotoPriorityExpression <expression>]  [-type (
     REQUEST | RESPONSE )] [-invoke  (<labelType>  <labelName>) ]  ) |
    -analyticsProfile <string>@)
```

Example:

```
bind lb vserver lb-http3 -policyName ctx_doc_pdf -priority 100 -type
REQUEST
```

Bind cache policy global to HTTP/3 global bind point

To bind a cache policy HTTP/3 global bind point:

```
bind cache global <policy> -priority <positive_integer>  [-
    gotoPriorityExpression <expression>] [-type <type>] [-invoke (<
    labelType> <labelName>) ]
```

Example:

```
bind cache global ctx_doc_pdf -priority 3 -type HTTPQUIC_REQ_DEFAULT
```

For more information, see Integrated cache policy configuration.

Global built-in cache policies

After you upgrade your appliance to Citrix ADC release 13.0 build 82.x, the following cache policies will be automatically bound to the HTTP/3 default bind point.

On upgrade to the 13.0 82.x release, the following cache policies are automatically bound to the HTTP/3 default bind point.

```
> sho cache global -type HTTPQUIC_REQ_DEFAULT
1)      Policy Name: NOPOLICY
        Priority: 185883
        GotoPriorityExpression: USE_INVOCATION_RESULT
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
5          Invoke type: policylabel        Invoke name:
               _httpquicReqBuiltinDefaults
6          Global bindpoint: HTTPQUIC_REQ_DEFAULT
7
8   Done
9   > sho cache global -type HTTPQUIC_RES_DEFAULT
10  1)      Policy Name: NOPOLICY
11          Priority: 185883
12          GotoPriorityExpression: USE_INVOCATION_RESULT
13          Invoke type: policylabel        Invoke name:
               _httpquicResBuiltinDefaults
14          Global bindpoint: HTTPQUIC_RES_DEFAULT
```

After an upgrade, if the policies are not bound, you can use the following commands to manually bind and save the configuration.

```
1  add cache policylabel _httpquicReqBuiltinDefaults -evaluates
       HTTPQUIC_REQ
2
3  add cache policylabel _httpquicResBuiltinDefaults -evaluates
       HTTPQUIC_RES
4
5  bind cache policylabel _httpquicReqBuiltinDefaults -policyName
       _nonGetReq -priority 100
6
7  bind cache policylabel _httpquicReqBuiltinDefaults -policyName
       _advancedConditionalReq -priority 200
8
9  bind cache policylabel _httpquicReqBuiltinDefaults -policyName
       _personalizedReq -priority 300
10
11 bind cache policylabel _httpquicResBuiltinDefaults -policyName
       _uncacheableStatusRes -priority 100
12
13 bind cache policylabel _httpquicResBuiltinDefaults -policyName
       _uncacheableVaryRes -priority 200
14
15 bind cache policylabel _httpquicResBuiltinDefaults -policyName
       _uncacheableCacheControlRes -priority 300
16
17 bind cache policylabel _httpquicResBuiltinDefaults -policyName
       _cacheableCacheControlRes -priority 400
18
19 bind cache policylabel _httpquicResBuiltinDefaults -policyName
       _uncacheablePragmaRes -priority 500
20
21 bind cache policylabel _httpquicResBuiltinDefaults -policyName
       _cacheableExpiryRes -priority 600
22
23 bind cache policylabel _httpquicResBuiltinDefaults -policyName
       _imageRes -priority 700
24
25 bind cache policylabel _httpquicResBuiltinDefaults -policyName
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
      _personalizedRes -priority 800
26
27 bind cache global NOPOLICY -priority 185883 -gotoPriorityExpression
      USE_INVOCATION_RESULT -type HTTPQUIC_REQ_DEFAULT -invoke policylabel
       _httpquicReqBuiltinDefaults
28
29 bind cache global NOPOLICY -priority 185883 -gotoPriorityExpression
      USE_INVOCATION_RESULT -type HTTPQUIC_RES_DEFAULT -invoke policylabel
       _httpquicResBuiltinDefaults
```

> **Note:**
>
> The first two commands in the list of commands, and the last two commands in the same list, are included for the sake of completeness. You might encounter an error when running the four commands, since the commands are already run at the time of appliance restart. But you can ignore these errors.

URL Transformation policy configuration for HTTP/3 traffic

The URL transformation modifies all URLs in designated requests from an external version seen by outside users to an internal URL seen only by your Web servers and administrators. You can redirect user requests seamlessly, without exposing your network structure to users. You can also modify complex internal URLs that users might find difficult to remember into simpler, more easily remembered external URLs.
HTTP over QUIC type virtual servers have cache policy support. However, as QUIC uses UDP as its transport mechanism, TCP based expressions are excluded and UDP based expressions are included. New or existing policy configurations with TCP expressions cannot be bound to HTTP/3 virtual servers or to the newly added HTTP/3 global bind points. Instead of TCP expressions, UDP expressions can be included in the policy configurations that are bound to HTTP/3 QUIC virtual servers or HTTP over QUIC bind points.

Add URL Transform profile

To add a URL transformation profile, at the command prompt, type:

```
1 add transform profile <name> [-type URL]
```

Example:

```
add transform profile msapps
```

Add URL Transform action

To add URL transformation action, at the command prompt, type:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
add transform action <name> <profileName> <priority> [-state ( ENABLED
    | DISABLED )]
```

Example:

```
add transform action docx2doc msapps 2
```

Add URL Transform action

To add URL transform action to replace URL, at the command prompt, type:

```
add transform action <name> <profileName> <priority> [-state ( ENABLED
    | DISABLED )]
```

Example:

```
add transform action docx2doc msapps 1
```

Add URL Transform policy

To add a URL transformation policy, at the command prompt, type:

```
add transform policy <name> <rule> <profileName> [-comment <string>]
    [-logAction <string>]
```

Example:

```
add transform policy urltrans_udp "CLIENT.UDP.DSTPORT.EQ(443)"msapps
```

Bind URL Transform policy with load balancing virtual server of type HTTP/3_QUIC

To bind URL transformation policy with load balancing virtual server of type HTTP/3_QUIC, at the command prompt, type:

```
bind lb vserver <name>@ ((<serviceName>@  [-weight <positive_integer>]
    ) | <serviceGroupName>@ |  (-policyName <string>@  [-priority <
    positive_integer>]  [-gotoPriorityExpression <expression>]  [-type (
     REQUEST | RESPONSE )] [-invoke  (<labelType>  <labelName>) ]  ) |
    -analyticsProfile <string>@)
```

Example:

```
bind lb vs lb-http3 -policyName urltrans_udp -type REQUEST -priority
8
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Bind URL transform policy global with HTTP/3 QUIC based load balancing virtual server

To bind a URL transform policy HTTP/3 global bind point, at the command prompt, type:

```
bind transform global <policyName> <priority>  [<gotoPriorityExpression
    >] [-type <type>] [-invoke (<labelType>  <labelName>) ]
```

Example:

```
bind transform global urltrans_udp 100 -type HTTPQUIC_REQ_DEFAULT
```

For more information, see URL transformation policy configuration.

Front end optimization (FEO) policy configuration for HTTP/3 traffic

The HTTP protocols that underlie web applications were originally developed to support the transmission and rendering of simple webpages. New technologies such as JavaScript and cascading style sheets (CSS), and new media types such as Flash videos and graphics-rich images, place heavy demands on front-end performance, that is, on performance at the browser level. The Citrix ADC front end optimization (FEO) feature addresses such issues and reduces the load time and render time of webpages.

> **Note:**
>
> `HTTP_QUIC _Override/Default_Request` Type is not supported for FEO policy global binding.

Add Front end optimization (FEO) action

To add a FEO action, at the command prompt, type:

```
add feo action <name> [-pageExtendCache] [<cacheMaxage>][-
    imgShrinkToAttrib] [-imgGifToPng] [-imgToWebp] [-imgToJpegXR] [-
    imgInline] [-cssImgInline] [-jpgOptimize] [-imgLazyLoad] [-cssMinify
    ] [-cssInline] [-cssCombine] [-convertImportToLink] [-jsMinify] [-
    jsInline] [-htmlMinify] [-cssMoveToHead] [-jsMoveToEND][-
    domainSharding <string> <dnsShards> ...] [-clientSideMeasurements]
```

Example:

```
add feo action feoact -imgGifToPng -pageExtendCache
```

Add Front end optimization (FEO) policy

To add a FEO policy, at the command prompt, type:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
add feo policy <name> <rule> <action>
```

Example:

```
add feo policy udp_feo_img "CLIENT.UDP.DSTPORT.EQ(443)"IMG_OPTIMIZE
```

Bind FEO policy with load balancing virtual server of type HTTP/3_QUIC

To bind FEO policy with load balancing virtual server of type HTTP/3_QUIC, at the command prompt, type:

```
bind lb vserver <name>@ ((<serviceName>@   [-weight <positive_integer>]
     ) | <serviceGroupName>@ |         (-policyName <string>@  [-
    priority <positive_integer>]  [-gotoPriorityExpression <expression>]
      [-type <type>]  [-invoke  (<labelType>  <labelName>) ]  ) | -
    analyticsProfile <string>@)
```

Example:

```
bind lb vserver lb-http3 -policyName udp_feo_img -priority 4 -gotoPriorityExpr
 END -type REQUEST
```

Bind FEO policy to HTTP/3 global bind point

To bind a cache policy to the HTTP/3 global bind point, at the command prompt, type:

```
bind cache global <policy> -priority <positive_integer>  [-
    gotoPriorityExpression <expression>] [-type <type>] [-invoke (<
    labelType> <labelName>) ]
```

Example:

```
bind cache global ctx_doc_pdf -priority 3 -type HTTPQUIC_REQ_DEFAULT
```

For more information, see Front end optimization policy configuration.

SSL Policy configuration for HTTP/3 traffic

HTTP over QUIC type virtual servers have SSL policy support. However, as QUIC uses UDP as its transport mechanism, TCP based expressions are excluded and UDP based expressions are included. New or existing policy configurations with TCP expressions cannot be bound to HTTP/3 virtual servers or to the newly added HTTP/3 global bind points. Instead of TCP expressions, UDP expressions can be included in the policy configurations that are bound to HTTP/3 QUIC virtual servers or HTTP over QUIC bind points.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

SSL policies with actions that are supported for TLSv1.3 are only applicable for HTTP/3 bind points or virtual servers.

Add SSL Policy

To add a FEO policy, at the command prompt, type:

```
add ssl policy <name> -rule <expression> [-action <string>] [-
    undefAction <string>] [-comment <string>]
```

Example:

```
add ssl policy ssl-pol -rule CLIENT.SSL.IS_SSL -action NOOP
```

Bind SSL Policy to HTTP/3 virtual server

To bind an SSL policy to the HTTP/3 virtual server, at the command prompt:

```
bind ssl policylabel <labelName> <policyName> <priority> [<
    gotoPriorityExpression>] [-invoke (<labelType> <labelName>)
```

Example:

```
bind ssl vserver lb-http3 -policyName ssl-pol -priority 4 -type
REQUEST
```

Add SSL policy with UDP expression for SSL Policy

To add an SSL policy with UDP expression, at the command prompt:

```
add ssl policy <name> -rule <expression> [-action <string>] [-
    undefAction <string>] [-comment <string>]
```

Example:

```
add ssl policy ssl_udp_clnt -rule "CLIENT.UDP.DSTPORT.EQ(443)"-action
 NOOP
```

Bind SSL Policy with UDP expression to HTTP/3 virtual server

To bind an SSL policy with UDP expression to the HTTP/3 virtual server, at the command prompt, type

```
bind ssl policylabel <labelName> <policyName> <priority> [<
    gotoPriorityExpression>] [-invoke (<labelType> <labelName>)
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Example:

```
bind ssl vs lb-http3 -policyName ssl_udp_clnt -priority 8 -type
REQUEST
```

Add SSL policy for CLIENTHELLO bind point for HTTP/3 traffic

To bind SSL policy for CLIENTHELLO bind point for HTTP/3 traffic, at the command prompt, type:

```
1 bind ssl policylabel <labelName> <policyName> <priority> [<
     gotoPriorityExpression>] [-invoke (<labelType> <labelName>)
```

Example:

```
add ssl policy ssl-pol-ch -rule "CLIENT.SSL.CLIENT_HELLO.CIPHERS.
HAS_HEXCODE(0x1301)"-action RESET
```

Bind SSL policy to CLIENTHELLO bind point

To bind an SSL policy to the CLIENTHELLO bind point, at the command prompt, type:

```
1 bind ssl policylabel <labelName> <policyName> <priority> [<
     gotoPriorityExpression>] [-invoke (<labelType> <labelName>)
```

Example:

```
bind ssl vs lb-http3 -policyName ssl-pol-ch -type CLIENTHELLO_REQ -
priority 100
```

Bind SSL policy to HTTP/3 global bind point

To bind an SSL policy to the HTTP/3 global bind point, at the command prompt, type:

```
bind cache global <policy> -priority <positive_integer> [-gotoPriorityExpressi
 <expression>] [-type <type>] [-invoke (<labelType> <labelName>)]
```

Example:

Following is an example of a DATA policy being bound to a HTTP/3 global bind point:

```
Bind ssl global -policyName ssl-pol-ch -priority 7 -type HTTPQUIC_DATA_DEFAULT
```

> **Note:**

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

> Forward action that can be set for CLIENTHELLO bind point for SSL virtual servers is currently not supported for HTTP_QUIC type virtual servers.

Application Firewall Policy configuration for HTTP/3 traffic

HTTP over QUIC type virtual servers have web application firewall policy support. However, as QUIC uses UDP as its transport mechanism, TCP based expressions are excluded and UDP based expressions are included.
New or existing policy configurations with TCP expressions cannot be bound to HTTP/3 virtual servers or to the newly added HTTP/3 global bind points. Instead of TCP expressions, UDP expressions can be included in the policy configurations that are bound to HTTP/3 QUIC virtual servers or HTTP over QUIC bind points.

Add Web Application Firewall policy with UDP expression

To add Web Application Firewall policy with UDP expression, at the command prompt:

```
add appfw policy <name> <rule> <profileName> [-comment <string>] [-
    logAction <string>]
```

Example:

```
add appfw policy appfw_udp "CLIENT.UDP.DSTPORT.EQ(443)"APPFW_BYPASS
```

Bind log expressions with UDP based expression for Web Application Firewall profile

To bind log expressions with UDP for Web Application Firewall profile, at the command prompt:

Example:

```
bind appfw profile APPFW_BLOCK -logExpression logexp-1 "CLIENT.UDP.
DSTPORT.EQ(443)"
```

Bind Application Firewall policy with HTTP/3 virtual server

To bind Web Application Firewall policy with HTTP/3 virtual server, at the command prompt:

```
bind appfw policylabel <labelName> <policyName> <priority> [<
    gotoPriorityExpression>] [-invoke (<labelType> <labelName>)
```

Example:

```
bind lb vs lb-http3 -policyName appfw_udp -priority 3 -type REQUEST
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Bind Web Application Firewall policy to HTTP/3 global bind point

To bind a Web Application Firewall policy to the HTTP/3 global bind point, at the command prompt, type:

```
bind appfw global <policy> -priority <positive_integer>  [-
    gotoPriorityExpression <expression>] [-type <type>] [-invoke (<
    labelType> <labelName>) ]
```

Example:

```
bind appfw global appfw_udp 100 -type HTTPQUIC_REQ_DEFAULT
```

AppQoE Policy configuration for HTTP/3 traffic

HTTP over QUIC type virtual servers have AppQoE policy support. However, as QUIC uses UDP as its transport mechanism, TCP based expressions are excluded and UDP based expressions are included. New or existing policy configurations with TCP expressions cannot be bound to HTTP/3 virtual servers or to the newly added HTTP/3 global bind points. Instead of TCP expressions, UDP expressions can be included in the policy configurations that are bound to HTTP/3 QUIC virtual servers or HTTP over QUIC bind points.

Add AppQoE policy with UDP based expression

To add AppQoE policy with UDP expression, at the command prompt:

```
add AppQoE policy <name> <rule> <profileName> [-comment <string>] [-
    logAction <string>]
```

Example:

```
add appqoe policy appqoe-pol-udp -rule "CLIENT.UDP.DSTPORT.EQ(443)"-
action appqoe-act-basic-prhigh
```

Bind AppQoE policy with HTTP/3 virtual server

To bind the AppQoE policy with the HTTP/3 virtual server, at the command prompt, type:

```
bind appqoe policylabel <labelName> <policyName> <priority> [<
    gotoPriorityExpression>] [-invoke (<labelType> <labelName>)
```

Example:

```
bind lb vs lb-http3 -policyName appqoe-pol-udp -type REQUEST -priority
 3
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Bind AppQoE policy to HTTP_QUIC virtual server

To bind AppQoE policy to HTTP_QUIC virtual server, at the command prompt, type:

```
bind appqoe <policy> -priority <positive_integer>  [-
    gotoPriorityExpression <expression>] [-type <type>] [-invoke (<
    labelType> <labelName>) ]
```

Example:

```
bind lb vs lb-http3 -policyName appqoe-pol-primd -priority 8 -type
REQUEST
```

HTTP/3 service discovery

September 14, 2021

HTTP protocol relies on using HTTP Alternative Services for origin server to advertise the availability of an equivalent service. HTTP/3 service discovery also uses the same principle. An alternative HTTP/3 endpoint can be advertised using any one of the following methods:

- HTTP Alt-Svc response header
- HTTP/2 Alt-Svc Frame in the response
- Application Layer Protocol Negotiation (ALPN)

The alternative service advertises the usage of an HTTP Alt-Svc response header and the HTTP/2 Alt-Svc frame as HTTP/3 endpoint. Servers may serve HTTP/3 on any UDP port. An alternative service advertisement includes an explicit port, and URLs contain either an explicit port or a default port associated with the scheme.

Clients receiving alternate service headers or frames are not bound to use them. The client, if made aware of an alternate service and if it supports the alternate service mechanism should use the appropriate alternate service advertised. In other words, a HTTP/1.1 service or a HTTP/2 service may advertise an equivalent endpoint that supports HTTP/3 protocol. The client on receiving this alternate service information can choose to establish a QUIC connection with the specified alternate service and once available, this connection can be used for any subsequent requests. If the establishment of the connection with the selected alternate service fails, the client can fall back to the original endpoint. When the client starts using the alternate service advertised, will indicate this by including a Alt-Used header.

Citrix ADC supports advertising equivalent HTTP/3 endpoints on HTTP and SSL type virtual servers.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Configure HTTP/3 service discovery

Complete the following steps to configure HTTP/3 service discovery:

1. Configure HTTP/3 alternative service endpoint by using an HTTP Alt-Svc Header
2. Configure HTTP/3 alternative service endpoint by using an HTTP/2 Alt-Svc frame
   Configure HTTP/3 alternative service endpoint by using an HTTP Alt-Svc Header
   To advertise an HTTP/3 endpoint by using a HTTP Alt-Svc Header, type the following command:

Note: The main purpose of advertising alternative service is to let user know that HTTP/3 capability can be accessed on HTTP/1.1 or HTTP/2 service on a.b.c.d:443 also.

```
1 add ns httpProfile <name> -custom -altsvc [ ENABLED | DISABLED ]
```

Example:

```
1 add ns httpProfile http-profile -altsvc ENABLED -altSvcValue  "h3
     -29=\":443\"; ma=3600; persist=1"
```

or

```
1 set ns httpProfile http-custom -altsvc ENABLED -altSvcValue  "h3
     -29=\":443\"; ma=3600; persist=1"
```

Configure HTTP/3 alternative service endpoint by using an HTTP/2 Alt-Svc frame

To advertise an HTTP/3 endpoint by using a HTTP/2 Alt-svc frame, type the following command:

```
1 add ns httpProfile <name> -custom -altsvc [ ENABLED | DISABLED ] -
     http2AltSvcFrame [ ENABLED | DISABLED ]
```

Example:

```
add ns httpProfile http-custom -http2 ENABLED -http2Direct ENABLED -
http2AltSvcFrame ENABLED -altsvc ENABLED -altSvcValue "h3-29=\":443\";
 ma=3600; persist=1"
```

or

```
set ns httpProfile http-custom -http2 ENABLED -http2Direct ENABLED -
http2AltSvcFrame ENABLED -altsvc ENABLED -altSvcValue "h3-29=\":443\";
 ma=3600; persist=1"
```

Configure HTTP/3 alternative service with HTTP Alt-Svc header value by using GUI

1. Navigate to **System > Profiles > HTTP Profiles**.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

2. Click **Add**.
3. In **Create HTTP Profile** page, go to HTTP/3 section and select **Alternative Service** checkbox.
4. The system displays the **Alternative Service Value** text box in the http2 section.
5. Enter the alternative service value as “h3-29=”:443”; ma=3600; persist=1”
6. Click **OK** and **Close**.

gRPC

September 14, 2021

gRPC in a Citrix ADC appliance is a lightweight, high performance, and open-source universal Remote Procedure Call (RPC) framework. The framework is optimal to work across multiple languages running on any operation system. Also when compared to other protocols, gRPC offers better performance and security.

gRPC for Citrix ADC is preferred for the following reasons:

- Build distributed applications for data-center and public/private cloud infrastructure.
- Provide client-server communication for mobile, web, or cloud.
- Access cloud services and applications
- Microservice deployments

Why gRPC in Citrix ADC

gRPC in Citrix ADC is implemented over HTTP/2 to support highly performance and scalable APIs. The use of binary than text keeps the payload compact and efficient. In Citrix ADC, the HTTP/2 requests are multiplexed over a single TCP connection, allowing multiple concurrent messages to be in flight without compromising the network resource usage. It also uses header compression to reduce the size of requests and responses.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

gRPC supports the following types of service methods for a client to remotely invoke parameters and return types.

1. **Unary RPC**. Client sends a single request to the gRPC server and gets a single response back.

   Example:
   ```
   rpc SayHello(HelloRequest)returns (HelloResponse);
   ```

2. **Server streaming RPC**. Client sends a single request to the gRPC server and gets a stream response.

   Example:
   ```
   rpc StreamingResponse(HelloRequest)returns (HelloResponse);
   ```

3. **Client streaming RPC**. Client sends a sequence of messages and waits for the server to read and return its response.

   Example:
   ```
   rpc IntroduceYourself(stream HelloRequest)returns (HelloResponse)
   ```

4. **Bidirectional streaming RPC**. Both client and server from both sides send a stream of messages using the read-write stream. The two streams operate independently.

   Example:
   ```
   rpc ChatSession (stream HelloRequest)returns (stream HelloResponse
   )
   ```

Citrix ADC supports the following capabilities for its services with gRPC endpoints:

- Load balancing
- Content switching
- Secure end-point services like Web Application Firewall, authentication .
- Policy configuration
- Stats and logging
- Content rewriting, content filtering
- Layer 4 and Layer 7 optimizations, TLS offering
- Gateway solutions for protocol translations

gRPC end-to-end configuration

December 29, 2023

The gRPC end-to-end configuration works by sending a gRPC request from a client over HTTP/2 protocol and again forwarding gRPC messages responded by the gRPC server.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

How end-to-end gRPC configuration works

The following diagram shows a gRPC configuration works in a Citrix ADC appliance.

1. To deploy the gRPC configuration, you must first enable HTTP/2 in the HTTP profile and also enable HTTP/2 support globally on server side.
2. When a client sends a gRPC request, the load balancing virtual server evaluates the gRPC traffic using policies.
3. Based on policy evaluation, the load balancing virtual server (with gRPC service bound to it) terminates the request and forwards it as a gRPC request to the back-end gRPC server.
4. Similarly, when the gRPC server responds to the client, the appliance terminates the response and forwards it as a gRPC response to the client.

Example for gRPC request sent to gRPC server

The request header is sent as HTTP/2 headers in HEADERS+CONTINUATION Frames.

```
```
HEADERS (flags = END_HEADERS)
: method = POST
: scheme = http
: path = /helloworld.citrix-adc/SayHello
: authority = 10.10.10.10.:80
grpc-timeout = 15
content-type = application/grpc+proto
grpc-encoding = gzip
DATA (flags = END_STREAM)
<Length-Prefixed Message>
```
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Example for gRPC response header from gRPC server to Citrix ADC appliance

Response-Headers & Trailers-Only are delivered in a single HTTP/2 HEADERS frame block. Most responses are expected to have both headers and trailers but Trailers-Only is permitted for calls that produce an immediate error. Status must be sent in Trailers even if the HTTP status code is OK.

```
```
HEADERS (flags = END_HEADERS)
: status = 200
Grpc-encoding= gzip
Content-type = application/grpc+proto
DATA
<Length-Prefixed Message>
HEADERS (flags = END_STREAM, END_HEADERS)
grpc-status = 0 # OK

```
```

Configure gRPC by using the CLI

To configure an end-to-end gRPC deployment, you must complete the following:

- Add HTTP profile with HTTP/2 and HTTP/2 direct enabled.
- Enable global back end HTTP/2 support in HTTP parameter
- Add load balancing virtual server of type SSL/HTTP and set HTTP profile
- Add Service for gRPC endpoint and set HTTP profile
- Bind gRPC end point service to load balancing virtual server

Add HTTP profile with HTTP/2 and HTTP/2 direct enabled

You must enable HTTP/2 and HTTP/2 direct parameters in the HTTP profile. Also, you must enable the HTTP/2 direct parameter if gRPC over HTTP/2 cleartext is required.

At the command prompt, type:

```
add ns httpProfile <name> - http2 ( ENABLED | DISABLED )[-http2Direct
 ( ENABLED | DISABLED )]
```

Example:

```
add ns httpProfile http2gRPC -http2Direct ENABLED -http2 ENABLED
```

Enable global back-end HTTP/2 support through HTTP parameter

To enable HTTP/2 support globally on the server side by using the Citrix ADC command line.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

At the command prompt, type:

```
set ns httpParam -http2ServerSide( ON | OFF )
```

Example:

```
set ns httpParam -http2ServerSide ON
```

Add load balancing virtual server of type SSL/HTTP and set HTTP profile

To add a load balancing virtual server by using the **Citrix ADC** command interface:

At the command prompt, type:

```
add lb vserver <name> <service type> [(<IP address>@ <port>)] [-
httpProfileName <string>]
```

Example:

```
add lb vserver lb-grpc HTTP 10.10.10.11 80 -httpProfileName http2gRPC
```

> **Note:**
>
> If you are using a load balancing virtual server of type SSL, then you must bind the server certificate. See Bind server certificate topic for more information.

Add Service for gRPC endpoint and set HTTP profile

To add a gRPC service with HTTP profile by using the **Citrix ADC** command interface:
At the command prompt, type:

```
add service <name> (<IP> | <serverName> )<serviceType> <port> [-
httpProfileName <string>]
```

Example:

```
add service svc-grpc 10.10.10.10 HTTP 80 -httpProfileName http2gRPC
```

Bind gRPC end point service to load balancing virtual server

To bind a gRPC service to load balancing virtual server by using the **Citrix ADC** command interface:

At the command interface, type:

```
bind lb vserver <name> <serviceName>
```

Example:

```
bind lb vserver lb-grpc svc-grpc
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Configure end-to-end gRPC deployment by using the GUI

Complete the following steps to configure gRPC by using the GUI.

Add HTTP profile with HTTP/2 and HTTP/2 direct enabled

1. Navigate to **System > Profiles** and click **HTTP Profiles**.
2. Select the **HTTP/2** checkbox in a new HTTP profile or existing HTTP profile.

Enable global back end HTTP/2 support in HTTP parameter

1. Navigate to **System > Settings > HTTP Parameters**.
2. In the **Configure HTTP Parameter** page, select **HTTP/2 on Server Side** checkbox.
3. Click **OK**.

Add load balancing virtual server of type SSL/HTTP and set HTTP profile

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**.
2. Click Add to create a load balancing virtual server for gRPC traffic.
3. In Load Balancing Virtual Server page, click Profiles.
4. In the Profiles section, select the profile type as HTTP.
5. Click OK and then Done.

Add Service for gRPC endpoint and set HTTP profile

1. Navigate to **Traffic Management > Load Balancing > Services**.
2. Click Add to create an application server for gRPC traffic.
3. In Load Balancing Service page, go to Profile section.
4. Under Profiles, add HTTP profile for gRPC endpoint.
5. Click OK and then Done.

For detailed GUI procedures related to loading balancing, see Load Balancing topic.

gRPC bridging

December 29, 2023

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

When a client sends a request over HTTP/1.1 protocol, the Citrix ADC appliance supports bridging of the gRPC requests over HTTP/1.1 protocol which is in compliance with the gRPC server over HTTP/2 protocol. Similarly, in reverse bridging, the appliance receives the client gRPC request over the HTTP/2 protocol and performs reverse bridging for the gRPC requests in compliance with the gRPC server of the HTTP/1.1 protocol.

How gRPC bridging works

In this scenario, the Citrix ADC appliance seamlessly bridges gRPC content received on an HTTP/1.1 connection and forwards it to the back-end gRPC server over HTTP/2.

The following diagram shows how components interact with each other in a gRPC bridging configuration.

1. When a gRPC request is sent, the Citrix ADC appliance checks if the connection is HTTP/1.1 and the content type is application/grpc. The HTTP/1.1 requests translate to the following pseudo headers.
2. On receiving a gRPC request on HTTP/1.1. connection as indicated by the Content-Type header, the ADC appliance transforms the request into gRPC over HTTP/2 as given below:

```
1     :method: Method-name in HTTP/1.1 request
2     :path: Path is HTTP/1.1 request
3     content-type: application/grpc
```

1. Based on policy evaluation, the load balancing virtual server (with the gRPC service bound to it) terminates the request or forwards it over HTTP/2 frames to the back-end gRPC server.
2. On receiving the response on a HTTP/2 connection from the gRPC server, the appliance buffers until it receives the HTTP/2 trailer and then checks for the gRPC-status code. If it is non-zero gRPC error status, the appliance looks for the mapping HTTP Status code and send a suitable HTTP/1.1 error response.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Configure gRPC bridging by using the CLI

To configure gRPC bridging, you must complete the following steps:

1. Add HTTP profile with HTTP/2 and HTTP/2 direct enabled
2. Enable global back-end HTTP/2 support in the HTTP parameter
3. Add load balancing virtual server of type SSL/HTTP and set the HTTP profile
4. Add Service for gRPC endpoint and set the HTTP profile
5. Bind gRPC end point service to load balancing virtual server
6. Map gRPC status code to the HTTP response for non-zero gRPC status
7. Configure gRPC buffering by time and/or size

Add HTTP profile with the HTTP/2 and HTTP/2 direct enabled

To begin the configuration, you must enable the HTTP/2 feature in the HTTP profile. If the client sends the HTTP 1.1 requests, the appliance bridges the request and forward it to the back-end server.

At the command prompt, type:

```
add ns httpProfile <name> - http2 ( ENABLED | DISABLED )[-http2Direct
 ( ENABLED | DISABLED )]
```

Example:

```
add ns httpProfile http2gRPC -http2Direct ENABLED -http2 ENABLED
```

Enable global back end HTTP/2 support in the HTTP parameter

To enable the HTTP/2 support globally on the server side by using the Citrix ADC command line.

At the command prompt, type:

```
set ns httpParam -http2ServerSide( ON | OFF )
```

Example:

```
set ns httpParam -http2ServerSide ON
```

Add load balancing virtual server of type SSL/HTTP and set the HTTP profile

To add a load balancing virtual server by using the **Citrix ADC** command interface

At the command prompt, type:

```
add lb vserver <name> <service type> [(<IP address>@ <port>)] [-
httpProfileName <string>]
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Example:

```
add lb vserver lb-grpc HTTP 10.10.10.10 80 -httpProfileName http2gRPC
```

> **Note:**
>
> If you are using a load balancing virtual server of type SSL, then you must bind the server certificate. See Bind server certificate topic for more information.

Add Service for gRPC endpoint and set the HTTP profile

To add a gRPC service with the HTTP profile by using the **Citrix ADC** command interface.

At the command prompt, type:

```
add service <name> (<IP> | <serverName> )<serviceType> <port> [-
httpProfileName <string>]
```

Example:

```
add service svc-grpc 10.10.10.10 HTTP 80 -httpProfileName http2gRPC
```

Bind gRPC end point service to load balancing virtual server

To bind a gRPC end point service to the load balancing virtual server by using the CLI.

At the command interface, type:

```
bind lb vserver <name> <serviceName>
```

Example:

```
bind lb vserver lb-grpc svc-grpc
```

Map gRPC status code to HTTP status-code in the HTTP/1.1 response

In gRPC bridging scenario, the gRPC service responds to the request with a gRPC status-code. The appliance maps the gRPC status code to a corresponding HTTP response code and reason phrase. The mapping is done based on the table provided below. The Citrix ADC appliance when sending the HTTP/1.1 response to the client sends the HTTP status code and the reason phrase.

gRPC status-code	HTTP response status-code	HTTP response reason-phrase
OK = 0	200	OK

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

gRPC status-code	HTTP response status-code	HTTP response reason-phrase
CANCELLED = 1	499	*
UNKNOWN = 2	500	Internal Server Error
INVALID_ARGUMENT = 3	400	Bad Request
DEADLINE_EXCEEDED = 4	504	Gateway Timeout
NOT_FOUND = 5	404	*
ALREADY_EXISTS = 6	409	Conflict
PERMISSION_DENIED = 7	403	Forbidden
UNAUTHENTICATED = 16	401	Unauthorized
RESOURCE_EXHAUSTED = 8	429	*
FAILED_PRECONDITION = 9	400	Bad Request
ABORTED = 10	409	Conflict
OUT_OF_RANGE = 11	400	Bad Request
UNIMPLEMENTED = 12	501	Not Implemented
INTERNAL = 13	500	Internal Server Error
UNAVAILABLE = 14	503	Service Unavailable
DATA_LOSS = 15	500	Internal Server Error

Configure gRPC buffering by time and/or size

The Citrix ADC appliance buffers the gRPC response from the back-end server until the response trailer is received. This breaks bi-directional gRPC calls. Also, if the gRPC response is huge, it consumes a significant amount of memory to buffer the response completely. To resolve the issue, the gRPC bridging configuration is enhanced to limit buffering by time and/or size. If the buffer size or time limit exceeds threshold, the appliance stops buffering and forwards the response to the client even when any one of the limitations triggers (either the trailer is not received within the configured buffer size or if the configured timeout occurs). As a result, the configured policies and its expressions (based on grpc-status code) do not work as expected.

To limit gRPC buffering by time and/or size by the CLI, you can configure when you add a new HTTP profile or configure when you modify an existing profile.

At the command prompt, type:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
add ns httpProfile http2gRPC [-grpcHoldLimit <positive_integer>] [-
grpcHoldTimeout <positive_integer>]
```

Or

```
set ns httpProfile http2gRPC [-grpcHoldLimit <positive_integer>] [-
grpcHoldTimeout <positive_integer>]
```

Where,

`grpcholdlimit`. Maximum size in bytes allowed to buffer gRPC packets until trailer is received. You can configure both the parameters and any one.

Default value: 131072
Minimum value: 0
Maximum value: 33554432

`grpcholdtimeout`. Maximum time in milliseconds allowed to buffer gRPC packets until trailer is received. The value should be in multiples of 100.
Default value: 1000
Minimum value: 0
Maximum value: 180000

Example:

```
add httpprofile http2gRPC -grpcholdlimit 1048576 -grpcholdtimeout
5000
set httpprofile http2gRPC -grpcholdlimit 1048576 -grpcholdtimeout
5000
```

Configure gRPC bridging by using the GUI

Complete the following steps to configure gRPC bridging by using the Citrix ADC GUI.

Add HTTP profile with HTTP/2 and HTTP/2 direct enabled

1. Navigate to **System > Profiles** and click **HTTP Profiles**.
2. Select **HTTP/2** in the HTTP profile.

Enable global back-end HTTP/2 support in the HTTP parameter

1. Navigate to **System > Settings > HTTP Parameters**.
2. In the **Configure HTTP Parameter** page, select **HTTP/2 on Server Side** option.
3. Click **OK**.

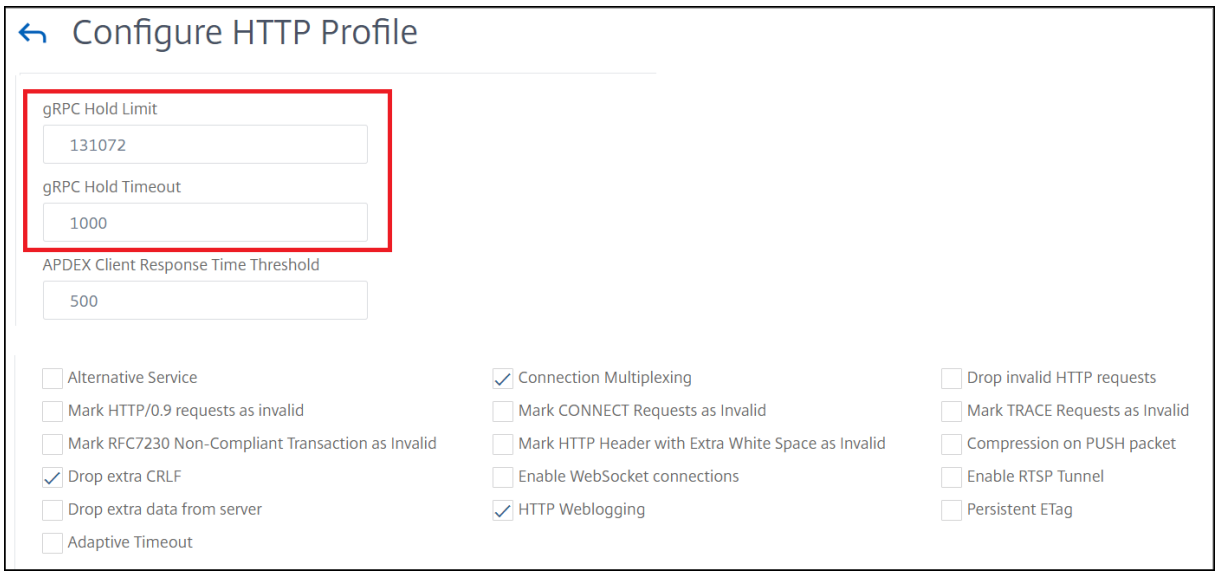
© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Add load balancing virtual server of type SSL/HTTP and set HTTP profile

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**.
2. Click **Add** to create a load balancing virtual server for gRPC traffic.
3. In **Load Balancing Virtual Server** page, click **Profiles**.
4. In the **Profiles** section, select the profile type as HTTP.
5. Click **OK** and then **Done**.

Add Service for gRPC endpoint and set HTTP profile

1. Navigate to **Traffic Management > Load Balancing > Services**.
2. Click **Add** to create an application server for gRPC traffic.
3. In **Load Balancing Service** page, go to **Profile** section.
4. Under **Profiles**, add **HTTP profile** for gRPC endpoint.
5. Click **OK** and then **Done**.



Bind Service for gRPC endpoint to load balancing virtual server

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**.
2. Click **Add** to create a load balancing virtual server for gRPC traffic.
3. In **Load Balancing Virtual Server** page, click **Service and Service Groups** section.
4. In the **Load Balancing Virtual Server Service Binding** page, select the gRPC service to bind.
5. Click **Close** and then **Done**.

Configure gRPC buffering by time and size by using the GUI

1. Navigate to **System > Profiles** and click **HTTP Profiles**.
2. Select **HTTP/2** in the HTTP profile.
3. In the **Configure HTTP Profile** page, set the following parameters:
    a) grpcHoldTimeout. Enter the time in milliseconds to buffer gRPC packets until the trailer is received.
    b) grpcHoldLimit. Enter the maximum size in bytes to buffer gRPC packets until the trailer is received.
4. Click **OK** and **Close**.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

For detail GUI procedures for binding service and load balancing virtual servers, see Load Balancing topic.

gRPC reverse bridging

December 29, 2023

In this scenario, the Citrix ADC appliance seamlessly bridges gRPC content received on an HTTP/2 connection and forwards it to the back-end gRPC server over HTTP/1.1.

How reverse bridging works

The following diagram shows how components interact with each other in a gRPC bridging configuration.

1. Client sends a gRPC request on HTTP/2 connection with gRPC headers in HTTP/2 frames and proto-buf payload.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

2. Based on policy evaluation, the load balancing virtual server (with gRPC service bound to it) translates and forwards the request over HTTP/1.1 connection to backend server.
3. On receiving the HTTP/1.1 response, if there is no grpc-status code in the response, ADC derives a grpc status-case from the HTTP response code.
4. The appliance then inserts the gRPC headers into HTTP/2 trailer before forwarding the response to the client.

Configure gRPC reverse bridging by using the CLI

To configure gRPC reverse bridging, you must complete the following steps:

- Add HTTP profile 1 with HTTP/2 and HTTP/2 direct enabled for load balancing virtual server
- Add HTTP profile 2 with HTTP/2 disabled for back-end server
- Add load balancing virtual server of type SSL/HTTP and set to HTTP profile 1
- Add service for gRPC endpoint and set to HTTP profile 2
- Bind Service for gRPC endpoint to load balancing virtual server
- Map HTTP-status code to gRPC status code if the response does not have a grpc status code

Add HTTP profile 1 with HTTP/2 and HTTP/2 direct enabled for load balancing virtual server

To begin the reverse bridging configuration, you must add two HTTP profiles. One profile for enabling HTTP/2 for gRPC client requests and another profile for disabling HTTP/2 for non-gRPC server response.

At the command prompt, type:

```
add ns httpProfile <name> - http2 ( ENABLED | DISABLED )[-http2Direct
 ( ENABLED | DISABLED )]
```

Example:

add ns httpProfile profile1 –http2 ENABLED -http2Direct ENABLED

Add HTTP profile 2 with HTTP/2 disabled for back-end server

To disable HTTP/2 support on the HTTP profile for back-end server response by using the Citrix ADC command line.

At the command prompt, type:

```
add ns httpProfile <name> - http2 ( ENABLED | DISABLED )[-http2Direct
 ( ENABLED | DISABLED )]
```

Example:

add ns httpProfile profile2 –http2 DISABLED http2Direct DISABLED

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Add load balancing virtual server of type SSL/HTTP and set to HTTP profile 1

To add a load balancing virtual server by using the Citrix ADC command interface.

At the command prompt, type:

```
add lb vserver <name> <service type> [(<IP address>@ <port>)] [-
httpProfileName <string>]
```

Example:

add lb vserver lb-grpc HTTP 10.10.10.10 80 -httpProfileName profile1

> **Note:**
>
> If you are using a load balancing virtual server of type SSL, then you must bind the server certificate. See Bind server certificate topic for more information.

Add service for gRPC endpoint and set to HTTP profile 2

To add a service with gRPC endpoint and set HTTP profile 2 by using the Citrix ADC command interface.

At the command prompt, type:

```
add service <name> (<IP> | <serverName> )<serviceType> <port> [-
httpProfileName <string>]
```

Example:

```
add service svc-grpc 10.10.10.11 HTTP 80 -httpProfileName profile2
```

Bind service for gRPC endpoint to load balancing virtual server

To bind a gRPC service to load balancing virtual server by using the Citrix ADC command interface.

At the command interface, type:

```
bind lb vserver <name> <serviceName>
```

Example:

```
bind lb vserver lb-grpc svc-grpc
```

Map HTTP response code to gRPC status code

If the server does not generate a gRPC status code, the Citrix ADC appliance generates a suitable gRPC status code based on the HTTP response received. The status codes are listed in the below mapping table.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

HTTP Response status-code	gRPC status code
200	OK
400	INTERNAL = 13
403	PERMISSION_DENIED = 7
401	UNAUTHENTICATED = 16
429, 502, 503, 504	UNAVAILABLE = 14
404	UNIMPLEMENTED = 12

Configure gRPC reverse bridging by using the GUI

Add HTTP profile 1 with HTTP/2 and HTTP/2 direct enabled for load balancing virtual server

1. Navigate to System > Profiles and click HTTP Profiles.
2. Enable **HTTP/2** option in a HTTP profile 1.

Add HTTP profile 2 with HTTP/2 disabled for back-end server

1. Navigate to **System > Profiles** and click **HTTP Profiles**.
2. Enable **HTTP/2** option in a HTTP profile 2.
3. Click **OK**.

Add load balancing virtual server of type SSL/HTTP and set to HTTP profile 1

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**.
2. Click **Add** to create a load balancing virtual server for gRPC traffic.
3. In **Load Balancing Virtual Server** page, click **Profiles**.
4. In the **Profiles** section, select the profile type as HTTP.
5. Click **OK** and then **Done**.

Add service with gRPC endpoint and set to HTTP profile 2

1. Navigate to **Traffic Management > Load Balancing > Services**.
2. Click **Add** to create an application server for gRPC traffic.
3. In **Load Balancing Service** page, go to **Profile** section.
4. Under **Profiles**, add **HTTP profile** for gRPC endpoint.
5. Click **OK** and then **Done**.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Bind Service for gRPC endpoint to load balancing virtual server

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**.
2. Click **Add** to create a load balancing virtual server for gRPC traffic.
3. In **Load Balancing Virtual Server** page, click **Service** and **Service Groups** section.
4. In the **Load Balancing Virtual Server Service Binding** page, select the gRPC service to bind.
5. Click **Close** and then **Done**.

For detail GUI procedures, see Load Balancing topic.

gRPC call termination

September 14, 2021

When a Citrix ADC appliance has policies such as rate limiting, Web App Firewall security configured and if a policy evaluates to true, the appliance can terminate the call and respond with a computable gRPC error message to the client.

gRPC with rewrite policy

September 14, 2021

The gRPC with rewrite policy use case explains how Citrix ADC appliance works in rewriting some information in the gRPC requests or responses. The following diagram shows the components interact.

The following diagram shows how components interact with each other in a gRPC with rewrite policy configuration.

1. Enable rewrite feature on the appliance.
2. Configure rewrite action to modify, add, or delete gRPC headers.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

3. Configure rewrite policy for determining the gRPC requests (traffic) on which an action has to be taken.
4. Bind the rewrite policy to the load balancing virtual server to examine if the traffic matches the policy expression.
5. By using a rewrite policy, you can perform the following based on gRPC status code.

    a) Modify responses from gRPC web server.
    b) Modify, add, or delete gRPC headers.
    c) Modify the URL of the request to the gRRC server.

Configure gRPC call termination with rewrite policy

To configure gRPC call termination with rewrite policy, you must complete the following steps:

1. Enable rewrite feature
2. Add rewrite policy
3. Bind rewrite policy to load balancing virtual server

Enable rewrite feature

To use the rewrite feature, you must first enable it.

At the command prompt, type:

```
enable ns rewrite
```

Add rewrite policy

After you configure a rewrite action, you must next configure a rewrite policy to select the gRPC requests to which the Citrix ADC appliance must rewrite.

At the command prompt, type:

```
add rewrite policy <name> <expression> <action> [<undefaction>]-
appFlowaction <actionName>
```

Example:

```
add rewrite policy grpc-rewr_pol1 "http.res.header(\"grpc-status\").
NE(\"0\")"RESET
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Bind rewrite policy to load balancing virtual server

To put a policy into effect, you must bind it to the load balancing virtual server with the gRPC service.

At the command prompt, type:

```
bind rewrite global <policyName> <priority> [<gotoPriorityExpression>
 [-type <type>] [-invoke (<labelType> <labelName>)]
```

Example:

```
bind lb vserver lb-grpc –policyName grpc-rewr_pol1 –priority 100
```

gRPC with the responder policy

September 14, 2021

The gRPC with responder policy configuration explains how a Citrix ADC appliance provides different responses to gRPC requests over the HTTP/2 protocol. When users request a website home page, you might want to provide a different home page depending on where each user is located or the browser the user is using.

The following diagram shows the components that interact.

1. Enable the responder feature on the appliance.
2. Configure the responder action to generate a custom response, redirect a request to a different webpage, or reset a connection.
3. Configure the responder policy for determining the gRPC requests (traffic) on which an action has to be taken.
4. Bind the responder policy to the load balancing virtual server to examine if the traffic matches the policy expression.
5. By using a responder policy, you can perform the following based on the gRPC status code.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Configure gRPC call termination with the responder policy by using the CLI

To configure gRPC call termination with the responder policy, you must complete the following steps:

1. Enable the responder feature
2. Add a responder action
3. Add a responder policy and associate responder action
4. Bind the responder policy to load balancing virtual server

Enable the responder feature

To use the responder feature, you must first enable it.

At the command prompt, type:

```
enable ns responder
```

Add the responder action

After enabling the feature, you must configure the responder action for handling the gRPC response based on the status code returned by the back-end server.

At the command prompt, type:

```
add responder action <name> <type>
```

Example:

```
add responder action grpc-act respondwith "HTTP/1.1 200 OK\r\nServer:
 NS-Responder\r\nContent-Type:application/grpc\r\ngrpc-status: 12\r\
ngrpc-message: Not Implemented\r\n\r\n"+ "Method: "+ HTTP.REQ.URL+ "
is not implemented."
```

Adding responder policy

After you configure a responder action, you must next configure a responder policy to select the gRPC request to which the Citrix ADC appliance must respond.

At the command prompt, type:

```
add responder policy <name> <expression> <action> [<undefaction>]-
appFlowaction <actionName>
```

Example:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
add responder policy grpc-resp-pol1 HTTP.REQ.URL.NE("/helloworld.
Greeter/SayHello")grpc-act
```

Bind responder policy to load balancing virtual server

To put a policy into effect, you must bind it to the load balancing virtual server with the gRPC service.

At the command prompt, type:

```
bind responder global <policyName> <priority> [<gotoPriorityExpression
> [-type <type>] [-invoke (<labelType> <labelName>)]
```

Example:

```
bind lb vserver lb-grpc svc-grpc -policyName grpc-resp-pol1 –priority
 100
```

For more information about the responder policy, see Responder Policy topic.

Policy expressions for matching gRPC protocol buffer fields

The Citrix ADC appliance supports the following policy expressions in the gRPC configuration:

- **gRPC protocol buffer field access.** The arbitrary gRPC API call matches the message field number with the new policy expressions. In a PI configuration, the matches are done using only the 'field numbers'and 'API path'.
- **gRPC header filtering.** The "HttpProfile"parameters for gRPC is used to adjust the default behavior of gRPC parsing (including gRPC policy expressions). The following parameters are applicable to gRPC policy expressions:
  - **gRPCLengthDelimitation.** It is enabled by default and expects the protocol buffers to be presented with a length delimited message.
  - **gRPCHoldLimit.** The default value is 131072. It is the maximum protocol buffer message size in bytes. It is also the maximum string length and the maximum 'byte'field length as well.

Configure gRPC advance policy expressions by using the CLI

At the command prompt, type:

```
set ns httpProfile <name> -http2 \( ENABLED | DISABLED ) -
    gRPCLengthDelimitation \( ENABLED | DISABLED ) -gRPCHoldLimit <int>
```

Example:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
set ns httpProfile http2gRPC -http2 ENABLED -gRPCLengthDelimitation
    ENABLED -gRPCHoldLimit 131072
```

Configure gRPC header filtering parameters by using the GUI

1. Navigate to **System > Profiles** and click **HTTP Profiles**.
2. On the **Create HTTP Profile** page, scroll down to **HTTP/3** section, select **gRPC Length Delimitation**.

The following policy expression example shows a value in message 5, submessage 4, and field 3. It is a 32-bit int equal to 2.

```
http.req.body(1000).grpc.message(5).message(4).int32(3).eq(2)
```

The following policy expressions are added for matching gRPC protocol buffer message fields by number:

- message
- double
- float
- int32
- int64
- uint32
- uint64
- sint64
- sint32
- fixed32
- fixed64
- sfixed32
- sfixed64
- bool
- string
- enum
- bytes

API path matching

The API path matching is used to match the correct gRPC API call when more than one API is used. Match the API path, which can be found in the ‘: path’pseudo header in the HTTP request.

Example:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
http.req.header(":path").eq("acme.inventory.v1/ListBooks")
```

QUIC

September 14, 2021

Quick UDP Internet Protocol (QUIC) is a combination of (TCP+TLS+HTTP/2) protocols implemented on UDP. The QUIC transport protocol multiplexes the connections between two endpoints using UDP. Also when compared to other protocols, QUIC provides a high-performance in terms of security, fast delivery of traffic, and lower latency.

A QUIC bridge is configured in a Citrix ADC appliance for load balancing QUIC traffic between a QUIC client and QUIC back-end server. The QUIC bridge enables you to have persistent QUIC connections between client and server if there is a NAT rebinding or a connection migration. This configuration however does not process data. It is used only for load balancing of QUIC traffic through the Citrix ADC appliance.

QUIC packets contain connection ID to allow endpoints to associate the packets with different address or 4-tuple to the same connection. The connection ID contains the details of the server ID that are shared to the Citrix ADC appliance and to the back end servers. The Citrix ADC appliance extracts the connection ID details of the server ID and sends the traffic back to the back end server. The connection IDs are in protected packets that makes the connections robust in the event of connection migration.

> **Important**
>
> The back end servers must have support to encode server ID in QUIC connection ID.

Benefits of QUIC bridge

QUIC bridge for the Citrix ADC appliance is preferred for the following reasons:

- No expensive crypto operations.
- Stateless routing is possible (no 4-tuple based load balancing).

QUIC bridge configuration

December 29, 2023

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

To configure QUIC bridge, you must complete the following:

- Add QUIC bridge profile
- Add QUIC back-end servers
- Add QUIC service on the appliance
- Add load balancing virtual server of type QUIC bridge
- Bind QUIC bridge to load balancing virtual server of type QUIC bridge

> **Important**
>
> Before you configure the QUIC bridge, ensure you first enable the load balancing feature on the appliance. For more information, see Set up basic load balancing.

Configure QUIC bridge by using the CLI

The following sections must be configured by using the CLI.

Add a QUIC bridge profile

You must add a QUIC bridge profile.

At the command prompt, type:

```
add quicBridge profile <name> -routingAlgorithm <PLAINTEXT> -
    serveridlen <value>
```

Example:

```
add quicBridge profile q1 -routingAlgorithm PLAINTEXT -serveridlen 6
```

> **Note**
>
> The `serveridlen` parameter configured in the example is the length of a custom server ID, which is the hex string of IP and PORT.

Add QUIC back-end application server

You must add QUIC back-end application servers.

At the command prompt, type:

```
-  add server <name> (<IPAddress>)
-  add server <name> (<IPAddress>)
```

Example:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
1 -  add server s1 192.0.2.20
2 -  add server s2 192.0.2.30
```

Add QUIC bridge service

You must add QUIC bridge service to the application servers.

At the command prompt, type:

```
1 -  add service  <name>  \(<IP> | <serverName>) <serviceType> <port> \[-
     CustomServerID <string>]
2
3 -  add service  <name>  \(<IP> | <serverName>) <serviceType> <port> \[-
     CustomServerID <string>]
```

Example:

```
1 -  add service src1 s1 QUIC_BRIDGE 443 -CUSTOMSERVERID C0A8026401BB
2
3 -  add service src2 s2 QUIC_BRIDGE 443 -CUSTOMSERVERID C0A802C801BB
```

> **Note**
>
> The `CustomServerID` parameters configured in the preceding example are the hex string of a corresponding IP and the PORT of the server (s1 and s2). For the QUIC bridge feature, Citrix recommends you to configure the `CustomServerID` parameter in the hex string format only.

Add a load balancing virtual server of type QUIC bridge

You must add a load balancing virtual server of type QUIC bridge.

At the command prompt, type:

```
1 add lb vserver <name> [<IPAddress>@ <port>] [-persistenceType <
     persistenceType >] [-lbMethod < lbMethod >] [-rule <rule>] [-
     cltTimeout <secs>] [-quickBridgeProfilename <name>]
```

Example:

```
1 add lb vserver quic_bridge_vip QUIC_BRIDGE 192.0.2.10 443 -
     persistenceType CUSTOMSERVERID -lbMethod TOKEN -rule QUIC.
     CONNECTIONID -cltTimeout 120 -quicBridgeProfilename q1
```

> **Note**
>
> While configuring the QUIC bridge virtual server, you must configure `persistenceType` parameter as `CUSTOMSERVERID`, `rule` parameter as `QUIC.CONNECTIONID` and `LbMethod`

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

> parameter as TOKEN.

Bind QUIC bridge service to the load balancing virtual server of type QUIC bridge

You must bind the QUIC bridge service to the load balancing virtual server of type QUIC bridge.

At the command prompt, type:

```
- bind lb vserver <name> (<serviceName>)

- bind lb vserver <name> (<serviceName>)
```

Example:

```
- bind lb vserver quic_bridge_vip src1

- bind lb vserver quic_bridge_vip src2
```

Configure QUIC bridge for service groups

You can also configure QUIC bridge capabilities to service groups. The following steps guide you to configure QUIC bridge for service groups.

To configure QUIC bridge for service groups, you must complete the following:

Add QUIC bridge profile

At the command prompt, type:

```
add quicBridge profile <name> -routingAlgorithm <PLAINTEXT> -
    serveridlen <value>
```

Example:

```
add quicBridge profile q1 -routingAlgorithm PLAINTEXT -serveridlen 6
```

Add server of type QUIC

At the command prompt, type:

```
- add server <name> (<IPAddress>)
- add server <name> (<IPAddress>)
```

Example:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
1 -  add server s1 192.0.2.20
2 -  add server s2 192.0.2.30
```

Add QUIC bridge service group

At the command prompt, type:

```
1 add serviceGroup <serviceGroupName> \(<IP> | <serverName>) <serviceType
      >
```

Example:

```
1 add serviceGroup svg1 QUIC_BRIDGE
```

Bind the QUIC servers to the service group

At the command prompt, type:

```
1 -  bind serviceGroup <serviceGroupName> \(<IP>@ | \(<serverName>) \[-
      CustomServerID <string>]
2 -  bind serviceGroup <serviceGroupName> \(<IP>@ | \(<serverName>) \[-
      CustomServerID <string>]
```

Example:

```
1 -  bind serviceGroup svg1 s1 443 -customServerID C0A8026401BB
2 -  bind serviceGroup svg1 s2 443 -customServerID C0A802C801BB
```

Add load balancing virtual server of type QUIC bridge

At the command prompt, type:

```
1 add lb vserver <name> [<IPAddress>@ <port> [-persistenceType <
      persistenceType >] [-lbMethod < lbMethod > [-cltTimeout <secs>] [-
      quickBridgeProfilename <name>]
```

Example:

```
1 add lb vserver quic_bridge_vip QUIC_BRIDGE 192.0.2.10 443 -
      persistenceType CUSTOMSERVERID -lbMethod TOKEN -cltTimeout 120 -
      quicBridgeProfilename q1
```

Bind the load balancing virtual server of type QUIC bridge to the service group

At the command prompt, type:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
bind lb vserver <name>@ (<serviceName>@ <serviceGroupName>
```

Example:

```
bind lb vserver quic_bridge_vip svg1
```

Configure QUIC bridge using the GUI

Complete the following steps to configure QUIC bridge by using the GUI.

1. Navigate to **Traffic Management > Load balancing > Virtual Servers**.
2. On the **Virtual Servers** page, click **Add**.
3. On the **Load Balancing Virtual Server** page, select the Protocol as **QUIC_BRIDGE** and enter the details.
4. Click **Continue** and **Done**.

Configure load balancing for the services by using the GUI

Complete the following steps to configure load balancing for the services by using the GUI.

1. Navigate to **Traffic Management > Load Balancing > Services**. On the **Services** page, click **Add**.
2. On the **Load Balancing Service** page, enter the details and click **OK**.
3. On the **Virtual Servers** page, select the created virtual server to bind the service.
4. Scroll down on the **Load Balancing Virtual Server** page and select the **Services and Service Groups**.
5. On the **Service Binding** screen, click **Select Service** field.
6. On the **Service** screen, select the service to bind to the load balancing virtual server, and click **Select**.
7. On the **Service Binding** screen, select the service that you created and click **Bind**.
8. On the **Load Balancing Virtual Server** page, click **Done**.

Proxy protocol

December 29, 2023

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Proxy protocol safely transports client details from client to server across Citrix ADC appliances. The appliance adds a proxy protocol header with client details and forwards it to the back-end server. Following are some of the usage scenarios for proxy protocol in a Citrix ADC appliance.

- Learning original client IP address
- Selecting a language for a website
- Block listing selected IP addresses
- Logging and collecting statistics.

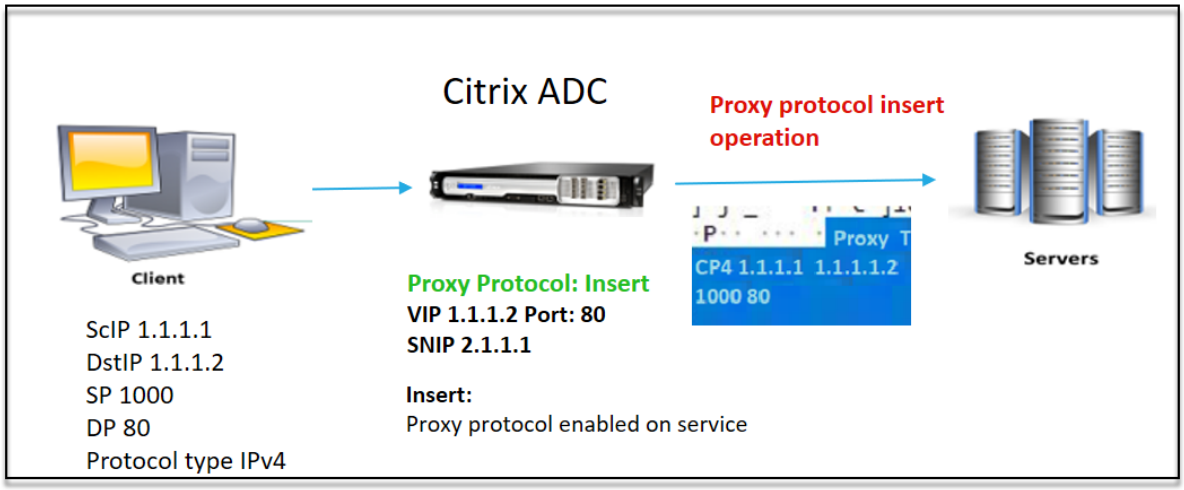
Following are the three modes of operation:

- Insert. The appliance inserts the client details and sends it to the back-end server.
- Forward. The appliance forwards the client details to the back-end server.
- Stripped. The appliance stores the client details for logging purpose. Also, if the proxy protocol is not supported on the back-end server, sends the client details to the server by using the rewrite policy configuration

The following table provides you information on the status of LB virtual server and service in different proxy protocol modes:

Proxy Protocol Mode	LB virtual server	Service
Insert	Disabled	Enabled
Forward	Enabled	Enabled
Stripped	Enabled	Disabled

Limitations

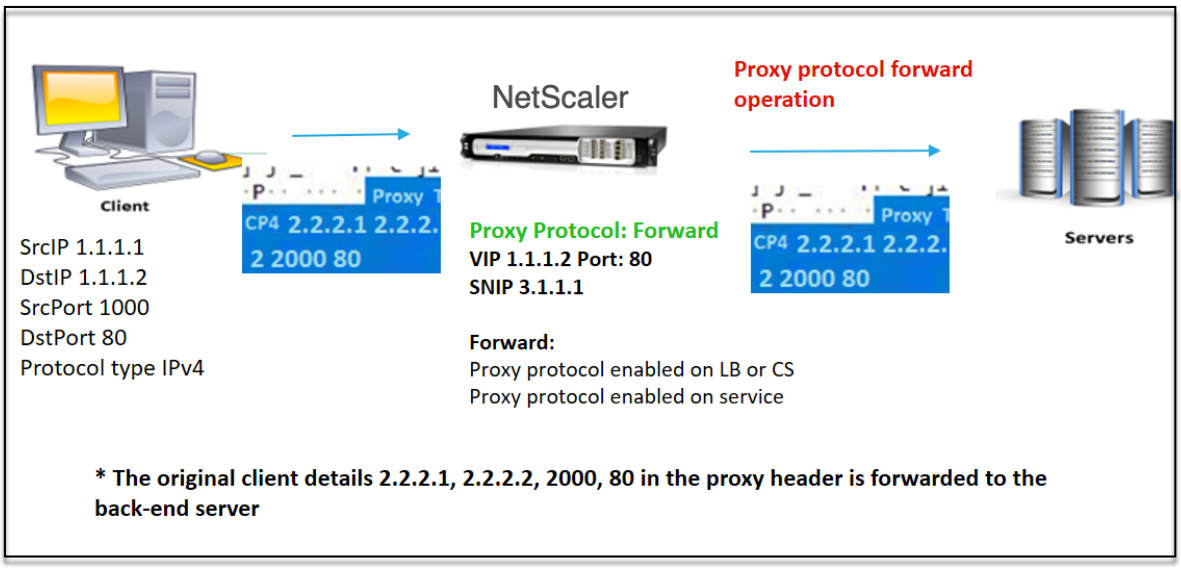


The proxy protocol is not supported for the TCP Fast Open (TFO) and MultiPath TCP features. The feature is supported only for services for which the Citrix ADC appliance does TCP connection termination. It is not support for other services, for example, "ANY".

How proxy protocol works in a Citrix ADC appliance

The following flow diagrams show how you can configure the proxy protocol across Citrix ADC appliances for Insert, Forwards, and Stripped operation:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

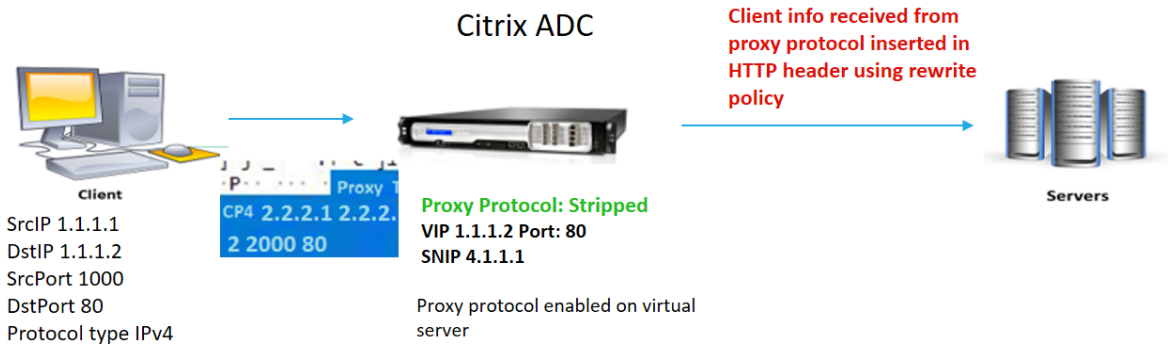


Insert operation

The component interact is as follows:

- At the Citrix ADC instance, you must enable proxy protocol in the net profile and bind it to the service.
- In the Insert operation, Citrix ADC adds a proxy header with client connection details and forwards it to the back-end server.
- On the sending side, the appliance decides the proxy protocol version based on CLI configuration.

Forward operation



The component interact is as follows:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- A client sends a request along with the proxy header to the Citrix ADC. The appliance dynamically identifies the version.
- In the Citrix ADC appliance, it is a Forward operation. The proxy protocol is enabled on the load balancing virtual server or content switching virtual server and enabled on the service. The appliance receives the proxy header and forwards the header details to the back-end server.
- If the proxy header details are in invalid format, the appliance resets the connection.
- On the sending side, the appliance decides the proxy protocol version based on CLI configuration.

Stripped operation

The component interact is as follows:

- A client sends a request along with a proxy header to the Citrix ADC appliance.
- In the Citrix ADC appliance, if it is a Stripped operation, the appliance forwards the client information obtained from the proxy protocol and inserts it into the HTTP header using rewrite policy expressions.
- The client details such as source IP address, destination IP address, source port, and destination port are added in an HTTP header using rewrite policy expressions. The rewrite policy evaluates the expression and if "true,"the corresponding rewrite policy action is triggered. And the client details are forwarded to the back-end server in an HTTP header.
- If the proxy header details are in invalid format, the appliance resets the connection.

Proxy protocol version formats

The Proxy protocol version is available as two formats. The appliance decides to use a format based on the incoming data length. For detailed information, see Proxy Protocol RFP.

1. Proxy protocol version-1 format

   ```
   PROXY TCP4/TCP6/UNKNOWN <SRC IP> <DST IP> <SRC PORT> <DST PORT>
   ```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- PROXY -> Unique string format for Proxy header version -1.
- Support protocols TCP over IPv4 and TCP over IPv6. For the remaining protocols, this is UNKNOWN.
- SRC IP –Source IP (Original Client IP) address of a packet.
- DST IP –Destination IP address of a packet.
- SRC port –Source port of a packet.
- DST port –Destination port of a packet.

2. Proxy protocol version-2 format

```
0D 0A 0D 0A 00 0D 0A 51 55 49 54 0A <13th byte> <14th byte>
<15-16th byte> <17th byte onwards>
```

- D 0A 0D 0A 00 0D 0A 51 55 49 54 0A -> Unique binary string for Proxy header version -2.
- Support protocols TCP over IPv4 and TCP over IPv6. For the remaining protocols, this is UNKNOWN.
- Thirteenth byte –protocol version and command.
- Fourteenth byte –address and protocol family.
- 15-16th byte –Address length in network order.
- Seventeenth byte onwards –Addresses info present in network order- src IP, dst IP, src port, dst port.

Configure Proxy protocol in Citrix ADC appliance

Complete the following steps to configure the Proxy protocol in your Citrix ADC appliance.

1. Enable proxy protocol as global.
2. Configure proxy protocol for Insert operation
3. Configure proxy protocol for Forward operation
4. Configure proxy protocol for Strip operation
5. Configure proxy protocol for no operation

Enable the proxy protocol as global

At the command prompt, type the following:

```
set ns param –proxyProtocol ENABLED
```

Configure proxy protocol for Insert operation

To configure the proxy protocol for Insert operation, you must enable or disable the protocol on the load balancing virtual server and enable it on the service.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Add net profile with Proxy protocol disabled for load balancing virtual server At the command prompt, type the following:

```
add netprofile <name> -proxyProtocol ENABLED/DISABLED> -proxyprotocoltxversion
 <V1/V2>
```

Example:

```
Add netprofile proxyprofile-1 –proxyProtocol ENABLED –proxyprotocoltxversion
 V1
```

> **Note:**
>
> If you disable proxy protocol on your appliance, you need not set the protocol version parameter.

Add net profile with a proxy protocol enabled for service At the command prompt, type the following:

```
add netprofile <name> -proxyProtocol ENABLED/DISABLED> -proxyprotocoltxversion
 <V1/V2>
```

Example:

```
add netprofile proxyprofile-2 –proxyProtocol ENABLED –proxyprotocoltxversion
 V1
```

Add load balancing virtual server for Citrix ADC appliance in the proxy layer At the command prompt, type the following:

```
add lb vserver <name>@ <serviceType> [(<IPAddress>@ <port>)]
```

Example:

```
add lb vserver lbvserver-1 http 1.1.1.1 80
```

Add HTTP service for Citrix ADC appliance in the proxy layer At the command prompt, type the following:

```
add service <name>@ (<IP>@ | <serverName>@)<serviceType> <port>
```

Example:

```
Add service http-service-1 2.2.2.1 http 80
```

Set net profile with load balancing virtual server in Citrix ADC appliance At the command prompt, type the following:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
set lb vserver <vserver name> -netprofile <name>
```

Example:

```
set lb vserver lbvserver-1 –netprofile proxyProfile-1
```

Set net profile with HTTP service in Citrix ADC appliance At the command prompt, type the following:

```
set service <service name> –netprofile <name>
```

Example:

```
set service http-service-1 –netprofile proxyProfile-1
```

Configure proxy protocol for forward operation

To configure the proxy protocol for Forward operation for the next Citrix ADC instance in the proxy layer. You must enable or disable the protocol and bind to the virtual server or service.

Add net profile with proxy protocol enabled for load balancing virtual server At the command prompt, type the following:

```
add netprofile <name> -proxyProtocol ENABLED/DISABLED> -proxyprotocoltxversion
 <V1/V2>
```

Example:

```
add netprofile proxyprofile-3 –proxyProtocol ENABLED –proxyprotocoltxversion
 V1
```

Add net profile with proxy protocol enabled for service At the command prompt, type the following:

```
add netprofile <name> -proxyProtocol ENABLED/DISABLED> -proxyprotocoltxversion
 <V1/V2>
```

Example:

```
add netprofile proxyprofile-4 –proxyProtocol ENABLED –proxyprotocoltxversion
 V1
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Add load balancing virtual server for Citrix ADC appliance in the proxy layer At the command prompt, type the following:

```
add lb vserver <name>@ <serviceType> [(<IPAddress>@ <port>)]
```

Example:

```
add lb vserver lbvserver-2 http 2.2.2.2 80
```

Add HTTP service for Citrix ADC appliance in the proxy layer At the command prompt, type the following:

```
add service <name>@ (<IP>@ | <serverName>@)<serviceType> <port>
```

Example:

```
Add service http-service-2 3.3.3.1 http 80
```

Set net profile with load balancing virtual server in Citrix ADC appliance At the command prompt, type the following:

```
set lb vserver <vserver name> -netprofile <name>
```

Example:

```
set lb vserver lbvserver-2 –netprofile proxyProfile-3
```

Set net profile with HTTP service in Citrix ADC appliance At the command prompt, type the following:

```
set service <service name> –netprofile <name>
```

Example:

```
set service http-service-2 –netprofile proxyProfile-4
```

Configure proxy protocol for strip operation

To configure the proxy protocol for strip operation, you must enable the proxy protocol on the load balancing virtual server and disable the proxy protocol on the service.

Add net profile with proxy protocol enabled for virtual server At the command prompt, type the following:

```
add netprofile <name> -proxyProtocol ENABLED> -proxyprotocoltxversion
 <V1/V2>
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Example:

```
add netprofile proxyprofile-5 –proxyProtocol ENABLED –proxyprotocoltxversion
 V1
```

Add load balancing or content switching virtual server for Citrix ADC appliance in the proxy layer
At the command prompt, type the following:

```
add lb vserver <name>@ <serviceType> [(<IPAddress>@ <port>)]
```

Example:

```
add lb vserver lbvserver-3 http 2.2.2.2 80
```

Add HTTP service for Citrix ADC appliance in the proxy layer At the command prompt, type the following:

```
add service <name>@ (<IP>@ | <serverName>@)<serviceType> <port>
```

Example:

```
Add service http-service-3 3.3.3.1 http 80
```

Set net profile with load balancing or content switching virtual server in Citrix ADC appliance
At the command prompt, type the following:

```
set lb vserver <vserver name> -netprofile <name>
```

Example:

```
set lb vserver lbvserver-3 –netprofile proxyProfile-5
```

Configure Proxy protocol by using Citrix ADC GUI

1. Navigate to **System** > **Settings** > **Change Global System Settings**.
2. In the **Configure Global System Settings Parameters** page, select **Proxy Protocol** check box.
3. Click **OK** and **Close**.
4. Navigate to **System** > **Network** > **Net Profiles**.
5. In the details pane, click **Add** to create a net profile for the load balancing virtual server.
6. In the **Net Profile** page, set the following parameters:
    a) Name. Name of the net profile.
    b) Proxy Protocol. Enable or disable proxy protocol for the load balancing virtual server.
    c) Proxy Protocol TX Version. Set proxy protocol version as V1 or V2 based on incoming data format.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

7. Click **OK**.
8. Navigate to **Traffic Management** > **Load Balancing** > **Virtual Servers**.
9. In the details pane, click **Add**.
10. In the **Load Balancing Virtual Server** page, the set the basic parameters.
11. In the **Advanced Settings** section, select **Profiles**.
12. In the **Profiles** section, click the pencil icon.
13. Select a net profile and click **OK**.
14. Click **Done**.
15. Navigate to **Traffic Management** > **Load Balancing** > **Services**.
16. In the details pane, click **Add**.
17. In the **Load Balancing Service** page, set the basic parameters.
18. In the **Advanced Settings** section, select **Profiles**.
19. In the **Profiles** section, click the pencil icon.
20. Select a net profile and click **OK**.
21. Click **Done**.

> **Note:**
>
> If you have more than one Citrix ADC appliance as part of the proxy layer, you must set the proxy protocol configuration on each appliance for the Forward operation.

Client IP address in TCP option

September 14, 2021

The Citrix ADC appliance uses many ways to send the client information to the back-end server. One such method is by sending the client IP address in the TCP option of the first data packet. The appliance uses the TCP option number in the TCP profile, if the back-end server using TCP option to read the client IP address. The IP address is carried in the TCP option number 28 (configurable on the appliance service).

The TCP option method includes both insert and forward functionality in carrying the client IP address to the back-end server.

In the TCP option configuration, the appliance adds a TCP option, 28 to insert the client IP address and forward it to the back-end server. Following are some the of usage scenarios for TCP option configuration in a Citrix ADC appliance.

Multiplexing is disabled if this feature is enabled for traffic coming to TCP profile. Also, if nsapimgr and clientip tcp-options in TCP profile are enabled, clientip tcp-option takes precedence.

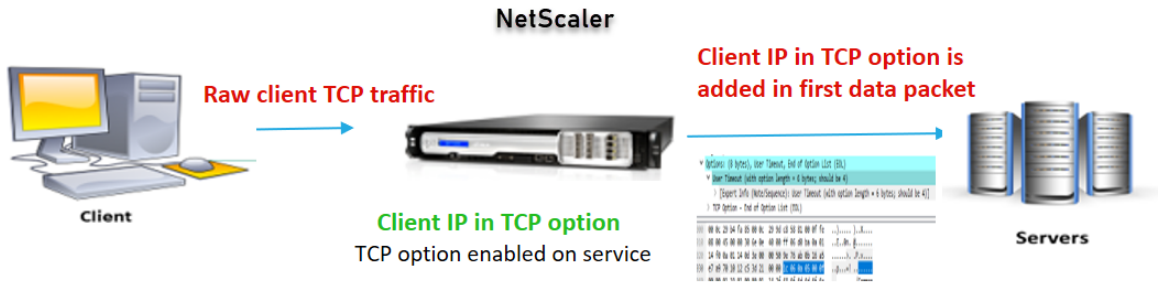
© 1999–2025 Cloud Software Group, Inc. All rights reserved.

> **Note:**
>
> However, multiplexing is disabled on the appliance if Client IP TCP option is enabled for the traffic that comes to the TCP profile.

- Learning original client IP address
- Selecting a language for a website
- Block listing selected IP addresses

Following are the two modes of operation:

- Insert. The appliance adds the client details in the TCP option 28 (configurable but preferable value is 28) field and sends it to the back-end server.
- Forward. The appliance forwards the client details in the TCP option 28 (configurable on the front-end of the appliance service). However, the option number at the back-end can be modified based on the value configured in the back-end



> **Note:**
>
> In case of TCP or HTTP virtual server, the TCP option number is forwarded with or without this feature enabled in transparent mode.

Limitations

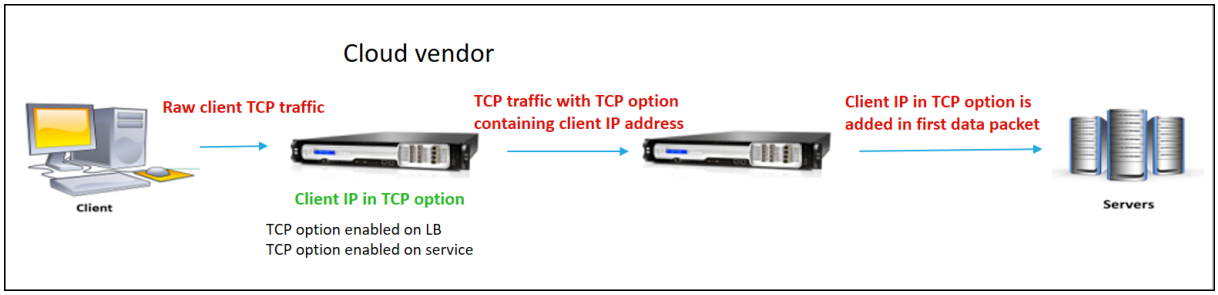
The TCP option configuration feature is not supported in TFO, MultiPath TCP, and HTTP2 features.

How TCP option configuration in a Citrix ADC appliance

The following flow diagrams show how you can configure TCP option in the Citrix ADC appliances for Insert and forward operations.

The component interact is as follows:

- A client sends a request to Citrix ADC.



© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- In Citrix ADC appliance, you must create a TCP profile, enable the TCP option feature, and specify the TCP option number.

  Note: It is advisable to configure TCP option number as 28 in the TCP profile.

- In Insert operation, Citrix ADC inserts the client details in the TCP option 28 bound to the service. The client details are then sent it to the back-end server. If the incoming traffic is HTTPS, the client IP address in the TCP option will be sent in the SSL client hello message which is the first data packet at the TCP level

Forward operation:

The component interact is as follows:

- A client sends a HTTP/HTTPS request to Citrix ADC.
- At Citrix ADC appliance, if is a Forward operation, the TCP option is enabled on load balancing virtual server or content switching virtual server and also enabled on the service. The appliance receives the client info in the TCP option number specified in the virtual server and forwards it to the back-end server in the TCP option number (configurable in the service) added in the first data packet

Configure TCP option for Insert operation

Following the procedure given below to configure TCP option in your Citrix ADC appliance.

1. Add a TCP profile.
2. Configure TCP option for Insert operation
3. Bind TCP profile to service

Add a TCP profile

At the command prompt, type:

```
add tcpprofile <name> -clientIpTcpOption (enabled | disabled> -
clientIpTcpOptionNumber <positive_integer>
```

Example:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
add tcprofile p1
```

Configure TCP option for Insert operation

At the command prompt, type:

```
add tcpprofile <name> -clientIpTcpOption (enabled | disabled> -
clientIpTcpOptionNumber <positive_integer>
```

Example:

```
add tcpprofile p1 -clientIpTcpOption ENABLED -clientIpTcpOptionNumber
 28
```

Add service

At the command prompt, type:

```
add service <name> <server name> <service type> <port>
```

Example:

```
add service service-http1 1.1.1.1 HTTP 80
```

Bind TCP profile to service

At the command prompt, type:

```
set service <name> –tcpprofileName <name>
```

Example:

```
set service s1 –tcpprofileName p1
```

> **Note:**
>
> The basic configuration for service must be taken care.

Configure TCP option for Forward operation

Following the procedure given below to configure TCP option in the TCP profile for Forward operation.

1. Add TCP profile with TCP option number
2. Bind TCP profile to virtual server
3. Bind TCP profile to service.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Add TCP profile with TCP option number

At the command prompt, type:

```
add tcpprofile <name> -clientIpTcpOption (enabled | disabled> -
clientIpTcpOptionNumber <positive_integer>
```

Example:

```
add tcpprofile p1 -clientIpTcpOption ENABLED -clientIpTcpOptionNumber
 29
```

Bind TCP profile to virtual server (load balancing or content switching)

At the command prompt, type:

```
set lb vserver <name> -tcpprofileName <name>
```

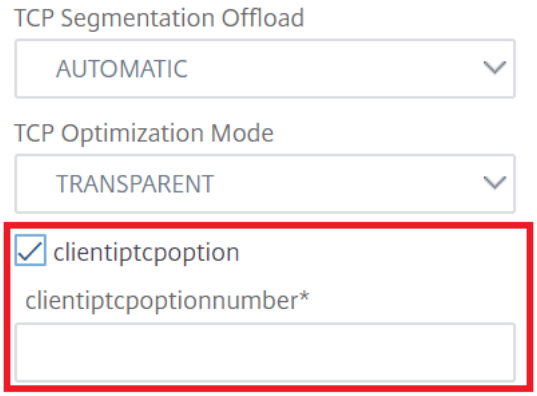
Example:

```
set lb vservice s1 –tcpprofileName p1
```

Bind TCP profile to service

At the command prompt, type:

```
set service <name> -tcpprofileName p1
```



Example:

```
set service s1 -tcpprofileName p1
```

Configure TCP option by using Citrix ADC GUI

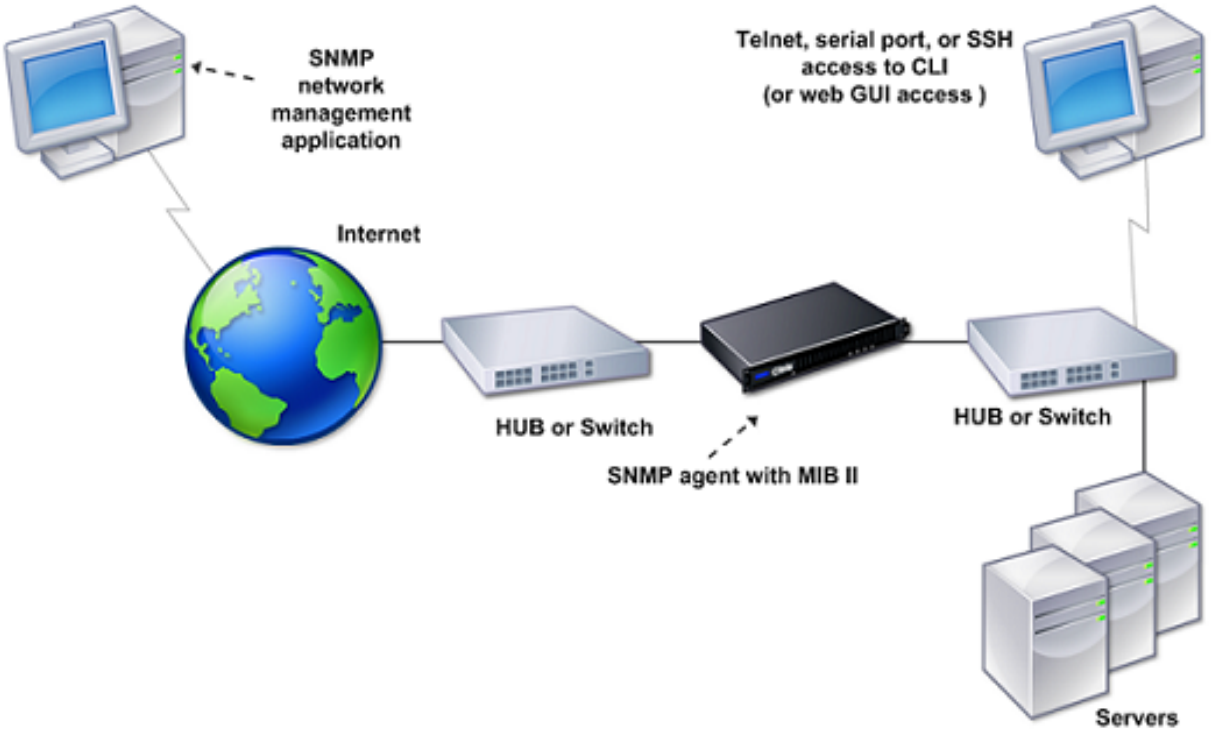
1. Navigate to **System** > **Profiles**.
2. In the **TCP Profile** tab page, click **Add**.
3. In the **Configure TCP profile** page, configure the following parameters:
   a. clientIptcpoption. TCP option to send or receive client IP address.
   b. clientiptcpoptionnumber. Configurable TCP option number to receive the client IP address.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

4. Click **OK** and **Close**.

SNMP

September 14, 2021



You can use Simple Network Management Protocol (SNMP) to configure the SNMP agent on the Citrix ADC appliance to generate asynchronous events, which are called *traps*. The traps are generated whenever there are abnormal conditions on the Citrix ADC. The traps are then sent to a remote device called a *trap listener*, which signals the abnormal condition on the Citrix ADC appliance. Or, you can query the SNMP agent for System-specific information from a remote device called an *SNMP manager*. The agent then searches the management information base (MIB) for the data requested and sends the data to the SNMP manager.

The SNMP agent on the Citrix ADC can generate traps compliant with SNMPv1, SNMPv2, and SNMPv3. For querying, the SNMP agent supports SNMP version 1 (SNMPv1), SNMP version 2 (SNMPv2), and SNMP version 3 (SNMPv3).

For information about SNMP parameters, traps, and its descriptions, see Citrix ADC SNMP OID Reference.

The following figure illustrates a network with a Citrix ADC that has SNMP enabled and configured. In the figure, each SNMP network management application uses SNMP to communicate with the SNMP agent on the Citrix ADC. The SNMP agent searches its management information base (MIB) to collect the data requested by the SNMP Manager and provides the information to the application.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

> **Important**
>
> The SNMP module in a Citrix ADC appliance supports a maximum length of 128 bytes (as compliant with RFC 3416) for an SNMP OID. A long index variable name for an object can result in an SNMP OID exceeding 128 bytes in length.
>
> To resolve this issue, the Citrix ADC SNMP module supports a maximum length of 31 characters for an index variable name. If an index variable name exceeds 31 characters in length, the SNMP module using an hash algorithm converts the name to a 31 characters hash value. This hashed value is used in the SNMP OID for that variable.
>
> The original index variable name is stored in another variable, which has the following name format: `<variable type>FullName`. For example, When the name of a load balancing virtual server has more the 31 characters, `vserverName` SNMP OID contains the hashed value and `vsvrFullName` SNMP OID contains the full (original) name of the virtual server.
>
> Similarly, for SNMP traps, the index variable displays a hashed valued. `<variable type>FullName`, which stores the full name of the original index variable name, is also part of the trap messages.

Importing MIB Files to the SNMP Manager and Trap Listener

To monitor a Citrix ADC appliance, you must download the MIB object definition files. The Citrix ADC appliance supports the following enterprise-specific MIBs:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- **A subset of standard MIB-2 groups**. Provides MIB-2 groups SYSTEM, IF, ICMP, UDP, and SNMP.
- **A system enterprise MIB**. Provides system-specific configuration and statistics.

You can obtain the MIB object definition files from the /netscaler/snmp directory or from the Downloads tab of the GUI.

Configuring the Citrix ADC to generate SNMP traps

February 16, 2023

You can configure the Citrix ADC appliance to generate asynchronous events, which are called *traps*. The traps are generated whenever there are abnormal conditions on the appliance. The traps are sent to a remote device called a *trap listener*. It helps administrators monitor the appliance and respond promptly to any issues.

The Citrix ADC appliance provides a set of condition entities called *SNMP alarms*. When the condition in any SNMP alarm is met, the appliance generates SNMP trap messages that are sent to the configured trap listeners. For example, when the LOGIN-FAILURE alarm is enabled, a trap message is generated and sent to the trap listener whenever there is a login failure on the appliance.

To configure the Citrix ADC appliance to generate traps, you need to enable and configure alarms. Then, you specify the trap listeners to which the appliance sends the generated trap messages.

Enabling an SNMP alarm

The Citrix ADC appliance generates traps only for SNMP alarms that are enabled. Some alarms are enabled by default, but you can disable them.

When you enable an SNMP alarm, the appliance generates corresponding trap messages when some events occur. Some alarms are enabled by default.

To enable an SNMP alarm by using the CLI

At the command prompt, type the following commands to set the parameters and verify the configuration:

- `enable snmp alarm <trapName>`
- `show snmp alarm <trapName>`

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

To enable an SNMP alarm by using the GUI

1. Navigate to **System > SNMP > Alarms**, and select the alarm.
2. Click **Actions** and select **Enable**.

Configuring alarms

The Citrix ADC appliance provides a set of condition entities called *SNMP alarms*. When the condition set for an SNMP alarm is met, the appliance generates SNMP traps messages that are sent to the configured trap listeners. For example, when the LOGIN-FAILURE alarm is enabled, a trap message is generated and sent to the trap listener whenever there is a login failure on the appliance.

You can assign an SNMP alarm with a severity level. When you do this, the corresponding trap messages are assigned that severity level.

The following are the severity levels, defined on the appliance, in decreasing order of severity.

- Critical
- Major
- Minor
- Warning
- Informational

For example, if you set a warning severity level for the SNMP alarm named LOGIN-FAILURE, the trap messages generated when there is a login failure is assigned with the warning severity level.

> **Note**
>
> Citrix ADC supports various SNMP alarms. For more information, see SNMP alarms.

You can also configure an SNMP alarm to log the corresponding trap messages generated whenever the condition on that alarm is met.

To configure an SNMP alarm by using the CLI

At the command prompt, type the following commands to configure an SNMP alarm and verify the configuration:

- `set snmp alarm <trapName> [-thresholdValue <positive_integer> [-normalValue <positive_integer>]] [-time <secs>] [-state ( ENABLED | DISABLED )] [-severity <severity>] [-logging ( ENABLED | DISABLED )]`
- `show snmp alarm <trapName>`

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Where,

ThresholdValue: Value for the high threshold. The Citrix ADC appliance generates an SNMP trap message when the value of the attribute associated with the alarm is greater than or equal to the specified high threshold value.

NormalValue: Value for the normal threshold. A trap message is generated if the value of the respective attribute falls to or below this value after exceeding the high threshold.

To configure SNMP alarms by using the GUI

Navigate to **System > SNMP > Alarms**, select an alarm, and configure the alarm parameters.

Configuring SNMPv1 or SNMPv2 traps

After configuring the alarms, you need to specify the trap listener to which the appliance sends the trap messages. Apart from specifying parameters such as IP or IPv6 address and the destination port of the trap listener, you can specify the type of trap (either generic or specific) and the SNMP version.

You can configure a maximum of 20 trap listeners for receiving either generic or specific traps.

You can also configure the appliance to send SNMP trap messages with a source IP address other than the Citrix ADC IP (NSIP or NSIP6) address to a particular trap listener. For a trap listener that has an IPv4 address, you can set the source IP to either a mapped IP (MIP) address or a subnet IP (SNIP) address configured on the appliance. For a trap listener that has an IPv6 address, you can set the source IP to a subnet IPv6 (SNIP6) address configured on the appliance.

You can also configure the appliance to send trap messages to a trap listener based on a severity level. For example, if you set the severity level as Minor for a trap listener, all trap messages of the severity level equal to or greater than Minor (Minor, Major, and Critical) are sent to the trap listener.

If you have defined a community string for the trap listener, you must also specify a community string for each trap that is to be sent to the listener. A trap listener for which a community string has been defined accepts only trap messages that include a community string matching the community string defined in the trap listener. Other trap messages are dropped.

To add an SNMP trap by using the CLI

At the command prompt, type the following commands to set the parameters and verify the configuration:

- `add snmp trap <trapClass> <trapDestination> -version ( V1 | V2 )-destPort <port> -communityName <string> -srcIP <ip_addr> -severity <severity>`

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- `show snmp trap`

Example:

```
> `add snmp trap specific 192.0.2.10 -version V2 -destPort 162 -
    communityName com1 -severity Major`
```

To configure SNMP traps by using the GUI

Navigate to **System > SNMP > Traps**, and create the SNMP trap.

Configuring SNMPv3 traps

SNMPv3 provides security capabilities such as authentication and encryption by using the credentials of SNMP users. An SNMP manager can receive SNMPv3 trap messages only if its configuration includes the password assigned to the SNMP user.

The trap destination can now receive SNMPv1, SNMPv2, and SNMPv3 trap messages.

To configure an SNMPv3 trap by using the CLI

At the command prompt, do the following:

1. Add an SNMPv3 trap.

   ```
   add snmp trap <trapClass> <trapDestination> -version ( V1 | V2 |
    V3)-destPort <port> -communityName <string> -srcIP <ip_addr> -
   severity <severity>
   ```

   > **Note**
   >
   > Once set, the SNMP trap version cannot be modified.

   Example

   ```
   > add snmp trap specific 192.0.2.10 -version V3 -destPort 162 -
       communityName com1 -severity Major
   ```

2. Add an SNMP user.

   ```
   add snmp user <name> -group <string> [ -authType ( MD5 | SHA ){ -
   authPasswd } [-privType ( DES | AES ){ -privPasswd } ]]
   ```

   Example

   ```
   > add snmp user edocs_user -group edocs_group
   ```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

3. Bind the SNMPv3 trap to the SNMP user.

```
bind snmp trap <trapClass> <trapDestination> [-version <version>] (-
userName <string> [-securityLevel <securityLevel>])
```

Example

```
1      > bind snmp trap specific 192.0.2.10 -version V3 -userName
          edocs_user -securityLevel authPriv
```

To configure an SNMPv3 trap by using the GUI

1. Add an SNMPv3 trap.

   Navigate to **System > SNMP > Traps**, and create the SNMP trap by selecting V3 as the SNMP version.

2. Add an SNMP user.

   Navigate to **System > SNMP > Users** and create the SNMP user.

3. Bind the SNMPv3 trap to the SNMP user.

   - Navigate to **System > SNMP > Traps**, and select the SNMP version 3 trap.
   - Select the user to which the trap should be bound and define the appropriate Security Level.

SNMP trap logging

A Citrix ADC appliance can log SNMP trap messages (for SNMP alarms in which logging capability is enabled) when you enable the SNMP trap logging option and at least one trap listener is configured on the appliance. Now, you can specify the audit log level of trap messages sent to an external log server. The default log level is Informational. Possible values are Emergency, Alert, Critical, Error, Warning, Debug, and Notice.

For example, you can set the audit log level to Critical for an SNMP trap message generated by a logon failure. That information is then available on the NSLOG or SYSLOG server for troubleshooting.

To enable SNMP trap logging and configure trap log level by using the CLI

At the command prompt, type the following commands to configure SNMP trap logging and verify the configuration:

- `set snmp option [-snmpTrapLogging (ENABLED | DISABLED)][-snmpTrapLoggingLe <snmpTrapLoggingLevel>]`
- `show snmp option`

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

To enable SNMP trap logging and configure SNMP trap log level by using the GUI

Navigate to **System > SNMP**, click Change SNMP Options, and set the following parameters:

1. SNMP Trap Logging—Select this check box to enable SNMP trap logging when at least one trap listener is configured on the appliance.
2. SNMP Trap Logging Level—Select an audit log level for the SNMP trap. By default, the audit level for an SNMP trap is set to "Informational."

Configuring Citrix ADC for SNMP v1 and v2 queries

September 14, 2021

You can query the Citrix ADC SNMP agent for system-specific information from a remote device called *SNMP managers*. The agent then searches the management information base (MIB) for the data requested and sends the data to the SNMP manager.

The following types of SNMP v1 and v2 queries are supported by the SNMP agent:

- GET
- GET NEXT
- ALL
- GET BULK

You can create strings called community strings and associate each of these to query types. You can associate one or more community strings to each query type. Community string are passwords and used to authenticate SNMP queries from SNMP managers.

For example, if you associate two community strings, such as **abc** and **bcd**, to the query type GET NEXT, the SNMP agent on the Citrix ADC appliance considers only those GET NEXT SNMP query packets that contain **abc** or **bcd** as the community string.

Specifying an SNMP manager

You must configure the Citrix ADC appliance to allow the appropriate SNMP managers to query it. You must also provide the SNMP manager with the required Citrix ADC-specific information. You can add up to a maximum of 100 SNMP managers or networks.

For an IPv4 SNMP manager you can specify a host name instead of the manager's IP address. If you do so, you must add a DNS name server that resolves the host name of the SNMP manager to its IP address. You can add up to a maximum of five host-name based SNMP managers.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

> **Note**:
> The appliance does not support use of host names for SNMP managers that have IPv6 addresses. You must specify the IPv6 address.

If you do not configure at least one SNMP manager, the appliance accepts and responds to SNMP queries from all IP addresses on the network. If you configure one or more SNMP managers, the appliance accepts and responds only to SNMP queries from those specific IP addresses.

If you remove an SNMP manager from the configuration, that manager can no longer query the appliance.

To add SNMP managers by specifying IP addresses by using the command line interface

At the command prompt, type the following commands to set the parameters and verify the configuration:

- `add snmp manager <IPAddress> ... [-netmask <netmask>]`
- `show snmp manager`

Example `> add snmp manager 10.102.29.10 10.102.29.15 10.102.29.30`

To add an SNMP manager by specifying its host name by using the command line interface

Important: If you specify the SNMP manager's host name instead of its IP address, you must configure a DNS name server to resolve the host name to the SNMP manager's IP address. For more information, see "Adding a Name Server."

At the command prompt, type the following commands to set the parameters and verify the configuration:

- `add snmp manager <IPAddress> [-domainResolveRetry ****<integer>]`
- `show snmp manager`

Example

```
add nameserver 10.103.128.15
add snmp manager engwiki.eng.example.net –domainResolveRetry 10
```

To add an SNMP manager by using the GUI

1. Navigate to **System** > **SNMP** > **Managers**, and create the SNMP manager.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

> **Important**:
>
> If you specify the SNMP manager's host name instead of its IPv4 address, you must configure a DNS name server to resolve the host name to the SNMP manager's IP address.

> **Note**:
> The appliance does not support host names for SNMP managers that have IPv6 addresses.

Specifying an SNMP community

You can create strings called community strings and associate them with the following SNMP query types on the appliance:

- GET
- GET NEXT
- ALL
- GET BULK

You can associate one or more community strings to each query types. For example, when you associate two community strings, such as **abc** and **bcd**, to the query type GET NEXT, the SNMP agent on the appliance considers only those GET NEXT SNMP query packets that contain **abc** or **bcd** as the community string.

If you do not associate any community string to a query type then the SNMP agent responds to all SNMP queries of that type.

To specify an SNMP community by using the command line interface

At the command prompt, type the following commands to set the parameters and verify the configuration:

- `add snmp community <communityName> <permissions>`
- `show snmp community`

Example `> add snmp community com all`

To configure an SNMP community string by using the GUI

Navigate to **System** > **SNMP** > **Community**, and create the SNMP community.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Configuring Citrix ADC for SNMPv3 queries

September 14, 2021

Simple Network Management Protocol Version 3 (SNMPv3) is based on the basic structure and architecture of SNMPv1 and SNMPv2. However, SNMPv3 enhances the basic architecture to incorporate administration and security capabilities, such as authentication, access control, data integrity check, data origin verification, message timeliness check, and data confidentiality.

To implement message level security and access control, SNMPv3 introduces the user-based security model (USM) and the view-based access control model (VACM).

- **User-Based Security Model.** The user-based security model (USM) provides message-level security. It enables you to configure users and security parameters for the SNMP agent and the SNMP manager. USM offers the following features:
  - **Data integrity:** To protect messages from being modified during transmission through the network.
  - **Data origin verification:** To authenticate the user who sent the message request.
  - **Message timeliness:** To protect against message delays or replays.
  - **Data confidentiality:** To protect the content of messages from being disclosed to unauthorized entities or individuals.
- **View-Based Access Control Model.** The view-based access control model (VACM) enables you to configure access rights to a specific subtree of the MIB based on various parameters, such as security level, security model, user name, and view type. It enables you to configure agents to provide different levels of access to the MIB to different managers.

Citrix ADC supports the following entities that enable you to implement the security features of SNMPv3:

- SNMP Engines
- SNMP Views
- SNMP Groups
- SNMP Users

These entities function together to implement the SNMPv3 security features. Views are created to allow access to subtrees of the MIB. Then, groups are created with the required security level and access to the defined views. Finally, users are created and assigned to the groups.

> **Note**:
>
> The view, group, and user configuration are synchronized and propagated to the secondary node in a high availability (HA) pair. However, the engine ID is neither propagated nor synchronized as

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

> it is unique to each Citrix ADC appliance.

To implement message authentication and access control, you need to do the following:

Setting the engine ID

SNMP engines are service providers that reside in the SNMP agent. They provide services such as sending, receiving, and authenticating messages. SNMP engines are uniquely identified using engine IDs.

The Citrix ADC appliance has a unique engineID based on the MAC address of one of its interfaces. It is not necessary to override the engineID. However, if you want to change the engine ID, you can reset it.

To set the engine ID by using the command line interface

At the command prompt, type the following commands to set the parameters and verify the configuration:

- `set snmp engineId <engineID>`
- `show snmp engineId`

Example `> set snmp engineId 8000173f0300c095f80c68`

To set the engine ID by using GUI

Navigate to **System** > **SNMP** > **Users**, click **Configure Engine ID** and type an engine ID.

Configure a view

SNMP views restrict user access to specific portions of the MIB. SNMP views are used to implement access control.

To add an SNMP view by using the command line interface

At the command prompt, type the following commands to set the parameters and verify the configuration:

- `add snmp view <name> <subtree> -type ( included | excluded )`

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- `show snmp view <name>`
- `rm snmp view <name> <subtree>`

Where,

Name. Name for the SNMPv3 view. It can consist of 1 to 31 characters that include uppercase and lowercase letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) characters. You should choose a name that helps identify the SNMPv3 view.

Subtree. A particular branch (subtree) of the MIB tree that you want to associate with this SNMPv3 view. You must specify the subtree as an SNMP OID. This is an argument of maximum Length: 99.

type. Include or exclude the subtree, specified by the subtree parameter, in or from this view. This setting can be useful when you have included a subtree, such as A, in an SNMPv3 view and you want to exclude a specific subtree of A, such as B, from the SNMPv3 view. This is a mandatory argument. Possible values: included, excluded.

Examples add snmp view SNMPv3test 1.1.1.1 -type included
sh snmp view SNMPv3test
rm snmp view SNMPv3test 1.1.1.1

To configure an SNMP view by using the GUI

Navigate to **System** > **SNMP** > **Views**,and create the SNMP view.

Configure a group

SNMP groups are logical aggregations of SNMP users. They are used to implement access control and to define the security levels. You can configure an SNMP group to set access rights for users assigned to that group, thereby restricting the users to specific views.

You need to configure an SNMP group to set access rights for users assigned to that group.

To add an SNMP group by using the command line interface

At the command prompt, type the following commands to set the parameters and verify the configuration:

- `add snmp group <name> <securityLevel> -readViewName <string>`
- `show snmp group <name> <securityLevel>`

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Where,

Name. Name for the SNMPv3 group. Can consist of 1 to 31 characters that include uppercase and lowercase letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) characters. You should choose a name that helps identify the SNMPv3 group.

securityLevel. Security level required for communication between the Citrix ADC appliance and the SNMPv3 users who belong to the group. Specify one of the following options:

noAuthNoPriv. Require neither authentication nor encryption.

authNoPriv. Require authentication but no encryption.

authPriv. Require authentication and encryption. Note: If you specify authentication, you must specify an encryption algorithm when you assign an SNMPv3 user to the group. If you also specify encryption, you must assign both an authentication and an encryption algorithm for each group member. This is a mandatory argument. Possible values: noAuthNoPriv, authNoPriv, authPriv.

readViewName. Name of the configured SNMPv3 view that you want to bind to this SNMPv3 group. An SNMPv3 user bound to this group can access the subtrees that are bound to this SNMPv3 view as type INCLUDED, but cannot access the ones that are type EXCLUDED. If the Citrix ADC appliance has multiple SNMPv3 view entries with the same name, all such entries are associated with the SNMPv3 group. This is a mandatory argument. Maximum Length: 31

To configure an SNMP group by using the GUI

Navigate to **System** > **SNMP** > **Groups**, and create the SNMP group.

Configuring a user

SNMP users are the SNMP managers that the agents allow to access the MIBs. Each SNMP user is assigned to an SNMP group.

You need to configure users at the agent and assign each user to a group.

To configure a user by using the command line interface

At the command prompt, type the following commands to set the parameters and verify the configuration:

- `add snmp user <name> -group <string> [-authType ( MD5 | SHA ){ -authPasswd } [-privType ( DES | AES ){ -privPasswd } ]]`
- `show snmp user <name>`

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Where,

authType is the authentication option available while configuring an user. There are two authentication types such as MD5 and SHA.

privType is the encryption option available while configuring an user. There are two types of encryption such as DES of key size 128 bit, and AES of key size 128 bit.

Example:

```
> add snmp user edocs_user -group edocs_group
```

To configure an SNMP user by using the GUI

Navigate to **System** > **SNMP** > **Users**, and create the SNMP user.

Configuring SNMP Alarms for rate limiting

November 13, 2024

Citrix ADC appliances such as the Citrix ADC MPX 10500, 12500, and 15500 are rate limited. The maximum throughput (in percentage) and packets per second (PPS) are determined by the license purchased for the appliance. For rate-limited platforms, you can configure SNMP traps to send notifications when throughput and PPS approach their limits and when they return to normal.

Throughput and PPS are monitored every seven seconds. You can configure traps with high-threshold and normal-threshold values, which are expressed as a percentage of the licensed limits. The appliance then generates a trap when throughput or PPS exceeds the high threshold, and a second trap when the monitored parameter falls to the normal threshold. In addition to sending the traps to the configured destination device, the Citrix ADC logs the events associated with the traps in the /var/log/ns.log file as EVENT ALERTSTARTED and EVENT ALERTENDED.

Exceeding the throughput limit can result in packet loss. You can configure SNMP alarms to report packet loss.

For more information about SNMP alarms and traps, see "Configuring the Citrix ADC to generate SNMP v1 and v2 Traps."

This document includes the following details:

- Configuring an SNMP Alarm for Throughput or PPS
- Configuring SNMP Alarm for Dropped Packets

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Configuring an SNMP alarm for throughput or PPS

To monitor both throughput and PPS, you must configure seperate alarms and set threshold and PPS value.

To configure an SNMP alarm for the throughput rate by using the command line interface

At the command prompt, type the following commands to configure the SNMP alarm, set threshold value (in percentage) and verify the configuration:

- `set snmp alarm PF-RL-RATE-THRESHOLD [-thresholdValue <positive_integer> [-normalValue <positive_integer>]] [-state ( **ENABLED** | **DISABLED** )] [-severity <severity>] [-logging ( **ENABLED** | **DISABLED** )]`
- `show snmp alarm PF-RL-RATE-THRESHOLD`

Example

```
> set snmp alarm PF-RL-RATE-THRESHOLD -thresholdValue 70 -normalValue
   50
```

To configure an SNMP alarm for PPS by using the command line interface

At the command prompt, type the following commands to configure the SNMP alarm for PPS and verify the configuration:

- `set snmp alarm PF-RL-PPS-THRESHOLD [-thresholdValue <positive_integer> [-normalValue <positive_integer>]] [-state ( **ENABLED** | **DISABLED** )] [-severity <severity>] [-logging ( **ENABLED** | **DISABLED** )]`
- `show snmp alarm PF-RL-PPS-THRESHOLD`

Example

```
> set snmp alarm PF-RL-PPS-THRESHOLD -thresholdValue 70 -normalValue 50
```

To configure an SNMP alarm for throughput or PPS by using the GUI

1. Navigate to **System** > **SNMP** > **Alarms**, and select **PF-RL-RATE-THRESHOLD** (for throughput rate) or **PF-RL-PPS-THRESHOLD** (for packets per second).
2. Set the alarm parameters and enable the selected SNMP alarm.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Configuring SNMP alarm for dropped packets

You can configure an alarm for packets dropped as a result of exceeding the throughput limit and an alarm for packets dropped as a result of exceeding the PPS limit.

To configure an SNMP alarm for packets dropped because of excessive throughput, by using the command line interface

At the command prompt, type:

```
set snmp alarm PF-RL-RATE-PKTS-DROPPED [-state (ENABLED | DISABLED)]
[-severity <severity>] [-logging ( ENABLED | DISABLED )]
```

To configure an SNMP alarm for packets dropped because of excessive PPS, by using the command line interface

At the command prompt, type:

```
set snmp alarm PF-RL-PPS-PKTS-DROPPED [-state (ENABLED | DISABLED)]
[-severity <severity>] [-logging ( ENABLED | DISABLED )]
```

To configure an SNMP alarm for dropped packets by using the GUI

1. Navigate to **System** > **SNMP** > **Alarms**, and select **PF-RL-RATE-PKTS-DROPPED** (for packets dropped because of excessive throughput) or **PF-RL-PPS-PKTS-DROPPED** (for packets dropped because of excessive PPS).
2. Set the alarm parameters and enable the selected SNMP alarm.

Configuring SNMP in FIPS mode

September 14, 2021

FIPS mode requires Simple Network Management Protocol version 3 (SNMPv3) with the authentication and privacy (authPriv) option. SNMP version 1 and version 2 use a community string mechanism to provide secured access to management data. The community string is sent as clear text between an SNMP manager and an SNMP agent. This type of communication is unsecure, allowing intruders to access SNMP information on the network.

The SNMPv3 protocol uses the User-based Security Model (USM) and View-based Access Control Model (VACM) to authenticate and control management access to SNMP messaging data. SNMPv3

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

has three security levels: no authentication no privacy (noAuthNoPriv), authentication and no privacy (authNoPriv), and authentication and privacy (authPriv).

Enabling FIPS mode and restarting the Citrix ADC appliance removes the following SNMP configurations from the appliance:

1. Community configuration for SNMPv1 and SNMPv2 protocols.
2. SNMPv3 groups configured with the noAuthNoPriv or authNoPriv security-level option.
3. Traps configured for SNMPv1 or SNMPv2, or SNMPv3 with the noAuthNoPriv security-level option.

After restarting the appliance, configure SNMPv3 with the authPriv option. For more information about configuring authPriv option in SMNP v3, see SNMPV3 topic

> **Note**:
>
> Enabling FIPS mode and restarting your appliance blocks execution of the following SNMP trap and group commands:

```
1.  add snmp community <communityName> <permissions>

2.  add snmp trap <trapClass> <trapDestination> ... [-version: v1/
    v2]   [-td <positive_integer>] [-destPort <port>] [-
    communityName <string>] [-srcIP <ip_addr|ipv6_addr>] [-severity
    <severity>] [-allPartitions ( ENABLED | DISABLED )]

3.  add snmp group <name> <securityLevel : noAuthNoPriv/ authNoPriv
    > -readViewName <string>

4.  bind snmp trap specific <TrapIp>-userName <v3 user name> -
    securityLevel <noAuthNoPriv/ authNoPriv>
```

Audit logging

November 18, 2022

> **Important**
>
> Citrix recommends you to update a SYSLOG or NSLOG configuration only during maintenance or downtime. If you update a configuration after creating a session, the changes are not applied to the existing session logs.

Auditing is a methodical examination or review of a condition or situation. The audit logging feature enables you to log the Citrix ADC states and status information collected by various modules. The log

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

information can be in the kernel and in the user-level daemons. For audit logging, you can use the SYSLOG protocol, the native NSLOG protocol, or both.

SYSLOG is a standard protocol for logging. It has two components:

- **SYSLOG auditing module.** Runs on the Citrix ADC appliance.
- **SYSLOG server.** Runs on the underlying FreeBSD operating system (OS) of the Citrix ADC appliance or on a remote system.

SYSLOG uses a user data protocol (UDP) for data transfer.

Similarly, the native NSLOG protocol has two components:

- **NSLOG auditing module.** Runs on the Citrix ADC appliance.
- **NSLOG server.** Runs on the underlying FreeBSD OS of the Citrix ADC appliance or on a remote system.

NSLOG uses TCP for data transfer.

When you run a SYSLOG or NSLOG server, it connects to the Citrix ADC appliance. The Citrix ADC appliance then starts sending all the log information to the SYSLOG or NSLOG server. And the server filters the log entries before storing them in a log file. An NSLOG or SYSLOG server receives log information from more than one Citrix ADC appliance. The Citrix ADC appliance sends log information to more than one SYSLOG server or NSLOG server.

If multiple SYSLOG servers are configured, the Citrix ADC appliance sends its SYSLOG events and messages to all the configured external log servers. It results in storing redundant messages and makes monitoring difficult for system administrators. To address this issue, the Citrix ADC appliance offers load balancing algorithms. The appliance can load balance the SYSLOG messages among the external log servers for better maintenance and performance. The supported load balancing algorithms include RoundRobin, LeastBandwidth, CustomLoad, LeastPackets, and AuditlogHash.

> **Note**
>
> The Citrix ADC appliance can send audit log messages up to 16 KB to an external SYSLOG server.

The log information that a SYSLOG or NSLOG server collects from a Citrix ADC appliance is stored in a log file in the form of messages. These messages typically contain the following information:

- The IP address of a Citrix ADC appliance that generated the log message.
- A time stamp
- The message type
- The predefined log levels (Critical, Error, Notice, Warning, Informational, Debug, Alert, and Emergency)
- The message information

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

To configure audit logging, you first configure the audit modules on the Citrix ADC appliance. The appliance involves creating audit policies and specifying the NSLOG server or SYSLOG server information. You then install and configure the SYSLOG or the NSLOG server on the underlying FreeBSD OS of the Citrix ADC appliance or on a remote system.

> **Note**
>
> SYSLOG is an industry standard for logging program messages, and various vendors provide support. The documentation does not include SYSLOG server configuration information.

The NSLOG server has its own configuration file (auditlog.conf). You can customize logging on the NSLOG server system by making extra modifications to the configuration file (auditlog.conf).

> **Note**
>
> ICMP access to Syslog server is mandatory if syslog server is used as FQDN under Syslog Action in the network. If ICMP access is blocked in the environment, configure it as load balanced Syslog server and set the value of the healthMonitor parameter in the set service command to NO.
> For configuring ICMP, see Load balancing SYSLOG servers

Configuring Citrix ADC appliance for audit logging

December 29, 2023

> **Warning:**
>
> Classic policy expressions and its usage are deprecated (discouraged from use but still supported) from Citrix ADC 12.0 build 56.20 onwards and as an alternative, Citrix recommends you to use advanced policies. For more information, see Advanced Policies.

Audit logging displays status information from different modules so that an administrator can see event history in the chronological order. The main components of an Audit framework are 'audit action'and 'audit policy'. 'Audit action'describes Audit Server configuration information whereas 'audit policy'links a bind entity to an 'audit action'. The audit policies use the 'Classic Policy Engine' (CPE) framework or Progress Integration (PI) framework to link 'audit action'to 'system global bind entities'.

However, the policy frameworks differ from each other in binding audit log policies to global entities. Previously, the audit module supported only classic expression but now it supports both classic and advanced policy expressions. Currently, using the advanced expression you can bind audit log policies only to System global entities.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

> **Note**
>
> When you bind a policy to global entities, you must bind it to a system global entity of the same expression. For example, you can't bind a classic policy to an advanced global entity or bind an advanced policy to a classic global entity.
>
> Also, you can't bind both classic audit log policy and advanced audit log policy to a load balancing virtual server.

Configuring audit log policies in a classic policy expression

Configuring audit logging in classic policy consists of the following steps:

1. **Configuring an audit log action**. You can configure an audit action for different servers and for different log levels. 'Audit action'describes Audit Server configuration information whereas 'audit policy'links a bind entity to an 'audit action'. By default, SYSLOG uses a user data protocol (UDP) for data transfer and NSLOG uses only TCP to transfer log information to the log servers. TCP is more reliable than UDP for transferring complete data. When using TCP for SYSLOG, you can set the buffer limit on the Citrix ADC appliance to store the logs. After the buffer limit is reached, the logs are sent to the SYSLOG server.
2. **Configuring audit log policy**. You can configure either SYSLOG policies to log messages to a SYSLOG server or NSLOG policy to log messages to an NSLOG server. Each policy includes a rule that is set to **`true`** or `ns_true` for the messages to be logged, and a SYSLOG or NSLOG action.
3. **Binding audit log policies to global entities**. You must globally bind the audit log policies to global entities such SYSTEM, VPN, Citrix ADC AAA and so on. You can do it to enable logging of all Citrix ADC system events. By defining the priority level, you can set the evaluation order of the audit server logging. Priority 0 is the highest and is evaluated first. The higher the priority number, the lower is the priority of evaluation.

Each of these steps is explained in the following sections.

Configuring audit log action

To configure SYSLOG action in advanced policy infrastructure by using the CLI.

> **Note**
>
> The Citrix ADC appliance allows you to configure only one SYSLOG action to SYSLOG server IP address and port. The appliance does not allow you to configure multiple SYSLOG actions to the same server IP address and port.

A syslog action contains a reference to a syslog server. It specifies which information to log and mentions how to log that information.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

At the command prompt, type the following commands to set the parameters and verify the configuration:

```
1 - add audit syslogAction <name> <serverIP> [-serverPort <port>] -
    logLevel <logLevel> [-dateFormat ( MMDDYYYY | DDMMYYYY )] [-
    transport ( TCP | UDP )]`
2 - show audit syslogAction [<name>]
```

Configure the NSLOG action in advanced policy infrastructure by using the CLI.

An ns log action contains a reference to a nslog server. It specifies which information to log and mentions how to log that information.

At the command prompt, type the following commands to set the parameters and verify the configuration:

```
1 - add audit nslogAction <name> <serverIP> [-serverPort <port>] -
    logLevel <logLevel> [-dateFormat ( MMDDYYYY | DDMMYYYY )]
2 - show audit nslogAction [<name>]
```

Configuring audit log policies

Configure audit log Policies in classic policy infrastructure by using the CLI.

At the command prompt, type:

```
1 - add audit syslogpolicy <name> <-rule> <action>
2 - add audit nslogpolicy <name> <-rule> <action>
```

Binding audit syslog policies to audit syslog global

Bind audit log policy in advanced policy framework by using the CLI.

At the command prompt, type:

```
bind syslogGlobal -policyName <policyName> -priority <priority>
```

```
unbind syslogGlobal -policyName <policyName> -priority <priority>
```

Bind audit log policy in classic policy framework by using the CLI.

At the command prompt, type:

```
bind systemglobal <policy Name> <Priority>
```

```
unbind systemglobal <policy Name> <Priority>
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Configuring audit log policies using advanced policy expression

Configuring audit logging in advanced policy consists of the following steps:

1. **Configuring an audit log action**. You can configure an audit action for different servers and for different log levels. 'Audit action'describes Audit Server configuration information whereas 'audit policy'links a bind entity to an 'audit action'. By default, SYSLOG uses a user data protocol (UDP) for data transfer and NSLOG uses only TCP to transfer log information to the log servers. TCP is more reliable than UDP for transferring complete data. When using TCP for SYSLOG, you can set the buffer limit on the Citrix ADC appliance to store the logs. After the buffer limit is reached, the logs are sent to the SYSLOG server.
2. **Configuring audit log policy**. You can configure either SYSLOG policies to log messages to a SYSLOG server or NSLOG policy to log messages to an NSLOG server. Each policy includes a rule that is set to **`true`** or `ns_true` for the messages to be logged, and a SYSLOG or NSLOG action.
3. **Binding audit log policies to global entities**. You must globally bind the audit log policies to SYSTEM global entity to enable logging of all Citrix ADC system events. By defining the priority level, you can set the evaluation order of the audit server logging. Priority 0 is the highest and is evaluated first. The higher the priority number, the lower is the priority of evaluation.

> **Note**
>
> The Citrix ADC appliance evaluates all the policies that are bind to true.

Configuring audit log action

Configure syslog action in advanced policy infrastructure by using the CLI.

At the command prompt, type the following commands to set the parameters and verify the configuration:

```
1 - add audit syslogAction <name> <serverIP> [-serverPort <port>] -
    logLevel <logLevel> [-dateFormat ( MMDDYYYY | DDMMYYYY )] [-
    transport ( TCP | UDP )]
2 - show audit syslogAction [<name>]
```

Configure NSLOG action in advanced policy infrastructure by using the CLI.

At the command prompt, type the following commands to set the parameters and verify the configuration:

```
1 - add audit nslogAction <name> <serverIP> [-serverPort <port>] -
    logLevel <logLevel> [-dateFormat ( MMDDYYYY | DDMMYYYY )]
2 - show audit nslogAction [<name>]
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Configuring audit log policies

Add a syslog audit action by using the CLI.

At the command prompt, type:

```
add audit syslogAction <name> (<serverIP> | ((<serverDomainName>[-
   domainResolveRetry <integer>])
| -lbVserverName <string>))[-serverPort <port>] -logLevel <logLevel
   >[-dateFormat <dateFormat>]
 [-logFacility <logFacility>][-tcp ( NONE | ALL )] [-acl ( ENABLED
    | DISABLED )]
[-timeZone ( GMT_TIME | LOCAL_TIME )][-userDefinedAuditlog ( YES |
   NO )]
 [-appflowExport ( ENABLED | DISABLED )] [-lsn ( ENABLED | DISABLED
     )][-alg ( ENABLED | DISABLED )]
[-subscriberLog ( ENABLED | DISABLED )][-transport ( TCP | UDP )]
   [-tcpProfileName <string>][-maxLogDataSizeToHold
```

Example

```
> add audit syslogaction audit-action1 10.102.1.1 -loglevel
   INFORMATIONAL -dateformat MMDDYYYY
> add audit nslogAction nslog-action1 10.102.1.3 -serverport 520 -
   loglevel INFORMATIONAL -dateFormat MMDDYYYY
> add audit syslogpolicy syslog-pol1 TRUE audit-action1
> add audit nslogPolicy nslog-pol1 TRUE nslog-action1
> bind system global nslog-pol1 -priority 20
```

Add a nslog audit action by using the CLI.

At the command prompt, type:

```
add audit nslogAction <name> (<serverIP> | (<serverDomainName>[-
   domainResolveRetry <integer>])) [-serverPort <port>]       -
   logLevel <logLevel> ... [-dateFormat <dateFormat>][-logFacility
   <logFacility>] [-tcp ( NONE | ALL )][-acl ( ENABLED | DISABLED )
   ] [-timeZone ( GMT_TIME | LOCAL_TIME )][-userDefinedAuditlog (
   YES | NO )][-appflowExport ( ENABLED | DISABLED )] [-lsn (
   ENABLED | DISABLED )][-alg ( ENABLED | DISABLED )] [-
   subscriberLog ( ENABLED | DISABLED )]`
```

Binding audit log policies to global entities

Bind syslog audit log policy in advanced policy framework by using the CLI.

At the command prompt, type:

```
bind audit syslogGlobal <policyName> [-globalBindType <globalBindType
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
unbind audit syslogGlobal <policyName>[-globalBindType <globalBindType
>]
```

Configuring audit log policy by using the GUI

1. Navigate to **Configuration** > **System** > **Auditing** > **Syslog**.
2. Select **Servers** tab.
3. Click **Add**.
4. In the **Create Auditing Server** page, populate the relevant fields, and click **Create**.
5. To add the policy, select the **Policies** tab, and click **Add**.
6. In the **Create Auditing Syslog Policy** page, populate the relevant fields, and click **Create**.
7. To bind the policy globally, select **Advanced Policy Global Bindings** from the drop-down list. Select the **best_syslog_policy_ever** policy. Click **Select**.
8. From the drop-down list, select the bind point as **SYSTEM_GLOBAL** and click **Bind**, and then click **Done**.

Configuring policy-based logging

You can configure policy-based logging for rewrite and responder policies. Audit messages are then logged in a defined format when the rule in a policy evaluates to TRUE. To configure policy-based logging, you configure an audit-message action that uses default syntax expressions to specify the format of the audit messages. And associate the action with a policy. The policy can be bound either globally or to a load balancing or content switching virtual server. You can use audit-message actions to log messages at various log levels, either in syslog format only or in both syslog and new nslog formats

Prerequisites

- User Configurable Log Messages (userDefinedAuditlog) option is enabled for when configuring the audit action server to which you want to send the logs in a defined format.
- The related audit policy is bound to system global.

Configuring an audit message action

You can configure audit message actions to log messages at various log levels, either in syslog format only or in both syslog and new ns log formats. Audit-message actions use expressions to specify the format of the audit messages.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Create an audit message action by using the CLI At the command prompt, type:

```
add audit messageaction <name> <logLevel> <stringBuilderExpr> [-
    logtoNewnslog (YES|NO)] [-bypassSafetyCheck (YES|NO)]
```

```
add audit messageaction log-act1 CRITICAL '"Client:"+CLIENT.IP.SRC+"
    accessed "+HTTP.REQ.URL' -bypassSafetyCheck YES
```

Configure an audit message action by using the GUI Navigate to **System > Auditing > Message Actions**, and create the audit message action.

Binding audit message action to a policy

After you've created an audit message action, you must bind it to a rewrite or responder policy. For more information about binding log message actions to a rewrite or responder policy, see Rewrite or Responder.

Installing and configuring the NSLOG server

September 14, 2021

During installation, the NSLOG server executable file (auditserver) is installed along with other files. The auditserver executable file includes options for performing several actions on the NSLOG server, including running and stopping the NSLOG server. In addition, you use the auditserver executable to configure the NSLOG server with the IP addresses of the Citrix ADC appliances from which the NSLOG server will start collecting logs. Configuration settings are applied in the NSLOG server configuration file (auditlog.conf).

Then, you start the NSLOG server by executing the auditserver executable. The NSLOG server configuration is based on the settings in the configuration file. You can further customize logging on the NSLOG server system by making additional modifications to the NSLOG server configuration file (auditlog.conf).

> **Attention**:
>
> The version of the NSLOG server package must be the same as that of the Citrix ADC. For example, if the version of the Citrix ADC is 10.1 Build 125.9, the NSLOG server must also be of the same version.

The following table lists the operating systems on which the NSLOG server is supported.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Operating system	Software requirements	Remarks
Windows	Windows XP Professional, Windows Server 2003, Windows 2000/NT, Windows Server 2008, Windows Server 2008 R2	
Linux	RedHat Linux 4 or later, SUSE Linux Enterprise 9.3 or later	
FreeBSD	FreeBSD 6.3 or later	For Citrix ADC 10.5, use only FreeBSD 8.4.
Mac OS	Mac OS 8.6 or later	Not supported on Citrix ADC 10.1 and later releases.

The minimum hardware specifications for the platform running the NSLOG server are as follows:

- Processor- Intel x86 ~501 megahertz (MHz)
- RAM - 512 megabytes (MB)
- Controller - SCSI

Installing NSLOG server on the Linux operating system

Log on to the Linux system as an administrator. Use the following procedure to install the NSLOG server executable files on the system.

To install the NSLOG server package on a Linux operating system

1. At a Linux command prompt, type the following command to copy the NSauditserver.rpm file to a temporary directory:

   ```
   cp <path_to_cd>/Utilities/auditserver/Linux/NSauditserver.rpm /tmp
   ```

2. Type the following command to install the NSauditserver.rpm file.

   rpm -i NSauditserver.rpm

   This command extracts the files and installs them in the following directories:

   - /usr/local/netscaler/etc
   - /usr/local/netscaler/bin
   - /usr/local/netscaler/samples

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

To uninstall the NSLOG server package on a Linux operating system

1. At a command prompt, type the following command to uninstall the audit server logging feature:

   ```
   rpm -e NSauditserver
   ```

2. For more information about the NSauditserver RPM file, use the following command:

   ```
   rpm -qpi \*.rpm
   ```

3. To view the installed audit server files use the following command:

   ```
   rpm -qpl *.rpm
   ```

   `*.rpm`: Specifies the file name.

Installing NSLOG server on the FreeBSD operating system

Before you can install the NSLOG server, you have to copy the NSLOG package from the Citrix ADC product CD or download it from www.citrix.com. The NSLOG package has the following name format:

`AuditServer_<release number>-<build number>.zip`

For example: `AuditServer_10.5-58.11.zip`

This package contains files for all supported platforms: Linux, Windows, and FreeBSD. On a FreeBSD operating system, install the NSLOG package that has the following name format:

`audserver_bsd-<release number>-<build number>.tgz`

For example: `audserver_bsd-10.5-58.11.tgz`

To download NSLOG package from www.citrix.com:

1. In a web browser, go to www.citrix.com.
2. In the menu bar, click **Log In**.
3. Enter your login credentials, and then click **Log In**.
4. In the menu bar, click **Downloads**.
5. From the **Select a product** list, select **Citrix ADC**.
6. On the **Citrix ADC** page, select the release for which you want to download the NSLOG package (for example, Release 10.5), and then select **Firmware**.
7. Under **Firmware**, select the Citrix ADC firmware for the build number for which you want to download the NSLOG package.
8. On the page that appears, scroll down, select **Audit Servers**, and click **Download File** next to the package that you want to download.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

To install the NSLOG server package on a FreeBSD operating system

1. On the system to which you have downloaded the NSLOG package AuditServer_<release number>-<build number>.zip (for example, AuditServer_9.3-51.5.zip), extract the FreeBSD NSLOG server **package** audserver_bsd-<release number>-<build number>.tgz (for example, audserver_bsd-9.3-51.5.tgz) from the package.
2. Copy the FreeBSD NSLOG server package audserver_bsd-<release number>-<build number>.tgz (for example, audserver_bsd-9.3-51.5.tgz) to a directory on a system running FreeBSD OS.
3. At a command prompt for the directory into which the FreeBSD NSLOG server package was copied, run the following command to install the package:

   ```
   pkg_add audserver_bsd-<release number>-<build number>.tgz
   ```

   Example:

   ```
   1 pkg_add audserver_bsd-9.3-51.5.tgz
   ```

   The following directories are extracted:

   - <root directory extracted from the FreeBSD NSLOG server **package** tgz file>Citrix ADCbin (for example, /var/auditserver/netscaler/bin)
   - <root directory extracted from the FreeBSD NSLOG server **package** tgz file>netscaler/etc (for example, /var/auditserver/netscaler/etc)
   - <root directory extracted from the FreeBSD NSLOG server **package** tgz file>\netscaler\samples (for example, /var/auditserver/samples)

4. At a command prompt, type the following command to verify that the package is installed:

   ```
   pkg_info | grep NSaudserver
   ```

To uninstall the NSLOG server package on a FreeBSD operating system

At a command prompt, type:

```
pkg_delete NSaudserver
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Installing NSLOG Server Files on the Windows Operating System

Before you can install the NSLOG server, you have to copy the NSLOG package from the Citrix ADC product CD or download it from www.citrix.com. The NSLOG package has the following name format AuditServer _<release number>-<build number>.zip (for example, AuditServer_9.3-51.5.zip). This package contains NSLOG installation packages for all supported platforms.

To download NSLOG package from www.Citrix.com

1. In a web browser, go to www.citrix.com.
2. In the menu bar, click Log In.
3. Enter your login credentials, and then click Log In.
4. In the menu bar, click Downloads.
5. Search to find the page that provides the appropriate release number and build.
6. On that page, under Audit Servers, click Download to download the NSLOG package, having the format AuditServer_<release number>-<build number>.zip , to your local system (for example, AuditServer_9.3-51.5.zip).

To install NSLOG server on a Windows operating system

1. On the system, where you have downloaded the NSLOG package AuditServer_<release number>-<build number>.zip (for example, AuditServer_9.3-51.5.zip), extract audserver_win-<release number>-<build number>.zip (for example, audserver_win-9.3-51.5.zip) from the package.
2. Copy the extracted file audserver_<release number>-<build number>.zip (for example, audserver_win-9.3-51.5.zip) to a Windows system on which you want to install the NSLOG server.
3. Unzip the audserver_<release number>-<build number>.zip file (for example, audserver_win-9.3-51.5.zip).
4. The following directories are extracted:

   a) <root directory extracted from the Windows NSLOG server package zip file>\bin(for example, C:\audserver_win-9.3-51.5\bin)
   b) <root directory extracted from the Windows NSLOG server package zip file>\etc (for example, C:\audserver_win-9.3-51.5\etc)

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

c) <root directory extracted from the Windows NSLOG server **package** zip file>\samples (for example, C:\audserver_win-9.3-51.5\samples)

5. At a command prompt, run the following command from the <root directory extracted from the Windows NSLOG server **package** zip file>\bin path

   audserver -install -f <directorypath>\auditlog.conf

   <directorypath>: Specifies the path to the configuration file (auditlog.conf). By default, log.conf is under \<root directory extracted from Windows NSLOG server **package** zip file\>\samples directory. But you can copy auditlog.conf to your desired directory.

To uninstall the NSLOG server on a Windows operating system

At a command prompt, run the following from the <root directory extracted from Windows NSLOG server **package** zip file>\bin path:

audserver -remove

NSLOG Server Command Options

For information about NSLOG server commands, see Audit Server Options.

Run the audserver command from the directory in which the audit server executable is present:

- On Windows: \ns\bin
- On Solaris and Linux:\usr\local\netscaler\bin

The audit server configuration files are present in the following directories:

- On Windows: \ns\etc
- On Linux: \usr\local\netscaler\etc

The audit server executable is started as ./auditserver in Linux and FreeBSD.

Adding the Citrix ADC Appliance IP Addresses on the NSLOG Server

In the configuration file (auditlog.conf), add the IP addresses of the Citrix ADC appliances whose events must be logged.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

To add the IP addresses of the Citrix ADC appliance

At a command prompt, type the following command:

```
audserver -addns -f <directorypath\>\auditlog.conf
```

<directorypath>: Specifies the path to the configuration file (auditlog.conf).

You are prompted to enter the information for the following parameters:

NSIP: Specifies the IP address of the Citrix ADC appliance, for example, 10.102.29.1.

Userid: Specifies the user name, for example, nsroot.

Password: Specifies the password, for example, nsroot.

If you add multiple Citrix ADC IP addresses (NSIP), and later you do not want to log all of the Citrix ADC appliance event details, you can delete the NSIPs manually by removing the NSIP statement at the end of the auditlog.conf file. For a high availability (HA) setup, you must add both primary and secondary Citrix ADC IP addresses to auditlog.conf by using the audserver command. Before adding the IP address, make sure the user name and password exist on the system.

Verifying the NSLOG Server Configuration File

Check the configuration file (audit log.conf) for syntax correctness to enable logging to start and function correctly.

To verify configuration, at a command prompt, type the following command:

```
audserver -verify -f <directorypath>\auditlog.conf
```

<directorypath>: Specifies the path to the configuration file (audit log.conf).

Running the NSLOG server

September 14, 2021

To start audit server logging

Type the following command at a command prompt:

audserver -start -f <directorypath>\auditlog.conf

<directorypath>: Specifies the path to the configuration file (audit log.conf).

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

To stop audit server logging that starts as a background process in FreeBSD or Linux

Type the following command:

```
audserver -stop
```

To stop audit server logging that starts as a service in Windows

Type the following command:

```
audserver -stopservice
```

Customizing logging on the NSLOG server

September 14, 2021

You can customize logging on the NSLOG server by making additional modifications to the NSLOG server configuration file (log.conf). Use a text editor to modify the log.conf configuration file on the server system.

To customize logging, use the configuration file to define filters and log properties.

- **Log filters.** Filter log information from a Citrix ADC appliance or a set of Citrix ADC appliances.
- **Log properties.** Each filter has an associated set of log properties. Log properties define how to store the filtered log information.

This document includes the following details:

- Creating Filters
- Specifying Log Properties

Creating filters

You can use the default filter definition located in the configuration file (audit log.conf), or you can modify the filter or create a new filter. You can create more than one log filter.

> Note:
> For consolidated logging, if a log transaction occurs for which there is no filter definition, the default filter is used (if it is enabled.) The only way you can configure consolidated logging of all the Citrix ADC appliances is by defining the default filter.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

To create a filter

At the command prompt, type the following command in the configuration file (auditlog.conf):

```
filter <filterName> [IP <ip>] [NETMASK <mask>] ON | OFF]
```

filterName: Specify the name of the filter (maximum of 64 alphanumeric characters).

ip: Specify the IP addresses.

mask: Specify the subnet mask to be used on a subnet.

Specify ON to enable the filter to log transactions, or specify OFF to disable the filter. If no argument is specified, the filter is ON.

Examples:

```
filter F1 IP 192.168.100.151 ON
```

To apply the filter F2 to IP addresses 192.250.100.1 to 192.250.100.254:

```
filter F2 IP 192.250.100.0 NETMASK 255.255.255.0 ON
```

filterName is a required parameter if you are defining a filter with other optional parameters, such as IP address, or the combination of IP address and Netmask.

Specifying log properties

Log properties associated with the filter are applied to all the log entries present in the filter. The log property definition starts with the key word BEGIN and ends with END as illustrated in the following example:

```
BEGIN <filtername>
    logFilenameFormat ...
    logDirectory ...
    logInterval ...
    logFileSizeLimit ....
END
```

Entries in the definition can include the following:

- **LogFilenameFormat** specifies the file name format of the log file. The name of the file can be of the following types:
  - Static: A constant string that specifies the absolute path and the file name.
  - Dynamic: An expression that includes the following format specifiers:
    - Date (%{format}t)
    - creates file name with NSIP

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Example:

```
LogFileNameFormat Ex%`{
`%m%d%y }
t.log
```

This creates the first file name as Exmmddyy.log. New files are named: Exmmddyy.log.0, Exmmddyy.log.1, and so on. In the following example, the new files are created when the file size reaches 100MB.

Example:

```
LogInterval size
LogFileSize 100
LogFileNameFormat Ex%`{
`%m%d%y }
t
```

> **Caution**
>
> The date format %t specified in the LogFilenameFormat parameter overrides the log interval property for that filter. To prevent a new file being created every day instead of when the specified log file size is reached, do not use %t in the LogFilenameFormat parameter.

- **logDirectory** specifies the directory name format of the log file. The name of the file can be either of the following:
  - Static: Is a constant string that specifies the absolute path and file name.
  - Dynamic: Is an expression containing the following format specifiers:
    - Date (%{format}t)
    - creates directory with NSIP

  The directory separator depends on the operating system. In Windows, use the directory separator.

  Example:

  ```
  LogDirectory dir1\dir2\dir3
  ```

  In the other operating systems (Linux, FreeBsd, and so forth.), use the directory separator.

- **LogInterval** specifies the interval at which new log files are created. Use one of the following values:
  - Hourly: A file is created every hour. Default value.
  - Daily: A file is created very day at midnight.
  - Weekly: A file is created every Sunday at midnight.
  - Monthly : A file is created on the first day of the month at midnight.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- None: A file is created only once, when audit server logging starts.
- Size: A file is created only when the log file size limit is reached.

Example:

```
LogInterval Hourly
```

- **LogFileSizeLimit** specifies the maximum size (in MB) of the log file. A new file is created when the limit is reached.

> **Note**
>
> You can override the loginterval property by assigning size as its value.

The default LogFileSizeLimit is 10 MB.

Example:

```
LogFileSizeLimit 35
```

SYSLOG Over TCP

September 14, 2021

Syslog is a standard for sending event notification messages. These messages can be stored locally or on an external log server. Syslog enables network administrators to consolidate log messages and derive insights from the collected data.

Syslog is originally designed to work over UDP, which can transmit a huge amount of data within the same network with minimal packet loss. However, telco operators prefer to transmit syslog data over TCP, because they need reliable, ordered data transmission between networks. For example, telco tracks user activities, and TCP provides retransmission in the event of network failure.

How Syslog over TCP works

To understand how syslog over TCP works, consider two hypothetical cases:

Sam, a network administrator, wants to log significant events on an external syslog server.

XYZ Telecom, an ISP, has to transmit and store a significant amount of data on syslog servers to comply with government regulations.

In both cases, the log messages must be transmitted over a reliable channel and stored safely on an external syslog server. Unlike UDP, TCP establishes a connection, transmits messages securely, and retransmits (from sender to receiver) any data that is corrupted or lost because of network failure.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

The Citrix ADC appliance sends log messages over UDP to the local syslog daemon, and sends log messages over TCP or UDP to external syslog servers.

SNIP support for Syslog

When the audit-log module generates syslog messages, it uses a Citrix ADC IP (NSIP) address as the source address for sending the messages to an external syslog server. To configure a SNIP as the source address, you must make it part of the netProfile option and bind the netProfile to the syslog action.

> **Note**
>
> TCP uses SNIP for sending monitoring probes to check the connectivity and then sends the logs over NSIP. Hence the syslog server must be reachable via SNIP. Net profiles can be used to redirect all the TCP syslog traffic through SNIP entirely.

Use of a SNIP address is not supported in internal logging.

Fully qualified domain name Support for audit Log

Previously, the audit-log module was configured with the destination IP address of the external syslog server to which the log messages are sent. Now, the audit-log server uses a fully qualified domain name (FQDN) instead of the destination IP address. The FQDN configuration resolves the configured domain name of the syslog server to the corresponding destination IP address for sending the log messages from the audit-log module. The name server must be properly configured to resolve the domain name and avoid domain based service issues.

> **Note**
>
> When configuring an FQDN, server domain name configuration of the same Citrix ADC appliance in syslog action or nslog action is not supported.

Configuring Syslog over TCP by using the Command Line Interface

To configure a Citrix ADC appliance to send syslog messages over TCP by using the command line interface

At the command prompt, type:

```
1     add audit syslogAction <name> (<serverIP> | ((<serverDomainName>[-
          domainResolveRetry <integer>]) | -lbVserverName<string>))[-
          serverPort <port>] -logLevel <logLevel>[-dateFormat <dateFormat
          >] [-logFacility <logFacility>]   [-tcp ( NONE | ALL )] [-acl (
          ENABLED | DISABLED )][-timeZone ( GMT_TIME | LOCAL_TIME )][-
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
userDefinedAuditlog ( YES | NO )][-appflowExport ( ENABLED |
DISABLED )] [-lsn ( ENABLED | DISABLED )][-alg ( ENABLED |
DISABLED )] [-subscriberLog ( ENABLED | DISABLED )][-transport (
 TCP | UDP )] [-tcpProfileName <string>][-maxLogDataSizeToHold <
positive_integer>][-dns ( ENABLED | DISABLED )] [-netProfile <
string>]
```

```
1 add audit syslogaction audit-action1 10.102.1.1 -loglevel
    INFORMATIONAL -dateformat MMDDYYYY -transport TCP
```

Adding SNIP IP address to net profile option by using the command line interface

To add a SNIP IP address to the net profile by using the command line interface

At the command prompt, type:

```
1 add netProfile <name> [-td <positive_integer>] [-srcIP <string>][-
    srcippersistency ( ENABLED | DISABLED )][-overrideLsn ( ENABLED
    | DISABLED )]add syslogaction <name> <serverIP>  – loglevel all
    – netprofile net1
```

```
1 add netprofile net1  – srcip 10.102.147.204`
```

Where, srcIP is the SNIP.

Adding net profile in a syslog action by using the command line interface

To add a netProfile option in a syslog action by using the command line interface

At the command prompt, type:

```
1  add audit syslogaction <name> (<serverIP> | -lbVserverName <string
     >)  -logLevel <logLevel>
2 -netProfile <string> ...
```

```
1 add syslogaction sys_act1 10.102.147.36  – loglevel all  – netprofile
    net1
```

Where, -netprofile specifies the name of the configured net profile. The SNIP address is configured as part of the netProfile and this netProfile option is bound to the syslog action.

> **Note**
>
> You must always bind the netProfile option to the SYSLOGUDP or SYSLOGTCP services bound to the SYSLOGUDP or SYSLOGTCP load balancing virtual server, when an LB virtual server name is configured in syslog action.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Configuring FQDN support by using the command line interface

To add a server domain name to a Syslog action by using the command line interface

At the command prompt, type:

```
1 add audit syslogAction <name> (<serverIP> | ((<serverDomainName>[-
     domainResolveRetry <integer>]) | -lbVserverName <string>)) -logLevel
      <logLevel> ...
2     set audit syslogAction <name> [-serverIP <ip_addr|ipv6_addr|*>]-
        serverDomainName <string>] [-lbVserverName <string>]-
        domainResolveRetry <integer>] [-domainResolveNow]
```

To add a server domain name to a Nslog action by using the command line interface.

At the command prompt, type:

```
1     add audit nslogAction <name> (<serverIP> | (<serverDomainName>[-
        domainResolveRetry <integer>]))  -logLevel <logLevel> ...
2     set audit nslogAction <name> [-serverIP <ip_addr|ipv6_addr|*>][-
        serverDomainName <string>] [-domainResolveRetry <integer>][-
        domainResolveNow]
```

Where serverDomainName. Domain name of the log server. Is mutually exclusive with serverIP/ lbVserverName.

DomainResolveRetry integer. Time (in seconds) that the Citrix ADC appliance waits, after a DNS resolution fails, before sending the next DNS query to resolve the domain name.

DomainResolveNow. Included if the DNS query has to be sent immediately to resolve the server's domain name.

Configuring Syslog over TCP by using the GUI

To configure the Citrix ADC appliance to send Syslog messages over TCP by using the GUI

1. Navigate to **System** > **Auditing** > **Syslog** and select the **Servers** tab.
2. Click **Add** and select Transport Type as **TCP**.

Configuring a net profile for SNIP support by using the GUI To configure net profile for SNIP support by using the GUI

1. Navigate to **System > Auditing > Syslog** and select the **Servers** tab.
2. Click **Add** and select a net profile from the list.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Configuring FQDN by using the GUI To configure FQDN by using the GUI

1. Navigate to **System** > **Auditing** > **Syslog** and select the **Servers** tab.
2. Click **Add** and select a Server Type and Server Domain Name from the list.

Load balancing SYSLOG servers

November 18, 2022

The Citrix ADC appliance send its SYSLOG events and messages to all the configured external log servers. This results in storing redundant messages and makes monitoring difficult for system administrators. To address this issue, the Citrix ADC appliance offers load balancing algorithms that can load balance the SYSLOG messages among the external log servers for better maintenance and performance. The supported load balancing algorithms include RoundRobin, LeastBandwidth, CustomLoad, LeastConnection, LeastPackets, and AuditlogHash.

Load balancing of SYSLOG servers using the command line interface

At the command prompt, type:

1. Add a service and specify the service type as SYSLOGTCP or SYSLOGUDP.

   ```
   add service <name>(<IP> | <serverName>)<serviceType (SYSLOGTCP |
   SYSLOGUDP)> <port>
   ```

2. Add a load balancing virtual server, specify the service type as SYSLOGTCP or SYSLOGUDP, and load balancing method as AUDITLOGHASH.

   ```
   add lb vserver <name> <serviceType (SYSLOGTCP | SYSLOGUDP)> [-
   lbMethod <AUDITLOGHASH>]
   ```

3. Bind the service to the load balancing virtual server.

   ```
   Bind lb vserver <name> <serviceName>
   ```

4. Add a SYSLOG action and specify the load balancing server name that has SYSLOGTCP or SYSLOGUDP as service type.

   ```
   add syslogaction <name> <serverIP> [-lbVserverName <string>] [-
   logLevel <logLevel>]
   ```

5. Add a SYSLOG policy by specifying the rule and action.

   ```
   add syslogpolicy <name> <rule> <action>
   ```

6. Bind the SYSLOG policy to the system global for the policy to take effect.

   ```
   bind system global <policyName>
   ```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Load balancing of SYSLOG servers using the GUI

1. Add a service and specify the service type as SYSLOGTCP or SYSLOGUDP.

   Navigate to **Traffic Management** > **Services**, click **Add** and select **SYLOGTCP** or **SYSLOGUDP** as protocol.

2. Add a load balancing virtual server, specify the service type as SYSLOGTCP or SYSLOGTCP, and load balancing method as AUDITLOGHASH.

   Navigate to **Traffic Management** > **Virtual Servers**, click **Add** and select **SYLOGTCP** or **SYSLOGUDP** as protocol.

3. Bind the service to the load balancing virtual server.

   Navigate to **Traffic Management** > **Virtual Servers**, select a virtual server and then select **AUDITLOGHASH** in the **Load Balancing Method.**

4. Add a SYSLOG action and specify the load balancing server name that has SYSLOGTCP or SYSLOGUDP as service type.

   Navigate to **System** > **Auditing**, click **Servers** and add a server by selecting **LB Vserver** option in **Servers**.

5. Add a SYSLOG policy by specifying the rule and action.

   Navigate to **System** > **Syslog**, click **Policies** and add a SYSLOG policy.

6. Bind the SYSLOG policy to the system global for the policy to take effect.

   Navigate to **System** > **Syslog**, select a SYSLOG policy and click **Action**, and then click **Global Bindings** and bind the policy to system global.

Example:

The following configuration specifies load balance of SYSLOG messages among the external log servers using the AUDITLOGHASH as load balancing method. AUDITLOGHASH method load balances the traffic based on input hash value from the audit agents. The agents are the modules which generate auditlog in a Citrix ADC appliance. For example, if an agent LSN wants to load balance auditlogs based on client IP address, LSN module generates the hash value based on clientIP and passes the hash value to auditlog module. The auditlog module sends the auditlog messages which have same hash value to the external syslog server.

The Citrix ADC appliance generates SYSLOG events and messages that are load balanced amongst the services, service1, service2, and service 3.

```
add service service1 192.0.2.10 SYSLOGUDP 514
add service service2 192.0.2.11 SYSLOGUDP 514
add service service3 192.0.2.11 SYSLOGUDP 514
add lb vserver lbvserver1 SYSLOGUDP -lbMethod AUDITLOGHASH
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
bind lb vserver lbvserver1 service1
bind lb vserver lbvserver1 service2
bind lb vserver lbvserver1 service3
add syslogaction sysaction1 -lbVserverName lbvserver1 -logLevel All
add syslogpolicy syspol1 ns_true sysaction1
bind system global syspol1
```

Use the following command to configure SYSLOG using LB server with FQDN when ICMP packet is blocked:

```
set service service1 -healthMonitor NO
```

Limitations:

- The Citrix ADC appliance does not support an external load balancing virtual server load balancing the SYSLOG messages among the log servers.

Default settings for the log properties

September 14, 2021

The following is an example of the default filter with default settings for the log properties:

```
begin default
 logInterval Hourly
 logFileSizeLimit 10
 logFilenameFormat  auditlog%`{
 `%y%m%d }
 t.log
 end default
```

Following are two examples of defining the default filters:

Example 1:

```
Filter f1 IP 192.168.10.1
```

This creates a log file for NSI 192.168.10.1 with the default values of the log in effect.

Example 2:

```
Filter f1 IP 192.168.10.1
begin f1
    logFilenameFormat logfiles.log
end f1
```

This creates a log file for NSIP 192.168.10.1. Since the log file name format is specified, the default values of the other log properties are in effect.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Sample configuration file (audit.conf)

September 14, 2021

Following is a sample configuration file:

```
##############################
# This is the Auditserver configuration file
# Only the default filter is active
# Remove leading # to activate other filters
##############################
MYIP <NSAuditserverIP>
MYPORT 3023
#   Filter filter_nsip  IP <Specify the Citrix ADC IP address to filter
    on > ON
#   begin filter_nsip
#       logInterval         Hourly
#       logFileSizeLimit    10
#       logDirectory         logdir\%A\
#       logFilenameFormat   nsip%\\{
 \\%d%m%Y }
 t.log
#   end filter_nsip
Filter default
begin default
    logInterval      Hourly
    logFileSizeLimit    10
    logFilenameFormat   auditlog%\{
 \%y%m%d }
 t.log
end default
```

Web server logging

February 10, 2025

You can use the Web server logging feature to send logs of HTTP and HTTPS requests to a client system for storage and retrieval. This feature has two components:

- The Web log server, which runs on the Citrix ADC.
- The Citrix ADC Web Logging (NSWL) client, which runs on the client system.

When you run the Citrix ADC Web Logging (NSWL) client:

1. It connects to the Citrix ADC.
2. The Citrix ADC buffers the HTTP and HTTPS request log entries before sending them to the client.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

3. The client can filter the entries before storing them.

Configure web server logging

To configure web server logging, follow these steps:

1. Enable the Web logging feature on the NetScaler and configure the buffer size for temporarily storing log entries.
2. Ensure that TCP port 3011 is open between the NetScaler IP (NSIP) address and Web logging clients, especially if there is a firewall between them.
3. Install the NSWL client on the client system.
4. Add the NetScaler IP address (NSIP) to the NSWL configuration file.
5. Start the NSWL client to begin logging.
6. Customize web server logging by modifying the necessary entries in the NSWL configuration file (log.conf).

Configuring the Citrix ADC for web server logging

September 14, 2021

To configure the Citrix ADC for web server logging you are required to only enable the Web Server Logging feature. Optionally, you can perform the following configurations:

- Modify the size of the buffer (default size is 16 MB) that stores the logged information before it is sent to the Citrix ADC Web Logging (NSWL) client.
- Specify the custom HTTP headers that you want to export to the NSWL client. You can configure a maximum of two HTTP request and two HTTP response header names.

To configure web server logging by using the command line interface

At the command prompt, perform the following operations:

- Enable the web server logging feature.

  ```
  enable ns feature WL
  ```

- [Optional] Modify the buffer size for storing the logged information.

  ```
  set ns weblogparam -bufferSizeMB <size>
  ```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

> **Note**:
>
> To activate your modification, you must disable and then re-enable the Web server logging feature.

- [Optional] Specify the custom HTTP header names that you want to export.

  ```
  set ns weblogparam [-customReqHdrs <string> ...] [-customRspHdrs <string> ...]
  ```

```
1     > enable ns feature WL
2     Done
3     > set ns weblogparam -bufferSizeMB 60
4     Done
5     > show ns weblogparam
6         Web Logging parameters:
7         Log buffer size:  60MB
8         Custom HTTP request headers: (none)
9         Custom HTTP response headers: (none)
10    Done
11    > set ns weblogparam -customReqHdrs req1 req2 -customRspHdrs res1
          res2
12    Done
13    > show ns weblogparam
14        Web Logging parameters:
15        Log buffer size:  60MB
16        Custom HTTP request headers: req1, req2
17        Custom HTTP response headers: res1, res2
18    Done
```

To configure web server logging by using the GUI

1. Navigate to **System** > **Settings** and perform the following operations:
   a) To enable the web server logging feature, click **Change Advanced Features** and select **Web Logging**.
   b) To modify the buffer size, click **Change Global System Settings** and under **Web Logging**, enter the buffer size.
   c) To specify the custom HTTP headers to be exported, click **Change Global System Settings** and under **Web Logging**, specify the header values.

Installing the Citrix ADC web logging (NSWL) client

September 14, 2021

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

When you install NSWL, the client executable file (NSWL) is installed along with other files. The NSWL executable file provides a list of options that you can use. For details, see Configuring the NSWL Client.

> **Attention**
>
> The version of the NSWL client must be the same as Citrix ADC. For example, if the version of the Citrix ADC is 10.1 Build 125.9, the NSWL client must also be of the same version. Also, the web logging (NSWL) client works on both 32 bit and on 64 bit server machines. The download page has only a 32 bit weblog client. The 64 bit weblog client is available on request, and recommends you to contact Citrix support for more information.

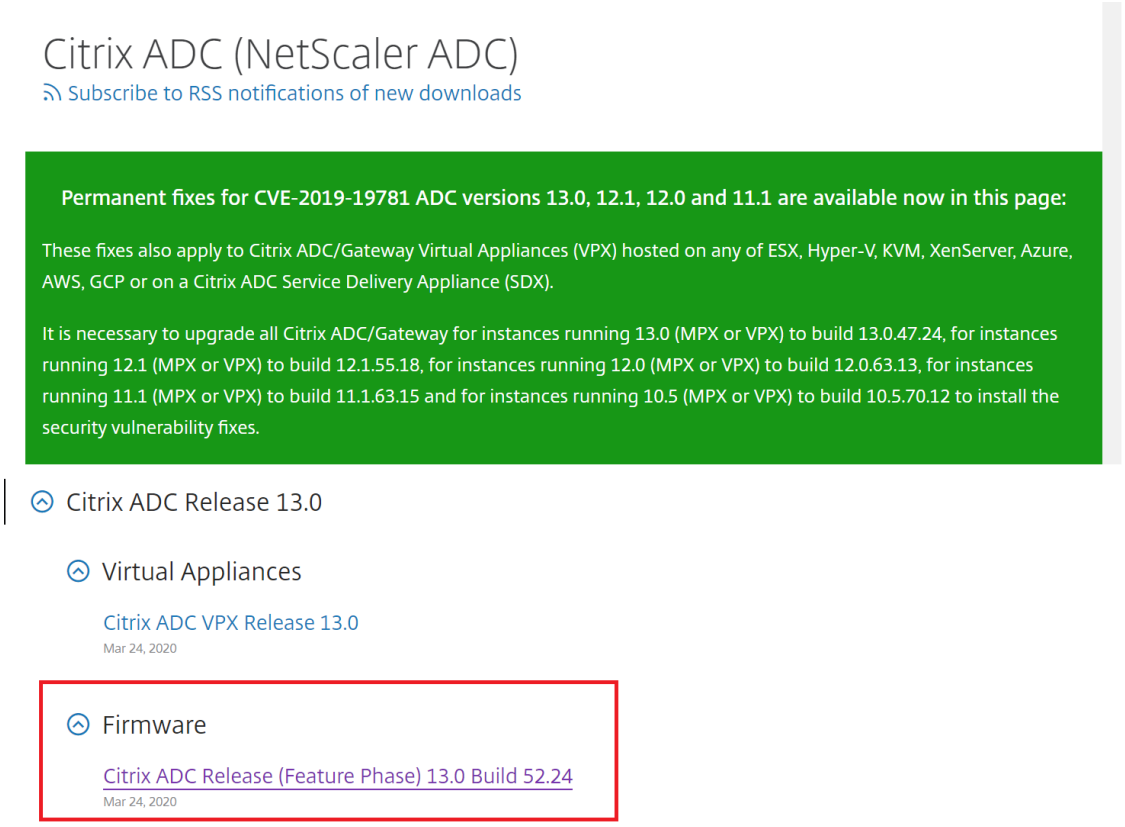
The following table lists the operating systems on which the NSWL client can be installed.

Operating system	Version	Hardware requirements	Remarks
Windows	Windows Server 2016 or later	Processor - x86/amd64 CPU (1 GHz or higher), RAM - 4 GB (or higher)	
macOS	macOS 8.6 or later	Not supported on Citrix ADC 10.1 and later releases.	
Linux	Ubuntu, SUSE Linux, CentOS, Red Hat Enterprise Linux released in 2016 or later	Processor - x86/amd64 CPU (1 GHz or higher), RAM - 4 GB (or higher)	
Solaris	Solaris Sun OS 5.6 or later	Processor - UltraSPARC-IIi 400 MHz, RAM - 512 MB, Controller - SCSI	Not supported on Citrix ADC 10.5 and later releases.
FreeBSD	FreeBSD 6.3 or later	Processor - x86/amd64 CPU (1 GHz or higher), RAM - 4 GB (or higher)	For Citrix ADC 10.5, use only FreeBSD 8.4.
AIX	AIX 6.1	-	Not supported on Citrix ADC 10.5 and later releases.

If the NSWL client system cannot process the log transaction because of a CPU limitation, the Web log buffer overruns and the logging process reinitiates.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

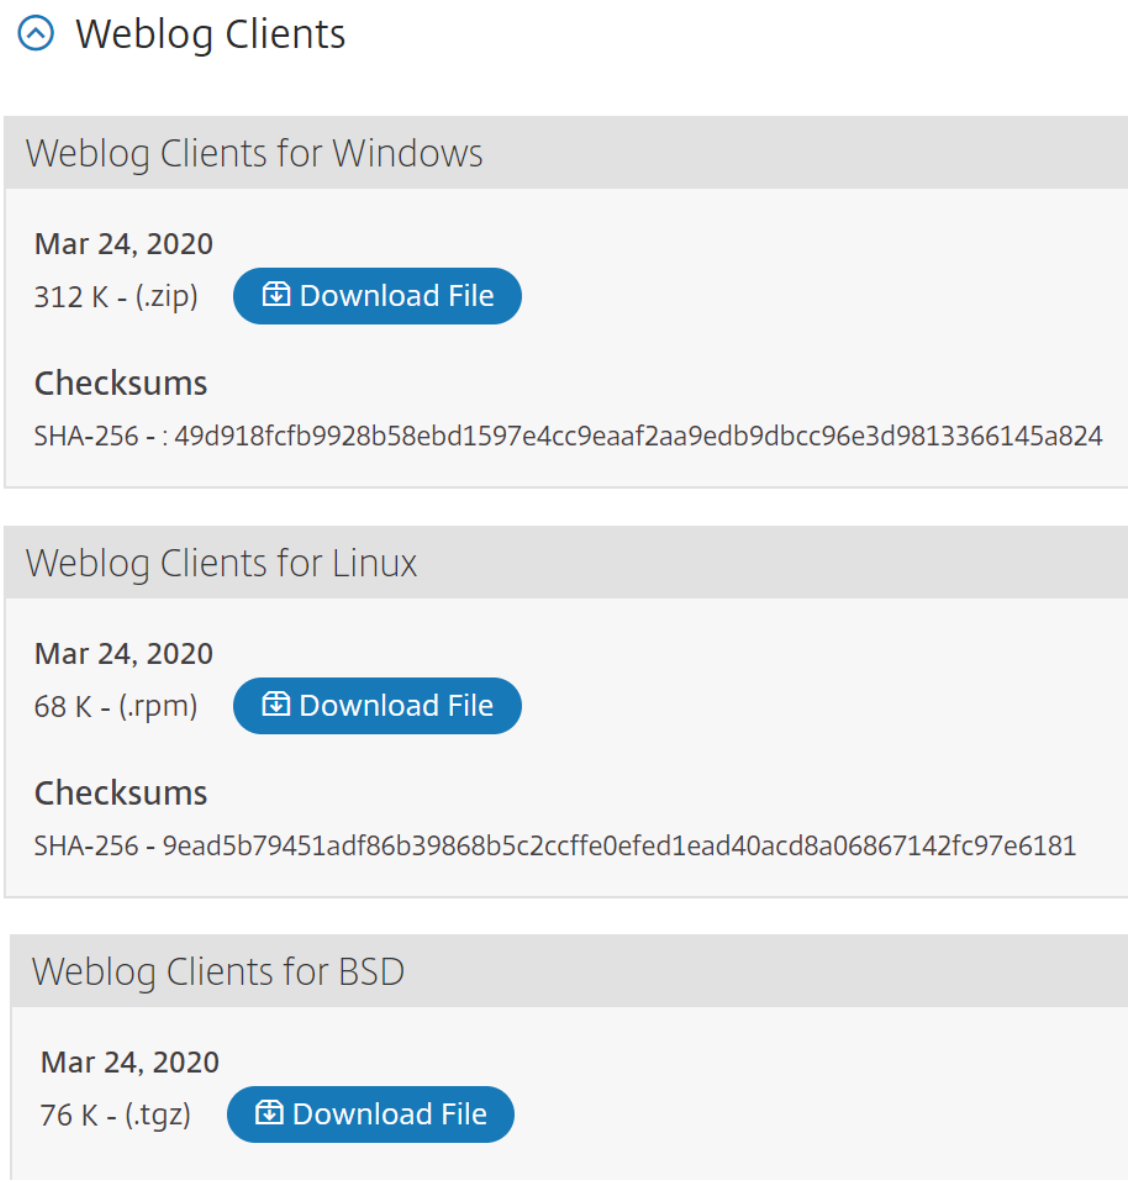
> **Caution**
>
> Reinitiation of logging can result in loss of log transactions.



To temporarily solve an NSWL client system bottleneck caused by a CPU limitation, you can tune the Web server logging buffer size on the Citrix ADC appliance. To solve the problem, you need a client system that can handle the site's throughput.

Download NSWL client

You can obtain the NSWL client package from either the Citrix ADC product CD or the Citrix downloads site. Within the package there are separate installation packages for each supported platform.



To download the NSWL client from the Citrix website

1. Log on to Citrix by accessing the URL `https://www.citrix.com/downloads/citrix-adc/`.
2. Navigate to a particular Citrix ADC release version and look for its Firmware.
3. Click **Firmware** (for example, Citrix ADC Release (Feature Phase) 13.0 Build 52.24).

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

4. In the **Citrix ADC Release (Feature Phase) Build** page, go to **Weblog Clients** section.
5. The section allows you to download Weblog clients for Windows, Linux, and BSD.

Install NSWL client on Solaris

To install the NSWL client, perform the following operations on the system where you downloaded the package.

1. Extract the `nswl_solaris-<release number>-<build number>.tar file` from the package.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

2. Copy the extracted file to a Solaris system on which you want to install the NSWL client.
3. Extract the files from the tar file with the following command:

   ```
   tar xvf nswl_solaris-9.3-51.5.tar
   ```

A directory Weblog is created in the temporary directory, and the files are extracted to the Weblog directory.

- Install the package with the following command:

  ```
  pkgadd -d
  ```

- The list of available packages appears. In the following example, one Weblog package is shown:

  ```
  1 NSweblog Citrix ADC Weblogging (SunOS,sparc)7.0
  ```

You are prompted to select the packages. Select the package number of the Weblog to be installed.

After you select the package number and press **Enter**, the files are extracted and installed in the following directories:

- /usr/local/netscaler/etc
- /usr/local/netscaler/bin
- /usr/local/netscaler/samples

1. To check whether the NSWL package is installed, run the following command:

   ```
   pkginfo | grep NSweblog
   ```

2. To uninstall the NSWL package, run the following command:

   ```
   pkgrm NSweblog
   ```

Install NSWL client on Linux

> **Important**
>
> The installation of an NSWL client on Linux replaces the configuration file. You must take a backup before installing it.

To install the NSWL client, perform the following operations on the system where you downloaded the package.

1. Extract the nswl_linux-<release number>-<build number>.rpm file from the package.
2. Copy the extracted file to a system, running Linux OS, on which you want to install the NSWL client.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

3. To install the NSWL package, run the following command:

   ```
   rpm -i nswl_linux-9.3-51.5.rpm
   ```

This command extracts the files and installs them in the following directories.

- /usr/local/netscaler/etc
- /usr/local/netscaler/bin
- /usr/local/netscaler/samples

1. To uninstall the NSWL package, run the following command:

   ```
   rpm -e NSweblog
   ```

2. To get more information about the Weblog RPM file, run the following command:

   ```
   rpm -qpi *.rpm
   ```

3. To view the installed Web server logging files, run the following command:

   ```
   rpm -qpl *.rpm
   ```

Install NSWL client on FreeBSD

To install the NSWL client, perform the following operations on the system where you downloaded the package.

1. Extract the nswl_bsd-<release number>-<build number>.tgz file from the package.
2. Copy the extracted file to a system, running FreeBSD OS, on which you want to install the NSWL client.
3. To install the NSWL package, run the following command:

   ```
   pkg_add nswl_bsd-9.3-51.5.tgz
   ```

This command extracts the files and installs them in the following directories.

```
1 -  /usr/local/netscaler/etc
2 -  /usr/local/netscaler/bin
3 -  /usr/local/netscaler/samples
```

1. To uninstall the NSWL package, run the following command:

   ```
   pkg_delete NSweblog
   ```

2. To verify that the package is installed, run the following command:

   ```
   pkg_info | grep NSweblog
   ```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Install the NSWL client on Mac

To install the NSWL client, perform the following operations on the system where you downloaded the package.

1. Extract the nswl_macos-<release number>-<build number>.tgz file from the package.
2. Copy the extracted file to a system, running macOS, on which you want to install the NSWL client.
3. To install the NSWL package, run the following command:

   ```
   pkg_add nswl_macos-9.3-51.5.tgz
   ```

This command extracts the files and installs them in the following directories:

- /usr/local/netscaler/etc
- /usr/local/netscaler/bin
- /usr/local/netscaler/samples

1. To uninstall the NSWL package, run the following command:

   ```
   pkg_delete NSweblog
   ```

2. To verify that the package is installed, run the following command:

   ```
   pkg_info | grep NSweblog
   ```

Install NSWL client on Windows

To install the NSWL client, perform the following operations on the system where you downloaded the package.

1. Extract the nswl_win-<release number>-<build number>.zip file from the package.
2. Copy the extracted file to a Windows system on which you want to install the NSWL client.
3. On the Windows system, unzip the file in a directory (referred as <NSWL-HOME>). The following directories are extracted: /bin, and /etc and /samples.
4. At the command prompt, run the following command from the <NSWL-HOME>\bin directory:

   ```
   nswl -install -f <directorypath>\log.conf
   ```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Where,

Directory path refers to the path of the configuration file (log.conf). By default, the file is in the <NSWL-HOME> and /etc directory. You can copy the configuration file to any other directory.

> **Note**
>
> To uninstall the NSWL client, at the command prompt, run the following command from the <NSWL-HOME>\bin directory:

```
1 > nswl -remove
```

Install NSWL client on AIX system

To install the NSWL client, perform the following operations on the system where you downloaded the package.

1. Extract the nswl_aix-<release number>-<build number>.rpm file from the package.
2. Copy the extracted file to a system, running AIX OS, on which you want to install the NSWL client.
3. To install the NSWL package, run the following command:

   ```
   rpm -i nswl_aix-9.3-51.5.rpm
   ```

This command extracts the files and installs them in the following directories.

- /usr/local/netscaler/etc
- /usr/local/netscaler/
- usr/local/netscaler/samples

1. To uninstall the NSWL package, run the following command:

   ```
   rpm -e NSweblog
   ```

2. To get more information about the Weblog RPM file, run the following command:

   ```
   rpm -qpi *.rpm
   ```

3. To view the installed Web server logging files, run the following command:

   ```
   rpm -qpl *.rpm
   ```

Configure NSWL client

July 5, 2022

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

After you install the NSWL client, you can configure the NSWL client using the nswl executable. These configurations are stored in the NSWL client configuration file (log.conf).

> **Note:**
>
> You can further customize logging on the NSWL client by making additional modifications to the NSWL configuration file (log.conf). For details, see Customizing Logging on the NSWL Client System.

The following table describes the commands that you can use to configure the NSWL client.

NSWL command	Specifies
nswl -help	The available NSWL help options.
nswl -addns -f <path-to-configuration-file>	The system that gathers the log transaction data. You are prompted to enter the IP address of the Citrix ADC appliance. Enter a valid user name and password.
nswl -verify -f <path-to-configuration-file>	Check for syntax or semantic errors in the configuration file.
nswl -start -f <path-to-configuration-file>	Start the NSWL client based on the settings in the configuration file. Note: For Solaris and Linux: To start Web server logging as a background process, type the ampersand sign (&) at the end of the command.
nswl -stop (Solaris and Linux only)	Stop the NSWL client if it was started as a background process; otherwise, use CTRL+C to stop Web server logging.
nswl -install -f <path-to-configuration-file> (Windows only)	Install the NSWL client as a service in Windows.
nswl -startservice (Windows only)	Start the NSWL client by using the settings in the configuration file specified in the nswl install option. You can also start NSWL client from Start > Control Panel > Services. Note: The NSWL log files will be created in C:\Windows\SysWOW64.
nswl -stopservice (Windows only)	Stops the NSWL client.
nswl -remove	Remove the NSWL client service from the registry.

Run the following commands from the directory in which the NSWL executable is located:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- Windows: \ns\bin
- Solaris and Linux: \usr\local\netscaler\bin

The Web server logging configuration files are located in the following directory path:

- Windows: \ns\etc
- Solaris and Linux: \usr\local\netscaler\etc

The NSWL executable is started as .\nswl in Linux and Solaris.

Add the IP addresses of the Citrix ADC appliance

In the NSWL client configuration file (log.conf), add the Citrix ADC IP address (NSIP) from which the NSWL client will start collecting logs.

To add the NSIP address of the Citrix ADC appliance

1. At the client system command prompt, type:

   ```
   nswl -addns -f < directorypath > \log.conf
   < directorypath >: Specifies the path to the configuration file (
   log.conf).
   ```

2. At the next prompt, enter the following information:

   - **NSIP**: Specify the IP address of the Citrix ADC appliance.
   - User name and Password: Specify the nsroot user credentials of the Citrix ADC appliance.

     > **Note:**
     >
     > Any system user with logging privilege enabled supports this functionality.

> **Note**:
>
> If you add multiple Citrix ADC IP addresses (NSIP), and later you do not want to log all of Citrix ADC system log details, you can delete the NSIPs manually by removing the NSIP statement at the end of the log.conf file. During a failover setup, you must add both primary and secondary Citrix ADC IP addresses to the log.conf by using the command. Before adding the IP address, make sure the user name and password exist on the Citrix ADC appliances.

Verify the NSWL configuration file

To make sure that logging works correctly, check the NSWL configuration file (log.conf) on the client system for syntax errors.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

To verify the configuration in the NSWL configuration file

At the client system command prompt, type:

```
nswl -verify -f <directorypath>\log.conf
```

< directorypath>: Specifies the path to the configuration file (log.conf).

Execute NSWL Client

Start Web server logging

At the client system command prompt, type:

```
nswl -start -f <directorypath>\log.conf
```

<directorypath>: Specifies the path to the configuration file (log.conf).

Stop Web server logging started as a background process on the Solaris or Linux operating systems

At the command prompt, type:

```
nswl -stop
```

To stop Web server logging started as a service on the Windows operating system

At the command prompt, type:

```
nswl -stopservice
```

Customize logging on the NSWL client system

October 18, 2024

You can customize logging on the Citrix ADC Web Logging (NSWL) client system by making more modifications to the NSWL client configuration file (log.conf). Use a text editor to modify the log.conf configuration file on the client system.

To customize logging, use the configuration file to define filters and log properties.

- **Log filters.** Filter log information based on the host IP address, domain name, and host name of the Web servers.
- **Log properties.** Each filter has an associated set of log properties. Log properties define how to store the filtered log information.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Sample configuration file

Following is a sample configuration file:

```
##########
# This is the NSWL configuration file
# Only the default filter is active
# Remove leading # to activate other filters
##########
##########
# Default filter (default on)
# W3C Format logging, new file is created every hour or on reaching 10 MB file size,
# and the file name is Exyymmdd.log
##########
Filter default
begin default
        logFormat               W3C
        logInterval             Hourly
        logFileSizeLimit        10
        logFilenameFormat       Ex%`{
 `%y%m%d }
 t.log
end default
##########
# Citrix ADC caches example
# CACHE_F filter covers all the transaction with HOST name www.netscaler.com and the listed server ip's
##########
#Filter CACHE_F HOST www.netscaler.com IP 192.168.100.89 192.168.100.95 192.168.100.52 192.168.100.53 ON

#end VHOST_F

########## END FILTER CONFIGURATION ##########
```

Creating filters

You can use the default filter definition in the configuration file (log.conf), or you can modify the filter or create a filter. You can create more than one log filter.

> **Note**
>
> Consolidated logging, which logs transactions for which no filter is defined, uses the default filter if it is enabled. Consolidated logging of all servers can be done by defining only the default filter.

If the server hosts multiple websites and each website has its own domain name, and each domain is associated with a virtual server, you can configure Web server logging to create a separate log directory for each website. The following table displays the parameters for creating a filter.

Parameter	Specifies
filterName	Name of the filter. The filter name can include alphanumeric characters and cannot be longer than 59 characters. Filter names longer than 59 characters are truncated to 59 characters.
Host name	Host name of the server for which the transactions are being logged.
IP `ip`	IP address of the server for which transactions are to be logged (for example, if the server has multiple domains that have one IP address).
IP ip 2…ip n	Multiple IP addresses (for example, if the server domain has multiple IP addresses).
ip6 IP	IPv6 address of the server for which transactions are to be logged.
IP ip NETMASK mask	IP addresses and netmask combination to be used on a subnet.
`ON` | `OFF`	Enable or disable the filter to log transactions. If no argument is selected, the filter is enabled (ON).

Table 1. Parameters for Creating a Filter

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

To create a filter

To create a filter, enter the following command in the log.conf file:

- `filter <filterName> <HOST name> | [IP<ip> ] | [IP<ip 2...ip n> ] | <IP ip NETMASK mask> [ON | OFF]`
- `filter <filterName> <HOST name> | [IP6 ip/<prefix length>] [ON | OFF]`

To create a filter for a virtual server

To create a filter for a virtual server, enter the following command in the log.conf file:

```
filter <filterName> <VirtualServer IP address>
```

Example

In the following example, you specify an IP address of 192.168.100.0 and netmask of 255.255.255.0. The filter applies to IP addresses 192.168.100.1 through 192.168.100.254.

```
Filter F1 HOST www.netscaler.com ON
Filter F2 HOST www.netscaler.com IP 192.168.100.151 ON
Filter F3 HOST www.netscaler.com IP 192.168.100.151 192.165.100.152 ON
Filter F4 IP 192.168.100.151
Filter F5 IP 192.168.100.151 HOST www.netscaler.com OFF
Filter F6 HOST www.netscaler.com HOST www.xyz.com HOST www.abcxyz.com
   IP 192.168.100.200 ON
Filter F7 IP 192.250.100.0 NETMASK 255.255.255.0
Filter F8 HOST www.xyz.com IP 192.250.100.0 NETMASK 255.255.255.0 OFF
For creating filters for servers having IPv6 addresses.
Filter F9 2002::8/112 ON
Filter F10 HOST www.abcd.com IP6 2002::8 ON
```

Specifying log properties

Log properties are applied to all log entries associated with the filter. The log property definition begins with the keyword BEGIN and ends with END as illustrated in the following example:

```
BEGIN <filtername>
 logFormat ...
 logFilenameFormat ...
 logInterval ...
 logFileSize ....
 logExclude ....
 logTime ....
 END
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Entries in the definition can include the following:

-

LogFormat specifies the Web server logging feature that supports NCSA, W3C Extended, and custom log file formats.

```
By default, the `logformat` property is w3c. To override, enter custom
   or NCSA in the configuration file, for example:
```

```
    LogFormat NCSA
```

> **Note**
>
> For the NCSA and custom log formats, local time is used to time stamp transactions and for file rotation.

- **LogInterval** specifies the intervals at which new log files are created. Use one of the following values:
  - Hourly: A file is created every hour.
  - Daily: A file is created every day at midnight. Default value.
  - Weekly: A file is created every Sunday at midnight.
  - Monthly: A file is created on the first day of the month at midnight.
  - None: A file is created only once, when Web server logging starts.

Example:

```
LogInterval Daily
```

LogFileSizeLimit specifies the maximum size of the log file in MB. It can be used with any log interval (weekly, monthly, and so on.) A file is created when the maximum file size limit is reached or when the defined log interval time elapses.

To override this behavior, specify the size as the `loginterval` property so that a file is created only when the log file size limit is reached.

The default LogFileSizeLimit is 10 MB.

Example:

```
LogFileSizeLimit 35
```

- **LogFilenameFormat** specifies the file name format of the log file. The name of the file can be of the following types:
  - Static: Specifies a constant string that contains the absolute path and file name.

    Dynamic: Specifies an expression containing the following format:
    - Server IP address

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

* Date (%{format}t)
* URL suffix (%x)
* Host name (%v)

Example:

```
LogFileNameFormat Ex%`{
 `%m%d%y }
 t.log
```

This command creates the first file name as Exmmddyy.log, then every hour creates a file with a file name: Exmmddyy.log.0, Exmmddyy.log.1,…, Exmmddyy.log.n.

Example:

```
      LogInterval size
      LogFileSize 100
      LogFileNameFormat Ex%`{
`%m%d%y }
t
```

> **Caution**
>
> The date format %t specified in the LogFilenameFormat command overrides the log interval property for that filter. To prevent a new file being created every day instead of when the specified log file size is reached, do not use %t in the LogFilenameFormat.

- **LogExclude** prevents logging of transactions with the specified file name extensions.

Example:

```
      LogExclude .html
```

This command creates a log file that excludes log transactions for *.html files.

LogTime specifies log time as either GMT or LOCAL.

The defaults are:

- NCSA log file format: LOCAL
- W3C log file format: GMT.

Understanding NCSA and W3C log formats

The Citrix ADC supports the following standard log file formats:

- NCSA Common Log Format
- W3C Extended Log Format

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

NCSA Common Log Format

If the log file format is NCSA, the log file displays log information in the following format:

```
Client_IP_address -User_Name [Date:Time -TimeZone] "Method Object
    HTTP_version" HTTP_StatusCode BytesSent
```

To use the NCSA Common log format, enter NCSA in the LogFormat argument in the log.conf file.

The following table describes the NCSA Common log format.

Argument	Specifies
Client_IP_address	The IP address of the client computer.
User Name	The user name.
Date	The date of the transaction.
Time	The time when the transaction was completed.
Time Zone	The time zone (Greenwich Mean Time or local time).
Method	The request method (for example; GET, POST).
Object	The URL.
HTTP_version	The version of HTTP used by the client.
HTTP_StatusCode	The status code in the response.
Bytes Sent	The number of bytes sent from the server.

W3C extended log format

An extended log file contains a sequence of lines containing ASCII characters terminated by either a Line Feed (LF) or the sequence Carriage Return Line Feed (CRLF.) Log file generators must follow the line termination convention for the platform on which they are run.

Log analyzers must accept either LF or CRLF form. Each line might contain either a directive or an entry. If you want to use the W3C Extended log format, enter W3C as the Log-Format argument in the log.conf file.

By default, the standard W3C log format is defined internally as the custom log format, shown as follows:

```
%`{
  `%Y-%m-%d%H:%M:%S }
  t %a %u %S %A %p %m %U %q %s %j %J %T %H %+{
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
 user-agent }
 i %+{
 cookie }
  i%+{
 referer }
 i
```

You can also change the order or remove some fields in this W3C log format. For example:

```
logFormat W3C %`{
 `%Y-%m-%d%H:%M:%S }
 t %m %U
```

W3C log entries are created with the following format:

```
#Version: 1.0
#Fields: date time cs-method cs-uri
#Date: 12-Jun-2001 12:34
2001-06-12 12:34:23 GET /sports/football.html 2001-06-12 12:34:30
GET /sports/football.html
```

Entries

Entries consist of a sequence of fields relating to a single HTTP transaction. Fields are separated by white space. Citrix recommends the use of tab characters. If a field in a particular entry is not used, a dash (-) marks the omitted field.

Directives

See the Directives table for the information about the logging process. Lines beginning with the pound sign (#) contain directives.

Example:

The following sample log file shows the log entries in W3C Extended log format:

```
#Version: 1.0
#Fields: time cs-method cs-uri
#Date: 12-Jan-1996 00:00:00
00:34:23 GET /sports/football.html
12:21:16 GET /sports/football.html
12:45:52 GET /sports/football.html
12:57:34 GET /sports/football.html
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Fields

The Fields directive lists a sequence of field identifiers that specify the information recorded in each entry. Field identifiers might have one of the following forms:

- **identifier:** Relates to the transaction as a whole.
- **prefix-identifier:** Relates to information transfer between parties defined by the value prefix.
- **prefix (header):** Specifies the value of the HTTP header field header for transfer between parties defined by the value prefix. Fields specified in this manner always have the type.

The following table describes defined prefixes.

Prefix	Specifies
c	Client
s	Server
r	Remote
cs	Client to server
sc	Server to client
sr	Server to remote server (prefix used by proxies)
rs	Remote server to server (prefix used by proxies)
x	Application-specific identifier

Examples:

The following examples are defined identifiers that use prefixes:

cs-method: The method in the request sent by the client to the server.

sc(Referer): The `Referer` field in the reply.

c-ip: The IP address of the client.

Identifiers

The following table describes the W3C Extended log format identifiers that do not require a prefix.

Identifier	Description
date	The date on which the transaction was done.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Identifier	Description
time	The time when the transaction is done.
time-taken	The time taken (in seconds) for the transaction to complete.
bytes	The number of bytes transferred.
cached	Records whether a cache hit has occurred. A zero indicates a cache miss.

Table 5. W3C Extended Log Format Identifiers (No Prefix Required)

The following table describes the W3C Extended log format identifiers that require a prefix.

Identifier	Description
IP	The IP address and the port number.
DNS	The DNS name.
status	The status code.
comment	The comment returned with a status code.
method	The method.
url	The URL.
url-stem	The stem portion of the URL.
url-query	The query portion of the URL.

Table 6. W3C Extended Log Format Identifiers (Requires a Prefix)

The W3C Extended Log file format allows you to choose log fields. These fields are shown in the following table.

Field	Description
Date	The date on which the transaction is done.
Time	The time when the transaction is done.
Client IP	The IP address of the client.
User Name	The user name.
Service Name	The service name, which is always HTTP.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Field	Description
Server IP	The server IP address.
Server Port	The server port number
Method	The request method (for example; GET, POST).
Url Stem	The URL stem.
Url Query	The query portion of the URL.
HTTP Status	The status code in the response.
Bytes Sent	The number of bytes sent to the server (request size, including HTTP headers).
Bytes Received	The number of bytes received from the server (response size, including HTTP headers).
Time Taken	The time taken for a transaction to complete, in seconds.
Protocol Version	The version number of HTTP being used by the client.
User Agent	The User-Agent field in the HTTP protocol.
Cookie	The Cookie field of the HTTP protocol.
`Referer`	The `Referer` field of the HTTP protocol.

Table 7. W3C Extended Log File Format (Allows Log Fields)

Creating a custom log format

You can customize the display format of the log file data manually or by using the NSWL library. By using the custom log format, you can derive most of the log formats that Apache currently supports.

Creating a custom log format by using the NSWL library

Use one of the following NSWL libraries depending on whether the NSWL executable has been installed on a Windows or Solaris host computer:

- **Windows:** The nswl.lib library in the \ns\bin directory on the system manager host computer.
- **Solaris:** The libnswl.a library in /usr/local/netscaler/bin.

To create the custom log format by using the NSWL library

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

1. Add the following two C functions defined by the system in a C source file:

   ns_userDefFieldName(): This function returns the string that must be added as a custom field name in the log record.

   ns_userDefFieldVal(): This function implements the custom field value, then returns it as a string that must be added at the end of the log record.

2. Compile the file into an object file.
3. Link the object file with the NSWL library (and optionally, with third party libraries) to form a new NSWL executable.
4. Add a %d string at the end of the logFormat string in the configuration file (log.conf).

Example:

```
##########
# A new file is created every midnight or on reaching 20MB file size,
# and the file name is
/datadisk5/netscaler/log/NS<hostname>/Nsmmddyy.log and create
digital
#signature field for each record.
BEGIN CACHE_F
    logFormat custom "%a - "%{
 user-agent }
 i" [%d/%B/%Y %T -%g] "%x"
%s %b%{
 referrer }
 i "%{
 user-agent }
 i" "%{
 cookie }
 i" %d "
    logInterval Daily
    logFileSizeLimit 20
    logFilenameFormat
/datadisk5/netscaler/log/%v/NS%`{
 `%m%d%y }
 t.log
END CACHE_F
```

Creating a Custom log format manually

To customize the format in which log file data must appear, specify a character string as the argument of the LogFormat log property definition. The following is an example where character strings are used to create a log format:

```
LogFormat Custom ""%a - "%{
 user-agent }
 i" %[%d/%m/%Y]t %U %s %b %T"
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- The string can contain the “c”type control characters \n and \t to represent new lines and tabs.
- Use the Esc key with literal quotes and backslashes.

The characteristics of the request are logged by placing % directives in the format string, which are replaced in the log file by the values.

If the %v (Host name) or %x (URL suffix) format specifier is present in a log file name format string, the following characters in the file name are replaced by an underscore symbol in the log configuration file name:

”*. /: < > ?

Characters whose ASCII values lie in the range of 0-31 are replaced by the following:

%<ASCII value of character in hexadecimal>.

For example, the character with ASCII value 22 is replaced by %16.

> **Caution**
>
> If the %v format specifier is present in a log file name format string, a separate file is opened for each virtual host. To ensure continuous logging, the maximum number of files that a process can have open must be sufficiently large. See your operating system documentation for a procedure to change the number of files that can be opened.

Creating Apache log formats

You can derive from the custom logs most of the log formats that Apache currently supports. The custom log formats that match Apache log formats are:

NCSA/combined: LogFormat custom %h %l %u [%t] “%r”%s %B “%{referer}i”“%{user-agent}i”

NCSA/Common: LogFormat custom %h %l %u [%t] “%r”%s %B

Referer Log: LogFormat custom “%{referer}i”-> %U

User agent: LogFormat custom %{user-agent}i

Similarly, you can derive the other server log formats from the custom formats.

Arguments for defining a custom log format

See the Custom log format PDF table for more information about defining a custom log format.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

> **Notes:**
>
> - The virtual IP address of HTTP transaction is displayed as "-"in the following scenarios:
>   - Transparent mode is enabled
>   - Integrated Caching is enabled, where Citrix ADC responds to client from Cache
>   - An error response is generated
> - For instructions on how to export custom HTTP headers, see Configuring the Citrix ADC for Web Server Logging.

For example, if you define the log format as %+{user-agent}i, and if the user agent value is Citrix ADC system Web Client, then the information is logged as Citrix ADC system+Web+Client. An alternative is to use double quotation marks. For example, "%{user-agent}i"logs it as "Citrix ADC system Web Client."Do not use the <Esc> key on strings from %.. .r, %. . .i and, %. . .o. It complies with the requirements of the Common Log Format. Clients can insert control characters into the log. Therefore, you must take care when working with raw log files.

Time format definition

See the Time format definition table to know about the format part of the %{format}t string described in the Custom Log Format table. Values within brackets ([ ]) show the range of values that appear. For example, [1,31] in the %d description in the following table shows %d ranges from 1 to 31.

> **Note**
>
> If you specify a conversion that does not correspond to any of the ones described in the preceding table, or to any of the modified conversion specifications listed in the next paragraph, the behavior is undefined and returns 0.

The difference between %U and %W (and also between modified conversions %OU and %OW) is the day considered to be the first day of the week. Week number 1 is the first week in January (starting with a Sunday for %U, or a Monday for %W). Week number 0 contains the days before the first Sunday or Monday in January for %U and %W.

Displaying server logs

You can configure an NSWL feature to display server logs on the console or redirect server logs to a directory on the Citrix ADC appliance.

There are two ways to display logs on the console (standard output):
Option 1: Display all logs on the console.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Option 2: Display only selected logs on the console with filters with `logfilenameformat` as STDOUT.

Call Home

September 14, 2021

Appliances might sometimes fail to perform well because of software or hardware issues. In such cases, Citrix needs to collect data and perform issue resolution before a potential impact can occur at the customer site. By enabling Call Home on your Citrix ADC appliance, you can automate the error notification process. Not only you avoid calling Citrix support, raising a service request, and uploading system data before the support team can troubleshoot the issue, but support can identify and address an issue before it occurs. Call Home periodically monitors the appliance and automatically uploads data to the Citrix technical support server. In addition, the incoming Call Home data provide insights about Citrix ADC usage. Multiple teams within Citrix can use this data to better design, support, and implement Citrix ADC.

By default, Call Home is enabled on all platforms and all flavors of Citrix ADC (MPX, VPX, SDX). By having this feature enabled, you allow Citrix to collect Citrix ADC deployment and telemetry data for better implementation, and support service.

> **Note**
>
> You can also see the Call Home FAQ page for information pertaining to Call Home.

Benefits

Call Home provides the following benefits.

- Monitor hardware and software error conditions. For more information, see Monitor critical error conditions section.
- Notify critical events that impact your network.
- Send performance data and system usage details to Citrix to:
  - Analyze and improve product quality.
  - Provide real-time troubleshooting information for proactive issue identification, and faster issue resolution.

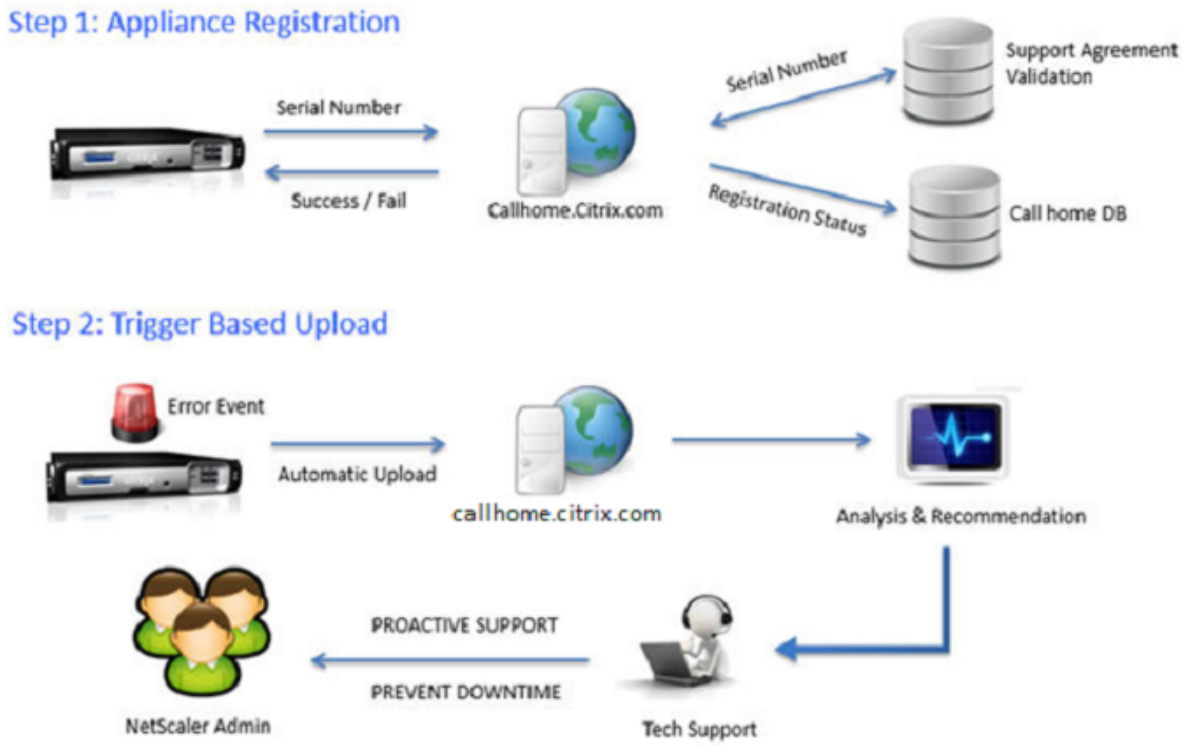
© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Platform support

Call Home feature is supported on all Citrix ADC platforms and all appliance models (MPX, VPX, and SDX).

- Citrix ADC MPX: All MPX models.
- Citrix ADC VPX: All VPX models, including VPX appliances that obtain their license from external or central licensing pools.
- Citrix ADC SDX: Monitors the disk drive and assigned SSL chips for any errors or failures. The VPX instances, however, do not have access to the Power Supply Unit (PSU) and therefore their status is not monitored. In an SDX platform, you can configure Call Home either directly on an individual instance or through the SVM.

Prerequisites



To use Call Home, the Citrix ADC appliance must have the following:

- **Internet connection.** Call Home requires an internet connection for the Citrix ADC to connect to the Citrix support server for uploading a data archive.

How Call Home works

The following figure shows a basic workflow of Call Home in a Citrix ADC appliance deployed at a customer site.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

The following are the workflow of a Call Home:

1. Set up Internet Connectivity. For Call Home to upload system data, your appliance must have an internet connectivity. If it does not, you can configure a proxy server configuration to provide internet connectivity. For more information, see Configuring Call Home section.

2. Enable Call Home. When upgrading your appliance to the latest software through either Citrix ADC command interface or GUI, Call Home is enabled by default and the system delays the registration process by 24 hours. During this period, you can choose to manually disable the feature, but Citrix recommends you to have it enabled.

> **Note**
>
> If you are upgrading your appliance from an older version that explicitly has Call Home disabled, the system still enables the feature by default and displays a notification message on your first login.

In addition, if you are doing any configuration changes for an internet connectivity, you must disable and enable Call Home. It enables Call Home to register with the Citrix Insight Services (CIS) server without any failure errors.

3. Register the Citrix ADC appliance on the Citrix Support Server. When Call Home registers the appliance with the Citrix Support server, the server checks the database for the validity of the appliance serial number. If the serial number is valid, the server registers the appliance for Call Home service

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

and sends a successful registration response. Otherwise, the server sends back a registration failure message. The basic system information is sent as a separate message. The data includes memory and CPU usage details along with the throughput numbers. The data is sent periodically as part of the heartbeat message every 7 days, by default. However, a value of less than 5 days is not recommended, because frequent uploads are not useful.

4. Monitor critical error conditions. Once registered, Call Home starts monitoring the appliance. The following table lists the conditions Call Home can monitor on the appliance.

Critical Error Condition	Description	Call Home Monitoring Interval	Corresponding SNMP Alarm Name
Compact flash drive errors	The compact flash drive on the appliance encountered read or write failures.	24 hours	COMPACT-FLASH-ERRORS
Hard disk drive errors	The hard drives on the appliance encountered read or write failures.	24 hours	HARD-DISK-DRIVE-ERRORS
Power supply unit failure	One of the power supply units on the Citrix ADC appliance has failed.	7 seconds	POWER-SUPPLY-FAILURE
SSL card failure	One of the SSL cards on the Citrix ADC appliance has failed.	7 seconds	SSL-CARD-FAILED
Warm restart	The appliance has warm restarted due to a failure of a system process.	After every restart of the Citrix ADC appliance.	WARM-RESTART-EVENT
Memory anomaly error	Memory utilization progressively increases above its normal limit and exceeds the threshold.	1 day	No SNMP alarm
Rate limit packet drop	The throughput limits or packets-per-second (pps) limits is reached.	7 seconds	PF-RL-PPS-PKTS-DROPPED, PF-RL-RATE-PKTS-DROPPED

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

5. Upload Call Home data. If any one of the previous critical conditions is identified on the appliance, the Call Home feature automatically notifies the Citrix support. The support archives are uploaded to the Citrix support server. Also, you can configure the CALLHOME-UPLOAD-EVENT SNMP alarm to generate an SNMP alert whenever Call Home upload happens. The SNMP alert notifies the local administrator about the critical event.

> **Note**
>
> Call Home creates the Call Home tar file and uploads it to the Citrix tech support server for only the first occurrence of a particular error condition since the last reboot. If you want the appliance to send alerts each time a particular error condition occurs, configure the corresponding SNMP alarm for the error condition.

6. Create Service Request. Call Home automatically creates a service request for all the critical hardware related events. The events are classified as; power supply failure, SSL card failure, hard disk drive errors, and compact flash errors. For other errors, after you review the System Logs, you can contact the Citrix support team to raise a service request for investigation.

Configuring Call Home

To configure Call Home, verify the internet connectivity on the appliance and ensure a DNS nameserver is configured. If there is no internet connection, configure a proxy server or service. Then, enable Call Home on the appliance and verify the registration status of the appliance with the Citrix support server. Once registered, Call Home can monitor and upload data. In addition, you can configure SNMP alarms to notify the administrator at the customer site.

To configure Call Home, you can use either the Citrix ADC command interface or the GUI to do the following tasks:

- Enable Call Home.
- Configure Call Home for optional proxy server parameters.
- Verify Call Home Registration Status.
- View errors and timestamp details.
- Configure SNMP Alarms.

To configure Call Home by using the Citrix ADC command interface

The Citrix ADC command interface enables you to do the following:

`Enabling Call Home`

At the command prompt, type:

```
enable ns feature callhome
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Configuring Call Home for optional proxy server parameters

Call Home enables you to configure the optional proxy server for internet connectivity. You can either configure a proxy server with IP address and port or configure a proxy authentication service with one-way or two-way authentication.

To configure optional proxy server with IP address and port

At the command prompt, type:

```
set callhome –proxyMode ( YES | NO )[-IPAddress <ip_addr|ipv6_addr
|*>] [-port <port |*>]
```

```
1 set callhome – proxyMode YES – IPAddress 10.102.167.33 – port 80
```

> **Note**
>
> Call Home uses the proxy server only when you set the proxy-mode parameter to YES. If you set it to NO, the proxy functionality does not work, even if the IP address and port are configured. The port number must be for an HTTP service, not for an HTTPS service.

To configure optional proxy authentication service

This mode provides two types of security authentication: one-way and two-way. To set up either type, you must configure an SSL service. For more information, see Configuring an SSL Service topic.

In one-way authentication, only the Citrix ADC appliance authenticates the proxy server. In two-way authentication, the Citrix ADC appliance authenticates the proxy server and the proxy server, in turn, authenticates the appliance.

To configure proxy authentication service

At the command prompt, type:

```
set callhome –proxyMode ( YES | NO )[-proxyAuthService <string>]
```

```
1 set callhome – proxyMode YES – proxyAuthService callhome_proxy
```

To configure one-way proxy server authentication

Do the following tasks to configure one-way proxy server authentication.

1. Create an SSL service.
2. Bind a CA certificate to the service.
3. Bind an HTTPS Monitor to the service.
4. Configure Call Home to use the SSL service.

To configure two-way proxy server authentication

Do the following tasks to configure two-way proxy server authentication.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

1. Create an SSL service
2. Bind a CA certificate to the service.
3. Bind a Client Certificate.
4. Bind an HTTPS Monitor to the service.
5. Configure Call Home to use the SSL service.

Verifying Call Home Registration status

At the command prompt, type:

```
show callhome

    show callhome

     Registration with Citrix upload server SUCCESSFUL

     Mode: Default

     Contact email address: exampleadmin@example.com

     Heartbeat Custom Interval (days): 7

     Proxy Mode: Yes

        Proxy IP Address:10.102.29.200

        Proxy Authentication Service:

        Proxy Port: 80

    Trigger event                  State   First occurrence
                       Latest occurrence

     -------------                  -----   ----------------
                      -----------------

     1) Warm boot                  Enabled N/A
                                   ..

     2) Compact flash errors       Enabled ..
                                     ..

     3) Hard disk drive errors     Enabled ..
                                     ..

     4) SSL card failure           N/A     N/A
                                   N/A

     5) Power supply unit failure  N/A     N/A
                                   N/A

     6) Rate limit packet drops    Enabled ..
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
                                        ..
36
37      7) Memory anomaly               Enabled ..
                                         ..
38
39      Done
```

> **Note**
>
> If the Call Home fails to register with CIS, the appliance displays an error message.

Enabling SNMP Alarms

The Citrix ADC appliance provides a set of error condition entities called *SNMP alarms*. When an error condition in an SNMP alarm is met, the appliance generates SNMP trap messages that are sent to the configured trap listeners. For example, when the SSL-CARD-FAILED alarm is enabled, a trap message is generated and sent to the trap listener. The trap message is sent whenever there is an SSL card failure on the appliance. For more information, see SNMP.

At the command prompt, type:

```
enable snmp alarm <trapName>
```

```
show snmp alarm <trapName>
```

To configure Call Home by using GUI

To verify if the Call Home feature is enabled by default in the GUI

1. Navigate to **Configuration** > **System** > **Settings**.
2. In the **details** pane, click **Configure Advanced features** link.
3. In the **Configure Advanced Features** page, **Call Home** option must display as enabled.

To enable Call Home by using GUI

1. Navigate to **Configuration** > **System** > **Settings**.
2. In the **details** pane, click **Configure Advanced features** link and select **Callhome** option.

To configure Call Home for optional proxy mode authentication by using GUI

1. You can use any of the two ways to access the Call Home page:
    a) Navigate to **System** > **System Information**.
    b) Navigate to **System** > **Diagnostics**.
        i. In the details pane, under **Technical Support Tools**, select **Call Home**.
2. On the **Configure Call Home** page, set the following parameters.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

a) **Mode**. Call Home mode of operation. Possible types: Default, Citrix Service Provider (CSP) deployment.

> **Note**
>
> This option is not user configurable. The mode is automatically determined and set based on the type of Citrix ADC deployment.

b) **Email address**. Email address of the contact administrator at the customer site.

c) **CallHome Heartbeats Interval (days).** Monitoring interval (in days) between Call Home heartbeats. Minimum value=1 and Maximum value=7.

d) **Enable Call Home**. Enable or disable the Call Home feature to view the status of appliance registration on the Citrix support server.

e) **Proxy Mode**. If you do not have an internet connectivity, enable proxy mode and set the optional proxy parameters.

f) **Proxy Server**. If you set the proxy mode by using a proxy server, specify the server IP address.

i. **Proxy Service**. If you set the proxy mode by using a proxy service, specify the service name.

ii. **IP Address**. IP address of the proxy server.

iii. **Port**. Port number of the proxy server.

iv. **Proxy Authentication SSL Service**. The name of the proxy service that provides proxy-mode authentication.

3. Click **OK** and **Done**.

To configure SSL service for proxy server authentication by using GUI

For information about configuring the SSL service by using the GUI, see Configuring an SSL Service topic.

To verify Call Home registration status by using the GUI

1. You can use any of the two ways to access the **Call Home** page:

   a) Navigate to **System** > **System Information**.

   b) Navigate to **System** > **Diagnostics**.

      i. In the details pane, under **Technical Support Tools**, select **Call Home**.

2. In the **Configure Call Home** page, the **Registration with Citrix upload server** field shows the registration status.

To configure an SNMP alarm

1. Navigate to **System** > **SNMP** > **Alarms**.
2. In the details pane, select an alarm and configure its parameters.
3. Click **OK** and **Close**.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Citrix Service Provider (CSP) deployment support

In a Citrix Service Provider (CSP) environment where Citrix ADC services are deployed on VPX instances, Call Home can monitor and track the license-specific information and securely send the information to Citrix Insight Services (CIS). CIS in turn sends the information to the License Usage Insights (LUI) portal for accounting purposes and for CSP customers to review their license usage. Currently, CSP environments support Citrix ADC services on VPX instances only, not on MPX or SDX appliances. The VPX instances can be deployed in either standalone or high availability mode.

Reporting tool

September 14, 2021

Use the Citrix® Citrix ADC® Reporting tool to view Citrix ADC performance statistics data as reports. Statistics data are collected by the `nscollect` utility and are stored in a database. When you want to view certain performance data over a period, the Reporting tool pulls out specified data from the database and displays them in charts.

Reports are a collection of charts. The Reporting tool provides built-in reports and the option to create custom reports. In a report, you can modify the charts and add new charts. You can also modify the operation of the data collection utility, `nscollect`, and stop or start its operation.

Using the reporting tool

The Reporting tool is a web-based interface accessed from the Citrix® Citrix ADC® appliance. Use the Reporting tool to display the performance statistics data as reports containing graphs. In addition to using the built-in reports, you can create custom reports, which you can modify at any time. Reports can have between one and four charts. You can create up to 256 custom reports. You can create a custom report for any number of entities.

To invoke the reporting tool

1. Use the Web browser of your choice to connect to the IP address of the Citrix ADC (for example, `http://10.102.29.170/`). The Web Logon screen appears.
2. In the User Name text box, type the user name assigned to the Citrix ADC.
3. In the Password text box, type the password.
4. In the Start in drop-down list box, select Reporting.Click Login.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

The following screenshots show the report toolbar and the chart toolbar, which are frequently referenced in this documentation.

Figure 1. *Report Toolbar*

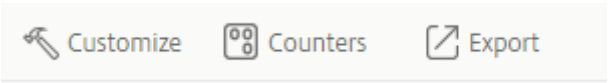


Figure 2. *Chart Toolbar*

Working with reports

You can plot and monitor statistics for the various functional groups configured on the Citrix ADC over a specified time interval. Reports enable you to troubleshoot or analyze the behavior of your appliance. There are two types of reports: built-in reports and custom reports. Report content for built-in or custom reports can be viewed in a graphical format or a tabular format. The graphical view consists of line, area, and bar charts that can display up to 32 sets of data (counters). The tabular view displays the data in columns and rows. This view is useful for debugging error counters.

The default report that is displayed in the Reporting tool is CPU vs. Memory Usage and HTTP Requests Rate. You can change the default report view by displaying the report you want as your default view, and then clicking Default Report.

Reports can be generated for the last hour, last day, last week, last month, last year, or you can customize the duration.

You can do the following with reports:

- Toggle between a tabular view of data and a graphical view of data.
- Change the graphical display type, such as bar chart or line chart.
- Customize charts in a report.
- Export the chart as an Excel comma-separated value (CSV) file.
- View the charts in detail by zooming in, zooming out, or using a drag operation (scrolling).
- Set a report as the default report for viewing whenever you log on.
- Add or remove counters.
- Print reports.
- Refresh reports to view the latest performance data.

Using built-in reports

The Reporting tool provides built-in reports for frequently viewed data. Built-in reports are available for the following functional groups: System, Network, SSL, Compression, Integrated Cache, Citrix ADC

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Gateway, and Citrix ADC Application Firewall. By default, the built-in reports are displayed for the last day. However, you can view the reports for the last hour, last week, last month, or last year.

> **Note**:
>
> You cannot save changes to built-in reports, but you can save a modified built-in report as a custom report.

To display a built-in report

1. In the left pane of the Reporting tool, under Built-in Reports, expand a group (for example, SSL).
2. Click a report (for example, **SSL > All Backend Ciphers)**.

Creating and deleting reports

You can create your own custom reports and save them with user-defined names for reuse. You can plot different counters for different groups based on your requirements. You can create up to 256 custom reports.

You can either create a new report or save a built-in report as a custom report. By default, a newly created custom report contains one chart named System Overview, which displays the CPU Usage counter plotted for the last day. You can customize the interval and set the data source and time zone from the report toolbar.

To create a custom report

1. In the **Reporting** tool, on the report toolbar, click **Create**, or if you want to create a new custom report based on an existing report, open the existing report, and then click **Save As**.
2. In **Report Name** box, type a name for the custom report.
3. Do one of the following:
   - To add the report to an existing folder, in Create in or Save in, click the down arrow to choose an existing folder, and then click **OK**.
   - To create a new folder to store the report, click the Click to add folder icon, in Folder Name, type the name of the folder, and in Create in, specify where you want the new folder to reside in the hierarchy, and then click **OK**.

> **Note**:
>
> You can create up to 128 folders.

To delete a custom report

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

1. In the left pane of the Reporting tool, next to Custom Reports, click the Click to manage the custom reports icon.
2. Select the check box that corresponds with the report you want to delete, and then click Delete.

> **Note**:
>
> When you delete a folder, all the contents of that folder are deleted.

Modifying the time interval

By default, built-in reports display data for the last day. However, if you want to change the time interval for a built-in report, you can save the report as a custom report. The new interval applies to all charts in the report. The following table describes the time-interval options.

To modify the time interval

1. In the left pane of the Reporting tool, click a report.
2. On the report toolbar, click **Duration**, and then click a time interval.

Setting the data Source and time zone

You can retrieve data from different data sources to display them in the reports. You can also define the time zone for the reports and apply the currently displayed report's time selection to all the reports, including the built-in reports.

To set the data source and time zone

1. In the **Reporting tool**, on the report toolbar, click **Settings**.
2. In the **Settings** dialog box, in Data Source, select the data source from which you want to retrieve the counter information.
3. Do one or both of the following:
   - If you want the tool to remember the time period for which a chart is plotted, select the **Remember time selection for charts** check box.
   - If you want the reports to use the time settings of your Citrix ADC appliance, select the **Use Appliance's time zone** check box.

Exporting and importing custom reports

You can share reports with other Citrix ADC administrators by exporting reports. You can also import reports.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

To export or import custom reports

1. In the left pane of the Reporting tool, next to Custom Reports, click the **Click to manage custom reports** icon.
2. Select the check box that corresponds with the report you want to export or import, and then click **Export** or **Import**.

> **Note**:
>
> When you export the file, it is exported in a .gz file format.

Working with charts

Use charts to plot and monitor counters or groups of counters. You can include up to four charts in one report. In each chart, you can plot up to 32 counters. The charts can use different graphical formats (for example, area and bar). You can move the charts up or down within the report, customize the colors and visual display for each counter in a chart, and delete a chart when you do not want to monitor it.

In all report charts, the horizontal axis represents time and the vertical axis represents the value of the counter.

Adding a chart

When you add a chart to a report, the System Overview chart appears with the CPU Usage counter plotted for the last one day.

> **Note**:
>
> If you add charts to a built-in report, and you want to retain the report, you must save the report as a custom report.

Use the following procedure to add a chart to a report.

To add a chart to a report

1. In the left pane of the Reporting tool, click a report.
2. Under the chart where you want to add the new chart, click the Add icon.

Modifying a chart

You can modify a chart by changing the functional group for which the statistics are displayed and by selecting different counters.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

To modify a chart

1. In the left pane of the Reporting tool, click a report.
2. Under the chart that you want to modify, click Counters.
3. In the dialog box that appears, in the Title box, type a name for the chart.
4. Next to the Plot chart for, do one of the following:
   - To plot counters for global counters, such as Integrated Cache and Compression, click System global statistics.
   - To plot entity counters for entity types, such as Load Balancing and GSLB, click System entities statistics.
5. In the Select group, click the desired entity.
6. Under Counters, in Available, click one or more counter names that you want to plot, and then click the > button.
7. If you selected System entities statistics in step 4, on the Entities tab, under Available, click one or more entity instance names you want to plot, and then click the > button.
8. Click OK.

Viewing a chart

You can specify the graphical formats of the plotted counters in a chart. Charts can be viewed as line charts, spline charts, step-line charts, scatter charts, area charts, bar charts, stacked area charts, and stacked bar charts. You can also zoom in, zoom out, or scroll inside the plot area of a chart. You can zoom in or out for all data sources for 1 hour, 1 day, 1 week, 1 month, 1 year, and 3 years.

Other options for customizing the view of a chart include customizing the axes of the charts, changing the background and edge color of the plot area, customizing the color and size of the grids, and customizing the display of each data set (counter) in a chart.

Data set numbers, such as Data Set 1, correspond to the order in which the counters in your graph are displayed at the bottom of the chart. For example, if CPU usage and Memory usage are displayed in first and second order at the bottom of the chart, CPU usage is equal to Data Set 1 and Memory usage is equal to Data Set 2.

Whenever you modify a built-in report, you need to save the report as a custom report to retain your changes.

To change the graph type of a chart

1. In the left pane of the Reporting tool, select a report.
2. In the right pane, under the chart you want to view, on the chart toolbar, click **Customize**.
3. On the **Chart** tab, under **Category**, click **Plot type**, and then click the graph type you want to display for the chart. If you want to display the graph is 3D, select the Use 3D check box.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

To refocus a chart with detailed data

1. In the left pane of the Reporting tool, select a report.
2. In the right pane, on the report toolbar, click **Zoom In**, and do one or both of the following:
   - To refocus the chart to display data for a specific time window, drag the cursor from the start time to the end time. For example, you can view data for a one-hour period on a certain day.
   - To refocus the chart to display data for a data point, simply click once on the chart where you want to zoom in and get more detailed information.
3. Once you have the desired range of time for which you want to view detailed data, on the report toolbar, click Tabular View. Tabular view displays the data in numeric form in rows and columns.

To view numeric data for a graph

1. In the left pane of the Reporting tool, select a report.
2. In the right pane, on the report toolbar, click Tabular View. To return to the graphical view, click **Graphical View**.

> **Note**: You can also view the numeric data in the graphical view by hovering your cursor over the notches in the gridlines.

To scroll through time in a chart

1. In the left pane of the Reporting tool, select a report.
2. In the right pane, on the report toolbar, click **Scroll**, and then click inside the chart and drag the cursor in the direction for which you want to see data for a new time period. For example, if you want to view data in the past, drag to the left.

To change the background color and text color of a chart

1. In the left pane of the Reporting tool, select a report.
2. In the right pane, under the chart for which you want to customize the axes, click **Customize**.
3. On the **Chart** tab, under **Category**, click one or more of the following:
   - To change the background color, click **Background Color**, and then select the options for color, transparency, and effects.
   - To change the text color, click Text **Color**, and then select the options for color, transparency, and effects.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

To customize the axes of a chart

1. In the left pane of the Reporting tool, select a report.
2. In the right pane, under the chart for which you want to customize the axes, click **Customize**.
3. On the **Chart** tab, under Category, click one or more of the following:

    - To change the scale of the left y-axis, click **Left Y-Axis**, and then select the scale you want.
    - To change the scale of the right y-axis, click Right Y-Axis, in the data set to plot, select the date set, and then select the scale you want.

      > Note:
      > The data set numbers, such as Data Set 1, correspond to the order in which the counters in your graph are displayed at the bottom of the chart. For example, if CPU usage and Memory usage are displayed in first and second order at the bottom of the chart, CPU usage is equal to Data Set 1 and Memory usage is equal to Data Set 2.

    - To plot each data set in its own hidden y-axis, click Multiple Axes, and then click Enable.

To change the background color, edge color, and gridlines for a plot area of a chart

1. In the left pane of the Reporting tool, select a report.
2. In the right pane, under the chart for which you want to customize the plot area, click **Customize**.
3. On the **Plot Area** tab, under Category, click one or more of the following:

    - To change the background color and edge color of the chart, click **Background Color and Edge Color**, and then select the options for color, transparency, and effects.
    - To change the horizontal or vertical grids of the chart, click **Horizontal Grids** or **Vertical Grids**, and then select the options for displaying the grids, grid width, grid color, transparency, and effects.

To change the color and graph type of a data set

1. In the left pane of the Reporting tool, select a report.
2. In the right pane, under the chart for which you want to customize the display of the data set (counters), click **Customize**.
3. On the **Data Set** tab, in Select Data Set, select the data set (counter) for which you want to customize the graphical display.
   Note: The data set numbers, such as Data Set 1, correspond to the order in which the counters in your graph are displayed at the bottom of the chart. For example, if
   CPU usage and
   Memory usage are displayed in first and second order at the bottom of the chart,
   CPU usage is equal to

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Data Set 1 and
Memory usage is equal to
Data Set 2.

4. Under Category, do one of more of the following:
   - To change the background color, click **Color**, and then select the options for color, transparency, and effects.
   - To change the graph type, click **Plot type**, and then select the graph type you want to display for the data set. If you want to display the graph as 3D, select the Use 3D check box.

Exporting chart data to excel For further data analysis, you can export charts to Excel in a comma-separated value (CSV) format.

To export chart data to excel

1. In the left pane of the Reporting tool, select a report.
2. In the right pane, under the chart with the data you want to export to Excel, click **Export**.

Deleting a chart

If you do not want to use a chart, you can remove it from the report. You can permanently remove charts from custom reports only. If you delete a chart from a built-in report and want to retain the changes, you need to save the report as a custom report.

To delete a chart

1. In the left pane of the Reporting tool, select a report.
2. In the right pane, under the chart that you want to delete, click the **Delete** icon.

Examples

To display the trend report for CPU usage and memory usage for the last week

1. In the left pane of the Reporting tool, under Built-in Reports, expand System.
2. Click the report CPU vs. Memory Usage and HTTP Requests Rate.
3. In the right pane, on the report toolbar, click **Duration**, and then click **Last Week**.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

To compare the bytes received rate and the bytes transmitted rate between the two interfaces for the last week

1. In the right pane, on the report toolbar, click Create.
2. In the **Report Name** box, type a name for the custom report (for example, Custom_Interfaces), and then click **OK**. The report is created with the default System Overview chart, which displays the CPU Usage counter plotted for the last hour.
3. Under System Overview, on the chart toolbar, click Counters.
4. In the counter selection pane, in Title, type a name for the chart (for example, Interfaces bytes data).
5. In Plot chart for, click System entities statistics, and then in Select Group, select Interface.
6. On the **Entities** tab, click one or more interface names you want to plot (for example, 1/1 and 1/2), and then click the > button.
7. On the Counters tab, click Bytes received (Rate) and Bytes transmitted (Rate) and then click the > button.
8. Click **OK**.
9. On the report toolbar, click **Duration**, and then click **Last Week**.

Stopping and starting the data collection utility

The data collection utility, `nscollect`, runs automatically when you start the Citrix ADC. This utility retrieves the application performance data and stores it in the form of data sources on the ADC. You can create up to 32 data sources. The default data source is `/var/log/db/default`.

The data collection utility creates databases for global counters and entity-specific counters, and uses this data to generate reports. Global-counter databases are created at `/var/log/db/<DataSourceName>`. The entity-specific databases are created based on the entities configured on the Citrix ADC, and a separate folder is created for each entity type in `/var/log/db/<DataSourceName/EntityNameDB>`.

The `nscollect` retrieves data once every 5 minutes. It retains data in 5-minute granularity for one day, hourly for the last 30 days, and daily for three years.

You might have to stop and restart the data collection utility if data is not updated accurately or the reports display corrupted data.

To stop `nscollect`

At the command prompt, type:

```
/netscaler/nscollect stop
```

To start nscollect on the current SSH session to the Citrix ADC:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

At the command prompt, type:

```
/netscaler/nscollect start
```

To start nscollect on the local system:

At the command prompt, type:

```
/netscaler/nscollect start &
```

CloudBridge Connector

September 14, 2021

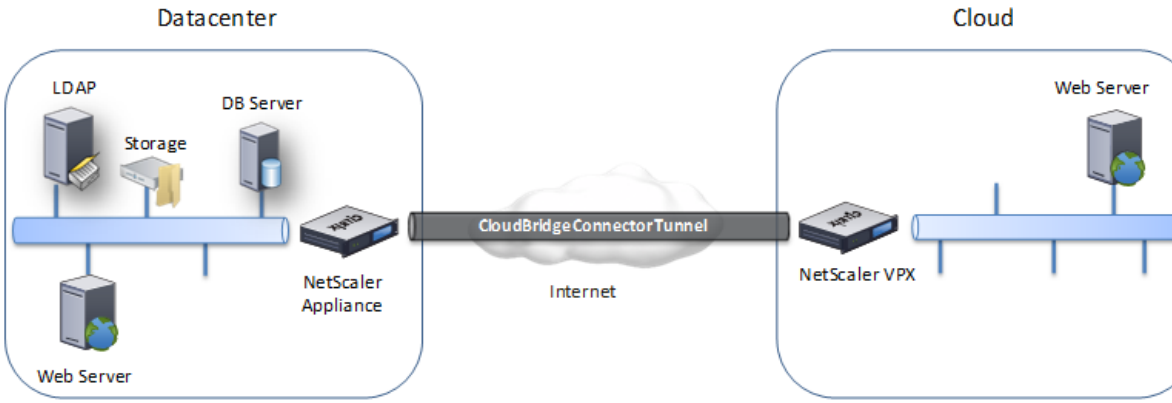
Note: The current Citrix ADC 1000V release does not support this feature.

The CloudBridge Connector feature of the Citrix ADC appliance connects enterprise datacenters to external clouds and hosting environments, making the cloud a secure extension of your enterprise network. Cloud-hosted applications appear as though they are running on one contiguous enterprise network. With Citrix CloudBridge Connector, you can augment your datacenters with the capacity and efficiency available from cloud providers.

The CloudBridge Connector enables you to move your applications to the cloud to reduce costs and increase reliability.

In addition to using CloudBridge Connector between a datacenter and a cloud, you can use it to connect two datacenters for a high-capacity secure and accelerated link.

Understanding CloudBridge Connector



To implement the Citrix CloudBridge Connector solution, you connect a datacenter to another datacenter or an external cloud by setting up a tunnel called the CloudBridge Connector tunnel.

To connect a datacenter to another datacenter, you set up a CloudBridge Connector tunnel between two Citrix ADC appliances, one in each datacenter.

To connect a datacenter to an external cloud (for example, Amazon AWS cloud), you set up a CloudBridge Connector tunnel between a Citrix ADC appliance in the datacenter and a virtual appliance (VPX) that resides in the Cloud. The remote end point can be a CloudBridge Connector or a Citrix ADC VPX with Premium license.

The following illustration shows a CloudBridge Connector tunnel set up between a datacenter and an

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

external cloud.

The appliances between which a CloudBridge Connector tunnel is set up are called the *end points* or *peers* of the CloudBridge Connector tunnel.

A CloudBridge Connector tunnel uses the following protocols:

- Generic Routing Encapsulation (GRE) protocol
- Open-standard IPSec Protocol suite, in transport mode

The GRE protocol provides a mechanism for encapsulating packets, from a wide variety of network protocols, to be forwarded over another protocol. GRE is used to:

- Connect networks running non-IP and non-routable protocols.
- Bridge across a wide area network (WAN).
- Create a transport tunnel for any type of traffic that needs to be sent unchanged across a different network.

The GRE protocol encapsulates packets by adding a GRE header and a GRE IP header to the packets.

The Internet Protocol security (IPSec) protocol suite secures communication between peers in the CloudBridge Connector tunnel.

In a CloudBridge Connector tunnel, IPSec ensures:

- Data integrity
- Data origin authentication
- Data confidentiality (encryption)
- Protection against replay attacks

IPSec uses the transport mode in which the GRE encapsulated packet is encrypted. The encryption is done by the Encapsulating Security Payload (ESP) protocol. The ESP protocol ensures the integrity of the packet by using a HMAC hash function, and ensures confidentiality by using an encryption algorithm. After the packet is encrypted and the HMAC is calculated, an ESP header is generated. The ESP

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

header is inserted after the GRE IP header and, an ESP trailer is inserted at the end of the encrypted payload.

Peers in the CloudBridge Connector tunnel use the Internet Key Exchange version (IKE) protocol (part of the IPSec protocol suite) to negotiate secure communication, as follows:

- The two peers mutually authenticate with each other, using one of the following authentication methods:
  - **Pre-shared key authentication**. A text string called a pre-shared key is manually configured on each peer. The pre-shared keys of the peers are matched against each other for authentication. Therefore, for the authentication to be successful, you must configure the same pre-shared key on each of the peers.
  - **Digital certificates authentication**. The initiator (sender) peer signs message interchange data by using its private key, and the other receiver peer uses the sender's public key to verify the signature. Typically, the public key is exchanged in messages containing an X.509v3 certificate. This certificate provides a level of assurance that a peer's identity as represented in the certificate is associated with a particular public key.
- The peers then negotiate to reach agreement on:
  - An encryption algorithm.
  - Cryptographic keys for encrypting data in one peer and decrypting the data in the other.

This agreement upon the security protocol, encryption algorithm and cryptographic keys is called a Security Association (SA). SAs are one-way (simplex). For example, when two peers, CB1 and CB2, are communicating through a Connector tunnel, CB1 has two Security Associations. One SA is used for processing out-bound packets, and the other SA is used for processing inbound packets.

SAs expire after a specified length of time, which is called the *lifetime*. The two peers use the Internet Key Exchange (IKE) protocol (part of the IPSec protocol suite) to negotiate new cryptographic keys and establish new SAs. The purpose of the limited lifetime is to prevent attackers from cracking a key.

The following table lists some IPSec propeties supported by a Citrix ADC appliance:

IPSec Properties	Types Supported
IKE Versions	V1, V2
IKE DH group	A Citrix ADC appliance supports only DH group 2 (1024 bits MODP algorithm) for both IKEv1 and IKEv2.
IKE Authentication Methods	Pre-shared key authentication, Digital certificates authentication

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

IPSec Properties	Types Supported
Encryption Algorithm	AES (128 bits), AES 256 (256 bits), 3DES
Hash Algorithm	HMAC SHA1, HMAC SHA256, HMAC SHA384, HMAC SHA512, HMAC MD5

Monitoring CloudBridge Connector tunnels

September 14, 2021

You can display the statistics for monitoring the performance of a CloudBridge Connector tunnel. To display CloudBridge Connector tunnel statistics on a Citrix ADC appliance, use the GUI or the Citrix ADC command line.

The following table lists the statistical counters available for monitoring CloudBridge Connector tunnels on a Citrix ADC appliance.

Statistical counter	**Specifies**
Bytes Received	Total number of bytes received by the Citrix ADC appliance through all the configured CloudBridge Connector tunnels since the appliance was last started.
Bytes Sent	Total number of bytes sent by the Citrix ADC appliance through all the configured CloudBridge Connector tunnels since the appliance was last started.
Packets Received	Total number of packets received by the Citrix ADC appliance through all the configured CloudBridge Connector tunnels since the appliance was last started.
Packets Sent	Total number of packets sent by the Citrix ADC appliance through all the configured CloudBridge Connector tunnels since the appliance was last started.
Bytes Received Rate	Number of bytes per second received by the Citrix ADC appliance through all the configured CloudBridge Connector tunnels.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Statistical counter	Specifies
Bytes Sent Rate	Number of bytes per second sent by the Citrix ADC appliance through all the configured CloudBridge Connector tunnels
Packets Received Rate	Number of bytes per second received by the Citrix ADC appliance through all the configured CloudBridge Connector tunnels
Packets Sent Rate	Number of bytes per second received by the Citrix ADC appliance through all the configured CloudBridge Connector tunnels

All these counters are reset to 0 when the Citrix ADC appliance is restarted. They do not increment during the following phases:

- Internet Key Exchange (IKE) authentication (pre-shared key) phase on any configured CloudBridge Connector tunnel.
- IKE Security Association (SA) establishment phase on any configured CloudBridge Connector tunnel.

To display CloudBridge Connector tunnel statistics by using the Citrix ADC command line

At the command prompt, type:

- **stat ipsec counters**

To display CloudBridge Connector tunnel statistics by using the GUI

1. Access the GUI by using a web browser to connect to the IP address of the Citrix ADC appliance.
2. On the **Configuation** tab, navigate to **System** > **CloudBridge Connector**.
3. On the CloudBridge Connector page, click **Create/Monitor CloudBridge Connector**. The **IPSec Bytes** and **IPSec Packets** charts display the bytes received rate, bytes sent rate, packets received rate, and packets sent rate of all the CloudBridge Connector tunnels configured on the Citrix ADC appliance.

```
1      > stat ipsec counters
2      Secure tunnel(s) summary
3                           Rate (/s)        Total
4      Bytes Received    0    2811248
5      Bytes Sent          0    157460630
6      Packets Received    0    56787
7      Packets Sent        0    200910
8      Done
9      >
```

Configuring a CloudBridge Connector tunnel between two datacenters

September 14, 2021

You can configure a CloudBridge Connector tunnel between two different datacenters to extend your network without reconfiguring it, and leverage the capabilities of the two datacenters. A CloudBridge Connector tunnel between the two geographically separated datacenters enables you to implement redundancy and safeguard your setup from failure. The CloudBridge Connector tunnel helps achieve optimal utilization of infrastructure and resources across datacenters. The applications available across the two datacenters appear as local to the user.

To connect a datacenter to another datacenter, you set up a CloudBridge Connector tunnel between a Citrix ADC appliance in one datacenter and a Citrix ADC appliance in the other datacenter.

As an illustration of CloudBridge Connector tunnel between datacenters, consider an example in which a CloudBridge Connector tunnel is set up between Citrix ADC appliance NS_Appliance-1 in datacenter DC1 and Citrix ADC appliance NS_Appliance-2 in datacenter DC2.

Both NS_Appliance-1 and NS_Appliance-2 function in L2 and L3 mode. They enable communication between private networks in datacenters DC1 and DC2. In L3 mode, NS_Appliance-1 and NS_Appliance-2 enable communication between client CL1 in datacenter DC1 and server S1 in the datacenter DC2 through the CloudBridge Connector tunnel. Client CL1 and server S1 are on different private networks.

Because client CL1 and server S1 are on different private networks, L3 mode is enabled on NS_Appliance-1 and NS_Appliance-2, and routes are updated as follows:

- CL1 has a route to NS_Appliance-1 for reaching S1.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- NS_Appliance-1 has a route to NS_Appliance-2 for reaching S1.
- S1 has a route to NS_Appliance-2 for reaching CL1.
- NS_Appliance-2 has a route to NS_Appliance-1 for reaching CL1.

The following table lists the settings on Citrix ADC appliance NS_Appliance-1 in datacenter DC1.

The following table lists the settings on Citrix ADC appliance NS_Appliance-2 in datacenter DC2.

Entity	Name	Details
The NSIP address		198.51.100.12
SNIP address		198.51.100.15
CloudBridge Connector tunnel	Cloud_Connector_DC1-DC2	1. Local endpoint IP address of the CloudBridge Connector tunnel: 198.51.100.15, 2. Remote endpoint IP address of the CloudBridge Connector tunnel: 203.0.113.133. GRE Tunnel Details Name = Cloud_Connector_DC1-DC2, IPSec Profile Details Name = Cloud_Connector_DC1-DC2, Encryption algorithm = AES, Hash algorithm = HMAC SHA1

Points to consider for configuring CloudBridge Connector tunnel

Before setting up a CloudBridge Connector tunnel, verify that the following tasks have been completed:

1. Deploy and set up a Citrix ADC appliance in each of the two datacenters.
2. Make sure that the CloudBridge Connector tunnel end-point IP addresses are accessible to each other.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Configuration procedure

To set up a CloudBridge Connector tunnel between a Citrix ADC appliance that resides in one datacenter and another Citrix ADC appliance that resides in the other datacenter, use the GUI or the command line interface of one of the Citrix ADC appliances.

When you use the GUI, the CloudBridge Connector tunnel configuration created on the first Citrix ADC appliance is automatically pushed to the other endpoint (the other Citrix ADC appliance) of the CloudBridge Connector tunnel. Therefore, you do not have to access the GUI of the other Citrix ADC appliance to create the corresponding CloudBridge Connector tunnel configuration on it.

The CloudBridge Connector tunnel configuration on each of the Citrix ADC appliances consists of the following entities:

- **IPSec profile**—An IPSec profile entity specifies the IPSec protocol parameters, such as IKE version, encryption algorithm, hash algorithm, and PSK, to be used by the IPSec protocol in the CloudBridge Connector tunnel.
- **GRE tunnel**—An IP tunnel specifies the local IP address (a public SNIP address configured on the local Citrix ADC appliance), remote IP address (a public SNIP address configured on the remote Citrix ADC appliance), protocol (GRE) used to set up the CloudBridge Connector tunnel, and an IPSec profile entity.
- **Create a PBR rule and associate the IP tunnel with it**—A PBR entity specifies a set of conditions and an IP tunnel entity. The source IP address range and the destination IP range are the conditions for the PBR entity. You must set the source IP address range and the destination IP address range to specify the subnet whose traffic is to traverse the CloudBridge Connector tunnel. For example, consider a request packet that originates from a client on the subnet in the first datacenter and is destined to a server on the subnet in the second datacenter. If this packet matches the source and destination IP address range of the PBR entity on the Citrix ADC appliance in the first datacenter, it is sent across the CloudBridge Connector tunnel associated with the PBR entity.

To create an IPSEC profile by using the command line interface

At the command prompt, type:

- `add ipsec profile <name> [-ikeVersion (V1 | V2)] [-encAlgo (AES | 3DES)...] [-hashAlgo <hashAlgo\> ...] [-lifetime <positive_integer>] (-psk | (-publickey<string> -privatekey <string>-peerPublicKey <string>))[-livenessCheckInterval <positive_intege>][-replayWindowSize \<positive_integer>] [-ikeRetryInterval <positive_integer>] [-retransmissiontime <positive_integer>]`
- `show ipsec profile <name>`

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

To create an IP tunnel and bind the IPSEC profile to it by using the command line interface

At the command prompt, type:

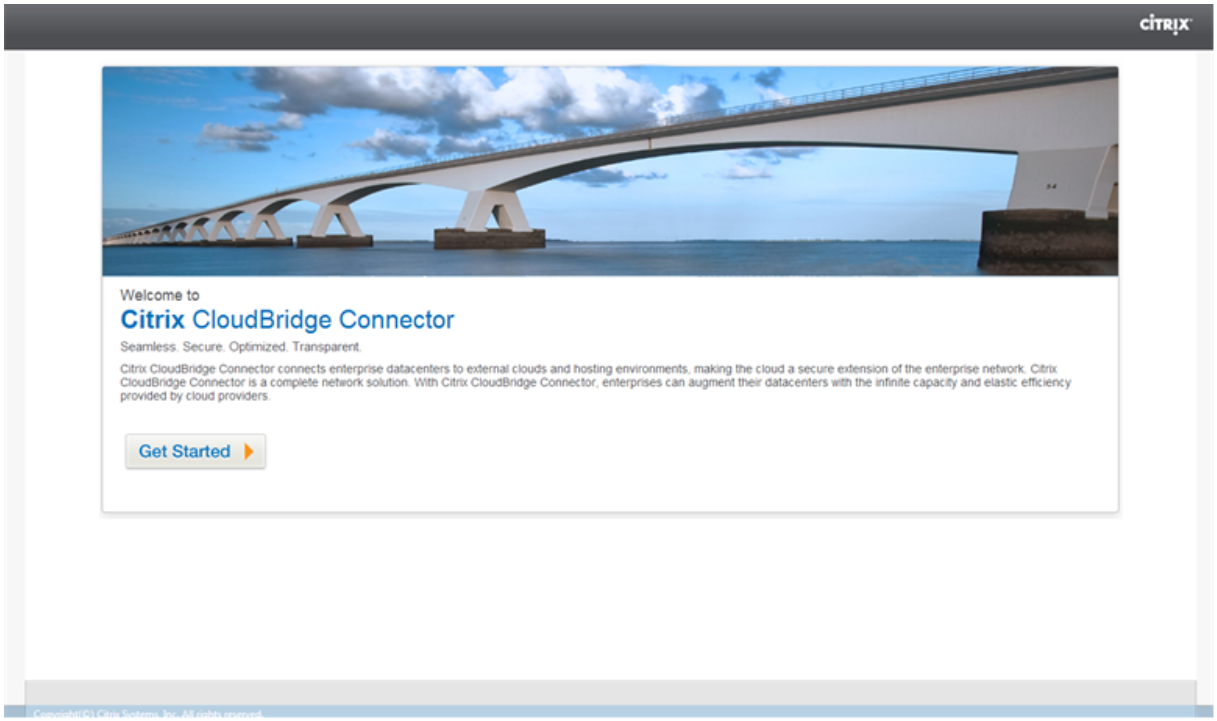
- `add ipTunnel <name> <remote><remoteSubnetMask> <local> [-protocol <protocol>] [-ipsecProfileName <string>]`
- `show ipTunnel <name>`

To create a PBR rule and bind the IPSEC tunnel to it by using the command line interface

At the command prompt, type:

- `add ns pbr <pbr_name> ALLOW -srcIP = <local_subnet_range> -destIP = <remote_subnet_range> -ipTunnel <tunnel_name>`
- `apply ns pbrs`
- `show ns pbr <pbr_name>`

Example

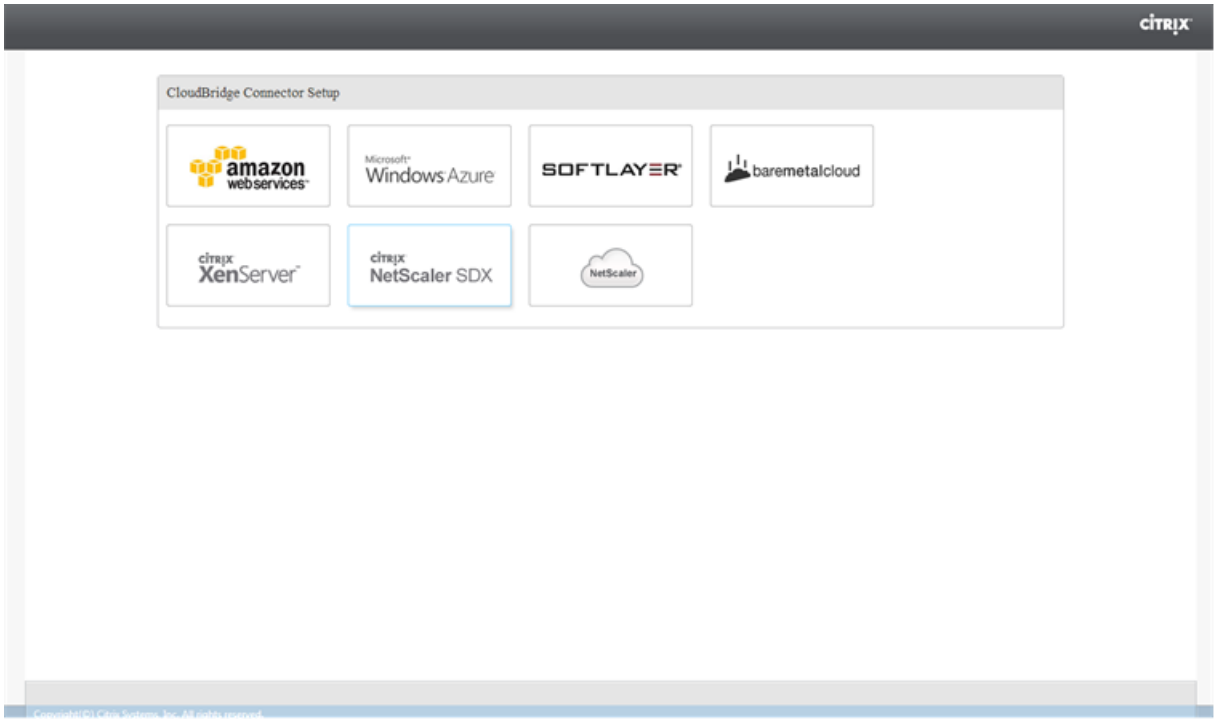


```
1  add ipsec profile Cloud_Connector_DC1-DC2  -encAlgo AES -hashAlgo
       HMAC_SHA1
2      Done
3      > add ipTunnel Cloud_Connector_DC1-DC2 203.0.113.133
           255.255.255.255 198.51.100.15 -protocol GRE -ipsecProfileName
           Cloud_Connector_DC1-DC2
4
5      Done
6      > add ns pbr PBR-DC1-DC2 ALLOW -srcIP 198.51.100.15 -destIP
           203.0.113.133 ipTunnel Cloud_Connector_DC1-DC2
7
8      Done
9      > apply ns pbrs
10
11     Done
```

To configure a CloudBridge Connector tunnel in a Citrix ADC appliance by using the GUI

1. Type the NSIP address of a Citrix ADC appliance in the address line of a web browser.
2. Log on to the GUI of the Citrix ADC appliance by using your account credentials for the appliance.
3. Navigate to **System** > **CloudBridge Connector**.
4. In the right pane, under **Getting Started**, click **Create/Monitor CloudBridge**.

   The first time you configure a CloudBridge Connector tunnel on the appliance, a **Welcome** screen appears.
5. On the **Welcome** screen click **Get Started**.



© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Note:

If you already have a CloudBridge Connector tunnel configured on the Citrix ADC appliance, the Welcome screen does not appear, so you do not click Get Started.

1. In the **CloudBridge Connector Setup** pane, click **Citrix ADC**.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

1. In the Citrix ADC pane, provide your account credentials for the remote Citrix ADC appliance. Click **Continue**.
2. In the **CloudBridge Connector Setting** pane, set the following parameter:
    - **CloudBridge Connector Name**—Name for the CloudBridge Connector configuration on the local appliance. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the CloudBridge Connector configuration is created.
3. Under **Local Setting**, set the following parameter:
    - **Subnet IP**—IP address of the local endpoint of the CloudBridge Connector tunnel.
4. Under **Remote Setting**, set the following parameter:
    - **Subnet IP**—IP address of the peer endpoint of the CloudBridge Connector tunnel.
5. Under **PBR** Setting, set the following parameters:
    - **Operation**—Either the equals (=) or does not equal (!=) logical operator.
    - **Source IP Low** —Lowest source IP address to match against the source IP address of an outgoing IPv4 packet.
    - **Source IP High**—Highest source IP address to match against the source IP address of an outgoing IPv4 packet.
    - **Operation**—Either the equals (=) or does not equal (!=) logical operator.
    - Destination IP Low*—Lowest destination IP address to match against the destination IP address of an outgoing IPv4 packet.
    - **Destination IP High**—Highest destination IP address to match against the destination IP address of an outgoing IPv4 packet.
6. (Optional) Under **Security Settings**, set the following IPSec protocol parameters for the CloudBridge Connector tunnel:
    - **Encryption Algorithm**—Encryption algorithm to be used by the IPSec protocol in the CloudBridge tunnel.
    - **Hash Algorithm**—Hash algorithm to be used by the IPSec protocol in the CloudBridge tunnel.
    - **Key**—Select one of the following IPSec authentication methods to be used by the two peers to mutually authenticate.
        - **Auto Generate Key**—Authentication based on a text string, called a pre-shared key (PSK), generated automatically by the local appliance. The PSKs keys of the peers are matched against each other for authentication.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- **Specific Key**—Authentication based on a manually entered PSK. The PSKs of the peers are matched against each other for authentication.
  - Pre Shared Security Key—The text string entered for pre-shared key based authentication.
- **Upload Certificates**—Authentication based on digital certificates.
  - **Public Key**—A local digital certificate to be used to authenticate the local Citrix ADC appliance to the peer before establishing IPSec security associations. The same certificate should be present and set for the Peer Public Key parameter in the peer.
  - **Private Key**—Private key of the local digital certificate.
  - **Peer Public Key**—Digital certificate of the peer. Used to authenticate the peer to the local end point before establishing IPSec security associations. The same certificate should be present and set for the Public key parameter in the peer.

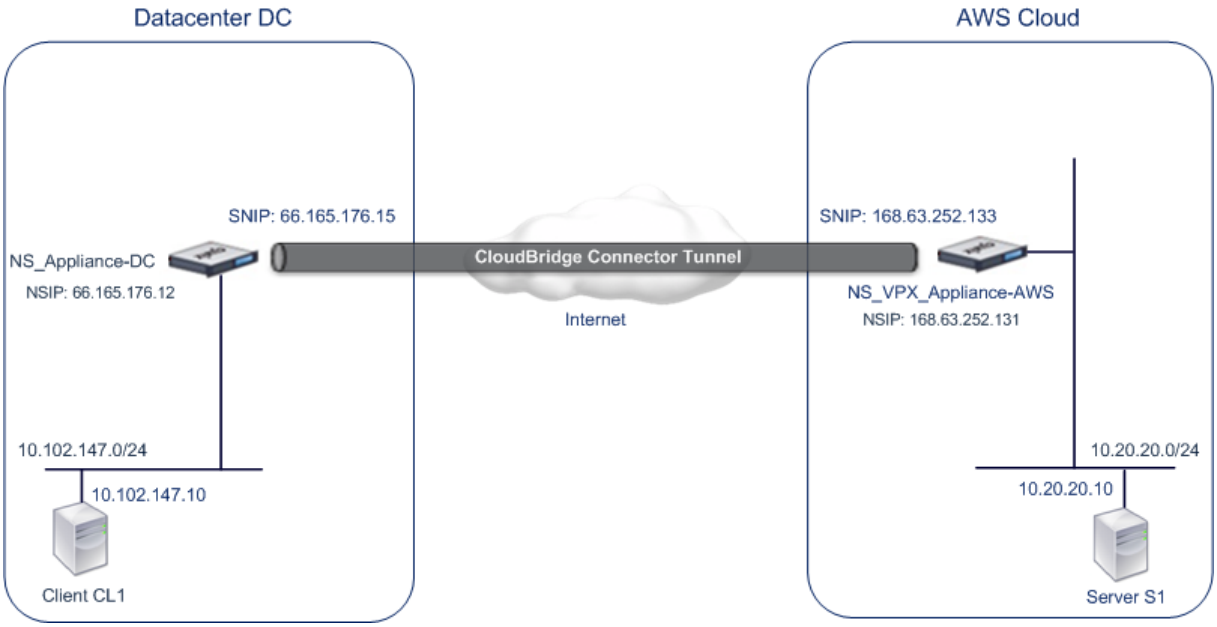
7. Click **Done**.

The new CloudBridge Connector tunnel configuration on both the Citrix ADC appliances appears on the Home tab of the respective GUI. The current status of the CloudBridge connector tunnel is indicated in the Configured CloudBridge Connectors pane. A green dot indicates that the tunnel is up. A red dot indicates that the tunnel is down.

Monitoring the CloudBridge Connector Tunnel

You can monitor the performance of CloudBridge Connector tunnels on a Citrix ADC appliance by using CloudBridge Connector tunnel statistical counters. For more information about displaying CloudBridge Connector tunnel statistics on a Citrix ADC appliance, see Monitoring CloudBridge Connector Tunnels.

Configuring CloudBridge Connector between datacenter and AWS cloud



September 14, 2021

You can configure a CloudBridge Connector tunnel between a datacenter and AWS cloud to leverage the infrastructure and computing capabilities of the data center and the AWS cloud. With AWS, you can extend your network without initial capital investment or the cost of maintaining the extended network infrastructure. You can scale your infrastructure up or down, as required. For example, you can lease more server capabilities when the demand increases.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

To connect a datacenter to AWS cloud, you set up a CloudBridge Connector tunnel between a Citrix ADC appliance that resides in the datacenter and a Citrix ADC virtual appliance (VPX) that resides in AWS cloud.

As an illustration of a CloudBridge Connector tunnel between a datacenter and Amazon AWS cloud, consider an example in which a CloudBridge Connector tunnel is set up between Citrix ADC appliance NS_Appliance-DC, in datacenter DC, and Citrix ADC virtual appliance (VPX) NS_VPX_Appliance-AWS.

Both NS_Appliance-DC and NS_VPX_Appliance-AWS function in L3 mode. They enable communication between private networks in datacenter DC and the AWS cloud. NS_Appliance-DC and NS_VPX_Appliance-AWS enable communication between client CL1 in datacenter DC and server S1 in the AWS cloud through the CloudBridge Connector tunnel. Client CL1 and server S1 are on different private networks.

> **Note**:
>
> AWS does not support L2 mode, hence it is necessary to have only L3 mode enabled on both the endpoints.

For proper communication between CL1 and S1, L3 mode is enabled on NS_Appliance-DC and NS_VPX_Appliance-AWS and routes are updated as such:

- CL1 have a route to NS_Appliance-DC for reaching S1.
- NS_Appliance-DC have a route to NS_VPX_Appliance-AWS for reaching S1.
- S1 should have a route to NS_VPX_Appliance-AWS for reaching CL1.
- NS_VPX_Appliance-AWS have a route to NS_Appliance-DC for reaching CL1.

The following table lists the settings on Citrix ADC appliance NS_Appliance-DC in datacenter DC.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Entity	Name	Details
The NSIP address		66.165.176.12
SNIP address		66.165.176.15
CloudBridge Connector tunnel	CC_Tunnel_DC-AWS	Local endpoint IP address of the CloudBridge Connector tunnel: 66.165.176.15, Remote endpoint IP address of the CloudBridge Connector tunnel: 168.63.252.133, GRE Tunnel Details - Name= CC_Tunnel_DC-AWS

The following table lists the settings on Citrix ADC VPX NS_VPX_Appliance-AWS on AWS cloud.

Entity	Name	Details
NSIP address		10.102.25.30
Public EIP address mapped to the NSIP address		168.63.252.131
SNIP address		10.102.29.30
Public EIP address mapped to the SNIP address		168.63.252.133
CloudBridge Connector tunnel	CC_Tunnel_DC-AWS	Local endpoint IP address of the CloudBridge Connector tunnel:168.63.252.133, Remote endpoint IP address of the CloudBridge Connector tunnel: 66.165.176.15; **GRE Tunnel Details** Name= CC_Tunnel_DC-AWS, IPSec Profile Details, Name= CC_Tunnel_DC-AWS, Encryption algorithm= AES, Hash algorithm= HMAC SHA1

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Prerequisites

Before setting up a CloudBridge Connector tunnel, verify that the following tasks have been completed:

1. Install, configure, and launch an instance of Citrix ADC Virtual appliance (VPX) on AWS cloud. For instructions on installing Citrix ADC VPX on AWS, see Deploy a Citrix ADC VPX instance on AWS.
2. Deploy and configure a Citrix ADC physical appliance, or provisioning and configuring a Citrix ADC virtual appliance (VPX) on a virtualization platform in the datacenter.
3. Make sure that the CloudBridge Connector tunnel end-point IP addresses are accessible to each other.

Citrix ADC VPX license

After the initial instance launch, Citrix ADC VPX for AWS requires a license. If you are bringing your own license (BYOL), see the VPX Licensing Guide at: http://support.citrix.com/article/CTX122426.

You have to:

1. Use the licensing portal within Citrix website to generate a valid license.
2. Upload the license to the instance.

If this is a **paid** marketplace instance, then you do not need to install a license. The correct feature set and performance will activate automatically.

Configuration steps

To set up a CloudBridge Connector tunnel between a Citrix ADC appliance that resides in a datacenter and a Citrix ADC virtual appliance (VPX) that resides on the AWS cloud, use the GUI of the Citrix ADC appliance.

When you use the GUI, the CloudBridge Connector tunnel configuration created on the Citrix ADC appliance, is automatically pushed to the other endpoint or peer (the Citrix ADC VPX on AWS) of the CloudBridge Connector tunnel. Therefore, you do not have to access the GUI (GUI) of the Citrix ADC VPX on AWS to create the corresponding CloudBridge Connector tunnel configuration on it.

The CloudBridge Connector tunnel configuration on both peers (the Citrix ADC appliance that resides in the datacenter and the Citrix ADC virtual appliance (VPX) that resides on the AWS cloud) consists of the following entities:

- **IPSec profile**—An IPSec profile entity specifies the IPSec protocol parameters, such as IKE version, encryption algorithm, hash algorithm, and PSK, to be used by the IPSec protocol in both the peers of the CloudBridge Connector tunnel.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- **GRE tunnel**—An IP tunnel specifies a local IP address (a public SNIP address configured on the local peer), remote IP address (a public SNIP address configured on the remote peer), protocol (GRE) used to set up the CloudBridge Connector tunnel, and an IPSec profile entity.
- **Create a PBR rule and associate the IP tunnel with it**—A PBR entity specifies a set of conditions and an IP tunnel entity. The source IP address range and the destination IP range are the conditions for the PBR entity. You must set the source IP address range and the destination IP address range to specify the subnet whose traffic is to traverse the CloudBridge Connector tunnel. For example, consider a request packet that originates from a client on the subnet in the datacenter and is destined to a server on the subnet in the AWS cloud. If this packet matches the source and destination IP address range of the PBR entity on the Citrix ADC appliance in the datacenter, it is sent across the CloudBridge Connector tunnel associated with the PBR entity.

To create an IPSEC profile by using the command line interface

At the command prompt, type:

- `add ipsec profile <name> [-**ikeVersion** (V1 | V2)] [-** encAlgo** (AES | 3DES)...] [-**hashAlgo** <hashAlgo> ...] [-**lifetime** <positive_integer>] (-**psk** | (-**publickey** <string> -**privatekey** <string> -**peerPublicKey** <string>)) [-**livenessCheckInterval** <positive_integer>] [-**replayWindowSize ** <positive_integer>] [-**ikeRetryInterval** <positive_integer>] [-**retransmissiontime** <positive_integer>]`
- `**show ipsec profile** <name>`

To create an IP tunnel and bind the IPSEC profile to it by using the command line interface

At the command prompt, type:

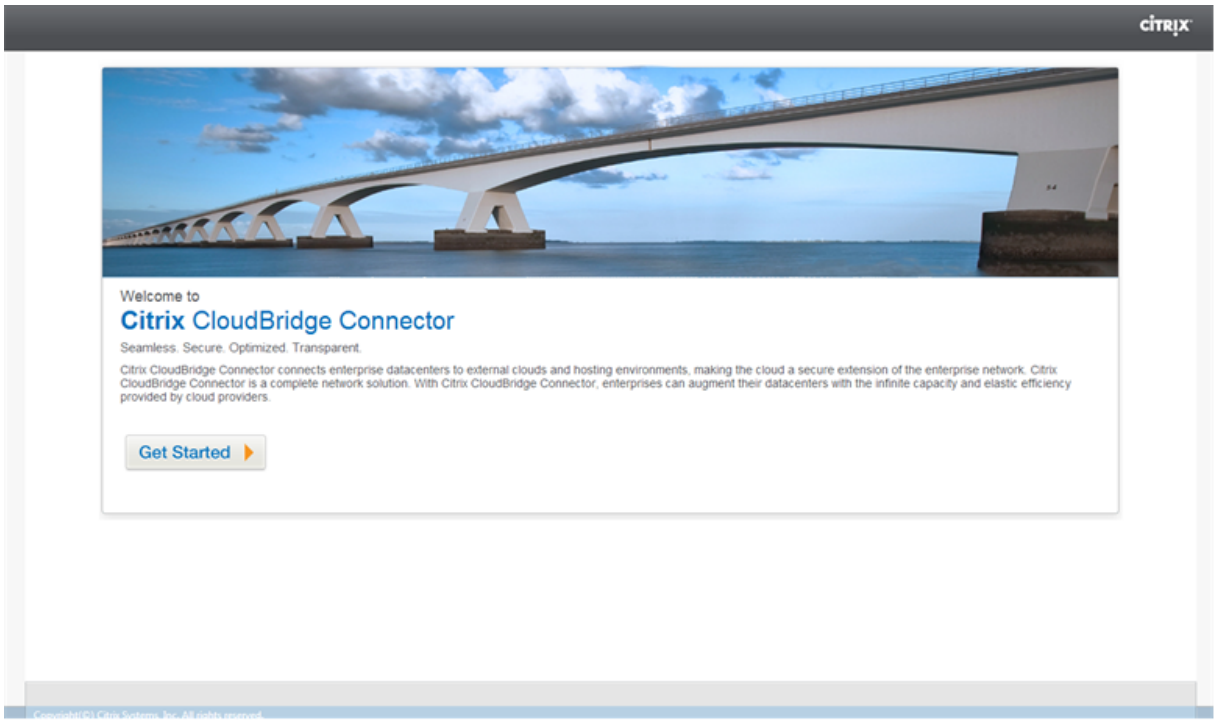
- `add ipTunnel <name> <remote><remoteSubnetMask> <local> [-protocol <protocol>] [-ipsecProfileName <string>]`
- `show ipTunnel <name>`

To create a PBR rule and bind the IPSEC tunnel to it by using the command line interface

At the command prompt, type:

- `add ns pbr <pbr_name> ALLOW -srcIP = <local_subnet_range> -destIP = <remote_subnet_range> -ipTunnel <tunnel_name>`
- `apply ns pbrs`
- `show ns pbr <pbr_name>`

Example

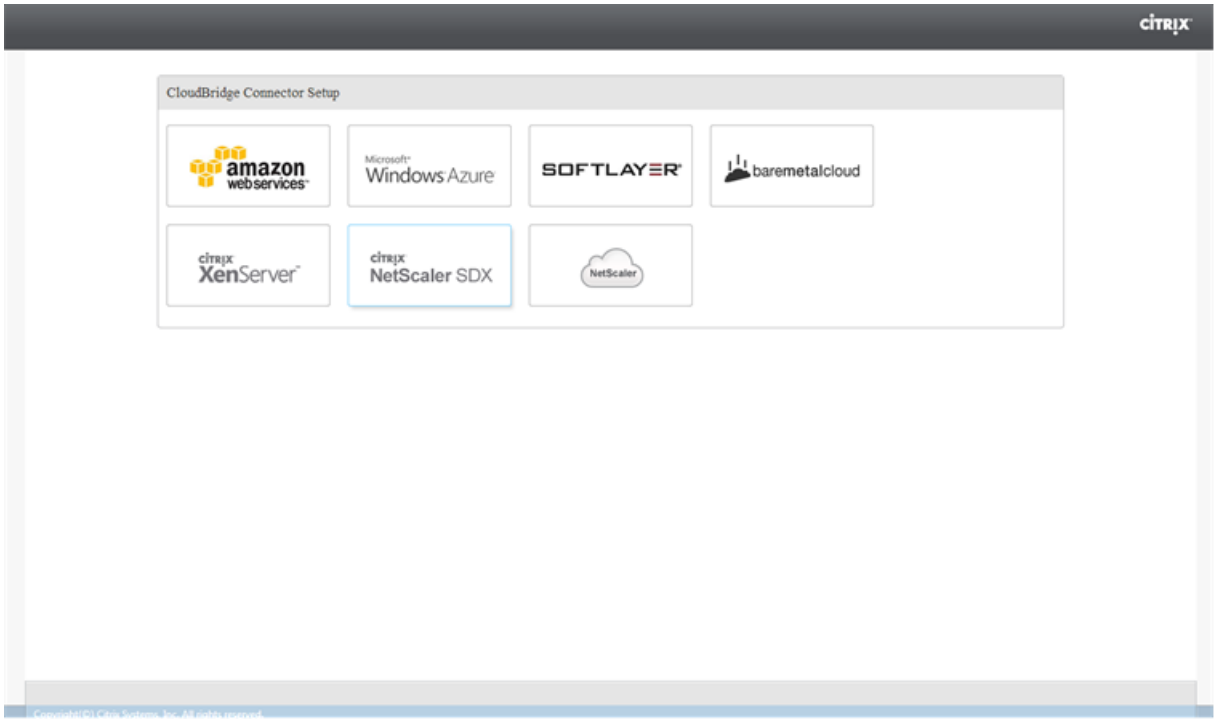


```
1      > add ipsec profile CC_Tunnel_DC-AWS -encAlgo AES -hashAlgo
          HMAC_SHA1
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
2
3       Done
4       > add ipTunnel CC_Tunnel_DC-AWS 168.63.252.133 255.255.255.0
            66.165.176.15  –protocol GRE -ipsecProfileName CC_Tunnel_DC-AWS
5
6       Done
7       > add ns pbr PBR-DC-AWS ALLOW  –srcIP 66.165.176.15  –destIP
            168.63.252.133 ipTunnel CC_Tunnel_DC-AWS
8
9       Done
10      > apply ns pbrs
11
12      Done
```

To configure a CloudBridge Connector tunnel in a Citrix ADC appliance by using the GUI



1. Type the NSIP address of a Citrix ADC appliance in the address line of a web browser.
2. Log on to the GUI of the Citrix ADC appliance by using your account credentials for the appliance.
3. Navigate to **System** > **CloudBridge Connector**.
4. In the right pane, under **Getting Started**, click **Create/Monitor CloudBridge**.
5. The first time you configure a CloudBridge Connector tunnel on the appliance, a **Welcome** screen appears.
6. On the **Welcome** screen click **Get Started**.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

> **Note**:
>
> If you already have a CloudBridge Connector tunnel configured on the Citrix ADC appliance, the Welcome screen does not appear, so you do not click Get Started.

1. In the **CloudBridge Connector Setup** pane, click **amazon web services**

1. In the **Amazon** pane, provide your AWS account credentials: AWS Access Key ID and AWS Secret Access Key. You can obtain these access keys from the AWS GUI console. Click **Continue**.

> **Note**
>
> Earlier, the Setup wizard always connects to the same AWS region even when another region is selected. As a result, configuring CloudBridge Connector tunnel to a Citrix ADC VPX running on the selected AWS region used to fail. This issue has been fixed now.

1. In the **Citrix ADC** pane, select the NSIP address of the Citrix ADC virtual appliance running on AWS. Then, provide your account credentials for the Citrix ADC virtual appliance. Click **Continue**.
2. In the **CloudBridge Connector Setting** pane, set the following parameter:

   - **CloudBridge Connector Name**—Name for the CloudBridge Connector configuration on the local appliance. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the CloudBridge Connector configuration is created.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

3. Under **Local Setting**, set the following parameter:

    - **Subnet IP**—IP address of the local endpoint of the CloudBridge Connector tunnel. Must be a public IP address of type SNIP.

4. Under **Remote Setting**, set the following parameter:

    - **Subnet IP**—IP address of the CloudBridge Connector tunnel end point on the AWS side. Must be an IP address of type SNIP on the Citrix ADC VPX instance on AWS.
    - **NAT**—Public IP address (EIP) in AWS that is mapped to the SNIP configured on the Citrix ADC VPX instance on AWS.

5. Under **PBR Setting**, set the following parameters:

    - **Operation**—Either the equals (=) or does not equal (!=) logical operator.
    - **Source IP Low**—Lowest source IP address to match against the source IP address of an outgoing IPv4 packet.
    - **Source IP High**—Highest source IP address to match against the source IP address of an outgoing IPv4 packet.
    - **Operation**—Either the equals (=) or does not equal (!=) logical operator.
    - **Destination IP Low**—Lowest destination IP address to match against the destination IP address of an outgoing IPv4 packet.
    - **Destination IP High**—Highest destination IP address to match against the destination IP address of an outgoing IPv4 packet.

6. (Optional) Under **Security Settings**, set the following IPSec protocol parameters for the CloudBridge Connector tunnel:

    - **Encryption Algorithm**—Encryption algorithm to be used by the IPSec protocol in the CloudBridge tunnel.
    - **Hash Algorithm**—Hash algorithm to be used by the IPSec protocol in the CloudBridge tunnel.
    - **Key**—Select one of the following IPSec authentication methods to be used by the two peers to mutually authenticate.
        - **Auto Generate Key**—Authentication based on a text string, called a pre-shared key (PSK), generated automatically by the local appliance. The PSKs keys of the peers are matched against each other for authentication.
        - **Specific Key**—Authentication based on a manually entered PSK. The PSKs of the peers are matched against each other for authentication.
            * **Pre Shared Security Key**—The text string entered for pre-shared key based authentication.
        - **Upload Certificates**—Authentication based on digital certificates.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

* **Public Key**—A local digital certificate to be used to authenticate the local peer to the remote peer before establishing IPSec security associations. The same certificate should be present and set for the Peer Public Key parameter in the peer.
* **Private Key**—Private key of the local digital certificate.
* **Peer Public Key**—Digital certificate of the peer. Used to authenticate the peer to the local end point before establishing IPSec security associations. The same certificate should be present and set for the Public key parameter in the peer.

7. Click **Done**.

The new CloudBridge Connector tunnel configuration on the Citrix ADC appliance in the datacenter appears on the Home tab of the GUI. The corresponding new CloudBridge Connector tunnel configuration on the Citrix ADC VPX appliance in the AWS cloud appears on the GUI. The current status of the CloudBridge connector tunnel is indicated in the Configured CloudBridge pane. A green dot indicates that the tunnel is up. A red dot indicates that the tunnel is down.

Monitoring the CloudBridge Connector tunnel

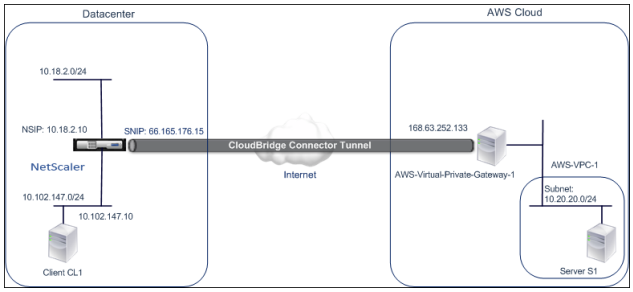
You can monitor the performance of CloudBridge Connector tunnels on a Citrix ADC appliance by using CloudBridge Connector tunnel statistical counters. For more information about displaying CloudBridge Connector tunnel statistics on a Citrix ADC appliance, see Monitoring CloudBridge Connector Tunnels.

Configuring a CloudBridge Connector tunnel between a Citrix ADC appliance and virtual private gateway on AWS

September 14, 2021

To connect a datacenter to Amazon Web Services (AWS), you can configure a CloudBridge Connector tunnel between a Citrix ADC appliance in the datacenter and a virtual private gateway on AWS. The Citrix ADC appliance and the virtual private gateway form the endpoints of the CloudBridge Connector tunnel and are called peers.

> **Note:**
>
> You can also set up a CloudBridge Connector tunnel between a Citrix ADC appliance in a datacenter and a Citrix ADC VPX instance (instead of a virtual private gateway) on AWS. For more information, see Configuring CloudBridge Connector between Datacenter and AWS Cloud.



© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Virtual private gateways on AWS support the following IPSec settings for a CloudBridge Connector tunnel. Therefore, you must specify the same IPSec settings when you configure the Citrix ADC appliance for the CloudBridge Connector tunnel.

IPSec Properties	Setting
IPSec mode	Tunnel mode
IKE version	Version 1
IKE Authentication method	Pre-Shared Key
Encryption algorithm	AES
Hash algorithm	HMAC SHA1

Example of CloudBridge Connector tunnel configuration and data flow

As an illustration of the traffic flow in a CloudBridge Connector tunnel, consider an example in which a CloudBridge Connector tunnel is set up between Citrix ADC appliance NS_Appliance-1 in a datacenter and virtual private gateway gateway AWS-Virtual-Private-Gateway-1 on AWS cloud.

NS_Appliance-1 also functions as an L3 router, which enables a private network in the datacenter to reach a private network in the AWS cloud through the CloudBridge Connector tunnel. As a router, NS_Appliance-1 enables communication between client CL1 in the datacenter and server S1 in the AWS cloud through the CloudBridge Connector tunnel. Client CL1 and server S1 are on different private networks.

On NS_Appliance-1, the CloudBridge Connector tunnel configuration includes an IPSec profile entity named NS_AWS_IPSec_Profile, a CloudBridge Connector tunnel entity named NS_AWS_Tunnel, and a policy based routing (PBR) entity named NS_AWS_Pbr.

The IPSec profile entity NS_AWS_IPSec_Profile specifies the IPSec protocol parameters, such as IKE version, encryption algorithm, and hash algorithm, to be used by the IPSec protocol in the CloudBridge Connector tunnel. NS_AWS_IPSec_Profile is bound to IP tunnel entity NS_AWS_Tunnel.

CloudBridge Connector tunnel entity NS_AWS_Tunnel specifies the local IP address (a public IP—SNIP—address configured on the Citrix ADC appliance), the remote IP address (the IP address of the

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

AWS-Virtual-Private-Gateway-1), and the protocol (IPSec) used to set up the CloudBridge Connector tunnel. NS_AWS_Tunnel is bound to policy based routing (PBR) entity NS_AWS_Pbr.

The PBR entity NS_AWS_Pbr specifies a set of conditions and a CloudBridge Connector tunnel entity (NS_AWS_Tunnel). The source IP address range and the destination IP address range are the conditions for NS_AWS_Pbr. The source IP address range and the destination IP address range are specified as a subnet in the datacenter and a subnet in the AWS cloud, respectively. Any request packet originating from a client in the subnet in the datacenter and destined to a server in the subnet on the AWS cloud matches the conditions in NS_AWS_Pbr. This packet is then considered for CloudBridge Connector processing and is sent across the CloudBridge Connector tunnel (NS_AWS_Tunnel) bound to the PBR entity.

The following table lists the settings used in this example.

IP address of the CloudBridge Connector tunnel end point (NS_Appliance-1) in the datacenter side	66.165.176.15
IP address of the CloudBridge Connector tunnel end point (AWS-Virtual-Private-Gateway-1) in the AWS	168.63.252.133
Datacenter Subnet, the traffic of which is to traverse the CloudBridge Connector tunnel	10.102.147.0/24
AWS Subnet, the traffic of which is to traverse the CloudBridge Connector tunnel	10.20.20.0/24

Settings on Amazon AWS

Customer Gateway	AWS-Customer-Gateway-1	Routing = Static, IP Address = Internet-routable CloudBridge Connector tunnel endpoint IP address on the Citrix ADC side = 66.165.176.15
Virtual Private Gateway	AWS-Virtual-Private-Gateway-1	Associated VPC = AWS-VPC-1

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Customer Gateway	AWS-Customer-Gateway-1	Routing = Static, IP Address = Internet-routable CloudBridge Connector tunnel endpoint IP address on the Citrix ADC side = 66.165.176.15
VPN Connection	AWS-VPN-Connection-1	Customer Gateway = AWS-Customer-Gateway-1, Virtual Private Gateway= Virtual-Private-Gateway-1, Routing Options: Type = Static, Static IP Prefixes = Subnets on the Citrix ADC side = 10.102.147.0/24

Settings on Citrix ADC appliance NS_Appliance-1 in Datacenter-1:

Appliance	Settings	
SNIP1(for reference purposes only)	66.165.176.15	
IPSec profile	NS_AWS_IPSec_Profile	IKE version = v1, Encryption algorithm = AES, Hash algorithm = HMAC SHA1
CloudBridge Connector tunnel	NS_AWS_Tunnel	Remote IP = 168.63.252.133, Local IP= 66.165.176.15, Tunnel protocol = IPSec, IPSec profile= NS_AWS_IPSec_Profile
Policy based route	NS_AWS_Pbr	Source IP range = Subnet in the datacenter =10.102.147.0-10.102.147.255, Destination IP range =Subnet in AWS =10.20.20.0-10.20.20.255, IP Tunnel = NS_AWS_Tunnel

Points to consider for a CloudBridge Connector tunnel configuration

Before configuring a CloudBridge Connector tunnel between a Citrix ADC appliance and AWS gateway, consider the following points:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

1. AWS supports the following IPSec settings for a CloudBridge Connector tunnel. Therefore, you must specify the same IPSec settings when you configure the Citrix ADC appliance for the CloudBridge Connector tunnel.
    - IKE version = v1
    - Encryption algorithm = AES
    - Hash algorithm = HMAC SHA1
2. You must configure the firewall at the Citrix ADC end to allow the following.
    - Any UDP packets for port 500
    - Any UDP packets for port 4500
    - Any ESP (IP protocol number 50) packets
3. You must configure Amazon AWS before specifying the tunnel configuration on the Citrix ADC, because the public IP address of the AWS end (gateway) of the tunnel and the PSK are automatically generated when you set up the tunnel configuration in AWS. You need this information for specifying the tunnel configuration on the Citrix ADC appliance.
4. AWS gateway supports static routes and the BGP protocol for route updates. The Citrix ADC appliance does not support the BGP protocol in a CloudBridge Connector tunnel to AWS gateway. Therefore, appropriate static routes must be used on both sides of the CloudBridge Connector tunnel for proper routing of traffic through the tunnel.

Configuring Amazon AWS for the CloudBridge Connector tunnel

To create a CloudBridge Connector tunnel configuration on Amazon AWS, use the Amazon AWS Management Console, which is a web based graphical interface for creating and managing resources on Amazon AWS.

Before you begin the CloudBridge Connector tunnel configuration on AWS cloud, make sure that:

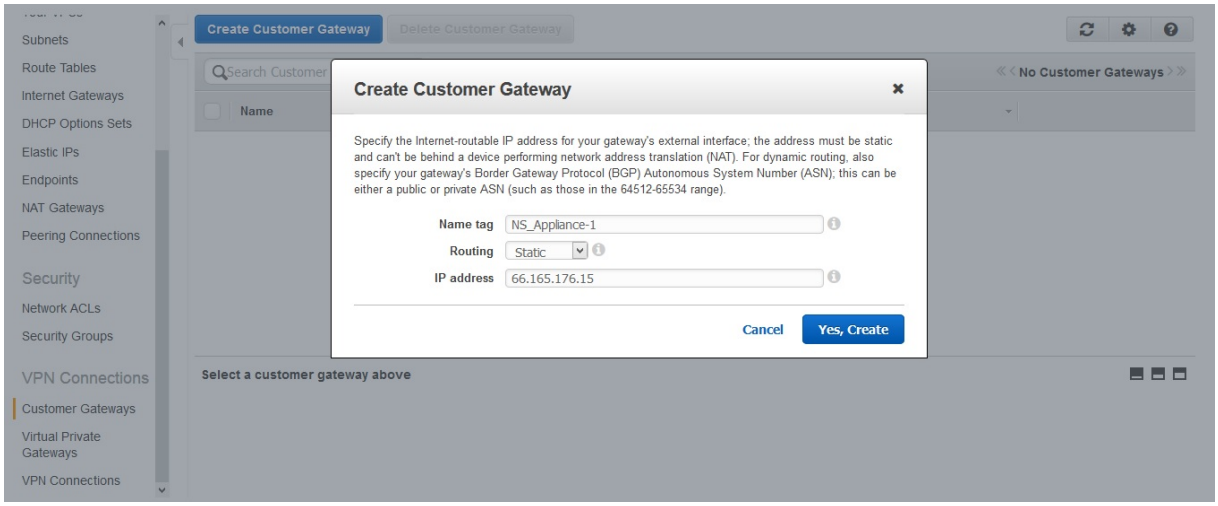
- You have a user account for Amazon AWS cloud.
- You have a virtual private cloud whose networks you want to connect to the networks at the Citrix ADC side through the CloudBridge Connector tunnel.
- You are familiar with the Amazon AWS Management Console.

> **Note**:
>
> The procedures for configuring Amazon AWS for a CloudBridge Connector tunnel might change over time, depending on the Amazon AWS release cycle. Citrix recommends you refer Amazon AWS documentation for the latest procedures.

To configure a CloudBridge connector tunnel between a Citrix ADC and AWS gateway perform the following tasks on the AWS Management Console:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- **Create a Customer Gateway**. A customer gateway is an AWS entity that represents a CloudBridge Connector tunnel endpoint. For a CloudBridge Connector tunnel between a Citrix ADC appliance and AWS gateway, the customer gateway represents the Citrix ADC appliance on AWS. The customer gateway specifies a name, the type of routing (static or BGP) used in the tunnel, and the CloudBridge Connector tunnel endpoint IP address on the Citrix ADC side. The IP address can be an Internet-routable Citrix ADC owned subnet IP (SNIP) address or, if the Citrix ADC appliance is behind a NAT device, an Internet-routable NAT IP address that represents the SNIP address.
- **Create a Virtual Private Gateway and attach it to a VPC**. A virtual private gateway is a CloudBridge Connector tunnel endpoint at the AWS side. When you create a virtual private gateway, you assigned it a name or allow AWS to assign the name. You then associate the virtual private gateway with a VPC. This association enables the subnets of the VPC to connect to the subnets at the Citrix ADC side through the CloudBridge Connector tunnel.
- **Create a VPN Connection**. A VPN connection specifies a customer gateway and a virtual private gateway between which a CloudBridge Connector tunnel is to be created. It also specifies an IP prefix for the networks at the Citrix ADC side. Only IP prefixes that are known to the virtual private gateway (through static route entry) can receive traffic from the VPC through the tunnel. Also, the virtual private gateway does not route any traffic not destined to the specified IP prefixes through the tunnel. After configuring a VPN connection, you might have to wait few minutes for it to be created.
- **Configure Routing Options**. For the VPC's network to reach the networks at the Citrix ADC side through the CloudBridge Connector tunnel, you must configure the VPC's routing table to include routes for the networks at the Citrix ADC side and point those routes to the virtual private gateway. You can include routes in a VPC's routing table in one of the following ways:
  - **Enable Route Propagation**. You can enable route propagation for your routing table, so that routes are automatically propagated to the table. The static IP prefixes that you specify for VPN configuration are propagated to the routing table after you've created the VPN connection.
  - **Enter Static Routes Manually**. If you do not enable route propagation, you must manually enter the static routes for the networks at the Citrix ADC side.
- **Download Configuration**. After the CloudBridge Connector tunnel (VPN connection) configuration is created on AWS, download the configuration file of the VPN connection to your local system. You might need the information in the configuration file for configuring the CloudBridge Connector tunnel on the Citrix ADC appliance.



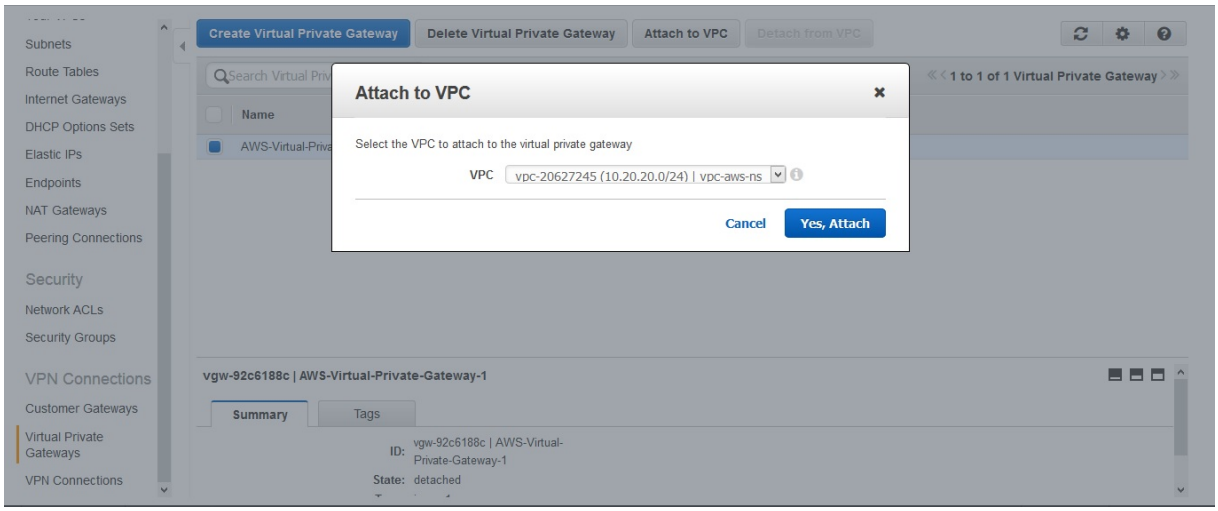
To create a customer gateway

1. Open the Amazon VPC console at https://console.aws.amazon.com/vpc/.
2. Navigate to **VPN Connections** > **Customer Gateways** and click on **Create Customer Gateway**.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

3. In the **Create Customer Gateway** dialog box, set the following parameters and then click **Yes, Create**:

    - **Name tag**. A name for the customer gateway.
    - **Routing list**. Type of routing between Citrix ADC appliance and AWS virtual private gateway for advertising routes to each other through the CloudBridge Connector tunnel. Select **Static Routing** from the **Routing** list. **Note**: The Citrix ADC appliance does not support the BGP protocol in a CloudBridge Connector tunnel to AWS gateway. Therefore, appropriate static routes must be used on both sides of the CloudBridge Connector tunnel for proper routing of traffic through the tunnel.
    - **IP Address**. Internet-routable CloudBridge Connector tunnel endpoint IP address on the Citrix ADC side. The IP address can be an Internet-routable Citrix ADC owned subnet IP (SNIP) address or, if the Citrix ADC appliance is behind a NAT device, an Internet-routable NAT IP address that represents the SNIP address.

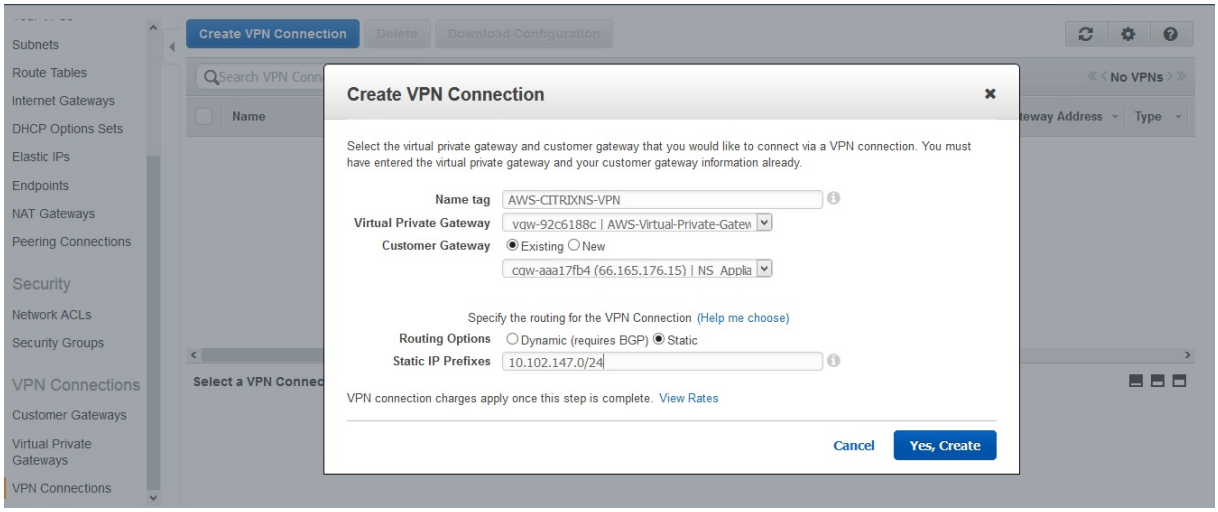


To create a virtual private gateway and attach it to a VPC

1. Navigate to **VPN Connections** > **Virtual Private Gateways**, and then click Create Virtual Private Gateway.
2. Enter a name for the virtual private gateway, and then click Yes, Create.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

1. Select the virtual private gateway that you created, and then click Attach to VPC.
2. In the Attach to VPC dialog box, select your VPC from the list, and then choose Yes, Attach.



To create a VPN connection:

1. Navigate to VPN Connections > VPN Connections and then click Create VPN Connection.
2. In the Create VPN Connection dialog box set the following parameters and then choose Yes, Create:

    - **Name tag**. A name for the VPN connection.
    - **Virtual Private Gateway**. Select the virtual private gateway that you created earlier.
    - **Customer Gateway**. Select Existing. Then, from the drop down list, select the customer gateway that you created earlier.
    - **Routing Options**. Type of routing between the virtual private gateway and customer gateway (Citrix ADC appliance). Select Static. In the Static IP Prefixes field, specify the IP prefixes for the subnet on the Citrix ADC side, separated by commas.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

To enable route propagation:

1. Navigate to **Route Tables** and select the routing table that's associated with the subnet whose traffic is to traverse the CloudBridge Connector tunnel.

> **Note**
>
> By default, this is the main routing table for the VPC.

1. On the **Route Propagation** tab in the details pane, choose **Edit**, select the virtual private gateway, and then choose **Save**.

To manually enter static routes:

1. Navigate to **Route Tables** and select your routing table.
2. On the **Routes** tab, click **Edit**.
3. In the **Destination** field, enter the static route used by your CloudBridge Connector tunnel (VPN connection).
4. Select the virtual private gateway ID from the **Target** list, and then click **Save**.

To download the configuration file:

1. Navigate to **VPN Connection**, select a VPN connection, and then click **Download Configuration**.
2. In the **Download Configuration** dialog box, set the following parameters, and then click **Yes, Download**.
    - **Vendor**. Select **Generic**.
    - **Platform**. Select **Generic**.
    - **Software**. Select **Vendor Agnostic**.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Configuring the Citrix ADC appliance for the CloudBridge Connector tunnel

To configure a CloudBridge Connector tunnel between a Citrix ADC appliance and a virtual private gateway on AWS cloud, perform the following tasks on the Citrix ADC appliance.
You can use either the Citrix ADC command line or the GUI.

- **Create an IPSec profile**. An IPSec profile entity specifies the IPSec protocol parameters, such as IKE version, encryption algorithm, hash algorithm and PSK to be used by the IPSec protocol in the CloudBridge Connector tunnel.
- **Create an IP tunnel that uses IPSec protocol and associate the IPSec profile with it**. An IP tunnel specifies the local IP address (a SNIP address configured on the Citrix ADC appliance), remote IP address (the public IP address of the virtual private gateway in AWS), protocol (IPSec) used to set up the CloudBridge Connector tunnel, and an IPSec profile entity. The created IP tunnel entity is also called the CloudBridge Connector tunnel entity.
- **Create a PBR rule and associate it with the IP tunnel**. A PBR entity specifies a set of rules and an IP tunnel (CloudBridge Connector tunnel) entity. The source IP address range and the destination IP address range are the conditions for the PBR entity. Set the source IP address range to specify the Citrix ADC-side subnet whose traffic is to traverse the tunnel, and set the destination IP address range to specify the AWS VPC subnet whose traffic is to traverse the CloudBridge Connector tunnel. Any request packet that originates from a client in the subnet on the Citrix ADC side and is destined to a server in the AWS cloud subnet, and matches the source and destination IP range of the PBR entity, is sent across the CloudBridge Connector tunnel associated with the PBR entity.

To create an IPSEC profile by using the Citrix ADC command line

At the Command prompt, type:

- `add ipsec profile <name> -psk <string> -**ikeVersion** v1`
- `show ipsec profile** <name>`

To create an IPSEC tunnel and bind the IPSEC profile to it by using the Citrix ADC command line

At the Command prompt, type:

- `add ipTunnel <name> <remote> <remoteSubnetMask> <local> -protocol IPSEC –ipsecProfileName <string>`
- `show ipTunnel <name>`

To create a PBR rule and bind the IPSEC tunnel to it by using the Citrix ADC command line

At the Command prompt, type:

- `add pbr <pbrName> ALLOW –srcIP <subnet-range> -destIP** <subnet-range> -*ipTunnel <tunnelName>`

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- apply pbrs
- show pbr <pbrName>

The following commands create all settings of Citrix ADC appliance NS_Appliance-1 used in "Example of CloudBridge Connector Configuration and Data Flow."

```
1      > add ipsec profile NS_AWS_IPSec_Profile -psk
          DkiMgMdcbqvYREEuIvxsbKkW0Foyabcd -ikeVersion v1 –lifetime
          31536000
2      Done
3      > add iptunnel NS_AWS_Tunnel 168.63.252.133 255.255.255.255
          66.165.176.15 –protocol IPSEC –ipsecProfileName
          NS_AWS_IPSec_Profile
4
5      Done
6      > add pbr NS_AWS_Pbr -srcIP 10.102.147.0-10.102.147.255 –destIP
          10.20.0.0-10.20.255.255 –ipTunnel NS_AWS_Tunnel
7      Done
8
9      > apply pbrs
10
11     Done
```

To create an IPSEC profile by using the GUI

1. Navigate to **System** > **CloudBridge Connector** > **IPSec Profile**.
2. In the details pane, click **Add**.
3. In the **Add IPSec Profile** dialog box, set the following parameters:
   - Name
   - Encryption Algorithm
   - Hash Algorithm
   - IKE Protocol Version (select V1)
4. Select the **Pre-shared Key Authentication** method and set the **Pre-Shared Key Exists** parameter.
5. Click **Create**, and then click **Close**.

To create an IP tunnel and bind the IPSEC profile to it by using the GUI

1. Navigate to **System** > **CloudBridge Connector** > **IP Tunnels**.
2. On the **IPv4 Tunnels** tab, click Add.
3. In the **Add IP Tunnel** dialog box, set the following parameters:
   - Name
   - Remote IP

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- Remote Mask
- Local IP Type (In the Local IP Type drop down list, select Subnet IP).
- Local IP (All the configured IPs of the selected IP type are in the Local IP drop down list. Select the desired IP from the list.)
- Protocol
- IPSec Profile

4. Click **Create**, and then click **Close**.

To create a PBR rule and bind the IPSEC tunnel to it by using the GUI

1. Navigate to **System** > **Network** > **PBR**.
2. On the **PBR** tab, click **Add**.
3. In the **Create PBR** dialog box, set the following parameters:

   - Name
   - Action
   - Next Hop Type (Select IP Tunnel)
   - IP Tunnel Name
   - Source IP Low
   - Source IP High
   - Destination IP Low
   - Destination IP High

4. Click **Create**, and then click **Close**.

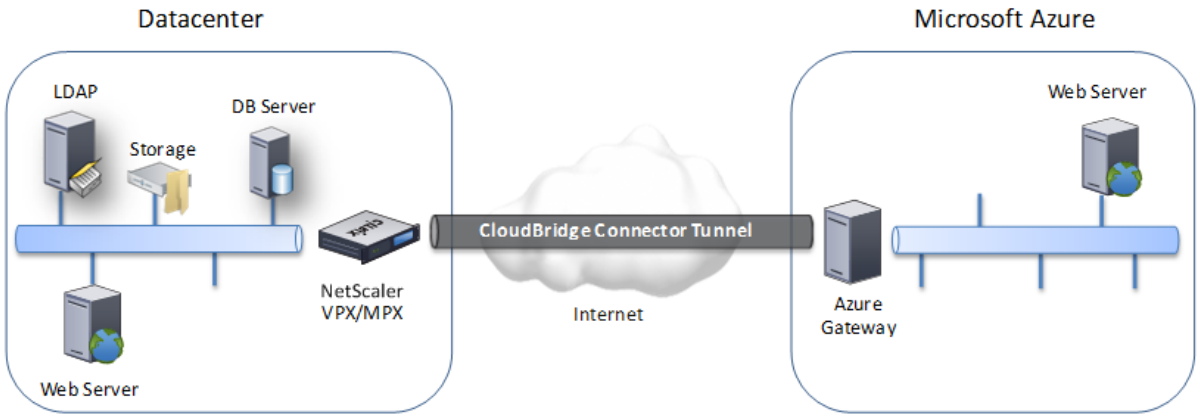
The corresponding new CloudBridge Connector tunnel configuration on the Citrix ADC appliance appears in the GUI.

The current status of the CloudBridge connector tunnel is shown in the Configured CloudBridge Connector pane. A green dot indicates that the tunnel is up. A red dot indicates that the tunnel is down.

Monitoring the CloudBridge Connector tunnel

You can monitor the performance of CloudBridge Connector tunnels on a Citrix ADC appliance by using CloudBridge Connector tunnel statistical counters.
For more information about displaying CloudBridge Connector tunnel statistics on a Citrix ADC appliance, see Monitoring CloudBridge Connector Tunnels.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.



Configuring a CloudBridge Connector tunnel between a datacenter and Azure cloud

September 14, 2021

The Citrix ADC appliance provides connectivity between your enterprise datacenters and the Microsoft cloud hosting provider, Azure, making Azure a seamless extension of the enterprise network. Citrix ADC encrypts the connection between the enterprise datacenter and Azure cloud so that all data transferred between the two is secure.

How CloudBridge Connector tunnel works

To connect a datacenter to Azure cloud, you set up a CloudBridge Connector tunnel between a Citrix ADC appliance that resides in the datacenter and a gateway that resides in the Azure cloud. The Citrix ADC appliance in the datacenter and the gateway in Azure cloud are the end points of the CloudBridge Connector tunnel and are called peers of the CloudBridge Connector tunnel.

A CloudBridge Connector tunnel between a datacenter and Azure cloud uses the open-standard Internet Protocol security (IPSec) protocol suite, in tunnel mode, to secure communications between peers in the CloudBridge Connector tunnel. In a CloudBridge Connector tunnel, IPSec ensures:

- Data integrity
- Data origin authentication
- Data confidentiality (encryption)
- Protection against replay attacks

IPSec uses the tunnel mode in which the complete IP packet is encrypted and then encapsulated. The encryption uses the Encapsulating Security Payload (ESP) protocol, which ensures the integrity of the packet by using a HMAC hash function and ensures confidentiality by using an encryption algorithm. The ESP protocol, after encrypting the payload and calculating the HMAC, generates an ESP header

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

and inserts it before the encrypted IP packet. The ESP protocol also generates an ESP trailer and inserts it at the end of the packet.

The IPSec protocol then encapsulates the resulting packet by adding an IP header before the ESP header. In the IP header, the destination IP address is set to the IP address of the CloudBridge Connecter peer.

Peers in the CloudBridge Connector tunnel use the Internet Key Exchange version 1 (IKEv1) protocol (part of the IPSec protocol suite) to negotiate secure communication, as follows:

1. The two peers mutually authenticate with each other, using pre-shared key authentication, in which the peers exchange a text string called a pre-shared key (PSK). The pre-shared keys are matched against each other for authentication. Therefore, for the authentication to be successful, you must configure the same pre-shared key on each of the peers.
2. The peers then negotiate to reach agreement on:

   - An encryption algorithm
   - Cryptographic keys for encrypting data on one peer and decrypting it on the other.

   This agreement upon the security protocol, encryption algorithm and cryptographic keys is called a Security Association (SA). SAs are one-way (simplex). For example, when a CloudBridge Connector tunnel is set up between a Citrix ADC appliance in a datacenter and a gateway in an Azure cloud, both the datacenter appliance and the Azure gateway have two SAs. One SA is used for processing out-bound packets, and the other SA is used for processing inbound packets. SAs expire after a specified interval of time, which is called the lifetime.

Example of CloudBridge Connector tunnel configuration and data flow

As an illustration of CloudBridge Connector Tunnel, consider an example in which a CloudBridge Connector tunnel is set up between Citrix ADC appliance CB_Appliance-1 in a datacenter and gateway Azure_Gateway-1 in Azure cloud.

CB_Appliance-1 also functions as an L3 router, which enables a private network in the datacenter to reach a private network in the Azure cloud through the CloudBridge Connector tunnel. As a router, CB_Appliance-1 enables communication between client CL1 in the datacenter and server S1 in the Azure cloud through the CloudBridge Connector tunnel. Client CL1 and server S1 are on different private networks.

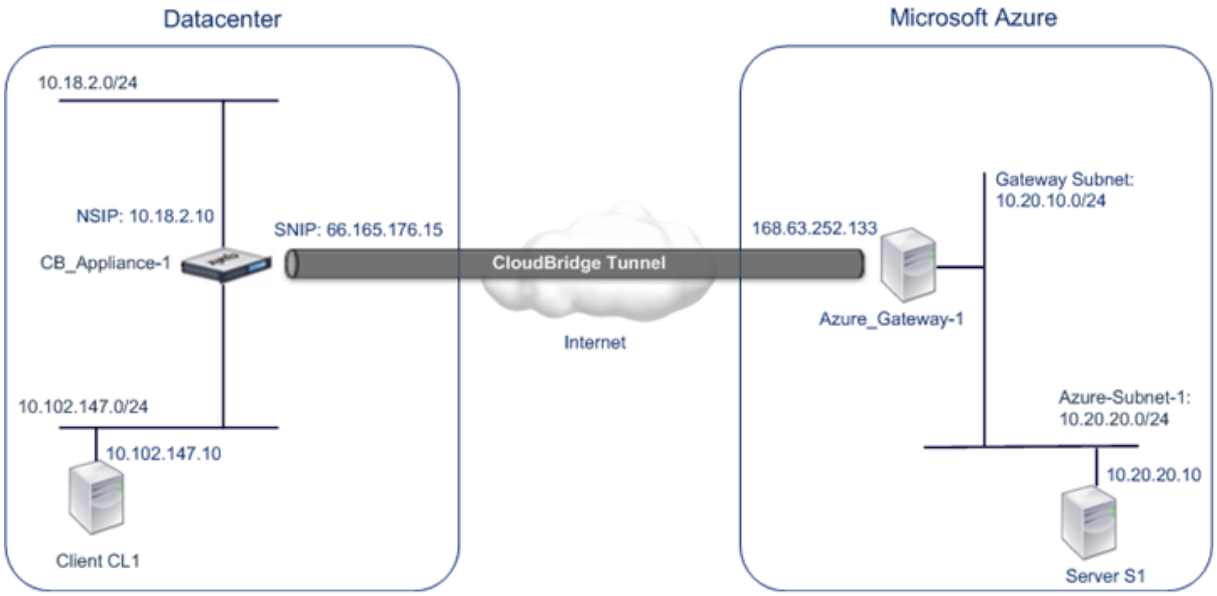
On CB_Appliance-1, the CloudBridge Connector tunnel configuration includes an IPSec profile entity named CB_Azure_IPSec_Profile, a CloudBridge Connector tunnel entity named CB_Azure_Tunnel, and a policy based routing (PBR) entity named CB_Azure_Pbr.

The IPSec profile entity CB_Azure_IPSec_Profile specifies the IPSec protocol parameters, such as IKE

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

version, encryption algorithm, and hash algorithm, to be used by the IPSec protocol in the CloudBridge Connector tunnel. CB_Azure_IPSec_Profile is bound to IP tunnel entity CB_Azure_Tunnel.

CloudBridge Connector tunnel entity CB_Azure_Tunnel specifies the local IP address (a public IP (SNIP) address configured on the Citrix ADC appliance), the remote IP address (the IP address of the Azure_Gateway-1), and the protocol (IPSec) used to set up the CloudBridge Connector tunnel. CB_Azure_Tunnel is bound to the PBR entity CB_Azure_Pbr.



The PBR entity CB_Azure_Pbr specifies a set of conditions and a CloudBridge Connector tunnel entity (CB_Azure_Tunnel). The source IP address range and the destination IP address range are the conditions for CB_Azure_Pbr. The source IP address range and the destination IP address range are specified as a subnet in the datacenter and a subnet in the Azure cloud, respectively. Any request packet originating from a client in the subnet in the datacenter and destined to a server in the subnet on the Azure cloud matches the conditions in CB_Azure_Pbr. This packet is then considered for CloudBridge processing and is sent across the CloudBridge Connector tunnel (CB_Azure_Tunnel) bound to the PBR entity.

On Microsoft Azure, the CloudBridge Connector tunnel configuration includes a local network entity named My-Datacenter-Network, a virtual network entity named Azure-Network-for-CloudBridge-Tunnel, and a gateway named Azure_Gateway-1.

The local (local to Azure) network entity My-Datacenter-Network specifies the IP address of the Citrix ADC appliance on the datacenter side, and the datacenter subnet whose traffic is to traverse the CloudBridge Connector tunnel. The virtual network entity Azure-Network-for-CloudBridge-Tunnel defines a private subnet named Azure-Subnet-1 in Azure. The traffic of the subnet traverses the CloudBridge Connector tunnel. The server S1 is provisioned in this subnet.

The local network entity My-Datacenter-Network is associated with the virtual network entity Azure-Network-for-CloudBridge-Tunnel. This association defines the remote and local network details of the CloudBridge Connector tunnel configuration in Azure. Gateway Azure_Gateway-1 was created for this association to become the CloudBridge end point at the Azure end of the CloudBridge Connector tunnel.

For more information about the settings, refer to the CloudBridge Connector Tunnel Settings pdf.

Points to consider for a CloudBridge Connector tunnel configuration

Before configuring a CloudBridge Connector tunnel between a Citrix ADC appliance in datacenter and Microsoft Azure, consider the following points:

1. The Citrix ADC appliance must have a public facing IPv4 address (type SNIP) to use as a tunnel end-point address for the CloudBridge Connector tunnel. Also, the Citrix ADC appliance should not be behind a NAT device.
2. Azure supports the following IPSec settings for a CloudBridge Connector tunnel. Therefore, you must specify the same IPSec settings while configuring the Citrix ADC for the CloudBridge Connector tunnel.
    - IKE version = v1
    - Encryption algorithm = AES
    - Hash algorithm = HMAC SHA1
3. You must configure the firewall in the datacenter edge to allow the following.
    - Any UDP packets for port 500
    - Any UDP packets for port 4500
    - Any ESP (IP protocol number 50) packets
4. IKE re-keying, which is renegotiation of new cryptographic keys between the CloudBridge Connector tunnel end points to establish new SAs, is not supported. When the Security Associations (SAs) expire, the tunnel goes into the DOWN state. Therefore, you must set a very large value for the lifetimes of SAs.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

5. You must configure Microsoft Azure before specifying the tunnel configuration on the Citrix ADC, because the public IP address of the Azure end (gateway) of the tunnel, and the PSK, are automatically generated when you set up the tunnel configuration in Azure. You need this information for specifying the tunnel configuration on the Citrix ADC.

Configuring the CloudBridge Connector tunnel

For setting up a CloudBridge Connector tunnel between your datacenter and Azure, you must install CloudBridge VPX/MPX in your datacenter, configure Microsoft Azure for the CloudBridge Connector tunnel, and then configure the Citrix ADC appliance in the data center for the CloudBridge Connector tunnel.

Configuring a CloudBridge Connector tunnel between a Citrix ADC appliance in datacenter and Microsoft Azure consists of the following tasks:

1. **Setting up the Citrix ADC appliance in the datacenter**. This task involves deploying and configuring a Citrix ADC physical appliance (MPX), or provisioning and configuring a Citrix ADC virtual appliance (VPX) on a virtualization platform in the datacenter.
2. **Configuring Microsoft Azure for the CloudBridge Connector tunnel**. This task involves creating local network, virtual network, and gateway entities in Azure. The local network entity specifies the IP address of the CloudBridge Connector tunnel end point (the Citrix ADC appliance) on the datacenter side, and the datacenter subnet whose traffic is to traverse the CloudBridge Connector tunnel. The virtual network defines a network on Azure. Creating the virtual network includes defining a subnet whose traffic is to traverse the CloudBridge Connector tunnel to be formed. You then associate the local network with the virtual network. Finally, you create a gateway that becomes the end point at the Azure end of the CloudBridge Connector tunnel.
3. **Configuring the Citrix ADC appliance in the datacenter for the CloudBridge Connector tunnel**. This task involves creating an IPSec profile, an IP tunnel entity, and a PBR entity in the Citrix ADC appliance in datacenter. The IPSec profile entity specifies the IPSec protocol parameters, such as IKE version, encryption algorithm, hash algorithm, and PSK, to be used in the CloudBridge Connector tunnel. The IP tunnel specifies the IP address of both the CloudBridge Connector tunnel end points (the Citrix ADC appliance in datacenter and the gateway in Azure) and the protocol to be used in the CloudBridge Connector tunnel. You then associate the IPSec profile entity with the IP tunnel entity. The PBR entity specifies the two subnets, in the datacenter and in the Azure cloud, that are to communicate with each other through the CloudBridge Connector tunnel. You then associate the IP tunnel entity with the PBR entity.

Configuring Microsoft Azure for the CloudBridge Connector tunnel

To create a CloudBridge Connector tunnel configuration on Microsoft Azure, use the Microsoft Windows Azure Management Portal, which is a web based graphical interface for creating and managing resources on Microsoft Azure.

Before you begin the CloudBridge Connector tunnel configuration on Azure cloud, make sure that:

- You have a user account for Microsoft Azure.
- You have a conceptual understanding of Microsoft Azure.
- You are familiar with the Microsoft Windows Azure Management Portal.

To configure a CloudBridge Connector tunnel between a datacenter and an Azure cloud, perform the following tasks on Microsoft Azure by using the Microsoft Windows Azure Management Portal:

- **Create a local network entity**. Create a local network entity in Windows Azure for specifying the network details of the datacenter. A local network entity specifies the IP address of the CloudBridge Connector tunnel end point (the Citrix ADC) on the datacenter side and the datacenter subnet whose traffic is to traverse the CloudBridge Connector tunnel.
- **Create a Virtual Network**. Create virtual network entity that defines a network on Azure. This task includes defining a private address space, where you provide a range of private addresses and subnets belonging to the range specified in the address space. The traffic of the subnets will traverse the CloudBridge Connector tunnel. You then associate a local network entity with the virtual network entity. This association lets Azure create a configuration for a CloudBridge Connector tunnel between the virtual network and the data center network. A gateway (to be created) in Azure for this virtual network will be the CloudBridge end point at the Azure end of the CloudBridge Connector tunnel. You then define a private subnet for the gateway to be created. This subnet belongs to the range specified in the address space in the virtual network entity.
- **Create a gateway in Windows Azure**. Create a gateway that becomes the end point at the Azure end of the CloudBridge Connector tunnel. Azure, from its pool of public IP addresses, assigns an IP address to the gateway created.
- **Gather the public IP address of the gateway and the pre-shared key.** For a CloudBridge Connector tunnel configuration on Azure, the public IP address of the gateway and the pre-shared Key (PSK) are automatically generated by Azure. Make a note of this information. You will need it for configuring the CloudBridge Connector tunnel on the Citrix ADC in datacenter.

> **Note:**
>
> The procedures for configuring Microsoft Azure for a CloudBridge Connector tunnel might change over time, depending on the Microsoft Azure release cycle. For the latest procedures, see the Microsoft Azure documentation.

Configuring the Citrix ADC Appliance in the datacenter for the CloudBridge Connector tunnel

To configure a CloudBridge Connector tunnel between a datacenter and an Azure cloud, perform the following tasks on the Citrix ADC in the datacenter. You can use either the Citrix ADC command line or the GUI:

- **Create an IPSec profile**. An IPSec profile entity specifies the IPSec protocol parameters, such as IKE version, encryption algorithm, hash algorithm, and PSK, to be used by the IPSec protocol in the CloudBridge Connector tunnel.
- **Create an IP tunnel with IPSec protocol and associate the IPSec profile to it**. An IP tunnel specifies the local IP address (a public SNIP address configured on the Citrix ADC appliance), remote IP address (the public IP address of the gateway in Azure), protocol (IPSec) used to set up the CloudBridge Connector tunnel, and an IPSec profile entity. The created IP tunnel entity is also called the CloudBridge Connector tunnel entity.
- **Create a PBR rule and associate the IP tunnel to it**. A PBR entity specifies a set of conditions and an IP tunnel (CloudBridge Connector tunnel) entity. The source IP address range and the destination IP range are the conditions for the PBR entity. You must set the source IP address range to specify the datacenter subnet whose traffic is to traverse the tunnel, and the destination IP address range to specify the Azure subnet whose traffic is to traverse the CloudBridge Connector tunnel. Any request packet originated from a client in the subnet on the datacenter and destined to a server in the subnet on the Azure cloud matches the source and destination IP range of the PBR entity. This packet is then considered for CloudBridge Connector tunnel processing and is sent across sent across the CloudBridge Connector tunnel associated with the PBR entity.

The GUI combines all these tasks in a single wizard called the CloudBridge Connector wizard.
To create an IPSEC profile by using the Citrix ADC command line:

At the Command prompt, type:

```
add ipsec profile <name> -psk <string> -ikeVersion v1
```

To create an IPSEC tunnel and bind the IPSEC profile to it by using the Citrix ADC command line:

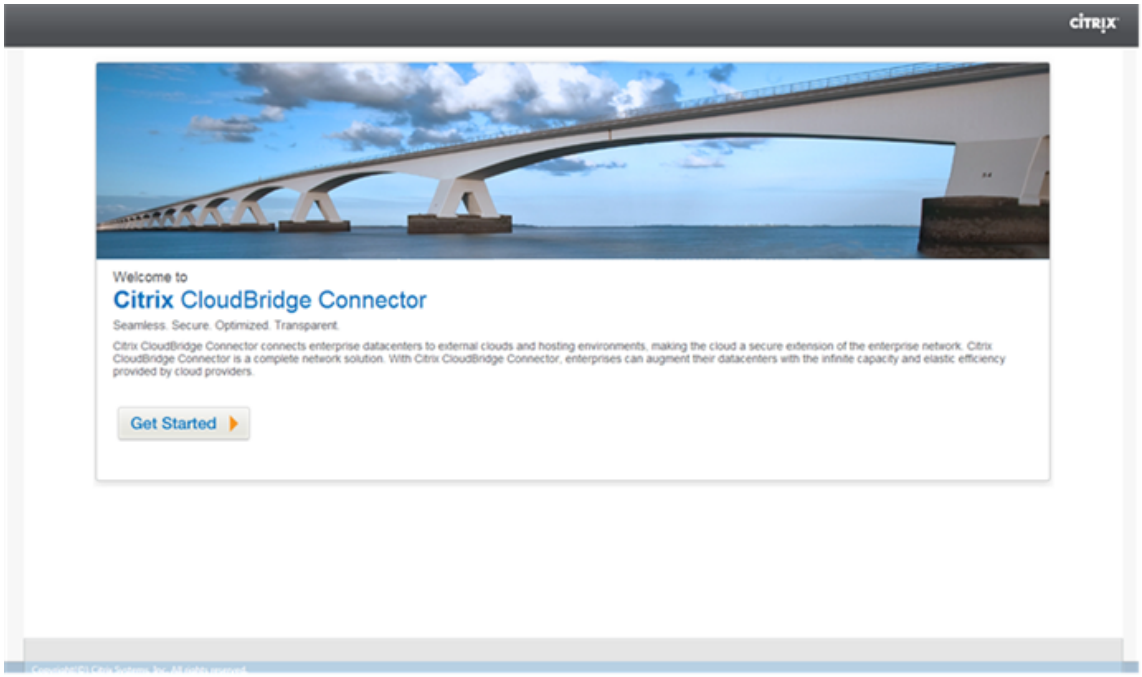
At the Command prompt, type:

```
add ipTunnel <name> <remote> <remoteSubnetMask> <local> -protocol
IPSEC –ipsecProfileName <string>
```

To create a PBR rule and bind the IPSEC tunnel to it by using the Citrix ADC command line

```
add pbr <pbrName> ALLOW –srcIP <subnet-range> -destIP <subnet-range>
ipTunnel <tunnelName> apply pbrs
```

Sample Configuration

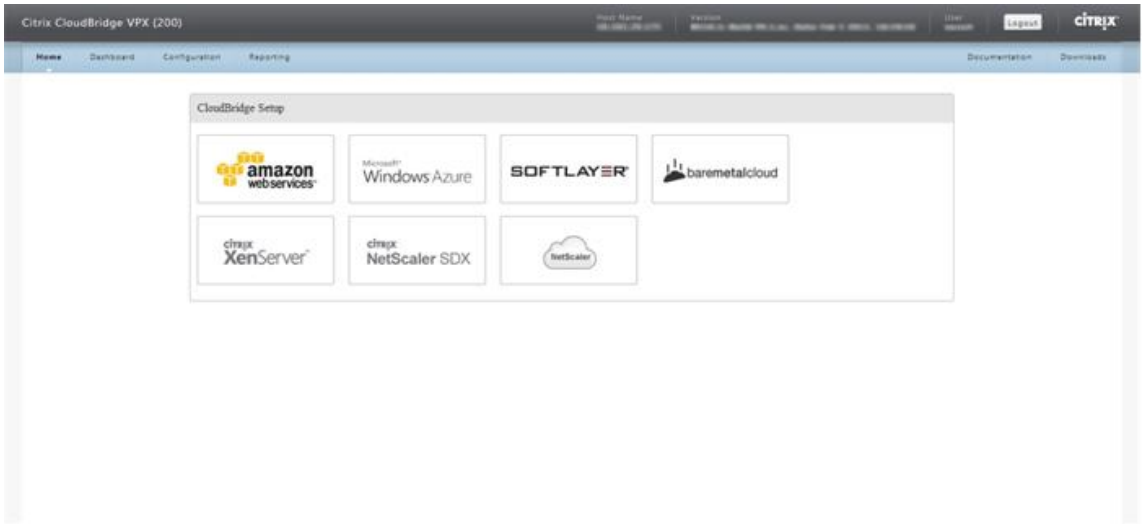


© 1999–2025 Cloud Software Group, Inc. All rights reserved.

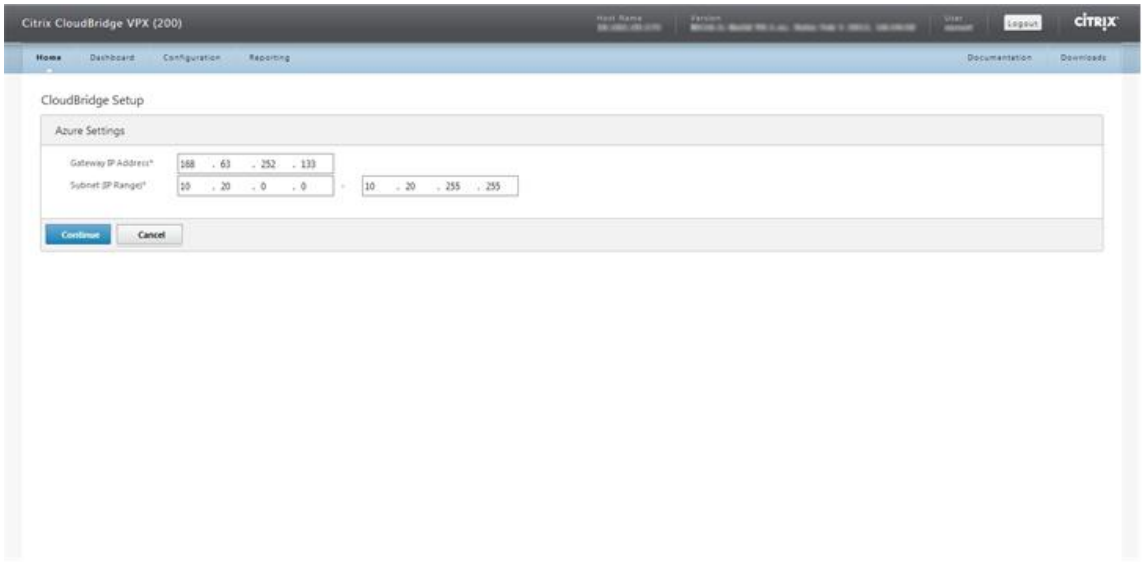
The following commands create all settings of Citrix ADC appliance CB_Appliance-1 used in "Example of CloudBridge Connector Configuration and Data Flow".

```
1  > add ipsec profile CB_Azure_IPSec_Profile -psk
       DkiMgMdcbqvYREEuIvxsbKkW0FOyDiLM  -ikeVersion v1  – lifetime 31536000
2  Done
3
4  >  add iptunnel CB_Azure_Tunnel 168.63.252.133 255.255.255.255
       66.165.176.15  – protocol IPSEC  – ipsecProfileName
       CB_Azure_IPSec_Profile
5  Done
6
7  > add pbr CB_Azure_Pbr -srcIP 10.102.147.0-10.102.147.255  – destIP
       10.20.0.0-10.20.255.255  – ipTunnelCB_Azure_Tunnel
8  Done
9
10 > apply pbrs
11 Done
```

To configure a CloudBridge Connector tunnel in a Citrix ADC appliance by using the GUI



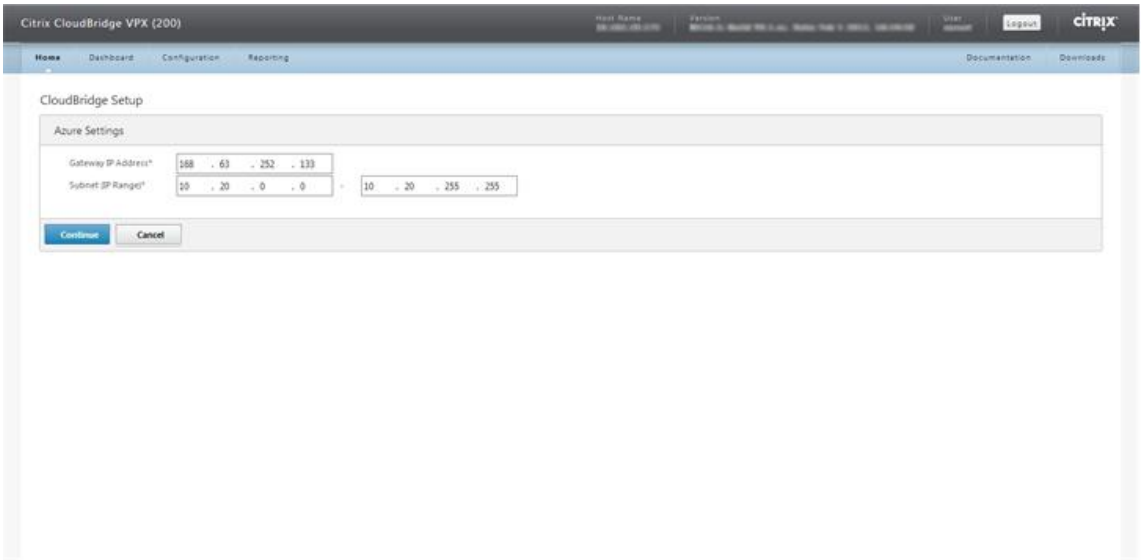
1. Access the GUI by using a web browser to connect to the IP address of the Citrix ADC appliance in the datacenter.
2. Navigate to **System** > **CloudBridge Connector**.
3. In the right pane, under **Getting Started**, click **Create/Monitor CloudBridge**.
4. Click **Get Started**.



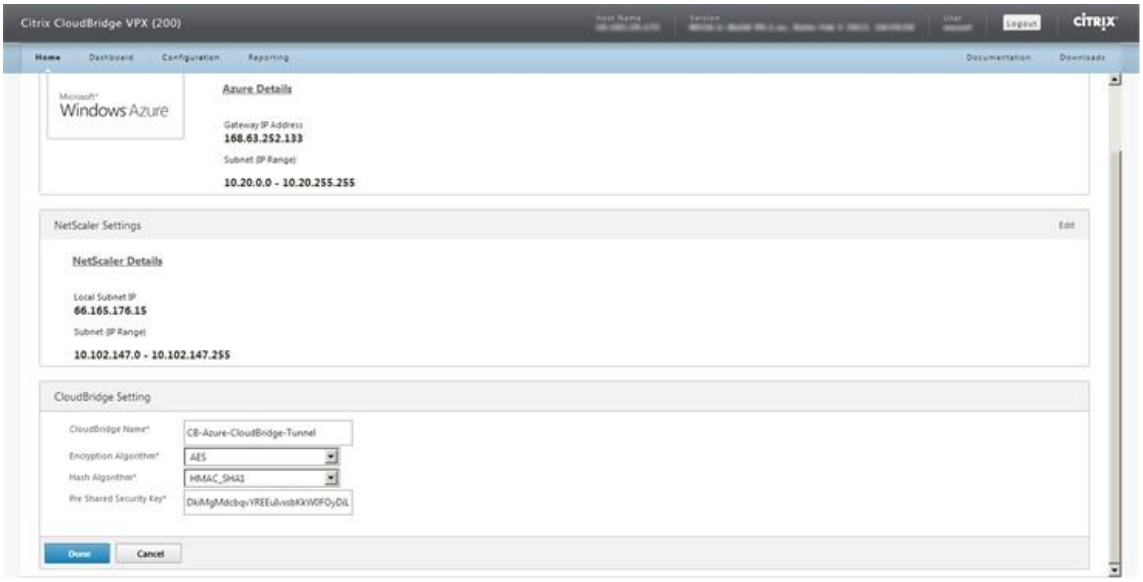
© 1999–2025 Cloud Software Group, Inc. All rights reserved.

> **Note**: If you already have any CloudBridge Connector tunnel configured on the Citrix ADC appliance, this screen does not appear, and you are taken to the CloudBridge Connector Setup pane.

5. In the CloudBridge Setup pane, click **Microsoft Windows Azure**.



6. In the Azure Settings pane, in the **Gateway IP Address** field, type the IP address of the Azure gateway. The CloudBridge Connector tunnel is then set up between the Citrix ADC appliance and the gateway. In the **Subnet (IP Range)** text boxes, specify a subnet range (in Azure cloud), the traffic of which is to traverse the CloudBridge Connector tunnel. Click **Continue**.



7. In the Citrix ADC Settings pane, from the **Local Subnet IP** drop-down list, select a publicly accessible SNIP address configured on the Citrix ADC appliance. In **Subnet (IP Range)** text boxes, specify a local subnet range, the traffic of which is to traverse the CloudBridge Connector tunnel. Click **Continue**.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

8. In the **CloudBridge Setting** pane, in the CloudBridge Name text box, type a name for the CloudBridge that you want to create.

9. From the Encryption Algorithm and Hash Algorithm drop-down lists, select the AES and HMAC_SHA1 algorithms, respectively. In the Pre Shared Security Key text box, type the security key.
10. Click **Done**.

Monitoring the CloudBridge Connector tunnel

You can view statistics for monitoring the performance of a CloudBridge Connector tunnel between the Citrix ADC appliance in the datacenter and Microsoft Azure. To view CloudBridge Connector tunnel

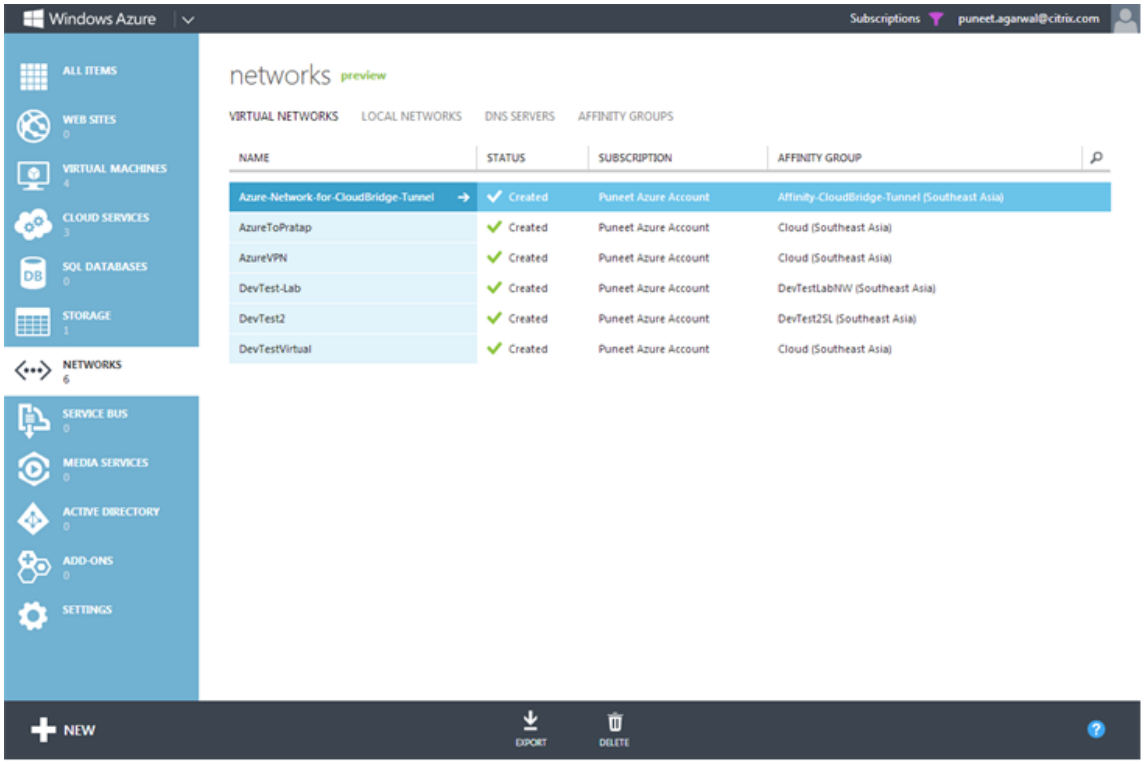
© 1999–2025 Cloud Software Group, Inc. All rights reserved.

statistics on the Citrix ADC appliance, use GUI or Citrix ADC command line. To view CloudBridge Connector tunnel statistics in Microsoft Azure, use the Microsoft Windows Azure Management Portal.

Displaying CloudBridge Connector tunnel Statistics in the Citrix ADC appliance

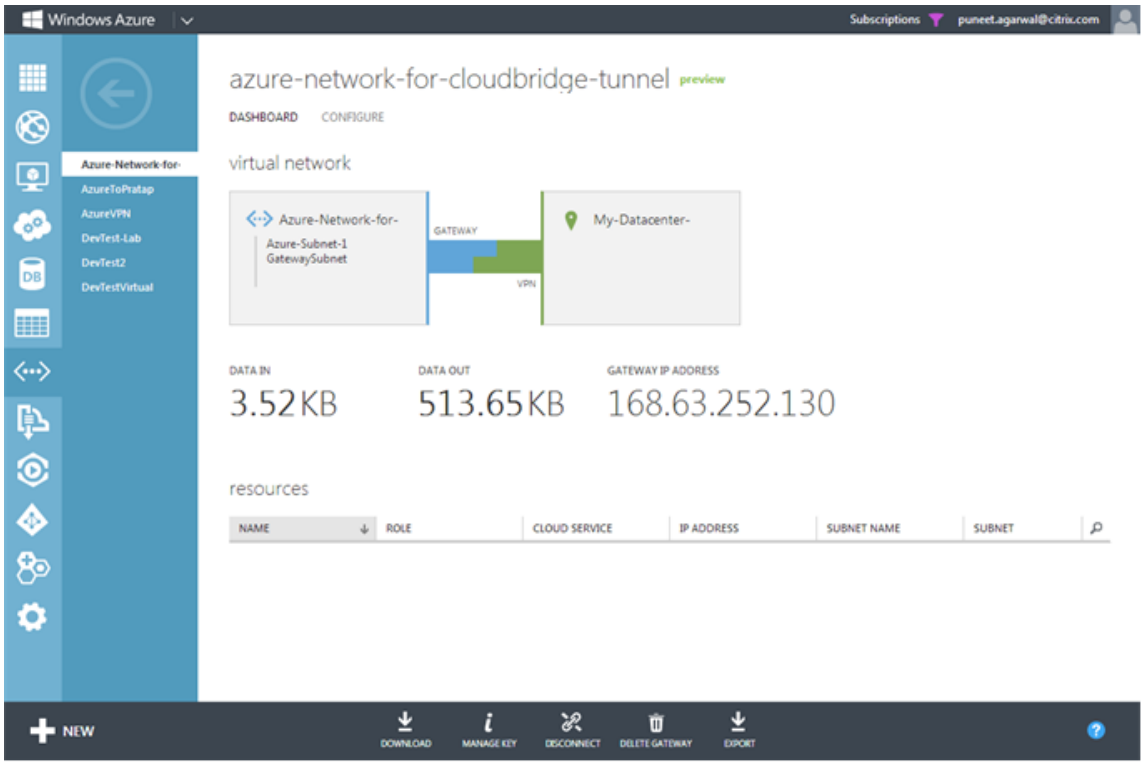
For information about displaying CloudBridge Connector tunnel statistics on a Citrix ADC appliance, see Monitoring CloudBridge Connector Tunnels.

Displaying CloudBridge Connector tunnel Statistics in Microsoft Azure



The following table lists the statistical counters available for monitoring CloudBridge Connector tunnels in Microsoft Azure.

Statistical counter	Specifies
DATA IN	Total number of kilobytes received by the Azure gateway through the CloudBridge Connector tunnel since the gateway was created.
DATA OUT	Total number of kilobytes sent by the Azure gateway through the CloudBridge Connector tunnel since the gateway was created.



To display CloudBridge Connector tunnel statistics by using the Microsoft Windows Azure Management Portal

1. Log on to the Windows Azure Management Portal by using your Microsoft Azure account credentials.
2. In the left pane, click **NETWORKS**.
3. On the **Virtual Network** tab, in the Name column, select the virtual network entity associated with a CloudBridge Connector tunnel whose statistics you want to display.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

4. On the **DASHBOARD** page of the virtual network, view the DATA IN and DATA OUT counters for the CloudBridge Connector tunnel.

Configuring CloudBridge Connector tunnel between datacenter and softlayer enterprise cloud

September 14, 2021

The GUI includes a wizard that helps you to easily configure a CloudBridge Connector tunnel between a Citrix ADC appliance in a datacenter and Citrix ADC VPX instances on the SoftLayer enterprise cloud.

When you use the wizard of the Citrix ADC appliance in the datacenter, the CloudBridge Connector tunnel configuration created on the Citrix ADC appliance, is automatically pushed to the other endpoint or peer (the Citrix ADC VPX on SoftLayer) of the CloudBridge Connector tunnel.

Using the wizard of the Citrix ADC appliance in the datacenter, you perform the following steps to configure a CloudBridge Connector tunnel.

1. Connect to the Softlayer enterprise cloud by providing the user log on credentials.
2. Select the Citrix XenServer that is running the Citrix ADC VPX appliance.
3. Select the Citrix ADC VPX appliance.
4. Provide CloudBridge Connector tunnel parameters to:
    - Configure a GRE Tunnel.
    - Configure IPsec on the GRE tunnel.
    - Create a netbridge, which is a logical representation of the CloudBridge connector, by specifying a name.
    - Bind the GRE Tunnel to the netbridge.

To configure a CloudBridge Connector tunnel by using the GUI

1. Log on to the GUI of the Citrix ADC appliance in the datacenter by using your account credentials for the appliance.
2. Navigate to **System** > **CloudBridge Connector** .
3. In the right pane, under **Getting Started**, click **Create/Monitor CloudBridge Connector**.
4. Click **Get Started**.

> **Note**:
>
> If you already have any CloudBridge Connector tunnel configured on the Citrix ADC appliance, this screen does not appear, and you are taken to the CloudBridge Connector Setup pane.

1. In the CloudBridge Connector Setup pane, click Softlayer, and then follow the instructions in the wizard.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

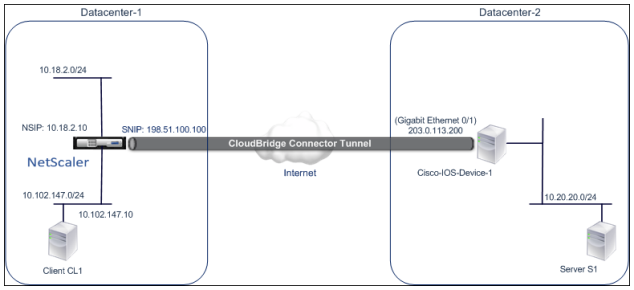
Monitoring the CloudBridge Connector tunnel

You can monitor the performance of CloudBridge Connector tunnels on a Citrix ADC appliance by using CloudBridge Connector tunnel statistical counters. For more information about displaying CloudBridge Connector tunnel statistics on a Citrix ADC appliance, see Monitoring CloudBridge Connector Tunnels.

Configuring a CloudBridge Connector tunnel between a Citrix ADC appliance and Cisco IOS device

September 14, 2021

You can configure a CloudBridge Connector tunnel between a Citrix ADC appliance and a Cisco device to connect two datacenters or extend your network to a Cloud provider. The Citrix ADC appliance and the Cisco IOS device form the end points of the CloudBridge Connector tunnel and are called peers.



Example of CloudBridge Connector tunnel configuration and data flow

As an illustration of the traffic flow in a CloudBridge Connector tunnel, consider an example in which a CloudBridge Connector tunnel is set up between the following devices:

- Citrix ADC appliance NS_Appliance-1 in a datacenter designated as Datacenter-1
- Cisco IOS device Cisco-IOS-Device-1 in a datacenter designated as Datacenter-2

NS_Appliance-1 and Cisco-IOS-Device-1 enable communication between private networks in Datacenter-1 and Datacenter-2 through the CloudBridge Connector tunnel. In the example, NS_Appliance-1 and Cisco-IOS-Device-1 enable communication between client CL1 in Datacenter-1 and server S1 in Datacenter-2 through the CloudBridge Connector tunnel. Client CL1 and server S1 are on different private networks.

On NS_Appliance-1, the CloudBridge Connector tunnel configuration includes IPSec profile entity NS_Cisco_IPSec_Profile, CloudBridge Connector tunnel entity NS_Cisco_Tunnel, and policy based routing (PBR) entity NS_Cisco_Pbr.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

For more information, refer to the CloudBridge Connector tunnel between a Citrix ADC appliance and Cisco IOS device settings pdf.

Points to Consider for a CloudBridge Connector tunnel configuration

Before configuring a CloudBridge Connector tunnel between a Citrix ADC appliance and a Cisco IOS device, consider the following points:

- The following IPSec settings are supported for a CloudBridge Connector tunnel between a Citrix ADC appliance and a Cisco IOS device.

IPSec Properties	Setting
IPSec mode	Tunnel mode
IKE version	Version 1
IKE DH group	DH group 2 (1024 bits MODP algorithm)
IKE authentication method	Pre-Shared Key
IKE encryption algorithm	AES, 3DES
IKE hash algorithm	HMAC SHA1, HMAC SHA256, HMAC SHA384, HMAC SHA512, HMAC MD5
ESP encryption algorithm	AES, 3DES
ESP hash algorithm	HMAC SHA1, HMAC SHA256, HMAC SHA256, HMAC SHA256, HMAC MD5

- You must specify the same IPSec settings on the Citrix ADC appliance and the Cisco IOS device at the two ends of the CloudBridge Connector.
- Citrix ADC provides a common parameter (in IPSec profiles) for specifying an IKE hash algorithm and an ESP hash algorithm. It also provides another, and a common parameter for specifying an IKE encryption algorithm and an ESP encryption algorithm. Therefore on the Cisco device, you must specify the same hash algorithm and same encryption algorithm for IKE (while creating IKE policy) and ESP (while creating IPSec transform set).
- You must configure the firewall at the Citrix ADC end and Cisco device end to allow the following.
  - Any UDP packets for port 500
  - Any UDP packets for port 4500
  - Any ESP (IP protocol number 50) packets

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Configuring the Cisco IOS device for the CloudBridge Connector tunnel

To configure a CloudBridge Connector tunnel on a Cisco IOS device, use the Cisco IOS command line interface, which is the primary user interface for configuring, monitoring, and maintaining Cisco devices.

Before you begin the CloudBridge Connector tunnel configuration on a Cisco IOS device, make sure that:

- You have a user account with administrator credentials on the Cisco IOS device.
- You are familiar with the Cisco IOS command line interface.
- The Cisco IOS device is UP and running, is connected to the Internet, and is also connected to the private subnets whose traffic is to be protected over the CloudBridge Connector tunnel.

> **Note**:
>
> The procedures for configuring CloudBridge Connector tunnel on a Cisco IOS device might change over time, depending on the Cisco release cycle. Citrix recommends that you follow the official Cisco product documention for more information, see Configuring IPSec VPN tunnels topic.

To configure a CloudBridge connector tunnel between a Citrix ADC appliance and a Cisco IOS device, perform the following tasks on the Cisco device's IOS command line:

- Create an IKE Policy.
- Configure a Pre-shared key for IKE authentication.
- Define a transform set and configure IPSec in tunnel mode.
- Create a crypto access List
- Create a crypto map
- Apply the crypto Map to an interface

The examples in the following procedures create settings in `Cisco IOS device Cisco-IOS-Device-1` mentioned in section "Example of CloudBridge Connector Configuration and Data Flow."

To create an IKE policy, refer to the IKE policy pdf.

To configure a pre-shared key by using the Cisco IOS command line:

At the Cisco IOS device's command prompt, type the following commands, starting in global configuration mode, in the order shown:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Command	Example	Command Description
crypto isakmp identity address	Cisco-ios-device-1(config)# crypto isakmp identity address	Specify the ISAKMP identity (address) for the Cisco IOS device to use when communicating with the peer (Citrix ADC appliance) during IKE negotiations. This example specifies the address keyword, which uses IP address 203.0.113.200 (Gigabit Ethernet interface 0/1 of Cisco-IOS-Device-1) as the identity for the device.
crypto isakmp key keystringaddress peer-address	Cisco-ios-device-1 (config)# crypto isakmp key examplepresharedkey address 198.51.100.100	Specify a pre-shared key for the IKE authentication. This example configures shared key examplepresharedkey to be used with the Citrix ADC appliance NS_Appliance-1 (198.51.100.100). The same pre-shared key must be configured on the Citrix ADC appliance for IKE authentication to be successful between the Cisco IOS device and the Citrix ADC appliance.

To create a crypto access list by using the Cisco IOS command line:

At the Cisco IOS device's command prompt, type the following command in global configuration mode, in the order shown:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Command	Example	Command Description
access-listaccess-list-number permit IPsource source-wildcard destination destination-wildcard	Cisco-ios-device-1(config)# access-list 111 permit ip 10.20.20.0 0.0.0.255 10.102.147.0 0.0.0.255	Specify conditions to determine the subnets whose IP traffic is to be protected over the CloudBridge Connector tunnel. This example configures access list 111 to protect traffic from subnets 10.20.20.0/24 (at the Cisco-IOS-Device-1 side) and 10.102.147.0/24 (at the NS_Appliance-1 side).

To define a transform and configure IPSec tunnel mode by using the Cisco IOS command line:

At the Cisco IOS device's command prompt, type the following commands, starting in global configuration mode, in the order shown:
Command	Example	Command Description
–	–	–
crypto ipsec transform-setname ESP_Authentication_Transform ESP_Encryption_Transform Note: ESP_Authentication_Transform can take the following values: esp-sha-hmac, esp-sha256-hmac, esp-sha384-hmac, esp-sha512-hmac, esp-md5-hmac. ESP_Encryption_Transform can take the following values: esp-aes or esp-3des	Cisco-ios-device-1(config)# crypto ipsec transform-set NS-CISCO-TS esp-sha256-hmac esp-3des	Define a transform set and specify the ESP hash algorithm (for authentication) and the ESP encryption algorithm to be used during exchange of data between the CloudBridge Connector tunnel peers. This example defines transform set NS-CISCO-TS and specifies ESP authentication algorithm as esp-sha256-hmac, and ESP encryption algorithm as esp-3des.
mode tunnel	Cisco-ios-device-1 (config-crypto-trans)# mode tunnel	Set IPSec in tunnel mode.
exit	Cisco-ios-device-1 (config-crypto-trans)# exit, Cisco-ios-device-1 (config)#	Exit back to global configuration mode.

To create a crypto map by using the Cisco IOS command line:

At the Cisco IOS device's command prompt, type the following commands starting in global configuration mode, in the order shown:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Command	Example	Command Description
crypto mapmap-name seq-num ipsec-isakmp	Cisco-ios-device-1 (config)# crypto map NS-CISCO-CM 2 ipsec-isakmp	Enter crypto map configuration mode, specify a sequence number for the crypto map, and configure the crypto map to use IKE to establish security associations (SAs). This example configures sequence number 2 and IKE for crypto map NS-CISCO-CM.
set peer ip-address	Cisco-ios-device-1 (config-crypto-map)# set peer 172.23.2.7	Specify the peer (Citrix ADC appliance) by its IP address. This example specifies 198.51.100.100, which is the CloudBridge Connector endpoint IP address on the Citrix ADC appliance.
match addressaccess-list-id	Cisco-ios-device-1 (config-crypto-map)# match address 111	Specify an extended access list. This access list specifies conditions to determine the subnets whose IP traffic is to be protected over the CloudBridge Connector tunnel. This example specifies access list 111.
set transform-set transform-set-name	Cisco-ios-device-1 (config-crypto-map)# set transform-set NS-CISCO-TS	Specify which transform sets are allowed for this crypto map entry. This example specifies transform set NS-CISCO-TS.
exit	Cisco-ios-device-1 (config-crypto-map)# exit	
Cisco-ios-device-1 (config)#	Exit back to global configuration mode.	

To apply a crypto map to an interface by using the Cisco IOS command line:

At the Cisco IOS device's command prompt, type the following commands starting in global configuration mode, in the order shown:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Command	Example	Command Description
interfaceinterface-ID	Cisco-ios-device-1(config)# interface GigabitEthernet 0/1	Specify a physical interface to which to apply the crypto map and enter interface configuration mode. This example specifies Gigabit Ethernet interface 0/1 of the Cisco device Cisco-IOS-Device-1. IP address 203.0.113.200 is already set to this interface.
crypto mapmap-name	Cisco-ios-device-1 (config-if)# crypto map NS-CISCO-CM	Apply the crypto map to the physical interface. This example applies crypto map NS-CISCO-CM.
exit	Cisco-ios-device-1 (config-if)# exit, Cisco-ios-device-1 (config)#	Exit back to global configuration mode.

Configuring the Citrix ADC appliance for the CloudBridge Connector tunnel

To configure a CloudBridge Connector tunnel between a Citrix ADC appliance and a Cisco IOS device, perform the following tasks on the Citrix ADC appliance. You can use either the Citrix ADC command line or the Citrix ADC graphical user interface (GUI):

- Create an IPSec profile.
- Create an IP tunnel that uses IPSec protocol, and associate the IPSec profile with it.
- Create a PBR rule and associate it with the IP tunnel.

To create an IPSEC profile by using the Citrix ADC command line:

At the Command prompt, type:

- `add ipsec profile <name> -psk <string> -ikeVersion v1`
- `show ipsec profile <name>`

To create an IPSEC tunnel and bind the IPSEC profile to it by using the Citrix ADC command line:

At the Command prompt, type:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- add ipTunnel <name> <remote> <remoteSubnetMask> <local> -protocol IPSEC –ipsecProfileName <string>
- add ipTunnel <name>

To create a PBR rule and bind the IPSEC tunnel to it by using the Citrix ADC command line:

At the Command prompt, type:

- add pbr <pbrName> ALLOW –srcIP <subnet-range> -destIP <subnet-range> -ipTunnel <tunnelName>
- apply pbrs
- show pbrs <pbrName>

The following commands create settings in Citrix ADC appliance NS_Appliance-1 mentioned in section **Example of CloudBridge Connector Configuration and Data Flow**.

```
1      > add ipsec profile NS_Cisco_IPSec_Profile -psk
          examplepresharedkey -ikeVersion v1 – lifetime 315360 – encAlgo 3
          DES
2      Done
3      > add iptunnel NS_Cisco_Tunnel 203.0.113.200 255.255.255.255
          198.51.100.100 – protocol IPSEC – ipsecProfileName
          NS_Cisco_IPSec_Profile
4
5      Done
6      > add pbr NS_Cisco_Pbr -srcIP 10.102.147.0-10.102.147.255 – destIP
          10.20.0.0-10.20.255.255 – ipTunnel NS_Cisco_Tunnel
7
8      Done
9      > apply pbrs
10
11     Done
```

To create an IPSEC profile by using the GUI:

1. Navigate to **System** > **CloudBridge Connector** > **IPSec Profile**.
2. In the details pane, click **Add**.
3. In the **Add IPSec Profile** dialog box, set the following parameters:
   - Name
   - Encryption Algorithm
   - Hash Algorithm
   - IKE Protocol Version
4. Configure the **IPSec authentication** method to be used by the two CloudBridge Connector tunnel peers to mutually authenticate: Select the **Pre-shared key authentication** method and set the **Pre-Shared Key Exists** parameter.
5. Click **Create**, and then click **Close**.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

To create an IP tunnel and bind the IPSEC profile to it by using the GUI:

1. Navigate to **System** > **CloudBridge Connector** > **IP Tunnels**.
2. On the **IPv4 Tunnels** tab, click **Add**.
3. In the **Add IP Tunnel** dialog box, set the following parameters:
    - Name
    - Remote IP
    - Remote Mask
    - Local IP Type (In the Local IP Type drop down list, select Subnet IP).
    - Local IP (All the configured IPs of the selected IP type are in the Local IP drop down list. Select the desired IP from the list.)
    - Protocol
    - IPSec Profile
4. Click **Create**, and then click **Close**.

To create a PBR rule and bind the IPSEC tunnel to it by using the GUI

1. Navigate to **System** > **Network** > **PBR**.
2. On the **PBR** tab, click **Add**.
3. In the **Create PBR** dialog box, set the following parameters:
    - Name
    - Action
    - Next Hop Type (Select IP Tunnel)
    - IP Tunnel Name
    - Source IP Low
    - Source IP High
    - Destination IP Low
    - Destination IP High
4. Click **Create**, and then click **Close**.

To apply a PBR by using the GUI:

1. Navigate to **System** > **Network** > **PBRs**.
2. On the **PBRs** tab, select the **PBR**, in the **Action list**, select **Apply**.

The corresponding new CloudBridge Connector tunnel configuration on the Citrix ADC appliance appears in the GUI. The current status of the CloudBridge connector tunnel is shown in the Configured CloudBridge Connector pane. A green dot indicates that the tunnel is up. A red dot indicates that the tunnel is down.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Monitoring the CloudBridge Connector Tunnel

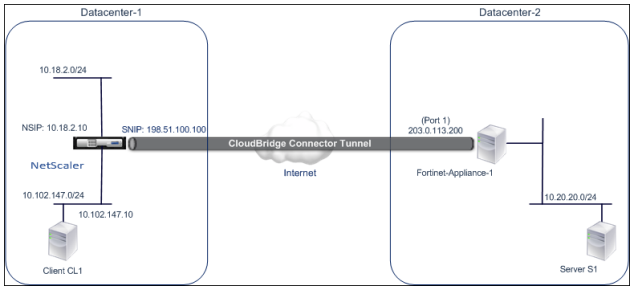
You can monitor the performance of CloudBridge Connector tunnels on a Citrix ADC appliance by using CloudBridge Connector tunnel statistical counters. For more information about displaying CloudBridge Connector tunnel statistics on a Citrix ADC appliance, see Monitoring CloudBridge Connector Tunnels.

Configuring a CloudBridge Connector tunnel between a Citrix ADC appliance and fortinet fortiGate appliance

September 14, 2021

You can configure a CloudBridge Connector tunnel between a Citrix ADC appliance and a Fortinet FortiGate appliance to connect two datacenters or extend your network to a cloud provider. The Citrix ADC appliance and the FortiGate appliance form the end points of the CloudBridge Connector tunnel and are called peers.

Example of a CloudBridge Connector Tunnel Configuration



As an illustration of the traffic flow in a CloudBridge Connector tunnel, consider an example in which a CloudBridge Connector tunnel is set up between the following devices:

- Citrix ADC appliance NS_Appliance-1 in a datacenter designated as Datacenter-1
- FortiGate appliance FortiGate-Appliance-1 in a datacenter designated as Datacenter-2

NS_Appliance-1 and FortiGate-Appliance-1 enable communication between private networks in Datacenter-1 and Datacenter-2 through the CloudBridge Connector tunnel. In the example, NS_Appliance-1 and FortiGate-Appliance-1 enable communication between client CL1 in Datacenter-1 and server S1 in Datacenter-2 through the CloudBridge Connector tunnel. Client CL1 and server S1 are on different private networks.

On NS_Appliance-1, the CloudBridge Connector tunnel configuration includes IPSec profile entity NS_Fortinet_IPSec_Profile, CloudBridge Connector tunnel entity NS_Fortinet_Tunnel, and policy based routing (PBR) entity NS_Fortinet_Pbr.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

For more information, see CloudBridge Connector tunnel configuration table pdf.

For information about Settings on Fortinet FortiGate-Appliance-1 in Datacenter-2, see table.

Points to consider for a CloudBridge Connector tunnel configuration

Before configuring a CloudBridge Connector tunnel between a Citrix ADC appliance and a FortiGate appliance, consider the following points:

- The following IPSec settings are supported for a CloudBridge Connector tunnel between a Citrix ADC appliance and a FortiGate appliance.

IPSec Properties	Settings
IPSec mode	Tunnel mode
IKE version	Version 1
IKE DH group	DH group 2 (1024 bits MODP algorithm)
IKE authentication method	Pre-Shared Key
IKE encryption algorithm	AES
IKE hash algorithm	HMAC SHA1
ESP encryption algorithm	AES
ESP hash algorithm	HMAC SHA1

- You must specify the same IPSec settings on the Citrix ADC appliance and the FortiGate appliance at the two ends of the CloudBridge Connector.
- Citrix ADC provides a common parameter (in IPSec profiles) for specifying an IKE hash algorithm and an ESP hash algorithm. It also provides another common parameter for specifying an IKE encryption algorithm and an ESP encryption algorithm. Therefore in the FortiGate appliance, you must specify the same hash algorithm and same encryption algorithm in IKE (phase 1 configuration) and ESP (phase 2 configuration).

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- You must configure the firewall at the Citrix ADC end and FortiGate end to allow the following.
  - Any UDP packets for port 500
  - Any UDP packets for port 4500
  - Any ESP (IP protocol number 50) packets
- FortiGate appliance supports two types of VPN tunnels: Policy-based and Route-based. Only policy-based VPN tunnel is supported between a FortiGate appliance and a Citrix ADC appliance.

Configuring FortiGate appliance for the CloudBridge Connector tunnel

To configure a CloudBridge Connector tunnel on a FortiGate appliance, use the Fortinet Web-based Manager, which is the primary user interface for configuring, monitoring, and maintaining FortiGate appliances.

Before you begin the CloudBridge Connector tunnel configuration on a FortiGate appliance, make sure that:

- You have a user account with administrator credentials on the FortiGate appliance.
- You are familiar with the Fortinet Web-based Manager.
- The FortiGate appliance is UP and running, is connected to the Internet, and is also connected to the private subnets whose traffic is to be protected over the CloudBridge Connector tunnel.

> **Note**
>
> The procedures for configuring CloudBridge Connector tunnel on a FortiGate appliance might change over time, depending on the Fortinet release cycle. Citrix recommends that you follow the official Fortinet product documentation for Configuring IPSec VPN tunnels.

To configure a CloudBridge connector tunnel between a Citrix ADC appliance and a FortiGate appliance, perform the following tasks on the FortiGate appliance by using the Fortinet Web-based manager:

- **Enable Policy-based IPSec VPN feature**. Enable this feature for creating policy-based VPN tunnels on the FortiGate appliance. Only policy-based type of VPN tunnel is supported between a FortiGate appliance and a Citrix ADC appliance. A policy-based VPN tunnel configuration on a FortiGate appliance includes phase 1 settings, phase 2 settings, and an IPSec security policy.
- **Define phase 1 parameters.** Phase 1 parameters are used by the FortiGate appliance for IKE Authentication before forming a secure tunnel to the Citrix ADC appliance.
- **Define phase 2 parameters**. Phase 2 parameters are used by the FortiGate appliance for forming a secure tunnel to the Citrix ADC appliance by establishing IKE security associations (SA).
- **Specify private subnets**. Define the FortiGate-side and the Citrix ADC-side private subnets whose IP traffic is to be transported through the tunnel.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- **Define an IPSec security policy for the tunnel**. A security policy allow IP traffic to pass between interfaces on a FortiGate appliance. An IPSec security policy specifies the interface to the private subnet and the interface connecting the Citrix ADC appliance through the tunnel.

To enable Policy-based IPSec VPN feature by using the Fortinet Web-based Manager

1. Navigate to **System** > **Config** > **Features**.
2. On the **Feature Settings** page, select **Show More** and turn on **Policy-based IPSec VPN**.

To define phase 1 parameters by using the Fortinet Web-based Manager

1. Navigate to **VPN** > **IPsec** > **Auto Key (IKE)** and click **Create Phase1**.
2. On the **New Phase 1** page, set the following parameters:
    - Name: Enter a name for this phase 1 configuration.
    - Remote Gateway: Select *Static IP Address.*
    - Mode: Select *Main (ID Protection)*.
    - Authentication Method: Select *Preshared Key*.
    - Pre-Shared Key: Enter a pre-shared key. The same pre-shared key must be configured on the Citrix ADC appliance.
    - Peer Options: Set the following IKE paramters for authenticating a Citrix ADC appliance.
        - IKE Version: Select *1*.
        - Mode Config: Clear this option if it is selected.
        - Local Gateway IP: Select *Main Interface IP*.
        - P1 Proposal: Select the encryption and authentication algorithms for IKE Authentication before forming a secure tunnel to the Citrix ADC appliance.
            * 1 - Encryption: Select *AES128*.
            * Authentication: Select *SHA1*.
            * Keylife: Enter an amount of time (in seconds) for the phase 1 key life.
            * DH Group: Select 2.
        - X-Auth: Select *Disable*.
        - Deed Peer Detection: Select this option.
3. Click **OK**.

To specify private subnets by using the Fortinet Web-based Manager

1. Navigate to **Firewall Objects** > **Address** > **Addresses** and select **Create New**.
2. On the **New Address** page, set the following parameters:
    - Name: Enter a name for FortiGate-side subnet.
    - Type: Select *Subnet*.
    - Subnet / IP Range: Enter the address of the FortiGate-side subnet.
    - Interface: Select the local interface to this subnet.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

3. Click **OK**.
4. Repeat steps 1-3 to specify the Citrix ADC-side subnet.

To define phase 2 parameters by using the Fortinet Web-based Manager

1. Navigate to **VPN** > **IPsec** > **Auto Key (IKE)** and click **Create Phase 2**.
2. On the **New Phase 2** page, set the following parameters:
    - Name: Enter a name for this phase 2 configuration.
    - Phase 1: Select the Phase 1 configuration from the drop-down list.
3. Click **Advanced** and set the following parameters:
    - P2 Proposal: Select the encryption and authentication algorithms for forming a secure tunnel to the Citrix ADC appliance.
        - 1 - Encryption: Select *AES128*.
        - Authentication: Select *SHA1*.
        - Enable replay detection: Select this option.
        - Enable perfect forward secrecy (PFS): Select this option.
        - DH Group: Select *2*.
    - Keylife: Enter an amount of time (in seconds) for the phase 2 key life.
    - Autokey Keep Alive: Select this option.
    - Auto-negotiate: Select this option.
    - Quick Mode Selector: Specify the FortiGate-side and the Citrix ADC-side private subnets whose traffic is to be traversed through the tunnel.
        - Source Address: Select the FortiGate-side subnet from the drop-down list.
        - Source Port: Enter *0*.
        - Destination Address: Select the Citrix ADC-side subnet from the drop-down list.
        - Destination Port: Enter *0*.
        - Protocol: Enter *0*.
4. Click **OK**.

To define an IPSec security policy by using the Fortinet Web-based Manager

1. Navigate to **Policy** > **Policy** > **Policy** and click **Create New**.
2. On the **Edit Policy** page, set the following parameters:
    - Policy Type: Select *VPN*.
    - Policy Subtype: Select *IPSec*.
    - Local Interface: Select the local interface to the internal (private) network.
    - Local Protected Subnet: Select the FortiGate-side subnet from the drop-down list whose traffic is to be traversed through the tunnel.
    - Outgoing VPN Interface: Select the local interface to the external (public) network.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- Remote Protected Subnet: Select the Citrix ADC-side subnet from the drop-down list whose traffic is to be traversed through the tunnel.
- Schedule: Keep the default setting (*always*) unless changes are needed to meet specific requirements.
- Service: Keep the default setting (*ANY*) unless changes are needed to meet your specific requirements.
- VPN Tunnel: Select *Use Existing* and select the tunnel from the drop-down list.
- Allow traffic to be initiated from the remote site: Select if traffic from the remote network will be allowed to initiate the tunnel.

3. Click **OK**.

Configuring the Citrix ADC appliance for the CloudBridge Connector tunnel

To configure a CloudBridge Connector tunnel between a Citrix ADC appliance and a FortiGate appliance, perform the following tasks on the Citrix ADC appliance. You can use either the Citrix ADC command line or the Citrix ADC graphical user interface (GUI):

- **Create an IPSec profile**. An IPSec profile entity specifies the IPSec protocol parameters, such as IKE version, encryption algorithm, hash algorithm, and authentication method to be used by the IPSec protocol in the CloudBridge Connector tunnel.
- **Create an IP tunnel that uses IPSec protocol, and associate the IPSec profile with it**. An IP tunnel specifies the local IP address (CloudBridge Connector tunnel end point IP address (of type SNIP) configured on the Citrix ADC appliance), remote IP address (CloudBridge Connector tunnel endpoint IP address configured on the FortiGate appliance), protocol (IPSec) used to set up the CloudBridge Connector tunnel, and an IPSec profile entity. The created IP tunnel entity is also called the CloudBridge Connector tunnel entity.
- **Create a PBR rule and associate it with the IP tunnel**. A PBR entity specifies a set of rules and an IP tunnel (CloudBridge Connector tunnel) entity. The source IP address range and the destination IP address range are the conditions for the PBR entity. Set the source IP address range to specify the Citrix ADC-side subnet whose traffic is to be protected over the tunnel, and set the destination IP address range to specify the FortiGate appliance side subnet whose traffic is to be protected over the tunnel.

To create an IPSEC profile by using the Citrix ADC command line

At the command prompt, type:

- `add ipsec profile <name> -psk <string> -ikeVersion v1 -encAlgo AES -hashAlgo HMAC_SHA1 -perfectForwardSecrecy ENABLE`
- `show ipsec profile <name>`

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

To create an IPSEC tunnel and bind the IPSEC profile to it by using the Citrix ADC command line

At the command prompt, type:

- `add ipTunnel <name> <remote> <remoteSubnetMask> <local> -protocol IPSEC –ipsecProfileName** <string>`
- `show ipTunnel <name>`

To create a PBR rule and bind the IPSEC tunnel to it by using the Citrix ADC command line

At the command prompt, type:

- `add pbr <pbrName> ALLOW –srcIP <subnet-range> -destIP <subnet-range> -ipTunnel <tunnelName>`
- `apply pbrs`
- `show pbr <pbrName>`

To create an IPSEC profile by using the GUI

1. Navigate to **System** > **CloudBridge Connector** > **IPSec Profile**.
2. In the details pane, click **Add**.
3. In the **Add IPSec Profile** page, set the following parameters:
    - Name
    - Encryption Algorithm
    - Hash Algorithm
    - IKE Protocol Version
    - Perfect Forward Secrecy (Enable this paramter)
4. Configure the IPSec authentication method to be used by the two CloudBridge Connector tunnel peers to mutually authenticate: Select the Pre-shared key authentication method and set the Pre-Shared Key Exists parameter.
5. Click **Create**, and then click **Close**.

To create an IP tunnel and bind the IPSEC profile to it by using the GUI

1. Navigate to **System** > **CloudBridge Connector** > **IP Tunnels**.
2. On the **IPv4 Tunnels** tab, click **Add**.
3. In the **Add IP Tunnel** page, set the following parameters:
    - Name
    - Remote IP
    - Remote Mask
    - Local IP Type (In the Local IP Type drop-down list, select *Subnet IP*).
    - Local IP (All the configured IP addresses of the selected IP type are in the Local IP drop down list. Select the desired IP from the list.)

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- Protocol
- IPSec Profile

4. Click **Create**, and then click **Close**.

To create a PBR rule and bind the IPSEC tunnel to it by using the GUI

1. Navigate to **System** > **Network** > **PBR**.
2. On the **PBR** tab, click **Add**.
3. In the **Create PBR** page, set the following parameters:

   - Name
   - Action
   - Next Hop Type (Select *IP Tunnel*)
   - IP Tunnel Name
   - Source IP Low
   - Source IP High
   - Destination IP Low
   - Destination IP High

4. Click **Create**, and then click **Close**.

The corresponding new CloudBridge Connector tunnel configuration on the Citrix ADC appliance appears in the GUI.

The current status of the CloudBridge connector tunnel is shown in the Configured CloudBridge Connector pane. A green dot indicates that the tunnel is up. A red dot indicates that the tunnel is down.

The following commands create settings of Citrix ADC appliance NS_Appliance-1 in "Example of a CloudBridge Connector Configuration."

```
1      > add ipsec profile NS_Fortinet_IPSec_Profile -psk
          examplepresharedkey -ikeVersion v1 –encAlgo AES –hashalgo
          HMAC_SHA1 –lifetime 315360 -perfectForwardSecrecy ENABLE
2
3       Done
4      > add iptunnel NS_Fortinet_Tunnel 203.0.113.200 255.255.255.255
          198.51.100.100 –protocol IPSEC –ipsecProfileName
          NS_Fortinet_IPSec_Profile
5
6       Done
7      > add pbr NS_Fortinet_Pbr -srcIP 10.102.147.0-10.102.147.255 –
          destIP 10.20.0.0-10.20.255.255 –ipTunnel NS_Fortinet_Tunnel
8
9       Done
10     > apply pbrs
11
12      Done
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Monitoring the CloudBridge Connector tunnel

You can monitor the performance of CloudBridge Connector tunnels on a Citrix ADC appliance by using CloudBridge Connector tunnel statistical counters. For more information about displaying CloudBridge Connector tunnel statistics on a Citrix ADC appliance, see Monitoring CloudBridge Connector Tunnels.

CloudBridge Connector tunnel diagnostics and troubleshooting

September 14, 2021

If you have problems with a CloudBridge Connector tunnel configuration, make sure that all prerequisites were observed before the tunnel was set up. If they were, the problem might be with the tunnel end-point IP addresses, a NAT configuration, the way the tunnel was set up, or with the data traffic.

Troubleshooting a CloudBridge Connector tunnel

If your CloudBridge Connector tunnel does not function properly, the issue could be with tunnel establishment or with the data traffic. If you are unsure which type of problem you have, look for an error message in the log file and see if the error message is in the list of tunnel-establishment issues. If you do not find your error message, check the list of possible issues related to data traffic.

Issues Related to tunnel establishment

After the requirements for configuring the IPSec tunnel are met and the CloudBridge Connector tunnel is configured, if the status of the tunnel is not UP, look for debugging information in the iked.log file on one or both Citrix ADC appliances configured as the tunnel end points.

On either appliance, type the following command at the Citrix ADC shell prompt:

```
cat /tmp/iked.debug | tee /var/iked.log
```

The Troubleshooting pdf lists some common errors and their solutions.

Issues related to data traffic

If the data in the CloudBridge Connector tunnel are not exchanged properly between the tunnel end points, do the following.

- For a CloudBridge Connector tunnel that uses GRE and IPSec protocols:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- Make sure that L2 mode is enabled on both of the CloudBridge Connector tunnel end points. To enable L2 mode, type the following command at the Citrix ADC command line interface:

  ```
  enable mode L2
  ```

  * If one of the CloudBridge Connector tunnel end points is a CloudBridge virtual appliance (VPX) and is provisioned on a VMware ESXi hypervisor, make sure that Promiscuous mode is set to Accept for the vSwitch associated with the CloudBridge VPX appliance.
- If a VLAN is extended through a CloudBridge Connector tunnel, verify one-to-one mapping on the extended VLAN entity on each of the tunnel end points
- Make sure that the IP tunnel entity is bound to the correct netbridge entity in each of the tunnel end points.
- Verify that the ARP entry for the peer CloudBridge Connector tunnel end point exists on the local tunnel end point, by typing the following command at the Citrix ADC command line interface:

  ```
  show arp
  ```
- If the output shows an incomplete ARP entry, bidirectional traffic is not flowing through the tunnel. If bidirectional traffic is flowing, the ARP entry shows the name of tunnel interface for the devices on the other side of the tunnel.
- Remove the IP tunnel entities from both tunnel end points and add them again with the same parameters, but with the IPSec profile set to NONE, so that the tunnel uses only the GRE protocol.

  After verifying the following in the IP tunnel (that uses GRE protocol), configure the tunnel with IPSec parameters by specifying a valid IPSec profile to the respective IP tunnel entities on each of the tunnel end points.

  Proper PING or TCP flow through the tunnel.
  Proper flow of data traffic through the tunnel.

  After the configured tunnel (that uses GRE and IPSec protocols) is in UP state, if the data traffic does not flow properly through the tunnel, and if a NAT device was deployed in front of any or both of the tunnel end points, analyze the ingress and egress packets on the NAT devices.

- If a Citrix ADC appliance is used as Router or Gateway.
  - Make sure that L3 mode is enabled on the Citrix ADC appliance. To enable L3 mode, run the following command in the CloudBridge command line.
  - enable mode L3
  - If subnets are bound to a netbridge entity, make sure that correct IP tunnel entity is also bound to the netbridge.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- Run the following command in the Citrix ADC command line to see where the packets (Input and Output)are getting dropped:

  ```
  stat ipsec counters
  ```

- Make sure that the correct routes are configured on both the tunnel end points.
- If no NAT device is deployed in front of the Citrix ADC appliance, make sure that the firewalls are configured to allow any ESP (IP protocol number 50) packets and any UDP packets for port 4500.

If none of the above measures result in successful exchange of traffic between the tunnel end points, contact Citrix Technical Support.

Checklist before contacting Citrix technical Support

For a speedy resolution, make sure that you have the following items ready before contacting Citrix Technical Support.

- Details of the deployment and network topology.
- Log file collected by typing the following command at the Citrix ADC shell prompt.
  ```
  cat /tmp/iked.debug | tee /var/log/iked.log
  ```
- Tech support bundle captured by typing the following command at the Citrix ADC command line.
  ```
  show techsupport
  ```
- Packet traces captured on both CloudBridge Connector tunnel end points. To start a packet trace, type the following command at the Citrix ADC command line.
  ```
  start nstrace -size 0
  ```

  To stop packet trace, type the following command at the Citrix ADC command line.
  ```
  stop nstrace
  ```
- Output of the following command typed at the Citrix ADC command prompt.
  ```
  show arp
  ```

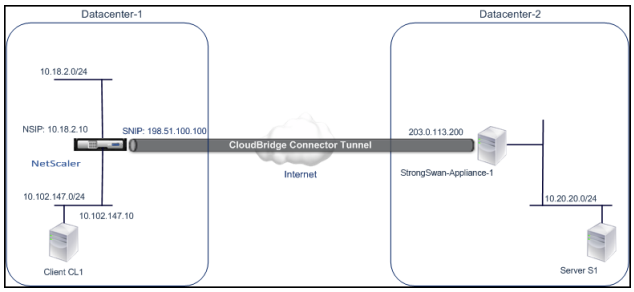
CloudBridge Connector interoperability –StrongSwan

September 14, 2021

StrongSwan is an opensource IPSec implementation for Linux platforms. You can configure a CloudBridge Connector tunnel between a Citrix ADC appliance and a StrongSwan appliance to connect two

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

datacenters or extend your network to a cloud provider. The Citrix ADC appliance and the StrongSwan appliance form the end points of the CloudBridge Connector tunnel and are called peers.



Example of a CloudBridge Connector tunnel configuration

As an illustration of the traffic flow in a CloudBridge Connector tunnel, consider an example in which a CloudBridge Connector tunnel is set up between the following devices:

- Citrix ADC appliance NS_Appliance-1 in a datacenter designated as Datacenter-1
- StrongSwan appliance StrongSwan-Appliance-1 in a datacenter designated as Datacenter-2

NS_Appliance-1 and StrongSwan-Appliance-1 enable communication between private networks in Datacenter-1 and Datacenter-2 through the CloudBridge Connector tunnel. In the example, NS_Appliance-1 and StrongSwan-Appliance-1 enable communication between client CL1 in Datacenter-1 and server S1 in Datacenter-2 through the CloudBridge Connector tunnel. Client CL1 and server S1 are on different private networks.

On NS_Appliance-1, the CloudBridge Connector tunnel configuration includes IPSec profile entity NS_StrongSwan_IPSec_Profile, CloudBridge Connector tunnel entity NS_StrongSwan_Tunnel, and policy based routing (PBR) entity NS_StrongSwan_Pbr.

The following table lists the settings used in this example.

Main settings of the CloudBridge Connector tunnel setup

Entity	Details
IP address of the CloudBridge Connector tunnel end point (NS_Appliance-1) in Datacenter-1	198.51.100.100
IP address of the CloudBridge Connector tunnel end point (StrongSwan-Appliance-1) in Datacenter-2	203.0.113.200
Datacenter–1's subnet whose traffic is to be protected over the CloudBridge Connector tunnel	10.102.147.0/24

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Entity	Details
Datacenter–2's subnet whose traffic is to be protected over the CloudBridge Connector tunnel	10.20.20.0/24

Settings on Citrix ADC appliance NS_Appliance-1 in Datacenter-1

SNIP1(for reference purposes only)	198.51.100.100	
IPSec profile	NS_StrongSwan_IPSec_Profile	IKE version: v1, Encryption algorithm: AES, Hash algorithm: HMAC_SHA1 psk = examplepresharedkey (Note: This is an example of a pre-share key, for illustration. Citrix does not recommend to use this string in your CloudBridge Connector configuration)
CloudBridge Connector tunnel	NS_StrongSwan_Tunnel	Remote IP = 203.0.113.200, Local IP= 198.51.100.100, Tunnel protocol = IPSEC, IPSec profile= NS_StrongSwan_IPSec_Profile
Policy based route	NS_StrongSwan_Pbr	Source IP range = Subnet in the Datacenter-1=10.102.147.0-10.102.147.255, Destination IP range =Subnet in Datacenter-2=10.20.20.0-10.20.20.255, IP Tunnel = NS_StrongSwan_Tunnel

Points to consider for a CloudBridge Connector tunnel configuration

Before you begin configuring CloudBridge connector tunnel, make sure that:

- You have a basic knowledge about linux configurations.
- You have a basic Knowledge about IPSec protocol suite.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- The StrongSwan appliance is UP and running, is connected to the Internet, and is also connected to the private subnets whose traffic is to be protected over the CloudBridge Connector tunnel.
- The Citrix ADC appliance is UP and running, is connected to the Internet, and is also connected to the private subnets whose traffic is to be protected over the CloudBridge Connector tunnel.
- The following IPSec settings are supported for a CloudBridge Connector tunnel between a Citrix ADC appliance and a StrongSwan appliance.
  - IPSec mode: Tunnel mode
  - IKE version: Version 1
  - IKE authentication method: Pre-Shared Key
  - IKE encryption algorithm: AES
  - IKE hash algorithm: HMAC SHA1
  - ESP encryption algorithm: AES
  - ESP hash algorithm: HMAC SHA1
- You must specify the same IPSec settings on the Citrix ADC appliance and the StrongSwan appliance at the two ends of the CloudBridge Connector tunnel.
- Citrix ADC provides a common parameter (in IPSec profiles) for specifying an IKE hash algorithm and an ESP hash algorithm. It also provides another common parameter for specifying an IKE encryption algorithm and an ESP encryption algorithm. Therefore, in the StrongSwan appliance, you must specify the same hash algorithm and same encryption algorithm in IKE and ESP parameters in the IPSec.conf file.
- You must configure the firewall at the Citrix ADC end and StrongSwan end to allow the following.
  - Any UDP packets for port 500
  - Any UDP packets for port 4500
  - Any ESP (IP protocol number 50) packets

Configure StrongSwan for the CloudBridge Connector tunnel

To configure a CloudBridge connector tunnel between a Citrix ADC appliance and a StrongSwan appliance, perform the following tasks on the StrongSwan appliance:

- **Specify IPsec connection information in ipsec.conf file**. ipsec.conf file defines all control and configuration information for IPsec connections in the strongSwan appliance.
- **Specify pre-shared key in ipsec.secrets file**. ipsec.secrets file defines secrets for IKE/IPsec authentication for IPsec connections in the strongSwan appliance.

The procedures for configuring IPsec VPN (CloudBridge Connector tunnel) on a StrongSwan appliance might change over time, depending on the StrongSwan release cycle. Citrix recommends that you follow the official StrongSwan documentation for Configuring IPSec VPN tunnels.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Following sample excerpt of ipsec.conf file specifies IPsec information for setting up the IPsec VPN tunnel, described in Example of a CloudBridge Connector Configuration topic. For more information, see CloudBridge Connector Configuration pdf.

Following sample excerpt of ipsec.secrets file specifies the IKE authentication pre-shared key for setting up the IPsec VPN tunnel, described in Example of a CloudBridge Connector Configuration topic.

`/etc/ipsec.secrets` PSK 'examplepresharedkey'#pre-shared key for IPsec IKE authentication

Configuring the Citrix ADC appliance for the CloudBridge Connector tunnel

To configure a CloudBridge Connector tunnel between a Citrix ADC appliance and a StrongSwan appliance, perform the following tasks on the Citrix ADC appliance. You can use either the Citrix ADC command line or the Citrix ADC graphical user interface (GUI):

- **Create an IPSec profile**. An IPSec profile entity specifies the IPSec protocol parameters, such as IKE version, encryption algorithm, hash algorithm, and authentication method to be used by the IPSec protocol in the CloudBridge Connector tunnel.
- **Create an IP tunnel that uses IPSec protocol, and associate the IPSec profile with it**. An IP tunnel specifies the local IP address (CloudBridge Connector tunnel endpoint IP address (of type SNIP) configured on the Citrix ADC appliance), remote IP address (CloudBridge Connector tunnel endpoint IP address configured on the StrongSwan appliance), protocol (IPSec) used to set up the CloudBridge Connector tunnel, and an IPSec profile entity. The created IP tunnel entity is also called the CloudBridge Connector tunnel entity.
- **Create a PBR rule and associate it with the IP tunnel**. A PBR entity specifies a set of rules and an IP tunnel (CloudBridge Connector tunnel) entity. The source IP address range and the destination IP address range are the conditions for the PBR entity. Set the source IP address range to specify the Citrix ADC-side subnet whose traffic is to be protected over the tunnel, and set the destination IP address range to specify the StrongSwan side subnet whose traffic is to be protected over the tunnel.

To create an IPSEC profile by using the Citrix ADC command line

At the command prompt, type:

- `add ipsec profile <name> -psk <string> -ikeVersion v1 -encAlgo AES -hashAlgo HMAC_SHA1`
- `show ipsec profile <name>`

To create an IPSEC tunnel and bind the IPSEC profile to it by using the Citrix ADC command line

At the command prompt, type:

- `add ipTunnel <name> <remote> <remoteSubnetMask> <local> -protocol IPSEC –ipsecProfileName <string>`

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- `show ipTunnel <name>`

To create a PBR rule and bind the IPSEC tunnel to it by using the Citrix ADC command line

At the command prompt, type:

- `add pbr <pbrName> ALLOW –srcIP <subnet-range> -destIP <subnet-range> -ipTunnel <tunnelName>`
- `apply pbrs`
- `show pbr <pbrName>`

To create an IPSEC profile by using the GUI

1. Navigate to **System** > **CloudBridge Connector** > **IPSec Profile**.
2. In the details pane, click **Add**.
3. In the **Add IPSec Profile** page, set the following parameters:
    - Name
    - Encryption Algorithm
    - Hash Algorithm
    - IKE Protocol Version
4. Configure the IPSec authentication method to be used by the two CloudBridge Connector tunnel peers to mutually authenticate: Select the **Pre-shared key authentication method** and set the **Pre-Shared Key Exists** parameter.
5. Click **Create**, and then click **Close**.

To create an IP tunnel and bind the IPSEC profile to it by using the GUI

1. Navigate to **System** > **CloudBridge Connector** > **IP Tunnels**.
2. On the **IPv4 Tunnels** tab, click **Add**.
3. In the Add IP Tunnel page, set the following parameters:
    - Name
    - Remote IP
    - Remote Mask
    - Local IP Type (In the Local IP Type drop-down list, select *Subnet IP*).
    - Local IP (All the configured IP addresses of the selected IP type are in the Local IP drop-down list. Select the desired IP from the list.)
    - Protocol
    - IPSec Profile
4. Click **Create**, and then click **Close**.

To create a PBR rule and bind the IPSEC tunnel to it by using the GUI

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

1. Navigate to **System** > **Network** > **PBR**.
2. On the **PBR** tab, click **Add**.
3. In the **Create PBR** page, set the following parameters:
   - Name
   - Action
   - Next Hop Type (Select *IP Tunnel*)
   - IP Tunnel Name
   - Source IP Low
   - Source IP High
   - Destination IP Low
   - Destination IP High
4. Click **Create**, and then click **Close**.

The corresponding new CloudBridge Connector tunnel configuration on the Citrix ADC appliance appears in the GUI. The current status of the CloudBridge connector tunnel is shown in the Configured CloudBridge Connector pane. A green dot indicates that the tunnel is up. A red dot indicates that the tunnel is down.
The following commands create settings of Citrix ADC appliance NS_Appliance-1 in "Example of a CloudBridge Connector Configuration:

```
> add ipsec profile NS_StrongSwan_IPSec_Profile -psk
   examplepresharedkey -ikeVersion v1 –encAlgo AES –hashalgo
   HMAC_SHA1

Done

> add iptunnel NS_StrongSwan_Tunnel 203.0.113.200 255.255.255.255
   198.51.100.100 –protocol IPSEC –ipsecProfileName
   NS_StrongSwan_IPSec_Profile

Done

> add pbr NS_StrongSwan_Pbr -srcIP 10.102.147.0-10.102.147.255 –
   destIP 10.20.0.0-10.20.255.255 –ipTunnel NS_StrongSwan_Tunnel

Done

> apply pbrs

Done
```

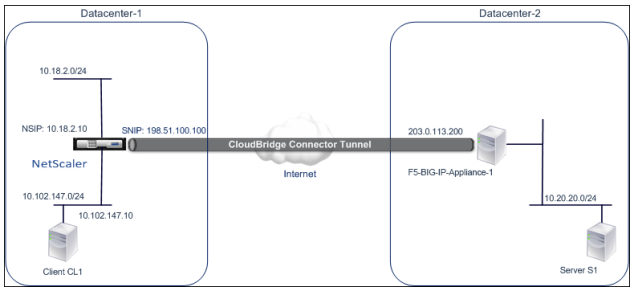
Monitoring the CloudBridge Connector tunnel

You can monitor the performance of CloudBridge Connector tunnels on a Citrix ADC appliance by using CloudBridge Connector tunnel statistical counters. For more information about displaying CloudBridge Connector tunnel statistics on a Citrix ADC appliance, see Monitoring CloudBridge Connector Tunnels.

CloudBridge Connector interoperability –F5 BIG-IP

September 14, 2021

You can configure a CloudBridge Connector tunnel between a Citrix ADC appliance and a F5 BIG-IP appliance to connect two datacenters or extend your network to a cloud provider. The Citrix ADC appliance and the F5 BIG-IP appliance form the end points of the CloudBridge Connector tunnel and are called peers.



Example of a CloudBridge Connector tunnel configuration

As an illustration of the traffic flow in a CloudBridge Connector tunnel, consider an example in which a CloudBridge Connector tunnel is set up between the following devices:

- Citrix ADC appliance NS_Appliance-1 in a datacenter designated as Datacenter-1
- F5 BIG-IP appliance F5-BIG-IP-Appliance-1 in a datacenter designated as Datacenter-2

NS_Appliance-1 and F5-BIG-IP-Appliance-1 enable communication between private networks in Datacenter-1 and Datacenter-2 through the CloudBridge Connector tunnel. In the example, NS_Appliance-1 and F5-BIG-IP-Appliance-1 enable communication between client CL1 in Datacenter-1 and server S1 in Datacenter-2 through the CloudBridge Connector tunnel. Client CL1 and server S1 are on different private networks.

On NS_Appliance-1, the CloudBridge Connector tunnel configuration includes IPSec profile entity NS_F5-BIG-IP_IPSec_Profile, CloudBridge Connector tunnel entity NS_F5-BIG-IP_Tunnel, and policy based routing (PBR) entity NS_F5-BIG-IP_Pbr.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

For more information, refer to F5 big IP pdf.

Points to consider for a CloudBridge Connector tunnel configuration

- The Citrix ADC appliance is UP and running, is connected to the Internet, and is also connected to the private subnets whose traffic is to be protected over the CloudBridge Connector tunnel.
- The F5 BIG-IP appliance is UP and running, is connected to the Internet, and is also connected to the private subnets whose traffic is to be protected over the CloudBridge Connector tunnel.
- The following IPSec settings are supported for a CloudBridge Connector tunnel between a Citrix ADC appliance and an F5 BIG-IP appliance.
  - IPSec mode: Tunnel mode
  - IKE version: Version 1
  - IKE authentication method: Pre-Shared Key
  - IKE encryption algorithm: AES
  - IKE hash algorithm: HMAC SHA1
  - ESP encryption algorithm: AES
  - ESP hash algorithm: HMAC SHA1
- You must specify the same IPSec settings on the Citrix ADC appliance and the F5 BIG-IP appliance at the two ends of the CloudBridge Connector tunnel.
- Citrix ADC provides a common parameter (in IPSec profiles) for specifying an IKE hash algorithm and an ESP hash algorithm. It also provides another common parameter for specifying an IKE encryption algorithm and an ESP encryption algorithm. Therefore, in the F5 BIG-IP appliance, you must specify the same hash algorithm and same encryption algorithm in IKE (phase 1 configuration) and ESP (phase 2 configuration).
- You must configure the firewall at the Citrix ADC end and F5 BIG-IP end to allow the following.
  - Any UDP packets for port 500
  - Any UDP packets for port 4500
  - Any ESP (IP protocol number 50) packets

Configuring F5 BIG-IP for the CloudBridge Connector tunnel

To configure a CloudBridge connector tunnel between a Citrix ADC appliance and an F5 BIG-IP appliance, perform the following tasks on the F5 BIG-IP appliance:

- **Create a forwarding virtual server for IPsec**. A forwarding virtual server intercepts IP traffic for the IPsec tunnel.
- **Create an IKE peer.** An IKE peer specifies the local and remote IPsec tunnel endpoints. It also specifies algorithms and credentials to be used for IPsec IKE phase 1.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- **Create a custom IPsec policy.** A policy specifies the IPSec protocol (ESP) and the mode (tunnel) to be used for forming the IPsec tunnel. It also specifies the algorithms and security parameters to be used for IKE IPsec phase 2.
- **Create a bidirectional IPsec traffic selector**. A traffic selector specifies the F5 BIG-IP side and Citrix ADC side subnets whose IP traffic is to be traversed through the IPsec tunnel.

The procedures for configuring IPsec VPN (CloudBridge Connector tunnel) on an F5 BIG-IP appliance might change over time, depending on the F5 release cycle. Citrix recommends that you follow the official F5 BIG-IP documentation for configuring IPSec VPN tunnels, at:

https://f5.com

To create a forwarding virtual server for IPsec by using the F5 BIG-IP GUI

1. On the **Main** tab, click **Local Traffic** > **Virtual Servers**, and then click **Create**.
2. On **New Virtual Server List** screen, set the following parameters:
    - **Name**. Type a unique name for the virtual server.
    - **Type**. Select **Forwarding (IP)**.
    - **Destination Address**. Type a wildcard network address in CIDR format, for example, 0.0.0.0/0 for IPv4 to accept any traffic.
    - **Service Port**. Select **All Ports** from the list.
    - **Protocol list**. Select **All Protocols** from the list.
    - **VLAN and Tunnel Traffic**. Retain the default selection, **All VLANs and Tunnels**.
3. Click **Finished**.

To create a custom IPsec policy by using the F5 BIG-IP GUI

1. On the **Main** tab, click **Network** > **IPsec** > **IPsec Policies**, and then click **Create**.
2. On the **New Policy** screen, set the following parameters:
    - **Name**. Type a unique name for the policy.
    - **IPsec Protocol**. Retain the default selection, ESP.
    - **Mode**. Select Tunnel. The screen refreshes to show additional related settings.
    - **Tunnel Local Address**. Type the local IPsec tunnel endpoint IP address (Configured on the F5 BIG-IP appliance).
    - **Tunnel Remote Address**. Type the remote IPsec tunnel endpoint IP address (Configured on the Citrix ADC appliance).
3. For the IKE Phase 2 parameters, retain the default values, or select the options that are appropriate for your deployment.
4. Click **Finished**.

To create a bidirectional IPsec traffic selector by using the F5 BIG-IP GUI

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

1. On the **Main** tab, click **Network** > **IPsec** > **Traffic Selectors**, and then click **Create**.
2. On the **New Traffic Selector** screen, set the following parameters:
   - **Name**. Type a unique name for the traffic selector.
   - **Order**. Retain the default value **(First)**. This setting specifies the order in which the traffic selector appears on the Traffic Selector List screen.
3. From the **Configuration** list, select **Advanced**, and set the following parameters:
   - **Source IP Address**. Click **Host** or **Network**, and in **Address** field, type the address of the F5 BIG-IP side subnet whose traffic is to be protected over the IPsec tunnel.
   - **Source Port**. Select *** All Ports**.
   - **Destination IP Address**. Click **Host**, and in the **Address** field, type the address of the Citrix ADC side subnet whose traffic is to be protected over the IPsec tunnel.
   - **Destination Port**. Select *** All Ports**.
   - **Protocol**. Select *** All Protocols**.
   - **Direction**. Select **Both**.
   - **Action**. Select **Protect**. The **IPsec Policy Name** setting appears.
   - **IPsec Policy Name**. Select the name of the custom IPsec policy that you created.
4. Click **Finished**.

Configuring the Citrix ADC appliance for the CloudBridge Connector tunnel

To configure a CloudBridge Connector tunnel between a Citrix ADC appliance and a F5 BIG-IP appliance, perform the following tasks on the Citrix ADC appliance. You can use either the Citrix ADC command line or the Citrix ADC graphical user interface (GUI):

- **Create an IPSec profile**. An IPSec profile entity specifies the IPSec protocol parameters, such as IKE version, encryption algorithm, hash algorithm, and authentication method to be used by the IPSec protocol in the CloudBridge Connector tunnel.
- **Create an IP tunnel that uses IPSec protocol, and associate the IPSec profile with it**. An IP tunnel specifies the local IP address (CloudBridge Connector tunnel end point IP address (of type SNIP) configured on the Citrix ADC appliance), remote IP address (CloudBridge Connector tunnel endpoint IP address configured on the F5 BIG-IP appliance), protocol (IPSec) used to set up the CloudBridge Connector tunnel, and an IPSec profile entity. The created IP tunnel entity is also called the CloudBridge Connector tunnel entity.
- **Create a PBR rule and associate it with the IP tunnel**. A PBR entity specifies a set of rules and an IP tunnel (CloudBridge Connector tunnel) entity. The source IP address range and the destination IP address range are the conditions for the PBR entity. Set the source IP address range to specify the Citrix ADC-side subnet whose traffic is to be protected over the tunnel, and set the destination IP address range to specify the F5 BIG-IP side subnet whose traffic is to be protected over the tunnel.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

To create an IPSEC profile by using the Citrix ADC command line

At the command prompt, type:

- `add ipsec profile <name> -psk <string> -ikeVersion v1 -encAlgo AES -hashAlgo HMAC_SHA1 -perfectForwardSecrecyENABLE`
- `show ipsec profile** <name>`

To create an IPSEC tunnel and bind the IPSEC profile to it by using the Citrix ADC command line

At the command prompt, type:

- `add ipTunnel <name> <remote> <remoteSubnetMask> <local> -protocol IPSEC –ipsecProfileName <string>`
- `show ipTunnel <name>`

To create a PBR rule and bind the IPSEC tunnel to it by using the Citrix ADC command line

At the command prompt, type:

- `add pbr <pbrName> ALLOW –srcIP <subnet-range> -destIP <subnet-range> -ipTunnel <tunnelName>`
- `apply pbrs`
- `show pbr <pbrName>`

To create an IPSEC profile by using the GUI

1. Navigate to **System** > **CloudBridge Connector** > **IPSecProfile**.
2. In the details pane, click **Add**.
3. In the **Add IPSec Profile** page, set the following parameters:
    - Name
    - Encryption Algorithm
    - Hash Algorithm
    - IKE Protocol Version
4. Configure the IPSec authentication method to be used by the two CloudBridge Connector tunnel peers to mutually authenticate: Select the **Pre-shared key authentication method** and set the **Pre-Shared Key Exists** parameter.
5. Click **Create**, and then click **Close**.

To create an IP tunnel and bind the IPSEC profile to it by using the GUI

1. Navigate to **System** > **CloudBridge Connector** > **IP Tunnels**.
2. On the **IPv4 Tunnels** tab, click **Add**.
3. In the **Add IP Tunnel** page, set the following parameters:
    - Name

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- Remote IP
- Remote Mask
- Local IP Type (In the Local IP Type drop-down list, select *Subnet IP*).
- Local IP (All the configured IP addresses of the selected IP type are in the Local IP drop down list. Select the desired IP from the list.)
- Protocol
- IPSec Profile

4. Click **Create**, and then click **Close**.

To create a PBR rule and bind the IPSEC tunnel to it by using the GUI

1. Navigate to **System** > **Network** > **PBR**.
2. On the **PBR** tab, click **Add**.
3. In the **Create PBR** page, set the following parameters:

- Name
- Action
- Next Hop Type (Select *IP Tunnel*)
- IP Tunnel Name
- Source IP Low
- Source IP High
- Destination IP Low
- Destination IP High

4. Click **Create**, and then click **Close**.

The corresponding new CloudBridge Connector tunnel configuration on the Citrix ADC appliance appears in the GUI. The current status of the CloudBridge connector tunnel is shown in the Configured CloudBridge Connector pane. A green dot indicates that the tunnel is up. A red dot indicates that the tunnel is down.

The following commands create settings of Citrix ADC appliance NS_Appliance-1 in “Example of a CloudBridge Connector Configuration.:

```
1      > add ipsec profile NS_F5-BIG-IP_IPSec_Profile -psk
         examplepresharedkey -ikeVersion v1 –encAlgo AES –hashalgo
         HMAC_SHA1 –lifetime 315360 -perfectForwardSecrecy ENABLE
2
3
4      Done
5
6      > add iptunnel NS_F5-BIG-IP_Tunnel 203.0.113.200 255.255.255.255
         198.51.100.100 –protocol IPSEC –ipsecProfileName NS_F5-BIG-
         IP_IPSec_Profile
7
8
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
Done

> add pbr NS_F5-BIG-IP_Pbr -srcIP 10.102.147.0-10.102.147.255 –
    destIP 10.20.0.0-10.20.255.255 – ipTunnel NS_F5-BIG-IP_Tunnel

Done

> apply pbrs

Done
```

Monitoring the CloudBridge Connector tunnel

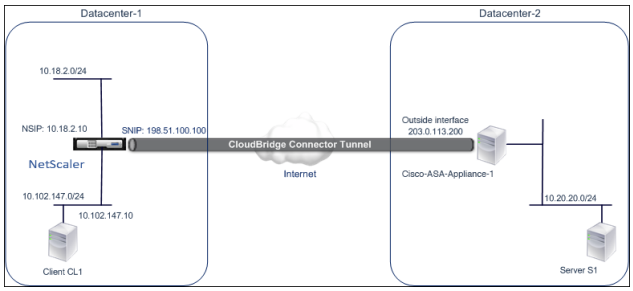
You can monitor the performance of CloudBridge Connector tunnels on a Citrix ADC appliance by using CloudBridge Connector tunnel statistical counters. For more information about displaying CloudBridge Connector tunnel statistics on a Citrix ADC appliance, see Monitoring CloudBridge Connector Tunnels.

CloudBridge Connector interoperability –Cisco ASA

September 14, 2021

You can configure a CloudBridge Connector tunnel between a Citrix ADC appliance and a Cisco ASA appliance to connect two datacenters or extend your network to a cloud provider. The Citrix ADC appliance and the Cisco ASA appliance form the end points of the CloudBridge Connector tunnel and are called peers.

Example of a CloudBridge Connector tunnel configuration



As an illustration of the traffic flow in a CloudBridge Connector tunnel, consider an example in which a CloudBridge Connector tunnel is set up between the following appliances:

- Citrix ADC appliance NS_Appliance-1 in a datacenter designated as Datacenter-1
- Cisco ASA appliance Cisco-ASA-Appliance-1 in a datacenter designated as Datacenter-2

NS_Appliance-1 and Cisco-ASA-Appliance-1 enable communication between private networks in Datacenter-1 and Datacenter-2 through the CloudBridge Connector tunnel. In the example, NS_Appliance-1 and Cisco-ASA-Appliance-1 enable communication between client CL1 in Datacenter-1 and server S1 in Datacenter-2 through the CloudBridge Connector tunnel. Client CL1 and server S1 are on different private networks.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

On NS_Appliance-1, the CloudBridge Connector tunnel configuration includes IPSec profile entity NS_Cisco-ASA_IPSec_Profile, CloudBridge Connector tunnel entity NS_Cisco-ASA_Tunnel, and policy based routing (PBR) entity NS_Cisco-ASA_Pbr.

Points to consider for a CloudBridge Connector tunnel configuration

Before you begin configuring CloudBridge connector tunnel, make sure that:

- The following IPSec settings are supported for a CloudBridge Connector tunnel between a Citrix ADC appliance and a Cisco ASA appliance.

IPSec Properties	Settings
IPSec mode	Tunnel mode
IKE version	Version 1
IKE authentication method	Pre-Shared Key
IKE encryption algorithm	AES, 3DES
IKE hash algorithm	HMAC SHA1, HMAC MD5
ESP encryption algorithm	AES, 3DES
ESP hash algorithm	HMAC SHA1, HMAC MD5

- You must specify the same IPSec settings on the Citrix ADC appliance and the Cisco ASA appliance at the two ends of the CloudBridge Connector tunnel.
- Citrix ADC provides a common parameter (in IPSec profiles) for specifying an IKE hash algorithm and an ESP hash algorithm. It also provides another common parameter for specifying an IKE encryption algorithm and an ESP encryption algorithm. Therefore, in the Cisco ASA appliance, you must specify the same hash algorithm and same encryption algorithm in IKE (phase 1 configuration) and ESP (phase 2 configuration).
- You must configure the firewall at the Citrix ADC end and Cisco ASA end to allow the following.
  - Any UDP packets for port 500

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- Any UDP packets for port 4500
- Any ESP (IP protocol number 50) packets

Configuring Cisco ASA for the CloudBridge Connector tunnel

To configure a CloudBridge Connector tunnel on a Cisco ASA appliance, use the Cisco ASA command line interface, which is the primary user interface for configuring, monitoring, and maintaining Cisco ASA appliances.

Before you begin the CloudBridge Connector tunnel configuration on a Cisco ASA appliance, make sure that:

- You have a user account with administrator credentials on the Cisco ASA appliance.
- You are familiar with the Cisco ASA command line interface.
- The Cisco ASA appliance is UP and running, is connected to the Internet, and is also connected to the private subnets whose traffic is to be protected over the CloudBridge Connector tunnel.

> **Note**
>
> The procedures for configuring CloudBridge Connector tunnel on a Cisco ASA appliance might change over time, depending on the Cisco release cycle. Citrix recommends that you follow the official Cisco ASA product documentation for Configuring IPSec VPN tunnels, at:

- http://www.cisco.com

To configure a CloudBridge connector tunnel between a Citrix ADC appliance and a Cisco ASA appliance, perform the following tasks on the Cisco ASA appliance's command line:

- **Create an IKE Policy**. An IKE policy defines a combination of security parameters to be used during the IKE negotiation (phase 1). For example, parameters such as hash algorithm, encryption algorithm, and authentication method to be used in the IKE negotiation are set in this task.
- **Enable IKE on the outside interface**. Enable IKE on the outside interface through which the tunnel traffic will flow to the tunnel peer.
- **Create a tunnel group**. A tunnel group specifies the type of tunnel and the pre-shared key. The tunnel type must be set to ipsec-l2l, which stands for IPsec LAN to LAN. A pre-shared key is a text string, which the peers of a CloudBridge Connector tunnel use to mutually authenticate with each other. The pre-shared keys are matched against each other for IKE authentication. Therefore, for the authentication to be successful, you must configure the same pre-shared key on the Cisco ASA appliance and the Citrix ADC appliance.
- **Define a transform set**. A transform set defines a combination of security parameters (phase 2) to be used in the exchange of data over the CloudBridge Connector tunnel after the IKE negotiation is successful.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- **Create an access List**. Crypto access lists are used to define the subnets whose IP traffic will be protected over the CloudBridge tunnel. The source and destination parameters in the access list specify the Cisco appliance side and Citrix ADC side subnets that are to be protected over the CloudBridge Connector Tunnel. The access list must be set to permit. Any request packet that originates from an appliance in the Cisco appliance side subnet and is destined to an appliance in the Citrix ADC side subnet, and that matches the source and destination parameters of the access list, is sent across the CloudBridge Connector tunnel.
- **Create a crypto map**. Crypto maps define the IPSec parameters for security associations (SAs). They include the following: Crypto access list to identify the subnets whose traffic is to be protected over the CloudBridge tunnel, peer (Citrix ADC) identification by IP address, and transform set to match the peer security settings.
- **Apply the crypto Map to the outside interface**. In this task, you apply the crypto map to the outside interface through which the tunnel traffic will flow to the tunnel peer. Applying the crypto map to an interface instructs the Cisco ASA appliance to evaluate all interface traffic against the crypto map set and to use the specified policy during connection or security association negotiations.

The examples in the following procedures create settings of Cisco ASA appliance Cisco-ASA-Appliance-1 used in Example of CloudBridge Connector Configuration and Data Flow.

To create an IKE policy by using the Cisco ASA command line

At the Cisco ASA appliance's command prompt, type the following commands, starting in global configuration mode, in the order shown:

Command	Example	Command Description
crypto ikev1 policy priority	Cisco-ASA-appliance-1(config)# crypto ikev1 policy 1	Enter IKE policy configuration mode and identify the policy to create. (Each policy is uniquely identified by the priority number you assign.) This example configures policy 1.
encryption (3des | aes)	Cisco-ASA-appliance-1 (config-ikev1-policy)# encryption 3des	Specify the encryption algorithm. This example configures the 3DES algorithm.
hash (sha | md5)	Cisco-ASA-appliance-1 (config-ikev1-policy)# hash sha	Specify the hash algorithm. This example configures SHA.
authenticationpre-share	Cisco-ASA-appliance-1 (config-ikev1-policy)# authentication pre-share	Specify the pre-share authentication method.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Command	Example	Command Description
group 2	Cisco-ASA-appliance-1 (config-ikev1-policy)# group 2	Specify 1024-bit Diffie-Hellman group identifier (2).
lifetime seconds	Cisco-ASA-appliance-1 (config-ikev1-policy)# lifetime 28800	Specify the security association's lifetime in seconds. This example configures 28800 seconds, which is the default value of lifetime in a Citrix ADC appliance.

To enable IKE on the outside interface by using the Cisco ASA command line

At the Cisco ASA appliance's command prompt, type the following commands, starting in global configuration mode, in the order shown:

Command	Example	Command Description
crypto ikev1 enable outside	Cisco-ASA-appliance-1(config)# crypto ikev1 enable outside	Enable IKEv1 on the interface through which the tunnel traffic flows to the tunnel peer. This example enables IKEv1 on the interface named outside.

To create a tunnel group by using the Cisco ASA command line

At the Cisco ASA appliance's command prompt, type the following commands, starting in global configuration mode, as show in the attached pdf Tunnel Group using Cisco ASA command line:

To create a crypto access list by using the Cisco ASA command line

At the Cisco ASA appliance's command prompt, type the following command in global configuration mode, in the order shown:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Command	Example	Command Description
access-list access-list-number permit IP source source-wildcard destination destination-wildcard	Cisco-ASA-appliance-1(config)# access-list 111 permit ip 10.20.20.0 0.0.0.255 10.102.147.0 0.0.0.255	Specify conditions to determine the subnets whose IP traffic is to be protected over the CloudBridge Connector tunnel. This example configures access list 111 to protect traffic from subnets 10.20.20.0/24 (at the Cisco-ASA-Appliance-1 side) and 10.102.147.0/24 (at the NS_Appliance-1 side).

To define a transform set by using the Cisco ASA command line

At the Cisco ASA appliance's command prompt, type the following commands, starting in global configuration mode. See Transform set using ASA command line table pdf.

To create a crypto map by using the Cisco ASA command line

At the Cisco ASA appliance's command prompt, type the following commands starting in global configuration mode, in the order shown:

Command	Example	Command Description
crypto map map-name seq-num match address access-list-name	Cisco-ASA-appliance-1 (config)# crypto map NS-CISCO-CM 1 match address 111	Create a crypto map and specify an access list to it. This example configures crypto map NS-CISCO-CM with sequence number 1 and assigns access list 111 to NS-CISCO-CM.
crypto map map-name seq-num set peer ip-address	Cisco-ASA-appliance-1 (config)# crypto map NS-CISCO-CM 1 set peer 198.51.100.100	Specify the peer (Citrix ADC appliance) by its IP address. This example specifies 198.51.100.100, which is the tunnel endpoint IP address on the Citrix ADC appliance.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Command	Example	Command Description
crypto map map-name seq-num set ikev1 transform-set transform-set-name	Cisco-ASA-appliance-1 (config)# crypto map NS-CISCO-CM 1 set ikev1 transform-set NS-CISCO-TS	Specify which transform set is allowed for this crypto map entry. This example specifies transform set NS-CISCO-TS.

To apply a crypto map to an interface by using the Cisco ASA command line

At the Cisco ASA appliance's command prompt, type the following commands starting in global configuration mode, in the order shown:

Command	Example	Command Description
crypto map map-nameinterface interface-name	Cisco-ASA-appliance-1(config)# crypto map NS-CISCO-CM interface outside	Apply the crypto map to the interface through which CloudBridge Connector tunnel traffic will flow. This example applies crypto map NS-CISCO-CM to interface outside.

Configuring the Citrix ADC appliance for the CloudBridge Connector tunnel

To configure a CloudBridge Connector tunnel between a Citrix ADC appliance and a Cisco ASA appliance, perform the following tasks on the Citrix ADC appliance. You can use either the Citrix ADC command line or the Citrix ADC graphical user interface (GUI):

- Create an IPSec profile.
- Create an IP tunnel that uses IPSec protocol, and associate the IPSec profile with it.
- Create a PBR rule and associate it with the IP tunnel.

To create an IPSEC profile by using the Citrix ADC command line:

At the command prompt, type:

- `add ipsec profile <name> -psk <string> -ikeVersion v1 -encAlgo AES -hashAlgo HMAC_SHA1 -perfectForwardSecrecy ENABLE`
- `show ipsec profile <name>`

To create an IPSEC tunnel and bind the IPSEC profile to it by using the Citrix ADC command line:

At the command prompt, type:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- `add ipTunnel <name> <remote> <remoteSubnetMask> <local> -protocol IPSEC –ipsecProfileName <string>`
- `show ipTunnel <name>`

To create a PBR rule and bind the IPSEC tunnel to it by using the Citrix ADC command line:

At the command prompt, type:

- `**add pbr** <pbrName> **ALLOW** –**srcIP** <subnet-range> -** destIP** <subnet-range>`
- `**ipTunnel** <tunnelName>`
- `**apply pbrs**`
- `**show pbr** <pbrName>`

To create an IPSEC profile by using the GUI:

1. Navigate to **System** > **CloudBridge Connector** > **IPSec Profile**.
2. In the details pane, click **Add**.
3. In the **Add IPSec Profile** page, set the following parameters:
    - Name
    - Encryption Algorithm
    - Hash Algorithm
    - IKE Protocol Version
    - Perfect Forward Secrecy (Enable this parameter)
4. Configure the IPSec authentication method to be used by the two CloudBridge Connector tunnel peers to mutually authenticate: Select the **Pre-shared key authentication** method and set the **Pre-Shared Key Exists** parameter.
5. Click **Create**, and then click **Close**.

To create an IP tunnel and bind the IPSEC profile to it by using the GUI:

1. Navigate to **System** > **CloudBridge Connector** > **IP Tunnels**.
2. On the **IPv4 Tunnels tab**, click **Add**.
3. In the **Add IP Tunnel** page, set the following parameters:
    - Name
    - Remote IP
    - Remote Mask
    - Local IP Type (In the Local IP Type drop-down list, select Subnet IP).
    - Local IP (All the configured IP addresses of the selected IP type are in the Local IP drop down list. Select the desired IP from the list.)
    - Protocol
    - IPSec Profile

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

4. Click **Create**, and then click **Close**.

To create a PBR rule and bind the IPSEC tunnel to it by using the GUI:

1. Navigate to **System** > **Network** > **PBR**.
2. On the **PBR** tab, click **Add**.
3. In the **Create PBR** page, set the following parameters:
   - Name
   - Action
   - Next Hop Type (Select IP Tunnel)
   - IP Tunnel Name
   - Source IP Low
   - Source IP High
   - Destination IP Low
   - Destination IP High
4. Click **Create**, and then click **Close**.

The corresponding new CloudBridge Connector tunnel configuration on the Citrix ADC appliance appears in the GUI. The current status of the CloudBridge connector tunnel is shown in the Configured CloudBridge Connector pane. A green dot indicates that the tunnel is up. A red dot indicates that the tunnel is down.

The following commands create settings of Citrix ADC appliance NS_Appliance-1 in "Example of a CloudBridge Connector Configuration.":

```
1  >  add ipsec profile NS_Cisco-ASA_IPSec_Profile -psk
       examplepresharedkey -ikeVersion v1 –encAlgo AES –hashalgo
       HMAC_SHA1 –lifetime 315360 -perfectForwardSecrecy ENABLE
2
3  Done
4
5  >  add iptunnel NS_Cisco-ASA_Tunnel 203.0.113.200 255.255.255.255
       198.51.100.100 –protocol IPSEC –ipsecProfileName NS_Cisco-
       ASA_IPSec_Profile
6
7
8  Done
9
10 > add pbr NS_Cisco-ASA_Pbr -srcIP 10.102.147.0-10.102.147.255 –destIP
       10.20.0.0-10.20.255.255 –ipTunnel NS_Cisco-ASA_Tunnel
11
12
13 Done
14
15 > apply pbrs
16
17 Done
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Monitoring the CloudBridge Connector Tunnel

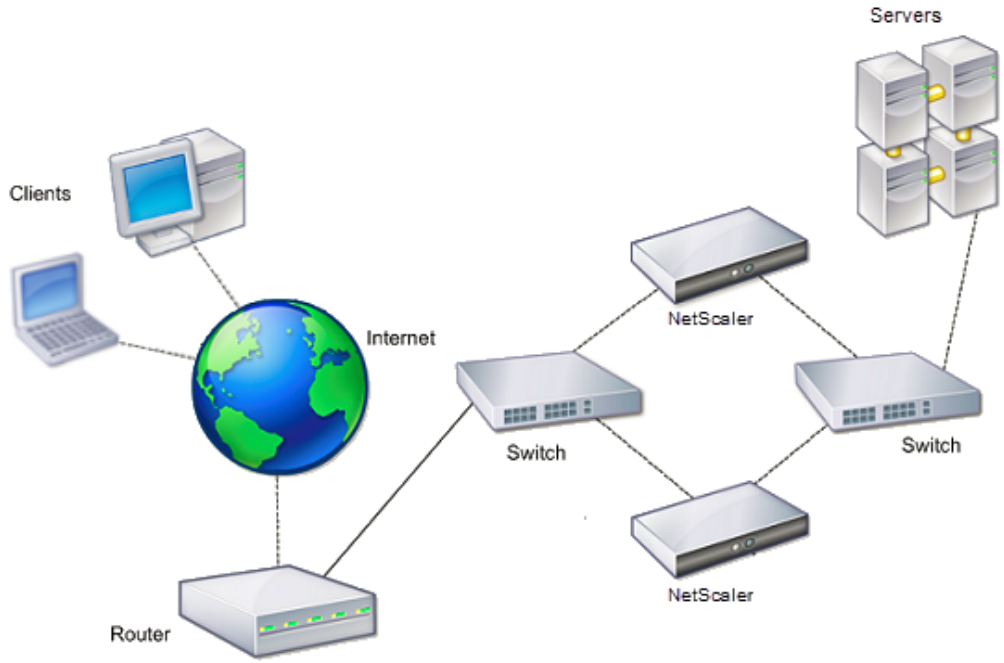
You can monitor the performance of CloudBridge Connector tunnels on a Citrix ADC appliance by using CloudBridge Connector tunnel statistical counters. For more information about displaying CloudBridge Connector tunnel statistics on a Citrix ADC appliance, see Monitoring CloudBridge Connector Tunnels.

High Availability

September 14, 2021

A high availability (HA) deployment of two Citrix ADC appliances can provide uninterrupted operation in any transaction. With one appliance configured as the primary node and the other as the secondary node, the primary node accepts connections and manages servers while the secondary node monitors the primary. If, for any reason, the primary node is unable to accept connections, the secondary node takes over.

The secondary node monitors the primary by sending periodic messages (often called heartbeat messages or health checks) to determine whether the primary node is accepting connections. If a health check fails, the secondary node retries the connection for a specified period, after which it determines that the primary node is not functioning normally. The secondary node then takes over for the primary (a process called failover).



After a failover, all clients must reestablish their connections to the managed servers, but the session persistence rules are maintained as they were before the failover.

With Web server logging persistence enabled, no log data is lost due to the failover. For logging persistence to be enabled, the log server configuration must carry entries for both systems in the log.conf file.

The following figure shows a network configuration with an HA pair.

Figure 1. Citrix ADC Appliances in a High Availability Configuration

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

To configure HA, you might want to begin by creating a basic setup, with both nodes in the same subnet. You can then customize the intervals at which the nodes communicate health-check information, the process by which nodes maintain synchronization, and the propagation of commands from the primary to the secondary. You can configure fail-safe mode to prevent a situation in which neither node is primary. If your environment includes devices that do not accept Citrix ADC gratuitous ARP messages, you should configure virtual MAC addresses. When you are ready for a more complex configuration, you can configure HA nodes in different subnets.

To improve the reliability of your HA setup, you can configure route monitors and create redundant links. In some situations, such as when troubleshooting or performing maintenance tasks, you might want to force a node to fail over (assign primary status to the other node), or you might want to force the secondary node to stay secondary or the primary node to stay primary.

Points to consider for a high availability setup

September 14, 2021

> **Note**
>
> The following requirements for configuring systems in an HA setup:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- In an HA configuration, the primary and secondary Citrix ADC appliances should be of the same model. Different Citrix ADC models are not supported in an HA pair.
- In an HA setup, both nodes must run the same version of Citrix ADC.
- Entries in the configuration file (ns.conf) on both the primary and the secondary system must match, with the following exceptions:
  - The primary and the secondary systems must each be configured with their own unique IP addresses (NSIPs.)
  - In an HA pair, the node ID and associated IP address of one node must point to the other node. For example, if you have nodes NS1 and NS2, you must configure NS1 with a unique node ID and the IP address of NS2, and you must configure NS2 with a unique node ID and the IP address of NS1.
- If you create a configuration file on either node by using a method that does not go directly through the GUI or the CLI (for example, importing SSL certificates, or changing to startup scripts), you must copy the configuration file to the other node or create an identical file on that node.
- Initially, all Citrix ADC appliances are configured with the same RPC node password. RPC nodes are internal system entities used for system-to-system communication of configuration and session information. For security, you should change the default RPC node passwords.

  One RPC node exists on each Citrix ADC. This node stores the password, which is checked against the password provided by the contacting system. To communicate with other systems, each Citrix ADC requires knowledge of those systems, including how to authenticate on those systems. RPC nodes maintain this information, which includes the IP addresses of the other systems, and the passwords they require for authentication.

  RPC nodes are implicitly created when adding a node or adding a Global Server Load Balancing (GSLB) site. You cannot create or delete RPC nodes manually.

  > **Note**:
  >
  > If the Citrix ADC appliances in a high availability setup are configured in one-arm mode, you must disable all system interfaces except the one connected to the switch or hub.

  For an IPv6 HA configuration, the following considerations apply:

  - You must install the IPv6PT license on both Citrix ADC appliances.
  - After installing the IPv6PT license, enable the IPv6 feature by using the GUI or the command line interface.
  - Both Citrix ADC appliances require a global NSIP IPv6 address. In addition, network entities (for example, switches and routers) between the two nodes must support IPv6.

Configuring high availability

August 16, 2023

To set up a high availability configuration, you create two nodes, each of which defines the other's Citrix ADC IP (NSIP) address as a remote node. Begin by logging on to one of the two Citrix ADC appliances that you want to configure for high availability, and add a node. Specify the other appliance's Citrix ADC IP (NSIP) address as the address of the new node. Then, log on to the other appliance and add a node that has the NSIP address of the first appliance. An algorithm determines which node becomes primary and which becomes secondary.

The following figure shows a simple HA setup, in which both nodes are in the same subnet.

Figure 1. Two Citrix ADC Appliances Connected in a High Availability Configuration

Steps to configure high availability

Setting up a high availability pair of two Citrix ADC appliances consists of the following tasks on both the appliances:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- **Add a node**. On an appliance, say N1, add the other appliance, say N2, by specifying a unique node ID and the appliance's (N2) NSIP address. You can specify any integer in the range of 1-64 for the peer node ID.

  The peer node ID specified on the self-node is applicable only to the self-node and it does not have any relevance on the peer node. For example, you have added N2 as peer node on N1 and specified the node ID as 33 for N2. The N2's node ID setting as 33 is applicable only on N1 and has no effect on N2's configuration.

  The peer node ID, specified on both the nodes, need not be of the same value and can be modified. On both the nodes, the self-node ID is hardcoded to zero and cannot be modified.

- **Disable HA monitor for unused interfaces**. On the self-node, you must disable the HA monitor for each interface that is not connected or not being used for traffic. Disabling HA monitor for unused interfaces prevents any HA failovers caused when the state of any of these unused interfaces becomes DOWN.

> **Note**:
>
> To ensure that each node in the high availability configuration has the same settings, you must synchronize your SSL certificates, startup scripts, and other configuration files with those on the primary node.

CLI procedures

To set up a high availability pair of two Citrix ADC appliances by using the CLI, perform the following tasks on each of the two appliances:

To add a node by using the CLI:

At the command prompt, type:

- `add ha node <id> <IPAddress>`
- `show ha node`

To disable the HA monitor for an unused interface by using the CLI:

At the command prompt, type:

- `set interface <ifNum> [-haMonitor ( ON | OFF )]`
- `show interface <ifNum>`

Example:

```
1 > add ha node 33 203.0.113.33
2
3 > set interface 1/3 -haMonitor OFF
4  Done
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

GUI procedure

The Citrix ADC GUI provides a screen that combines the tasks of adding a peer node as well as disabling the HA monitor on unused interfaces on the self-node. The screen also provides an option to automatically configure the peer node for the HA setup avoiding the need to manually configure the peer node.

To set up a high availability pair of two Citrix ADC appliances by using the GUI:

1. Log on to the GUI of one of the appliances.
2. Navigate to **System** > **High Availability** > **Nodes**, provide the peer node's NSIP address in the **Remote Node IP Address** field.
3. Select **Turn Off HA Monitor interface/channels that are down**.
4. Select **Configure remote system to participate High Availability setup** and provide the peer node's login credentials.
5. Click **Create**.

Disabling or Enabling a Node

You can disable or enable only a secondary node. When you disable a secondary node, it stops sending heartbeat messages to the primary node, and therefore the primary node can no longer check the status of the secondary. When you enable a node, the node takes part in the high availability configuration.

To disable or enable a node by using the command line interface

At the command prompt, type one of the following commands:

- `set ha node -hastatus DISABLED`
- `set ha node -hastatus ENABLED`

To disable or enable a node by using the GUI

1. Navigate to **System** > **High Availability** and, on the **Nodes** tab, open the node.
2. In the **High Availability Status** list, select **ENABLED (Actively Participate in HA)** or **DISABLED (Do not participate in HA)**.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Configuring the communication intervals

March 1, 2023

The hello interval is the interval at which the heartbeat messages are sent to the peer node. The dead interval is the time interval after which the peer node is marked DOWN if heartbeat packets are not received. The heartbeat messages are UDP packets sent to port 3003 of the other node in an HA pair. The dead interval must be set as a multiple of the hello interval. By default, the hello interval is set to 200 milliseconds and the dead interval is set to 3 seconds.

To set the hello and dead intervals by using the command line interface

At the command prompt, type:

- `set HA node [-helloInterval <msecs>] [-deadInterval <secs>]`
- `show HA node <id>`

To set the hello and dead intervals by using the GUI

1. Navigate to **System** > **High Availability** and, on the **Nodes** tab, open the node.
2. Set the following parameters:
    - Hello Interval (msecs)
    - Dead Interval (secs)

Configuring synchronization

November 8, 2023

Synchronization is a process of duplicating the configuration of the primary node on the secondary node. The purpose of synchronization is to ensure that there's no loss of configuration information between the primary and the secondary nodes, regardless of the number of failovers that occur. Synchronization uses TCP port 3008 or 3010.

Synchronization is triggered when one of the following conditions is met:

- The secondary node in an HA setup comes up after a restart.
- The primary node becomes secondary after a failover.

Automatic synchronization is enabled by default. You can also force synchronization.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

> **Note:**
>
> During an HA synchronization, the secondary node runs the `clear ns config` command to clear the existing configuration and load the new configuration pulled from the primary node. However, the clear configuration does not remove the default static route configured in the secondary node. If this default static route points to an incorrect gateway, it might result in downtime of the services.

Disabling or enabling synchronization

Automatic HA synchronization is enabled by default on each node in an HA pair. You can enable or disable it on either node.

To disable or enable automatic synchronization by using the command line interface

At the command prompt, type:

- `set HA node -haSync DISABLED`
- `set HA node -haSync ENABLED`

To disable or enable synchronization by using the GUI

1. Navigate to **System** > **High Availability**.
2. Under HA Synchronization, clear or select the Secondary node will fetch the configuration from the Primary option.

Forcing the secondary node to synchronize with the primary node

In addition to automatic synchronization, the Citrix ADC supports forced synchronization. You can force the synchronization from either the primary or the secondary node. When you force synchronization from the secondary node, it starts synchronizing its configuration with the primary node.

However, if synchronization is already in progress, forced synchronization fails and the system displays a warning. Forced synchronization also fails in any of the following circumstances:

- You force synchronization on a standalone system.
- The secondary node is disabled.
- HA synchronization is disabled on the secondary node.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

To force synchronization by using the command line interface

At the command prompt, type:

```
force HA sync
```

To force synchronization by using the GUI

1. Navigate to **System** > **High Availability**.
2. On the **Nodes** tab, in the Action list, click **Force Synchronization**.

Synchronizing configuration files in a high availability setup

September 14, 2021

In a high availability setup, all configuration files are synchronised automatically from the primary node to the secondary node at an interval of one minute. Synchronizing configuration files can be performed manually by using the command line interface or the GUI at either the primary or the secondary node.

Files located on the secondary that are specific to the secondary (not present on the primary) are not deleted during the synchronization.

To synchronize files in a high availability setup by using the command line interface

At the command prompt, type:

```
sync HA files <mode>
```

Example

```
1 > sync HA files all
2  Done
```

```
1 > sync HA files ssl
2  Done
```

Parameter descriptions (of the command listed in the CLI procedure)

```
sync ha files <mode>
```

```
mode
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Specify one of the following modes of synchronization.

- **all** - Synchronize files related to system configuration, Access Gateway bookmarks, SSL certificates, SSL CRL lists, HTML injection scripts, and Application Firewall XML objects.
- **bookmarks** - Synchronize all Access Gateway bookmarks.
- **ssl** - Synchronize all certificates, keys, and CRLs for the SSL feature.
- **htmlinjection** - Synchronize all scripts configured for the HTML injection feature.
- **imports** - Synchronizeall XML objects (for example, WSDLs, schemas, error pages) configured for the application firewall.
- **misc** - Synchronize all license files and the rc.conf file.
- **all_plus_misc** - Synchronize files related to system configuration, Access Gateway bookmarks, SSL certificates, SSL CRL lists, HTML injection scripts, application firewall XML objects, licenses, and the rc.conf file.

To synchronize files in a high availability setup by using the GUI

Navigate to **System** > **Diagnostics** and, in the **Utilities** group, click **Start HA files synchronization**.

Configuring command propagation

November 8, 2023

In an HA setup, any command issued on the primary node propagates to the secondary node. The propagated command is run on the secondary node before it's run on the primary node. If command propagation or execution fails on the secondary, the primary node runs the command and logs an error. Command propagation uses TCP port 3008 or 3010.

In an HA pair configuration, command propagation is enabled by default on both the primary and secondary nodes. You can enable or disable command propagation on either node in an HA pair. If you disable command propagation on the primary node, commands aren't propagated to the secondary node. If you disable command propagation on the secondary node, commands propagated from the primary node aren't run on the secondary node.

> **Note**
>
> After re-enabling propagation, remember to force synchronization.

If synchronization occurs while you're disabling propagation, any configuration-related changes that you make before the disabling of propagation takes effect are synchronized with the secondary node. This is also true for cases where propagation is disabled while synchronization is in progress.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

To disable or enable command propagation by using the command line interface

At the command prompt, type:

- set HA node -haProp DISABLED
- set HA node -haProp ENABLED

To disable or enable command propagation by using the GUI

1. Navigate to **System** > **High Availability** and, on the **Nodes** tab, open the node.
2. Clear or select the Primary node will propagate the configuration to the Secondary option.

Restricting high availability synchronization traffic to a VLAN

November 7, 2023

In a high availability (HA) deployment, traffic related to maintaining the HA configuration flows between the two HA nodes. This traffic is of the following types:

- Config synchronization
- Config propagation
- Connection mirroring
- Load balancing persistency config synchronization
- Persistent session synchronization
- Session state synchronization

Proper flow of this HA related traffic between the two nodes is critical for the functioning of the HA deployment. Typically, the HA related traffic is small in volume but can become very high during a failover. It becomes very high if stateful connection failover is enabled and the node that was primary before the failover was handling a large number of connections.

By default, the HA related traffic flows through the VLANs to which the NSIP address is bound. To accommodate a potential surge in this traffic, you can separate the HA related traffic from the management traffic and restrict its flow to a separate VLAN. This VLAN is called the HA SYNC VLAN.

> **Note:**
>
> In an HA setup, if the `tag all` parameter is enabled, then the HA packets are also tagged with the VLAN traffic. However, there might be issues with the high availability communication. Therefore, it is recommended to configure NSVLAN or HA SYNC VLAN for HA traffic.
>
> - For NSVLAN configuration, see Configuring NSVLAN.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

> - For HA SYNC VLAN configuration, see Configure HA SYNC VLAN.

Points to consider before Configuring an HA SYNC VLAN

- The configuration of an HA SYNC VLAN is neither propagated nor synchronized. In other words, the HA SYNC VLAN is node specific and is configured independently on each node.
- HA SYNC VLAN configuration is removed when you clear the configuration in only FULL mode.
- HA MON must be set to OFF for interfaces that are part of the HA SYNC VLAN, to avoid a situation in which both nodes function as the primary node.
- Management interfaces (for example, 0/1 and 0/2) must not be part of the HA SYNC VLAN, so that HA related traffic does not flow through management interfaces.
- Citrix recommends disabling high availability heartbeat messages on management interfaces and enabling on HA SYNC VLAN interfaces. After meeting these recommendations, high availability heartbeat messages can also be enabled on data interfaces.

  For more information on disabling high availability heartbeat messages on interfaces, see Managing high availability heartbeat messages on a Citrix ADC appliance.

Configure HA SYNC VLAN

To configure an HA SYNC VLAN on a Citrix ADC node, specify a configured VLAN with the HA SYNC VLAN parameter of the local node entity.

To configure an HA SYNC VLAN on a local node by using the command line:

At the command prompt, type:

- `set ha node –syncvlan <VLANID>`
- `show node`

Parameter Description:

syncvlan (Sync VLAN) - VLAN on which HA related traffic is sent. This includes traffic for synchronization, propagation, connection mirroring, load balancing persistency, configuration synchronization, persistent session synchronization, and session state synchronization. However, HA heartbeats can use any interface.

To configure an HA SYNC VLAN on a node by using the GUI:

1. Navigate to **System** > **High Availability**.
2. Set the **Sync VLAN** parameter while modifying the local node.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Configuring fail-safe mode

October 13, 2023

In an HA configuration, fail-safe mode ensures that one node is always primary when both nodes fail the health check. This is to ensure that when a node is only partially available, backup methods are enabled to handle traffic as best as possible. The HA fail-safe mode is configured independently on the primary and secondary nodes.

The following table shows some of the fail-safe cases. The NOT_UP state means that the node failed the health check yet it is partially available. The UP state means that the node passed the health check.

Node A (Primary) Health State	Node B (Secondary) Health State	Default HA Behavior	Fail-Safe Enabled HA Behavior	Description
NOT_UP(failed last)	NOT_UP (failed first)	A (Secondary), B (Secondary)	A (Primary), B (Secondary)	If both nodes fail, one after the other, the node that was the last primary remains primary.
NOT_UP (failed first)	NOT_UP(failed last)	A (Secondary), B (Secondary)	A(Secondary), B(Primary)	If both nodes fail, one after the other, the node that was the last primary remains primary.
UP	UP	A (Primary), B (Secondary)	A (Primary), B (Secondary)	If both nodes pass the health check, no change in behavior with fail-safe enabled.
UP	NOT_UP	A(Primary), B(Secondary)	A (Primary), B (Secondary)	If only the secondary node fails, no change in behavior with fail-safe enabled.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Node A (Primary) Health State	Node B (Secondary) Health State	Default HA Behavior	Fail-Safe Enabled HA Behavior	Description
NOT_UP	UP	A(Secondary), B(Primary)	A(Secondary), B(Primary)	If only the primary fails, no change in behavior with fail-safe enabled.
NOT_UP	UP (STAYSECONDARY)	A (Secondary), B (Secondary)	A (Primary), B (Secondary)	If the secondary is configured as STAYSECONDARY, the primary remains primary even if it fails.

To enable fail-safe mode by using the command line interface

At the command prompt, type:

```
set HA node [-failSafe ( **ON** | **OFF** )]
```

Example

```
1 set ha node -failsafe ON
```

To enable fail-safe mode by using the GUI

1. Navigate to **System** > **High Availability** and, on the **Nodes** tab, open the node.
2. Under **Fail-Safe Mode**, select the **Maintain one Primary** node even when both nodes are unhealthy option.

Configuring Virtual MAC Addresses

September 14, 2021

A virtual MAC address is a floating entity shared by the primary and the secondary nodes in an HA setup.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

In an HA setup, the primary node owns all of the floating IP addresses, such as the MIPs, SNIPs, and VIPs. The primary node responds to Address Resolution Protocol (ARP) requests for these IP addresses with its own MAC address. As a result, the ARP table of an external device (for example, an upstream router) is updated with the floating IP address and the primary node's MAC address.

When a failover occurs, the secondary node takes over as the new primary node. It then uses Gratuitous ARP (GARP) to advertise the floating IP addresses that it acquired from the primary. However, the MAC address that the new primary advertises is the MAC address of its own interface.

Some devices (notably a few routers) do not accept the GARP messages generated by the Citrix ADC appliance. As a result, some external devices retain the old IP to MAC mapping advertised by the old primary node. This can result in a site going down.

You can overcome this problem by configuring a virtual MAC on both nodes of an HA pair. Both nodes then possess identical MAC addresses. Therefore, when failover occurs, the MAC address of the secondary node remains unchanged, and the ARP tables on the external devices do not need to be updated.

To create a virtual MAC, you need to first create a Virtual Router ID (VRID) and bind it to an interface. (In an HA setup, you need to bind the VRID to the interfaces on both nodes.) Once the VRID is bound to an interface, the system generates a virtual MAC with the VRID as the last octet.

This section includes the following details:

- Configuring IPv4 virtual MACs
- Configuring IPv6 virtual MAC6s

Configuring IPv4 virtual MACs

When you create a IPv4 virtual MAC address and bind it to a interface, any IPv4 packet sent from the interface uses the virtual MAC address that is bound to the interface. If there is no IPv4 virtual MAC bound to an interface, the interface's physical MAC address is used.

The generic virtual MAC is of the form `00:00:5e:00:01:<VRID>`. For example, if you create a VRID with a value of 60 and bind it to an interface, the resulting virtual MAC is 00:00:5e:00:01:3c, where 3c is the hex representation of the VRID. You can create 255 VRIDs with values from 1 to 255.

Creating or modifying an IPv4 virtual MAC

You create an IPv4 virtual MAC by assigning it a virtual router ID. You can then you bind the virtual MAC to an interface. You cannot bind multiple VRIDs to the same interface. To verify the virtual MAC configuration, you should display and examine the virtual MACs and the interfaces bound to the virtual MACs.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

To add a virtual MAC by using the command line interface At the command prompt, type:

- `add vrID`
- `bind vrid <id> -ifnum <interface_name>`
- `show vrID`

Example

```
> add vrID 100
 Done
> bind vrid 100 -ifnum 1/1 1/2 1/3
 Done
```

To unbind interfaces from a virtual MAC by using the command line interface At the command prompt, type:

- `unbind vrid <id> -ifnum <interface_name>`
- `show vrID`

To configure a virtual MAC by using the GUI Navigate to **System** > **Network** > **VMAC** and, on the **VMAC** tab, add a new virtual MAC, or edit an existing virtual MAC.

Removing an IPv4 virtual MAC

To remove an IPv4 virtual MAC, you delete its virtual router ID.

To remove an IPv4 virtual MAC by using the command line interface At the command prompt, type:

`rm vrid <id>`

Example

```
rm vrid 100s
```

To remove an IPv4 virtual MAC by using the GUI Navigate to **System** > **Network** > **VMAC** and, on the **VMAC** tab, delete the IPv4 virtual MAC.

Configuring IPv6 virtual MAC6s

The Citrix ADC supports virtual MAC6 for IPv6 packets. You can bind any interface to a virtual MAC6, even if an IPv4 virtual MAC is bound to the interface. Any IPv6 packet sent from the interface uses the

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

virtual MAC6 bound to that interface. If there is no virtual MAC6 bound to an interface, an IPv6 packet uses the physical MAC.

Creating or Modifying a virtual MAC6

You create an IPv6 virtual MAC by assigning it an IPv6 virtual router ID. You can then you bind the virtual MAC to an interface. You cannot bind multiple IPv6 VRIDs to an interface. To verify the virtual MAC6 configuration, you should display and examine the virtual MAC6s and the interfaces bound to the virtual MAC6s.

To add a virtual MAC6 by using the command line interface At the command prompt, type:

- `add vrID6 <id>`
- `bind vrID6 <id> -ifnum <interface_name>`
- `show vrID6`

Example

```
1 > add vrID6 100
2 Done
3 > bind vrID6 100 -ifnum 1/1 1/2 1/3
4  Done
```

To unbind interfaces from a virtual MAC6 by using the command line interface At the command prompt, type:

- `unbind vrID6 <id> -ifnum <interface_name>`
- `show vrID6`

To configure a virtual MAC6 by using the GUI Navigate to **System** > **Network** > **VMAC** and, on the **VMAC6** tab, add a new virtual MAC6, or edit an existing virtual MAC6.

Removing a virtual MAC6

To remove an IPv4 virtual MAC, you delete its virtual router ID.

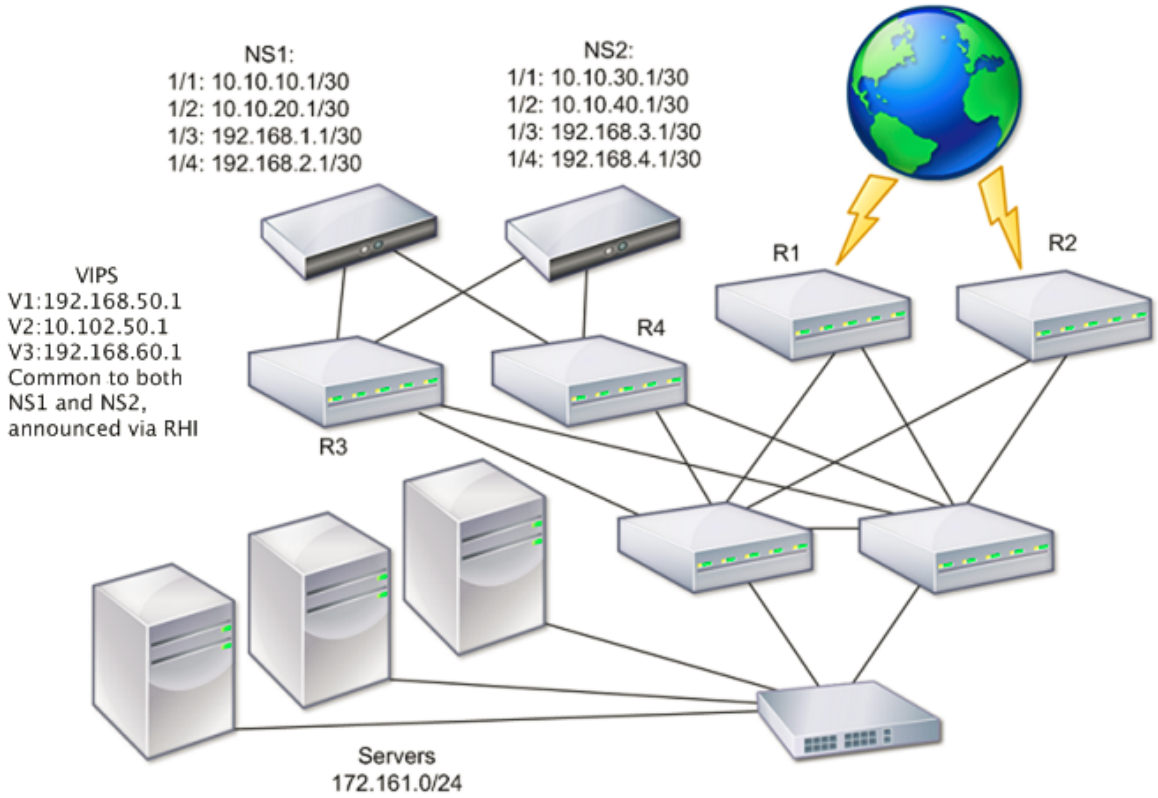
To remove a virtual MAC6 by using the command line interface At the command prompt, type:

`rm vrid6 <id>`

Example

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
rm vrid6 100s
```



To remove a virtual MAC6 by using the GUI Navigate to **System** > **Network** > **VMAC** and, on the **VMAC6** tab, delete the virtual router ID.

Configuring high availability nodes in different subnets

October 1, 2024

The following figure shows an HA deployment with the two systems located in different subnets:

Figure 1. High Availability over a Routed Network

In the figure, the systems NS1 and NS2 are connected to two separate routers, R3 and R4, on two different subnets. The Citrix ADC appliances exchange heartbeat packets through the routers. This configuration could be expanded to accommodate deployments involving any number of interfaces.

> **Note:**
>
> If you use static routing on your network, you must add static routes between all the systems to

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

> ensure that heartbeat packets are sent and received successfully. (If you use dynamic routing on your systems, static routes are unnecessary.)

If the nodes in an HA pair reside on two separate networks, the primary and secondary node must have independent network configurations. This means that nodes on different networks cannot share entities such as SNIP address, VLANs, and routes. This type of configuration, where the nodes in an HA pair have different configurable parameters, is known as Independent Network Configuration (INC) or Symmetric Network Configuration (SNC).

The following table summarizes the configurable entities and options for an INC, and shows how they must be set on each node.

NetScaler entities	Options
IPs (NSIP/SNIPs)	Node-specific. Active only on that node.
VIPs	Floating.
VLANs	Node-specific. Active only on that node.
Routes	Node-specific. Active only on that node. Link load balancing routes are floating.
ACLs	Floating (Common). Active on both nodes.
Dynamic routing	Node-specific. Active only on that node. The secondary node should also run the routing protocols and peer with upstream routers.
L2 mode	Floating (Common). Active on both nodes.
L3 mode	Floating (Common). Active on both nodes.
Reverse NAT (RNAT)	RNAT configuration with the NAT IP address set to a virtual server IP address (VIP) because the VIP address is floating (common).
Policy Based Routing (PBR)	In an HA -INC mode, it is node-specific. In an HA non-INC mode, it is propagated to the secondary node.

As in configuring HA nodes in the same subnet, to configure HA nodes in different subnets, you log on to each of the two Citrix ADC appliances and add a remote node representing the other appliance.

Adding a Remote Node

When two nodes of an HA pair reside on different subnets, each node must have a different network configuration. Therefore, to configure two independent systems to function as an HA pair, you must

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

specify INC mode during the configuration process.

When you add an HA node, you must disable the HA monitor for each interface that is not connected or not being used for traffic. For CLI users, this is a separate procedure.

To add a node by using the CLI

At the command prompt, type:

- `add ha node <id> <IPAddress> -inc ENABLED`
- `show ha node`

Example

```
> add ha node 3 10.102.29.170 -inc ENABLED
 Done
> add ha node 3 1000:0000:0000:0000:0005:0600:700a:888b
  Done
```

To disable an HA monitor by using the CLI

At the command prompt, type:

- `set interface <ifNum> [-haMonitor ( **ON** | **OFF** )]`
- `show interface <ifNum>`

Example

```
> set interface 1/3 -haMonitor OFF
 Done
```

To add a remote node by using the GUI

1. Navigate to **System** > **High Availability** and, on the **Nodes** tab, add a new remote node.
2. Make sure to select the Turn off HA monitor on interfaces/channels that are down and Turn on INC (Independent Network Configuration) mode on self mode options.

Removing a Node

If you remove a node, the nodes are no longer in high availability configuration.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

To remove a node by using the CLI

At the command prompt, type:

```
rm ha node <id>
```

Example

```
1 > rm ha node 2
2   Done
```

To remove a node by using the GUI

Navigate to **System** > **High Availability** and, on the **Nodes** tab, delete the node.

> **Note:**
>
> You can use the Network Visualizer to view the Citrix ADC appliances that are configured as a high availability (HA) pair and perform high availability configuration tasks.

Configuring route monitors

September 12, 2023

You can use route monitors to make the HA state dependent on the internal routing table, whether the table contains any dynamically learned or static routes. In an HA configuration, a route monitor on each node watches the internal routing table to make sure that a route entry for reaching a particular network is always present. If the route entry is not present, the state of the route monitor changes to DOWN.

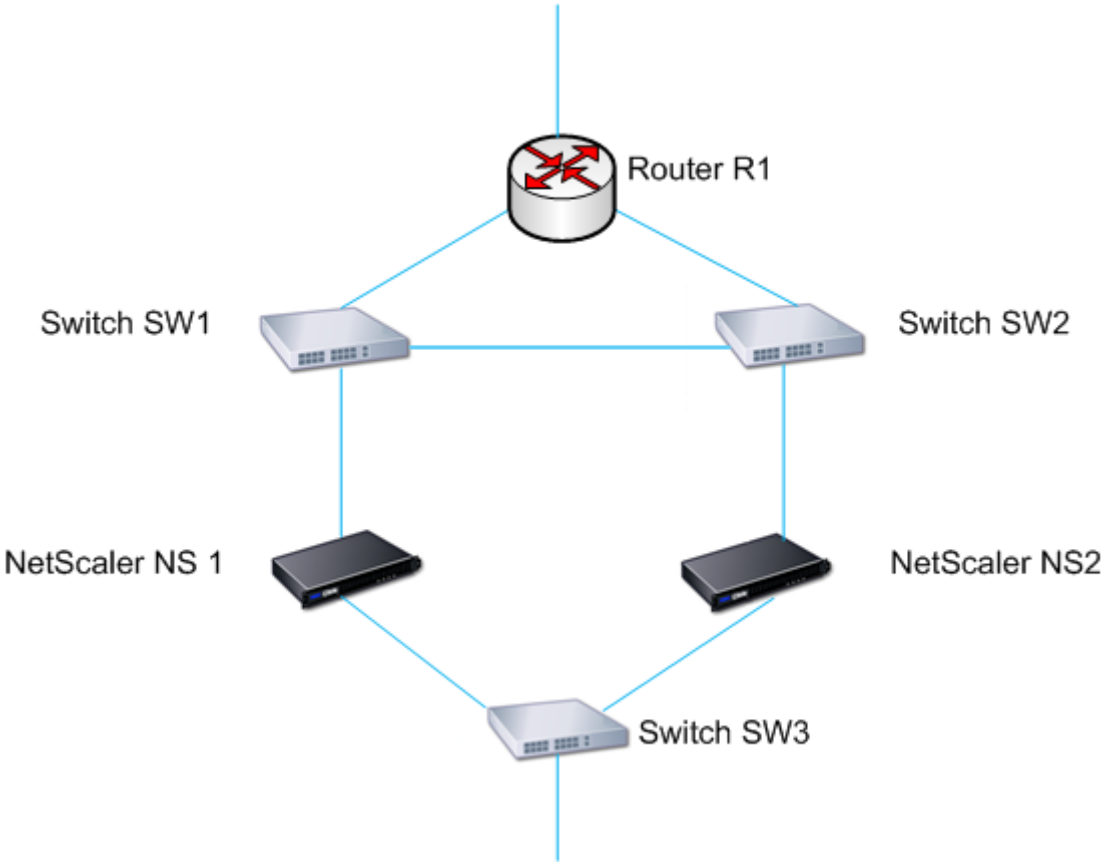
When a Citrix ADC appliance has only static routes for reaching a network, and you want to create a route monitor for the network, you must enable monitored static routes (MSR) for the static routes. MSR removes unreachable static routes from the internal routing table. If MSR is disabled on static routes, an unreachable static route can remain in the internal routing table, defeating the purpose of having the route monitor.

Route Monitors are supported both in non-INC and INC mode.

Route Monitors in HA in non-INC mode	Route Monitors in HA in INC mode
Route monitors are propagated by nodes and exchanged during synchronization.	Route monitors are neither propagated by nodes nor exchanged during synchronization.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Route Monitors in HA in non-INC mode	Route Monitors in HA in INC mode
Route monitors are active only in the current primary node. The Citrix ADC appliance always displays the state of a route monitor as UP irrespective of whether the route entry is present or not in the internal routing table. A route monitor starts monitoring its route after 180 seconds in the following cases [This is done to allow dynamic routes to get learned, which may take 180 secs]: reboot, failover, set route6 command for v6 routes, set route msr enable/disable command for v4 routes, adding a new route monitor.	Route monitors are active on both the primary and the secondary node. The Citrix ADC appliance displays the state of the route monitor as DOWN if the corresponding route entry is not present in the internal routing table. -



Route monitors are useful in a non-INC mode HA configuration where you want the non-reachability of a gateway from a primary node to be one of the conditions for HA failover.

Consider an example of a non-Inc mode HA setup in a two-arm topology that has Citrix ADC appliances NS1 and NS2 in the same subnet, with router R1 and switches SW1, SW2, and SW3.

Because R1 is the only router in this setup, you want the HA setup to failover whenever R1 is not reachable from the current primary node. You can configure a route monitor (say, RM1 and RM2, respectively) on each of the nodes to monitor the reachability of R1 from that node.

Figure 1.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

With NS1 as the current primary node, the execution flow is as follows:

1. Route monitor RM1 on NS1 monitors NS1's internal routing table for the presence of a route entry for router R1. NS1 and NS2 exchange heartbeat messages through switch SW1 or SW3 at regular intervals.
2. If switch SW1 goes down, the routing protocol on NS1 detects that R1 is not reachable and therefore removes the route entry for R1 from the internal routing table. NS1 and NS2 exchanges heartbeat messages through switch SW3 at regular intervals.
3. Detecting that the route entry for R1 is not present in the internal routing table, RM1 initiates a failover. If the route to R1 is down from both NS1 and NS2, failover happens every 180 seconds until one of the appliances is able to reach R1 and restore the connectivity.

Adding a route monitor to a high availability node

A single procedure creates a route monitor and binds it to an HA node.

> Note:
>
> If you have configured admin partitions, make sure that you add route monitors from the default partition.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

To add a route monitor by using the command line interface

At the command prompt, type:

- `bind HA node <id> (-routeMonitor <ip_addr|ipv6_addr> [<netmask>])`
- `show HA node`

Example

```
> bind HA node 0 -routeMonitor 10.102.71.0 255.255.255.0
 Done
> bind HA node 0 -routeMonitor 1000:0000:0000:0000:0005:0600:700a:888b
 Done
```

To add a route monitor by using the GUI

Navigate to **System** > **High Availability** and, on the **Route Monitors** tab, click **Configure**.

Removing route monitors

To remove a route monitor by using the command line interface

At the command prompt, type:

- `unbind HA node <id> (-routeMonitor <ip_addr|ipv6_addr> [<netmask>])`
- show ha node

Example

```
unbind HA node 3 -routeMonitor 10.102.71.0 255.255.255.0
unbind HA node 3 -routeMonitor 1000:0000:0000:0000:0005:0600:700a:888b
```

To remove a route monitor by using the GUI

Navigate to **System** > **High Availability** and, on the **Route Monitors** tab, delete the route monitor.

Limiting failovers caused by route monitors in non-INC mode

September 14, 2021

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

In an HA configuration in non-INC mode, if route monitors fail on both nodes, failover happens every 180 seconds until one of the nodes is able to reach all of the routes monitored by the respective route monitors.

However, for a node, you can limit the number of failovers for a given interval by setting the Maximum Number of Flips and Maximum Flip Time parameters on the nodes. When either limit is reached, no more failovers occur, and the node is assigned as primary (but node state as NOT UP) even if any route monitor fails on that node. This combination of HA state as Primary and Node state as NOT UP is called Stick Primary state.

If the node is then able to reach all of the monitored routes, the next monitor failure triggers resetting of the Maximum Number of Flips and Maximum Flip Time parameters on the node and starting the time specified in the Maximum Flip Time parameter.

These parameters are set independently on each node and therefore are neither propagated nor synchronized.

Parameters for limiting the number of failovers

- **Maximum Number of Flips (maxFlips)**

  Maximum number of failovers allowed, within the Maximum Flip Time interval, for the node in HA in non INC mode, if the failovers are caused by route-monitor failure.

- **Maximum Flip Time (maxFlipTime)**

  Amount of time, in seconds, during which failovers resulting from route-monitor failure are allowed for the node in HA in non INC mode.

To limit the number of failovers by using the command line interface

At the command prompt, type:

- `set HA node [-maxFlips < positive_integer>] [-maxFlipTime < positive_integer>]`
- `show HA node [< id>]`

To limit the number of failovers by using the GUI

1. Navigate to **System** > **High Availability** and, on the **Nodes** tab, open the local node.
2. Set the following parameters:

- Maximum Number of Flips
- Maximum Flip Time

```
1      > set ha node -maxFlips 30 -maxFlipTime 60
2      Done
3      > sh ha node
4      1) Node ID: 0
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
    IP: 10.102.169.82 (NS)

    Done
```

SNMP Alarm for Sticky Primary State

Enable HA-STICKY-PRIMARY SNMP alarm in a node of a high availability set up if you want to be alerted of the node becoming sticky primary. When the node becomes sticky primary, it alerts by generating a trap message (stickyPrimary (1.3.6.1.4.1.5951.1.1.0.138)) and sends it to all the configured SNMP trap destinations. For more information about configuring SNMP alarms and trap destinations, see onfiguring the Citrix ADC to Generate SNMPv1 and SNMPv2 Traps.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Frequently Asked Questions

Consider an example of a high availability setup of two Citrix ADC appliances NS-1 and NS-2 in non-INC mode. Maximum numbers of flips and maximum flip time in both the nodes have been set with the same values.

The following table lists the settings used in this example:

Entity	Detail
IP address of NS-1	10.102.173.211
IP address of NS-2	10.102.173.212
Maximum number of flips	2
Maximum flip time	200

For information about the maximum number of flips and maximum flip time settings, refer to the pdf.

Configuring failover interface set

September 14, 2021

A Failover Interface Set (FIS) is a logical group of interfaces. In an HA configuration, using a FIS is a way to prevent failover by grouping interfaces so that, when one interface fails, other functioning interfaces are still available. A FIS can also be configured for the nodes of a Citrix ADC cluster.

HA MON interfaces that are not bound to an FIS are known as critical interfaces (CI) because if any of them fails, failover is triggered.

> **Note**:
>
> An FIS does not create an active and standby configuration. It also does not prevent bridging loops when connecting to links to the same VLAN.

Creating or Modifying an FIS

To add an FIS and bind interfaces to it by using the command line interface

At the command prompt, type:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- add fis <name>
- bind fis \<name\> \<ifnum\> ...
- show fis \<name\>

Example

```
1 > add fis fis1
2  Done
3 > bind fis fis1 1/3 1/5
4  Done
```

An unbound interface becomes a critical interface (CI) if it is enabled and HA MON is on.

To unbind an interface from an FIS by using the command line interface

At the command prompt, type:

- unbind fis \<name\> \<ifnum\> ...
- show fis \<name\>

Example

```
1 > unbind fis fis1 1/3
2  Done
```

To configure an FIS by using the GUI

Navigate to System > High Availability and, on the Failover Interface Set tab, add a new FIS, or edit an existing FIS.

Removing an FIS

When the FIS is removed, its interfaces are marked as critical interfaces.

To remove an FIS by using the command line interface

At the command prompt, type:

```
rm fis <name>
```

Example

```
1 > rm fis fis1
2   Done
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

To remove an FIS by using the GUI

Navigate to **System** > **High Availability** and, on the **Failover Interface Set** tab, delete the FIS.

Understanding the causes of failover

September 14, 2021

The following events can cause failover in an high availability configuration:

1. If the secondary node does not receive a heartbeat packet from the primary for a period of time that exceeds the dead interval set on the secondary. (See Note 1.)
2. The primary node experiences a hardware failure of its SSL card.
3. The primary node does not receive any heartbeat packets on its network interfaces for three seconds.
4. On the primary node, a network interface that is not part of a Failover Interface Set (FIS) or a Link Aggregation (LA) channel and has the HA Monitor (HAMON) enabled, fails. (See Note 2.)
5. On the primary node, all interfaces in an FIS fail. (See Note 2.)
6. On the primary node, an LA channel with HAMON enabled fails. (See Note 2.)
7. On the primary node, all interfaces fail (see Note 2). In this case, failover occurs regardless of the HAMON configuration.
8. On the primary node, all interfaces are manually disabled. In this case, failover occurs regardless of the HAMON configuration.
9. You force a failover by issuing the force failover command on either node.
10. A route monitor that is bound to the primary node goes DOWN.

> **Note 1:**
>
> For more information about setting the dead interval, see Configuring the Communication Intervals. Possible causes for a node not receiving heartbeat packets from a peer node include:
>
> - A network configuration problem prevents heartbeats from traversing the network between the HA nodes.
> - The peer node experiences a hardware or software failure that causes it to freeze (hang), reboot, or otherwise stop processing and forwarding heartbeat packets.
>
> **Note 2:**
>
> In this case, fail means that the interface was enabled but goes to the DOWN state, as can be seen from the show interface command or from the GUI. Possible causes for an enabled interface to be in the DOWN state are LINK DOWN and TXSTALL.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Forcing a node to fail over

September 14, 2021

You might want to force a failover if, for example, you need to replace or upgrade the primary node. You can force failover from either the primary or the secondary node. A forced failover is not propagated or synchronized. To view the synchronization status after a forced failover, you can view the status of the node.

A forced failover fails in any of the following circumstances:

- You force failover on a standalone system.
- The secondary node is disabled.
- The secondary node is configured to remain secondary.

The Citrix ADC appliance displays a warning message if it detects a potential issue when you run the force failover command. The message includes the information that triggered the warning, and requests confirmation before proceeding.

You can force a failover on a primary node, secondary node, and when nodes are in listen mode.

- **Forcing Failover on the Primary Node**.

  If you force failover on the primary node, the primary becomes the secondary and the secondary becomes the primary. Forced failover is possible only when the primary node can determine that the secondary node is UP.

  If the secondary node is DOWN, the force failover command returns the following error message: "Operation not possible due to invalid peer state. Rectify and retry."

  If the secondary system is in the claiming state or inactive, it returns the following error message:

  ```
  Operation not possible now. Please wait for the system to stabilize
   before retrying.
  ```

- **Forcing Failover on the Secondary Node**.

  If you run the force failover command from the secondary node, the secondary node becomes primary and the primary node becomes secondary. A force failover can occur only if the secondary node's health is good and it is not configured to stay secondary.

  If the secondary node cannot become the primary node, or if the secondary node was configured to stay secondary (using the STAYSECONDARY option), the node displays the following error message:

  ```
  Operation not possible as my state is invalid. View the node for
  more information.
  ```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- **Forcing Failover When Nodes Are in Listen Mode**.

  When the two nodes of an HA pair are running different versions of the system software, the node running the higher version switches to the listen mode. In this mode, neither command propagation nor synchronization works.

  Before upgrading the system software on both nodes, test the new version on one of the nodes. To do this, you must force a failover on the system that has already been upgraded. The upgraded system then takes over as the primary node, but neither command propagation or synchronization occurs. Also, all connections must be re-established.

> **Important!**
>
> If you force a failover when an HA synchronization operation is in progress, some active data sessions on the HA setup might be lost. So, wait for the HA synchronization operation to be completed before performing the force failover operation.

To force failover on a node by using the command line interface:

At the command prompt, type:

```
force HA failover
```

To force failover on a node by using the GUI:

Navigate to **System** > **High Availability** and, on the **Nodes** tab, select the node, in the Action list, select **Force Failover**.

Forcing the secondary node to stay secondary

September 14, 2021

In an HA setup, the secondary node can be forced to stay secondary regardless of the state of the primary node.

For example, suppose the primary node needs to be upgraded and the process will take a few seconds. During the upgrade, the primary node may go down for a few seconds, but you do not want the secondary node to take over; you want it to remain the secondary node even if it detects a failure in the primary node.

When you force the secondary node to stay secondary, it will remain secondary even if the primary node goes down. Also, when you force the status of a node in an HA pair to stay secondary, it does not participate in HA state machine transitions. The status of the node is displayed as STAYSECONDARY.

Forcing the node to stay secondary works on both standalone and secondary nodes. On a standalone node, you must use this option before you can add a node to create an HA pair. When you add the

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

new node, the existing node stops processing traffic and becomes the secondary node. The new node becomes the primary node.

> **Note**:
>
> When you force a system to remain secondary, the forcing process is not propagated or synchronized. It affects only the node on which you run the command.

To force the secondary node to stay secondary by using the command line interface

At the command prompt, type:

```
set ha node -hastatus STAYSECONDARY
```

To force the secondary node to stay secondary by using the GUI

Navigate to **System** > **High Availability**, on the **Nodes** tab, open the local node, and select **STAY SECONDARY**.

Forcing the primary node to stay primary

September 14, 2021

In an HA setup, you can force a healthy primary node to remain primary even after a failover. You can enable this option either on a primary node in an HA pair. This option allows the primary node to be in primary state as long as it is healthy.

On a standalone node, you must use this option before you can add a node to create an HA pair. When you add the new node, the existing node continues to function as the primary node, and the new node becomes the secondary node.

To force the primary node to stay primary by using the command line interface

At the command prompt, type:

```
set ha node -hastatus STAYPRIMARY
```

To force the primary node to stay primary by using the GUI

Navigate to **System** > **High Availability**, on the **Nodes** tab, open the local node, and select **STAY PRIMARY**.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

High Availability FAQs

November 8, 2023

1. What are the various ports used to exchange the HA-related information between the nodes in an HA configuration?

   In an HA configuration, both nodes use the following ports to exchange HA-related information:

   - UDP Port 3003, to exchange heartbeat packets.
   - TCP Port 3008 or 3010, for synchronization and command propagation.

2. What are the conditions that trigger synchronization?

   Synchronization is triggered by any of the following conditions:

   - The incarnation number of the primary node, received by the secondary, does not match that of the secondary node.
     Note: Both nodes in an HA configuration maintain a counter called *incarnation number*, which counts the number of configurations in the node's configuration file. Each node sends its incarnation number to each other node in the heartbeat messages. The incarnation number isn't incremented for the following commands:
     a) All HA configuration related commands. For example, add ha node, set ha node, and bind ha node.
     b) All Interface related commands. For example, set interface and unset interface.
     c) All channel-related commands. For example, add channel, set channel, and bind channel.
   - The secondary node comes up after a restart.
   - The primary node becomes secondary after a failover.

3. What configurations aren't synced or propagated in an HA configuration in INC or non-INC mode?

   The following commands are neither propagated nor synced to the secondary node:

   - All node specific HA configuration commands. For example, add ha node, set ha node, and bind ha node.
   - All Interface related configuration commands. For example, set interface and unset interface.
   - All channel related configuration commands. For example, add channel, set channel, and bind channel.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

> **Note:**
>
> The following configurations are neither synced nor propagated only in HA in INC mode. Each node has its own:
>
> - SNIPs
> - VLANs
> - Routes (except LLB routes)
> - Route monitors
> - RNAT rules (except any RNAT rule with VIP as the NAT IP)
> - Dynamic routing configurations
> - Net profiles

4. Does a configuration added to the secondary node get synchronized on the primary?

   No, a configuration added to the secondary node isn't synchronized to the primary.

5. What can be the reason for both nodes claiming to be the primary in an HA configuration?

   The most likely reason is that the primary and secondary nodes are both healthy but the secondary does not receive the heartbeat packets from the primary. The problem can be with the network between the nodes.

6. Does an HA configuration run into any issues if you deploy the two nodes with different system clock settings?

   Different system-clock settings on the two nodes can cause the following issues:

   - The time stamps in the log file entries do not match. This situation makes it difficult to analyze the log entries for any issues.
   - After a failover, you might have problems with any type of cookie-based persistence for load balancing. A significant difference between the times can cause a cookie to expire sooner than expected, resulting in termination of the persistence session.
   - Similar considerations apply to any time-related decisions on the nodes.

7. What are the conditions for failure of the *force HA sync* command?

   Forced synchronization fails in any of the following circumstances:

   - You force synchronization when synchronization is already in progress.
   - You force synchronization on a standalone Citrix ADC appliance.
   - The secondary node is disabled.
   - HA synchronization is disabled on the current secondary node.
   - HA propagation is disabled on the current primary node and you force synchronization from the primary.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

8. What are the conditions for failure of the *sync HA files* command?

   Synchronizing configuration files fail in either of the following circumstances:

   - On a standalone system.
   - With the secondary node disabled.

9. In an HA configuration, if the secondary node takes over as the primary, does it switch back to secondary status if the original primary comes back online?

   No. After the secondary node takes over as the primary, it remains as primary even if the original primary node comes back online again. To interchange the primary and secondary status of the nodes, run the *force failover* command.

10. What are the conditions for failure of the force failover command?

    A forced failover fails in any of the following circumstances:

    - You force failover on a standalone system.
    - The secondary node is disabled.
    - The secondary node is configured to remain secondary.
    - The primary node is configured to remain primary.
    - The state of the peer node is unknown.

Troubleshooting high availability issues

September 14, 2021

The most common high availability issues involve the high availability feature not working at all, or working only intermittently. Following are common high availability issues, and probable causes and resolutions.

- **Issue**
  The inability of the Citrix ADC appliances to pair the Citrix ADC appliances in a high availability setup.
  - **Cause**
    Network connectivity
    Resolution
    Verify that both the appliances are connected to the switch and the interfaces are enabled.
  - **Cause**
    Mismatch in the Password for the default Administrator account

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Resolution

Verify that the password on both the appliances is the same.

- **Cause**

  IP conflict

  Resolution

  Verify that both the appliances have unique Citrix ADC IP (NSIP) address. The appliances should not have the same NSIP address.

- **Cause**

  Node ID mismatch

  Resolution

  Verify that the Node ID Configuration on both the appliances is unique. The appliances should not have the same Node ID configuration. Additionally, you must assign value for a Node ID between 1 and 64.

- **Cause**

  Mismatch in the password of the RPC node

  Resolution

  Verify that both the nodes have the same RPC node password.

- **Cause**

  An administrator has disabled the remote node

  Resolution

  Enable the remote node.

- **Cause**

  The Firewall application has blocked the heartbeat packets

  Resolution

Verify that the UDP port 3003 is allowed.

- **Issue**
  Both the appliances claim to be the primary appliance.

  - **Cause**

    Missing heartbeat packets between the appliances

    Resolution

    Verify that the UDP port 3003 is not blocked for communication between the appliances.

- **Issue**
  The Citrix ADC appliance is not able to synchronize the configuration.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- **Cause**

  A Firewall application is blocking the required port.

  Resolution

  Verify that the UDP port 3010 (or UDP port 3008 with secure synchronization) is not blocked for communication between the appliances.

- **Cause**

  An administrator has disabled synchronization.

  Resolution

  Enable synchronization on the appliance that has the issue.

- **Cause**

  Different Citrix ADC releases or builds are installed on appliances.

  Resolution

  Upgrade the appliances to the same Citrix ADC release or build.

- **Issue**

  Command propagation fails between the appliances.

  - **Cause**

    A Firewall application is blocking the port.

    Resolution

    Verify that the UDP port 3011 (or UDP port 3009 with secure propagation) is not blocked for communication between the appliances.

  - **Cause**

    An administrator has disabled command propagation.

    Resolution

    Enable command propagation on the appliance that has the issue.

  - **Cause**

    Different Citrix ADC releases or builds are installed on appliances.

    Resolution

    Upgrade the appliances to the same Citrix ADC release or build.

- **Issue**

  The Citrix ADC appliances in the high availability pair are unable to run the force failover process.

  - **Cause**

    The Secondary node is disabled.

    Resolution

    Enable the secondary node.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- **Cause**

  The Secondary node is configured to stay secondary.

  Resolution

  Set the secondary high availability status of the secondary node to Enable from Stay Secondary.

- **Issue**

  The secondary appliance does not receive any traffic after the failover process.

  - **Cause**

    The upstream router does not understand GARP messages of Citrix ADC appliance.

    Resolution

    Configure virtual MAC address on the secondary appliance.

Managing high availability heartbeat messages on a Citrix ADC appliance

August 10, 2022

The two nodes in a high availability configuration send and receive heartbeat messages to and from each other on all interfaces that are enabled. The heartbeat messages flow regardless of the HA MON setting on these interfaces. If NSVLAN or both (NSVLAN and SYNC) are configured on an appliance, the heartbeat messages flow only through the enabled interfaces that are part of the NSVLAN and SYNCVLAN.

If a node does not receive the heartbeat messages on an enabled interface, it sends critical alerts to the specified SNMP managers. These critical alerts give false alarms and draw unnecessary attention from the administrators for interfaces that are not configured as part of the connections to the peer node.

To resolve this issue, the HAHeartBeat option for interfaces and channels is used for enabling or disabling HA heartbeat-message flow on them.

To manage the high availability heartbeat messages on an interface by using the command line interface

At the command prompt, type:

- `set interface <ID> [-HAHeartBeat ( ON | OFF )]`
- `show interface <ID>`

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

To manage the high availability heartbeat messages on a channel by using the command line interface

At the command prompt, type:

- `set channel <ID> [-HAHeartBeat ( ON | OFF )]`
- `show channel <ID>`

To manage the high availability heartbeat messages for an interface by using the GUI

1. Navigate to **System** > **Network** > **Interfaces**.
2. Enable or disable the **HA Heart Beat** parameter.

To manage the high availability heartbeat messages on a channel by using the GUI

1. Navigate to **System** > **Network** > **Channels**.
2. Enable or disable the **HA Heart Beat** parameter.

Remove and Replace a Citrix ADC in a High Availability Setup

September 14, 2021

This topic helps you to address RMA replacements. Also, this topic has instructions on how to backup configurations, upgrade or downgrade shipped software version, and setup of RPC password on ADC.

Points to Consider

The following configurations are not synchronized or propagated in a high availability configuration in INC (Independent Network Configuration) or non-INC mode:

- All node specific HA configuration commands. For example, add ha node, set ha node, and bind ha node.
- All Interface related configuration commands. For example, set interface and unset interface.
- All channel related configuration commands. For example, add channel, set channel, and bind channel.
- All Interface HA Monitoring configuration commands.

The following configurations are not synced nor propagated in an HA configuration in INC mode (Independent Network Configuration):

- SNIPs

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- VLANs
- Routes (except LLB routes)
- Route monitors
- RNAT rules (except any RNAT rule with VIP as the NAT IP)
- Dynamic routing configurations

Instructions

Complete the following steps to replace a Citrix ADC in high availability setup:

- Remove an Active Citrix ADC secondary node
- Configure Replacement secondary node
- Verify and Update the Software Build on Replacement ADC
- Set Password on New secondary to Match primary
- Add Licenses to Replacement ADC
- Creating HA Pair between primary and New secondary node

Remove an Active Secondary Node

1. Log on to both ADCs and run the following command to confirm which node is primary and which node is secondary:

   ```
   1 show ha node
   ```

2. Log on to the primary ADC, backup the configurations on the primary node, and copy the files off of the ADC prior to the changes. These files are located under "/var /ns_sys_backup/"directory.

   The steps are as follows:

   a) Save the ADC running configurations to memory:

   ```
   1 save ns config
   ```

   b) Create the full backup file package:

   ```
   1 create system backup -level full
   ```

   c) Create the basic backup file package:

   ```
   1 create system backup -level basic
   ```

3. After all backup files have been generated, be sure to copy them off of the device before proceeding.

   From a windows terminal, open a Command Prompt and copy the backup files off of the ADC and onto your local hard drive. This can be done using the following command:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
pscp <username>@<NSIP>:<Target file source>  <Target file
    destination>
```

Example:

```
pscp nsroot@10.125.245.78:/var/ns_sys_backup/backup_basic_10
    .125.245.78_2016_09_14_15_08.tgz c:\nsbackup\backup_basic_10
    .125.245.78_2016_09_14_15_08.tgz
```

When prompted, enter the password for the specified administrator account, then hit Enter. Repeat these steps until all backup bundles are copied to the local PC before proceeding.

4. SSH into the secondary ADC, and set the unit to the "STAYSECONDARY"status. This will force the unit to not attempt to assume the primary role in the event of a detected failure during the swap. Confirm that you are connected to the secondary ADC before executing this step

```
set ha node  –haStatus <state>
set ha node  –haStatus STAYSECONDARY
```

5. Once the secondary ADC's **Node State** successfully displays STAYSECONDARY, switch to the primary ADC and delete the secondary node and run the following command:

```
save ns config
```

While logged into the primary ADC, run the following commands

a) Run the following command to identify which numerical value represents the secondary HA node:

```
show ha node
```

b) Run the following command to remove the secondary ADC from the primary HA pair;

```
rm ha node <node ID>
```

c) Run the following command to save the configuration:

```
save ns config
```

d) With the secondary ADC now removed, shutdown, disconnect, and remove the secondary ADC from the network.

Note. Be sure to label all connections before disconnecting.

Configure Replacement Secondary Node

1. With the replacement ADC in place, power up the new device. DO NOT CONNECT the network connections at this point.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

2. With boot-up complete, use the console port to connect to the ADC and configure the NSIP that you will use to connect to the unit.
3. When prompted, select **4**.

   Note. In this example, we are using a different NSIP for the replacement ADC. If you wish to use the original secondary unit's IP, You may change it on the replacement before binding the new ADC to the primary HA unit.
4. The ADC should now be booted. Now connect the network interface that will be used for Management traffic, and confirm that the IP address is reachable from your network.

Verify and Update the Software Build on Replacement ADC

Before syncing the new unit to the primary ADC, we need to ensure that both ADCs are running the same build.

1. To verify the version on ADC run the following command:

   ```
   show version
   ```
2. While on the new secondary ADC, create a subfolder in **/var** to be used for the upgrade.
3. Go to Citrix Downloads and download the appropriate package that matches the build version running on the primary ADC.
4. Download and extract the .tgz file:

   ```
   tar -xvzf "file.tgz"
   ```
5. Copy the extracted files to the secondary ADC. On your windows terminal, open a "Command Prompt"and navigate to the directory containing the extracted .tgz build package and run the following pscp command:

   ```
   pscp <Target file source>  <username>@<NSIP>:<Target file
      destination>
   ```

   Example:

   ```
   C:\inetpub>pscp c:\inetpub\build-12.1-47.14_nc.tgz nsroot@10
      .20.245.80:/var/NS_upg_12.1_47.14/build-12.1-47.14_nc.tgz
   ```
6. After the file has been transferred, return to the secondary ADC and upgrade. For detailed instructions, see Upgrading a Citrix ADX Standalone Appliance.
7. Once the new secondary has rebooted, SSH back into the unit and confirm that the upgrade is successful and the build matches that of the primary.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Set Password on Replacement Secondary Node to Match Primary

Note: If at this point you want to change the management IP (NSIP) address of the new secondary ADC, you may do so before moving forward.

Change the password on the new secondary ADC to match the password that is currently on the primary ADC.

1. Make that the default administrator (nsroot) account password is the same as the primary ADC. This is accomplished using the following command while logged in through SSH into the new secondary unit:

   ```
   set system user <user> <password>
   ```

   This command set/resets the password for the specified user.

2. SSH into the primary and new secondary ADC and confirm that passwords match.

Add Licenses to Replacement Secondary Node

With the new ADC updated and ready for pairing, download and install the appropriate licensing for the replacement node.

1. Navigate to https://www.citrix.com to request and download licenses for the new replacement unit.
2. Once you have all appropriate licenses downloaded, SSH into the new secondary ADC and type the following command to see the current state of licensing:

   ```
   show license
   ```

3. From the Windows terminal command prompt you must now upload the license files to the new secondary ADC using the following command:

   Note. If you have multiple licenses, repeat this step until all licenses are uploaded.

   ```
   pscp <Target file source>  <username>@<NSIP>:<Target file
      destination>
   ```

   Example:

   ```
   C:\inetpub>pscp c:\inetpub\NS-VPX-3K-LIC-020030ad0024.lic
      nsroot@10.125.245.80:/nsconfig/license/NS-VPX-3K-LIC-020030
      ad0024.lic
   ```

4. SSH into the new secondary ADC and perform a warm reboot using the following command:

   ```
   reboot  – w
   ```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

After the unit is restarted, SSH into the unit and run show license command once again. At this point, the licenses should be applied.

Set up High Availability between primary and New Secondary Node

At this point, we are now ready to join the Citrix ADC units into a high availability pair. For more information, see Configuring high availability.

Request retry

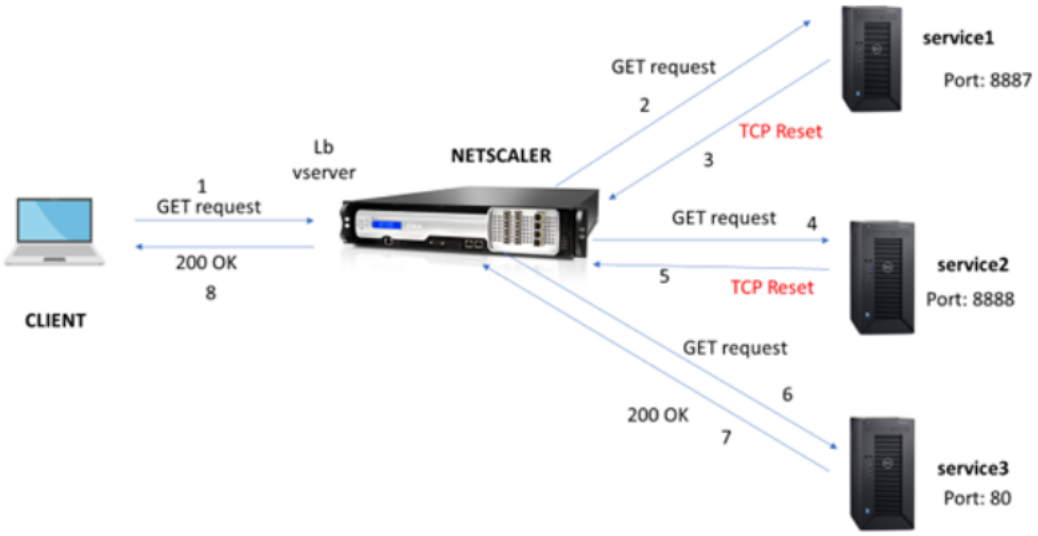
November 22, 2021

When a Citrix ADC appliance receives an HTTP request but has a connection failure with a back-end server, the appliance uses a retry directive. The request retry addresses connection failure scenarios and enables the appliance to choose the next available service and forward the request. By doing a request retry, the client can save round trip time (RTT).

Request retry feature is applicable for the following connection failure scenarios:

- If a back-end server resets a TCP connection when an HTTP request is received. For more details, see Request retry.
- If a back-end server resets a TCP connection during connection establishment. For more details, see Request retry.
- If a response from a back-end server times out (based on the configured time-out value) when an appliance sends an HTTP request. For more details, see Request retry.

Request retry if back-end server resets TCP connection



December 29, 2023

When a back-end server resets a TCP connection, the request retry feature forwards the request to the next available server, instead of sending the reset to the client. By doing reload balancing, the client saves RTT when the appliance initiates the same request to next available service.

How request retry works when back-end server resets a TCP connection

The following diagram shows how components interact with each other.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

1. The process starts by enabling appqoe feature on your appliance.
2. When the client sends an HTTP or HTTPS request, the load balancing virtual server sends the request to the back-end server.
3. If the requested service is unavailable, the back-end server resets the TCP connection.
4. If the appqoe configuration has "retry"enabled with the desired number of retry attempts specified, the load balancing virtual server uses the configured load balancing algorithm to forward the request to the next available application server.
5. After the load balancing virtual server receives the response, the appliance forwards the response to the client.
6. If the available back-end servers is equal or lesser than the retry count and if all the servers send reset, the appliance would respond a 500 internal server error. Consider a scenario with five available servers and the retry count set as six. If all the five servers resets the connection, then the appliance returns a 500 internal server error to the client.
7. Similarly, if the number of back-end servers is more than the retry count and if the back-end servers resets the connection, the appliance forwards the reset to the client. Consider a scenario with three back-end servers and the retry count set as two. If the three servers resets the connection, then the appliance sends a reset response to the client.

Configure request retry for GET method

For configuring retry feature for GET method, you must complete the following steps.

1. Enable AppQoE
2. Add AppQoE action

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

3. Add AppQoE policy
4. Bind AppQoE policy to load balancing virtual server

Enable AppQoE At the command prompt, type:

```
enable ns feature appqoe
```

Add AppQoE action You must configure an AppQoE action to specify if you want the appliance to retry after a TCP reset and the number of retry attempts.

```
add appqoe action reset_action -retryOnReset ( YES | NO )-numretries
<positive_integer>]
```

Example:

```
add appqoe action reset_action –retryOnReset YES –numretries 5
```

Where,
retryOnReset. Enable retry if the back-end server resets a TCP connection.
numretries. Retry count.

Add AppQoE policy To implement AppQoE you must configure AppQoE policy to prioritize incoming HTTP or SSL request in a specific queue.

At the command prompt, type:

```
add appqoe policy <name> -rule <expression> -action <string>
```

Example:

```
add appqoe policy reset_policy -rule http.req.method.eq(get)-action
reset_action
```

Bind appqoe policy to load balancing virtual server When a back-end server resets a TCP packet request and if you want the load balancing virtual server to forward the request to the next available service, you must bind the load balancing virtual server to the AppQoE policy.

At the command prompt, type:

```
bind lb vserver <name> ((<serviceName> (-policyName <string> [-
priority <positive_integer>] [-gotoPriorityExpression <expression
>] [-type ( REQUEST | RESPONSE )]
```

Example:

```
bind lb vserver v1 -policyName reset_policy -type REQUEST -priority 1
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Configure request retry for POST requests

You must always exercise caution when you reload balance requests that write data into the back-end server. For such requests, ensure the content length is short. If the content length is long, then it might result in resource consumption. Follow the steps given below to configure reload balancing for POST requests.

1. Enable AppQoE
2. Add AppQoE action
3. Add AppQoE policy
4. Bind appQoE policy to load balancing virtual server

Enable AppQoE At the command prompt, type:

```
enable ns feature appqoe
```

Add Appqoe action You must add an AppQoE action to retry after a TCP reset and number of retry attempts.

```
add appqoe action reset_action -retryOnReset ( YES | NO )-numretries
<positive_integer>]
```

Example:

```
add appqoe action reset_action –retryOnReset YES –numretries 5
```

Add Appqoe policy To implement AppQoE you must configure AppQoE policy to define how to queue the connections in a specific queue.

At the command prompt, type:

```
add appqoe policy <name> -rule <expression> -action <string>
```

Example:

```
add appqoe policy reset_policy -rule HTTP.REQ.CONTENT_LENGTH.le(2000)
-action reset_action
```

> **Note:**
>
> You can use this configuration if you prefer to restrict the request retry feature for content length less than 2000.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Bind load balancing virtual server to AppQoE policy When a back-end server resets a TCP packet request and if you want the load balancing virtual server to forward the request to the next available service through a specific queue, you must bind the load balancing virtual server to the AppQoE policy.

At the command prompt, type:

```
bind lb vserver <name> ((<serviceName> (-policyName <string> [-
priority <positive_integer>] [-gotoPriorityExpression <expression
>] [-type ( REQUEST | RESPONSE )]
```

Example:

```
bind lb vserver v1 -policyName reset_policy -type REQUEST -priority 1
```

Configure AppQoE policy for request retry by using the Citrix ADC GUI

1. Navigate to **AppExpert** > **AppQoE** > **Policies**.
2. In the **AppQoE Policies** page, click **Add**.
3. In the **Create an AppQoE Policy** page, set the following parameters:
   a. Name. AppQoE policy name
   b. Action. Add or edit an action. To create an action, see section.
   c. Expression. Select or enter `HTTP.REQ.CONTENT_LENGTH.le (2000)` policy expression.
4. Click **Create** and **Close**.

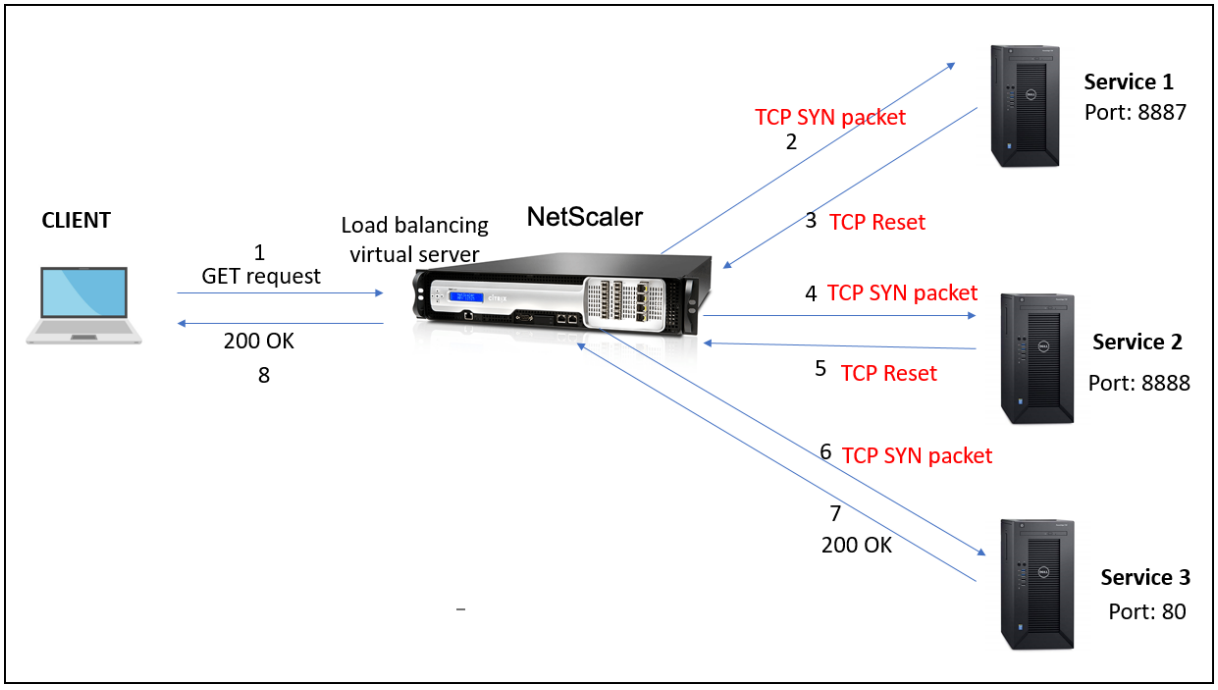
Configure AppQoE action for request retry balancing by using the Citrix ADC GUI

1. Navigate to **AppExpert** > **AppQoE** > **Action**.
2. In the **AppQoE Actions** page, click **Add**.
3. In the **Create AppQoE Action** page, set the following parameters for retry on TCP reset:
   a. Retry on TCP Reset. Select the check box to enable retry action for TCP reset.
   b. Retry Count. Enter the retry count.
4. Click **Create** and **Close**.

Configure request retry for GET method when back-end server resets on TCP SYN establishment

The CLI and GUI configuration is similar to steps followed for GET method. For more information, see Configure request try for GET method section. when back-end server resets a connection section.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.



Request retry if back-end server resets TCP connection during connection establishment

September 14, 2021

When a back-end server resets a TCP connection during connection establishment, the request retry feature forwards the request to the next available server, instead of sending the reset to the client. By doing reload balancing, the client saves RTT when the appliance initiates the same request to next available service.

How request retry works when back-end server resets a TCP connection on SYN establishment

The following diagram show the components interact with each other:

1. The process starts by enabling appqoe feature on your appliance.
2. When the client sends an HTTP or HTTPS request, the load balancing virtual server initiates connection to backend server.
3. If the requested service is unavailable on TCP SYN establishment, the back-end server resets the TCP connection.
4. If the appqoe configuration has “retry”enabled with the desired number of retry attempts specified, the load balancing virtual server uses the configured load balancing algorithm to forward the request to the next available application server.

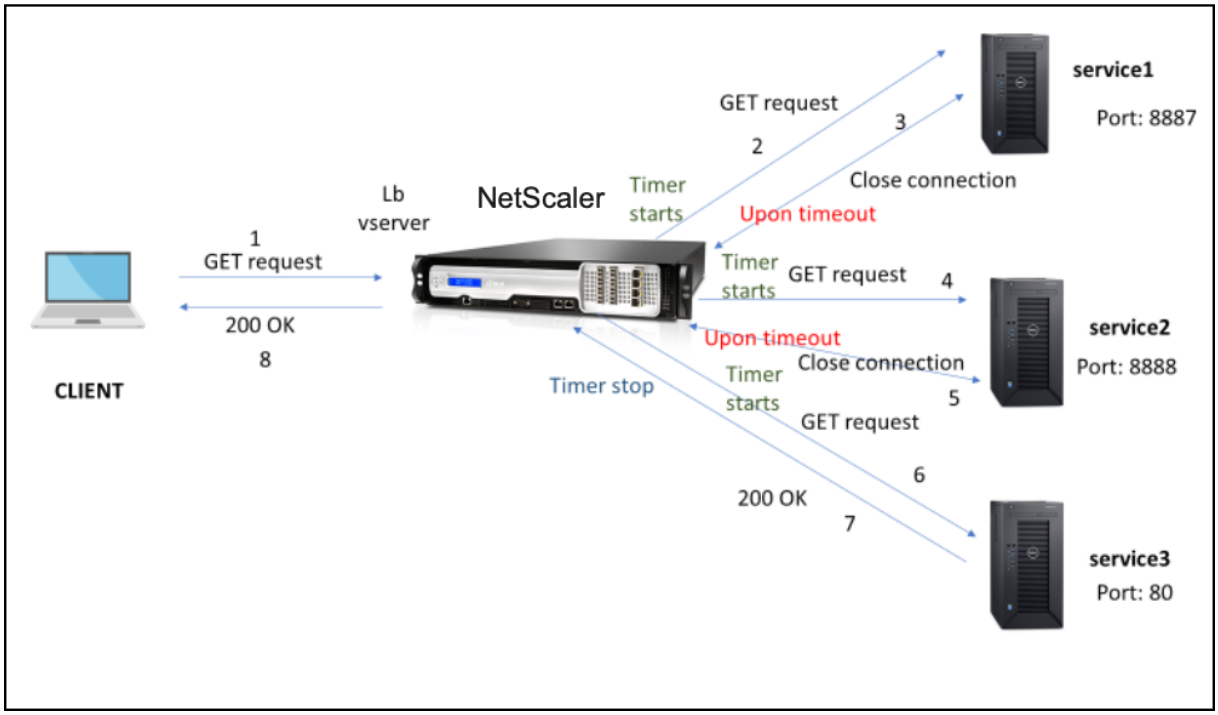
© 1999–2025 Cloud Software Group, Inc. All rights reserved.

5. After the load balancing virtual server receives the response, the appliance forwards the response to the client.
6. If the available back-end servers is equal or lesser than the retry count and if all the servers send reset, the appliance would respond a 500 internal server error. Consider a scenario with five available servers and the retry count set as six. If all the five servers resets the connection, then the appliance returns a 500 internal server error to the client.
7. Similarly, if the number of back-end servers is more than the retry count and if the back-end servers resets the connection on TCP SYN establishment, the appliance forwards the reset to the client. Consider a scenario with three back-end servers and the retry count set as two. If the three servers resets the connection, then the appliance sends a reset packet to the client.

Configure request retry (GET and POST method) when back-end server resets on TCP SYN establishment

The CLI and GUI configuration is similar to steps followed for GET and POST method. For more information, see Configure request retry for GET method topic, Configure request retry for POST method when back-end server resets a connection section.

Request retry if back-end server response times out



December 29, 2023

Request retry is available for one more scenario where, if a back-end server takes more time to respond to requests, the appliance performs re-load balancing upon timeout and forwards the request to the next available server.

How request retry works when back-end server response times out

The following diagram show the components interact with each other:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

1. The process starts by enabling appqoe feature on your appliance.
2. The appqoe configuration has “retryOnTimeout”parameter in milliseconds.
3. When the appliance sends a request and if the server takes more time to respond, the appliance performs re-load balancing based on the configured timeout value. The appliance resets the connection, chooses another service and forwards the request instead of waiting for the server response.
4. After the load balancing virtual server receives the response, the appliance forwards the response to the client. The usage of a time out parameter prevents the appliance to keep waiting for server response leading to an increased RTT.
5. If the available back-end servers is equal or lesser than the retry count and if all the servers times out for the request , the appliance would respond a 500 internal server error. Consider a scenario with five available servers and the retry count set as six. If all the five servers times out for the request, then the appliance returns a 500 internal server error to the client.
6. Similarly if the number of backend servers is more than the retry count and if the back-end server times out upon a request, the appliance keeps waiting upon the last service until the server sends out a response or client idle connection times out. Consider a scenario with three back-end servers and the retry count set as two. If all the three servers times out upon the request, the appliance keeps waiting upon the third service until the server sends out a response or client idle connection times out.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Configure request retry (GET and POST method) when back-end server response times out

For configuring request retry for GET method on timeout, you must complete the following steps.

1. Enable appqoe
2. Configure appqoe action
3. Add appqoe policy
4. Bind appqoe policy to load balancing virtual server

> **Note:**
>
> The request retry upon timeout scenario is also applicable for POST method.

Enable appqoe

At the command prompt, type:

```
enable ns feature appqoe
```

Add appqoe action for timeout

You must configure the appqoe action to retry on timeout and define the number of retry attempts.

At the command prompt, type:

```
add appqoe action <name> -retryOnTimeout <msecs> -numRetries <positive_integer
>
```

Example:

```
add appqoe action appact1 -retryOnTimeout 35 –numRetries 5
```

Add appqoe policy

To implement appqoe you must configure appqoe policy to define how to queue the connections.

At the command prompt, type:

```
add appqoe policy <name> -rule <rule> -action <name>
```

Example:

```
add appqoe policy timeout_policy -rule http.req.method.eq(get)-action
 appact1
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Bind appqoe policy to load balancing virtual server

When a back-end server takes a long time to respond and if you want the load balancing virtual server to forward the request to the next available service, you must bind the appqoe policy to balancing virtual server.

At the command prompt, type:

```
bind lb vserver <name> ((<serviceName> (-policyName <string> [-
priority <positive_integer>] [-gotoPriorityExpression <expression
>] [-type ( REQUEST | RESPONSE )]
```

Example:

```
bind lb vserver v1 -policyName timeout_policy -type REQUEST -priority
 1
```

Configure AppQoE policy for re-loadbalancing on timeout by using the Citrix ADC GUI

1. Navigate to **AppExpert > AppQoE > Policies**.
2. In the **AppQoE Policies** page, click **Add**.
3. In the **Create an AppQoE Policy** page, set the following parameters:

   a. Name. AppQoE policy name
   b. Action. Add or edit an action. To create a new action, see Create AppQoE Action section.
   c. Expression. Select or enter “http.req.method.eq(get)”policy expression.
4. Click **Create** and **Close**.

Configure AppQoE action for request retry by using the Citrix ADC GUI

1. Navigate to **AppExpert > AppQoE > Action**.
2. In the **AppQoE Actions** page, click **Add**.
3. In the **Create AppQoE Action** page, set the following parameter for retry on back-end server response time out:

   a. Retry on Timeout. Retry on request timeout (in millisec) upon sending request to backend servers.
4. Click **Create** and **Close**.

TCP optimization

July 12, 2023

TCP uses the following optimization techniques and congestion control strategies (or algorithms) to avoid network congestion in data transmission.

Congestion Control Strategies

The TCP has long been used to establish and manage Internet connections, handle transmission errors, and smoothly connect web applications with client devices. But network traffic has become more difficult to control, because packet loss does not depend only on the congestion in the network, and congestion does not necessarily cause packet loss. Therefore, to measure congestion, a TCP algorithm should focus on both packet loss and bandwidth.

Proportional Rate Recovery (PRR) algorithm

TCP Fast Recovery mechanisms reduce web latency caused by packet losses. The new Proportional Rate Recovery (PRR) algorithm is a fast recovery algorithm that evaluates TCP data during a loss recovery. It is patterned after Rate-Halving, by using the fraction that is appropriate for the target window chosen by the congestion control algorithm. It minimizes window adjustment, and the actual window size at the end of recovery is close to the Slow-Start threshold (ssthresh).

TCP Fast Open (TFO)

TCP Fast Open (TFO) is a TCP mechanism that enables speedy and safe data exchange between a client and a server during TCP's initial handshake. This feature is available as a TCP option in the TCP profile bound to a virtual server of a Citrix ADC appliance. TFO uses a TCP Fast Open Cookie (a security cookie) that the Citrix ADC appliance generates to validate and authenticate the client initiating a TFO connection to the virtual server. By using this TFO mechanism, you can reduce an application's network latency by the time required for one full round trip, which significantly reduces the delay experienced in short TCP transfers.

How TFO works

When a client tries to establish a TFO connection, it includes a TCP Fast Open Cookie with the initial SYN segment to authenticate itself. If authentication is successful, the virtual server on the Citrix ADC appliance can include data in the SYN-ACK segment even though it has not received the final ACK

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

segment of the three-way handshake. This saves up to one full round-trip compared to a normal TCP connection, which requires a three-way handshake before any data can be exchanged.

A client and a back-end server perform the following steps to establish a TFO connection and exchange data securely during the initial TCP handshake.

1. If the client does not have a TCP Fast Open Cookie to authenticate itself, it sends a Fast Open Cookie request in the SYN packet to the virtual server on the Citrix ADC appliance.
2. If the TFO option is enabled in the TCP profile bound to the virtual server, the appliance generates a cookie (by encrypting the client's IP address under a secret key) and responds to the client with an SYN-ACK that includes the generated Fast Open Cookie in a TCP option field.
3. The client caches the cookie for future TFO connections to the same virtual server on the appliance.
4. When the client tries to establish a TFO connection to the same virtual server, it sends SYN that includes the cached Fast Open Cookie (as a TCP option) along with HTTP data.
5. The Citrix ADC appliance validates the cookie, and if the authentication is successful, the server accepts the data in the SYN packet and acknowledges the event with an SYN-ACK, TFO Cookie, and HTTP Response.

> **Note:**
>
> If the client authentication fails, the server drops the data and acknowledges the event only with a SYN indicating a session timeout.

1. On the server side, if the TFO option is enabled in a TCP profile bound to a service, the Citrix ADC appliance determines whether the TCP Fast Open Cookie is present in the service to which it is trying to connect.
2. If the TCP Fast Open Cookie is not present, the appliance sends a cookie request in the SYN packet.
3. When the back-end server sends the Cookie, the appliance stores the cookie in the server information cache.
4. If the appliance already has a cookie for the given destination IP pair, it replaces the old cookie with the new one.
5. If the cookie is available in the server information cache when the virtual server tries to reconnect to the same back-end server by using the same SNIP address, the appliance combines the data in SYN packet with the cookie and sends it to the back-end server.
6. The back-end server acknowledges the event with both data and a SYN.

Note: If the server acknowledges the event with only a SYN segment, the Citrix ADC appliance immediately resends the data packet after removing the SYN segment and the TCP options from the original packet.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Configuring TCP fast open

To use the TCP Fast Open (TFO) feature, enable the TCP Fast Open option in the relevant TCP profile and set the TFO Cookie Timeout parameter to a value that suits the security requirement for that profile.

Enable or disable TFO by using the CLI At the command prompt, type one of the following commands to enable or disable TFO in a new or existing profile.

Note: The default value is DISABLED.

```
1     add tcpprofile <TCP Profile Name> - tcpFastOpen ENABLED | DISABLED
2     set tcpprofile <TCP Profile Name> - tcpFastOpen ENABLED | DISABLED
3     unset tcpprofile <TCP Profile Name> - tcpFastOpen
4     Examples
5     add tcpprofile Profile1 – tcpFastOpen
6     Set tcpprofile Profile1 – tcpFastOpen Enabled
7     unset tcpprofile Profile1 – tcpFastOpen
```

To set TCP Fast Open cookie timeout value by using the command line interface

At the command prompt, type:

```
1     set tcpparam –tcpfastOpenCookieTimeout <Timeout Value>
2     Example
3     set tcpprofile –tcpfastOpenCookieTimeout 30secs
```

To configure the TCP Fast Open by using the GUI

1. Navigate to **Configuration** > **System** > **Profiles** > and then click **Edit** to modify a TCP profile.
2. On the **Configure TCP Profile** page, select the **TCP Fast Open** check box.
3. Click **OK** and then **Done**.

To Configure the TCP Fast Cookie timeout value by using the GUI

Navigate to **Configuration** > **System** > **Settings** > **Change TCP Parameters** and then **Configure TCP Parameters** page to set the TCP Fast Open Cookie timeout value.

TCP HyStart

A new TCP profile parameter, HyStart, enables the HyStart algorithm, which is a slow-start algorithm that dynamically determines a safe point at which to terminate (ssthresh). It enables a transition to

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

congestion avoidance without heavy packet losses. This new parameter is disabled by default.

If congestion is detected, HyStart enters a congestion avoidance phase. Enabling it gives you better throughput in high-speed networks with high packet loss. This algorithm helps maintain close to maximum bandwidth while processing transactions. It can therefore improve throughput.

Configuring TCP HyStart

To use the HyStart feature, enable the Cubic HyStart option in the relevant TCP profile.

To configure HyStart by using the command line interface (CLI)

At the command prompt, type one of the following commands to enable or disable HyStart in a new or existing TCP profile.

```
add tcpprofile <profileName> -hystart ENABLED
set tcpprofile <profileName> -hystart ENABLED
unset tcprofile <profileName> -hystart
```

Examples:

```
    add tcpprofile profile1 -hystart ENABLED
    set tcpprofile profile1 -hystart ENABLED
    unset tcprofile profile1 -hystart
```

To configure HyStart support by using the GUI

1. Navigate to **Configuration** > **System** > **Profiles** > and click **Edit** to modify a TCP profile.
2. On the **Configure TCP Profile** page, select the **Cubic Hystart** check box.
3. Click **OK** and then **Done**.

TCP burst rate control

It is observed that TCP control mechanisms can lead to a bursty traffic flow on high speed mobile networks with a negative impact on the overall network efficiency. Due to mobile network conditions such as congestion or Layer-2 retransmission of data, TCP acknowledgments arrive clumped at the sender triggering a burst of transmission. These groups of consecutive packets sent with a short inter-packet gap it is called TCP packet burst. To overcome traffic burst, the Citrix ADC appliance uses a TCP Burst Rate Control technique. This technique evenly spaces data into the network for an entire round-trip-time so that the data is not sent into a burst. By using this burst rate control technique, you can achieve better throughput and lower packet drop rates.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

How TCP burst rate control works

In a Citrix ADC appliance, this technique evenly spreads the transmission of a packet across the entire duration of the round-trip-time (RTT). This is achieved by using a TCP stack and network packet scheduler that identifies the various network conditions to output packets for ongoing TCP sessions to reduce the bursts.

At the sender, instead of transmitting packets immediately upon receipt of an acknowledgment, the sender can delay transmitting packets to spread them out at the rate defined by scheduler (Dynamic configuration) or by the TCP profile (Fixed configuration).

Configuring TCP burst rate control

To use the TCP Burst Rate Control option in the relevant TCP profile and set the burst rate control parameters.

To set TCP burst rate control by using the command line

At the command prompt, set one of the following TCP Burst Rate Control commands are configured in a new or existing profile.

Note: The default value is DISABLED.

```
1 add tcpprofile <TCP Profile Name> -burstRateControl Disabled | Dynamic
     | Fixed
2
3 set tcpprofile <TCP Profile Name> -burstRateControl Disabled | Dynamic
     | Fixed
4
5 unset tcpprofile <TCP Profile Name> -burstRateControl Disabled |
     Dynamic | Fixed
```

Where,

Disabled –If the Burst rate control is disabled, then a Citrix ADC appliance does not perform burst management other than the maxBurst setting.

Fixed –If the TCP burst rate control is Fixed, the appliance uses the TCP Connection Payload Send Rate value mentioned in the TCP Profile.

Dynamic –If the Burst Rate Control is “Dynamic”the connection is being regulated based on various network conditions to reduce TCP bursts. This mode works only when the TCP connection is in ENDPOINT mode. When Dynamic Burst Rate control is enabled the maxBurst parameter of the TCP profile is not in effect.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
add tcpProfile  profile1 -burstRateControl Disabled

set tcpProfile profile1 -burstRateControl Dynamic

unset tcpProfile profile1 -burstRateControl Fixed
```

To set TCP Burst Rate Control parameters by using the command line interface At the command prompt, type:

```
    set ns tcpprofile nstcp_default_profile  – burstRateControl <type of
        burst rate control>  – tcprate <TCP rate> -rateqmax <maximum
       bytes in queue>

    T1300-10-2> show ns tcpprofile nstcp_default_profile
            Name: nstcp_default_profile
            Window Scaling status:  ENABLED
            Window Scaling factor: 8
            SACK status: ENABLED
            MSS: 1460
            MaxBurst setting: 30 MSS
            Initial cwnd setting: 16 MSS
            TCP Delayed-ACK Timer: 100 millisec
            Nagle's Algorithm: DISABLED
            Maximum out-of-order packets to queue: 15000
            Immediate ACK on PUSH packet: ENABLED
            Maximum packets per MSS: 0
            Maximum packets per retransmission: 1
            TCP minimum RTO in millisec: 1000
            TCP Slow start increment: 1
            TCP Buffer Size: 8000000 bytes
            TCP Send Buffer Size: 8000000 bytes
            TCP Syncookie: ENABLED
            Update Last activity on KA Probes: ENABLED
            TCP flavor: BIC
            TCP Dynamic Receive Buffering: DISABLED
            Keep-alive probes: ENABLED
            Connection idle time before starting keep-alive probes: 900
                seconds
            Keep-alive probe interval: 75 seconds
            Maximum keep-alive probes to be missed before dropping
               connection: 3

            Accept RST with last acknowledged sequence number: ENABLED
            SYN spoof protection: ENABLED
            TCP Explicit Congestion Notification: DISABLED
            Multipath TCP: DISABLED
            Multipath TCP drop data on pre-established subflow:
               DISABLED
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
38              Multipath TCP fastopen: DISABLED
39              Multipath TCP session timeout: 0 seconds
40              DSACK: ENABLED
41              ACK Aggregation: DISABLED
42              FRTO: ENABLED
43              TCP Max CWND : 4000000 bytes
44              FACK: ENABLED
45              TCP Optimization mode: ENDPOINT
46              TCP Fastopen: DISABLED
47              HYSTART: DISABLED
48              TCP dupack threshold: 3
49              Burst Rate Control: Dynamic
50              TCP Rate: 0
51              TCP Rate Maximum Queue: 0
```

To configure the TCP Burst Rate Control by using the GUI

1. Navigate to **Configuration** > **System** > **Profiles** > and then click **Edit** to modify a TCP profile.
2. On the **Configure TCP Profile** page, select **TCP Burst Control** option from the drop-down list:

    a) BurstRateCntrl
    b) CreditBytePrms
    c) RateBytePerms
    d) RateSchedulerQ

3. Click **OK** and then **Done**.

Protection against wrapped sequence (PAWS) algorithm

If you enable the TCP timestamp option in the default TCP profile, the Citrix ADC appliance uses the Protection Against Wrapped Sequence (PAWS) algorithm to identify and reject old packets whose sequence numbers are within the current TCP connection's receive window because the sequence has "wrapped"(reached its maximum value and restarted from 0).

If network congestion delays a non-SYN data packet and you open a new connection before the packet arrives, sequence-number wrapping might cause the new connection to accept the packet as valid, leading to data corruption. But if the TCP timestamp option is enabled, the packet is discarded.

By default, the TCP timestamp option is disabled. If you enable it, the appliance compares the TCP timestamp (SEG.TSval) in a packet's header with the recent timestamp (Ts.recent) value. If SEG.TSval is equal to or greater than Ts.recent, the packet is processed. Otherwise, the appliance drops the packet and sends a corrective acknowledgment.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

How PAWS works

The PAWS algorithm processes all the incoming TCP packets of a synchronized connection as follows:

1. If `SEG.TSval` < `Ts.recent`: The incoming packet is not acceptable. PAWS sends an acknowledgment (as specified in RFC-793) and drops the packet. Note: Sending an ACK segment is necessary to retain TCP's mechanisms for detecting and recovering from half-open connections.
2. If packet is outside the window: PAWS rejects the packet, as in normal TCP processing.
3. If `SEG.TSval` > `Ts.recent`: `PAWS` accepts the packet and processes it.
4. If `SEG.TSval` <= `Last.ACK.sent`(arriving segment satisfies): PAWS copies the `SEG.TSval` value to `Ts.recent`.
5. If the packet is in sequence: PAWS accepts the packet.
6. If packet is not in sequence: The packet is treated as a normal in-window, out-of-sequence TCP segment. For example, it might be queued for later delivery.
7. If the `Ts.recent` value is idle for more than 24 days: The validity of `Ts.recent` is checked if the PAWS timestamp check fails. If the Ts.recent value is found to be invalid, the segment is accepted and the `PAWS rule` updates the `Ts.recent` with the TSval value from the new segment.

To enable or disable TCP timestamp by using the command line interface

At the command prompt, type:

```
1 `set nstcpprofile nstcp_default_profile -TimeStamp (ENABLED | DISABLED)
    `
```

To enable or disable TCP timestamp by using the GUI

Navigate to **System** > **Profile** > **TCP Profile**, select the default TCP profile, click **Edit**, and select or clear the **TCP timestamp** check box.

Optimization Techniques

TCP uses the following optimization techniques and methods for optimized flow controls.

Policy based TCP Profile Selection

Network traffic today is more diverse and bandwidth-intensive than ever before. With the increased traffic, the effect that Quality of Service (QoS) has on TCP performance is significant. To enhance QoS, you can now configure AppQoE policies with different TCP profiles for different classes of network

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

traffic. The AppQoE policy classifies a virtual server's traffic to associate a TCP profile optimized for a particular type of traffic, such as 3G, 4G, LAN, or WAN.

To use this feature, create a policy action for each TCP profile, associate an action with AppQoE policies, and bind the policies to the load balancing virtual servers.

For information about using subscriber attributes to perform TCP optimization, see Policy-based TCP Profile.

Configuring policy based TCP profile selection

Configuring policy based TCP profile selection consists of the following tasks:

- Enabling AppQoE. Before configuring the TCP profile feature, you must enable the AppQoE feature.
- Adding AppQoE Action. After enabling the AppQoE feature, configure an AppQoE action with a TCP profile.
- Configuring AppQoE based TCP Profile Selection. To implement TCP profile selection for different classes of traffic, you must configure AppQoE policies with which your Citrix ADC can distinguish the connections and bind the correct AppQoE action to each policy.
- Binding AppQoE Policy to Virtual Server. Once you have configured the AppQoE policies, you must bind them to one or more load balancing, content switching, or cache redirection virtual servers.

Configuring using the command line interface

To enable AppQoE by using the command line interface

At the command prompt, type the following commands to enable the feature and verify that it is enabled:

- `enable ns feature appqoe`
- `show ns feature`

To bind a TCP profile while creating an AppQoE action using the command line interface

At the command prompt, type the following AppQoE action command with the `tcpprofiletobind` option.

```
add appqoe action <name> [-priority <priority>] [-respondWith ( ACS |
 NS )[<CustomFile>] [-altContentSvcName <string>] [-altContentPath <
string>] [-maxConn <positive_integer>] [-delay <usecs>]] [-polqDepth
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
<positive_integer>] [-priqDepth <positive_integer>] [-dosTrigExpression
 <expression>] [-dosAction ( SimpleResponse |HICResponse )] [-tcpprofiletobind
 <string>]
show appqoe action
```

To configure an AppQoE policy by using the command line interface

At the command prompt, type:

```
add appqoe policy <name> -rule <expression> -action <string>
```

To bind an AppQoE policy to load balancing, cache redirection or content switching virtual servers by using the command line interface

At the command prompt, type:

```
bind cs vserver cs1 -policyName <appqoe_policy_name> -priority <
priority>
bind lb vserver <name> - policyName <appqoe_policy_name> -priority <
priority>
bind cr vserver <name> -policyName <appqoe_policy_name> -priority <
priority>
```

Example

```
1    add ns tcpProfile tcp1 -WS ENABLED -SACK ENABLED -WSVal 8 -nagle
        ENABLED -maxBurst 30 -initialCwnd 16 -oooQSize 15000 -minRTO 500
         -slowStartIncr 1 -bufferSize 4194304 -flavor BIC -KA ENABLED -
        sendBuffsize 4194304 -rstWindowAttenuate ENABLED -spoofSynDrop
        ENABLED -dsack enabled -frto ENABLED -maxcwnd 4000000 -fack
        ENABLED -tcpmode ENDPOINT
2    add appqoe action appact1 -priority HIGH -tcpprofile tcp1
3    add appqoe policy apppol1 -rule "client.ip.src.eq(10.102.71.31)" -
        action appact1
4    bind lb vserver lb2 -policyName apppol1 -priority 1 -
        gotoPriorityExpression END -type REQUEST
5    bind cs vserver cs1 -policyName apppol1 -priority 1 -
        gotoPriorityExpression END -type REQUEST
```

Configuring policy based TCP profiling using the GUI

To enable AppQoE by using the GUI

1. Navigate to **System** > **Settings**.
2. In the details pane, click **Configure Advanced Features**.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

3. In the **Configure Advanced Features** dialog box, select the **AppQoE** check box.
4. Click **OK**.

To configure AppQoE policy by using the GUI

1. Navigate to **App-Expert** > **AppQoE** > **Actions**.
2. In the details pane, do one of the following:
3. To create an action, click **Add**.
4. To modify an existing action, select the action, and then click **Edit**.
5. In the **Create AppQoE Action** or the **Configure AppQoE Action** screen, type or select values for the parameters. The contents of the dialog box correspond to the parameters described in "Parameters for configuring the AppQoE Action"as follows (asterisk indicates a required parameter):

    a) Name—name
    b) Action type—respondWith
    c) Priority—priority
    d) Policy Queue Depth—polqDepth
    e) Queue Depth—priqDepth
    f) DOS Action—dosAction

6. Click **Create**.

To bind AppQoE policy by using the GUI

1. Navigate to **Traffic Management** > **Load Balancing** > **Virtual Servers**, select a server and then click **Edit**.
2. In the **Policies** section and click (+) to bind an AppQoE policy.
3. In the **Policies** slider, do the following:

    a) Select a policy type as AppQoE from the drop-down list.
    b) Select a traffic type from the drop-down list.

4. In the **Policy Binding** section, do the following:

    a) Click **New** to create an AppQoE policy.
    b) Click **Existing Policy** to select an AppQoE policy from the drop-down list.

5. Set the binding priority and click **Bind** to the policy to the virtual server.
6. Click **Done**.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

SACK block generation

TCP performance slows down when multiple packets are lost in one window of data. In such a scenario, a Selective Acknowledgment (SACK) mechanism combined with a selective repeat retransmission policy overcomes this limitation. For every incoming out-of-order packet, you must generate a SACK block.

If the out-of-order packet fits in the reassembly queue block, insert packet info in the block, and set the complete block info as SACK-0. If an out-of-order packet does not fit into the reassembly block, send the packet as SACK-0 and repeat the earlier SACK blocks. If an out-of-order packet is a duplicate and packet info is set as SACK-0 then D-SACK the block.

Note: A packet is considered as D-SACK if it is an acknowledged packet, or an out of order packet which is already received.

Client reneging

A Citrix ADC appliance can handle client reneging during SACK based recovery.

Memory checks for marking end_point on PCB are not considering total available memory

In a Citrix ADC appliance, if the memory usage threshold is set to 75 percent instead of using the total available memory, it causes new TCP connections to bypass TCP optimization.

Unnecessary retransmissions due to missing SACK blocks

In a non-endpoint mode, when you send DUPACKS, if SACK blocks are missing for few out of order packets, triggers more retransmissions from the server.

SNMP for connections bypassed optimization because of overload

The following SNMP ids have been added to a Citrix ADC appliance to track number of connections bypassed TCP optimizations due to overload.

1. 1.3.6.1.4.1.5951.4.1.1.46.131 (tcpOptimizationEnabled). To track the total number of connections enabled with TCP optimization.
2. 1.3.6.1.4.1.5951.4.1.1.46.132 (tcpOptimizationBypassed). To track the total number of connections bypassed TCP Optimization.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Dynamic receive buffer

To maximize TCP performance, a Citrix ADC appliance can now dynamically adjust the TCP receive buffer size.

Tail Loss Probe algorithm

A retransmission timeout (RTO) is a loss of segments at the tail end of a transaction. An RTO occurs if there are application latency issues, especially in short web transactions. To recover loss of segments at the end of a transaction, TCP uses the Tail Loss Probe (TLP) algorithm.
TLP is a sender only algorithm. If a TCP connection is not receiving any acknowledgment for a certain period, TLP transmits the last unacknowledged packet (loss probe). In the event of a tail loss in original transmission, acknowledge from loss probe triggers a SACK or FACK recovery.

Configuring the Tail Loss Probe

To use the Tail Loss Probe (TLP) algorithm, you must enable the TLP option in the TCP profile and set the parameter to a value that suits the security requirement for that profile.

Enable TLP by using the command line At the command prompt, type one of the following commands to enable or disable TLP in a new or existing profile.

> **Note**:
>
> The default value is DISABLED.

```
add tcpprofile <TCP Profile Name> - taillossprobe ENABLED | DISABLED

set tcpprofile <TCP Profile Name> - taillossprobe ENABLED | DISABLED

unset tcpprofile <TCP Profile Name> - taillossprobe
```

Examples:

```
add tcpprofile nstcp_default_profile – taillossprobe
set tcpprofile nstcp_default_profile –taillossprobe Enabled
unset tcpprofile nstcp_default_profile –taillossprobe
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Configure the Tail Loss Probe algorithm by using the Citrix ADC GUI

1. Navigate to **Configuration** > **System** > **Profiles** > and then click **Edit** to modify a TCP profile.
2. On the **Configure TCP Profile** page, select the **Tail Loss Probe** check box.
3. Click **OK** and then **Done**.

Troubleshooting solutions for Citrix ADC

September 14, 2021

This topic gives you some basic troubleshooting solutions needed to resolve issues that occur in your appliance. It gives you an understanding of NetScaler appliance, how it integrates with the network, and what issues you can expect in basic system features.

How to record a packet trace on Citrix ADC

December 3, 2024

You can record a packet trace using the Citrix ADC GUI. The trace is stored in `nstrace.cap`.

1. Navigate to **System > Diagnostics**.
2. Click **Start new trace** under **Technical Support Tools**.
3. In the **Start Trace page** update the following fields:

    a) **Packet Size** - Enter the size of the packet to capture during the trace. Enter 0 for full packet trace.

    - Default value: 164
    - Minimum value: 0
    - Maximum value: 1514

    b) **Capture trace in .pcap format** - You have the option to capture a packet trace in nstrace (.cap) or TCP dump (.pcap) format. By default, the packet trace is captured in nstrace format (.cap) and it is the recommended format. To capture trace in TCP dump format, select **Capture trace in .pcap format**.

    c) **Capture SSL Master keys** - To analyze the traces better, enable the **Capture SSL Master keys** option. This setting captures SSL keys for the current session, which are necessary to decrypt encrypted data. The SSL keys are stored in a file named `nstrace.sslkeys`.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

- When you click **Start** to initiate the trace with the **Capture SSL Master keys** option enabled, a security warning message is displayed. **Acknowledge** this warning to proceed.
- The SSL session keys generated are an alternative to the private key and can be used when the private key is either unavailable or cannot be shared. You can use these keys to decrypt only the NS trace. This method can decrypt RSA and Diffie-Hellman-based key exchanges (such as DHE or ECDHE).

d) **Number of trace files** - Enter the number of trace files to be generated during the trace.

- Default value: 24
- Minimum value: 1
- Maximum value: 100

e) **Trace File name** - Enter the name for the trace file.

f) **Trace File ID** - Enter the file ID for the trace file.

g) **Duration of data per file (seconds)** - Enter the time (in seconds) to capture the data for each trace file.

- Default value: 3600
- Minimum value: 1

h) **File size** - Enter the file size (in MB) for each trace file.

- Default value: 1024
- Minimum value: 0
- Maximum value: 10240

When the trace reaches the specified file size, a new trace starts. If the free disk space is less than 2 GB, the trace stops.

i) **Trace Buffers** - Enter the number of trace buffers (temporary storage) to store the packet capture. Each buffer is about 16 KB.

- Default value: 5000
- Minimum value: 1000

4. Enter the **Filter Expression**.

   Adding filter expressions for IP address, port, VLAN, or interface ensures capturing only the relevant traffic and reduces the load on Citrix ADC during the packet trace.

5. Select the **Merge** option from the list.

   - **ONSTOP** - The temporary trace files are merged into a single trace file.
   - **NOMERGE** - The trace files are not merged.
   - **ONTHEFLY** - The trace files are merged without creating any temporary file.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Default value: ONSTOP

6. Select the relevant option from the additional packet capture options available.

   Default value: Do Runtime cleanup

7. Select the required options in **Capturing Mode**.

   By default, **Packets buffered for Transmission (TXB)** and **Receive packets after NIC pipelining (NEW_RX)** are selected. To decrypt the trace without a private key, select **Decrypted SSL packets (SSLPLAIN)**.

8. Click **Start** to start recording the network packet trace.
9. In the **Stop Trace** page, click **Stop and Download** to stop recording the network packet trace after the test is complete.
10. In the **Delete/Download Trace files** page, select the file, click **Download**, and then click **Close**.

    Open the trace file with the Wireshark utility to display the content of the file.

We recommend you to use the recent Wireshark version from the automated build section available in the following webpage: http://www.wireshark.org/download/automated.

Use case to capture a packet trace with virtual server IP filter (both front-end and back end)

Using a filter of the virtual server IP address and enabling the option "–link"in CLI or selecting the option "Trace filtered connection peer traffic"in GUI, you can capture both the front-end and back-end traffic for the IP address.

```
1 start nstrace -size 0 -filter "CONNECTION.IP.EQ(1.1.1.1)" -link ENABLED
2
3 show nstrace
4         State:  RUNNING          Scope:  LOCAL            TraceLocation
             :  "/var/nstrace/24Mar2017_16_00_19/..." Nf:  24
                              Time:  3600              Size:  0
                             Mode:  TXB NEW_RX
5         Traceformat:  NSCAP      PerNIC:  DISABLED        FileName:  24
             Mar2017_16_00_19 Filter:  "CONNECTION.IP.EQ(1.1.1.1)" Link:
              ENABLED           Merge:  ONSTOP           Doruntimecleanup
             :  ENABLED
6         TraceBuffers:  5000      SkipRPC:  DISABLED       Capsslkeys:
             DISABLED    InMemoryTrace:  DISABLED
```

Capturing cyclic traces

It is always challenging to troubleshoot an intermittent issue. Cyclic tracing is best suited for issues which are intermittent. The traces can be run over a span of few hours or days before the issue occurs.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Also, you can use a specific filter and evaluate the size of the trace files that are generated before you run it for a longer time.

Run the following command from the CLI:

```
start nstrace -nf 60 -time 30 -size 0
This particular trace will create 60 files each of them for 30 sec.
   This means the files will start getting overwritten after 60 trace
   files or 30 mins
Show nstrace - To check the status of the nstrace
Stop nstrace - To stop the nstrace.
```

Best Practices

On a unit handling GB of traffic per second, capturing traffic is a very resource intensive process. The impact to resources is mainly in terms of the CPU and the disk space. Disk space impact can be reduced by using filtering expressions. However, the impact on the CPU remains and sometimes causes a slight increase as the appliance now needs to process packets according to the filter before capturing them.

The best practice with regard to tracing is:

1. The duration for which the trace is run must be as limited as possible when you still ensure the packets of interest are captured.
2. Schedule the tracing activity to happen at a time when the number of users (and hence the traffic) is greatly reduced, such as during off hours.

How to free space on the VAR directory for logging issues with a Citrix ADC appliance

April 14, 2023

The following article explains how an administrator can free the space from the `/var` directory of a Citrix ADC appliance. You can follow the steps when the Citrix GUI is not accessible.

When the amount of disk space is low in the /var directory of the appliance, you might not be able to sign in to the Citrix GUI. In this scenario, you can remove the old log files to create free space in the /var directory.

Points to remember

- Ensure that you back up the files before removing the files from the appliance.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

To free space in the /var directory of a Citrix ADC appliance, complete the following procedure:

1. Log on to the CLI of Citrix ADC by using SSH. For more information to complete this task, see the Citrix ADC Documentation.
2. After you log on to the Citrix ADC CLI, switch to the shell prompt using the following command.
   ```
   shell
   ```
3. Run the following command to see the availability of space on the Citrix ADC appliance. `df -h`
4. If the memory capacity of the /var directory is filled up to 90 percent, then you must delete few files from this directory.

   - Run the following commands to view the contents of the /var directory:
     ```
     cd /var
     ls -l
     ```

   The directories that are usually of interest are as follows:

   ```
   /var/nstrace - This directory contains trace files.This is the most common reason for HDD being filled on the Citrix ADC appliance. This is due to an nstrace being left running for indefinite amount of time. All traces that are not of interest can and should be deleted. To stop an nstrace, go back to the CLI and issue stop nstrace command.

   /var/log - This directory contains system specific log files.

   /var/nslog - This directory contains Citrix ADC log files.

   /var/tmp/support - This directory contains technical support files, also known as, support bundles. All files not of interest should be deleted.

   /var/core - Core dumps are stored in this directory. There will be directories within this directory and they will be labeled with numbers starting with 1. These files can be quite large in size. Clear all files unless the core dumps are recent and investigation is required.

   /var/crash - Crash files, such as process crashes are stored in this directory. Clear all files unless the crashes are recent and investigation is required.

   /var/nsinstall -  Firmware is placed in this directory when upgrading. Clear all files, except the firmware that is currently being used.
   ```

   - Verify if any of the directories are using more space:

     ```
     du -hs *
     44k     cache
     ```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
2.0k    clusterd
2.0k    configdb
6.0k    core
989M    crash
4.0k    cron
2.0k    dev
6.0k    download
2.0k    gui
2.0k    install
2.0k    krb
2.0k    learnt_data
122M    log
366M    NetScaler
14k    ns_gui
86k    ns_sys_backup
631M    nsinstall
883M    nslog
32k    nsproflog
2.0k    nssynclog
16k    nstemplates
36k    nstmp
4.5G    nstrace
8.1M    opt
6.0k    pubkey
52k    run
28M    safenet
72M    tmp
2.0k    vmtools
14k    vpn
```

- Delete the files which are not required:

```
rm -r nstrace/*
```

For more help on deleting files see FreeBSD Man Pages.

  - Delete the files which are not required.

    `rm -r nstrace/*`

    For more help on deleting files see FreeBSD Man Pages.

  - If the log or `nslog` directory is using more space, then run the following commands to open the log directory and view its contents:

```
cd /var/log
ls -l
cd /var/nslog
ls -l
```

1. Ensure that all files are compressed. This is indicated by the .tar.gz file name extension.

   If the file is not compressed, perform the following:

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

For compressing the file to .gz format:

```
cd /var/log
gzip <filename>
```

Compressed file is placed at /var/log

For compressing the file to .tar.gz format:

```
cd /var/nslog
tar -cz <filename>.tar.gz <filename>
```

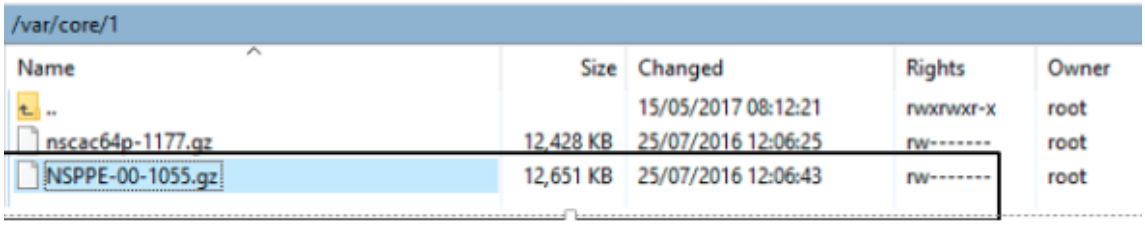
Compressed file is placed at /var/nslog

2. If you are using Citrix ADM, then verify the /var/ns_system_backup directory. Ensure that Citrix ADM clears the backup files it creates.

More resources

For information on any of the commands mentioned in the preceding procedure, see - http://ss64.com/bash/

How to download core or crashed files from Citrix ADC appliance



September 14, 2021

This troubleshooting article explains how an administrator can download core or crash files from the Citrix ADC appliance.

Download core or crash files from Citrix ADC appliance using SFTP client

To download the core or crash files from a NetScaler appliance, complete the following procedure:

1. Open WinSCP and log on to the NetScaler Management IP address.
2. Navigate to the `/var/core/1` to download the files.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

> **Note:**
>
> To download the latest crash or core file, you can also use the WinSCP tool through command interface. The files can be located either in the core or crash directory.

How to collect performance statistics and event logs

December 29, 2023

You can collect performance statistics of virtual servers and associated services from an archived `newnslog` file present in the `/var/nslog` directory. The `newnslog` files are interpreted by running `/netscaler/nsconmsg`.

Collect performance statistics and event logs using the CLI

You can run the `nsconmsg` command from the Citrix ADC shell prompt to report events.

At the command prompt, type:

```
/netscaler/nsconmsg -K /var/nslog/newnslog -d event
```

```
1 Displaying event information
2 NetScaler V20 Performance Data
3 NetScaler NS10.5: Build 57.7.nc, Date: May 14 2015, 07:35:21
4 rtime: Relative time between two records in milliseconds
5 seqno rtime event-message                          event-time
6 11648 16310 PPE-0 MonServiceBinding_10.104.20.110:443_(tcp-default)
```

View the time span covered by a given “newnslog”file

At the command prompt, type:

```
/netscaler/nsconmsg -K /var/nslog/newnslog -d setime
```

The current data is appended to the `/var/nslog/newnslog` file. NetScaler archives the `newnslog` file automatically every two days by default. To read the archived data, you must extract the archive as shown in the following example:

`cd /var/nslog` - command to go to a particular directory from NetScaler Shell Prompt.

`tar xvfz newnslog.100.tar.gz` - command to extract the tar file.

`/netscaler/nsconmsg -K newnslog.100 -d setime` - Command to check the time span covered by the particular file, in this example `newnslog.100`.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

`ls -l` Command checks all the logs file and time stamp associated with those files.

```
root@NETSCALER# cd /var/nslog
root@NETSCALER# ls -l
```

```
 wheel    461544 Aug  7  2014 newnslog.1.tar.gz
-rw-r--r--   1 root       wheel    191067 Aug  7  2014 newnslog.10.tar.
   gz
-rw-r--r--   1 root       wheel  11144873 Apr 26 22:04 newnslog.100.tar
   .gz
-rw-r--r--   1 root       wheel  11095053 Apr 28 22:04 newnslog.101.tar
   .gz
-rw-r--r--   1 root       wheel  11114284 Apr 30 22:04 newnslog.102.tar
   .gz
-rw-r--r--   1 root       wheel  11146418 May  2 22:04 newnslog.103.tar
   .gz
-rw-r--r--   1 root       wheel  11104227 May  4 22:04 newnslog.104.tar
   .gz
-rw-r--r--   1 root       wheel  11297419 May  6 22:04 newnslog.105.tar
   .gz
-rw-r--r--   1 root       wheel  11081212 May  8 22:04 newnslog.106.tar
   .gz
-rw-r--r--   1 root       wheel  11048542 May 10 22:04 newnslog.107.tar
   .gz
-rw-r--r--   1 root       wheel  11101869 May 12 22:04 newnslog.108.tar
   .gz
-rw-r--r--   1 root       wheel  11378787 May 14 22:04 newnslog.109.tar
   .gz
-rw-r--r--   1 root       wheel  44989298 Apr 11  2014 newnslog.11.gz
```

Display the time span within a file

Use the `nsconmsg` command to only display a span of time within the given file, as shown in the following example:

```
/netscaler/nsconmsg -K /var/nslog/newnslog -s time=22Mar2007:20:00 -T
 7 -s ConLb=2 -d oldconmsg
```

Where,

`s` - time=22Mar2007:20:00:00 is start at March 22, 2007 at exactly 20:00.

`T` 7 - Displays seven seconds of data

`s` - Displays detail level of load balancing statistics.

`d` - Displays statistical information.

> **Note:**
>
> From ADC release 12.1 you need add at the “time”seconds as well, that is: 22Mar2007:20:00:00

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

The statistical information provided by the -d oldconmsg parameter is recorded every seven seconds. The following is a sample output.

```
1  VIP(10.128.58.149:80:UP:WEIGHTEDRR): Hits(38200495, 18/sec) Mbps(1.02)

      Mbps(0.23) BWlmt(0 kbits) RspTime(125.38 ms)
14 Other: Pkt(38/sec, 670 bytes) Wt(10000) RHits(31556)
15 Conn: CSvr(32, 0/sec) MCSvr(20) OE(10) RP(7) SQ(0)
```

> **Note:**
>
> The client connection counts of the individual services do not add up to the client connection count of the virtual server. The reason is because of session reuse between the Citrix ADC appliance and the back-end service.

Virtual Server Output

```
VIP(10.128.58.149:80:UP:WEIGHTEDRR): Hits(38200495, 18/sec)Mbps(1.02)
Pers(OFF)Err(0)Pkt(186/sec, 610 bytes)actSvc(4)DefPol(NONE)override
(0)Conn: Clt(253, 1/sec, OE[252])Svr(3)
```

The following list describes the virtual server statistics:

1. IP (IP address:port:state:Load balancing method). The IP address and port of the Virtual IP address as configured. The virtual server state or virtual IP address is UP, DOWN, or OUT OF SERVICE; Load balancing method configured for the Virtual IP address.
2. Hits (#). Number of requests that reached the virtual server.
3. Mbps (#). Total traffic Volume on the virtual server (Rx + Tx) converted into Mbits/s
4. Pers: Type of persistence configured.
5. Err (#). Number of times an error page was generated by the virtual server.
6. Pkt (#/sec, # bytes): Volume of network traffic (as packets) passing through the virtual server and average packet size flowing through the virtual server.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

7. actSvc(#). Number of active services that are bound to the virtual server.
8. DefPol (RR). Indicates whether the default load balancing method is active. Default load balancing method is used for some number of initial requests to smooth the behavior of the other methods.
9. Clt (#, #/sec). Number of current client connections to the virtual server rate.
10. OE [#]. Number of server connections from the virtual server in open established state.
11. Svr (#). Number of current server connections from the virtual server.

In the preceding output, Svr(3) indicates the command collects he statistical sample. There are three active connections for the virtual server to the back-end server, even though there are four services in total. When a client establishes a connection with the virtual server, it is not necessary that the client sends or receives any traffic when the command collects the information. Therefore, it is common to see the Svr counter lower than the OE[] number. The Svr counter represents the number of active connections that are actively sending or receiving data. The Mapped IP address (MIP) or Subnet IP address (SNIP) is connected to the associated back-end server. And, the Citrix ADC tracks the virtual server connected to the back-end server and calculates the counter.

Virtual service output

```
1 S(10.128.49.40:80:UP) Hits(9443063, 4/sec, P[2602342, 0/sec]) ATr(5)
     Mbps(0.23) BWlmt(0 kbits) RspTime(112.58 ms)
2 Other: Pkt(36/sec, 712 bytes) Wt(10000) RHits(31555)
3 Conn: CSvr(42, 0/sec) MCSvr(20) OE(16) RP(11) SQ(0)
```

The following list describes the service statistics:

1. S (IP address:port:state). IP address, port, and state of the service such as, DOWN, UP, or OUT OF SERVICE.
2. Hits (#, P[#]). Number of requests directed to the service, Number of requests directed to the service due to configured server persistence.
3. ATr (#). Number of active connections to the service.

> **Note:**
>
> Active connections are ones which have the outstanding request to the service or currently have traffic activity.

1. Mbps (#.##). Total traffic Volume on the Service (Rx + Tx) converted into Mbits/s
2. BWlmt (# kbits): Defined bandwidth limit.
3. RspTime (# ms). Average response time of the service in milliseconds.
4. Pkt(#/sec, #bytes). Traffic volume in terms of packets per second going to the service; Average size of the packets.
5. Wt (#). Weight index, used in load balancing algorithm.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

> **Note:**
>
> If you divide this value by 10,000, then you get the actual configured weight of the service.

1. `RHits (#)`. Running requests counter used in Round Robin load balancing algorithm.
2. `CSvr (#, #/sec)`. Number of connections to the service rate.
3. `MCSvr (#)`. Maximum number of connections to the service.
4. `OE (#)`. Number of connections to the service in the established state.
5. `RP (#)`. Number of connections to the service, residing in the reuse pool.
6. `SQ (#)`. Number of connections to the service, waiting in the surge queue.

Collect performance statistics and event logs using the Citrix ADC GUI

1. Navigate to **System > Diagnostics > Maintenance > Delete/Download log files**.
2. Select a file and click **Download** to download the file.

How to configure log file rotation

September 14, 2021

The Citrix ADC appliance generates logs in multiple directories and in various formats. Some of these logs are not rotated by default and can grow in size consuming too much disk space. By using the included utilities for log rotation (`newsyslog`), you can manage these logs consistently, by keeping only relevant information for easier management and administration.

The `newsyslog` utility included in the Citrix ADC firmware archives log files and rotates the system logs so the current log is empty during rotation. The system crontab runs this utility every hour and it reads the configuration file which specifies the files to rotate and the conditions. The archived files might be compressed if necessary.

The existing configuration is located in `/etc/newsyslog.conf`. However, because this file resides in the memory filesystem, the administrator must save the modifications to `/nsconfig/newsyslog.conf` so the configuration survives restarting the NetScaler.

The entries contained in this file have the following format:
`logfilename [owner:group] mode count size when flags [/pid_file] [sig_num]`

> **Note:**
>
> Fields within squared brackets are optional and can be omitted.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

Each line on the file represents a log file and the conditions under which rotation must occur.

In the example, the `size` field indicates that the size of `ns.log` as 100 Kilobytes. The `count` field indicates that the number of archived `ns.log` files as 25. A size of 100 K and count of 25 are the default size and count values.

> **Note:**
>
> When the field is configured with an asterisk (*), meaning that the ns.log file is not rotated based on time. Every hour, a crontab job runs the `newsyslog` utility which checks if the size of ns.log is greater than or equal to the size configured in this file. In this example, if it is greater than or equal to 100 K, it rotates that file.

```
root@ns# cat /etc/newsyslog.conf
# Netscaler newsyslog.conf

# This file is present in the memory filesystem by default, and any
    changes
# to this file will be lost following a reboot. If changes to this file
# require persistence between reboots, copy this file to the /nsconfig
# directory and make the required changes to that file.
#
# logfilename [owner:group] mode count size when flags [/pid_file] [
    sig_num]
/var/log/cron 600 3 100 * Z
/var/log/amd.log 644 7 100 * Z
/var/log/auth.log 600 7 100 * Z
/var/log/ns.log 600 25 100 * Z
```

The `size` field can be changed to modify the minimum size of the `ns.log` file or the field can be changed to rotate the `ns.log` file based on a certain time.

The daily, weekly, and/or monthly specification is given as: `[Dhh]`, and `[Dhh [Mdd]]`, respectively. The time-of-day fields, which are optional, default to midnight. The ranges and meanings for these specifications are:

```
Hh hours, range 0 ... 23
w day of week, range 0 ... 6, 0 = Sunday
dd day of month, range 1 ... 31, or the letter L or l to specify the
    last day of the month.
```

Examples:

Here are some examples with explanations for the logs that are rotated by default:

`/var/log/auth.log 600 7 100 * Z`

The authentication log is rotated when the file reaches 100 K, the last 7 copies of the auth.log are archived and compressed with gzip (Z flag), and the resulting archives are assigned the following permissions –rw———-.

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
/var/log/all.log 600 7 * @T00 Z
```

The catch-all log is rotated 7 times at midnight every night (@T00) and compressed with gzip. The resulting archives are assigned the following permissions –rw-r—-.

```
/var/log/weekly.log 640 5 * $W6D0 Z
```

The weekly log is rotated 5 times at midnight every Monday. The resulting archives are assigned with permissions.

Common Rotation Patterns:

- D0. rotate every night at midnight
- D23. rotate every day at 23:00
- W0D23. rotate every week on Sunday at 23:00
- W5. rotate every week on Friday at midnight
- MLD6. rotate at the last day of every month at 6:00
- M5. rotate on every fifth day of the month at midnight

If an interval and a time specification are both given, then both conditions must be met. That is, the file must be as old as or older than the specified interval and the current time must match the time specification.

You can control the minimum file size but there is no limit on the file size before the newsyslog utility gets its turn in the next hour slot.

Debug newsyslog:

To debug the behavior of the newsyslog utility, add the verbose flag.

```
root@dj_ns# newsyslog -v
/var/log/cron <3Z>: size (Kb): 31 [100] --> skipping
/var/log/amd.log <7Z>: does not exist, skipped.
/var/log/auth.log <7Z>: size (Kb): 2 [100] --> skipping
/var/log/kerberos.log <7Z>: does not exist, skipped.
/var/log/lpd-errs <7Z>: size (Kb): 0 [100] --> skipping
/var/log/maillog <7Z>: --> will trim at Tue Mar 24 00:00:00 2009
/var/log/sendmail.st <10>: age (hr): 0 [168] --> skipping
/var/log/messages <5Z>: size (Kb): 7 [100] --> skipping
/var/log/all.log <7Z>: --> will trim at Tue Mar 24 00:00:00 2009
/var/log/slip.log <3Z>: size (Kb): 0 [100] --> skipping
/var/log/ppp.log <3Z>: does not exist, skipped.
/var/log/security <10Z>: size (Kb): 0 [100] --> skipping
/var/log/wtmp <3>: --> will trim at Wed Apr 1 04:00:00 2009
/var/log/daily.log <7Z>: does not exist, skipped.
/var/log/weekly.log <5Z>: does not exist, skipped.
/var/log/monthly.log <12Z>: does not exist, skipped.
/var/log/console.log <5Z>: does not exist, skipped.
/var/log/ns.log <5Z>: size (Kb): 18 [100] --> skipping
/var/log/nsvpn.log <5Z>: size (Kb): 0 [100] --> skipping
/var/log/httperror.log <5Z>: size (Kb): 1 [100] --> skipping
```

© 1999–2025 Cloud Software Group, Inc. All rights reserved.

```
/var/log/httpaccess.log <5Z>: size (Kb): 1 [100] --> skipping
root@dj_ns#
```

How to free space on a /flash directory in a Citrix ADC appliance

September 14, 2021

This troubleshooting article explains how an administrator can free space from the /flash directory of a Citrix ADC appliance.

Procedure to free space in the /flash directory of a Citrix ADC appliance

1. Log on to the CLI of Citrix ADC by using SSH.
2. After you log on to the Citrix ADC CLI, switch to the shell prompt using the following command.`shell`.
3. Run the `df -h` command to see the availability of space on the Citrix ADC appliance.
4. If the capacity of the /flash directory is more than 90 percent or low, you must delete few files from this directory.
5. Run the following commands to view the contents of the /flash directory:

   ```
   cd /flash
   ls -l
   ```

6. You might find multiple files of various versions of the NetScaler software release. Ensure that the files present in this location are the ones applicable to the current version of the NetScaler software on your appliance. Run the following command to remove any other files from the appliance.

   ```
   rm <filename>
   ```

> **Note**
>
> Remove only the older versions of the kernel. The /flash directory must contain the files that the current version or build of the NetScaler software release is using and the kernel.gz file. Citrix recommends not to remove these files from the /flash directory.

Reference Material

October 15, 2021

Use this reference information to get an in-depth understanding of the following Citrix ADC components:

Citrix ADC SNMP OIDs - Details of the SNMP OIDs that can be used to obtain information from a Citrix ADC appliance.

Citrix ADC Syslog Messages - Details of the Syslog messages given by the Citrix ADC appliance.

Citrix ADC CLI Commands - Details of the commands that can be used to configure the Citrix ADC appliance through the CLI. You can also view the details of each command in the CLI, by entering the `man <ns-command-name>` command.

Citrix NITRO API Reference - Details of all operations that can be performed on the Citrix ADC appliance by using the REST API.

Citrix ADC Advanced Policy Expressions - Details of the expressions that can be used to define advanced policies.
